PHARMACOPEIAL FORUM VOL. 35 NO. 1 **JAN.–FEB. 2009**

* The *USP–NF* (*USP 33–NF 28*), the *Supplement* (*Supp*), or the *Interim Revision Announcement* (*IRA*) for which the revision proposal is targeted is shown in parentheses next to each proposed item.

THE JOURNAL OF STANDARDS DEVELOPMENT AND OFFICIAL COMPENDIA REVISION

Please address comments on *PF* content to Executive Secretariat
USP–NF, 12601 Twinbrook Pkwy.,
Rockville, MD 20852

execsec@usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),* in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

Printed in USA by United Book Press, Baltimore, Maryland

ISSN: 0363-4655

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official pharmaceutical standards.

USP publishes *Pharmacopeial Forum* (*PF*) bimonthly and provides interested parties an opportunity to review and comment on the new or revised standards of the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

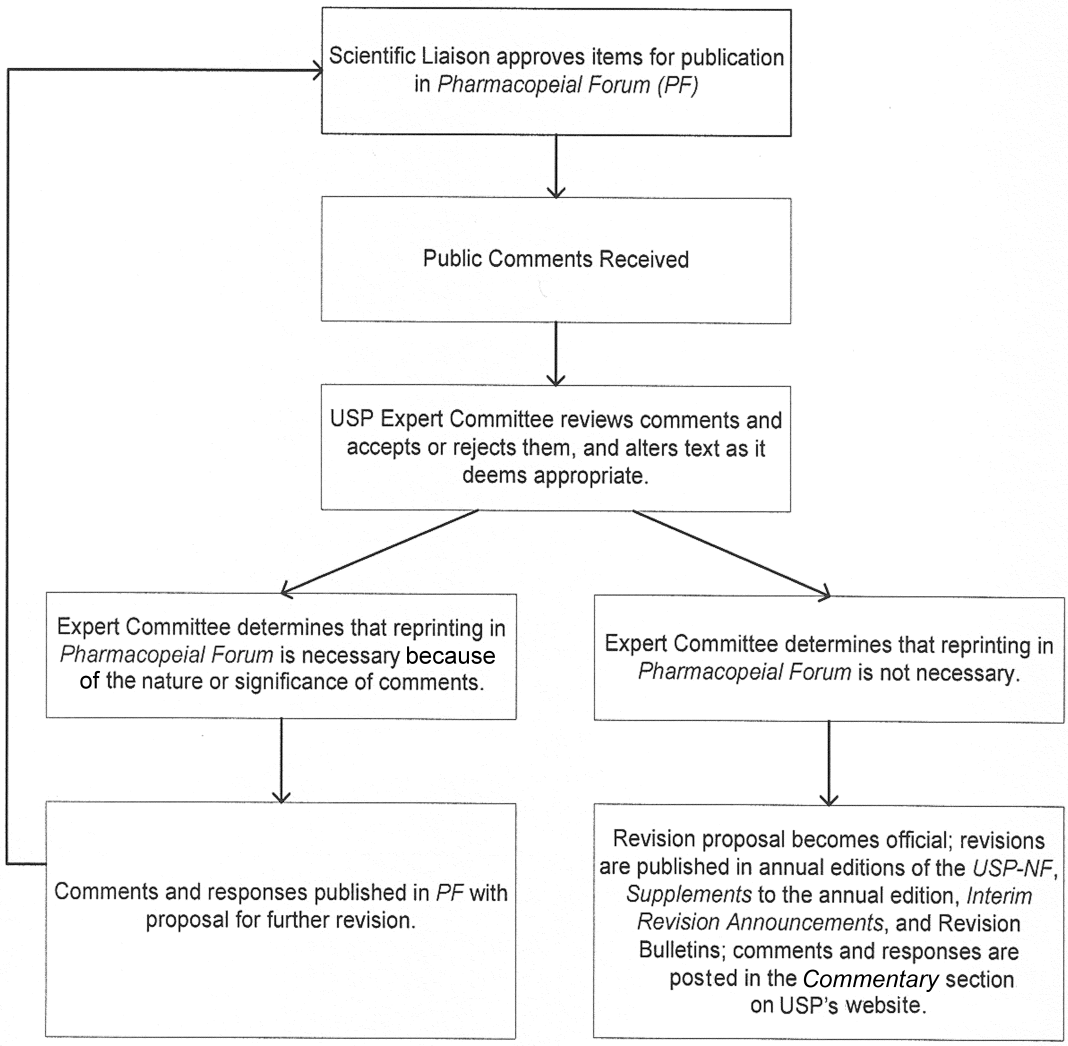
PF includes the following:

1. Potential revisions—entirely new standards, revision ideas, and drafts not yet targeted for official adoption (*Pharmacopeial Previews*)
2. Proposed revisions—new or revised standards targeted for official adoption (*In-Process Revision*)
3. Adopted revisions—new or revised standards that become official and binding before the publication of the next *USP–NF* or *Supplement* (*Interim Revision Announcement*)

USP welcomes comments and data on potential, proposed, or official standards. Comments, along with USP's responses, will be published either in *PF Briefings*, the *Commentary* section of *PF*, the *Commentary* section of *Supplements* to *USP–NF*, or the *Commentary* section of *USP–NF*.

The chart below shows the public review and comment process and its relationship to standards development.

Public Review and Comment Process for *USP-NF* Standards Development



Questions on the process should be addressed to Director, Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE *PF*

This section provides descriptions of the various parts of *PF*. It also includes *Committee Designations* and the *Staff Directory*.

The content of the different sections of *PF* is briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a *Request for Revision* is available in the *Guideline for Submitting Requests for Revision to the USP–NF* on the USP website (www.usp.org/USPNF/submitMonograph/subGuide.html).

Proposed and Adopted Revisions to the *USP–NF*

Section	Content	How Readers Can Respond
Pharmacopeial Previews Early ideas for revisions	•BRIEFING: Scientific rationale for potential inclusion or change. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •Potential revisions not yet targeted for official adoption that require a longer public review and comment process because of issues such as: — the controversial nature of an item; — the application of new technologies that require further study; and — articles produced by multiple sources.	Review drafts and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview.*
In-Process Revision Revisions targeted for adoption	•BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see *Standards Development*). New or revised text is marked with symbols (■■ or ●● or ▲▲) to specify the tentative earliest date on which the revision would be officially adopted.	Review material and send comments promptly to USP staff liaison (see the *Staff Directory*) identified at the end of the briefing accompanying each item. For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or fax number 301-816-8373. Comment deadlines are found at the end of the *Policies and Announcements* section.
Harmonization Items the Pharmacopeial Discussion Group (PDG) is working to harmonize internationally	•BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. The stage determines whether an item appears under *Pharmacopeial Previews* or under *In-Process Revision,* both separate sections of *Harmonization.* •For *In-Process Revision,* new or revised text is marked with symbols (■■) to specify the tentative earliest date on which the revision would be officially adopted.	Review material and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview* or *In-Process Revision.* Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia, with a copy to USP, for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows: EP Secretariat Ms. Lynn Kelso-Eleuterio Central Secretariat European Pharmacopoeia Department European Directorate for the Health Care Council of Europe 7, Allée Kastner CS 30026 67081 Strasbourg France Tel: +33 (3) 88 41 31 48 Fax: +33 (3) 88 41 27 71 lynn.kelso@edqm.eu JP Secretariat Dr. Shigenori Harada Quality Expert Pharmaceuticals and Medical Devices Agency (PMDA) Shin-kasumigaseki Building 3-3-2, Kasumigaseki, Chiyoda-ku Tokyo, 100-0013 Japan Phone: +81-3-3506-9431 Fax: +81-3-3506-9440 harada-shigenori@pmda.go.jp

Proposed and Adopted Revisions to the *USP–NF* (*Continued*)

Section	Content	How Readers Can Respond
Interim Revision Announcement Adopted standards	Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols •.	Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance.
Pending Proposals	In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *PF* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in either the *USP–NF*, its supplements, or an *IRA*. Those items that have not yet been adopted are still pending.	Review items to track pending proposals.
Canceled Proposals	Canceled proposals are items that were published in *PF* and were pending, but have since been canceled. Note that canceled proposals may be republished to be considered in the future for adoption into the *USP–NF*.	Review items to track canceled proposals.

Other Sections

Expert Committee Designations
Names of the Expert Committees (comprising volunteer scientific experts) that work with USP staff on the development of standards

Staff Directory
Names of key USP Standards Division staff members, including scientific liaisons, with contact information

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 35(1)

Chromatographic Reagents Used in USP–NF and Pharmacopeial Forum
Update of chromatographic reagents based on the proposals published in this issue of *PF*

POLICIES AND ANNOUNCEMENTS

This section includes information about general scientific and policy issues that may have an impact on *USP–NF* standards and processes and announcements about issues being considered by USP. This section also includes publication and comment schedules.

USP IMPLEMENTS GUIDELINE ON THE USE OF ACCELERATED PROCESSES FOR REVISIONS TO THE USP–NF. Sections 9.02 and 9.03 of the Rules and Procedures of the 2005–2010 Council of Experts specify various processes (Accelerated Processes) that can be used to make revisions to the *USP–NF* official more quickly than through USP's standard process (Standard Process). USP, in collaboration with the Compendial Process Improvement Project Team, has posted the Guideline on the Use of Accelerated Processes for Revision to *USP–NF*, with an official date of January 1, 2009. The Guideline is available at www.usp.org.

USP's Standard Process calls for publication of a proposed revision in the *Pharmacopeial Forum (PF)* for a 90-day notice and comment period and, after the revision is approved by the relevant USP Expert Committee, publication in the next *USP–NF* or *Supplement*, as applicable. Accelerated Processes, which include *Errata, Interim Revision Announcements*, and *Revision Bulletins*, do not always require notice and comment, and allow for a revision to become official prior to the next *USP–NF* or *Supplement*.

USP has issued this Guideline to delineate the circumstances under which these Accelerated Processes are utilized. The Guideline includes a Decision Tree that specifies the criteria that are applied by USP in considering whether an Accelerated Process is appropriate rather than USP's Standard Process. This Guideline also addresses the use of delayed official dates for revisions made through the Standard Process, where such revisions have broad industry impact and require additional time to implement.

If you have any questions, contact Susan de Mars, J.D., USP Chief Legal Officer (sdm@usp.org).

USP REDESIGNS *PHARMACOPEIAL FORUM.* USP has begun implementing a redesigned *Pharmacopeial Forum (PF)* as part of an initiative that will result in a completely online, freely available *PF* beginning in January 2011. The redesigned *PF* will no longer be used to publish new official text [*Interim Revision Announcements (IRAs)* and *Errata*], which will instead be posted on USP's website. During 2009, USP will begin posting approved *IRAs, Revision Bulletins*, and *Errata* on www.usp.org in a new ''official text'' section, but also continue to print approved *IRAs* and *Errata* in the *PF*.

USP also will be modifying *PF* beginning with *PF* 35(2) [March–April 2009] to display *In-Process Revision* monographs in the new monograph format that will become effective in *USP 33*.

USP encourages stakeholders to sign up for the Compendial Notices e-mail service in order to receive notices of new postings to the USP website. To sign up for this service, go to http://www.usp.org/support/products/uspNewsletters Request.html?promo=compendial.

If you have any questions about the redesign process, contact Susan de Mars, J.D., USP Chief Legal Officer (sdm@usp.org). If you have any questions about *Pharmacopeial Forum* subscriptions, please contact USP Customer Service [custsvc@usp.org or 301-881-0666, 1-800-227-8772 (U.S. and Canada), or 00-800-4875-5555 (Europe)].

USP ISSUES CALL FOR CANDIDATES FOR 2010–2015 COUNCIL OF EXPERTS, ITS EXPERT COMMITTEES, AND ITS ADVISORY PANELS. In accordance with the Bylaws of the USP Convention, USP is issuing a *Call for Candidates* for the 2010–2015 Council of Experts. The 2010–2015 Council of Experts includes Expert Committees in the areas of Nomenclature, Small Molecules, Biologics and Biotechnology, Excipients, General Chapters, Reference Standards, Compounding, Food Ingredients, and Dietary Supplements. In the 2010–2015 cycle, USP is expanding the number of Advisory Panels that report to Expert Committees. These Expert Committees and Advisory Panels align with the new USP Strategic Plan, which focuses on expanding and enhancing USP's core compendial and standards-setting activities.

The ability to add Advisory Panels according to the needs of USP introduces flexibility and scalability into USP's activities. USP plans to continue to attract global base experts, and therefore encourages any qualified individual to apply. Importantly, this approach also enables USP to closely align USP's documentary and reference standards activities for a more efficient standards-setting process.

Specific Expert Committees and Advisory Panels for which USP is seeking candidates are listed at USP's nominations website (www.usp.org/nominate). The deadline for applications for the Council of Experts (Expert Committee Chair) is **December 31, 2009**. The deadline for applications for Expert Committee members is **May 14, 2010**. Recruitment for Advisory Panels members will be continuous.

For further information, contact Angela G. Long, Vice President, Volunteer and Organizational Affairs (agl@usp.org or nominate@usp.org).

USP REVISES GENERAL NOTICES IN *USP 32–NF 27*. The Council of Experts Executive Committee has approved revisions to the *USP–NF* General Notices, which appear in *USP 32–NF 27*. The first draft of revisions to the *USP–NF* General Notices was posted on USP's website in May of 2007, and made available for public comment until August 31, 2007. Based on comments received on this draft, a second draft was prepared, which then appeared in *Pharmacopeial Forum (PF)* 34(1). This second draft was accompanied by an Explanatory Note, which summarized the comments received and the changes made by USP in response to those comments.

Comments also were received on the second draft, which were carefully considered, and incorporated as deemed appropriate by the Council of Experts Executive Committee into the final

version. Summaries of many of the comments received and USP's responses to the comments, including requests for additional input, are included in a Commentary document.

There also are additional topics for the future that require continuing dialog. These topics are not included in the version effective in *USP 32–NF 27*, but may be considered in the future. These topics include, but are not limited to the following:

- Consider that all compendia published by USP (*USP–NF, Food Chemicals Codex, Pending and Non-US monographs*) be covered by the General Notices because the General Notices include the terms essential for understanding any monograph;
- Consider standardizing language among the compendia to make it easier for users who refer both to *FCC* and *USP–NF*;
- Clarify the distinction between General Chapters intended to be enforceable and those intended to be informational.

The General Notices, Explanatory Note, Commentary, and a Questions and Answers document are posted on USP's website. Please direct questions regarding the General Notices revision to generalnotices@usp.org.

***PHARMACOPEIAL FORUM* PUBLIC REVIEW AND COMMENT PERIOD DEADLINES.** The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. In accordance with the Rules and Procedures of the 2005–2010 Council of Experts, USP has implemented a 90-day comment period by providing a deadline for each issue of *PF* unless otherwise stated in the individual briefing. The listing of comment period deadlines and the targeted official publications appears below.

Pharmacopeial Forum	Comment Deadline	Targeted Official Publication	Release Date	Official Date
PF 34(6)	February 15, 2009	*USP 33–NF 28*	November 2009	May 1, 2010
PF 35(1)	April 15, 2009			
PF 35(2)	June 15, 2009	*USP 33–NF 28 1st Supplement*	February 2010	August 1, 2010
PF 35(3)	August 15, 2009			
PF 35(4)	October 15, 2009	*USP 33–NF 28 2nd Supplement*	June 2010	December 1, 2010
PF 35(5)	December 15, 2009			
PF 35(6)	February 15, 2010	*USP 34–NF 29*	November 2010	May 1, 2011
PF 36(1)	March 31, 2010			

All official revisions are published in the annual edition or *Supplements* to *USP–NF* (twice yearly). Between these publications, official revisions are published in *PF* in the *Interim Revision Announcement* section; these revisions are also incorporated in the upcoming *Supplement* or book. The official publication in which an *IRA* is incorporated will depend upon publication deadlines. See table below. The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement.* The table below outlines the publications and their release and official dates, and the book or supplement which supersedes them.

Publication Schedules

Publication	Release Date	Official Date	Superseded by
USP 32–NF 27	November 1, 2008	May 1, 2009	*1st Supplement to USP 32–NF 27*
IRA [*PF* 35(1)]	January 1, 2009	February 1, 2009	*2nd Supplement to USP 32–NF 27*
1st Supplement to USP 32–NF 27	February 1, 2009	August 1, 2009	*2nd Supplement to USP 32–NF 27*
IRA [*PF* 35(2)]	March 1, 2009	April 1, 2009	*2nd Supplement to USP 32–NF 27*
IRA [*PF* 35(3)]	May 1, 2009	June 1, 2009	*USP 33–NF 28*
2nd Supplement to USP 32–NF 27	June 1, 2009	December 1, 2009	*USP 33–NF 28*
IRA [*PF* 35(4)]	July 1, 2009	August 1, 2009	*1st Supplement to USP 33–NF 28*
IRA [*PF* 35(5)]	September 1, 2009	October 1, 2009	*1st Supplement to USP 33–NF 28*
IRA [*PF* 35(6)]	November 1, 2009	December 1, 2009	*2nd Supplement to USP 33–NF 28*
USP 33–NF 28	November 1, 2009	May 1, 2010	*1st Supplement to USP 33–NF 28*

PRIORITY NEW MONOGRAPH ITEMS. In this edition of *PF* the Priority New Monograph Items list has been relocated from the *Pharmacopeial Forum* to http://www.usp.org/USPNF/submitMonograph/newMon.html. It will return to *PF* in 35(2).

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:

- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- New adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type (print edition only), as shown in the examples below:

— •new text• if slated for an *Interim Revision Announcement;*
— ▲new text▲ if slated for *USP 33–NF 28*; and
— ■new text■ if slated for a *Supplement* to *USP–NF*

The same symbols not set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Interim Revision Announcement* that will appear in issue 2 of a given *PF* volume, ■2S (USP32) indicates that the proposed revision is slated for the *Second Supplement* to *USP 32,* and ▲USP33 and ▲NF28 indicate that the revisions are proposed for *USP 33* and *NF 28*, respectively.

Errata—At the end of the *Interim Revision Announcement* section is a list of errata and corrections to *USP 31–NF 26*. The page number indicates where the item is found in *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be cumulative in future *Supplements,* and will appear in its corrected form in the next annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement.

INTERIM REVISION ANNOUNCEMENT to *USP 31* and to *NF 26*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

John W. Mauger, *Chair*
USP Board of Trustees

Roger L. Williams, M.D., *Executive Vice President, CEO,* and *Chairman, USP Council of Experts*

Darrell R. Abernethy, M.D., Ph.D., *Chief Science Officer*
William F. Koch, Ph.D., FACB, *Chief Metrology Officer*

Released January 1, 2009 **Official February 1, 2009**

All inquiries and comments regarding *USP 31* text and *NF 26* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852 (execsec@usp.org).

New USP Reference Standards

The following USP Reference Standards, which were not available when the associated monograph was made official, have since become available. The respective official date of each *USP 31* or *NF 26* standard, test, or assay requiring the use of the following USP Reference Standards is indicated in parentheses after the name of the Reference Standard.

USP Flumazenil Related Compound C RS (March 1, 2008)
USP Diluted Isosorbide Mononitrate RS (May 1, 2008)
USP Mibolerone RS (November 1, 2008)
USP Narasin RS (November 1, 2008)
USP Near IR System Suitability RS (May 1, 2008)
USP Powdered St. John's Wort Extract RS (November 1, 2008)
USP Pyrethrum Extract RS (March 1, 2008)
USP Δ^9-Tetrahydrocannabinol RS (May 1, 2008)

Unavailable First-Time Official USP Reference Standards

The official dates of any *USP 31* or *NF 26* standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards. This listing was updated as of October 8, 2008. Please refer to the current USP Catalog for a more up-to-date availability list. The USP Catalog can be accessed on-line at http://www.uspcatalog.com.

USP 23-Epi-26-deoxyactein RS
USP Acarbose RS
USP Acarbose System Suitability Mixture RS
USP Actein RS
USP (*S*)-Adenosyl-L-homocysteine RS
USP Albumin Human RS
USP Alteplase RS
USP Amifostine RS
USP Amifostine Thiol RS
USP Antithrombin III Human RS

REFERENCE STANDARD MATERIAL

Acceptable amino acid standards are commercially available* for amino acid analysis and typically consist of an aqueous mixture of amino acids. When determining amino acid composition, protein or peptide standards are analyzed with the test material as a control to demonstrate the integrity of the entire procedure. Highly purified bovine serum albumin has been used as a protein standard for this purpose.

Change to read:

PROTEIN HYDROLYSIS

Hydrolysis of protein and peptide samples is necessary for amino acid analysis of these molecules. The glassware used for hydrolysis must be very clean to avoid erroneous results. Glove powders and fingerprints on hydrolysis tubes may cause contamination. To clean glass hydrolysis tubes, boil tubes for 1 hour in 1 N hydrochloric acid or soak tubes in concentrated nitric acid or in a mixture of concentrated hydrochloric acid and concentrated nitric acid (1 : 1). Clean hydrolysis tubes are rinsed with high-purity water followed by a rinse with HPLC grade methanol, dried overnight in an oven, and stored covered until use. Alternatively, pyrolysis of clean glassware at 500° for 4 hours may be used to eliminate contamination from hydrolysis tubes. Adequate disposable laboratory material can also be used.

Acid hydrolysis is the most common method for hydrolyzing a protein sample before amino acid analysis. The acid hydrolysis technique can contribute to the variation of the analysis due to complete or partial destruction of several amino acids. Tryptophan is destroyed; serine and threonine are partially destroyed; methionine might undergo oxidation; and cysteine is typically recovered as cystine (but cystine recovery is usually poor because of partial destruction or reduction to cysteine). Application of adequate vacuum (less than 200 µm of mercury or 26.7 Pa) or introduction of an inert gas (argon) in the headspace of the reaction vessel can reduce the level of oxidative destruction. In peptide bonds involving isoleucine and valine, the amido bonds of Ile-Ile, Val-Val, Ile-Val, and Val-Ile are partially cleaved; and asparagine and glutamine are deamidated, resulting in aspartic acid and glutamic acid, respectively. The loss of tryptophan, asparagine, and glutamine during an acid hydrolysis limits quantitation to 17 amino acids. Some of the hydrolysis techniques described are used to address these concerns. Some of the hydrolysis techniques described (i.e., *Methods 4–11*) may cause modifications to other amino acids. Therefore, the benefits of using a given hydrolysis technique are weighed against the concerns with the technique and are tested adequately before employing a method other than acid hydrolysis.

A time-course study (i.e., amino acid analysis at acid hydrolysis times of 24, 48, and 72 hours) is often employed to analyze the starting concentration of amino acids that are partially destroyed or slow to cleave. By plotting the observed concentration of labile amino acids (i.e., serine and threonine) versus hydrolysis time, the line can be extrapolated to the origin to determine the starting concentration of these amino acids. Time-course hydrolysis studies are also used with amino acids that are slow to cleave (e.g., isoleucine and valine). During the hydrolysis time course, the analyst will observe a plateau in these residues. The level of this plateau is taken as the residue concentration. If the hydrolysis time is too long, the residue concentration of the sample will begin to decrease, indicating destruction by the hydrolysis conditions.

An acceptable alternative to the time-course study is to subject an amino acid calibration standard to the same hydrolysis conditions as the test sample. The amino acid in free form may not completely represent the rate of destruction of labile amino acids within a peptide or protein during the hydrolysis. This is especially true for peptide bonds that are slow to cleave (e.g., Ile-Val bonds). However, this technique will allow the analyst to account for some residue destruction. Microwave acid hydrolysis has been used and is rapid but it requires special equipment as well as special precautions. The optimal conditions for microwave hydrolysis must be investigated for each individual protein/peptide sample. The microwave hydrolysis technique typically requires only a few minutes, but even a deviation of 1 minute may give inadequate results (e.g., incomplete hydrolysis or destruction of labile amino acids). Complete proteolysis, using a mixture of proteases, has been used but can be complicated, requires the proper controls, and is typically more applicable to peptides than proteins. [NOTE—During initial analyses of an unknown protein, experiments with various hydrolysis time and temperature conditions are conducted to determine the optimal conditions.]

Method 1

Acid hydrolysis using hydrochloric acid containing phenol is the most common procedure used for protein/peptide hydrolysis preceding amino acid analysis. The addition of phenol to the reaction prevents the halogenation of tyrosine.

Hydrolysis Solution: 6 N hydrochloric acid containing 0.1% to 1.0% of phenol.

Procedure—

Liquid Phase Hydrolysis—Place the protein or peptide sample in a hydrolysis tube, and dry. [NOTE—The sample is dried so that water in the sample will not dilute the acid used for the hydrolysis.] Add 200 µL of *Hydrolysis Solution* per 500 µg of lyophilized protein. Freeze the sample tube in a dry ice–acetone bath, and flame seal in vacuum. Samples are typically hydrolyzed at 110° for 24 hours in vacuum or inert atmosphere to prevent oxidation. Longer hydrolysis times (e.g., 48 and 72 hours) are investigated if there is a concern that the protein is not completely hydrolyzed.

* •◆•|Suitable standards may be obtained from NIST (Gaithersburg, MD), Beckman Instruments (Fullerton, CA), Sigma Chemical (St. Louis, MO), Pierce (Rockford, IL), or Agilent (Palo Alto, CA).•◆•|

Interim Revision Announcement

Vapor Phase Hydrolysis—This is one of the most common acid hydrolysis procedures, and it is preferred for microanalysis when only small amounts of the sample are available. Contamination of the sample from the acid reagent is also minimized by using vapor phase hydrolysis. Place vials containing the dried samples in a vessel that contains an appropriate amount of *Hydrolysis Solution.* The *Hydrolysis Solution* does not come in contact with the test sample. Apply an inert atmosphere or vacuum (less than 200 µm of mercury or 26.7 Pa) to the headspace of the vessel, and heat to about 110° for a 24-hour hydrolysis time. Acid vapor hydrolyzes the dried sample. Any condensation of the acid in the sample vials is minimized. After hydrolysis, dry the test sample in vacuum to remove any residual acid.

Method 2

Tryptophan oxidation during hydrolysis is decreased by using mercaptoethanesulfonic acid (MESA) as the reducing acid.

Hydrolysis Solution: 2.5 M MESA solution.

Vapor Phase Hydrolysis—About 1 to 100 µg of the protein/peptide under test is dried in a hydrolysis tube. The hydrolysis tube is placed in a larger tube with about 200 µL of the *Hydrolysis Solution.* The larger tube is sealed in vacuum (about 50 µm of mercury or 6.7 Pa) to vaporize the *Hydrolysis Solution*. The hydrolysis tube is heated to between 170° to 185° for about 12.5 minutes. After hydrolysis, the hydrolysis tube is dried in vacuum for 15 minutes to remove the residual acid.

Method 3

Tryptophan oxidation during hydrolysis is prevented by using thioglycolic acid (TGA) as the reducing acid.

Hydrolysis Solution: a solution containing 7 M hydrochloric acid, 10% of trifluoroacetic acid, 20% of thioglycolic acid, and 1% of phenol.

Vapor Phase Hydrolysis—About 10 to 50 µg of the protein/peptide under test is dried in a sample tube. The sample tube is placed in a larger tube with about 200 µL of the *Hydrolysis Solution*. The larger tube is sealed in vacuum (about 50 µm of mercury or 6.7 Pa) to vaporize the TGA. The sample tube is heated to 166° for about 15 to 30 minutes. After hydrolysis, the sample tube is dried in vacuum for 5 minutes to remove the residual acid. Recovery of tryptophan by this method may be dependent on the amount of sample present.

Method 4

Cysteine-cystine and methionine oxidation is performed with performic acid before the protein hydrolysis.

Oxidation Solution—The performic acid is prepared fresh by mixing formic acid and 30 percent hydrogen peroxide (9 : 1), and incubating at room temperature for 1 hour.

Procedure—The protein/peptide sample is dissolved in 20 µL of formic acid, and heated at 50° for 5 minutes; then 100 µL of the *Oxidation Solution* is added. In this reaction, cysteine is converted to cysteic acid and methionine is converted to methionine sulfone. The oxidation is allowed to proceed for 10 to 30 minutes. The excess reagent is removed from the sample in a vacuum centrifuge. This technique may cause modifications to tyrosine residues in the presence of halides. The oxidized protein can then be acid hydrolyzed using *Method 1* or *Method 2*.

Method 5

Cysteine-cystine oxidation is accomplished during the liquid phase hydrolysis with sodium azide.

Hydrolysis Solution: 6 N hydrochloric acid containing 0.2% of phenol, to which sodium azide is added to obtain a final concentration of 0.2% (w/v). The added phenol prevents halogenation of tyrosine.

Liquid Phase Hydrolysis—The protein/peptide hydrolysis is conducted at about 110° for 24 hours. During the hydrolysis, the cysteine-cystine present in the sample is converted to cysteic acid by the sodium azide present in the *Hydrolysis Solution*. This technique allows better tyrosine recovery than *Method 4,* but it is not quantitative for methionine. Methionine is converted to a mixture of the parent methionine and its two oxidative products, methionine sulfoxide and methionine sulfone.

Method 6

Cysteine-cystine oxidation is accomplished with dimethyl sulfoxide (DMSO).

Hydrolysis Solution: 6 N hydrochloric acid containing 0.1% to 1.0% of phenol, to which DMSO is added to obtain a final concentration of 2% (v/v).

Vapor Phase Hydrolysis—The protein/peptide hydrolysis is conducted at about 110° for 24 hours. During the hydrolysis, the cysteine-cystine present in the sample is converted to cysteic acid by the DMSO present in the *Hydrolysis Solution*. As an approach to limit variability and to compensate for partial destruction, it is recommended to evaluate the cysteic acid recovery from oxidative hydrolyses of standard proteins containing 1 to 8 mol of cysteine. The response factors from protein/peptide hydrolysates are typically about 30% lower than those for nonhydrolyzed cysteic acid standards. Because histidine, methionine, tyrosine, and tryptophan are also modified, a complete compositional analysis is not obtained with this technique.

Method 7

Cysteine-cystine reduction and alkylation is accomplished by a vapor phase pyridylethylation reaction.

Reducing Solution—Transfer 83.3 µL of pyridine, 16.7 µL of 4-vinylpyridine, 16.7 µL of tributylphosphine, and 83.3 µL of water to a suitable container, and mix.

Procedure—Add the protein/peptide (between 1 and 100 µg) to a hydrolysis tube, and place in a larger tube. Transfer the *Reducing Solution* to the large tube, seal in vacuum (about 50 µm of mercury or 6.7 Pa), and incubate at about 100° for 5 minutes. Then remove the inner hydrolysis tube, and dry it in a vacuum desiccator for 15 minutes to remove residual reagents. The pyridylethylated protein/peptide can then be acid hydrolyzed using previously described procedures. The pyridylethylation reaction is performed simultaneously with a protein standard sample containing 1 to 8 mol of cysteine to improve accuracy in the pyridylethyl-cysteine recovery. Longer incubation times for the pyridylethylation reaction can cause modifications to the α-amino terminal group and the ϵ-amino group of lysine in the protein.

Method 8

Cysteine-cystine reduction and alkylation is accomplished by a liquid phase pyridylethylation reaction.

Stock Solutions—Prepare and filter three solutions: 1 M Tris hydrochloride (pH 8.5) containing 4 mM edetate disodium (*Stock Solution 1*), 8 M guanidine hydrochloride (*Stock Solution 2*), and 10% of 2-mercaptoethanol in water (*Stock Solution 3*).

Reducing Solution—Prepare a mixture of *Stock Solution 2* and *Stock Solution 1* (3 : 1) to obtain a buffered solution of 6 M guanidine hydrochloride in 0.25 M Tris hydrochloride.

Procedure—Dissolve about 10 µg of the test sample in 50 µL of the *Reducing Solution*, and add about 2.5 µL of *Stock Solution 3*. Store under nitrogen or argon for 2 hours at room temperature in the dark. To achieve the pyridylethylation reaction, add about 2 µL of 4-vinylpyridine to the protein solution, and incubate for an additional 2 hours at room temperature in the dark. The protein/peptide is desalted by collecting the protein/peptide fraction from a reverse-phase HPLC separation. The collected sample can be dried in a vacuum centrifuge before acid hydrolysis.

Method 9

Cysteine-cystine reduction and alkylation is accomplished by a liquid phase carboxymethylation reaction.

Stock Solutions—Prepare as directed for *Method 8*.

Carboxymethylation Solution—Prepare a solution containing 100 mg of iodoacetamide per mL of alcohol.

Buffer Solution—Use the *Reducing Solution,* prepared as directed for *Method 8*.

Procedure—Dissolve the test sample in 50 µL of the *Buffer Solution*, and add about 2.5 µL of *Stock Solution 3*. Store under nitrogen or argon for 2 hours at room temperature in the dark. Add the *Carboxymethylation Solution* in a 1.5 fold ratio per total theoretical content of thiols, and incubate for an additional 30 minutes at room temperature in the dark. [NOTE—If the thiol content of the protein is unknown, then add 5 µL of 100 mM iodoacetamide for every 20 nmol of protein present.] The reaction is stopped by adding excess of 2-mercaptoethanol. The protein/peptide is desalted by collecting the protein/peptide fraction from a reverse-phase HPLC separation. The collected sample can be dried in a vacuum centrifuge before acid hydrolysis. The *S*-carboxyamidomethylcysteine formed will be converted to *S*-carboxymethyl-cysteine during acid hydrolysis.

Method 10

Cysteine-cystine is reacted with dithiodiglycolic acid or dithiodipropionic acid to produce a mixed disulfide. [NOTE—The choice of dithiodiglycolic acid or dithiodipropionic acid depends on the required resolution of the amino acid analysis method.]

Reducing Solution: a solution containing 10 mg of dithiodiglycolic acid (or dithiodipropionic acid) per mL of 0.2 M sodium hydroxide.

Procedure—Transfer about 20 µg of the test sample to a hydrolysis tube, and add 5 µL of the *Reducing Solution*. Add 10 µL of isopropyl alcohol, and then remove all of the sample liquid by vacuum centrifugation. The sample is then hydrolyzed using *Method 1*. This method has the advantage that other amino acid residues are not derivatized by side reactions, and the sample does not need to be desalted prior to hydrolysis.

Method 11

Asparagine and glutamine are converted to aspartic acid and glutamic acid, respectively, during acid hydrolysis. Asparagine and aspartic acid residues are added and represented by *Asx,* while glutamine and glutamic acid residues are added and represented by *Glx.* Proteins/peptides can be reacted with bis(1,1-trifluoroacetoxy)iodobenzene (BTI) to convert the asparagine and glutamine residues to diaminopropionic acid and diaminobutyric acid residues, respectively, upon acid hydrolysis. These conversions allow the analyst to determine the asparagine and glutamine content of a protein/peptide in the presence of aspartic acid and glutamic acid residues.

Reducing Solutions—Prepare and filter three solutions: a solution of 10 mM trifluoroacetic acid (*Solution 1*), a solution of 5 M guanidine hydrochloride and 10 mM trifluoroacetic acid (*Solution 2*), and a freshly prepared solution of dimethylformamide containing 36 mg of BTI per mL (*Solution 3*).

Procedure—In a clean hydrolysis tube, transfer about 200 µg of the test sample, and add 2 mL of *Solution 1* or *Solution 2* and 2 mL of *Solution 3*. Seal the hydrolysis tube in vacuum. Heat the sample at 60° for 4 hours in the dark. The sample is then dialyzed with water to remove the excess reagents. Extract the dialyzed sample three times with equal volumes of *n*-butyl acetate, and then lyophilize. The protein can then be acid hydrolyzed using previously described procedures. The α-, *β*-diaminopropionic and α-, γ-diaminobutyric acid residues do not typically resolve from the lysine residues upon ion-exchange chromatography based on amino acid analysis. Therefore, when using ion-exchange as the mode of amino acid separation, the asparagine and glutamine contents are the quantitative difference in the aspartic acid and glutamic acid assayed contents with underivatized and BTI-derivatized acid hydrolysis. [NOTE—The threonine, methionine, cysteine, tyrosine, and histidine assayed content can be altered by BTI derivatization; a hydrolysis without BTI will have to be performed if the analyst is interested in the •composition•$_{1}$ of these other amino acid residues.]

Change to read:

METHODOLOGIES OF AMINO ACID ANALYSIS GENERAL PRINCIPLES

Many amino acid analysis techniques exist, and the choice of any one technique often depends on the sensitivity required from the assay. In general, about one-half of the amino acid analysis techniques employed rely on the separation of the free amino acids by ion-exchange chromatography followed by postcolumn derivatization (e.g., with ninhydrin or *o*-phthalaldehyde). Postcolumn detection techniques can be used with samples that contain small amounts of buffer components, such as salts and urea, and generally require between 5 and 10 µg of protein sample per analysis. The remaining amino acid techniques typically involve precolumn derivatization of the free amino acids (e.g., phenyl isothiocyanate; 6-aminoquinolyl-*N*-hydroxysuccinimidyl •carbamate•$_{1}$ or *o*-phthalaldehyde; (dimethylamino)azobenzenesulfonyl chloride; 9-fluorenyl-methylchloroformate; and 7-fluoro-4-nitrobenzo-2-oxa-1,3-diazole) followed by reverse-phase HPLC. Precolumn derivatization techniques are very sensitive and usually require between 0.5 and 1.0 µg of protein sample per analysis but may be influenced by buffer salts in the samples. Precolumn derivatization techniques may also result in multiple derivatives of a given amino acid, which complicates the result interpretation. Postcolumn derivatization techniques are generally influenced less by performance variation of the assay than precolumn derivatization techniques.

The following *Methods* may be used for quantitative amino acid analysis. Instruments and reagents for these procedures are available commercially. Furthermore, many modifications of these methodologies exist with different reagent preparations, reaction procedures, and chromatographic systems. Specific parameters may vary according to the exact equipment and procedure used. Many laboratories will utilize more than one amino acid analysis technique to exploit the advantages offered by each. In each of these *Methods*, the analog signal is visualized by means of a data acquisition system, and the peak areas are integrated for quantification purposes.

Method 1—Postcolumn Ninhydrin Detection •General Principle•$_{1}$

Ion-exchange chromatography with postcolumn ninhydrin detection is one of the most common methods employed for quantitative amino acid analysis. As a rule, a Li-based cation-exchange system is employed for the analysis of the more complex physiological samples, and the faster Na-based cation-exchange system is used for the more simplistic amino acid mixtures obtained with protein hydrolysates (typically containing 17 amino acid components). Separation of the amino acids on an ion-exchange column is accomplished through a combination of changes in pH and cation strength. A temperature gradient is often employed to enhance separation.

When the amino acid reacts with ninhydrin, the reactant has characteristic purple or yellow color. Amino acids, except imino acids, give a purple color, and show maximum absorption at 570 nm. The imino acids, such as proline, give a yellow color, and show maximum absorption at 440 nm. The postcolumn reaction between ninhydrin and amino acid eluted from the column is monitored at 440 nm and 570 nm, and the chromatogram obtained is used for the determination of amino acid composition.

Detection limit is considered to be 10 pmol for most of the amino acid derivatives, but 50 pmol for proline. Response linearity is obtained in the range of 20 to 500 pmol with correlation coefficients exceeding 0.999. To obtain good compositional data, samples larger than 1 µg before hydrolysis are best suited for this amino acid analysis of protein/peptide.

•
•$_{1}$

Method 2—Postcolumn OPA Fluorometric •Detection General Principle•

•
•
o-Phthalaldehyde• OPA reacts with primary amines in the presence of thiol compound to form highly fluorescent isoindole products. This reaction is utilized for the postcolumn derivatization in analysis of amino acids by ion-exchange chromatography. The rule of the separation is the same as *Method I*. Instruments and reagents for this form of amino acid analysis are available commercially. Many modifications of this method exist.

Although OPA does not react with secondary amines (imino acids, such as proline) to form fluorescent substances, the oxidation with sodium hypochlorite allows secondary amines to react with OPA. The procedure employs a strongly acidic cation-exchange column for separation of free amino acids followed by postcolumn oxidation with sodium hypochlorite and postcolumn derivatization using OPA and thiol compound, such as *N*-acetyl-L-cysteine and 2-mercaptoethanol. The derivatization of primary amino acids are not noticeably affected by the continuous supply of sodium hypochlorite.

Separation of the amino acids on an ion-exchange column is accomplished through a combination of changes of pH and cation strength. After postcolumn derivatization of eluted amino acids with OPA, the reactant passes through the fluorometric detector. Fluorescence intensity of OPA-derivatized amino acids are monitored with an excitation wavelength of 348 nm and an emission wavelength of 450 nm.

Detection limit is considered to be a few tens of pmol level for most of the amino acid derivatives. Response linearity is obtained in the range of a few pmol level to a few tens of nmol level. To obtain good compositional data, a sample greater than 500 ng before hydrolysis is best suited for the amino acid analysis of protein/peptide.

•
•

Method 3—Precolumn •PITC Derivatization General Principle•

•
•
Phenylisothiocyanate• (PITC) reacts with amino acids to form phenylthiocarbamyl (PTC) derivatives, which can be detected with high sensitivity at 254 nm. Therefore, precolumn derivatization of amino acids with PITC followed by a reverse-phase HPLC separation with UV detection is used to analyze the amino acid composition.

After the reagent is removed under vacuum, the derivatized amino acids can be stored dry and frozen for several weeks with no significant degradation. If the solution for injection is kept cold, no noticeable loss in chromatographic response occurs after three days.

Separation of the PTC-amino acids on a reverse-phase HPLC with ODS column is accomplished through a combination of changes in concentrations of acetonitrile and buffer ionic strength. PTC-amino acids eluted from the column are monitored at 254 nm.

Detection limit is considered to be 1 pmol for most of the amino acid derivatives. Response linearity is obtained in the range of 20 to 500 pmol with correlation coefficients exceeding 0.999. To obtain good compositional data, a sample larger than 500 ng of protein/peptide before hydrolysis is best suited for this amino analysis of proteins/peptides.

•
•

Method 4—Precolumn AQC Derivatization •General Principle•

Precolumn derivatization of amino acids with 6-aminoquinolyl-*N*-hydroxysuccinimidyl carbamate (AQC) followed by reverse-phase HPLC separation with fluorometric detection is used.

AQC reacts with amino acids to form stable, fluorescent unsymmetric urea derivatives (AQC-amino acids) which are readily amenable to analysis by reverse-phase HPLC. Therefore, precolumn derivatization of amino acids with AQC followed by reverse-phase HPLC separation is used to analyze the amino acid composition.

Separation of the AQC-amino acids on an ODS column is accomplished through a combination of changes in the concentrations of acetonitrile and salt. Selective fluorescence detection of the derivatives with an excitation wavelength at 250 nm and an emission wavelength at 395 nm allows for the direct injection of the reaction mixture with no significant interference from the only major fluorescent reagent byproduct, 6-aminoquinoline. Excess reagent is rapidly hydrolyzed ($t_{1/2} < 15$ seconds) to yield 6-aminoquinoline, *N*-hydroxysuccinimide and carbon dioxide, and after 1 minute no further derivatization can take place.

Peak areas for AQC-amino acids are essentially unchanged for at least 1 week at room temperature, and the derivatives have more than sufficient stability to allow for overnight automated chromatographic analysis.

The detection limit is considered to be ranging from about 40 fmol to 320 fmol for each amino acid, except for Cys. The detection limit for Cys is approximately 800 fmol. Response linearity is obtained in the range of 2.5 µM to 200 µM with correlation coefficients exceeding 0.999. Good compositional data can be obtained from the analysis of derivatized protein hydrolysates containing as little as 30 ng of protein/peptide.

•
•

Method 5—Precolumn OPA Derivatization •General Principle•

Precolumn derivatization of amino acids with *o*-phthalaldehyde (OPA) followed by reverse-phase HPLC separation with fluorometric detection is used. This technique does not detect amino acids that exist as secondary amines (e.g., proline).

OPA in conjunction with a thiol reagent reacts with primary amine groups to form highly fluorescent isoindole products. 2-Mercaptoethanol and 3-mercaptopropionic acid can be used as thiol. OPA itself does not fluoresce and consequently produces no interfering peaks. In addition, its solubility and stability in aqueous solution, along with the rapid kinetics for the reactions, make it amenable to automated derivatization and analysis using an autosampler to mix the sample with the reagent. However, lack of reactivity with secondary amino acids has been a predominant drawback. This method does not detect amino acids that exist as secondary amines (e.g., proline). To compensate for this drawback, this technique may be combined with another technique described in *Method 7* or *Method 8*.

Precolumn derivatization of amino acids with OPA is followed by reverse-phase HPLC separation. Because of the instability of the OPA-amino acid derivative, HPLC separation and analysis are performed immediately following derivatization. The liquid chromatograph is equipped with a fluorometric detector for the detection of derivatized amino acids. Fluorescence intensity of the OPA-derivatized amino acids are monitored with an excitation wavelength of 348 nm and an emission wavelength of 450 nm.

The detection limits as low as 50 fmol via fluorescence have been reported, although the practical limit of analysis remains at 1 pmol.

•
•

Method 6—Postcolumn DABS-Cl Derivatization •General Principle•

Precolumn derivatization of amino acids with (dimethylamino)azobenzenesulfonyl chloride (DABS-Cl) followed by reverse-phase HPLC separation with visible light detection is used.

DABS-Cl is a chromophoric reagent employed for the labeling of amino acids. Amino acids labeled with DABS-Cl (DABS-amino acids) are highly stable and show the maximum absorption at 436 nm.

DABS-amino acids, all 19 naturally occurring amino acid derivatives, can be separated on an ODS column of a reverse-phase HPLC by employing gradient systems consisting of acetonitrile and aqueous buffer mixture. Separated DABS-amino acids eluted from the column are detected at 436 nm in the visible region.

This method can analyze the imino acids, such as proline, together with the amino acids, at the same degree of sensitivity. DABS-Cl derivatization method permits the simultaneous quantification of tryptophan residues by previous hydrolysis of the protein/peptide with sulfonic acids, such as mercaptoethanesulfonic acid, *p*-toluenesulfonic acid, or methanesulfonic acid, described for *Method 2* in *Protein Hydrolysis* •. The other acid-labile residues, asparagine and glutamine, can also be analyzed by previous conversion into diaminopro-

Interim Revision Announcement

pionic acid and diaminobutyric acid, respectively, by treatment of protein/peptide with BTI, described for *Method 11* in *Protein Hydrolysis* •⟨1⟩.

The nonproteinogenic amino acid, norleucine, cannot be used as an internal standard in this method as this compound is eluted in a chromatographic region crowded with peaks of primary amino acids. Nitrotyrosine can be used as an internal standard because it is eluted in a clean region.

The detection limit of DABS-amino acid is about 1 pmol. As little as 2 to 5 pmol of an individual DABS-amino acid can be quantitatively analyzed with reliability, and only 10 ng to 30 ng of the dabsylated protein hydrolysate is required for each analysis.

•⟨1⟩

Method 7—Precolumn FMOC-Cl Derivatization •General Principle•⟨1⟩

Precolumn derivatization of amino acids with 9-fluorenylmethyl chloroformate (FMOC-Cl) followed by reverse-phase HPLC separation with fluorometric detection is used.

FMOC-Cl reacts with both primary and secondary amino acids to form highly fluorescent products. The reaction of FMOC-Cl with amino acid proceeds under mild conditions, in aqueous solution, and is completed in 30 seconds. The derivatives are stable, with only the histidine derivative showing any breakdown. Although FMOC-Cl is fluorescent itself, the reagent excess and fluorescent side-products can be eliminated without loss of FMOC-amino acids.

FMOC-amino acids are separated by reverse-phase HPLC using an ODS column. The separation is carried out by gradient elution varied linearly from a mixture of acetic acid buffer, methanol, and acetonitrile (50 : 40 : 10) to a mixture of acetonitrile and acetic acid buffer (50 : 50), and 20 amino acid derivatives that are separated in 20 minutes. Each derivative eluted from the column is monitored by a fluorometric detector set at an excitation wavelength of 260 nm and an emission wavelength of 313 nm.

The detection limit is in the low fmol range. A linearity range of 0.1 µM to 50 µM is obtained for most amino acids.

•⟨1⟩

Method 8—Precolumn NBD-F Derivatization •General Principle•⟨1⟩

Precolumn derivatization of amino acids with 7-fluoro-4-nitrobenzo-2-oxa-1,3-diazole (NBD-F) followed by reverse-phase HPLC separation with fluorometric detection is used.

7-Fluoro-4-nitrobenzo-2-oxa-1,3-diazole (NBD-F) reacts with both primary and secondary amino acids to form highly fluorescent products. Amino acids are derivatized with NBD-F by heating to 60° for 5 minutes.

NBD-amino acid derivatives are separated on an ODS column of reverse-phase HPLC by employing a gradient elution system consisting of acetonitrile and aqueous buffer mixture, and 17 amino acid derivatives that are separated in 35 minutes. *E*-aminocaproic acid can be used as an internal standard because it is eluted in a clean chromatographic region. Each derivative eluted from the column is monitored by a fluorometric detector set at an excitation wavelength of 480 nm and an emission wavelength of 530 nm.

The sensitivity of this method is almost the same as that for the precolumn OPA derivatization method (*Method 5*), excluding proline to which OPA is not reactive and might be advantageous for NBD-F against OPA.

The detection limit for each amino acid is about 10 fmol. Profile analysis was achieved for about 1.5 mg of protein hydrolysates in the final precolumn labeling reaction mixture for HPLC.

DATA CALCULATION AND ANALYSIS

When determining the amino acid content of a protein/peptide hydrolysate, it should be noted that the acid hydrolysis step destroys tryptophan and cysteine. Serine and threonine are partially destroyed by acid hydrolysis, while isoleucine and valine residues may be only partially cleaved. Methionine can undergo oxidation during acid hydrolysis, and some amino acids (e.g., glycine and serine) are common contaminants. Application of adequate vacuum (less than 200 µm of mercury or 26.7 Pa) or introduction of inert gas (argon) in the headspace of the reaction vessel during vapor phase hydrolysis can reduce the level of oxidative destruction. Therefore, the quantitative results obtained for cysteine, tryptophan, threonine, isoleucine, valine, methionine, glycine, and serine from a protein/peptide hydrolysate may be variable and may warrant further investigation and consideration.

Calculations

Amino Acid Mole Percent—This is the number of specific amino acid residues per 100 residues in a protein. This result may be useful for evaluating amino acid analysis data when the molecular weight of the protein/peptide under investigation is unknown. This information can be used to corroborate the identity of a protein and has other applications. Carefully identify and integrate the peaks obtained as directed for each *Procedure*. Calculate the mole percent for each amino acid present in the test sample by the formula:

$$100r_U / r$$

in which r_U is the peak response, in nmol, of the amino acid under test; and r is the sum of peak responses, in nmol, for all amino acids present in the test sample. Comparison of the mole percent of the amino acids under test to data from known proteins can help establish or corroborate the identity of the sample protein.

Unknown Protein Samples—This data analysis technique can be used to estimate the protein concentration of an unknown protein sample using the amino acid analysis data. Calculate the mass, in µg, of each recovered amino acid by the formula:

$$mM_W/1000$$

in which m is the recovered quantity, in nmol, of the amino acid under test; and M_W is the •⟨1⟩ molecular weight •⟨1⟩, for that amino acid, corrected for the weight of the water molecule that was eliminated during peptide bond formation. The sum of the masses of the recovered amino acids will give an estimate of the total mass of the protein analyzed after appropriate correction for partially and completely destroyed amino acids. If the molecular weight of the unknown protein is available (i.e., by SDS-PAGE analysis or mass spectroscopy), the amino acid composition of the unknown protein can be predicted. Calculate the number of residues of each amino acid by the formula:

$$m/(1000M/M_{WT})$$

in which m is the recovered quantity, in nmol, of the amino acid under test; M is the total mass, in µg, of the protein; and M_{WT} is the molecular weight •⟨1⟩ of the unknown protein.

Known Protein Samples—This data analysis technique can be used to investigate the amino acid composition and protein concentration of a protein sample of known molecular weight and amino acid composition using the amino acid analysis data. When the composition of the protein being analyzed is known, one can exploit the fact that some amino acids are recovered well, while other amino acid recoveries may be compromised because of complete or partial destruction (e.g., tryptophan, cysteine, threonine, serine, methionine), incomplete bond cleavage (i.e., for isoleucine and valine), and free amino acid contamination (i.e., by glycine and serine).

Because those amino acids that are recovered best represent the protein, these amino acids are chosen to quantify the amount of protein. Well-recovered amino acids are, typically, aspartate-asparagine, glutamate-glutamine, alanine, leucine, phenylalanine, lysine, and arginine. This list can be modified based on experience with one's own

analysis system. Divide the quantity, in nmol, of each of the well-recovered amino acids by the expected number of residues for that amino acid to obtain the protein content based on each well-recovered amino acid. Average the protein content results calculated. The protein content determined for each of the well-recovered amino acids should be evenly distributed about the mean. Discard protein content values for those amino acids that have an unacceptable deviation from the mean. Typically, a greater than 5% variation from the mean is considered unacceptable •1•. Recalculate the mean protein content from the remaining values to obtain the protein content of the sample. Divide the content of each amino acid by the calculated mean protein content to determine the amino acid composition of the sample by analysis.

Calculate the relative compositional error, in percentage, by the formula:

$$100m / m_S$$

in which m is the experimentally determined quantity, in nmol per amino acid residue, of the amino acid under test; and m_S is the known residue value for that amino acid. The average relative compositional error is the average of the absolute values of the relative compositional errors of the individual amino acids, typically excluding tryptophan and cysteine from this calculation. The average relative compositional error can provide important information on the stability of analysis run over time. The agreement in the amino acid composition between the protein sample and the known composition can be used to corroborate the identity and purity of the protein in the sample.

Add the following:

•⬥APPENDIX

AMINO ACID ANALYSIS PROCEDURES

The examples of the specific procedures for each *Method* described in *Methodologies of Amino Acid Analysis* are shown.

Method 1—Postcolumn Ninhydrin Detection

One method for postcolumn ninhydrin detection is shown below. Many other methods are also available, with instruments and reagents available commercially.

Mobile Phase Preparation—

Solution A—Transfer about 1.7 g of anhydrous sodium citrate and 1.5 mL of hydrochloric acid to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Adjust, if necessary, with hydrochloric acid to a pH of 3.0.

Solution B—Transfer about 1.7 g of anhydrous sodium citrate and 0.7 mL of hydrochloric acid to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Adjust, if necessary, with hydrochloric acid to a pH of 4.3.

Solution C—Prepare a solution containing 5% of sodium chloride, 1.9% of anhydrous sodium citrate, and 0.1% of phenol in water, and adjust to a pH of 6.

Column Regeneration Solution—Prepare a solution containing 0.8% of sodium hydroxide in water, and adjust to a pH of 13.

Mobile Phase—Use variable mixtures of *Solution A, Solution B,* and *Solution C* as directed for *Chromatographic system*.

Postcolumn Reagent—Transfer about 18 g of ninhydrin and 0.7 g of hydrindantin to 900 mL of a solution containing 76.7% of dimethyl sulfoxide, 0.7% of dihydrate lithium acetate, and 0.1% of acetic acid, and mix for at least 3 hours under inert gas, such as nitrogen. [NOTE—This reagent is stable for 30 days if kept between 2° and 8° under inert gas.]

Buffer Solution—Prepare a solution containing 2% of anhydrous sodium citrate, 1% of hydrochloric acid, 0.5% of thiodiglycol, and 0.1% of benzoic acid in water, and adjust to a pH of 2.

Chromatographic System—The liquid chromatograph is equipped with a detector with appropriate interference filters at 440, 570, or 690 nm and a 4.0-mm × 120-mm column that contains 7.5-µm sulfonated styrene-divinylbenzene copolymer packing. The flow rate is about 14 mL per hour. The system is programmed as follows. Initially equilibrate the column with *Solution A;* at 25 minutes, the composition of the *Mobile Phase* is changed to 100% *Solution B;* and at 37 minutes, the composition is changed to 100% *Solution C.* At 75 minutes into the run, the last amino acid has been eluted from the column, and the column is regenerated with *Column Regeneration Solution* for 1 minute. The column is then equilibrated with *Solution A* for 11 minutes before the next injection. The column temperature is programmed as follows. The initial temperature is 48°; after 11.5 minutes, the temperature is increased to 65° at a rate of 3° per minute; at about 35 minutes, the temperature is increased to 77° at a rate of 3° per minute; and finally at about 52 minutes, the temperature is decreased to 48° at a rate of 3° per minute.

Procedure and Postcolumn Reaction—Reconstitute the lyophilized protein/peptide hydrolysate in the *Buffer Solution,* inject an appropriate amount into the chromatograph, and proceed as directed for *Chromatographic System.* As the amino acids are eluted from the column, they are mixed with the *Postcolumn Reagent,* which is delivered at a flow rate of 7 mL per hour, through a tee. After mixing, the column effluent and the *Postcolumn Reagent* pass through a tubular reactor at a temperature of 135°, where a characteristic purple or yellow color is developed. From the reactor, the liquid passes through a colorimeter with a 12-mm flow-through cuvette. The light emerging from the cuvette is split into three beams for analysis by the detector with interference filters at 440, 570, or 690 nm. The 690-nm signal may be electronically subtracted from the other signals for improved signal-to-noise ratios. The 440-nm (imino acids) and the 570-nm (amino acids) signals may be added in order to simplify data handling.

Method 2—Postcolumn OPA Fluorometric Detection

One method of postcolumn OPA fluorometric detection is shown below.

Mobile Phase Preparation—

Solution A—Prepare a solution of sodium hydroxide, citric acid, and alcohol in HPLC grade water having a 0.2 N sodium concentration and containing 7% of alcohol (w/v), adjusted to a pH of 3.2.

Solution B—Prepare a solution of sodium hydroxide and citric acid in HPLC grade water having a 0.6 N sodium concentration, adjusted to a pH of 10.0.

Solution C: 0.2 N sodium hydroxide.

Mobile Phase—Use variable mixtures of *Solution A,* Solution B, and *Solution C* as directed for *Chromatographic System*.

Postcolumn Reagent Preparation—

Alkaline Buffer—Prepare a solution containing 384 mM sodium carbonate, 216 mM boric acid, and 108 mM potassium sulfate, and adjust to a pH of 10.0.

Hypochlorite Reagent—To 1 L of *Alkaline Buffer,* add 0.4 mL of sodium hypochlorite solution (10% chlorine concentration). [NOTE—The hypochlorite solution is stable for 2 weeks.]

OPA Reagent—Transfer 2 g of *N*-acetyl-L-cysteine and 1.6 g of OPA to a 15-mL volumetric flask, dissolve in and dilute with alcohol to volume, and mix. Transfer this solution and 4 mL of 10% aqueous polyethylene (23) lauryl ether to a 1-L volumetric flask, dilute with 980 mL of *Alkaline Buffer*, and mix.

Chromatographic System—The liquid chromatograph is equipped with a fluorometric detector set to an excitation wavelength of 348 nm and an emission wavelength of 450 nm and a 4.0-mm × 150-mm column that contains 7.5-µm packing L17. The flow rate is about 0.3 mL per minute, and the column temperature is set at 50°. The system is programmed as follows. The column is equilibrated with *Solution A;* over the next 20 minutes, the composition of the *Mobile Phase* is changed linearly to 85% *Solution A* and 15% *Solution B;* then there is a step change to 40% *Solution A* and 60% *Solution B;* over the next 18 minutes, the composition is changed linearly to 100% *Solution B* and held for 7 minutes; then there is a step change to 100% *Solution C,* and this is held for 6 minutes; then there is a step change to *Solution A,* and this composition is maintained for the next 8 minutes.

Procedure and Postcolumn Reaction—Inject about 1.0 nmol of each amino acid under test into the chromatograph, and proceed as directed for *Chromatographic System*. As the effluent leaves the column, it is mixed with the *Hypochlorite Reagent*. The mixture passes through the first postcolumn reactor which consists of stainless steel 0.5-mm × 2-m tubing. A second postcolumn reactor of similar design is placed immediately downstream from the first postcolumn reactor and is used for the OPA postcolumn reaction. The flow rates for both the *Hypochlorite Reagent* and the *OPA Reagent* are 0.2 mL per minute, resulting in a total flow rate (i.e., *Hypochlorite Reagent, OPA Reagent,* and column effluent) of 0.7 mL per minute exiting from the postcolumn reactors. Postcolumn reactions are conducted at 55°. This results in a residence time of about 33 seconds in the OPA postcolumn reactor. After postcolumn derivatization, the column effluent passes through the fluorometric detector.

Method 3—Precolumn PITC Derivatization

One method of precolumn PITC derivatization is described below.

Mobile Phase Preparation—

Solution A: 0.05 M ammonium acetate, adjusted with phosphoric acid to a pH of 6.8.

Solution B—Prepare 0.1 M ammonium acetate, adjust with phosphoric acid to a pH of 6.8, and then prepare a mixture of this solution and acetonitrile (1 : 1).

Solution C: a mixture of acetonitrile and water (70 : 30).

Mobile Phase—Use variable mixtures of *Solution A, Solution B,* and *Solution C* as directed for *Chromatographic System*.

Derivatization Reagent Preparation—

Coupling Buffer: a mixture of acetonitrile, pyridine, triethylamine, and water (10 : 5 : 2 : 3).

Sample Solvent: a mixture of water and acetonitrile (7 : 2).

Sample Derivatization Procedure—Dissolve the lyophilized test sample in 100 µL of the *Coupling Buffer,* and then dry in a vacuum centrifuge to remove any hydrochloride if a protein hydrolysis step was used. Dissolve the test sample in 100 µL of *Coupling Buffer,* add 5 µL of PITC, and incubate at room temperature for 5 minutes. The test sample is again dried in a vacuum centrifuge, and is dissolved in 250 µL of *Sample Solvent*.

Chromatographic System—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 250-mm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute, and the column temperature is maintained at 52°. The system is programmed as follows. The column is equilibrated with *Solution A;* over the next 15 minutes, the composition of the *Mobile Phase* is changed linearly to 85% *Solution A* and 15% *Solution B;* over the next 15 minutes, the composition is changed linearly to 50% *Solution A* and 50% *Solution B;* then there is a step change to 100% *Solution C,* and this is held for 10 minutes; then there is a step change to 100% *Solution A,* and the column is allowed to equilibrate before the next injection.

Procedure—Inject about 1.0 nmol of each PITC-amino acid under test (10-µL sample in *Sample Solvent*) into the chromatograph, and proceed as directed for *Chromatographic System*.

Method 4—Precolumn AQC Derivatization

One method of precolumn AQC derivatization is shown below.

Mobile Phase Preparation—

Solution A—Prepare a solution having a composition of 140 mM sodium acetate and 17 mM triethylamine, and adjust with phosphoric acid to a pH of 5.02.

Solution B: a mixture of acetonitrile and water (60 : 40).

Mobile Phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic System*.

Sample Derivatization Procedure—Dissolve about 2 µg of the test sample in 20 µL of 15 mM hydrochloric acid, and dilute with 0.2 M borate buffer (pH 8.8) to 80 µL. The derivatization is initiated by the addition of 20 µL of 10 mM AQC in acetonitrile, and allowed to proceed for 10 minutes at room temperature.

Chromatographic System—The liquid chromatograph is equipped with a fluorometric detector set at an excitation wavelength of 250 nm and an emission wavelength of 395 nm and a 3.9-mm × 150-mm column that contains 4-µm packing L1. The flow rate is about 1 mL per minute, and the column temperature is maintained at 37°. The system is programmed as follows. The column is equilibrated with *Solution A;* over the next 0.5 minute, the composition of the *Mobile Phase* is changed linearly to 98% *Solution A* and 2% *Solution B;* then over the next 14.5 minutes to 93% *Solution A* and 7% *Solution B;* then over the next 4 minutes to 87% *Solution A* and 13% *Solution B;* over the next 14 minutes to 68% *Solution A* and 32% *Solution B;* then there is a step change to 100% *Solution B* for a 5-minute wash; over the next 10 minutes, there is a step change to 100% *Solution A;* and the column is allowed to equilibrate before the next injection.

Procedure—Inject about 0.05 nmol of each AQC-amino acid under test into the chromatograph, and proceed as directed for *Chromatographic System.*

Method 5—Precolumn OPA Derivatization

One method of precolumn OPA derivatization is shown below.

Mobile Phase Preparation—

Solution A: a mixture of 100 mM sodium acetate (pH 7.2), methanol, and tetrahydrofuran (900 : 95 : 5).

Solution B: methanol.

Mobile Phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic System*.

Derivatization Reagent—Dissolve 50 mg of OPA in 1.25 mL of methanol (protein sequencing grade). Add 50 µL of 2-mercaptoethanol and 11.2 mL of 0.4 M sodium borate (pH 9.5), and mix. [NOTE—This reagent is stable for 1 week.]

Sample Derivatization Procedure—Transfer about 5 µL of the test sample to an appropriate container, add 5 µL of the *Derivatization Reagent,* and mix. After 1 minute, add not less than 20 µL of 0.1 M sodium acetate (pH 7.0). Use 20 µL of this solution for analysis. [NOTE—Use of an internal standard (e.g., norleucine) is recommended for quantitative analysis because of potential reagent volume variations in the sample derivatization. The sample derivatization is performed in an automated on-line fashion. Because of the instability of the OPA-amino acid derivative, HPLC separation and analysis are performed immediately following derivatization.]

Chromatographic System—The liquid chromatograph is equipped with a fluorometric detector set at an excitation wavelength of 348 nm and an emission wavelength of 450 nm and a 4.6-mm × 75-mm column that contains 3-µm packing L3. The flow rate is about 1.7 mL per minute, and the column temperature is maintained at 37°. The system is programmed as follows. The column is equilibrated with 92% *Solution A* and 8% *Solution B;* over the next 2 minutes, the composition of the *Mobile Phase* is changed to 83% *Solution A* and 17% *Solution B,* and held for an additional 3 minutes; then changed to 54% *Solution A* and 46% *Solution B* over the next 5 minutes, and held for an additional 2 minutes; then changed to 34% *Solution A* and 66% *Solution B* over the next 2 minutes, and held for 1 minute; then over the next 0.3 minute changed to 20% *Solution A* and 80% *Solution B,* and held for an additional 2.6 minutes; and then finally over 0.6 minute changed to 92% *Solution A* and 8% *Solution B,* and held for an additional 0.6 minute.

Procedure—Inject about 0.02 nmol of each OPA-amino acid under test into the chromatograph, and proceed as directed for *Chromatographic System.*

Method 6—Postcolumn DABS-Cl Derivatization

One method for precolumn DABS-Cl derivatization is shown below.

Mobile Phase Preparation—

Solution A: 25 mM sodium acetate (pH 6.5) containing 4% of dimethylformamide.

Solution B: acetonitrile.

Mobile Phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic System*.

Derivatization Reagent Preparation—

Sample Buffer: 50 mM sodium bicarbonate, adjusted to a pH of 8.1.

Derivatization Reagent—Dissolve 1.3 mg of DABS-Cl in 1 mL of acetonitrile. [NOTE—This reagent is prepared fresh shortly before the derivatization step.]

Sample Dilution Buffer—Prepare a mixture of 50 mM sodium phosphate (pH 7.0) and alcohol (1 : 1).

Sample Derivatization Procedure—Dissolve the test sample in 20 µL of *Sample Buffer*, add 40 µL of *Derivatization Reagent*, and mix. The sample container is sealed with a silicon-rubber stopper, and heated to 70° for 10 minutes. During the sample heating, the mixture will become completely soluble. After the derivatization, dilute the test sample with an appropriate quantity of the *Sample Dilution Buffer.*

Chromatographic System—The liquid chromatograph is equipped with a 436-nm detector and a 4.6-mm × 250-mm column that contains packing L1. The flow rate is about 1 mL per minute, and the column temperature is maintained at 40°. The system is programmed as follows. The column is equilibrated with 85% *Solution A* and 15% *Solution B;* over the next 20 minutes, the composition of the *Mobile Phase* is changed to 60% *Solution A* and 40% *Solution B;* over the next 12 minutes, the composition is changed to 30% *Solution A* and 70% *Solution B*, and held for an additional 2 minutes.

Procedure—Inject about 0.05 nmol of the DABS-amino acids into the chromatograph, and proceed as directed for *Chromatographic System.*

Method 7—Precolumn FMOC-Cl Derivatization

One method for precolumn FMOC-Cl derivatization is shown below.

Mobile Phase Preparation—

Acetic Acid Buffer—Transfer 3 mL of glacial acetic acid and 1 mL of triethylamine to a 1-L volumetric flask, and dilute with HPLC grade water to volume. Adjust with sodium hydroxide to a pH of 4.20.

Solution A: a mixture of *Acetic Acid Buffer,* methanol, and acetonitrile (50 : 40 : 10).

Solution B: a mixture of acetonitrile and *Acetic Acid Buffer* (50 : 50).

Mobile Phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic System*.

Derivatization Reagent Preparation—

Borate Buffer—Prepare a 1 M boric acid solution, and adjust with sodium hydroxide to a pH of 6.2.

FMOC-Cl Reagent—Dissolve 155 mg of 9-fluorenylmethyl chloroformate in 40 mL of acetone, and mix.

Sample Derivatization Procedure—To 0.4 mL of the test sample add 0.1 mL of *Borate Buffer* and 0.5 mL of *FMOC-Cl Reagent*. After about 40 seconds, extract the mixture with 2 mL of pentane, and then extract again with fresh pentane. The aqueous solution with amino acid derivatives is then ready for injection.

Chromatographic System—The liquid chromatograph is equipped with a fluorometric detector set at an excitation wavelength of 260 nm and an emission wavelength of 313 nm and a 4.6-mm × 125-mm column that contains 3-µm packing L1. The flow rate is about 1.3 mL per minute. The system is programmed as follows. The column is equilibrated with *Solution A,* and this composition is maintained for 3 minutes; over the next 9 minutes, it is changed to 100% *Solution B;* then over the next 0.5 minute, the flow rate is increased to 2 mL per minute, and held until the final FMOC-amino acid is eluted from the column. The total run time is about 20 minutes.

Procedure—Inject not less than 0.01 nmol of each FMOC-amino acid under test into the chromatograph, and proceed as directed for *Chromatographic System*. The FMOC-histidine derivative will generally give a lower response than the other derivatives.

Method 8—Precolumn NBD-F Derivatization

One method for precolumn NBD-F derivatization is shown below.

Mobile Phase Preparation—

Solution A: a solution of 10mM sodium citrate containing 75 mM sodium perchlorate, adjusted with hydrochloric acid to a pH of 6.2.

Solution B: a mixture of acetonitrile and water (50 : 50).

Derivatization Reagent Preparation—

Sample Buffer: a 0.1 M boric acid solution, adjusted with sodium hydroxide to a pH of 9.2.

Derivatization Reagent—Dissolve 5 mg of NBD-F in 1.0 mL of alcohol, and mix.

Sample Derivatization Procedure—Dissolve the test sample in 20 µL of *Sample buffer,* add 10 µL of *Derivatization Reagent,* and mix. The sample container is heated at 60° for 5 minutes. After the derivatization, dilute the test sample with 300 µL of *Solution A.*

Chromatographic System—The liquid chromatograph is equipped with a fluorometric detector set at an excitation wavelength of 480 nm and an emission wavelength of 530 nm and a 4.6-mm × 150-mm column that contains 5-µm particle size ODS silica packing. The flow rate is about 1.0 mL per minute, and the column temperature is maintained at 40°. The system is programmed as follows. The column is equilibrated with 94% *Solution A* and 6% *Solution B;* over the next 16 minutes, the composition is changed linearly to 63% *Solution A* and 37% *Solution B;* over the next 5 minutes, the composition is changed linearly to 62% *Solution A* and 38% *Solution B;* over the next 9 minutes, the composition is changed linearly to 100% *Solution B*, and held for an additional 5 minutes; then finally over 2 minutes, the composition is changed linearly to 94% *Solution A* and 6% *Solution B;* and then the column is allowed to equilibrate before the next injection.

Procedure—Inject about 15 pmol of each NBD-amino acid under test into the chromatograph, and proceed as directed for *Chromatographic System.*◆●1

⟨1053⟩ BIOTECHNOLOGY-DERIVED ARTICLES—CAPILLARY ELECTROPHORESIS

Change to read:

INTRODUCTION

Capillary electrophoresis is a physical method of analysis based on the migration, inside a capillary, of charged analytes dissolved in an electrolyte solution under the influence of a direct-current electric field. In this section we are describing four capillary electrophoresis methods: ●*Capillary Zone*●1 *Electrophoresis, Capillary Gel Electrophoresis, Capillary Isoelectric Focusing,* and *Micellar Electrokinetic Chromatography.*

Change to read:

GENERAL PRINCIPLE

The migration velocity of the analyte under an electric field of intensity E is determined by the electrophoretic mobility of the analyte and the electroosmotic mobility of the buffer inside the capillary. The electrophoretic mobility of a solute (μ_{ep}) depends on the characteristics of the solute (electrical charge, molecular size, and shape) and the characteristics of the buffer in which the migration takes place (type

Interim Revision Announcement

and ionic strength of the electrolyte, pH, viscosity, and additives). The electrophoretic velocity *(v_{ep})* of a solute, assuming a spherical shape, is as follows:

$$v_{ep} = \mu_{ep}E = \left(\frac{q}{6\pi\eta r}\right)\left(\frac{V}{L}\right)$$

in which q is the effective charge of the solute; η is the viscosity of the electrolyte solution; r is the Stoke's radius of the solute; V is the applied voltage; and L is the total length of the capillary.

When an electric field is applied through the capillary filled with buffer, a flow of solvent, called electroosmotic flow, is generated inside the capillary. Its velocity depends on the electroosmotic mobility *(μ_{eo}),* which in turn depends on the charge density on the capillary internal wall and the buffer characteristics. The electroosmotic velocity *(v_{eo})* is given by the equation:

$$v_{eo} = \mu_{eo}E = \left(\frac{\varepsilon\zeta}{\eta}\right)\left(\frac{V}{L}\right)$$

in which ϵ is the dielectric constant of the buffer; ζ is the zeta potential of the capillary surface; and the other terms are as defined above.

The velocity of the solute (v) is given by the equation:

$$v = v_{ep} + v_{eo}$$

The electrophoretic mobility of the analyte and the electroosmotic mobility may act in the same direction or in opposite directions, depending on the charge of the solute. In normal capillary electrophoresis, anions will migrate in the opposite direction by the electroosmotic flow and their velocities will be smaller than the electroosmotic velocity. Cations will migrate in the same direction as the electroosmotic flow and their velocities will be greater than the electroosmotic velocity. Under conditions in which there is a fast electroosmotic velocity with respect to the electrophoretic velocity of the solutes, both cations and anions can be separated in the same run. The time *(t)* taken by the solute to migrate the distance *(l)* from the injection end of the capillary to the detection point (capillary effective length) is as follows:

$$t = \frac{l}{v_{ep} + v_{eo}} = \frac{l(L)}{V\left(\mu_{ep} + \mu_{eo}\right)}$$

in which the other terms are as defined above.

In general, uncoated fused-silica capillaries above pH 3 have negative charge due to ionized silanol groups in the inner wall. Consequently, the electroosmotic flow is from anode to cathode. The electroosmotic flow has to remain constant from run to run to obtain good reproducibility in the migration velocity of the solutes. For some applications, it might be necessary to reduce or suppress the electroosmotic flow by modifying the inner wall of the capillary or by changing the concentration, composition, and/or the pH of the buffer solution.

After the introduction of the sample into the capillary, each analyte ion of the sample migrates within the background electrolyte as an independent zone according to its electrophoretic mobility. Zone dispersion, that is the spreading of each solute band results from a different phenomenon. Under ideal conditions, the sole contribution to the solute-zone broadening is molecular diffusion of the solute along the capillary (longitudinal diffusion). In this ideal case, the efficiency of the zone, expressed as the number of theoretical plates *(N),* is given by:

$$N = \frac{\left(\mu_{ep} + \mu_{eo}\right)(Vl)}{2DL}$$

in which D is the molecular diffusion of the solute in the buffer.

In practice, other phenomena, such as heat dissipation, sample adsorption onto the capillary wall, mismatched conductivity between sample and buffer, length of the injection plug, detector cell size, and unleveled buffer reservoirs, can also significantly contribute to band dispersion. Separation between two bands (expressed by the resolution, R_S) can be obtained by modification of the electrophoretic mobility of the analytes, by the electroosmotic mobility induced in the capillary, and by increasing the efficiency for the band of each analyte as follows:

$$R_s = \frac{\sqrt{N}\left(\mu_{epb} - \mu_{epa}\right)}{4\left(\bar{\mu}_{ep} + \mu_{eo}\right)}$$

in which μ_{epa} and μ_{epb} are the electrophoretic mobilities of the two analytes to be separated; $\bar{\mu}_{ep}$ is the average electrophoretic mobility of the two analytes calculated as:

$$\bar{\mu}_{ep} = ½\ (\mu_{epb} + \mu_{epa})$$

APPARATUS

An apparatus for capillary electrophoresis is composed of a high voltage controllable direct current power supply; two buffer reservoirs held at the same level and containing specified anodic and cathodic solutions; two electrode assemblies (cathode and anode) immersed in the buffer reservoirs and connected to the power supply; a separation capillary usually made of fused-silica, sometimes with an optical viewing window aligned with the detector, depending on the detector, with the ends of the capillary placed in the buffer reservoirs and the capillary being filled with a solution specified in a given monograph; a suitable injection system; a detector capable of monitoring the amount of substance of interest passing through a segment of the separation capillary at a given time, generally based on absorption spectrophotometry (UV and visible), fluorimetry, conductimetric, amperometric, or mass spectrometric detection, depending on the specific applications, or even indirect detection to detect non-UV-absorbing and nonfluorescent compounds; a thermostatic system capable of maintaining a constant temperature inside the capillary, recommended to obtain good separation reproducibility; a recorder; and a suitable integrator or a computer.

The definition of the injection process and its automation are critical for precise quantitative analysis. Modes of injection include gravity, pressure or vacuum, or electrokinetic injection. The amount of each sample component introduced electrokinetically depends on its electrophoretic mobility, leading to possible discrimination using this injection mode.

It is expected that the capillary, the buffer solutions, the preconditioning method, the sample solution, and the migration conditions will be specified in the individual monograph. The electrolytic solution employed may be filtered to remove particles and degassed to avoid bubble formation that could interfere with the detection system or interrupt the electrical contact in the capillary during the separation run. To achieve reproducible migration time of the solutes, it would be necessary to develop, for each analytical method, a rigorous rinsing routine after each injection.

•CAPILLARY ZONE•1 ELECTROPHORESIS

•Principle•1

In •capillary zone•1 electrophoresis, analytes are separated in a capillary containing only buffer without any anticonvective medium. In this technique, separation takes place because the different components of the sample migrate as discrete bands with different velocities. The velocity of each band depends on the electrophoretic mobility of the solute and the electroosmotic flow on the capillary •(see *General Principle*)•1. Coated capillaries ••1 can be used to increase the separation capacity of those substances absorbing on fused-silica surfaces.

This mode of capillary electrophoresis is appropriate for the analysis of small (MW < 2000) and large (2000 < MW < 100,000) molecules. Due to the high efficiency achieved •in capillary zone electrophoresis, separation of•1 molecules having only minute differences in their charge-to-mass ratio can be separated. This •separation mode•1 also allows the separation of chiral compounds by adding chiral selectors to the separation buffer.

•Optimization

Optimization of the separation is a complex process where several separation parameters can play a major role. The main factors to be considered in the development of the separations are instrumental and electrolytic solution parameters.•1

Instrumental Parameters

Voltage—•A Joule heating plot is useful in optimizing the applied voltage and column temperature.•1 The separation time is inversely proportional to applied voltage. However, an increase in the voltage used can cause excessive heat production, giving rise to temperature and, •as a result,•1 viscosity gradients in the buffer inside the capillary, which causes band broadening and decreases resolution.

•**Polarity**—Electrode polarity can be normal (anode at the inlet and cathode at the outlet) and the electroosmotic flow will move toward the cathode. If the electrode polarity is reversed the electroosmotic flow is away from the outlet and only charged analytes with electro-osmotic mobilities greater than the electroosmotic flow will pass to the outlet.•1

Temperature—The main effect of temperature is observed on buffer viscosity and electrical conductivity, thus affecting migration velocity. In some cases, an increase in capillary temperature can cause a conformational change of some proteins, modifying their migration time and the efficiency of the separation.

Capillary—The length and internal diameter of the capillary affects the analysis time, the efficiency of separations, and the load capacity. Increasing both effective length and total length can decrease the electric fields, at a constant voltage, which will increase migration time. For a given buffer and electric field, heat dissipation (thus, sample band broadening) depends on the internal diameter of the capillary. The latter also affects the detection limit, depending on the sample volume injected into the capillary and the detection system used.

The adsorption of sample components on the capillary wall limits efficiency; therefore, methods to avoid these interactions should be considered in the development of a separation method. This is critical in samples containing proteins. Strategies have been devised to avoid adsorption of proteins on the capillary wall. •Some of•1 these strategies include both the use of extreme pH and the adsorption of positively charged buffer additives that only require modification of the buffer composition •to prevent protein adsorption•1. Other strategies include the coating of the internal wall of the capillary with a polymer covalently bonded to the silica that prevents interaction between the proteins and the negatively charged silica surface. •For this purpose, ready-to-use•1 capillaries with coatings consisting of neutral-hydrophilic, cationic, and anionic polymers are commercially available.

Electrolytic Solution Parameters

Buffer Type and Concentrations—Suitable buffers for capillary electrophoresis have an appropriate buffer capacity in the pH range of choice and low mobility to minimize current generation.

To minimize peak shape distortion, it is important to match buffer–ion mobility to solute mobility whenever possible. The type of sample solvent used is important to achieve on-column sample focusing, which increases separation efficiency and improves detection. Also, an increase in buffer concentration at a given pH will decrease electroosmotic flow and solute velocity.

Buffer pH—The pH of the buffer can affect separation by modifying the charge of the analyte or ••1 additives and by changing the electroosmotic flow. For protein and peptide separation, a change in the pH of the buffer from above the isoelectric point to below the isoelectric point changes the net charge of the solute from negative to positive. An increase in the buffer pH generally increases the electroosmotic flow.

Organic Solvents—Organic modifiers, such as methanol, acetonitrile, and others, •may be•1 added to the aqueous buffer to increase the solubility of the solute or other additives and/or to affect the ionization degree of the sample components. The addition of these organic modifiers to the buffer generally causes a decrease in the electroosmotic flow.

Additives for Chiral Separations—To separate optical isomers, a chiral selector is added to the separation buffer. The most commonly used chiral selectors are cyclodextrins, although in some cases crown ethers, certain polysaccharides, or even proteins can be used. Because chiral recognition is governed by the different interactions between the chiral selector and each of the enantiomers, the resolution achieved for the chiral compounds depends largely on the type of chiral selector used. While developing a given separation it may be useful to test cyclodextrins having a different cavity size (α-, β-, or γ-cyclodextrin) or modified cyclodextrins with neutral (methyl, ethyl, hydroxyalkyl, etc.) or ionizable (aminomethyl, carboxymethyl, sulfobutylether, etc.) moities. •When using modified cyclodextrins, batch-to-batch variations in the degree of substitution of the cyclodextrins must be taken into account because it will influence the selectivity.•1 The resolution of chiral separations is also controlled by the concentration of the chiral selector, the composition and pH of the buffer, and the separation temperature. Organic additives, such as methanol or urea, can also affect the resolution of separation.

Change to read:

CAPILLARY GEL ELECTROPHORESIS

•In capillary gel electrophoresis, separation takes place inside a capillary filled with a gel that acts as a molecular sieve. Molecules with similar charge-to-mass ratios are separated according to molecular size because smaller molecules move more freely through the network of the gel and therefore migrate faster than larger molecules. Different biological macromolecules (for example, proteins and DNA fragments), which often have similar charge-to-mass ratios, can thus be separated according to their molecular mass by capillary gel electrophoresis.•1

Characteristics of ••1 Gels

•Two types of gels are used in capillary electrophoresis: permanently coated gels and dynamically coated gels. Permanently coated•1 gels are prepared inside the capillary by reaction of monomers. One example of such a gel is a cross-linked polyacrylamide. This type of gel is •usually•1 bonded to the fused-silica wall and cannot be removed without destroying the capillary. For protein analysis •under reducing conditions•1, the separation buffer usually contains sodium dodecyl sulfate, and the sample is denatured by heating in a mixture of sodium dodecyl sulfate and 2-mercaptoethanol or dithiothreitol before injection. •When non-reducing conditions are used (for example, analysis of an intact antibody), 2- mercaptoethanol and dithiothreitol are not used.•1 Optimization of separation in a cross-linked gel is ob-

tained by modifying the separation buffer (see •*Capillary Zone Electrophoresis*•) and by controlling the gel porosity during the gel preparation. For a cross-linked polyacrylamide gel, the porosity can be modified by changing the concentration of acrylamide and/or the ratio of the cross-linker. As a rule, a decrease in the porosity of the gel leads to a decrease in the mobility of the solutes. Due to the rigidity of this type of gel, only electrokinetic injection can be used.

•Dynamically coated gels• are hydrophilic polymers (i.e., linear polyacrylamide, cellulose derivatives, dextran, etc.) which can be dissolved in aqueous separation buffers, giving rise to a separation medium that also acts as a molecular sieve. These polymeric separation media are easier to prepare than cross-linked polymers. They can be prepared in a vial and filled by pressure in a wall-coated capillary with no electroosmotic flow. Replacing the gel before every injection generally improves the separation reproducibility. The porosity of the •dynamically coated• gels can be increased by using polymers of higher molecular •mass• (at a given polymer concentration) or by decreasing the polymer concentration (for a given polymer molecular •mass•). A decrease in gel porosity leads to a decrease in the mobility of the solute for the same buffer. Both hydrodynamic and electromigration injection techniques can be used because the dissolution of these polymers in the buffer gives low viscosity solutions.

CAPILLARY ISOELECTRIC FOCUSING

•Principle•

•In isoelectric focusing• the molecules migrate under the influence of the electric field, so long as they are charged, in a pH gradient generated by ampholytes having *pI* values in a wide range (poly-aminocarboxylic acids) dissolved in the separation buffer.

The three basic steps in capillary isoelectric focusing are loading, focusing, and mobilization.

LOADING

•Two methods may be employed.•

Loading in One Step—The sample is mixed with ampholytes and introduced into the capillary by pressure or vacuum.

Sequential Loading—A leading buffer, then the ampholytes, then the sample mixed with ampholytes, again ampholytes alone, and finally the terminating buffer are introduced into the capillary. The volume of the sample must be small enough so as to not modify the pH gradient.

FOCUSING

When the voltage is applied, ampholytes migrate toward the cathode or the anode according to their net charge, creating the pH gradient from anode (lower pH) to cathode (higher pH). •During this step• the components to be separated migrate until they reach a pH corresponding to their isoelectric point, and the current drops to very low values.

MOBILIZATION

•If mobilization is required for detection, use one of the following methods. Three methods are available.•

Method 1—•Mobilization is accomplished• during *Focusing,* under the influence of the electroosmotic flow when this flow is small enough to allow the focusing of the components.

Method 2—•Mobilization is accomplished• by application of positive pressure after *Focusing.*

Method 3—•Mobilization is achieved• after *Focusing,* by adding salts in the cathode reservoir or the anode reservoir, depending on the direction chosen for mobilization, in order to alter the pH in the capillary when the voltage is applied. As the pH is changed, the proteins and ampholytes are mobilized in the direction of the reservoir, which contains added salts, and pass the detector.

The separation achieved is expressed as Δ*pI* and depends on the pH gradient *(dpH/dx),* the number of ampholytes having different *pI* values, the •molecular• diffusion coefficient *(D),* the intensity of the electric field *(E),* and the variation of the electrophoretic mobility of the analyte with the pH •dμ/dpH):•

$$\Delta pI = 3\sqrt{\frac{D(dpH/dx)}{E(-d\mu/dpH)}}$$

••

Optimization ••

The major parameters that need to be considered in the development of separations are •the following:•

Voltage—The use of high fields from 300 V/cm to 1,000 V/cm during *Focusing.*

Capillary—Depending on the *Mobilization* strategy selected (see above), the electroosmotic flow must be reduced or suppressed. Coated capillaries tend to reduce the electroosmotic flow.

Solutions—The anode buffer reservoir is filled with a solution of a lower pH than the *pI* of the most acidic ampholyte, and the cathode reservoir is filled with a solution with a higher pH than the *pI* of the most basic ampholyte. Phosphoric acid for the anode and sodium hydroxide for the cathode are frequently used.

Addition of a polymer, like methylcellulose, in the ampholyte solution tends to suppress convective forces (if any) and electroosmotic flow by increasing the viscosity. Commercial ampholytes covering many pH ranges are available and may also be mixed to obtain an expanded pH range. Broad pH ranges are used to estimate the isoelectric point, whereas narrower ranges are employed to improve accuracy. Calibration can be made by correlating migration time with the isoelectric point of a series of standard protein markers. During *Focusing,* precipitation of proteins at their isoelectric point can be prevented, if necessary, using buffer additives such as glycerol, surfactants, urea, or Zwitterionic buffers. However, depending on the concentration, urea can denature proteins.

Change to read:

MICELLAR ELECTROKINETIC CHROMATOGRAPHY (MEKC)

•Principle•

Separation takes place in an electrolytic solution that contains a surfactant •• at a concentration above the critical micellar concentration •*(cmc).*• The solute molecules are distributed between the aqueous buffer and the pseudo-stationary phase composed by the micelles according to the solute's partition coefficient. The technique can be considered as a hybrid of electrophoresis and chromatography. It is •a• technique that can be used for the separation of both neutral and charged solutes maintaining the efficiency, speed, and instrumental suitability of capillary electrophoresis. One of the most widely used surfactants •in MEKC is the anionic surfactant,• sodium dodecyl sulfate, although other •• surfactants, such as •cationic surfactant• cetyl trimethyl ammonium salts, have also been used.

•The separation mechanism is as follows.• At neutral and alkaline pH, a strong electroosmotic flow is generated and moves the separation buffer ions in the direction of the cathode. If sodium dodecyl sulfate is used as surfactant, the electrophoretic migration of the anionic micelle is in the opposite direction, towards the anode. As a result, the overall micelle migration velocity is slowed compared to the bulk flow of the electrolytic solution. In the case of neutral solutes, because the analyte can partition between the micelle and the aqueous buffer and has no electrophoretic mobility, the analyte migration velocity

will only depend on the partition coefficient between the micelle and the aqueous buffer. In the •electropherogram,•1 the peak corresponding to each uncharged solute is always between that of the electroosmotic flow marker and that of the micelle; and the time elapsed between these two peaks is called the separation window. For electrically charged solutes, the migration velocity depends on both the partition coefficient of the solute between the micelle and the aqueous buffer and on the electrophoretic mobility of the solute in the absence of micelles.

•Because the mechanism in MEKC of neutral and weakly ionized solutes•1 is essentially chromatographic, migration of the solute and resolution can be •rationalized in terms of the retention•1 factor of the solute *(k′),* which is the ratio between the •1 number of moles of solute in the micelle to those in the mobile phase. For a neutral compound, k' is as follows:

$$k' = \frac{t_r - t_0}{t_0\left(1 - t_r/t_m\right)} = K\left(\frac{V_S}{V_M}\right)$$

in which t_r is the migration time of the solute; t_0 is the analysis time of the unretained solute obtained by injecting an electroosmotic flow marker that does not enter the micelle (i.e., methanol); t_m is the micelle migration time measured by injecting a micelle marker, such as Sudan III, which migrates continuously associated in the micelle; K is the partition coefficient of the solute; V_S is the volume of the •micellar•1 phase; and V_M is the volume of the mobile phase.

The resolution between two closely-migrating •solutes•1 *(R_S)* is as follows:

$$R_S = \frac{\sqrt{N}}{4} \times \frac{\alpha - 1}{\alpha} \times \frac{k_b'}{k_b' + 1} \times \frac{1 - \left(\frac{t_0}{t_m}\right)}{1 + k_\alpha' \times \left(\frac{t_0}{t_m}\right)}$$

in which N is the number of theoretical plates for one of the •solutes;•1 α is the selectivity; and k_a' and k_b' are retention factors for both •solutes,•1 respectively *($k_b' > k_a'$).*•1

Similar, but not identical equations give k' and R_S values for electrically charged •solutes.•1

Optimization••1

The main parameters to be considered in the development of separations by MEKC are instrumental and electrolytic solution parameters.

INSTRUMENTAL PARAMETERS

Voltage—Separation time is inversely proportional to applied voltage. An increase in voltage can cause excessive heat production that gives rise to temperature gradients and viscosity gradients of the buffer in the cross section of the capillary. This effect can be significant with high conductivity buffers, such as those containing micelles. Poor heat dissipation causes band broadening and decreases resolution.

Temperature—Variations in capillary temperature affect the partition coefficient of the solute between the buffer and the micelle, the critical micelle concentration, and the viscosity of the buffer. These parameters contribute to the migration time of the solutes. •The use of a good cooling system improves the reproducibility of the migration time for the solutes.•1

Capillary—•As in *Capillary Zone Electrophoresis*•1 length and internal diameter •of the capillary•1 contribute to analysis time and efficiency of separations. Increasing both effective length and total length can decrease the electrical fields, working at constant voltage, and will increase migration time and improve the separation efficiency. The internal diameter controls heat dissipation, at a given buffer and electrical field, and •consequently•1 a broadening of the sample band.

ELECTROLYTIC SOLUTION PARAMETERS

Surfactant Type and Concentration—The type of surfactant, as the stationary phase in chromatography, affects the resolution because it modifies separation selectively. The log K' of a neutral compound increases linearly with the concentration of •surfactant•1 in the mobile phase. When K' approaches the value of

$$\sqrt{t_m/t_0}$$

resolution in MEKC reaches a maximum. Modifying the concentration of surfactant in the mobile phase changes the resolution.

Buffer pH—pH does not modify the partition coefficient of non-ionized solutes, but it can modify the electroosmotic flow in uncoated capillaries. A decrease in the buffer pH decreases the electroosmotic flow and, therefore, increases the resolution of the neutral solutes •in MEKC, resulting in a•1 longer analysis time.

Organic Solvents—To improve •MEKC•1 separation of hydrophobic compounds, organic modifiers (methanol, propanol, acetonitrile, etc.) can be added to the •1 electrolytic solution. The addition of these modifiers generally decreases migration time and selectivity of the separation. The addition of organic modifiers affects micelle formation, thus, a given surfactant concentration can be used only with a certain percentage of organic modifier before the micellezation •is inhibited•1 or adversely affected, resulting in the absence of micelles and, therefore, the absence of the partition. •The dissociation•1 of micelles in the presence of a high content of organic solvent does not always mean that the separation will no longer be possible, because in some cases, the hydrophobic interaction between the ionic surfactant monomer and the neutral solutes forms solvophobic complexes that can be separated electrophoretically.

Additives for Chiral Separations—•For the separation of enantiomers using MEKC,•1 a chiral selector is included in the micellar system, either covalently bound to the surfactant or added to the micellar separation electrolyte. Micelles that have a moiety with chiral discrimination properties include salts, *N*-dodecanoyl-L-amino acids, bile salts, etc. Chiral resolution can also be achieved using chiral discriminators, such as cyclodextrins, added to the electrolytic solutions that contain micellized achiral surfactants.

Other Additives—Selectivity can be modified by adding chemicals to the buffer. Addition of several types of cyclodextrins to the buffer is also used to reduce the interaction of hydrophobic solutes with the micelle, increasing the selectivity for this type of compound. The addition of substances able to modify solute-micelle interactions by adsorption on the latter has been used to improve the selectivity of the separations in MEKC. These additives may consist of a second surfactant (ionic or non-ionic), which gives rise to mixed micelles or metallic cations that dissolve in the micelle and form co-ordination complexes with the solutes.

•QUANTIFICATION•1

Peak areas must be divided by the corresponding migration time to give the corrected area in order to compensate for the shift in migration time from run to run, thus reducing the variation of the response. Dividing the peak areas by migration time will also compensate for the different responses of sample constituents with different migration times. Where an internal standard is used, check that no peak of the substance to be examined is masked by that of the internal standard.

Calculations—From the values obtained, calculate the content of a component or components being determined. When indicated, the percentage of one (or more) components of the sample to be examined is calculated by determining the •corrected•1 area(s) of the peak(s) as a percentage of the total •of the•1 corrected areas of all the peaks, excluding those due to solvents or any added reagents

Interim Revision Announcement

•(normalization procedure).•1 The use of an automatic integration system (integrator or data acquisition and processing system) is recommended.

Change to read:

••1SYSTEM SUITABILITY

•In order to check the behavior of the capillary electrophoresis system, system suitability parameters are used. The choice of these parameters depends on the mode of capillary electrophoresis used. They are: retention•1 factor *(K′)* used only for *Micellar Electrokinetic Chromatography,* •apparent•1 number of theoretical plates *(N),* the symmetry factor *(A_S),* and the resolution *(R_S)*. Note that in previous sections, the theoretical expressions for N and R_S have been described, but more practical equations that allow for the determination of these suitability parameters using the •electropherograms•1 are described below.

•Apparent Number of Theoretical Plates—•1The •apparent•1 number of theoretical plates *(N)* may be calculated from the formula:

$$•N = 5.54\ (t_R / w_h)^2•_1$$

in which •t_R•1 is the •migration time or•1 distance ••1 along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak •corresponding to the component•1; and •w_h•1 is the peak width••1 at half-height.

•Resolution—•1The resolution *(R_S)* may be calculated from the formula:

$$•R_S = 1.18\ (t_{R1} - t_{R2}\ ) / (w_{h1} + w_{h2})$$

$$t_{R2} > t_{R1}•_1$$

in which •t_{R1} and t_{R2}•1 are the •migration times or•1 distances along the baseline between the point of injection and the perpendicular dropped from the maxima of two adjacent peaks and •w_{h1} and w_{h2}•1 are the peak widths ••1 at half-height.

•When appropriate,•1 the resolution *(R_S)* may also be calculated by measuring the height of the valley •(H_v)•1 between two partly resolved peaks in a standard preparation, the height of the smaller peak •(H_p)•1 and •calculating the peak-to-valley ratio:

$$p/v = H_p / H_v$$

Symmetry Factor—•1 The symmetry factor of a peak *(A_S)* may be calculated using the formula:

$$•A_s = w_{0.05} / 2d•_1$$

in which •$w_{0.05}$•1 is the width of the peak at one-twentieth of the peak height; and •d•1 is the distance between the perpendicular dropped from the peak maximum and the leading edge of the peak at one-twentieth of the peak height.

Other ••1 suitability parameters include tests for area repeatability (••1 standard deviation of areas or of area/migration time) and tests for migration time repeatability (••1standard deviation of migration time).•Migration time repeatability provides a test for the suitability of the capillary washing procedures. An alternative practice to avoid the lack of repeatability of the migration time is to use a migration time relative to an internal standard.

Signal-To-Noise Ratio—•1A test for the verification of the signal-to-noise ratio for a standard preparation or the determination of the limit of •quantification may also be useful for the determination of related substances•1 . The detection limit and •quantification—•1 limit correspond to a signal-to-noise ratio greater than 3 and 10, respectively. The signal-to-noise ratio *(S/N)* is calculated as follows:

$$S/N = 2H/h•_1$$

in which H is the height of the peak corresponding to the component concerned in the •electropherogram•1 obtained with the specified reference solution, •measured from the maximum of the peak to the extrapolated baseline of the signal observed over a distance equal to twenty times the width at half-height; and h is the range of the background in an electropherogram obtained after injection of a blank, observed over a distance equal to twenty times the width at the half-height of the peak in the electropherogram obtained with the prescribed reference solution and, if possible, situated equally around the place where this peak would be found.•1

⟨1054⟩ BIOTECHNOLOGY-DERIVED ARTICLES—ISOELECTRIC FOCUSING

Change to read:

•GENERAL PRINCIPLE•1

Isoelectric focusing (IEF) is a method of electrophoresis that separates proteins according to their isoelectric points. Separation is carried out in a slab of polyacrylamide or agarose gel that contains a mixture of amphoteric electrolytes (ampholytes). When subjected to an electrical field, the ampholytes migrate in the gel to create a pH gradient. In some cases, gels containing an immobilized pH gradient, prepared by incorporating weak acids and bases to specific regions of the gel network during the preparation of the gel, are used. When the applied proteins reach the gel fraction that has a pH that is the same as their isoelectric point •(pI),•1 their charge is neutralized and migration ceases. Gradients can be made over various ranges of pH, according to the mixture of ampholytes chosen.

Change to read:

•THEORETICAL ASPECTS•1

When a protein is at the position of its isoelectric point, it has no net charge and cannot be moved in a gel matrix by the electric field. It may, however, move from that position by diffusion. The pH gradient forces a protein to remain in its isoelectric point position, thus concentrating it; this concentration effect is called "focusing". Increasing the applied voltage or reducing the sample load results in improved resolution of bands. The applied voltage is limited by the heat generated because the heat must be dissipated. The use of thin gels and an efficient cooling plate controlled by a thermostatic circulator prevents the burning of the gel while allowing sharp focusing. The separation is estimated by determining the minimum pI difference •*(ΔpI),*•1 which is necessary to separate two neighboring bands, as follows:

$$\Delta pI = 3\sqrt{\frac{D(dpH/dx)}{E(-d\mu/dpH)}}$$

in which D is the diffusion coefficient of the protein; *dpH/dx* is the pH gradient; E is the intensity of the electric field, in volts per centimeter; and $-d\mu/dpH$ is the variation of the solute mobility with the pH in the region close to the pI. Because D and $-d\mu/dpH$ for a given protein cannot be altered, the separation can be improved by using a narrower pH range and by increasing the intensity of the electric field.

Resolution between protein bands on an IEF gel prepared with carrier ampholytes can be quite good. Better resolution may be achieved by using immobilized pH gradients where the buffering species, which are analogous to carrier ampholytes, are copolymerized within the gel matrix. Proteins exhibiting pI values differing by as little as 0.02 pH units may be resolved using a gel prepared with carrier ampholytes, whereas immobilized pH gradients can resolve protein differing by approximately 0.001 pH units.

Change to read:

•PRACTICAL ASPECTS•

From an operational point, special attention must be paid to sample characteristics and/or preparation. Salt in a sample can be problematic, and it is best to prepare the sample, if possible, in deionized water or 2% ampholytes using dialysis or gel filtration if necessary. •• The time required for completion of focusing in thin-layer polyacrylamide gels is determined by placing a colored protein (e.g., hemoglobin) at different positions on the gel surface and by applying the electric field: the steady state is reached when all applications give an identical band pattern. In some procedures the completion of the focusing is indicated by the time elapsed after the sample application.

The IEF gel can be used as an identity test when migration •pattern• on the gel is compared to a •suitable• standard preparation and IEF calibration proteins; the IEF gel can be used as a limit test when the density of a band on IEF is compared subjectively with the density of bands appearing in a standard preparation, or it can be used as a semiquantitative test when the density is measured using a densitometer or similar instrumentation to determine the relative concentration of protein in the bands •subject to validation.•

•ISOELECTRIC FOCUSING IN POLYACRYLAMIDE GELS: DETAILED PROCEDURE

The following method is a detailed description of an IEF procedure in thick polyacrylamide slab gels, which is used unless otherwise stated in the monograph.•

Preparation of the Gels

•Mold—The mold is• composed of a glass plate (A) on which a polyester film (B) is placed to facilitate handling of the gel, one or more spacers (C), a second glass plate (D), and clamps to hold the structure together (see *Figure 1*).

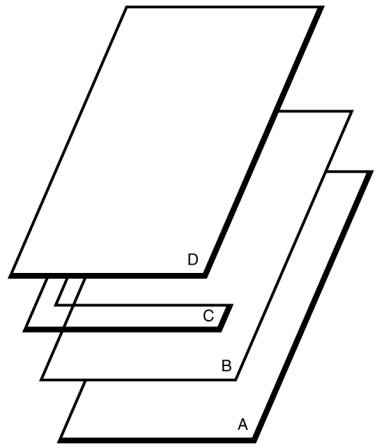

Figure 1. Mold

7.5% Polyacrylamide Gel—Dissolve 29.1 g of acrylamide and 0.9 g of methylenebisacrylamide in 100 mL of water. To 2.5 volumes of this solution, add the mixture of ampholytes specified in the individual monograph, and dilute •• to 10 volumes with water. Mix carefully, and degas the solution.

Preparation of the •Mold—•Place the polyester film on the lower glass plate, apply the spacer, place the second glass plate, and fit the clamps. Before use, place the mixture on a magnetic stirrer, and add 0.25 volumes of a •100 g/L• solution of ammonium persulfate and 0.25 volumes of tetramethylenediamine. Immediately fill the space between the glass plates of the •mold with the solution.•

Fixing Solution for Isoelectric Focusing Polyacrylamide Gel—Mix 35 g of sulfosalicylic acid and 100 g of trichloroacetic acid in 1000 mL of water.

Coomassie Staining Solution and Destaining Solution—Use the same solutions indicated in general information chapter *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* ⟨1056⟩.

Procedure

Dismantle the •*Mold*,• and using the polyester film, transfer the gel onto the cooled support wetted with a few mL of a suitable liquid, taking care to avoid forming air bubbles. Prepare the test solutions and reference solutions as specified in the individual monograph. Place strips of paper for sample application, about 10 mm × 5 mm in size, on the gel, and impregnate each with the prescribed amount of the test and reference solutions. •• Also apply the prescribed quantity of a solution of proteins with known isoelectric points as pH markers to calibrate the gel. In some procedures, the gel has precast slots where a solution of the sample is applied instead of using impregnated paper strips. Cut two strips of paper to the length of the gel, and impregnate them with the electrolyte solutions: acid for the anode and alkaline for the cathode. The compositions of the anode and cathode solutions are given in the individual monograph. Apply these paper wicks to each side of the gel several mm from the edge. Fit the cover so that the electrodes are in contact with the wicks (with respect to the anodic and cathodic poles). Proceed with the isoelectric focusing by applying the electrical parameters described in the individual monograph. Switch off the current when the migration of the mixture of standard proteins has stabilized. Using forceps, remove the sample application strips and the two electrode wicks. Immerse the gel in *Fixing Solution for Isoelectric Focusing Polyacrylamide Gel.* Incubate with gentle shaking at room temperature for 30 minutes. Drain off the solution, and add 200 mL of *Destaining Solution.* Incubate with shaking for 1 hour. Drain the gel, and add *Coomassie Staining Solution.* Incubate for 30 minutes. Destain the gel by passive diffusion with *Destaining Solution* until the bands are well visualized against a clear background. Locate the position and intensity of the bands in the electropherogram, as prescribed in the individual monograph.

•Variations to the Detailed Procedure (Subject to Validation)

Where reference to the general method on isoelectric focusing is made, variations in methodology or procedure may be made subject to validation.•1 These variations include the use of commercially available precast gels •and of commercial staining and destaining kits;•1 the use of immobilized pH gradients; the use of rod gels, and the use of cassettes of different dimensions, including ultra-thin (0.2 mm) gels; variations in the sample application procedure, including different sample volumes or the use of sample application masks or wicks other than paper; the use of alternate running conditions, including variations in the electric field depending on gel dimensions and equipment, and the use of fixed migration times rather than subjective interpretation of band stability; the inclusion of a prefocusing step; the use of automated instrumentation; and the use of agarose gels.

Change to read:

Validation of •Isoelectric Focusing•1 Procedures

Where alternative methods to the •detailed procedure•1 are employed, they must be validated. The following criteria may be used to validate the separation: formation of a stable pH gradient of desired characteristics, •assessed for example•1 using colored pH markers of known isoelectric points; comparison with the electropherogram provided with the chemical reference substance for the preparation to be examined; and any other validation criteria as prescribed in the individual monograph.

Change to read:

SPECIFIED VARIATIONS TO THE GENERAL METHOD

Variations to the general method required for the analysis of specific substances may be specified in detail in individual monographs. Variations may include the addition of urea in the running gel (a 3 M concentration is often satisfactory to keep the protein in solution, but up to 8 M can be used). Some proteins precipitate at their isoelectric point. In this case, urea is included in the gel formulation to keep the protein in solution. If urea is used, only fresh solutions should be used to prevent carbamylation of the protein. Other variations include the use of alternative staining methods and the use of gel additives such as nonionic detergents (e.g., octylglucoside) or zwitterionic detergents (e.g., CHAPS or CHAPSO) •and the addition of ampholyte to the sample•1 to prevent proteins from aggregating or precipitating.

Change to read:

•Points To Consider•1

••1

— Samples can be applied to any area on the gel, but ••1 to protect the proteins from extreme pH environments, samples should not be applied close to either electrode. During method development, the analyst can try applying the protein in three positions on the gel (i.e., middle and both ends); the pattern of a protein applied at opposite ends of the gel may not be identical.

— A phenomenon known as cathodic drift, where the pH gradient decays over time, may occur if a gel is focused too long. Although not well understood, electroendoosmosis and absorption of carbon dioxide may be factors that lead to cathodic drift. Cathodic drift is observed as focused protein migrating off the cathode end of the gel. Immobilized pH gradients may be used to address this problem.

— Efficient cooling (approximately 4°) of the bed that the gel lies on during focusing is important. High field strengths used during isoelectric focusing can lead to overheating and affect the quality of the focused gel.

⟨1055⟩ BIOTECHNOLOGY-DERIVED ARTICLES—PEPTIDE MAPPING

Change to read:

This chapter provides guidance and procedures used for characterization of biotechnology-derived articles by peptide mapping. This chapter is harmonized with the corresponding chapter in *JP* and *EP*. •Portions of the chapter that are not harmonized with the other two pharmacopeias are marked by the symbol ◆.•1 Other characterization tests, also harmonized, are shown in *Biotechnology-Derived Articles—Amino Acid Analysis* ⟨1052⟩, *Biotechnology-Derived Articles—Capillary Electrophoresis* ⟨1053⟩, *Biotechnology-Derived Articles—Isoelectric Focusing* ⟨1054⟩, *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* ⟨1056⟩, and *Biotechnology-Derived Articles—Total Protein Assay* ⟨1057⟩.

INTRODUCTION

Peptide mapping is an identity test for proteins, especially those obtained by rDNA technology. It involves the chemical or enzymatic treatment of a protein, resulting in the formation of peptide fragments, followed by separation and identification of the resultant fragments in a reproducible manner. It is a powerful test that is capable of identifying single amino acid changes resulting from events such as errors in the reading of complementary DNA (cDNA) sequences or point mutations. Peptide mapping is a comparative procedure because the information obtained, compared to a Reference Standard or Reference Material similarly treated, confirms the primary structure of the protein, is capable of detecting whether alterations in structure have occurred, and demonstrates process consistency and genetic stability. Each protein presents unique characteristics that must be well understood so that the scientific and analytical approaches permit validated development of a peptide map that provides sufficient specificity.

This •chapter•1 provides detailed assistance in the application of peptide mapping and its validation to characterize the desired protein product, to evaluate the stability of the expression construct of cells used for recombinant DNA products, to evaluate the consistency of the overall process, and to assess product stability, as well as to ensure the identity of the protein product or to detect the presence of protein variant. •◆•1 The validation scheme presented differentiates between qualification of the method at an early stage in the regulatory process, the Investigational New Drug (IND) level, and full validation in support of New Drug Application (NDA), Product License Application (PLA), or Marketing Authorization Application (MAA). The validation concepts described are consistent with the general information chapter *Validation of Compendial Procedures* ⟨1225⟩ and with the International Conference on Harmonization (ICH) document on *Analytical Methods Validation*.•◆•1

Interim Revision Announcement

Change to read:

THE PEPTIDE MAP

Peptide mapping is not a general method, but involves developing specific maps for each unique protein. Although the technology is evolving rapidly, there are certain methods that are generally accepted. Variations of these methods will be indicated, when appropriate, in specific monographs.

A peptide map may be viewed as a fingerprint of a protein and is the end product of several chemical processes that provide a comprehensive understanding of the protein being analyzed. Four major steps are necessary for the development of the procedure: isolation and purification of the protein, if the protein is part of a formulation; selective cleavage of the peptide bonds; chromatographic separation of the peptides; and analysis and identification of the peptides. A test sample is digested and assayed in parallel with a •Reference Standard or Reference Material.• Complete cleavage is more likely to occur when enzymes such as endoproteases (e.g., trypsin) are used instead of chemical cleavage reagents. A map should contain enough peptides to be meaningful. On the other hand, if there are too many fragments, the map might lose its specificity because many proteins will then have the same profiles.

Isolation and Purification

Isolation and purification are necessary for analysis of bulk drugs or dosage forms containing interfering excipients and carrier proteins and, when required, will be specified in the monograph. Quantitative recovery of protein from the dosage form should be validated.

Selective Cleavage of Peptide Bonds

The selection of the approach used for the cleavage of peptide bonds will depend on the protein under test. This selection process involves determination of the type of cleavage to be employed—enzymatic or chemical—and the type of cleavage agent within the chosen category. Several cleavage agents and their specificity are shown in *Table 1*. This list is not all-inclusive and will be expanded as other cleavage agents are identified.

PRETREATMENT OF SAMPLE

Depending on the size or the configuration of the protein, different approaches in the pretreatment of samples can be used. For monoclonal antibodies, the heavy and light chains will need to be separated before mapping. If trypsin is used as a cleavage agent for proteins with a molecular mass greater than 100,000 Da, lysine residues must be protected by citraconylation or maleylation; otherwise, too many peptides will be generated.

PRETREATMENT OF THE CLEAVAGE AGENT

Pretreatment of cleavage agents, especially enzymatic agents, might be necessary for purification purposes to ensure reproducibility of the map. For example, trypsin used as a cleavage agent will have to be treated with tosyl-L-phenylalanine chloromethyl ketone to inactivate chymotrypsin. Other methods, such as purification of trypsin by HPLC or immobilization of enzyme on a gel support, have been successfully used when only a small amount of protein is available.

PRETREATMENT OF THE PROTEIN

•Under certain conditions, it might be necessary• to concentrate the sample, or to separate the protein from added substances and stabilizers used in the formulation of the product if these interfere with the mapping procedure. Physical procedures used for pretreatment can include ultrafiltration, column chromatography, and lyophilization.

Other pretreatments such as the addition of chaotropic agents (e.g., urea) can be used to unfold the protein prior to mapping. •To• allow the enzyme to have full access to cleavage sites and permit some unfolding of the protein, •it is often necessary to reduce and alkylate the disulfide bonds prior to digestion.•

Digestion with trypsin can introduce ambiguities in the tryptic map as a result of side reactions occurring during the digestion reaction, such as nonspecific cleavage, deamidation, disulfide isomerization, oxidation of methionine residues, or formation of pyroglutamic groups created from the deamidation of glutamine at the *N*-terminal side of a peptide. Furthermore, peaks may be produced by autohydrolysis of trypsin. Their intensities depend on the ratio of trypsin to protein. To avoid autohydrolysis, solutions of proteases may be prepared at a pH that is not optimal (e.g., at pH 5 for trypsin), which would mean that the enzyme would not become active until diluted with the digest buffer.

ESTABLISHMENT OF OPTIMAL DIGESTION CONDITIONS

Factors that affect the completeness and effectiveness of digestion of proteins are those that could affect any chemical or enzymatic reactions.

pH—The digestion mixture pH is empirically determined to ensure the optimal performance of the given cleavage agent. For example, •when using cyanogen bromide as a cleavage agent,• a highly acidic environment (e.g., pH 2, formic acid) is necessary; however, when using trypsin as a cleavage agent, a slightly alkaline environment (pH 8) is optimal. As a general rule, the pH of the reaction milieu should not alter the chemical integrity of the protein during the digestion and should not change during the course of the fragmentation reaction.

Table 1. Examples of Cleavage Agents

Type	Agent	Specificity
Enzymatic	Trypsin, EC 3.4.21.4	*C*-terminal side of Arg and Lys
	Chymotrypsin, EC 3.4.21.1	*C*-terminal side of hydrophobic residues (e.g., Leu, Met, Ala, aromatics)
	Pepsin A (Pepsin), EC 3.4.23.1	Nonspecific digest
	Lysyl endopeptidase (Lys-C endopeptidase), EC 3.4.21.50	*C*-terminal side of Lys
	Glutamyl endopeptidase (Glu-C endoproteinase; V8 protease); (from *S. aureus* strain V8), EC 3.4.21.19	*C*-terminal side of Glu and Asp
	Peptidyl-Asp metalloendopeptidase (Asp-N endoproteinase), EC 3.4.24.33	*N*-terminal side of Asp
	Clostripain (Arg-C endopeptidase), EC 3.4.22.8	*C*-terminal side of Arg
Chemical	Cyanogen bromide	*C*-terminal side of Met
	2-Nitro-5-thiocyanobenzoic acid	*N*-terminal side of Cys
	O-Iodosobenzoic acid	*C*-terminal side of Trp and Tyr
	Dilute acid	Asp and Pro
	BNPS-skatole	Trp

Temperature—A temperature between 25° and 37° is adequate for most digestions. The temperature used is intended to minimize chemical side reactions. The type of protein under test will dictate the temperature of the reaction milieu because some proteins are more susceptible to denaturation as the temperature of the reaction increases. For example, digestion of recombinant bovine somatropin is conducted at 4° because at higher temperatures it will precipitate during digestion.

Time—If a sufficient amount of sample is available, a time course study is considered in order to determine the optimum time to obtain a reproducible map and avoid incomplete digestion. Time of digestion varies from 2 to 30 hours. The reaction is stopped by the addition of an acid that does not interfere with the tryptic map, or by freezing.

Amount of Cleavage Agent—Although excessive amounts of cleavage agent are used to accomplish a reasonably rapid digestion time (i.e., 6 to 20 hours), the amount of cleavage agent is minimized to avoid its contribution to the chromatographic map pattern. A protein-to-protease ratio between 20 : 1 and 200 : 1 is generally used. It is recommended that the cleavage agent be added in two or more stages to optimize cleavage. Nonetheless, the final reaction volume remains small enough to facilitate the next step in peptide mapping—the separation step. To sort out digestion artifacts that might be interfering with the subsequent analysis, a blank determination is performed using a digestion control with all the reagents except the test protein.

Chromatographic Separation

Many techniques are used to separate peptides for mapping. The selection of a technique depends on the protein being mapped. Techniques that have been successfully used for the separation of peptides are shown in *Table 2*.

Table 2. Techniques Used for the Separation of Peptides

Reverse-Phase High-Performance Liquid Chromatography (RP-HPLC)
Ion-Exchange Chromatography (IEC)
Hydrophobic Interaction Chromatography (HIC)
Polyacrylamide Gel Electrophoresis (PAGE), nondenaturating
Sodium Dodecyl Sulfate Polyacrylamide Gel Electrophoresis (SDS-PAGE)
Capillary Electrophoresis (CE)
Paper Chromatography
High-Voltage Paper Electrophoresis (HVPE)

In this section, a most widely used reverse-phase HPLC (RP-HPLC) method is described as one of the procedures of chromatographic separation.

The purity of solvents and mobile phases is a critical factor in HPLC separation. HPLC-grade solvents and water that are commercially available are recommended for RP-HPLC. Dissolved gases present a problem in gradient systems where the solubility of the gas in a solvent may be less in a mixture than in a single solvent. Vacuum degassing and agitation by sonication are often used as useful degassing procedures. The solid particles in the solvents are drawn into the HPLC system; they can damage the sealing of pump valves or clog the top of the chromatographic column. Both pre- and post-pump filtration are also recommended.

Chromatographic Column—The selection of a chromatographic column is empirically determined for each protein. Columns with 100 Å or 300 Å pore size and silica support can give optimal separation. For smaller peptides, •$_{\bullet 1}$ octylsilane chemically bonded to totally porous silica articles 3 to 10 µm in diameter (L7) and of octadecylsilane chemically bonded to porous silica or ceramic microparticles 3 to 10 µm in diameter (L1) •column packings$_{\bullet 1}$ are more efficient than the butyl silane chemically bonded to totally porous silica particles 5 to 10 µm in diameter (L26) •packing.$_{\bullet 1}$

Solvent—The most commonly used solvent is water with acetonitrile as the organic modifier to which less than 0.1% of trifluoroacetic acid is added. If necessary, add isopropyl alcohol or *n*-propyl alcohol to solubilize the digest components, provided that the addition does not unduly increase the viscosity of the components.

Mobile Phase—Buffered mobile phases containing phosphate are used to provide some flexibility in the selection of pH conditions, because shifts of pH in the 3.0 to 5.0 range enhance the separation of peptides containing acidic residues (e.g., glutamic and aspartic acids). Sodium or potassium phosphates, ammonium acetate, and phosphoric acid, with a pH between 2 and 7 (or higher for polymer-based supports), have also been used with acetonitrile gradients. Acetonitrile-containing trifluoroacetic acid is also used quite often.

Gradient Selection—Gradients can be linear, nonlinear, or include step functions. A shallow gradient is recommended in order to separate complex mixtures. Gradients are optimized to provide clear resolution of one or two peaks that will become "marker" peaks for the test.

Isocratic Selection—Isocratic HPLC systems using a single mobile phase are used on the basis of their convenience of use and improved detector responses. Optimal composition of a mobile phase to obtain clear resolution of each peak is sometimes difficult to establish. Mobile phases for which slight changes in component ratios or in pH significantly affect retention times of peaks in peptide maps should not be used in isocratic HPLC systems.

Other Parameters—Temperature control of the column is usually necessary to achieve good reproducibility. The flow rates for the mobile phases range from 0.1 to 2.0 mL per minute, and the detection of peptides is performed with a UV detector at 200 to 230 nm. Other methods of detection have been used (e.g., postcolumn derivatization), but they are not as robust or as versatile as UV detection.

System Suitability—The section *System Suitability* under *Chromatography* ⟨621⟩ provides an experimental means for measuring the overall performance of the test method. The acceptance criteria for system suitability depend on the identification of critical test parameters that affect data interpretation and acceptance. These critical parameters are also criteria that monitor peptide digestion and peptide analysis. An indicator that the desired digestion endpoint was achieved is the comparison with a Reference Standard or Reference Material, which is treated exactly as the article under test. The use of a USP Reference Standard in parallel with the protein under test is critical in the development and establishment of system suitability limits. In addition, a specimen chromatogram should be included with the USP Reference Standard or Reference Material for comparison purposes. Other indicators may include visual inspection of protein or peptide solubility, the absence of intact protein, or measurement of responses of a digestion-dependent peptide. The critical system suitability parameters for peptide analysis will depend on the particular mode of peptide separation and detection, and on the data analysis requirements.

When peptide mapping is used as an identification test, the system suitability requirements for the identified peptides cover selectivity and precision. In this case, as well as when identification of variant proteins is done, the identification of the primary structure of the peptide fragments in the peptide map provides both a verification of the known primary structure and the identification of protein variants by comparison with the peptide map of the USP Reference Standard or Reference Material for the specified protein. The use of a digested USP Reference Standard or Reference Material for a given protein in the determination of peptide resolution is the method of choice. For an analysis of a variant protein, a characterized mixture of a variant and a Reference Standard can be used, especially if the variant peptide is located in a less-resolved region of the map. The index of pattern consistency can be simply the number of major peptides detected. Peptide pattern consistency can be best defined by the resolution of peptide peaks. Chromatographic parameters—such as peak-to-peak resolution, maximum peak width, peak tailing factors, and column efficiency—may be used to define peptide resolution. Depending on the protein under test and the method of separation used, single peptide or multiple peptide resolution requirements may be necessary.

The replicate analysis of the digest of the USP Reference Standard or Reference Material for the protein under test yields measures of precision and quantitative recovery. Recovery of the identified peptides is generally ascertained by the use of internal or external peptide standards. The precision is expressed as the relative standard deviation (RSD). Differences in the recovery and precision of the identified peptides are expected; therefore, the system suitability limits will have to be established for both the recovery and the precision of the identified peptides. These limits are unique for a given protein and will be specified in the individual monograph.

Visual comparison of the relative retention times, the peak responses, the number of peaks, and the overall elution pattern is completed initially. It is then complemented and supported by mathematical analysis of the peak response ratios and by the chromatographic profile of a 1 : 1 (v/v) mixture of sample and USP Reference Standard or Reference Material digest. If all peaks in the sample digest and in the USP Reference Standard or Reference Material digest have the same relative retention times and peak response ratios, then the identity of the sample under test is confirmed.

If peaks that initially eluted with significantly different relative retention times are then observed as single peaks in the 1 : 1 mixture, the initial difference would be an indication of system variability. However, if separate peaks are observed in the 1 : 1 mixture, this would be evidence of the nonequivalence of the peptides in each peak. If a peak in the 1 : 1 mixture is significantly broader than the corresponding peak in the sample and USP Reference Standard or Reference Material digest, it may indicate the presence of different peptides. The use of computer-aided pattern recognition software for the analysis of peptide mapping data has been proposed and applied, but issues related to the validation of the computer software preclude its use in a compendial test in the near future. Other automated approaches have been used that employ mathematical formulas, models, and pattern recognition. Such approaches, for example, the automated identification of compounds by IR spectroscopy and the application of diode-array UV spectral analysis for identification of peptides, have been proposed. These methods have limitations due to inadequate resolutions, co-elution of fragments, or absolute peak response differences between USP Reference Standard or Reference Material and sample fragments.

The numerical comparison of the retention times and peak areas or peak heights can be done for a selected group of relevant peaks that have been correctly identified in the peptide maps. Peak areas can be calculated using one peak showing relatively small variation as an internal reference, keeping in mind that peak area integration is sensitive to baseline variation and is likely to introduce error into the analysis. Alternatively, the percentage of each peptide peak height relative to the sum of all peak heights can be calculated for the sample under test. The percentage is then compared to that of the corresponding peak of the USP Reference Standard or Reference Material. The possibility of autohydrolysis of trypsin is monitored by producing a blank peptide map that is the peptide map obtained when a blank solution is treated with trypsin.

The minimum requirement for the qualification of peptide mapping is an approved test procedure that includes system suitability as a test control. In general, •early in the regulatory process,• qualification of peptide mapping for a protein is sufficient. As the regulatory approval process for the protein progresses, additional qualifications of the test can include a partial validation of the analytical procedure to provide assurance that the method will perform as intended in the development of a peptide map for the specified protein.

Analysis and Identification of Peptides

This section gives guidance on the use of peptide mapping during development in support of regulatory applications.

The use of a peptide map as a qualitative tool does not require the complete characterization of the individual peptide peaks. However, validation of peptide mapping in support of regulatory applications requires rigorous characterization of each of the individual peaks in the peptide map. Methods to characterize peaks range from *N*-terminal sequencing of each peak followed by amino acid analysis to the use of mass spectroscopy (MS).

For characterization purposes, when *N*-terminal sequencing and amino acid analysis are used, the analytical separation is scaled up. Because scale-up might affect the resolution of peptide peaks, it is necessary, using empirical data, to assure that there is no loss of resolution due to scale-up. Eluates corresponding to specific peptide peaks are collected, vacuum-concentrated, and chromatographed again, if necessary. Amino acid analysis of fragments may be limited by the peptide size. If the *N*-terminus is blocked, it may need to be cleared before sequencing. *C*-terminal sequencing of proteins or a combination of carboxypeptidase digestion and matrix-assisted laser desorption ionization–time-of-flight (MALDI-TOF) MS can also be used for characterization purposes.

The use of MS for characterization of peptide fragments is by direct infusion of isolated peptides or by the use of on-line LC-MS for structure analysis. In general, it includes electrospray and MALDI-TOF analyzers as well as fast atom bombardment (FAB). Tandem MS has also been used to sequence a modified protein and to determine the type of amino acid modification that has occurred. The comparison of mass spectra of the digests before and after reduction provides a method to assign the disulfide bonds to the various sulfhydryl-containing peptides.

If regions of the primary structure are not clearly demonstrated by the peptide map, it might be necessary to develop a secondary peptide map. The goal of a validated method of characterization of a protein through peptide mapping is to reconcile and account for at least 95% of the theoretical composition of the protein structure.

•◆•1 THE USE OF PEPTIDE MAPPING FOR GENETIC STABILITY EVALUATION

A validated peptide map can be used to assess the integrity of the predicted primary sequence of a protein product (i.e., its genetic stability). It can also be used to determine lot-to-lot consistency of the biotechnology-derived product process. Furthermore, the performance of the protein expression of the production system is best assessed by peptide mapping of the expressed protein. Peptide maps of protein produced at various times of the protein expression process, including a point well beyond the normal protein expression time, compared with those of a USP Reference Standard or Reference Material, will evaluate the genetic stability of the expression system as a function of time.

Variant protein sequences can arise from a genetic variation at the DNA level (point mutation) or as an error in the translation process. A validated peptide map is the best approach to the detection of protein variants. However, the limitations of the peptide mapping itself must be taken into consideration. The detection of a structured variant is possible only if the corresponding peptide variant is easily isolated and characterized. To establish genetic stability will require the use of a battery of biochemical methods, provided that the variants have properties different from those of the "normal" protein.•◆•1

Change to read:

•◆•1 VALIDATION

Critical Factors

Validation of peptide mapping requires that a protocol be designed, outlining in detail the experiment to be conducted and the criteria for acceptance of the map. Criteria for acceptance of mapping include detection limit, specificity, linearity, range, accuracy, precision, and reagent stability. Reproducibility of the peptide map is a critical element in the utilization of such a map as an identity test and for confirming genetic stability. Those technical aspects of peptide mapping that influence the reproducibility of the map will be discussed.

The setting of limits, with respect to quantification (peak area or height) and identification (retention times) for the selected group of relevant peaks is based on empirical observations. These limits detect significant differences between the sample and USP Reference Standard or Reference Material within a series of analyses.

Interim Revision Announcement

Another critical issue is the recovery of peptides and its impact on peak area determination and reproducibility and on the establishment of acceptance criteria. The recovery criteria address all aspects of test methodology, from digestion to chromatographic conditions. Determination of peptide recovery includes quantitative amino acid analysis, spike addition, radiolabeling, and UV summation. An overall recovery of about 80% is considered satisfactory. Recovery of individual peptides is more problematic and is handled on a case-by-case basis. The critical factors considered in the validation of a peptide map are as follows.

Written Test Procedures—These procedures include a detailed description of the analytical method in which reagents, equipment, sample preparation, method of analysis, and analysis of the data are defined.

Validation Protocol—A protocol is prepared that contains a procedure for test validation.

Acceptance Criteria—The criteria can be minimal at the early stages, but need to be better defined as validation studies progress.

Reporting of Results—Results from the validation study are documented with respect to the analytical parameters listed in the validation protocol.

Revalidation of the Test Procedure—If the method used requires alteration that could affect the analytical parameter previously assessed in the validation of the procedure, the test procedure must be revalidated. Significant changes in the processing of the article, in laboratories performing the analysis, in formulation of the bulk or the finished products, and in any other significant parameter will require revalidation of the methods.

Requirements

PRECISION

Intratest Precision—This is a measure of the reproducibility of peptide mapping. The two critical steps in peptide mapping are fragmentation (i.e., digestion) and separation of peptides. An acceptable precision occurs where the absolute retention times and the relative peak areas are constant from run to run, and the average variation in retention time is small relative to that of a selected internal reference peak. The reproducibility of the map can be enhanced if a temperature-controlled column oven is used, if an extensive equilibration of the system is performed prior to the start of the test, if a blank (control digest mixture without protein) is run first to minimize ''first run effects,'' and if a USP Reference Standard or a Reference Material digest is interspersed periodically with test samples to evaluate chromatographic drift.

The criteria for validation of the fragmentation step are similar to those described below for separation of peptides, but they are met for consecutive tests of a series of separately prepared digests of the protein under test.

The criteria for validation of the separation of peptides step include the following:

1. The average standard deviation of the absolute retention times of all major peaks for a set of consecutive tests of the same digest does not exceed a specified acceptance criterion.
2. The average standard deviation of absolute peak area for all fully resolved major peaks does not exceed a specified percentage.

Intertest Precision—This is a measure of the reproducibility of the peptide mapping when the test is performed on different days, by different analysts, in different laboratories, with reagents or enzymes from different suppliers or different lots from the same supplier, with different instruments, on columns of different makes or columns of the same make from different lots, and on individual columns of the same make from the same lot. Although it would be desirable, from a scientific perspective, to validate all of these variables in terms of their impacts on precision, a practical approach is to validate the test using those variables most likely to be encountered under operational conditions. Additional variables can be included when needed.

The experimental design allows the analyst to make comparisons using peak retention times and areas that are expressed relative to a highly reproducible internal reference peak within the same chromatogram. The relative peak area is expressed as the ratio of the peak area to that of the internal reference peak. The relative retention time can be expressed as the difference between the absolute retention time and that of the reference peak. The use of relative values eliminates the need to make separate corrections for differences due to injector-to-injector volumes, units of measure for peak areas, column dimensions, and instrument dead volumes. The variability in the retention times and peak areas for the *Intertest Precision* experiments is expected to be slightly higher than the variability observed for *Intratest Precision*.

ROBUSTNESS

Factors such as composition of the *Mobile Phase*, protease quality or chemical reagent purity, column variation and age, and digest stability are likely to affect the overall performance of the test and its reproducibility. Tolerances for each of the key parameters are evaluated and baseline limits established in case the test is used for routine lot release purposes.

Mobile Phase—The composition of the *Mobile Phase* is optimized to obtain the maximum resolution of peptides throughout the elution profile. A balance between optimal resolution and overall reproducibility is desired. A lower pH might improve peak separation but might shorten the life of the column, resulting in lack of reproducibility. Peptide maps at a pH above and below the pH of the procedure are compared to the peptide map obtained at the pH of the procedure and checked for significant differences; they are also reviewed with respect to the acceptance criteria established in the validation protocol.

Protease Quality or Chemical Reagent Purity—A sample of the USP Reference Standard or Reference Material for the protein under test is prepared and digested with different lots of cleavage agent. The chromatograms for each digest are compared in terms of peak areas, shape, and number. The same procedure can be applied to other critical chemicals or pretreatment procedures used during sample preparation, such as reducing and carboxymethylation reagents.

Column Considerations—Column-to-column variability, even within a single lot, can affect the performance of the column in the development of peptide maps. Column size may also lead to significant differences. A USP Reference Standard or Reference Material of the protein under test is digested and the digest is chromatographed on different lots of column from a single manufacturer. The maps are then evaluated in terms of the overall elution profile, retention times, selectivity resolution, and recovery. To evaluate the overall lifetime of the column in terms of robustness, perform a peptide mapping test on different columns and vary significantly the number of injections (e.g., from 10 injections to 250 injections). The resulting maps can then be compared for significant differences in peak broadening, peak area, and overall resolution. As a column ages, an increase in back pressure might be observed that might affect the peptide maps.

A sensible precaution in the use of peptide mapping columns is to select alternative columns in case the original columns become unavailable or are discontinued. Perform a peptide mapping test using equivalent columns from different manufacturers, and examine the maps. Differences in particle shape and size, pore size and volume, carbon load, and end-capping can lead to significant differences in retention times, elution profile selectivity, resolution, and recovery. Slight modifications in the gradient profile may be required to achieve equivalency of mapping when using columns from different manufacturers. [NOTE—The equivalency between instrumentation used for the validation of the test and for routine quality control testing should be considered. It might be preferable to use the same HPLC system for all applications. Otherwise, equivalency of the systems is determined, which may require some changes in the chromatographic test conditions.]

Digest Stability—The length of time a digest can be kept before it is chromatographed, as well as the conditions under which the digest is stored before chromatography, is assessed. Several aliquots from a single digest are stored at different storage conditions and chromatographed. These maps are then evaluated for significant differences.

REPRODUCIBILITY

Determination of various parameters indicated above is repeated using the same USP Reference Standard or Reference Material and test sample in at least two different laboratories by two analysts equipped with similar HPLC systems. The generated peptide maps are evaluated for significant differences. •◆●1

⟨1056⟩ BIOTECHNOLOGY-DERIVED ARTICLES—POLYACRYLAMIDE GEL ELECTROPHORESIS

Change to read:

This chapter provides guidance and procedures used for characterization of biotechnology-derived articles by polyacrylamide gel electrophoresis.• Portions of the chapter that are not harmonized with the other two pharmacopeias are marked by the symbol ◆.●1 This chapter is harmonized with the corresponding chapter in *JP* and *EP*. Other characterization tests, also harmonized, are shown in *Biotechnology-Derived Articles—Amino Acid Analysis* ⟨1052⟩, *Biotechnology-Derived Articles—Capillary Electrophoresis* ⟨1053⟩, *Biotechnology-Derived Articles—Isoelectric Focusing* ⟨1054⟩, *Biotechnology-Derived Articles—Peptide Mapping* ⟨1055⟩, and *Biotechnology-Derived Articles—Total Protein Assay* ⟨1057⟩.

INTRODUCTION

•Scope

Polyacrylamide gel electrophoresis (PAGE) is used for the qualitative characterization of proteins in biological preparations, for control of purity and for quantitative determinations. ●1

•Purpose

Analytical gel electrophoresis is an appropriate method with which to identify and to assess the homogeneity of proteins in drug substances. The method is routinely used for the estimation of protein subunit molecular masses and for the determination of the subunit compositions of purified proteins.

Ready-to-use gels and reagents are widely available on the market and can be used instead of those described in this chapter, provided that they give equivalent results and that they meet the validity requirements given below under *Validation of the Test*.●1

Change to read:

•◆●1GENERAL PRINCIPLE OF ELECTROPHORESIS

Under the influence of an electrical field, charged particles migrate in the direction of the electrode bearing the opposite polarity. In gel electrophoresis, the movements of the particles are retarded by interactions with the surrounding gel matrix, which acts as a molecular sieve. The opposing interactions of the electrical force and molecular sieving result in differential migration rates according to the sizes, shapes, and charges of particles. Because of their different physicochemical properties, different macromolecules of a mixture migrate at different speeds during electrophoresis and thus are separated into discrete fractions. Electrophoretic separations can be conducted in systems without support phases (e.g., free solution separation in capillary electrophoresis) and in stabilizing media, such as thin-layer plates, films, or gels.•◆●1

Change to read:

CHARACTERISTICS OF POLYACRYLAMIDE GELS •●1

The sieving properties of polyacrylamide gels are established by the three-dimensional network of fibers and pores that is formed as the bifunctional bisacrylamide cross-links adjacent to polyacrylamide chains. Polymerization is catalyzed by a free-radical-generating system composed of ammonium persulfate and *N,N,N′,N′*-tetramethylethylenediamine (TEMED).

As the acrylamide concentration of a gel increases, its effective pore size decreases. The effective pore size of a gel is operationally defined by its sieving properties, that is, by the resistance it imparts to the migration of macromolecules. There are limits to the acrylamide concentrations that can be used. At high acrylamide concentrations, gels break much more easily and are difficult to handle. As the pore size of a gel decreases, the migration rate of a protein through the gel decreases. By adjusting the pore size of a gel, through manipulating the acrylamide concentration, the resolution of the method can be optimized for a given protein product. Thus, a given gel is physically characterized by its respective composition of acrylamide and bisacrylamide.

In addition to the composition of the gel, the state of the protein is an important component of electrophoretic mobility. In the case of proteins, electrophoretic mobility is dependent on the pK value of the charged groups and the size of the molecule. It is influenced by the type, the concentration, and the pH of the buffer; by the temperature and the field strength; and by the nature of the support material.

•Denaturing Polyacrylamide Gel Electrophoresis●1

•This method cited is limited to the analysis of monomeric polypeptides with a mass range of 14,000 to 100,000 Da. It is possible to extend the mass range by various techniques (e.g., gradient gels or particular buffer systems), but those techniques are not discussed in this chapter.●1

Denaturing PAGE using sodium dodecyl sulfate (SDS) •(SDS-PAGE)●1 is the most common mode of electrophoresis used in assessing the pharmaceutical quality of protein products •and will be the focus of the example method.●1 Typically, analytical electrophoresis of proteins is carried out •in polyacrylamide gels●1 under conditions that ensure dissociation of the proteins into their individual polypeptide subunits and that minimize aggregation . •Most commonly,●1 the strongly anionic detergent SDS is used in combination with heat to dissociate the proteins before they are loaded on the gel. The denatured polypeptides bind •to●1 SDS, become negatively charged, and exhibit a consistent charge-to-•mass●1 ratio regardless of protein type. Because the amount of SDS bound is almost always proportional to the molecular •mass●1 of the polypeptide and is •●1 independent of its sequence, SDS-polypeptide complexes migrate through polyacrylamide gels •with mobilities dependent on●1 the size of the polypeptide.

The electrophoretic mobilities of the resultant detergent–polypeptide complexes all assume the same functional relationship to •their molecular masses.●1 Migration of SDS •complexes●1 is toward the anode in a predictable manner, with low molecular •mass●1 complexes migrating faster than larger ones. •●1 The molecular •mass●1 of a protein can therefore be estimated from its relative mobility in calibrated SDS-PAGE and •the occurrence of●1 a single band in such a gel is a criterion of purity.

Modifications to the polypeptide backbone, such as *N*- or *O*-linked glycosylation, however, have a significant impact on the apparent molecular •mass of a protein, because●1 SDS does not bind to a carbohydrate moiety in a manner similar to a the polypeptide. Thus, a

consistent charge-to-mass ratio is not maintained. The apparent molecular mass of proteins having undergone post-translational modifications is not a true reflection of the mass of the polypeptide chain.

Reducing Conditions

Polypeptide subunits and three-dimensional structure is often maintained in proteins by the presence of disulfide bonds. A goal of SDS-PAGE analysis under reducing conditions is to disrupt this structure by reducing disulfide bonds. Complete denaturation and dissociation of proteins by treatment with 2-mercaptoethanol or dithiothreitol (DTT) will result in the unfolding of the polypeptide backbone and subsequent complexation with SDS. In these conditions, the molecular mass of the polypeptide subunits can be calculated by linear regression in the presence of suitable molecular mass standards.

Nonreducing Conditions

For some analyses, complete dissociation of protein into subunit peptides is not desirable. In the absence of treatment with reducing agents such as 2-mercaptoethanol or DTT, disulfide covalent bonds remain intact, preserving the oligomeric form of the protein. Oligomeric SDS-protein complexes migrate more slowly than their SDS-polypeptide subunits. In addition, nonreduced proteins may not be completely saturated with SDS and hence may not bind the detergent in a constant mass ratio. This makes molecular mass determinations of these molecules less straightforward than analyses of fully denatured polypeptides, because it is necessary that both standards and unknown proteins be in similar configurations for valid comparisons. However, the staining of a single band in such a gel is a criterion of purity.

Characteristics of a Discontinuous Buffer System Gel Electrophoresis

The most popular electrophoretic method for the characterization of a complex mixture of proteins involves the use of a discontinuous buffer system consisting of two contiguous, but distinct, gels: a resolving or separating (lower) gel and a stacking (upper) gel. The two gels are cast with different porosities, pHs, and ionic strengths. In addition, different mobile ions are used in the gel and electrode buffers. The buffer discontinuity concentrates large volumes of sample in the stacking gel, resulting in improved resolution. When power is applied, a voltage drop develops across the sample solution that drives the proteins into the stacking gel. Glycinate ions from the electrode buffer follow the proteins into the stacking gel. A moving boundary region is rapidly formed with the highly mobile chloride ions in the front and the relatively slow glycinate ions in the rear. A localized high-voltage gradient forms between the leading and trailing ion fronts, causing the SDS-protein complexes to form into a thin zone (stack) and migrate between the chloride and glycinate phases. Within broad limits, regardless of the height of the applied sample, all SDS proteins condense into a very narrow region and enter the resolving gel as a well-defined, thin zone of high protein density. The large-pore stacking gel does not retard the migration of most proteins and serves mainly as an anticonvective medium. At the interface between the stacking and resolving gels, the proteins experience a sharp retardation due to the restrictive pore size of the resolving gel. Once in the resolving gel, proteins continue to be slowed by the sieving of the matrix. The glycinate ions overtake the proteins, which then move in a space of uniform pH formed by tris(hydroxymethyl)aminomethane (Tris) and glycine. Molecular sieving causes the SDS-polypeptide complexes to separate on the basis of their molecular masses.

Preparing Vertical Discontinuous Buffer SDS-Polyacrylamide Gels

GEL STOCK SOLUTIONS

30% Acrylamide–Bisacrylamide Solution—Prepare a solution containing 290 g of acrylamide and 10 g of methylene bisacrylamide per L of warm water, and filter. [NOTE—Acrylamide and methylene bisacrylamide are slowly converted during storage to acrylic acid and bisacrylic acid, respectively. This deamidation reaction is catalyzed by light and alkali. The pH of the solution must be 7.0 or lower. Store the solution in dark bottles at room temperature. Fresh solutions are prepared every month.]

Ammonium Persulfate Solution—Prepare a small quantity of solution having a concentration of 100 g of ammonium persulfate per L, and store at 4°. [NOTE—Ammonium persulfate provides the free radicals that drive polymerization of acrylamide and bisacrylamide. Ammonium persulfate decomposes slowly; therefore, prepare fresh solutions weekly.]

TEMED—Use an electrophoresis-grade reagent. [NOTE—*TEMED* accelerates the polymerization of acrylamide and bisacrylamide by catalyzing the formation of free radicals from ammonium persulfate. Because *TEMED* works only as a free base, polymerization is inhibited at low pH.]

SDS Solution—Use an electrophoresis-grade reagent. Prepare a solution having a concentration of about 100 g of SDS per L, and store at room temperature.

1.5 M Buffer Solution—Transfer about 90.8 g of Tris to a 500-mL flask, dissolve in 400 mL of water, adjust with hydrochloric acid to a pH of 8.8, dilute with water to volume, and mix.

1 M Buffer Solution—Transfer about 60.6 g of Tris to a 500-mL flask, add 400 mL of water, adjust with hydrochloric acid to a pH of 6.8, dilute with water to volume, and mix.

PLATE PREPARATION

Clean two glass plates (size e.g., 10 cm × 8 cm), the polytetrafluroethylene comb, the two spacers, and the silicone rubber tubing (diameter e.g., 0.6 mm × 35 cm) with mild detergent, and rinse thoroughly with water. Dry all items with a paper towel or tissue.

Lubricate the spacers and the tubing with nonsilicone grease. Apply the spacers along each of the two short sides of the glass plate 2 mm away from the edges and 2 mm away from the long side corresponding to the bottom of the gel.

Begin to lay the tubing on the glass plate by using one spacer as a guide. Carefully twist the tubing at the bottom of the spacer, and follow the long side of the glass plate. While holding the tubing with one finger along the long side, twist the tubing again, and lay it on the second short side of the glass plate, using the spacer as a guide.

Place the second glass plate in perfect alignment and hold the gel mold together by hand pressure. Apply two clamps on each of the two short sides of the mold. Carefully apply four clamps on the longer side of the mold, thus forming the bottom of the gel mold. Verify that the tubing is running along the edge of the glass plates and has not been extruded while placing the clamps. The gel mold is now ready for pouring the gel.

PREPARATION OF THE GEL

In a discontinuous buffer SDS-polyacrylamide gel, it is important to pour the resolving gel, let the gel set, and then pour the stacking gel, because the composition of the two gels in the acrylamide–bisacrylamide, the buffer, and the pH are different.

Resolving Gel—In a conical flask, prepare the appropriate volume of solution, containing the desired concentration of acrylamide for the resolving gel using the values given in *Table 1*. Mix the components in the order shown. Where appropriate, before adding the *Ammonium Persulfate Solution* and the *TEMED,* filter the solution if neccessary under vacuum through a cellulose acetate membrane filter

Interim Revision Announcement

(pore diameter 0.45-µm), and keep the solution under vacuum swirling the filtration unit until no more bubbles are formed in the solution. Add appropriate amounts of *Ammonium Persulfate Solution* and *TEMED,* as indicated in *Table 1;* swirl and pour immediately into the gap between the two glass plates of the mold. Leave sufficient space for the stacking gel (the length of the teeth of the comb plus 1 cm). Using a tapered glass pipet, carefully overlay the solution with water-saturated isobutyl alcohol. Leave the gel in a vertical position at room temperature to allow polymerization.

After polymerization is complete (about 30 minutes later), pour off the isobutyl alcohol and wash the top of the gel several times with water to remove the isobutyl alcohol overlay and any unpolymerized acrylamide. Drain as much fluid as possible from the top of the gel, then remove any remaining water with the edge of a paper towel.

Table 1. Preparation of Resolving Gel

	Component Volume (mL) per Gel Mold Volume Below

Stacking Gel—In a conical flask, prepare the appropriate volume of solution containing the desired concentration of acrylamide, •using the values given•1 in *Table 2*. Mix the components in the order shown. •Where appropriate,•1 before adding the *Ammonium Persulfate Solution* and the *TEMED,* •filter the solution if neccessary under vacuum through a cellulose acetate membrane filter (pore diameter 0.45-µm), and keep the solution under vacuum swirling the filtration unit until•1 no more bubbles are formed in the solution. Add appropriate amounts of *Ammonium Persulfate Solution* and *TEMED* as •indicated•1 in *Table 2*, swirl, and pour immediately into the gap between the two glass plates of the mold directly onto the surface of the polymerized *Resolving Gel.* Immediately insert a clean •polytetrafluoroethylene•1 comb into the stacking gel solution, being careful to avoid trapping air bubbles. Add more stacking gel solution to fill the spaces of the comb completely. Leave the gel in a vertical position, and allow it to polymerize at room temperature. ••1

Electrophoretic Separation

Sample Buffer 1—Dissolve 1.89 g of Tris, 5.0 g of SDS, 50 mg of bromophenol blue, and 25.0 mL of glycerol in 100 mL of water. Adjust with hydrochloric acid to a pH of 6.8, and dilute with water to 125 mL. Before use, dilute with an equal volume of water or sample, and mix.

Sample Buffer 2 (for reducing conditions)—Prepare as directed in *Sample Buffer 1* except to add 12.5 mL of 2-mercaptoethanol before adjusting the pH. Alternatively, prepare as directed for *Sample Buffer 1* except to start with about 1.93 g of Tris and add a suitable quantity of DTT to obtain a final 100 µM DTT concentration.

Running Buffer—Dissolve 151.4 g of Tris, 721.0 g of aminoacetic acid (glycine), and 50.0 g of SDS in water; dilute with water to 5000 mL; and mix to obtain a stock solution. Immediately before use, dilute this stock solution with water to 10 times its volume, mix, and adjust to a pH between 8.1 and 8.8.

Procedure—•After polymerization is complete (about 30 minutes later), carefully remove the polytetrafluoroethylene comb.•1 Rinse the wells immediately with water or with the *Running Buffer* to remove any unpolymerized acrylamide. If necessary, straighten the teeth of the *Stacking Gel* with a blunt hypodermic needle attached to a syringe. Remove the clamps on one short side, carefully pull out the tubing, and replace the clamps. Proceed similarly on the other short side. Remove the tubing from the bottom part of the gel.

Mount the ••1 gel in the electrophoresis apparatus. Add the electrophoresis buffers to the top and bottom reservoirs. Remove any bubbles that become trapped at the bottom of the gel between the glass plates. •This•1 is best done with a bent hypodermic needle attached to a syringe. Never prerun the gel before loading the samples, because that will destroy the discontinuity of the buffer systems. Before loading the sample, carefully rinse the slot with *Running Buffer.*

Prepare the test and standard solutions in the recommended *Sample Buffer*, and treat as directed in the individual monograph. Apply the appropriate volume of each solution to the *Stacking Gel* wells.

Start the electrophoresis under the conditions recommended by the manufacturer of the equipment. •Manufacturers of SDS-PAGE equipment may provide gels of different surface area and thickness.•1 Electrophoresis running time and current/voltage may need to •vary as described by the manufacturer of the apparatus•1 in order to achieve optimum separation. Check that the dye front is moving into the *Resolving Gel.* When the dye •is reaching•1 the bottom of the gel, stop the electrophoresis. Remove the gel assembly from the apparatus, and separate the glass plates. Remove the spacers, cut off and discard the *Stacking Gel*, and immediately proceed with staining.

Detection of Proteins in Gels

Coomassie staining is the most common protein staining method, with a detection level on the order of 1 to 10 µg of protein per band. Silver staining is the most sensitive method for staining proteins in gels •and•1 a band containing 10 to 100 ng can be detected. ••1

All of the steps in gel staining are •done•1 at room temperature with gentle •shaking (e.g., on an orbital shaker platform).•1 Gloves must be worn when staining the gels, •because fingertips will stain.•1

REAGENTS

Coomassie Staining Solution—Prepare a solution of Coomassie brilliant blue R-250 having a concentration of 1.25 g per L in a mixture of water, methanol, and glacial acetic acid (5 : 4 : 1). Filter, and store at room temperature.

Destaining Solution—Prepare a mixture of water, methanol, and glacial acetic acid (5 : 4 : 1).

Fixing Solution 1—Prepare a mixture of water, methanol, and trichloroacetic acid (5 : 4 : 1).

Fixing Solution 2—Transfer 250 mL of methanol to a 500-mL volumetric flask, add 0.27 mL of formaldehyde, dilute with water to volume, and mix.

Silver Nitrate Reagent—To a mixture of 40 mL of 1 M sodium hydroxide and 3 mL of ammonium hydroxide, add, dropwise and with stirring, 8 mL of a 200 g per L solution of silver nitrate; dilute with water to 200 mL, and mix.

Developing Solution—Transfer 2.5 mL of a citric acid solution (2 in 100) and 0.27 mL of formaldehyde to a 500.0-mL volumetric flask, dilute with water to volume, and mix.

Stopping Solution—Prepare a 10% (v/v) solution of acetic acid.

Table 2. Preparation of Stacking Gel

Solution Component	Component Volume (mL) per Gel Mold Volume Below							
	1 mL	2 mL	3 mL	4 mL	5 mL	6 mL	8 mL	10 mL

COOMASSIE STAINING

Immerse the gel in a •large• excess of *Coomassie Staining Solution,* and •allow to stand• for at least 1 hour. Remove the *Coomassie Staining Solution*. Destain the gel with a •large• excess of *Destaining Solution.* Change the *Destaining Solution* several times, until the stained protein bands are clearly distinguishable on a clear background. The more thoroughly the gel is destained, the smaller the amount of protein that can be detected •by the method.• Destaining can be •speeded up• by including a few •grams• of anion-exchange resin or a small sponge in the *Destaining Solution.* [NOTE—The acid–alcohol solutions used in this procedure do not completely fix proteins in the gel. This can lead to losses of some low molecular •mass• proteins during the staining and destaining of thin gels. Permanent fixation is obtainable by •allowing the gel to stand• in *Fixing Solution 1* for 1 hour before it is immersed in the *Coomassie Staining Solution.*]

SILVER STAINING

Immerse the gel in a •large• excess of *Fixing Solution 2,* and •allow to stand• for 1 hour. Remove *Fixing Solution 2,* add fresh *Fixing Solution 2,* and incubate for at least 1 hour, or overnight if convenient. Discard *Fixing Solution 2,* and wash the gel in a large excess of water for 1 hour. Soak the gel for 15 minutes in a 1% solution of glutaraldehyde (v/v). Wash the gel twice, for 15 minutes each time in a •large• excess of water. Soak the gel in fresh *Silver Nitrate Reagent* for 15 minutes in darkness. Wash the gel three times, for 5 minutes each time, in a •large• excess of water. Immerse the gel for about 1 minute in *Developing Solution* until satisfactory staining has been obtained. Stop the development by incubation in the *Stopping Solution* for 15 minutes. •• Rinse the gel with water. ••

Drying of Gels

•Depending on the method used, the gels are treated in a slightly different way.• For Coomassie staining, after the destaining step, •allow the gel to stand• in a •100 g per L• glycerol solution •• for at least 2 hours. For silver staining, add to the final rinsing step a 5-minute incubation in a •20 g per L• glycerol solution ••.

Immerse two sheets of porous •cellulose film• in water, and incubate for 5 to 10 minutes. Place one of the sheets on a drying frame. Carefully lift the gel, and place it on the •cellulose film.• Remove any trapped air bubbles, and pour a few mL of water around the edges of the gel. Place the second sheet on top, and remove any trapped air bubbles. Complete the assembly of the drying frame. Place in an •• oven, and leave at room temperature until dry. ••

Molecular •Mass• Determination

Molecular •masses• of proteins are determined by comparison of their mobilities with those of several marker proteins of known molecular •mass.• Mixtures of proteins with precisely known molecular •masses• blended for uniform staining are available for calibrating gels. They are available in various molecular •mass• ranges. Concentrated stock solutions of proteins of known molecular •mass• are diluted in an •appropriate• sample buffer and loaded on the same gel as the protein sample to be •studied.•.

Immediately after the gel has been run, the position of the bromophenol blue tracking dye is marked to identify the leading edge of the electrophoretic ion front. This can be done by cutting notches in the edges of the gel or by inserting a needle soaked in India ink into the gel at the dye front. After staining, measure the migration distances of each protein band (markers and unknowns) from the top of the *Resolving Gel*. Divide the migration distance of each protein by the distance traveled by the tracking dye. The normalized migration distances so obtained are called the relative mobilities of the proteins (relative to the dye front) and conventionally denoted as R_F. Construct a •• plot of the logarithm of the molecular •masses • (M_R) of the protein standards as functions of the R_F values. •Note that the• graphs are slightly sigmoid. •Unknown molecular masses can be estimated by linear regression analysis of interpolation from the curves of log M_R against R_F as long as the values obtained for the unknown samples are positioned along the linear part of the graph.•

•VALIDATION OF THE TEST

The test is not valid unless the proteins of the molecular mass marker are distributed along 80% of the length of the gel and over the required separation range (e.g., the range covering the product and its dimer or the products and its related impurities); the separation obtained for the relevant protein bands shows a linear relationship between the logarithm of the molecular mass and the R_F. Additional validation requirements with respect to the solution under test may be specified in individual monographs.•

Quantification of Impurities

Where the impurity limit is specified in the individual monograph, a reference solution corresponding to that level of impurity •should be• prepared by diluting the test solution. For example, where the limit is 5.0%, a reference solution •would be a• 1 : 20 dilution of the test solution. No impurity—any band other than the main band—in the electropherogram obtained from the test solution •may be• more intense than the main band obtained with the reference solution.

Under validated conditions •• impurities may be quantified by normalization to the main band, using an integrating densitometer. In this case, the responses must be validated for linearity.

Interim Revision Announcement

ERRATA

Following is a list of errata and corrections to *USP–NF*. The page number indicates where the item is found and in which official or pending official publication of *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be available as a cumulative table in future *Supplements* and will appear in its corrected form in a future annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff is available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

Interim Revision Announcement

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) items that previously appeared under *Pharmacopeial Previews* and are now formally proposed as revisions, (2) proposed revisions placed directly under *In-Process Revision,* or (3) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

> **Name of Item**, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
>
> (DSN: L. Evans) RTS—C55678

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type (print edition only), as shown in the examples below:

•new text•

if slated for an *Interim Revision Announcement to USP 30–NF 25* (*IRA*);

▲new text▲*USP31*

if slated for *USP 31–NF 26*; and

■new text■

if slated for a *Supplement to USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Interim Revision Announcement* that will appear in issue 2 of a given *PF* volume, ■2S (*USP 30*) indicates that the proposed revision is slated for the *Second Supplement to USP 30*, and ▲*USP31* and ▲*NF26* indicate that the revisions are proposed for *USP 31* and *NF 26*, respectively.

Official Title Changes Where the specification ***"Monograph title change"*** is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

MONOGRAPHS (USP)

BRIEFING

Acetaminophen and Tramadol Hydrochloride Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The liquid chromatographic procedures in the tests for *Related compounds* and in the *Assay* are based on analyses performed with the Zorbax Eclipse XBD-Phenyl brand of L11 column. Typical retention times are about 3.5 minutes for acetaminophen and about 9 minutes for tramadol hydrochloride. The chromatographic procedure in the test for *Dissolution* was validated using a Symmetry C8 brand of L7 packing. Using this column, the retention times are about 2.7 minutes for acetaminophen and about 5.3 minutes for tramadol hydrochloride.

(MD-CCA: C. Anthony; BPC: M. Marques) RTS—C58918

Add the following:

▲Acetaminophen and Tramadol Hydrochloride Tablets

» Acetaminophen and Tramadol Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of acetaminophen ($C_8H_9NO_2$) and tramadol hydrochloride ($C_{16}H_{25}NO_2 \cdot HCl$).

Packaging and storage—Preserve in tight containers. Store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Acetaminophen RS. USP p-Aminophenol RS. USP Tramadol Hydrochloride RS. USP Tramadol Related Compound A RS.*

Identification—The retention times of the peaks for tramadol hydrochloride and acetaminophen in the chromatograms of the *Tramadol assay preparation* and the *Acetaminophen assay preparation* correspond to those in the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Dissolution ⟨711⟩—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Buffer solution—Dissolve 6.8 g of monobasic potassium phosphate in about 900 mL of water in a 1-L volumetric flask. Adjust with phosphoric acid to a pH of 2.50, and dilute with water to volume.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (4 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve accurately weighed amounts of USP Tramadol Hydrochloride RS and USP Acetaminophen RS in *Medium* to obtain a final solution having a known concentration of about 0.36 mg per mL of acetaminophen and 0.04 mg per mL of tramadol hydrochloride.

Test solution—Pass a portion of the solution under test through a suitable 0.45-µm filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 272-nm detector and a 4.6-mm × 15-cm column that contains 5-µm L7 packing. The column temperature is maintained at 25°. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.5 for acetaminophen and 1.0 for tramadol hydrochloride; the resolution, *R,* between acetaminophen and tramadol hydrochloride is not less than 5.0; and the relative standard deviation for replicate injections is not more than 2.0% for both the tramadol hydrochloride and acetaminophen peaks.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for about two times the retention time of tramadol hydrochloride, and measure the responses for the major peaks. Calculate the percentage of acetaminophen and tramadol hydrochloride by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times L}$$

In-Process Revision

in which r_U and r_S are the peak responses of acetaminophen or tramadol hydrochloride obtained from the *Test solution* and *Standard solution,* respectively; C_S is the concentration, in mg per mL, of acetaminophen or tramadol hydrochloride in the *Standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and L is the Tablet label claim, in mg, of acetaminophen or tramadol hydrochloride.

Tolerance—Not less than 80% (Q) of the labeled amounts of acetaminophen and tramadol hydrochloride are dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Limit of *p*-aminophenol—[NOTE—All Standards, test solutions, and blank solutions have to be mixed with *Basic ferricyanide solution* and analyzed as soon as possible after a 30-minute waiting period.]

Diluent: a mixture of water and methanol (1 : 1).

Basic ferricyanide solution—Dissolve 1 g of sodium ferricyanide and 1 g of anhydrous sodium carbonate in 100 mL of water.

Standard solution—Dissolve an accurately weighed quantity of USP *p*-Aminophenol RS in *Diluent* to obtain a solution having a known concentration of about 0.05 mg per mL. Sonicate if necessary to dissolve. Transfer 5 mL of the resulting solution to a 100-mL volumetric flask, and add about 50 mL of *Diluent* and 5 mL of *Basic ferricyanide solution.* Dilute with *Diluent* to volume, and mix. Let stand for 30 minutes. Pass the solution through a 0.45-µm nylon membrane filter, and use the filtrate.

Test solution—Weigh not fewer than 20 Tablets. Grind the Tablets into a fine powder. Accurately transfer an amount of powder, equivalent to about 5 g of acetaminophen based on the label claim, to a 100-mL volumetric flask. Add 50 mL of *Diluent*, and sonicate for 15 minutes with intermittent shaking, followed by mechanical shaking for 30 minutes. Add 6 mL of *Basic ferricyanide solution.* Dilute with *Diluent* to volume, mix, and let stand for 30 minutes. Centrifuge a portion of the solution, and filter the clear supernatant through a 0.45-µm nylon membrane filter, and use the filtrate for analysis.

Blank solution—Add about 50 mL of *Diluent* to a 100-mL volumetric flask. Add 5 mL of *Basic ferricyanide solution.* Dilute with *Diluent* to volume, and let stand for 30 minutes. Filter a portion of the solution through a 0.45-µm nylon membrane filter, and use the filtrate for analysis.

Procedure—Concomitantly measure and record the absorbance of the *Standard* and *Test solutions* at about 710 nm in a 1-cm cell against the *Blank solution.* The relative standard deviation of six replicate absorbance readings of the *Standard solution* is not more than 6.0%. The difference between the initial and final absorbance readings of the *Standard solution* differs by not more than 10%. Calculate the percentage of *p*-aminophenol in the portion of Tablets taken by the formula:

$$(C_S / C_U)(r_U / r_S) \times 100$$

in which C_S is the concentration, in mg per mL, of USP *p*-Aminophenol RS in the *Standard solution;* C_U is the concentration, in mg per mL, based on the label claim of acetaminophen in the *Test solution;* and r_U and r_S are the absorbance readings of the *Test solution* and *Standard solution*, respectively: not more than 0.01% of *p*-aminophenol is found.

Related compounds—

Diluent, Mobile phase, Stock assay preparation—Prepare as directed in the *Assay.*

Standard solution—Dissolve accurately weighed quantities of USP Tramadol Hydrochloride RS and USP Tramadol Related Compound A RS in *Diluent* to obtain a solution having known concentrations of about 0.75 µg per mL of tramadol hydrochloride and 0.75 µg per mL each of the related compounds.

Test solution—Pass a suitable volume of *Stock assay preparation* through a 0.45-µm nylon membrane filter. Use the filtrate after discarding the first 4 mL of filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay.* Make sure that the detector monitoring wavelength is set at 216 nm. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure,* identifying the peaks using the relative retention times provided in *Table 1:* the resolution, R, between tramadol related compound A and tramadol hydrochloride is not less than 2.0; the column efficiency is not less than 2000 theoretical plates for tramadol hydrochloride; and the relative standard deviation for six replicate injections is not more than 6.0% for the tramadol hydrochloride peak.

Procedure—Separately inject equal volumes (about 30 µL) of the *Diluent, Standard solution,* and *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Disregard the peaks due to the *Diluent*. Calculate the percentage of each known and unknown impurity in the portion of Tablets taken by the formula:

$$(C_S / C_U)(r_U / r_S) \times 100$$

in which C_S is the concentration, in µg per mL, of USP Tramadol Hydrochloride RS in the *Standard solution;* C_U is the concentration, in µg per mL, of tramadol hydrochloride in the *Test solution;* r_U is the peak response of each impurity obtained from the *Test solution;* and r_S is the response of the tramadol hydrochloride peak obtained from the *Standard solution.* The impurities are listed in *Table 1*.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water, tetrahydrofuran, trifluoroacetic acid, and triethylamine (92 : 8 : 0.1 : 0.1). [NOTE—The apparent pH of the final solvent mixture should be between 2.2 and 2.4.] Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Diluent: a mixture of water and methanol (9 : 1).

Standard preparation—Dissolve accurately weighed quantities of USP Acetaminophen RS and USP Tramadol Hydrochloride RS in *Diluent* to obtain a solution having known concentrations of about 0.065 mg per mL and about 0.075 mg per mL for acetaminophen and tramadol hydrochloride, respectively. [NOTE—Sonication may be used to aid dissolution.]

Stock assay preparation—Weigh not fewer than 20 Tablets, and determine the average Tablet weight. Grind the Tablets into a fine powder, and transfer an amount equivalent to one Tablet to a 50-mL volumetric flask. Add about 30 mL of *Diluent* with continuous shaking to disperse the powder. Sonicate for 15 minutes with intermittent shaking, and shake

Table 1

Impurity Name	Relative Retention Time	Limit %
O-Desmethyl-tramadol[1]	0.60	0.2
Tramadol related compound A[2]	0.80	0.2
Tramadol hydrochloride	1.0	n/a
Acetaminophen	0.38	n/a
Any other individual unspecified degradation product	—	0.2
Total impurities	—	0.8

[1] 3-{(1*RS*,2*RS*)-2-[(dimethylamino)methyl]-1-hydroxycyclohexyl}phenol

[2] (*RS,SR*-1-(3-Methoxyphenyl)-2-(dimethylaminomethyl)cyclohexanol hydrochloride

the flask on a mechanical shaker for 30 minutes. Dilute with *Diluent* to volume, and mix well. Centrifuge the suspension, and use the supernatant for subsequent dilutions.

Tramadol assay preparation—Quantitatively dilute the centrifuged *Stock assay preparation* with *Diluent* to obtain a final solution having a nominal concentration of about 0.075 mg per mL of tramadol hydrochloride.

Acetaminophen assay preparation—Quantitatively dilute the centrifuged *Stock assay preparation* with *Diluent* to obtain a final solution having a nominal concentration of about 0.065 mg per mL of acetaminophen.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a variable wavelength detector, a 4.6-mm × 15-cm column that contains 5-µm L11 packing. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 50°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure* in the *Assay for tramadol hydrochloride:* the resolution, *R,* between acetaminophen and tramadol hydrochloride is not less than 10.0; the column efficiency is not less than 2000 theoretical plates for each analyte; the tailing factor is not more than 2.0 for each analyte; and the relative standard deviation for five replicate injections is not more than 2.0% for each analyte.

Procedure—

Assay for tramadol hydrochloride—Set the detector wavelength to 216 nm. Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Tramadol assay preparation* into the chromatograph, record the chromatograms for about 4 times the retention time of acetaminophen, and measure the responses for the tramadol peak. Calculate the quantity, in percent label claim, of tramadol hydrochloride, ($C_{16}H_{25}NO_2 \cdot HCl$) in the portion of Tablets taken by the formula:

$$(C_S / C_U)(r_U / r_S) \times 100$$

in which C_S is the concentration, in mg per mL, of USP Tramadol Hydrochloride RS in the *Standard preparation;* C_U is the nominal concentration, in mg per mL, based on the label claim of tramadol hydrochloride in the *Tramadol assay preparation;* and r_U and r_S are the peak responses obtained from the *Tramadol assay preparation* and the *Standard preparation,* respectively.

Assay for acetaminophen—Set the detector wavelength to 249 nm. Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Acetaminophen assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the acetaminophen peaks. Calculate the quantity, in percent label claim, of acetaminophen ($C_8H_9NO_2$), in the portion of Tablets taken by the formula:

$$(C_S / C_U)(r_U / r_S) \times 100$$

in which C_S is the concentration, in mg per mL, of USP Acetaminophen RS in the *Standard preparation;* C_U is the nominal concentration, in mg per mL, based on the label claim of acetaminophen in the *Acetaminophen assay preparation;* and r_U and r_S are the peak responses obtained from the *Acetaminophen assay preparation* and the *Standard preparation,* respectively.▲*USP33*

BRIEFING

Alendronate Sodium Tablets, *USP 31* page 1321, page 3813 of the *Second Supplement*, and the *Interim Revision Announcement* on page 545 of *PF* 34(3) [May–June 2008]. It is proposed to clarify how to run the quantitative step in *Dissolution Test 2*.

(BPC: M. Marques) RTS—C70112

Change to read:

Dissolution ⟨711⟩—

•TEST 1—•3

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 15 minutes.

Determine the amount of $C_4H_{13}NO_7P_2$ dissolved by employing the following method.

In-Process Revision

Buffer solution and *Mobile phase*—Prepare as directed in the *Assay.*

0.05% 9-Fluorenylmethyl chloroformate solution—Transfer 100 mg of 9-fluorenylmethyl chloroformate to a 200-mL volumetric flask, dilute with acetonitrile to volume, and mix. Prepare this solution fresh.

Borate buffer—Dissolve 6.2 g of boric acid in approximately 950 mL of water, adjust with 1 N sodium hydroxide to a pH of 9.0, and dilute with water to 1 L.

Diluent—Transfer 176.4 g of sodium citrate dihydrate to a 1000-mL volumetric flask, dissolve in and dilute with *Medium* to volume, and mix.

Standard stock solution—Dissolve an accurately weighed quantity of USP Alendronate Sodium RS in *Medium,* and dilute quantitatively and stepwise with the same solvent to obtain a solution having a known concentration corresponding to the concentration that would be obtained by dissolving 1 Tablet in 900 mL of the same *Medium.* Calculate the concentration, *C,* in mg per mL, of anhydrous alendronate sodium in this solution.

Standard solution—Transfer 5.0 mL of the *Standard stock solution* to a 50-mL polypropylene screw-cap centrifuge tube containing 1.0 mL of *Diluent* and 5.0 mL of *Borate buffer,* and mix for about 3 minutes. Add 4.0 mL of 0.05% *9-Fluorenylmethyl chloroformate solution,* and agitate for about 30 seconds. Allow the solution to stand at room temperature for 25 minutes. Add 25 mL of methylene chloride, and agitate for about 40 seconds. Centrifuge the mixture for 5 minutes. Use a portion of the clear upper aqueous layer.

Reagent blank—Using 5 mL of water, proceed as directed for *Standard solution,* beginning with "to a 50-mL polypropylene screw-cap centrifuge tube."

Test solution—After 15 minutes, withdraw a portion of the solution under test, and centrifuge immediately. Using 5.0 mL of the clear supernatant, proceed as directed for *Standard solution,* beginning with "to a 50-mL polypropylene screw-cap centrifuge tube."

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay.* Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the capacity factor, k', is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution,* the *Test solution,* and the *Reagent blank* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of alendronic acid ($C_4H_{13}NO_7P_2$) dissolved by the formula:

$$827.1C(r_U/r_S)$$

in which C is defined under the *Standard stock solution;* and r_U and r_S are the peak areas obtained from the *Test solution* and the *Standard solution,* respectively. [NOTE—827.1 is the molecular weight conversion factor ($C_4H_{13}NO_7P_2/C_4H_{12}NNaO_7P_2$) multiplied by the volume of the *Medium* (900 mL).]

Tolerances—Not less than 80% *(Q)* of the labeled amount of alendronic acid ($C_4H_{13}NO_7P_2$) is dissolved in 15 minutes. Tablets labeled for weekly dosing: not less than 75% *(Q)* of the labeled amount of alendronic acid ($C_4H_{13}NO_7P_2$) is dissolved in 15 minutes.

•TEST 2—If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Determine the amount of $C_4H_{12}NNaO_7P_2 \cdot 3H_2O$ dissolved ~~as directed in the *Assay*~~

▲employing the following method.

0.1% 9-Fluorenylmethyl chloroformate solution and *Borate solution*—Proceed as directed in the *Assay.*

0.6 M Citrate buffer—Dissolve 176.4 g of sodium citrate dihydrate in 1000 mL of water.

0.05 M Buffer—Transfer 14.7 g of sodium citrate dihydrate and 7.05 g of anhydrous dibasic sodium phosphate to a 1000-mL volumetric flask, dissolve in about 900 mL of water, adjust with phosphoric acid to a pH of 8.0, and dilute with water to volume.

Mobile phase—Prepare a filtered and degassed mixture of *0.05 M Buffer,* acetonitrile, and methanol (76 : 19 : 5). Make adjustments if necessary (see *System suitability* under *Chromatography* ⟨621⟩).

Standard stock solution—Dissolve an accurately weighed quantity of USP Alendronate Sodium RS in *Medium,* and dilute quantitatively and stepwise with the same solvent to obtain a solution having a known concentration corresponding to the concentration that would be obtained by dissolving one Tablet in 900 mL of the same *Medium.* Calculate the concentration, *C,* in mg per mL, of anhydrous alendronate sodium in this solution.

Standard solution—Transfer 5.0 mL of *Standard stock solution* to a 50-mL screw-cap polypropylene centrifuge tube containing 1.0 mL of *0.6 M Citrate buffer* and 5.0 mL of 0.1 M *Borate solution,* and mix for about 3 minutes. Add 4.0 mL of *0.1% 9-Fluorenylmethyl chloroformate solution,* and agitate for about 30 seconds. Allow the solution to stand at room temperature for 30 minutes. Add 25 mL of methylene chloride, and agitate vigorously for about 40 seconds. Centrifuge the mixture for 10 minutes. Use a portion of the clear upper aqueous layer.

Reagent blank—Using 5 mL of water, proceed as directed for the *Standard solution,* beginning with "to a 50-mL screw-cap polypropylene centrifuge tube".

Test solution—

For Tablets labeled to contain 5 mg, 10 mg, 35 mg, or 40 mg—After 30 minutes, withdraw 30 mL of the solution under test, and pass through a suitable 0.45-µm filter, discarding the first 10 mL. Using 5.0 mL of the filtrate, proceed as directed for the *Standard solution,* beginning with "to a 50-mL screw-cap polypropylene centrifuge tube".

In-Process Revision

For Tablets labeled to contain 70 mg—After 30 minutes, withdraw 30 mL of the solution under test, and pass through a suitable 0.45-µm filter, discarding the first 10 mL. Transfer 6.0 mL of the filtrate to a 10-mL volumetric flask, and dilute with water to volume. Using 5.0 mL of this dilution, proceed as directed for the *Standard solution,* beginning with "to a 50-mL screw-cap polypropylene centrifuge tube".

Chromatographic system—Proceed as directed for the *Assay.* Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure*: the capacity factor, K', is not less than 2.0; the column efficiency is not less than 1500 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Proceed as directed in *Test 1.*▲*USP33*
Tolerances—Not less than 80% *(Q)* of the labeled amount of alendronate sodium ($C_4H_{12}NNaO_7P_2 \cdot 3H_2O$) is dissolved in 30 minutes.•3

BRIEFING

Amantadine Hydrochloride Capsules, *USP 31* page 1374. It is proposed to include a *Dissolution Test 2* for a generic version of this product recently approved by the FDA. The chromatographic procedure in this test was validated using the RTX-1 or DB-1 brand of G1 phase. The retention times for naphthalene and amantadine hydrochloride are approximately 6 and 7 minutes, respectively. In the absence of any adverse comments, it is proposed to implement this revision via the *Interim Revision Announcement* in *PF* 35(3) with an official date of June 1, 2009.

(BPC: M. Marques) RTS—C70389

Add the following:

•**Labeling—**When more than one *Dissolution Test* is given, the labeling states the *Dissolution Test* used only if *Test 1* is not used.•3

Change to read:

Dissolution ~~*Procedure for a Pooled Sample*~~ ••3 ⟨711⟩—

•TEST 1—*Procedure for a Pooled Sample.*•3
Medium: water; 900 mL.
Apparatus 1: 100 rpm.
Time: 45 minutes.

Internal standard solution—Dissolve an accurately weighed quantity of naphthalene in hexane to obtain a solution having a known concentration of about 0.054 mg per mL.
Standard solution—Dissolve an accurately weighed quantity of USP Amantadine Hydrochloride RS in water to obtain a solution having a known concentration of about 0.1 mg per mL. Pipet 15.0 mL of this solution into a 50-mL screw-capped test tube, add 5.0 mL of 5 N sodium hydroxide and 10.0 mL of *Internal standard solution*, and shake for 60 minutes. Collect the hexane layer.
Test solution—Filter 15.0 mL of the solution under test and place into a 50-mL screw-capped test tube. Pipet 5.0 mL of 5 N sodium hydroxide and 10.0 mL of the *Internal standard solution* into the test tube, and shake for 60 minutes. Collect the hexane layer (*Test solution*).
Chromatographic system—Proceed as directed under the *Assay.*
Procedure—Separately inject equal volumes (about 2.5 µL) of the *Standard solution* and the *Test solution*. Record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $C_{10}H_{17}N \cdot HCl$ dissolved.
Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{10}H_{17}N \cdot HCl$ is dissolved in 45 minutes.

•TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: water; 900 mL.

Apparatus 2: 75 rpm, with sinkers. [NOTE—A suitable sinker is available as catalog number CAPWHT-2S from www.QLA-LLC.com or www.tabletdissolution.com or www.labhut.com.]

Time: 45 minutes.

Standard stock solution—Dissolve an accurately weighed amount of USP Amantadine Hydrochloride RS in *Medium* to obtain a solution with a final concentration of about 0.12 mg per mL.

Internal standard solution—Dissolve an accurately weighed amount of naphthalene in hexanes to obtain a solution with a final concentration of about 0.06 mg per mL.

Working standard solution—Transfer 60.0 mL of the *Standard stock solution* to a 200-mL volumetric flask. Add 20 mL of 5 N sodium hydroxide and 40.0 mL of *Internal standard solution*. Shake the flask for approximately 10 minutes, and allow the layers to separate. Use the top layer for injection. The final concentration is about 0.18 mg per mL.

Test solution—Transfer 3.0 mL of the solution under test to a centrifuge tube. Add 1.0 mL of 5 N sodium hydroxide and 2.0 mL of *Internal standard solution*. Shake the tube for approximately 10 minutes, and allow the layers to separate. Use the top layer for injection.

Chromatographic system (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector and a 0.32-mm × 30-m column that contains 0.25-µm film of phase G1. The oven temperature is set at 100° for 3 minutes, then to 200° at 10° per minute, and then held at 200° for 2 minutes. The injector is maintained at 250°, and the detector at 300°. The carrier gas is helium at 1.4 mL per minute, and the split flow is 20 mL per minute. Chromatograph the *Working standard solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between naphthelene and amantadine hydrochloride is not less than 2; the tailing factor for the amantadine hydrochloride peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 2 µL) of the *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses for all peaks. Calculate the percentage of amantadine hydrochloride dissolved by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times L}$$

in which A_U is the ratio of the peak areas obtained from the *Test solution*; C_S is the concentration, in mg per mL, of amantadine hydrochloride in the *Standard stock solution*; A_S is the average ratio of the peak areas obtained from the *Working standard solution*; 900 is the volume, in mL, of *Medium*; 100 is the conversion factor to percentage; and *L* is the Capsule label claim in mg.

Tolerances—Not less than 75% (*Q*) of the labeled amount of amantadine hydrochloride is dissolved in 45 minutes.•3

In-Process Revision

BRIEFING

Amlodipine Besylate Tablets, page 1137 of *PF* 34(5) [Sept.–Oct. 2008]. It is proposed to make some corrections to the text of the test for *Dissolution*.

(BPC: M. Marques) RTS—C70406

Add the following:

■Amlodipine Besylate Tablets

» Amlodipine Besylate Tablets contain not less than 90 percent and not more than 110 percent of the labeled amount of amlodipine ($C_{20}H_{25}N_2O_5Cl$).

Packaging and storage—Preserve in tight, light-resistant containers. Store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Amlodipine Besylate RS. USP Amlodipine Related Compound A RS.*

Identification—

A: *Ultraviolet Absorption* ⟨197U⟩—The spectrum of the *Test solution* corresponds to that of the *Standard solution,* as obtained in the test for *Dissolution*.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the chromatogram of the *Standard preparation,* as obtained in the *Assay.*

Change to read:

Dissolution ⟨711⟩**—**

[NOTE—Do not expose any of the solutions to stainless steel because of the degradation of amlodipine.]

Medium: 0.01 M hydrochloric acid; 500 mL.

Apparatus 2: 75 rpm. Use paddles covered with Teflon or made of any inert material except stainless steel.

Time: 30 minutes.

Standard solution A—Transfer about 35.0 mg, accurately weighed, of USP Amlodipine Besylate RS to a 250-mL volumetric flask. Dissolve in 10 mL of methanol, and dilute with *Medium* to volume.

Standard solution B—Prepare as directed for *Standard solution A*.

Working standard solutions A and *B*—

FOR TABLETS LABELED TO CONTAIN 2.5 MG—Transfer 5.0 mL of *Standard solution A* to a 200-mL volumetric flask, and dilute with *Medium* to volume (*Working standard solution A*). Transfer 5.0 mL of *Standard solution B* to a 100-mL volumetric flask, and dilute with *Medium* to volume (*Working standard solution B*).

FOR TABLETS LABELED TO CONTAIN 5 MG—Transfer 5.0 mL of *Standard solution A* to a 100-mL volumetric flask, and dilute with *Medium* to volume (*Working standard solution A*). Transfer 10.0 mL of *Standard solution B* to a 100-mL volumetric flask, and dilute with *Medium* to volume (*Working standard solution B*).

FOR TABLETS LABELED TO CONTAIN 10 MG—Transfer 10.0 mL of *Standard solution A* to a 100-mL volumetric flask, and dilute with *Medium* to volume (*Working standard solution A*). Transfer 10.0 mL of *Standard solution B* to a 50-mL volumetric flask, and dilute with *Medium* to volume (*Working standard solution B*).

Calculate the absorptivity:

$$A_{1\,cm}^{1\,\%}$$

at 237 nm for each *Working standard solution* using the formula:

$$A_{1cm}^{1\%} = \frac{A_S \times 1000 \times 250 \times DF \times 100}{W_S \times 100 \times 1 \times 1 \times P}$$

in which DF is the dilution factor of the *Working standard solution*; and P is the purity, in percentage, of USP Amlodipine RS.

Test solution—Pass a portion of the solution under test through a suitable 0.45-µm filter.

Procedure—Determine the amount of amlodipine ~~besylate~~▲ ▲*USP33* dissolved by employing UV absorption at the wavelength of maximum absorbance at about 237 nm on portions of the *Test solution* in comparison with the *Standard solution,* using a 1-cm path length cell and *Medium* as the blank. Calculate the percentage of amlodipine dissolved by the formula:

~~$$\frac{A_U \times C_S \times 500 \times 408.9 \times 100}{A_{1cm}^{1\%} \times L \times 567.1}$$~~

▲

$$\frac{A_U \times 1000 \times 500 \times 408.9 \times 100}{\text{mean } A_{1cm}^{1\%} \times 100 \times 1 \times L \times 567.1}$$

▲*USP33*

in which A_U is the absorbance obtained from the *Test solution;* ~~C_S is the concentration, in mg per mL, of the *Standard solution;*~~▲ ▲*USP33* 500 is the volume, in mL, of *Medium*; 408.9 is the molecular weight of amlodipine; 100 is the conversion factor to percentage;

~~$A_{1\,cm}^{1\,\%}$~~

▲

$$\text{mean } A_{1\,cm}^{1\%}$$

▲*USP33*

is the ~~absorptivity previously calculated~~▲average absorptivity of *Working standard solution A* and *B*;▲*USP33* *L* is the Tablet label claim, in mg; and 567.1 is the molecular weight of amlodipine besylate.

Tolerances—Not less than 75% (*Q*) of the labeled amount of amlodipine is dissolved in 30 minutes.

Uniformity of dosage units ⟨905⟩**:** meet the requirements.

Related compounds—

Buffer solution, Mobile phase, and *Chromatographic system*—Proceed as directed in the *Assay.*

System suitability solution—Use the *System suitability preparation,* prepared as directed in the *Assay.*

Standard solution—Use the *System suitability preparation,* prepared as directed in the *Assay.*

Test solution—Place a suitable number of Tablets into a 25-mL volumetric flask to obtain a solution having a final nominal concentration of 0.4 mg per mL of amlodipine. Add about 10 mL of *Mobile phase* to the flask. Swirl to disintegrate the Tablet(s) followed by sonication for about 5 minutes for complete dissolution, and then cool the sample to room temperature. Dilute with *Mobile phase* to volume. Stir for an additional 15 minutes using a magnetic stir bar, and pass the sample through a 0.45-µm syringe tip filter, discarding the first 5 mL.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of amlodipine related compound A in the portion of the Tablets taken by the formula:

$$100(C_S / C_U)(r_U / r_S)(\mathrm{MW}_1/\mathrm{MW}_2)$$

in which C_S is the concentration, in mg per mL, of USP Amlodipine Related Compound A RS in the *Standard solution*; C_U is the nominal concentration, in mg per mL, of amlodipine in the *Test solution;* r_U is the peak response for amlodipine related compound A obtained from the *Test solution;* r_S is the peak response of amlodipine related compound A in the *Standard solution;* and MW_1 and MW_2 are the molecular weights of amlodipine related compound A, equal to 406.87, and amlodipine related compound A fumarate, equal to 522.95, respectively. Calculate the percentage of any other individual impurity in the portion of Tablets taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Amlodipine Besylate RS in the *Standard solution*; C_U is the nominal concentration, in mg per mL, of amlodipine in the *Test solution;* r_U is the peak response for each individual impurity obtained from the *Test solution*; and r_S is the peak response of amlodipine obtained from the *Standard solution*. The specified and unspecified impurities meet the limits specified in *Table 1*.

Table 1

Component	Relative Retention Tme	Limit (%)
Amlodipine related compound A*	0.5	1.0
Amlodipine besylate	1	—
Any other individual unspecified degradation product	—	0.10

* 3-Ethyl, 5-methyl [2-(2-aminoethoxymethyl)-4-(2-chlorophenyl)-6-methyl-3,5-pyridinedicarboxylate].

Assay—

Buffer solution—Pipet 7.0 mL of triethylamine into a 1000-mL flask containing approximately 900 mL of water. Adjust the solution with phosphoric acid to a pH of 3.0 ± 0.1. Dilute with water to volume, and mix well.

In-Process Revision

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution,* methanol, and acetonitrile (50 : 35 : 15). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability preparation—Transfer accurately weighed known quantities of USP Amlodipine Besylate RS and USP Amlodipine Related Compound A RS into a suitable volumetric flask, and dissolve in *Mobile phase* to obtain a solution having a known concentration of about 0.02 mg per mL of amlodipine and 0.002 mg per mL of amlodipine related compound A, respectively.

Standard preparation—Dissolve an accurately weighed quantity of USP Amlodipine Besylate RS in *Mobile phase,* and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.02 mg per mL of amlodipine.

Assay preparation—Place 5 Tablets into a 500-mL volumetric flask. Add 50 mL of *Mobile phase* to the flask, and swirl to disintegrate the Tablets. Add approximately 300 mL of additional *Mobile phase,* insert the stopper into the flask, and shake on a reciprocating shaker for about 30 minutes. Dilute with *Mobile phase* to volume, and mix well. Further dilute quantitatively and stepwise, if necessary, to obtain a concentration of 0.02 mg per mL of amlodipine. Pass the sample through a 0.45-µm syringe tip filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 237-nm detector and a 3.9-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. The run time is about three times the retention of the amlodipine peak. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure:* the resolution, *R*, between amlodipine and amlodipine related compound A is not less than 8.5; the tailing factor is not more than 2.0 for both amlodipine and amlodipine related compound A; and the relative standard deviation for replicate injections is not more than 1.0% for amlodipine and not more than 5.0% for amlodipine related compound A.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for amlodipine. Calculate the percentage of amlodipine free base ($C_{20}H_{25}N_2O_5Cl$), based on the label claim, in the portion of Tablets taken by the formula:

$$100(C_S / C_U)(r_U / r_S)(1/L)$$

in which C_S is the concentration, in mg per mL, of USP Amlodipine Besylate RS in the *Standard preparation;* C_U is the number of Tablets per mL in the *Assay preparation;* r_U and r_S are the peak responses of amlodipine in the *Assay preparation* and the *Standard preparation,* respectively; and L is the label claim in mg per Tablet.■2S (*USP32*)

BRIEFING

Ampicillin Sodium, *USP 31* page 1420. Elsewhere in this issue of *PF*, in the general chapter *Dimethylaniline* ⟨223⟩, a revision is proposed to replace the packed-column GC method with a capillary GC method to modernize the chapter. On the basis of data obtained during the validation of the new method, it is proposed to revise the test for *Dimethylaniline* in this monograph to delete the specific instructions provided and refer to the solutions in the general chapter.

(MD-ANT: A. Wise) RTS—C68623

Change to read:

Dimethylaniline ⟨223⟩: meets the requirement. ~~the *Internal standard solution*, *Standard preparation*, and *Test preparation* being prepared as follows~~.

~~*Internal standard solution*—Dissolve 75 mg of *N,N* diethylaniline in 25 mL of 1 N hydrochloric acid, and dilute quantitatively and stepwise with water to obtain a solution containing about 30 µg per mL.~~

~~*Standard preparation*— Transfer 50.0 mg of *N,N*-dimethylaniline to a 50-mL volumetric flask, add 25 mL of 1 N hydrochloric acid, swirl to dissolve, dilute with water to volume, and mix. Transfer 2.0 mL of the resulting solution to a 100-mL volumetric flask, dilute with water to volume, and mix. To a suitable centrifuge tube add 1.0 mL of this solution, 1.0 mL of 1.25 N sodium hydroxide, 1.0 mL of *Internal standard solution*, and 1.0 mL of cyclohexane, shake vigorously for 1 minute, and centrifuge. Use the clear supernatant as the *Standard preparation*.~~

~~*Test preparation*— Transfer 1.0 g of Ampicillin Sodium to a suitable centrifuge tube, add 2 mL of 1.25 N sodium hydroxide, swirl to dissolve the specimen, add 1.0 mL of *Internal standard solution* and 1.0 mL of cyclohexane, shake vigorously for 1 minute, and centrifuge. Use the clear supernatant as the *Test preparation*.~~

▲▲*USP33*

BRIEFING

Atenolol Tablets, *USP 31* page 1462. It is proposed to add information on adjusting the pH of the *Medium* in the *Dissolution* test.

(BPC: M. Marques) RTS—C70409

Change to read:

Dissolution ⟨711⟩—

Medium: 0.1 N acetate buffer, pH 4.6, prepared by mixing 44.9 parts (v/v) of 0.1 N sodium acetate with 55.1 parts (v/v) of 0.1 N acetic acid solution,

▲and adjusting with either diluted sodium hydroxide or diluted acetic acid to a pH of 4.6;▲*USP33*

900 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Determine the amount of $C_{14}H_{22}N_2O_3$ dissolved by employing the following method.

Mobile phase and *Chromatographic system*—Proceed as directed in the *Assay* under *Atenolol*.

Standard solution—Quantitatively dissolve an accurately weighed quantity of USP Atenolol RS in *Mobile phase* to obtain a solution having a known concentration of about 0.01 mg per mL.

Test solution—Prepare a filtered portion of the solution under test. Quantitatively dilute an accurately measured volume of the filtrate with *Mobile phase* to obtain a solution estimated to contain about 0.01 mg of atenolol per mL.

Procedure—Proceed as directed in the *Assay*, except to inject the *Test solution* instead of the *Assay preparation.* Calculate the quantity, in mg, of $C_{14}H_{22}N_2O_3$ dissolved by the formula:

$$900CD(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Atenolol RS in the *Standard solution; D* is the dilution factor involved in preparing the *Test solution;* and r_U and r_S are the atenolol peak areas obtained from the *Test solution* and the *Standard solution*, respectively.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{14}H_{22}N_2O_3$ is dissolved in 30 minutes.

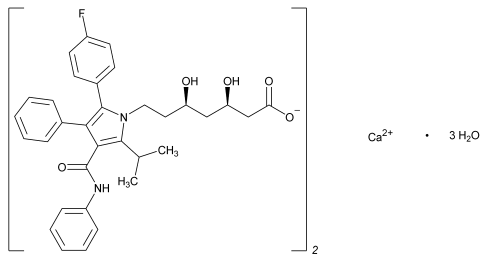
BRIEFING

Atorvastatin Calcium. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods of analysis, is proposed. The liquid chromatographic procedures in the tests for *Related compounds* and the *Assay* are based on analyses performed with the Zorbax Rx-C8 brand of L7 column. The typical retention time for the atorvastatin peak is 26–34 minutes. The liquid chromatographic procedure in the test for *Enantiomeric purity* is based on analyses performed with the Daicel Chiralpak AD brand of L51 column. The typical retention time for the atorvastatin peak is about 44 minutes.

(MD-GRE: E. Gonikberg) RTS—C53875

Add the following:

▲Atorvastatin Calcium



$C_{66}H_{68}CaF_2N_4O_{10} \cdot 3H_2O$ 1209.42

1*H*-Pyrrole-1-heptanoic acid, 2-(4-fluorophenyl)-β,δ-dihydroxy-5-(1-methylethyl)-3-phenyl-4-[(phenylamino)carbonyl]-, calcium salt (2 : 1), trihydrate [*R*-(*R**,*R**)]-.

Calcium (β*R*,δ*R*)-2-(*p*-fluorophenyl)-β,δ-dihydroxy-5-isopropyl-3-phenyl-4-(phenylcarbamoyl)pyrrole-1-heptanoate (1 : 2), trihydrate [*344423-98-9*].

Anhydrous 1155.34 [*134523-03-8*].

» Atorvastatin Calcium contains not less than 98.0 percent and not more than 102.0 percent of $C_{66}H_{68}CaF_2N_4O_{10}$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers, and store at room temperature.

In-Process Revision

USP Reference standards ⟨11⟩—*USP Atorvastatin Calcium RS. USP Atorvastatin Related Compound A RS. USP Atorvastatin Related Compound B RS. USP Atorvastatin Related Compound C RS. USP Atorvastatin Related Compound D RS. USP Atorvastatin Related Compound E RS.*

Identification—*Infrared Absorption* ⟨197K⟩.

Water, *Method Ia* ⟨921⟩**:** not less than 3.5% and not more than 5.5%.

Heavy metals, *Method II* ⟨231⟩**:** not more than 20 ppm.

Related compounds—

Diluent, 0.05 M Ammonium acetate buffer, Solution A, Solution B, Mobile phase, System suitability solution, and *Standard preparation*—Prepare as directed in the *Assay.*

Standard solution—Transfer accurately weighed amounts of USP Atorvastatin Related Compound A RS, USP Atorvastatin Related Compound B RS, USP Atorvastatin Related Compound C RS, and USP Atorvastatin Related Compound D RS to a suitable volumetric flask. Dissolve in and dilute with *Diluent* to volume to obtain a solution having known concentrations of about 0.0015 mg per mL of each component.

Test solution—Transfer about 50 mg of Atorvastatin Calcium, accurately weighed, to a 50-mL volumetric flask, dissolve in *Diluent,* using sonication if necessary, and mix well.

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay.* In addition, chromatograph the *Standard solution,* and identify the components based on their relative retention times given in *Table 1*.

Table 1

Name	Relative Retention Time	Limit (%)
Atorvastatin related compound A[1]	0.8	0.3
Atorvastatin related compound B[2]	0.9	0.3
Atorvastatin	1.0	n/a
Atorvastatin related compound C[3]	1.2	0.3
Atorvastatin related compound D[4]	2.1	0.1
Any other individual impurity	—	0.1
Total impurities[5]	—	1.0

[1] Desfluoro impurity, or (3*R,5R*)-7-[3-(phenylcarbamoyl)-2-isopropyl-4,5-diphenyl-1*H*-pyrrol-1-yl]-3,5-dihydroxyheptanoic acid.
[2] 3*S,5R* isomer, or (3*S,5R*)-7-[3-(phenylcarbamoyl)-5-(4-fluorophenyl)-2-isopropyl-4-phenyl-1*H*-pyrrol-1-yl]-3,5-dihydroxyheptanoic acid.
[3] Difluoro impurity, or (3*R,5R*)-7-[3-(phenylcarbamoyl)-4,5-bis(4-fluorophenyl)-2-isopropyl-1*H*-pyrrol-1-yl]-3,5-dihydroxyheptanoic acid.
[4] Oxirane impurity, or 3-(4-fluorobenzoyl)-2-isobutyryl-3-phenyloxirane-2-carboxylic acid phenylamide.
[5] Not including atorvastatin related compound E.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each of atorvastatin related compounds A, B, C, and D in the portion of Atorvastatin Calcium taken by the formula:

$$100\ (C_S / C_U)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of the relevant atorvastatin related compound in the *Standard solution;* C_U is the concentration, in mg per mL, of Atorvastatin Calcium in the *Test solution;* and r_U and r_S are the peak responses of the relevant atorvastatin related compound obtained from the *Test solution* and the *Standard solution,* respectively. Calculate the percentage of any other individual impurity in the portion of Atorvastatin Calcium taken by the formula:

$$100\ (r_i / r_s)$$

in which r_i is the peak response of any other individual impurity, and r_s is the sum of the responses of all the peaks in the *Test solution.* Disregard any peak observed in the blank. The reporting level for impurities is 0.05%.

Enantiomeric purity—

Mobile phase—Prepare a mixture of hexane, dehydrated alcohol, and trifluoroacetic acid (940 : 60 : 1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Resolution solution—Prepare a solution in methanol containing about 5 mg per mL of USP Atorvastatin Calcium RS and 37.5 µg per mL of USP Atorvastatin Related Compound E RS. Transfer 2.0 mL of this solution to a 10-mL volumetric flask, add 2.0 mL of dehydrated alcohol, and dilute with hexane to volume. [NOTE—Atorvastatin related compound E is the 3*S,5S* enantiomer of atorvastatin.]

Test solution—Transfer about 10 mg of Atorvastatin Calcium to a 10-mL volumetric flask, dissolve in 2.0 mL of methanol, add 2.0 mL of dehydrated alcohol, and dilute with hexane to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 244-nm detector and a 4.6-mm × 25-cm column that contains packing L51. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the elution order is atorvastatin related compound E followed by the atorvastatin peak; and the resolution, *R*, between the peaks is not less than 2.0.

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of atorvastatin related compound E in the portion of Atorvastatin Calcium taken by the formula:

$$100\,(r_U / r_s)$$

in which r_U is the peak response for atorvastatin related compound E, and r_s is the sum of the peak responses for atorvastatin related compound E and atorvastatin: not more than 0.3% of atorvastatin related compound E is found.

Assay—

Diluent—Use *N,N*-dimethylformamide.

0.05 M Ammonium acetate buffer—Prepare a solution in water containing 3.9 g of ammonium acetate per L, adjusted with glacial acetic acid to a pH of 5.0 ± 0.1.

Solution A—Prepare a mixture of *0.05 M Ammonium acetate buffer,* acetonitrile, and stabilizer-free tetrahydrofuran (67 : 21 : 12).

Solution B—Prepare a mixture of acetonitrile, *0.05 M Ammonium acetate buffer*, and stabilizer-free tetrahydrofuran (61 : 27 : 12).

Mobile phase—Use variable mixtures of *Solution A* and *Solution B*, as directed for *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Prepare a solution in *Diluent* containing about 0.05 mg per mL of USP Atorvastatin Calcium RS and about 0.06 mg per mL of USP Atorvastatin Related Compound B RS.

Standard preparation—Transfer an accurately weighed amount of USP Atorvastatin Calcium RS to a suitable volumetric flask. Dissolve in and dilute with *Diluent* to volume, using sonication if necessary, to obtain a solution having a known concentration of about 0.4 mg per mL.

Assay preparation—Transfer about 40 mg of Atorvastatin Calcium, accurately weighed, to a 100-mL volumetric flask. Dissolve in *Diluent,* using sonication if necessary, and mix well.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 244-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing

L7. The flow rate is about 1.5 mL per minute, and the column temperature is maintained at 35°. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–40	100	0	isocratic
40–70	100→20	0→80	linear gradient
70–85	20→0	80→100	linear gradient
85–100	0	100	isocratic
100–105	0→100	100→0	linear gradient
105–115	100	0	re-equilibration

Chromatograph the *System suitability solution,* and record the peak responses as directed for *Procedure:* the resolution, *R,* between the peaks for atorvastatin related compound B and atorvastatin is not less than 1.5. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the tailing factor is not more than 1.6, and the relative standard deviation for replicate injections is not more than 0.6%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{66}H_{68}CaF_2N_4O_{10}$ in the portion of Atorvastatin Calcium taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which C_S and C_U are the concentrations, in mg per mL, of atorvastatin calcium in the *Standard preparation* and the *Assay preparation,* respectively; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.

Content of calcium—

Diluent—Prepare a mixture of methanol, water, and hydrochloric acid (75 : 25 : 2).

Calcium standard stock solution—Quantitatively dilute with *Diluent* a suitable amount of a commercially prepared atomic absorption standard solution for calcium to obtain a solution containing 100 µg of calcium per mL.

Standard solutions—Transfer 1.0 and 3.0 mL of *Calcium standard stock solution* to separate 100-mL volumetric flasks, and dilute with *Diluent* to volume. These *Standard solutions* contain 1 and 3 µg of calcium per mL, respectively.

Blank solution—Use *Diluent.*

Test solution—Transfer about 5.0 mg of Atorvastatin Calcium, accurately weighed, to a 100-mL volumetric flask, and dissolve in and dilute with *Diluent* to volume.

Procedure—Concomitantly determine the absorbances of the *Standard solution,* the *Blank solution,* and the *Test solution* at the calcium emission line at 422.7 nm with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩), using an air–acetylene flame. Determine the concentration, C_S, in µg per mL, of calcium in the *Test solution*, using the calibration graph. Calculate the percentage of calcium in the portion of Atorvastatin Calcium taken by the formula:

$$100(0.001\, C_S / C_U)$$

where C_S is as defined above; the multiplier of 0.001 is for conversion of µg per mL to mg per mL; and C_U is the concentration, in mg per mL, of atorvastatin calcium in the *Test solution,* corrected for the *Water* content, as determined in the test for *Water.* The calcium content, calculated on the anhydrous basis, is between 3.2% and 3.8%.▲*USP33*

BRIEFING

Benzoin, *USP 31* page 1506. On the basis of comments received, it is proposed to revise the *Botanic characteristics* section for safety consideration. It is also proposed to delete *Identification* test *C* because it requires odor sensing, which is again a safety issue. The General Chapter reference is added to *Identification* test *B* for clarification.

(MD-OOD: F. Mao) RTS—C68574

Change to read:

Botanic characteristics—

Sumatra Benzoin—Blocks or lumps of varying size, made up of tears, compacted together, with a reddish brown, reddish gray, or grayish brown resinous mass. The tears are externally yellowish or rusty brown, milky white on fresh fracture; hard and brittle at ordinary temperatures but softened by heat. ~~and becoming gritty on chewing~~

▲▲*USP33*

Siam Benzoin—Pebble-like tears of variable size and shape, compressed, yellowish brown to rusty brown externally, milky white on fracture, separate or very slightly agglutinated, hard and brittle at ordinary temperatures but softened by heat. ~~and becoming plastic on chewing~~

▲▲*USP33*

Change to read:

Identification—

A: A solution in alcohol becomes milky upon the addition of water, and the mixture is acid to litmus paper.

B:

▲*Identification of articles of botanical origin* ⟨563⟩—▲*USP33*

Heat a few fragments in a test tube: Sumatra Benzoin evolves a sublimate consisting of plates and small, rod-like crystals of cinnamic acid and its esters that strongly polarize light. Siam Benzoin evolves a sublimate directly above the melted mass, consisting of numerous long, rod-shaped crystals of benzoic acid that do not strongly polarize light.

~~**C:** Heat about 500 mg in a test tube with 10 mL of potassium permanganate TS: only the Sumatra variety develops a faint odor of benzaldehyde.~~

▲▲*USP33*

BRIEFING

Bupropion Hydrochloride Extended-Release Tablets, *USP 31* page 1573, page 3623 of the *First Supplement,* page 1123 of the *Interim Revision Announcement* in *PF* 34(5), and page 570 of *PF* 34(3) [May–June 2008]. It is proposed to add a *Dissolution Test 8* for a product recently approved by FDA. In the absence of negative comments, it is proposed to implement this revision through an *Interim Revision Announcement* pertaining to *USP 32–NF 27*, with an official date of June 1, 2009.

Dissolution ⟨711⟩—

FOR PRODUCTS LABELED FOR DOSING EVERY 12 HOURS—

TEST 1—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Times: 1, 4, and 8 hours.

Procedure—Determine the amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 298 nm, using a 1.0-cm cell, on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Bupropion Hydrochloride RS in the same *Medium.*

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 25% and 45%
4	between 60% and 85%
8	not less than 80%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2.*

Medium: 0.1 N hydrochloric acid, pH 1.5 (prepared by transferring about 50 mL of concentrated hydrochloric acid to 6000 mL of water, adding about 18 g of sodium hydroxide, mixing, and adjusting with either diluted sodium hydroxide or hydrochloric acid to a pH of 1.5 ± 0.05); 900 mL, deaerated.

Apparatus 1: 50 rpm.

Times: 1, 2, 4, and 6 hours.

Determine the percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved by employing the following method.

Buffer solution—Dissolve 3.45 g of sodium phosphate monobasic monohydrate in 996 mL of water, add 4.0 mL of triethylamine, and mix. Adjust with phosphoric acid to a pH of 2.80 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Bupropion Hydrochloride RS in *Medium,* and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration similar to the one expected in the *Test solution.*

Test solution—Use portions of the solution under test, and pass through a 0.45-µm nylon filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 298-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

In-Process Revision

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of bupropion hydrochloride dissolved at each time point.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 25% and 50%
2	between 40% and 65%
4	between 65% and 90%
6	not less than 80%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium, Apparatus, and *Procedure*—Proceed as directed for *Test 1,* except using the wavelength of about 250 nm.

Times: 1, 2, 4, and 6 hours.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 30% and 55%
2	between 50% and 75%
4	between 70% and 90%
6	not less than 80%

TEST 5—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.

Medium and *Procedure*—Proceed as directed for *Test 1*.

Apparatus—Proceed as directed for *Test 1,* except to use a 0.5-cm cell.

Times: 1, 3, and 6 hours.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 35% and 55%
3	between 65% and 85%
6	not less than 80%

•TEST 7—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 7*.

Medium, Apparatus 1, and *Times*—Proceed as directed for *Test 2,* including the quantitative chromatographic method, but using as the *Mobile phase* a mixture of *Buffer solution* with methanol (55 : 45).

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 25% and 50%
2	between 45% and 70%
4	not less than 70%
6	not less than 80%

•5

FOR PRODUCTS LABELED FOR DOSING EVERY 24 HOURS—

TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

Medium: 0.1 N hydrochloric acid; 900 mL, deaerated.

Apparatus 1: 75 rpm.

Time: 2, 4, 8, and 16 hours.

Procedure—Determine the amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 252 nm, using a 1.0-mm cell, on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Bupropion Hydrochloride RS in the same *Medium.*

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
2	not more than 20%
4	between 20% and 45%
8	between 65% and 90%
16	not less than 80%

•TEST 6—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 6*.

Medium and *Apparatus:* Proceed as directed for *Test 4*.

Times: 1, 2, 4, 8, and 12 hours.

Procedure—Determine the amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 298 nm, using a 1.0-cm cell, on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Bupropion Hydrochloride RS in the same *Medium.*

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 15% and 35%
2	between 25% and 50%
4	between 40% and 65%
8	between 65% and 90%
12	not less than 80%

•6

•TEST 8—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 8*.

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 1: 75 rpm.

Times: 2, 4, 8, and 16 hours.

Standard solution—

FOR TABLETS LABELED TO CONTAIN 150 MG—Prepare a solution containing about 0.1667 mg of USP Buproprion Hydrochloride RS per mL in *Medium*.

FOR TABLETS LABELED TO CONTAIN 300 MG—Prepare a solution containing about 0.3333 mg of USP Bupropion Hydrochloride RS per mL in *Medium*.

Test solution—Pass a portion of the solution under test through a suitable filter having a porosity of 0.45 µm.

Procedure—Determine the percentage of bupropion hydrochloride dissolved by employing UV absorption at the wavelength of maximum absorbance at about 298 nm on portions of the *Test solution* in comparison with the *Standard solution*, using *Medium* as the blank.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
2	not more than 10%
4	between 10% and 35%
8	between 45% and 75%
16	not less than 80%

•[3]

Change to read:

Related compounds—

Solution A, Solution B, Mobile phase, System suitability solution 1, System suitability solution 2, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay preparation.*

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100(C/D)F(r_i / r_S)$$

in which C is the concentration, in mg per mL, of bupropion hydrochloride in the *Standard solution; F* is the relative response factor for each impurity (see the accompanying table); D is the concentration, in mg per mL, of bupropion hydrochloride in the *Test solution,* based on the number of Tablets taken, the labeled quantity per Tablet, and the extent of dilution; r_i is the peak response for each impurity obtained from the *Test solution;* and r_S is the peak response for bupropion hydrochloride obtained from the *Standard solution.* See the accompanying table for limits of individual impurities based upon Tablet strength.

BRIEFING

Capecitabine Tablets, *USP 31* page 1621. It is proposed to change the wavelength used in the quantitative step of the test for *Dissolution* from 325 nm to 304 nm, where the maximum absorbance occurs, for both Tablet strengths.

(BPC: M. Marques) RTS—C60525

Change to read:

Dissolution ⟨711⟩—

Medium: water; 900 mL, degassed.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Standard solution—For Tablets labeled to contain 150 mg: Transfer 17 mg, accurately weighed, of USP Capecitabine RS to a 100-mL volumetric flask, dissolve in and dilute with *Medium* to volume, and mix. For Tablets labeled to contain 500 mg: Transfer 28 mg, accurately weighed, of USP Capecitabine RS to a 50-mL volumetric flask, dissolve in and dilute with *Medium* to volume, and mix.

Test solution—Pass a portion of the solution under test through a 0.45-µm fiberglass filter.

Procedure—Determine the amount of capecitabine ($C_{15}H_{22}FN_3O_6$) dissolved by employing UV absorption at the wavelength of maximum absorbance at about 304 nm ~~(for Tablets labeled to contain 150 mg) and at about 325 nm (for Tablets labeled to contain 500 mg)~~

▲▲*USP33*

on portions of the *Test solution*, suitably diluted with *Medium*, if necessary, in comparison with the appropriate *Standard solution*, using a 1-mm quartz cell. Calculate the amount, in percentage, of $C_{15}H_{22}FN_3O_6$ dissolved by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times LC}$$

in which A_U and A_S are the absorbances obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of capecitabine ($C_{15}H_{22}FN_3O_6$) in the *Standard solution;* 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the Tablet label claim, in mg.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{15}H_{22}FN_3O_6$ is dissolved in 30 minutes.

Compound	Relative Retention Time	*F*	Limit (%) 100 mg or less	Limit (%) 150 mg or greater

BRIEFING

Carbidopa, *USP 31* page 1635. It is proposed to specify the type of aluminium chloride to be used in the test for *Specific rotation*.

(HDQ: M. Marques) RTS—C70304

Change to read:

Specific rotation ⟨781S⟩**:** between –21.0° and –23.5°, calculated as the monohydrate.

Test solution: 10 mg per mL, in aluminum chloride solution (2 in 3,

▲prepared using the hexahydrate form of the aluminium salt)▲*USP33*
that has been filtered and then adjusted with 0.25 N sodium hydroxide to a pH of 1.5.

BRIEFING

Clarithromycin Tablets, *USP 31* page 1788. It is proposed to clarify how to prepare the *0.1 M Sodium acetate buffer* used in the *Dissolution* test.

(HDQ: M. Marques) RTS—C70388

Change to read:

Dissolution ⟨711⟩—

0.1 M Sodium acetate buffer— ~~Transfer 13.61 g of sodium acetate trihydrate to a 1-L volumetric flask, add water to dissolve, dilute with water to volume, and mix. Adjust with 0.1 M acetic acid to a pH of 5.0.~~

▲Transfer 13.61 g of sodium acetate trihydrate to a 1-L volumetric flask, and dissolve in and dilute with water to volume. Transfer 5.7 mL of glacial acetic acid to another 1-L volumetric flask, and dilute with water to volume. Combine the two solutions to obtain a pH of 5.0 (the proportion is almost 1 : 1).▲*USP33*

Medium: 0.1 M Sodium acetate buffer; 900 mL.
Apparatus 2: 50 rpm.
Time: 30 minutes.
Procedure—Determine the amount of clarithromycin ($C_{38}H_{69}NO_{13}$) dissolved in the *Medium,* as directed in the *Assay,* using instead of the *Assay preparation* a filtered portion of the solution under test quantitatively diluted with *Mobile phase* to yield a test solution containing about 125 µg of clarithromycin per mL. Calculate the quantity, in mg, of clarithromycin dissolved by the formula:

$$900(CD)(r_U/r_S)$$

in which D is the appropriate dilution factor used to prepare the test solution, and the other terms are as defined therein.
Tolerances—Not less than 80% *(Q)* of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$) is dissolved in 30 minutes.

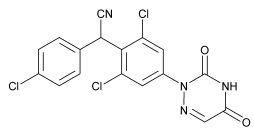
BRIEFING

Diclazuril. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed. The test for *Chromatographic purity* is an HPLC procedure based upon analyses performed with a Hypersil BDS brand of L1 column. The typical retention time is about 14 minutes for diclazuril. Interested parties are invited to submit comments.

(VET: I. DeVeau; T. Sigambris) RTS—C59275

Add the following:

▲Diclazuril



$C_{17}H_9Cl_3N_4O_2$ 407.64

Benzeneacetonitrile, 2,6-dichloro-α-(4-chlorophenyl)-4-(4,5-dihydro-3,5-dioxo-1,2,4-triazin-2(3*H*)-yl)-.

(*p*-Chlorophenyl)[2,6-dichloro-4-(4,5-dihydro-3,5-dioxo-*as*-triazin-2(3*H*)-yl)phenyl]acetonitrile [*101831-37-2*].

» Diclazuril contains not less than 97.0 percent and not more than 101.0 percent of $C_{17}H_9Cl_3N_4O_2$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers, and store at room temperature.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards ⟨11⟩—*USP Diclazuril RS. USP Diclazuril System Suitability Mixture RS.*

Identification—

Infrared Absorption ⟨197K⟩.

In-Process Revision

Loss on drying ⟨731⟩—Dry it at between 100° and 105° under vacuum for 4 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.1%.

Chromatographic purity—

Ammonium formate solution, Solution A, Solution B, Mobile phase, System suitability solution, and *Chromatographic system*—Proceed as directed in the *Assay.*

Standard solution—Prepare as directed for the *Standard preparation* in the *Assay.*

Test solution—Use the *Assay preparation.*

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the area percentage of each impurity, relative to diclazuril, in the portion of Diclazuril taken using the relative response factors (*F*) from *Table 1* below, and by the formula:

$$100(1/F)(C_S/C_U)(r_U/r_S)$$

in which F is the relative response factor; C_S is the concentration, in mg per mL, of diclazuril in the *Standard solution*; C_U is the concentration, in mg per mL, of diclazuril in the *Test solution;* r_U is the peak response for each impurity obtained from the *Test solution;* and r_S is the response of the diclazuril peak in the *Standard solution:* in addition to not exceeding the limits in *Table 1,* not more than 1.5% of total impurities is found. Disregard any peak observed in the blank. The reporting level for impurities is 0.05%.

Residual solvents—⟨467⟩**:** not more than 4000 ppm of *N*,*N*-dimethylformamide is found.

Assay—

Ammonium formate solution—Dissolve 6.3 g of ammonium formate in 800 mL of water, adjust with anhydrous formic acid to a pH of 4.0, add 200 mL of water, and mix.

Solution A—Prepare a mixture of water, acetonitrile, and *Ammonium formate solution* (75 : 15 : 10).

Solution B—Prepare a mixture of acetonitrile, *Ammonium formate solution,* and water (85 : 10 : 5).

Table 1

Name	Relative Retention Time	Relative Response Factor (*F*)	Limit (%)
6-Carboxylic acid[1]	0.62	0.85	0.50
6-Carboxamide[2]	0.80	0.92	0.50
Diclazuril	1.00	—	—
Ketone[3]	1.03	0.52	0.10

[5] 2-[3,5-Dichloro-4-(4-chlorobenzyl)phenyl]-1,2,4-triazine-3,5(2*H*,4*H*)-dione.
[6] (*RS*)-2-(4-Chlorophenyl)-2-(2,6-dichlorophenyl)acetonitrile.

In-Process Revision

Mobile phase—Use variable filtered and degassed mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

System suitability solution—Prepare a solution in dimethylformamide containing about 0.5 mg per mL of USP Diclazuril System Suitability Mixture RS.

Standard preparation—Dissolve an accurately weighed quantity of USP Diclazuril RS in dimethylformamide to obtain a solution having a concentration of about 0.5 mg per mL.

Assay preparation—Dissolve an accurately weighed quantity of Diclazuril in dimethylformamide to obtain a solution having a known concentration of about 0.5 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 10-cm column that contains base-deactivated 3-µm packing L1. It is maintained at a constant temperature of about 35° C. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–20	100→0	0→100	linear gradient
20–25	0	100	isocratic
25–26	0→100	100→0	linear gradient
26–36	100	0	re-equilibrate

Chromatograph the *System suitability solution,* identify the compounds, and record the peak responses as directed for *Procedure*: the resolution, *R,* between diclazuril and diclazuril ketone is not less than 1.9. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure*: the tailing factor for the diclazuril peak is not more than 1.4, and the relative standard deviation for replicate injections for the diclazuril peak is not more than 2.0%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak area responses. Calculate the percentage of $C_{17}H_9Cl_3N_4O_2$ in the portion of diclazuril taken by the formula:

$$100(C_S/C_U)(r_U/r_S)$$

in which C_S and C_U are the concentrations, in mg per mL, of diclazuril in the *Standard preparation* and the *Assay preparation,* respectively; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP33*

BRIEFING

Megestrol Acetate Oral Suspension, *USP 31* page 2604. It is proposed to include the possibility of diluting both the *Standard solution* and *Test solution* in *Dissolution Test 1*, in order to be within the linearity range of the spectrophotometer.

(BPC: M. Marques) RTS—C70306

Change to read:

Dissolution ⟨711⟩—

TEST 1—
Medium: 0.5% sodium lauryl sulfate in water; 900 mL.
Apparatus 2: 25 rpm.
Time: 30 minutes.
Standard solution—Transfer about 45 mg, accurately weighed, of USP Megestrol Acetate RS to a 250-mL volumetric flask, add about 12 mL of methanol, and place the flask in a warm water bath until the solid is dissolved. Dilute with *Medium* to volume. The final concentration is about 180 µg of megestrol acetate per mL.

▲Dilute with *Medium*, if necessary.▲*USP33*
Procedure—Transfer to the surface of the *Medium* in the dissolution vessel an accurately measured volume of Oral Suspension, freshly mixed and free from air bubbles, equivalent to about 160 mg of megestrol acetate. Determine the amount of $C_{24}H_{32}O_4$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 292 nm on filtered portions of the solution under test,

▲diluted with *Medium*, if necessary,▲*USP33*
in comparison with the *Standard solution.* Calculate the percentage of megestrol acetate ($C_{24}H_{32}O_4$) released by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times V \times LC}$$

in which A_U and A_S are the absorbances obtained from the solution under test and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution; V* is the sample volume, in mL, of Oral Suspension taken; 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the label claim, in mg per mL.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{24}H_{32}O_4$ is dissolved in 30 minutes.

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: 0.5% sodium lauryl sulfate in water; 900 mL.

Apparatus 2: 25 rpm.

Time: 30 minutes.

Standard solution—Transfer about 45 mg, accurately weighed, of USP Megestrol Acetate RS to a 250-mL volumetric flask. Add about 5 mL of methanol, and mix. Dilute with *Medium* to volume. Transfer 10 mL of this solution to a 100-mL volumetric flask, and dilute with *Medium* to volume. The final concentration is about 18 µg per mL.

Test solution—[NOTE—Use a separate syringe for each vessel.] Withdraw more than 10 mL of the Oral Suspension, using a 10-mL syringe with a long cannula. Remove air bubbles from the syringe. Adjust the volume to the 10-mL mark on the syringe, and remove the needle. Wipe the tip of the syringe, and accurately weigh (gross weight). Operate the apparatus, and rapidly dispense the Oral Suspension to the side of the vessel at about halfway from the bottom. Similarly dispense the Oral Suspension into other vessels. Accurately weigh each syringe after dispensing the sample (tare weight). Record sample weights. After completion of the dissolution, pass an aliquot through a nylon filter having a 0.45-µm porosity, and dilute 2.0 mL of the filtrate with *Medium* to 50.0 mL to obtain a solution having a theoretical concentration of about 18 µg per mL.

Procedure—Determine the amount of $C_{24}H_{32}O_4$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 292 nm, using 0.5-cm pathlength cuvettes, on the *Test solution* in comparison with the *Standard solution*. Calculate the percentage of megestrol acetate ($C_{24}H_{32}O_4$) released by the formula:

$$\frac{A_U \times C_S \times 900 \times d \times 100}{A_S \times W_U \times LC}$$

in which A_U and A_S are the absorbances obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution; d* is the density, in mg per mL, of the Oral Suspension obtained by dividing the weight of Oral Suspension taken by 10 mL; W_U is the weight, in mg, of Oral Suspension taken; 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the label claim, in mg per mL.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{24}H_{32}O_4$ is dissolved in 30 minutes.

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium: 0.5% sodium lauryl sulfate in degassed water; 900 mL. Use ultrapure sodium lauryl sulfate with an assay content of not less than 99.0%.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Determine the amount of $C_{24}H_{32}O_4$ dissolved by employing the following method.

Mobile phase—Proceed as directed in the *Assay.*

Standard solution—Transfer about 11.5 mg, accurately weighed, of USP Megestrol Acetate RS to a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.

Test solution—Proceed as directed for *Test 2,* introducing the sample into the vessel over a 10- to 15-second period (about 1 mL per second).

Chromatographic system (see *Chromatography* ⟨621⟩)—Proceed as directed in the *Assay.*

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of megestrol acetate ($C_{24}H_{32}O_4$) released by the formula:

$$\frac{r_U \times C_S \times 900 \times d \times 100}{r_S \times W_U \times LC}$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively; C_S is the concentration, in mg per mL, of the *Standard solution; d* is the density, in mg per mL, of the Oral Suspension obtained by dividing the weight of Oral Suspension taken by 10 mL; W_U is the weight, in mg, of Oral Suspension taken; 900 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and *LC* is the label claim, in mg per mL.

Tolerances—Not less than 80% *(Q)* of the labeled amount of $C_{24}H_{32}O_4$ is dissolved in 30 minutes.

BRIEFING

Metformin Hydrochloride Extended-Release Tablets, *USP 31* page 2642, and *Interim Revision Announcement* on page 1403 of *PF* 34(6). It is proposed to include a more generic description of the filters used in *Dissolution Tests 4* and *5*.

Change to read:

Dissolution ⟨711⟩—

TEST 1—

Medium: pH 6.8 phosphate buffer prepared by dissolving 6.8 g of monobasic potassium phosphate in 1000 mL of water and adjusting with 0.2 N sodium hydroxide to a pH of 6.8 ± 0.1; 1000 mL.

Apparatus 2: 100 rpm, for Tablets labeled to contain 500 mg.

Apparatus 1: 100 rpm, for Tablets labeled to contain 750 mg.

Times: 1, 3, and 10 hours.

Procedure—Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 232 nm on portions of the solution under test passed through a 0.45-µm hydrophilic polyethylene filter, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), in percentage, released at each time point by the formula:

$$\frac{[C \times (A_U / A_S) \times (V - V_S) + (C_{60} \times V_S) + (C_{180} \times V_S)] \times 100}{L}$$

in which C is the concentration, in mg per mL, of the Standard solution; A_U and A_S are the absorbances of the solution under test and the Standard solution, respectively; V is the initial volume, in mL, of *Medium* in the vessel; V_S is the volume, in mL, withdrawn from the vessel for previous samplings; C_{60} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 1 hour; C_{180} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 3 hours; 100 is the conversion factor to percentage; and L is the Tablet label claim, in mg.

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

In-Process Revision

Time (hours)	500-mg Tablet, Amount dissolved	750-mg Tablet, Amount dissolved
1	between 20% and 40%	between 22% and 42%
3	between 45% and 65%	between 49% and 69%
10	not less than 85%	not less than 85%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: Prepare as directed for *Medium* in *Test 1;* 1000 mL.

Apparatus 2: 100 rpm.

Times: 1, 2, 6, and 10 hours.

Procedure—Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 232 nm on portions of the solution under test passed through a 0.45-µm polyethylene filter, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the content of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), C_t, in mg per mL, in the *Medium* at each time point, *t,* by the formula:

$$\frac{A_U \times C_s \times D_U}{A_s}$$

in which A_U and A_S are the absorbances of the solution under test and the Standard solution, respectively; C_S is the concentration of metformin hydrochloride, in mg per mL, in the Standard solution; and D_U is the dilution factor of the solution under test. Calculate the percentage of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved at each time point by the following formulas:

Percentage dissolved at the first time point (1 hour):

$$\frac{C_1 \times 1000 \times 100}{L}$$

in which C_1 is the content of metformin hydrochloride, in mg per mL, in the *Medium* at the first time interval; 1000 is the volume, in mL, of *Medium;* 100 is the conversion factor to percentage; and L is the Tablet label claim, in mg.

Percentage dissolved at the second time point (2 hours):

$$\frac{C_2 \times (1000 - SV_1) + C_1 \times SV_1 \times 100}{L}$$

in which C_2 is the content of metformin hydrochloride, in mg per mL, in the *Medium* at the second time interval; 1000 is the volume, in mL, of *Medium;* SV_1 is the volume, in mL, of the sample withdrawn at 1 hour; C_1 is the content of metformin hydrochloride, in mg per mL, in the *Medium* at 1 hour; 100 is the conversion factor to percentage; and L is the Tablet label claim, in mg.

Percentage dissolved at the *n*th time point:

$$\frac{C_n \times [1000 - (n-1)SV] + (C_1 + C_2 + ... + C_{n-1}) \times SV \times 100}{L}$$

in which C_n is the content of metformin hydrochloride, in mg per mL, in the *Medium* at the *n*th time interval; *n* is the time interval of interest; *SV* is the volume, in mL, of sample withdrawn at each time interval; C_1, C_2, C_3, ... C_{n-1} is the content of metformin hydrochloride, in mg per mL, in the *Medium* at each time interval; 100 is the conversion factor to percentage; and L is the Tablet label claim, in mg.

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 20% and 40%
2	between 35% and 55%
6	between 65% and 85%
10	not less than 85%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium, Apparatus, and *Procedure*—Proceed as directed for *Test 1*.

Times: 1, 2, 5, and 12 hours for Tablets labeled to contain 500 mg; and 1, 3, and 10 hours for Tablets labeled to contain 750 mg.

Procedure—Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 232 nm on portions of the solution under test passed through a 0.45-µm hydrophilic polyethylene filter, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), in percentage, released at each time point by the formula:

$$\frac{[C \times (A_U / A_S) \times (V - V_S) + (C_{60} \times V_S) + (C_{120} \times V_S) + (C_{300} \times V_S)] \times 100}{L}$$

in which C is the concentration, in mg per mL, of the Standard solution; A_U and A_S are the absorbances of the solution under test and the Standard solution, respectively; V is the initial volume, in mL, of *Medium* in the vessel; V_S is the volume, in mL, withdrawn from the vessel for previous samplings; C_{60} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 1 hour; C_{120} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 2 hours; C_{300} is the concentration, in mg per mL, of metformin hydrochloride in the *Medium* determined at 5 hours; 100 is the conversion factor to percentage; and L is the Tablet label claim, in mg.

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

FOR TABLETS LABELED TO CONTAIN 500 MG:

Time (hours)	Amount dissolved
1	between 20% and 40%
2	between 35% and 55%
5	between 60% and 80%
12	not less than 85%

FOR TABLETS LABELED TO CONTAIN 750 MG:

Time (hours)	Amount dissolved
1	between 22% and 42%
3	between 49% and 69%
10	not less than 85%

TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4.*

Medium: Prepare as directed for *Medium* in *Test 1;* 1000 mL.

Apparatus 2: 100 rpm.

Times: 1, 3, 6, and 10 hours.

Procedure—Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 250 nm (shoulder) on portions of the solution under test passed through a ~~0.45-µm polyethylene filter,~~

▲suitable 0.45-µm filter,▲*USP33* suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the content of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), C_t, in mg per mL, in the *Medium* at each time point, *t,* by the formulas specified in *Test 2.*

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2.*

Time (hours)	Amount dissolved
1	between 20% and 40%
3	between 45% and 65%
6	between 65% and 85%
10	not less than 85%

TEST 5—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5.*

Medium: pH 6.8 phosphate buffer prepared by dissolving 6.8 g of monobasic potassium phosphate in 1000 mL of water and adjusting with 0.2 N sodium hydroxide to a pH of 6.8 ± 0.1; 900 mL, deaerated.

Apparatus 1: 100 rpm, with the vertical holder described below.

Times: 2, 8, and 16 hours.

Procedure—Place a vertical sample holder into each basket (see *Figures 1* and *2*). Place one Tablet inside the sample holder, making sure that the Tablets are vertical at the bottom of the baskets. Determine the amount of $C_4H_{11}N_5 \cdot HCl$ dissolved by UV absorption at the wavelength of maximum absorbance at about 250 nm on portions of the solution under test passed through a ~~0.45-µm polyethylene filter~~

▲suitable 0.45-µm filter,▲*USP33* suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Metformin Hydrochloride RS in the same *Medium*. Calculate the content of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), C_t, in mg per mL, in the *Medium* at each time point, *t,* by the formulas specified in *Test 2.*

Tolerances—The percentages of the labeled amount of $C_4H_{11}N_5 \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

In-Process Revision

BRIEFING

Mometasone Furoate Cream, *USP 31* page 2727. On the basis of comments received, it is proposed to (1) include the storage conditions in the *Packaging and storage* section, (2) add a test for *Related compounds,* and (3) replace the *Assay* procedure with an improved and validated method that provides better resolution and efficiency. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with a Supelcosil-ABZ PLUS brand of L60 column. The typical retention time for the mometasone furoate peak is about 35.2 minutes.

(MD-CCA: C. Anthony) RTS—C41345

Change to read:

Packaging and storage—Preserve in well-closed containers,

▲and store at controlled room temperature.▲*USP33*

Add the following:

▲**Related compounds—**[Note—Protect from light.]

Diluent A, Solution A, Solution B, and *Mobile phase*—Proceed as directed in the *Assay.*

Standard stock solution—Proceed as directed for *Standard stock preparation* in the *Assay.*

Diluent C—Prepare a solution consisting of a mixture of water, acetonitrile, and glacial acetic acid (70 : 30 : 1).

System suitability solution—Quantitatively transfer a quantity of *Standard stock solution* into a suitable container, and dilute quantitatively, and stepwise if necessary, with *Diluent C* to obtain a solution having a known concentration of about 0.1 µg per mL.

Blank solution: a mixture of 5.0 mL of *Diluent A* and 15.0 mL of *Diluent C.*

Test solution—Transfer an accurately weighed portion of Cream, equivalent to about 2.0 mg of mometasone furoate, to a 50-mL screw-capped centrifuge tube. Add 5.0 mL of *Diluent A* and a few glass beads, and mix on a vortex mixer. Add 15.0 mL of *Diluent C*, and mix. Centrifuge for 10 minutes. Pass the aqueous phase through a 0.2-µm polypropylene filter, discarding the first 1 to 2 mL of filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L60. The flow rate is about 2 mL per minute. The column temperature is maintained at 25 ± 5°. The chromatograph is programmed as directed in the *Assay.* Chromatograph the *System suitability solution,* and record the peak area responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 10%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Test solution* and the *Blank solution* into the chromatograph, record the chromatogram, and measure the peak area responses. Exclude any peak areas less than those obtained from the chromatogram of the *System suitability solution.* Also exclude any peaks with the same retention time as that observed in the chromatogram of the *Blank solution.* Any peaks having a relative retention time of about 1.04 or 1.13 are controlled in the *Mometasone Furoate* monograph, and therefore are not included in the total specified and unspecified impurities limit. Calculate the percentage of each impurity in the portion of Cream taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak area response for each impurity; and r_s is the sum of the area responses of all the peaks. The impurities meet the requirements specified in the table below.

Compound	Relative Retention Time	Limit (%)
9α-Chloro-11β,17,21-trihydroxy-16α-methylpregna-1,4-diene-3,20-dione 17-(2-furoate)	0.56	NMT 0.1
9α,21-Dichloro-11β,17-dihydroxy-16α-methylpregna-1,4-diene-3,20-dione	0.73	NMT 0.1
21-Chloro-17-hydroxy-16α-methylpregna-1,4-diene-3,11,20-trione 17-(2-furoate)	0.88	NMT 0.1

In-Process Revision

Assay—

~~*Mobile phase*~~ ~~Proceed as directed under the *Assay* for *Mometasone Furoate*.~~

~~*Internal standard solution*~~ ~~Dissolve a suitable quantity of beclomethasone dipropionate in acetonitrile to obtain a solution containing about 0.53 mg per mL.~~

~~*Standard preparation*~~ ~~Dissolve an accurately weighed quantity of USP Mometasone Furoate RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 0.136 mg per mL. Pipet equal amounts of this solution and the *Internal standard solution*, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having known concentrations of about 0.027 mg of mometasone furoate and 0.106 mg of beclomethasone dipropionate per mL.~~

~~*Assay preparation*~~ ~~Transfer an accurately weighed portion of Cream, equivalent to about 2.0 mg of mometasone furoate, to a 50-mL screw-capped centrifuge tube. Pipet 15.0 mL of *Internal standard solution* and 15.0 mL of acetonitrile into the tube, and attach the cap. Heat in an 85° water bath until the cream completely melts, and shake by hand for 2 minutes. Repeat the heating and shaking. Place the tube in an ice-methanol bath for 10 minutes. Centrifuge to obtain a clear supernatant, and transfer 10.0 mL of the supernatant layer into a 25-mL volumetric flask. Dilute with acetonitrile to volume, and mix.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)~~ ~~Proceed as directed in the *Assay* under *Mometasone Furoate*.~~

~~*Procedure*~~ ~~Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of mometasone furoate ($C_{27}H_{30}Cl_2O_6$) in the portion of Cream taken by the formula:~~

$$75C(R_U/R_S)$$

~~in which *C* is the concentration, in mg per mL, of USP Mometasone Furoate RS in the *Standard preparation*, and R_U and R_S are the ratios of the mometasone furoate peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.~~

▲[Note—Protect from light.]

Diluent A—Prepare a solution of tetrahydrofuran and glacial acetic acid (100 : 1).

Diluent B—Prepare a solution of water, acetonitrile, and glacial acetic acid (50 : 50 : 1).

Solution A: water.

Solution B: acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Internal standard solution—Dissolve a suitable quantity of diethyl phthalate in acetonitrile to obtain a solution having a concentration of about 1.4 mg per mL.

Standard stock preparation—Dissolve an accurately weighed quantity of USP Mometasone Furoate RS, and dilute quantitatively, and stepwise if necessary, with *Diluent A* to obtain a solution having a known concentration of about 0.2 mg per mL.

Standard preparation—Pipet equal quantities of the *Standard stock preparation* and the *Internal standard solution,* and dilute quantitatively, and stepwise if necessary, with *Diluent B* to obtain a solution having a known concentration of about 0.05 mg per mL of mometasone furoate and 0.35 mg per mL of diethyl phthalate.

Assay preparation—Transfer an accurately weighed portion of Cream, equivalent to about 1.0 mg of mometasone furoate, to a 50-mL screw-capped centrifuge tube. Add 5.0 mL of *Diluent A* and a few glass beads, and mix on a vortex mixer. Add 5.0 mL of *Internal standard solution*, and mix. Add 10.0 mL of *Diluent B,* mix on a vortex mixer for 1 minute, and centrifuge for 10 minutes. Pass the aqueous phase through a 0.2-µm polypropylene filter, discarding the first 1–2 mL of filtrate.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L60. The flow rate is about 2 mL per minute. The chromatograph is programmed as follows.

In-Process Revision

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	70	30	equilibration
0–2.0	70	30	isocratic
2.0–45.0	70→45	30→55	linear gradient
45.0–46.0	45→70	55→30	linear gradient
46.0–50	70	30	isocratic

Chromatograph the *Standard preparation*, and record the peak area responses as directed for *Procedure:* the relative retention times are about 0.4 for diethyl phthalate and 1.0 for mometasone furoate; the tailing factor for the mometasone furoate peak is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the percentage of mometasone furoate ($C_{27}H_{30}Cl_2O_6$) in the portion of Cream taken by the formula:

$$100(C_S/C_U)(R_U/R_S)$$

in which C_S is the concentration, in mg per mL, of USP Mometasone Furoate RS in the *Standard preparation*; C_U is the concentration, in mg per mL, of mometasone furoate in the *Assay preparation* based on the label claim; and R_U and R_S are the ratios of the mometasone furoate peak response to the diethyl phthalate peak response obtained from the *Assay preparation* and *Standard preparation,* respectively.▲*USP33*

BRIEFING

Mometasone Furoate Ointment, *USP 31* page 2728. On the basis of comments received, it is proposed to (1) include the storage conditions in the *Packaging and storage* section, (2) add a test for *Related compounds,* and (3) replace the *Assay* procedure with an improved and validated method that provides better resolution and efficiency. The liquid chromatographic procedures in the test for *Related compounds* and in the *Assay* are based on analyses performed with a Supelcosil-ABZ PLUS brand of L60 column. The typical retention time for the mometasone furoate peak is about 35.2 minutes.

In-Process Revision

BRIEFING

Mycophenolate Mofetil, page 3852 of the *Second Supplement*. On the basis of comments received, it is proposed to make the following changes:

1. *Identification* test *B* is revised to replaced the UV method with an HPLC retention time agreement.
2. The test for *Melting range* is deleted, and the melting range information is given in the *Description and Solubility.*
3. In the test for *Related compounds*, the impurity limits are revised, and the disregard limit is added in accordance with the FDA approved specification. The acceptance criteria for the total specified impurities and the total unknown impurities are deleted to be consistent with ICH guidelines.
4. The relative standard deviation requirement for the replicate injections in the *Chromatographic system* under the *Assay* is revised to be consistent with the monograph sponsor's test method.
5. The *Procedure* in the *Assay* is revised to update the calculation formula.

Assay—

0.3% Triethylamine phosphate buffer—Add 4 mL of triethylamine to 1300 mL of water, and adjust with phosphoric acid to a pH of 5.3.

Mobile phase—Prepare a suitable mixture of *0.3% Triethylamine phosphate buffer* and acetonitrile (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Mycophenolate Mofetil RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 1.0 mg per mL.

Assay preparation—Transfer about 50 mg of mycophenolate mofetil, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 250-nm detector and a 4.6-mm × 15-cm column that contains packing L7. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 45°. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 8000 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than ~~1.0%~~

▲2.0%.▲*USP33*

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. ~~Calculate the quantity, in mg, of $C_{23}H_{31}NO_7$ in the portion of Mycophenolate Mofetil taken by the formula:~~

~~$$50C(r_U/r_S)$$~~

~~in which C is the concentration, in mg per mL, of USP Mycophenolate Mofetil RS in the *Standard preparation;* and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.~~

▲Calculate the percentage of $C_{23}H_{31}NO_7$ in the portion of Mycophenolate Mofetil taken by the formula:

$$100(C_S / C_U)(r_U/r_S)$$

in which C_S is the concentration, in mg per mL, of Mycophenolate Mofetil in the *Standard preparation;* C_U is the concentration of mycophenolate mofetil in the *Assay preparation; and* r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP33*

BRIEFING

Naratriptan Hydrochloride Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being proposed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 25-cm analytical column that contains 5-µm packing L11. USP has received data indicating that a Spheraclone Phenyl from Phenomenex is suitable. The typical retention time for naratriptan hydrochloride is about 9.7 minutes.

(CRX: R. Schnatz) RTS—C60109

Add the following:

▲Naratriptan Hydrochloride Oral Suspension

» Naratriptan Hydrochloride Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled content of naratriptan hydrochloride. Prepare Naratriptan Hydrochloride Oral Suspension 0.5 mg per mL as fol-

In-Process Revision

lows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Naratriptan Hydrochloride	50 mg
Vehicle: a mixture of Vehicle for Oral Solution, *NF,* (regular or sugar free), and Vehicle for Oral Suspension, *NF,* (1 : 1), a sufficient quantity to make	100 mL

Calculate the required quantity of each ingredient for the total amount to be prepared. If using Tablets, place the required number of Tablets in a suitable mortar, and comminute the Tablets to a fine powder or add Naratriptan Hydrochloride powder. Add the Vehicle in small portions and triturate to make a smooth paste. Add increasing volumes of the Vehicle to make a naratriptan suspension that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the Vehicle to bring to final volume, and mix well.

Packaging and storage—Package in tight, light-resistant containers. Store at controlled room temperature or controlled cold temperature.

Labeling—Label it to state that it is to be well-shaken before use and to state the beyond-use date.

USP Reference standards ⟨11⟩—*USP Naratriptan Hydrochloride RS.*

Beyond-use date: not later than 90 days after the date on which it was compounded, when stored at controlled cold temperature, and not later than 7 days after the date on which it was compounded, when stored at controlled room temperature.

pH ⟨791⟩**:** between 4.0 and 4.5.

Assay—

Mobile phase—Prepare a solution consisting of 12 mM triethylamine phosphate buffer and 2-propanol (90 : 9). Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Dissolve about 25 mg of USP Naratriptan Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask. Dilute with *Mobile phase* to obtain a concentration of 0.5 mg per mL.

Standard preparation—Pipet 1 mL of *Standard stock solution* to a 25-mL volumetric flask and dilute with *Mobile phase* to volume to obtain a concentration of 20 µg per mL, and pass through a 0.22-µm filter.

Assay preparation—Shake thoroughly by hand each bottle of Oral Suspension. Accurately pipet 0.4 mL to a 10-mL volumetric flask. Add 1 mL of 0.1 N sodium hydroxide solution by pipet, and sonicate for five minutes. Dilute with *Mobile phase* to volume to obtain a nominal concentration of 20 µg naratriptan hydrochloride per mL. Centrifuge, and pass the naratriptan hydrochloride solution through a 0.22-µm filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm analytical column that contains 5-µm packing L11. The flow rate is about 1.4 mL per minute. Chromatograph the 20 µg per mL *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 9.7 minutes, and the relative standard deviation for replicate injections is not more than 4.9%.

Procedure—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of naratriptan hydrochloride ($C_{17}H_{25}N_3O_2S \cdot HCl$) in the volume of Oral Suspension taken by the formula:

$$(r_U / r_S)(C_S / C_U) \times 100$$

in which r_U and r_S are the peak responses obtained from the *Assay preparation* and *Standard preparation,* respectively; C_S is the concentration of USP Naratriptan Hydrochloride RS, µg per mL, in the *Sample preparation* on the anhydrous basis; and C_U is the nominal concentration of naratriptan hydrochloride, in µg per mL, in the *Assay preparation*.▲*USP33*

BRIEFING

Terbinafine Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being proposed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 4.6-mm × 25-cm analytical column that contains 5-µm packing L1. USP has received data indicating that a Zorbax RX-C18 from Phenomenex is suitable. The typical retention time for terbinafine is about 5.1 minutes.

(CRX: R. Schnatz) RTS—C61617

Add the following:

▲Terbinafine Oral Suspension

» Terbinafine Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled content of terbinafine hydrochloride. Prepare Terbinafine Oral Suspension 25 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Terbinafine Hydrochloride	2500 mg
Vehicle: a mixture of Vehicle for Oral Solution, *NF,* and Vehicle for Oral Suspension, *NF* (1 : 1), a sufficient quantity to make	100 mL

Calculate the required quantity of each ingredient for the total amount to be prepared. If using tablets, place the required number of tablets in a suitable mortar, and comminute the tablets to a fine powder, or add terbinafine hydrochloride powder. Add the Vehicle in small portions, and triturate to make a smooth paste. Add increasing volumes of the Vehicle to make a terbinafine suspension that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the liquid Vehicle to bring to final volume, and mix well.

Packaging and storage—Package in tight, light-resistant containers. Store at controlled room temperature or controlled cold temperature.

Labeling—Label it to state that it is to be well-shaken before use, and to state the beyond-use date.

USP Reference standards ⟨11⟩—*USP Terbinafine Hydrochloride RS.*

Beyond-use date: not later than 30 days after the date on which it was compounded, when stored at controlled cold temperature or controlled room temperature.

pH ⟨791⟩**:** between 5.3 and 5.7.

Assay—

Mobile phase—The *Mobile phase* consists of acetonitrile and water (40 : 60), with 0.15% triethylamine and 0.15% phosphoric acid. Filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Dissolve about 25 mg of USP Terbinafine Hydrochloride RS, accurately weighed, to a 25-mL volumetric flask. Dilute with methanol to obtain a concentration of 1.0 mg per mL.

Standard preparation—Pipet 0.5 mL of the *Standard stock preparation* to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a concentration of 5 µg per mL, and pass through a 0.22-µm filter.

Assay preparation—Shake thoroughly by hand each bottle of Oral Suspension. Accurately pipet 1.0 mL to a 25-mL volumetric flask. Dilute with methanol to volume to obtain a nominal concentration of 1 mg of terbinafine hydrochloride per mL. Mix, and centrifuge the solution. Accurately pipet 0.5 mL of the supernatant to a 10-mL volumetric flask, and dilute with methanol to volume to obtain a nominal concentration of 50 µg of terbinafine hydrochloride per mL. Mix the sample

In-Process Revision

again. Accurately pipet 1 mL of the diluted terbinafine hydrochloride solution to a 10-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a nominal concentration of 5 µg of terbinafine hydrochloride per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 224-nm detector and a 4.6-mm × 15-cm analytical column that contains 3.5-µm packing L1. The flow rate is about 0.4 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 5.1 minutes, and the relative standard deviation for replicate injections is not more than 5.8%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of terbinafine hydrochloride ($C_{21}H_{25}N \cdot HCl$) in the volume of Oral Suspension taken by the formula:

$$(r_U / r_S)(C_S / C_U) \times 100$$

in which r_U and r_S are the peak responses obtained from the *Assay preparation* and *Standard preparation,* respectively; C_S is the concentration of USP Terbinafine Hydrochloride RS, in µg per mL, in the *Sample preparation* on the anhydrous basis; and C_U is nominal concentration of terbinafine hydrochloride, in µg per mL, in the *Assay preparation*.▲*USP33*

BRIEFING

Terbutaline Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being proposed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 3.9-mm × 30-cm analytical column that contains 10-µm microphenyl packing L11. USP has received data indicating that a Microphenyl from Waters Associates, Inc., is suitable. The typical retention time for terbutaline is about 5.0 minutes.

(CRX: R. Schnatz) RTS—C60263

Add the following:

▲Terbutaline Oral Suspension

» Terbutaline Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled content of terbutaline sulfate. Prepare Terbutaline Oral Suspension 1 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Terbutaline Sulfate	100 mg
Syrup, *NF,** a sufficient quantity to make	100 mL

Calculate the required quantity of each ingredient for the total amount to be prepared. If using Tablets, place the required number of Tablets in a suitable mortar, and comminute to a fine powder, or add terbutaline sulfate powder. Add the Syrup, *NF,* in small portions and triturate to make a smooth paste. Add increasing volumes of the Syrup, *NF,* to make a terbutaline suspension that is pourable. Transfer the contents of the mortar, stepwise and

* Syrup, *NF,* containing 0.2% sodium benzoate.

quantitatively, to a calibrated bottle. Add enough of the Syrup, *NF,* to bring to final volume, and mix well.

Packaging and storage—Package in tight, light-resistant containers. Store at controlled cold temperature.

Labeling—Label it to state that it is to be well-shaken before use and to state the beyond-use date.

USP Reference standards ⟨11⟩—*USP Terbutaline Sulfate RS.*

Beyond-use date: not later than 30 days after the date on which it was compounded, when stored at controlled cold temperature.

Assay—

Mobile phase—Prepare a solution of methanol and 20 mM monobasic potassium phosphate (8 : 92) adjusted with phosphoric acid to a pH of 3.6. Filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Dissolve an accurately weighed quantity of USP Terbutaline Sulfate RS in water to obtain a concentration of 5 mg per mL.

Standard preparation—Pipet 0.2 mL of the *Standard stock preparation* to a 100-mL volumetric flask, dilute with water to volume to obtain a concentration of 10 µg per mL, and pass through a 0.22-µm filter.

Assay preparation—Shake thoroughly by hand each bottle of Oral Suspension. Accurately pipet 1.0 mL to a 10-mL volumetric flask. Dilute with *Mobile phase* to volume to obtain a nominal concentration of 100 µg terbutaline sulfate per mL. Extract terbutaline sulfate from the suspension with methanol. Accurately pipet 1 mL of Oral Suspension and 3 mL of *Mobile phase* in the barrel of a 5-mL plastic syringe. Shake, and pass through a 0.22-µm filter into a 10-mL volumetric flask. Repeat the process with an additional 2 mL of methanol. Bring to final 10 mL volume with *Mobile phase* to obtain a nominal concentration of 10 µg terbutaline sulfate per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 278-nm detector and a 3.9-mm × 30-cm analytical column that contains 10-µm microphenyl packing L11. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 5.0 minutes, and the relative standard deviation for replicate injections is not more than 2.2%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of terbutaline sulfate $((C_{12}H_{19}NO_3)_2 \cdot H_2SO_4)$ in the volume of Oral Suspension taken by the formula:

$$(r_U / r_S)(C_S / C_U) \times 100$$

in which r_U and r_S are the peak responses obtained from the *Assay preparation* and *Standard preparation,* respectively; C_S is the concentration of USP Terbutaline Sulfate RS, µg per mL, in the *Sample preparation* on the anhydrous basis; and C_U is nominal concentration of terbutaline sulfate, in µg per mL, in the *Assay preparation.*▲*USP33*

BRIEFING

Tiagabine Hydrochloride Oral Suspension. Because there is no existing *USP* monograph for this dosage form, the following new monograph is being proposed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with a 3.0-mm × 15-cm analytical column that contains 5-µm packing L10. USP has received data indicating that a Zorbax CN from MAC-MOD Analytical, Inc., is suitable. The typical retention time for tiagabine is about 3.2 minutes.

(CRX: R. Schnatz) RTS—C60334

In-Process Revision

Add the following:

▲Tiagabine Hydrochloride Oral Suspension

»Tiagabine Hydrochloride Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled content of tiagabine hydrochloride. Prepare Tiagabine Hydrochloride Oral Suspension 1 mg per mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* ⟨795⟩):

Tiagabine Hydrochloride	100 mg
Vehicle: a mixture of Vehicle for Oral Solution, *NF,* and Vehicle for Oral Suspension, *NF* (1 : 1), a sufficient quantity to make	100 mL

Calculate the required quantity of each ingredient for the total amount to be prepared. If using Tablets, place the required number of Tablets in a suitable mortar, and comminute the Tablets to a fine powder, or add Tiagabine Hydrochloride. Add the Vehicle in small portions and triturate to make a smooth paste. Add increasing volumes of the Vehicle to make a tiagabine suspension that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the Vehicle to bring to final volume, and mix well.

Packaging and storage—Package in tight, light-resistant containers. Store at controlled room temperature or controlled cold temperature.

Labeling—Label it to state that it is to be well-shaken before use and to state the beyond-use date.

USP Reference standards ⟨11⟩—*USP Tiagabine Hydrochloride RS.*

Beyond-use date: not later than 90 days after the date on which it was compounded, when stored at controlled cold temperature, and not later than 60 days after the date on which it was compounded, when stored at controlled room temperature.

pH ⟨791⟩**:** between 4.0 and 4.5.

Assay—

Mobile phase—Prepare a solution of 5 mM octanesulfonic acid and acetonitrile (50 : 50). Pass through a 0.45-µm filter and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard stock preparation—Dissolve about 25 mg of USP Tiagabine Hydrochloride RS, accurately weighed, to a 25-mL volumetric flask. Dilute with methanol to obtain a concentration of 1.0 mg per mL.

Standard preparation—Pipet 0.2 mL of the *Standard stock preparation* to a 10-mL volumetric flask. Dilute with *Mobile phase* to volume to obtain a concentration of 20 µg per mL. Centrifuge, and pass through a 0.22-µm filter.

Assay preparation—Shake thoroughly by hand each bottle of Oral Suspension. Centrifuge, and pass through a 0.22-µm filter. Accurately pipet 0.2 mL of the Oral Suspension to a 10-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a nominal concentration of 20 µg tiagabine hydrochloride per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 240-nm detector and a 3.0-mm × 15-cm analytical column that contains 5-µm packing L10. The flow rate is about 0.4 mL per minute. Chromatograph the *Standard preparation,* and record the peak responses as directed for *Procedure:* the retention time is about 3.2 minutes, and the relative standard deviation for replicate injections is not more than 1.7%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure

the responses for the major peaks. Calculate the percent of tiagabine hydrochloride ($C_{20}H_{25}NO_2S_2 \cdot HCl$) in the volume of Oral Suspension taken by the formula:

$$(r_U / r_S)(C_S / C_U) \times 100$$

in which r_U and r_S are the peak responses obtained from the *Assay preparation* and *Standard preparation,* respectively; C_S is the concentration of USP Tiagabine Hydrochloride RS, µg per mL, in the *Sample preparation* on the anhydrous basis; and C_U is the nominal concentration of tiagabine hydrochloride, in µg per mL, in the *Assay preparation*.▲*USP33*

BRIEFING

Trenbolone Acetate, *USP 31* page 3438. On the basis of comments received, several changes to the *Trenbolone Acetate* monograph are being proposed. The upper *Assay* limit is increased from 101.0% to 103.0% to reflect approved products in the U.S. market. The UV *Identification* test is proposed to be deleted. The TLC-based *Chromatographic purity* and HPLC-based *Limit of trenbolone acetate 17α-isomer* tests are proposed to be deleted and replaced by a single test for *Related compounds*. In addition, the *Assay* has been changed to one that has shorter analytical run times. The new *Related compounds* and *Assay* are HPLC methods, utilizing a 4.6-mm × 10-cm column that contains 3-µm packing L1. USP has received information indicating that a Thermo Scientific Hypersil ODS C18 brand of column is suitable. The typical retention time of trenbolone acetate is about 5 minutes. Interested parties are invited to submit comments.

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 344-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure:* the relative retention times are about 0.4 for trenbolone and 1.0 for trenbolone acetate, and the resolution, *R*, between the trenbolone peak and the trenbolone acetate peak is not less than 25. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the column efficiency is not less than 14,000 theoretical plates when calculated by the formula:~~

~~$$5.545(t_R / W_{h/2})^2$$~~

~~the tailing factor is not more than 1.2 when calculated by the formula:~~

~~$$W_{0.1}/2f$$~~

~~in which $W_{0.1}$ is the width of the peak at 10% height, and the relative standard deviation for replicate injections is not more than 2%.~~

~~*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of trenbolone acetate ($C_{20}H_{24}O_3$) in the portion of Trenbolone Acetate taken by the formula:~~

~~$$100C(r_U / r_S)$$~~

~~in which *C* is the concentration, in mg per mL, of USP Trenbolone Acetate RS in the *Standard preparation*, and r_U and r_S are the trenbolone acetate peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.~~

▲*Diluent*—Prepare a mixture of acetonitrile, methanol, water, and acetic acid (36.5 : 30 : 33.5 : 0.1), and mix well.

Solution A—Prepare a mixture of acetonitrile, methanol, and water (36.5 : 30 : 33.5). Mix, and degas.

Solution B—Prepare a mixture of acetonitrile and methanol (9 : 1). Mix, and degas.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed under *Chromatographic system.* Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Trenbolone Acetate RS in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 1 mg per mL. Sonicate, if necessary, to dissolve.

Assay preparation—Dissolve an accurately weighed quantity of Trenbolone Acetate in *Diluent,* and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 1 mg per mL. Sonicate, if necessary, to dissolve.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 229-nm detector and a 4.6-mm × 10-cm column that contains 3-µm L1 packing. The flow rate is about 1.0 mL per minute. The gradient profile is as follows:

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–6	100	0	isocratic
6–16	100→0	0→100	linear gradient
16–26	0	100	isocratic
26–26.1	0→100	100→0	linear gradient
26.1–30	100	0	re-equilibration

Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0% for the trenbolone acetate peak.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the potency, in percent, of $C_{20}H_{24}O_3$ in the portion of trenbolone acetate taken by the formula:

$$(r_U / r_S)(C_S / C_U) \times 100$$

in which r_U and r_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively; and C_S and C_U are the concentrations, in mg per mL, of USP Trenbolone Acetate RS and trenbolone acetate taken, respectively.▲*USP33*

In-Process Revision

BRIEFING

Valrubicin, *USP 31*, page 3494. On the basis of comments received, it is proposed to revise the monograph as follows:

1. The *Assay* specification was revised to 98.0%–102.0% which is representative of currently marketed products. The *Definition* section was revised to indicate that the *Assay* is calculated on the anhydrous basis to reflect the change in the *Loss on Drying* test (see below).
2. The USP Reference Standards section was updated to replace *USP Valrubicin Related Compound A RS,* which is unstable, with *USP Valrubicin Resolution Mixture RS*.
3. The *Ultraviolet Absorption* test was deleted from the *Identification* section since Infrared spectroscopy and chromatographic retention time comparison are adequate for identification purposes.
4. The *Loss on Drying* test, which provides information about the content of water and volatile solvents, was replaced with a test for *Water*.
5. The *Limit of residual solvents* test was deleted to be consistent with general chapter *Residual Solvents* ⟨467⟩.
6. The *Assay* and the test for *Related compounds* have been revised based on validated methods. The methods are based on analyses performed using a Zorbax SB C18 brand of L1 column. The typical retention time of valrubicin in the *Assay* is about 2.5 minutes. The typical retention time of valrubicin in the test for *Related compounds* is about 34 minutes.

~~*Internal standard solution* Prepare a solution of *n*-propyl alcohol in dimethyl sulfoxide having a concentration of about 0.05 µL per mL.~~

~~*Standard solution* Prepare a solution in *Internal standard solution* having a concentration of 2.5 µg of chloroform, 5.0 µg of dehydrated alcohol, 5.0 µg of acetone, 5.0 µg of butyl alcohol, 5.0 µg of dioxane, 10.0 µg of methylene chloride, 15.0 µg of diisopropyl ether, 20.5 µg of acetonitrile, 50 µg of pentane, and 100 µg of methanol in each mL, and sonicate.~~

~~*Test solution* Dissolve about 200 mg of Valrubicin, accurately weighed, in 4.0 mL of *Internal standard solution,* and sonicate.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩) The gas chromatograph is equipped with a flame-ionization detector and a 0.32-mm × 30-m fused silica capillary column coated with a 5-µm film of G2 stationary phase. The carrier gas is helium, flowing at a rate of 30 mL per minute. The column temperature is maintained at 220°. The injection port temperature and the detector block temperature are maintained at 250°. Chromatograph the *Standard solution,* and record the responses as directed for *Procedure:* the relative retention times are about 0.48 for methanol, 0.66 for dehydrated alcohol, 0.71 for acetonitrile, 0.76 for acetone, 0.86 for pentane, 0.92 for methylene chloride, 1.0 for *n*-propyl alcohol, 1.19 for diisopropyl ether, 1.22 for chloroform, 1.35 for butyl alcohol, and 1.52 for dioxane; the component solvent peaks are resolved; and the relative standard deviation of the ratios of the peak area of each solvent to the peak area of *n*-propyl alcohol is not more than 10%.~~

~~*Procedure* Separately inject equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the concentration, in µg per g, of each residual solvent in the portion of Valrubicin taken by the formula:~~

~~$$4000(C/W)(R_i/R_s)$$~~

~~in which C is the concentration, in µg per mL, of the respective individual solvent in the *Standard solution; W* is the quantity, in mg, of Valrubicin taken to prepare the *Test solution;* and R_i and R_s are the peak area ratios of the respective individual solvent to *n*-propyl alcohol obtained from the *Test solution* and the *Standard solution,* respectively: not more than 50 µg per g of chloroform, 100 µg per g of dehydrated alcohol, 100 µg per g of acetone, 100 µg per g of butyl alcohol, 100 µg per g of dioxane, 300 µg per g of methylene chloride, 410 µg per g of acetonitrile, 500 µg per g of diisopropyl ether, 1000 µg per g of pentane, and 2000 µg per g of methanol are found.~~▲*USP33*

Related compounds—

~~*Mobile phase* Prepare as directed in the *Assay*.~~

~~*Resolution solution* Prepare a solution of USP Valrubicin Related Compound A RS and USP Valrubicin RS in acetonitrile having known concentrations of about 0.25 mg per mL and 1 mg per mL, respectively.~~

~~*Test solution* Use the *Assay preparation*.~~

In-Process Revision

~~*Chromatographic system* (see *Chromatography* ⟨621⟩) The liquid chromatograph is equipped with a 254-nm detector, a guard column, and a 5-mm × 10-cm analytical column that contains a 4-µm packing L1. The flow rate is about 3.5 mL per minute. Chromatograph the *Resolution solution*, and record the responses as directed for *Procedure:* the relative retention times are about 0.8 for valrubicin related compound A and 1.0 for valrubicin; and the resolution, *R*, between valrubicin related compound A and valrubicin is not less than 2.~~

~~*Procedure*—Inject a volume (about 10 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas for the major peaks. Calculate the percentage of each impurity in the portion of Valrubicin taken by the formula:~~

~~$100(r_i/r_u)$~~

~~in which r_i is the peak area for each impurity; and r_u is the sum of the areas of all the peaks. Do not consider any peaks due to solvent or excipients. Not more than 0.3% of any individual impurity with a relative retention time of 0.06, 0.17, 0.27, or 0.52 is found; not more than 0.6% of any impurity with a relative retention time of about 0.14 is found; not more than 0.2% of any other individual impurity is found; not more than 1.0% of total other impurities that are not specified by relative retention time is found; and not more than 2.5% of total impurities that are not less than 0.1% is found.~~

▲*Solution A*—Use *Potassium phosphate buffer* prepared as directed in the *Assay.*

Solution B—Use acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic System*. Make adjustments if necessary (see *System suitability* under *Chromatography* ⟨621⟩).

Diluent—A mixture of acetonitrile and water (1 : 1).

Resolution solution—Dissolve a suitable amount of USP Valrubicin Resolution Mixture RS in acetonitrile, using about 50% of the final volume, then dilute with water to volume, and mix to obtain a solution containing about 2 mg of the mixture per mL.

Stock standard solution—Dissolve an accurately weighed amount of USP Valrubicin RS in acetonitrile, using about 50% of the final volume, then dilute with water to volume, and mix to obtain a solution having a known concentration of about 2 mg per mL.

Standard solution—Dilute the *Stock standard solution* quantitatively with *Diluent* to obtain a solution having a known concentration of about 0.01 mg per mL.

Test solution—Dissolve an accurately weighed amount of Valrubicin in acetonitrile, using about 50% of the final volume, then dilute with water to volume, and mix to obtain a solution having a nominal concentration of about 2 mg per mL.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector, and a 4.6-mm × 5-cm analytical column that contains a 1.8-µm packing L1. The flow rate is about 1.5 mL per minute. Maintain the column at a constant temperature of about 40°. The chromatograph is programmed as follows:

Time (minutes)	*Solution A* (%)	*Solution B* (%)	Elution
0–45	75→40	25→60	linear gradient
45–55	40	60	isocratic
55–58	40→20	60→80	linear gradient
58–68	20	80	isocratic
68–70	20→75	80→25	linear gradient
70–80	75	25	re-equilibration

[NOTE—Analysis time is 55 minutes. The steps that follow are for column washing and re-equilibration.]

The autosampler temperature is maintained at 4°. Chromatograph the *Resolution solution*, and record the responses as directed for *Procedure:* identify the peaks by the relative retention times listed in *Table 1*; the resolution, *R,* between doxorubicinone and daunorubicin is not less than 2.0.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the areas for all of the peaks. Calculate the percentage of each impurity in the portion of Valrubicin taken by the formula:

$$100(1/\mathrm{F})(C_S/C_U)(r_i/r_s)$$

in which F is the relative response factor as listed in *Table 1*; C_S is the concentration, in mg per mL, of the *Standard solution*; C_U is the nominal concentration, in mg per mL, of the *Test solution*; r_i is the peak area for each impurity obtained from the *Test solution*; and r_s is the response for valrubicin

In-Process Revision

obtained from the *Standard solution*. The limits of the specified and unspecified impurities meet the limits in *Table 1*. Reporting level is 0.05%.

Table 1

Peak Identification	Relative Retention Time	Relative Response Factor (F)	Limit (%)
Doxorubicin	0.05	1.0	0.15
Doxorubicinone[1]	0.10	0.63	0.15
Daunorubicin	0.12	0.86	0.15
Daunorubicin bromoketal[2]	0.42	1.4	0.15
Doxorubicin valerate[3]	0.48	1.3	0.15
Doxorubicinone valerate[4]	0.76	0.80	0.15
Valrubicin	1.0	—	—
Dianhydrovalrubicin[5]	1.2	0.47	0.15
Any unspecified impurity	—	1.0	0.10
Total impurities	—	—	1.0

Assay—

~~*Mobile phase*—Prepare a filtered and degassed mixture of 0.015 M phosphoric acid and acetonitrile (57 : 43). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).~~

~~*Standard preparation*—Dissolve an accurately weighed quantity of USP Valrubicin RS in acetonitrile, and dilute quantitatively with acetonitrile to obtain a solution having a known concentration of about 1 mg per mL.~~

~~*Assay preparation*—Transfer about 25 mg of Valrubicin, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix.~~

~~*Chromatographic system* (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector, a guard column, and a 5-mm × 10-cm analytical column that contains a 4-µm packing L1. The flow rate is about 3.5 mL per minute. Chromatograph the *Standard preparation,* and record the responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2%.~~

~~*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{34}H_{39}F_3NO_{14}$ in the portion of Valrubicin taken by the formula:~~

~~$$0.25CP(r_U/r_S)$$~~

~~in which C is the concentration, in mg per mL, of USP Valrubicin RS in the *Standard preparation;* P is the specified percentage of valrubicin in USP Valrubicin RS; and r_U and r_S are the valrubicin peak areas obtained from the *Assay preparation* and the *Standard preparation,* respectively.~~

▲*Potassium phosphate buffer*—Transfer about 3.4 g of monobasic potassium phosphate to a 1000-mL volumetric flask, and dilute with water to volume. Adjust with phosphoric acid to a pH of 3.1.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and *potassium phosphate buffer* (60 : 40). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard preparation—Dissolve an accurately weighed quantity of USP Valrubicin RS in acetonitrile, and dilute quantitatively with acetonitrile to obtain a solution having a known concentration of about 0.5 mg per mL.

Assay preparation—Transfer about 50 mg of Valrubicin, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector, and a 4.6-mm × 5-cm analytical column that contains a 1.8-µm packing L1. The flow rate is about 1.5 mL per minute. Maintain the column at a constant temperature of about 40°. Chromatograph the *Standard preparation,* and record the responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure

In-Process Revision

the areas for the major peaks. Calculate the percentage of $C_{34}H_{36}F_3NO_{13}$ in the portion of Valrubicin taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which C_S is the concentration, in mg per mL, of USP Valrubicin RS in the *Standard preparation*; C_U is the nominal concentration of valrubicin in the *Assay preparation*; and r_U and r_S are the valrubicin peak area responses obtained from the *Assay preparation* and the *Standard preparation,* respectively.▲*USP33*

BRIEFING

Vincristine Sulfate Injection, *USP 31* page 3514. On the basis of comments received, it is proposed to add the HPLC retention time agreement as an additional *Identification* test.

(MD-OOD: F. Mao) RTS—C68625

Change to read:

Identification—

▲A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—▲*USP33*

Spray reagent—Dissolve 2.0 g of ceric ammonium sulfate in 100 mL of water with heating and stirring, and slowly add 100 mL of phosphoric acid. Filter if necessary.

Procedure—Transfer a volume of Injection, equivalent to 2 mg of vincristine sulfate, to a small centrifuge tube. For each mL of solution add 1 drop of ammonium hydroxide. Add 0.2 mL of dichloromethane. Place the cap on the tube, shake it vigorously for not less than 1 minute, and centrifuge for 1 minute. Carefully withdraw the dichloromethane layer, and transfer to a small stoppered vial. Proceed as directed for *Procedure* in the test for *Identification* under *Vincristine Sulfate for Injection*, beginning with "Also prepare a 10-mg-per-mL solution of USP Vincristine Sulfate RS."

▲B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the *Standard preparation,* as obtained in the *Assay.*▲*USP33*

BRIEFING

Vincristine Sulfate for Injection, *USP 31* page 3515. On the basis of comments received, it is proposed to add the HPLC retention time agreement as an additional *Identification* test.

(MD-OOD: F. Mao) RTS—C68624

Change to read:

Identification—

▲A: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—▲*USP33*

Spray reagent—Dissolve 2.0 g of ceric ammonium sulfate in 100 mL of water with heating and stirring, and slowly add 100 mL of phosphoric acid. Filter if necessary.

Procedure—Dissolve a sufficient quantity in water to obtain a solution containing 25 mg per mL. Further dilute the solution to 10 mg per mL with methanol, and mix. Also prepare a 10-mg-per-mL solution of USP Vincristine Sulfate RS in a mixture of dichloromethane and methanol (3:1), and mix. Use a thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel mixture (see *Chromatography* ⟨621⟩). Develop it in a methanol prewash tank, and dry it, for maximum sensitivity, not more than 2 hours before use. Score it about 15 cm above the points of application. Apply 20 µL of each solution at points about 2.5 cm from the lower edge of the plate, and dry thoroughly (a current of cool air may be used to help dry the spots). Prepare the developing solvent system consisting of a mixture of fresh ether, methanol, and methylamine solution (2 in 5) (95 : 10 : 5) immediately prior to development. Place the plate in the nonequilibrated developing chamber that contains a paper liner around the back and sides and developing solvent to a depth of about 2 cm. Remove the plate when the solvent moves to the scored line (about 80 minutes), and discard the solvent system. Dry the plate in a fume hood at room temperature, heat on a metal plate on a steam bath for about 15 minutes, and spray the plate while still hot with *Spray reagent.* Continue heating the plate for 15 minutes to stabilize the spots: the R_F value and the color of the principal spot obtained from the test specimen correspond to those obtained from the Reference Standard.

▲B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the *Standard preparation,* as obtained in the *Assay.*▲*USP33*

DIETARY SUPPLEMENTS—MONOGRAPHS

BRIEFING

***N*-Acetyltyrosine.** Because there is no existing *USP* monograph for this dietary ingredient, a new monograph is being proposed. Interested parties are encouraged to submit comments.

(DSN: C. Phinney) RTS—C65493

Add the following:

▲*N*-Acetyltyrosine

$C_{11}H_{13}NO_4$ 223.2

N-Acetyl-L-tyrosine.

(2*S*)-2-(Acetylamino)-3-(4-hydroxyphenyl)propanoic acid) [*537-55-3*].

» *N*-Acetyltyrosine contains not less than 98.5 percent and not more than 101.0 percent of $C_{11}H_{13}NO_4$, as *N*-acetyl-L-tyrosine, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP N-Acetyl-L-tyrosine RS. USP L-Tyrosine RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: It meets the requirements for *Specific rotation*.

C: The R_F value of the principal spot in the chromatogram of the *Test solution* in the test for *Chromatographic purity* corresponds to that obtained from *Standard solution 1*.

Specific rotation ⟨781S⟩: between +46.0° and +49.0°, determined at 20°.

Test solution: 10 mg per mL.

Loss on drying ⟨731⟩—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

Chloride ⟨221⟩—A 0.7-g portion shows no more chloride than corresponds to 0.40 mL of 0.01 N hydrochloric acid: not more than 0.02% is found.

Sulfate ⟨221⟩—A 1.2-g portion shows no more sulfate than corresponds to 0.25 mL of 0.020 N sulfuric acid: not more than 0.02% is found.

Iron ⟨241⟩: 0.002%.

Heavy metals, *Method I* ⟨231⟩: 0.001%.

Chromatographic purity—

Standard solution 1—Prepare a solution in a mixture of water, glacial acetic acid, and alcohol (3 : 3 : 94) containing 8 mg of USP *N*-Acetyl-L-tyrosine RS per mL. Dilute 0.5 mL of this solution with alcohol to 10 mL to obtain a solution having a known concentration of about 0.4 mg per mL.

Standard solution 2—Dissolve an accurately weighed quantity of USP L-Trosine RS in a mixture of glacial acetic acid and water (1 : 1), and dilute with alcohol to obtain a solution having a known concentration of about 0.8 mg per mL.

Test solution—Transfer 0.8 g of *N*-Acetyltyrosine to a 10-mL volumetric flask, dissolve in 6 mL of a mixture of glacial acetic acid and water (1 : 1), and dilute with alcohol to volume.

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture containing a fluorescent indicator having an optimal intensity at 254 nm.

Application volume: 5 µL.

Developing solvent system: a mixture of ammonia and 2-propanol (3 : 7).

Spray reagent—Dissolve 0.2 g of ninhydrin in 100 mL of a mixture of ammonia and 2-propanol (30 : 70).

Procedure—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* ⟨621⟩. After air-drying the plate, repeat the development process. After air-drying a second time, spray with *Spray reagent*, and heat between 100° and 105° for about 15 minutes. Examine the plate. Any secondary spot in the chromatogram obtained from the *Test solution* is not larger or more intense than the principal spot in the chromatogram obtained from *Standard solution 1*: not more than 0.5% of any individual impurity is found, and a spot in the chromatogram obtained from the *Test solution* corresponding to tyrosine is not larger or more intense than the principal spot in the chromatogram obtained from *Standard solution 2*: not more than 1.0% of tyrosine is found.

Assay—Dissolve about 180 mg of *N*-Acetyltyrosine in 50 mL of carbon dioxide-free water, and titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N sodium hydroxide VS is equivalent to 22.32 mg of $C_{11}H_{13}NO_4$.▲*USP33*

BRIEFING

Excipients, USP and NF Excipients, Listed by Category, *NF 26* page 1057, page 3800 of the *Second Supplement,* and page 1511 of *PF* 34(6) [Nov.–Dec. 2008]. It is proposed to add *Chitosan* to the *Coating Agent, Film-Forming Agent, Suspending and/or Viscosity-Increasing Agent*, and *Vehicle (Solid Carrier)* categories; *Polyoxyl 15 Hydroxystearate* to the *Tablet and/or Capsule Lubricant, Vehicle (Oleaginous),* and *Wetting and/or Solubilizing Agent* categories; *Polyvinyl Acetate Dispersion* to the *Coating Agent* category; *Hydrogenated Starch Hydrolysate* to the *Humectant, Sweetening Agent, Tablet Binder*, and *Tablet and Capsule Diluent* categories; and *Starch, Pea* to the *Suspending and/or Viscosity-Increasing Agent, Tablet Binder, Tablet and/or Capsule Diluent, and Tablet Disintegrant* categories, to complement the proposed new monographs for *Chitosan, Polyoxyl 15 Hydroxystearate, Polyvinyl Acetate Dispersion, Hydrogenated Starch Hydrolysate,*and*Pea Starch,* which appear elsewhere in this issue of *PF.*

MONOGRAPHS (NF)

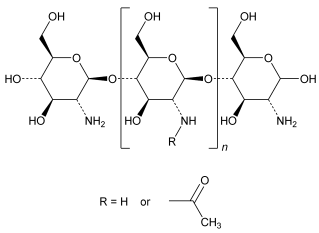
BRIEFING

Chitosan. Because there is no existing monograph for this article, a new monograph, based on validated methods of analysis, is being proposed. The high performance size exclusion chromatography (HPSEC) procedure in the test for *Average molecular weight and molecular weight distribution* is based on analysis performed with the Tosoh Bioscience TSK-GEL PW brand of column containing packing L38.

(EM2: H. Wang; NOM: A. Wilk; MSA: R. Tirumalai) RTS—C44080

Add the following:

▲Chitosan



Poly-β-(1,4)-2-Amino-2-deoxy-D-glucose [*9012-76-4*].

» Chitosan is an unbranched binary polysaccharide consisting of *N*-acetyl-D-glucosamine and D-glucosamine units linked in $\beta(1\rightarrow4)$ manner. Chitosan is obtained by partial deacetylation of chitin which is extracted from the shells of edible shrimps and crabs suitable for human use. Its degree of deacetylation is not less than 70.0 percent.

Packaging and storage—Preserve in light-resistant and well-closed containers in a dry place, and store at a temperature below 30°.

Labeling—Label it to indicate its weight-average molecular weight, M_w, and polydispersity (M_w/M_n). Where Chitosan is intended for use in the manufacture of wound dressings, it is so labeled. Where Chitosan must be subjected to further processing during the preparation of wound dressings, it is so labeled.

USP Reference standards ⟨11⟩—*USP Chitosan RS. USP Endotoxin RS.*

Identification—

A: *Infrared Absorption* ⟨197A⟩.

B: Add 80 g of water to 0.2 g of Chitosan powder, and stir briefly to obtain a dispersion. Separately prepare a glycolic acid solution by dissolving 0.1 g of glycolic acid in 20 g of water. Add the solution so obtained in one step to the dispersion. Stir the mixture gently at room temperature until it becomes a clear solution [NOTE—It takes approximately 30 to 60 minutes to obtain a clear solution]. Add 5 g of a 0.5% sodium lauryl sulfate aqueous solution to the clear solution. A gelatinous mass is formed.

Bacterial endotoxins ⟨85⟩—The level of bacterial endotoxins is such that the requirement under the relevant dosage form monograph(s) in which Chitosan is used can be met. Where the label states that Chitosan must be subjected to further processing during the preparation of wound dressing dosage forms, the level of bacterial endotoxins is such that the requirement under the relevant dosage form monograph(s) in which Chitosan is used can be met.

Test stock solution—Transfer 0.5 g of Chitosan to a 50-mL volumetric flask, add LAL Reagent Water[1] and 4.6 mL of 1 N hydrochloric acid, dilute with the LAL Reagent Water to volume, and mix well. Incubate this solution in a water-bath at 40° for 48 hours.

Test solution—Dilute the *Test stock solution* to 1 : 50 with LAL Reagent Water, including dilution 1 : 2 with β-glucan blocker.[2]

[1] Sterile Water for Injection or other water that shows no reaction with the specific LAL Reagent with which it is to be used, at the limit of sensitivity of such reagent.
[2] Available from Cambrex Europe s.p.r.l., Verviers, Belgium.

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 1000 cfu per g, and the total combined molds and yeasts count does not exceed 100 cfu per g. It meets the requirements of the tests for absence of *Pseudomonas aeruginosa* and *Staphylococcus aureus*.

Sample preparation—Prepare a solution (1 in 50).

Loss on drying ⟨731⟩—Dry 1.0 g in an oven at 100–105° for 7 hours: it loses not more than 5.0% of its weight.

Residue on ignition ⟨281⟩**:** not more than 1.0%.

Heavy metals, *Method III* ⟨231⟩**:** not more than 10 µg per g.

Limit of lead, mercury, chromium, nickel, cadmium, and arsenic—

65% Nitric acid—Use ultratrace nitric acid, 65-70% HNO_3, ACS reagent grade.

Internal standard—Transfer 0.2 mL of a solution containing 1000 ppm of yttrium [NOTE—Yttrium ICP standard solutions are commercially available.[3]] and 0.2 mL of a solution containing 1000 ppm of lutetium [NOTE—Lutetium ICP standard solutions are commercially available.[4]] to a 100-mL volumetric flask, add 1 mL of *65% Nitric acid*, dilute with water to volume, and mix.

Blank standard—Transfer 1.0 mL of *Internal standard* to a 100-mL volumetric flask, add 1 mL of *65% Nitric acid,* dilute with water to volume, and mix.

Standard solutions—Transfer 0.1 mL of a solution containing 10 ppm of each for lead, mercury, chromium, nickel, cadmium, and arsenic [NOTE—Multi-element ICP standard solutions are commercially available.[5]] to a 100-mL volumetric flask, add 1 mL of *Internal standard* and 1 mL of *65% Nitric acid*, dilute with water to volume (*Standard solution 0.01 ppm*). Transfer 0.1 mL of a solution containing 10 ppm of each for lead, mercury, chromium, nickel, cadmium, and arsenic [NOTE—Multi-element ICP standard solutions are commercially available.[5]] to a 1000-mL volumetric flask, add 10 mL of *Internal standard* and 10 mL of *65% Nitric acid*, and dilute with water to volume (*Standard solution 0.001 ppm*).

Test solution—Transfer about 1.0 g of Chitosan, accurately weighed, to a clean, dry, 100-mL Kjeldahl flask. [NOTE—A 300-mL flask may be used if the reaction foams excessively.] Clamp the flask at an angle of 45°, and add a sufficient quantity of a mixture of 8 mL of sulfuric acid and 10 mL of nitric acid to moisten the substance thoroughly. Warm gently until the reaction commences, allow the reaction to subside, and add portions of the same acid mixture, heating after each addition, until a total of 18 mL of the acid mixture has been added. Increase the amount of heat, and boil gently until the solution darkens. Cool, add 2 mL of nitric acid, and heat again until the solution darkens. Continue the heating, followed by addition of nitric acid until no further darkening occurs, then heat strongly to the production of dense, white fumes. Cool, cautiously add 5 mL of water, boil gently to the production of dense, white fumes, and continue heating until the volume is reduced to a few mL. Cool, cautiously add 5 mL of water, and examine the color of the solution. If the color is yellow, cautiously add 1 mL of 30 percent hydrogen peroxide, and again evaporate to the production of dense, white fumes and a volume of 2 to 3 mL. If the solution is still yellow, repeat the addition of 5 mL of water and the peroxide treatment. Cool, dilute cautiously with a few mL of water, rinse into a 20-mL volumetric flask, and dilute with water to volume. Transfer 5.0 mL of digestion solution to a 100-mL volumetric flask, and retain the remaining digestion solution for use in the *Limit of iron*. Add 1 mL of *Internal standard* to the 100-mL volumetric flask, dilute with water to volume, and mix.

Blank solution—Prepare the blank digestion solution following the preparation procedure for the *Test solution* but without using Chitosan. Transfer 5.0 mL of blank digestion solution to a 100-mL volumetric flask, and retain

[3] Suitable yttrium ICP standard is available from LGC Promochem (www.lgcpromochem.com) or from Merck KGaA, Frankfurter Str. 250, 64293 Darmstadt, Germany.
[4] Suitable lutetium ICP standard is available from LGC Promochem (www.lgcpromochem.com) or from Merck KGaA, Frankfurter Str. 250, 64293 Darmstadt, Germany.
[5] Suitable multi-element ICP standard is available from LGC Promochem (www.lgcpromochem.com) or from Merck KGaA, Frankfurter Str. 250, 64293 Darmstadt, Germany.

In-Process Revision

the remaining digestion solution for use in the *Limit of iron*. Add 1 mL of *Internal standard* to the 100-mL volumetric flask, dilute with water to volume, and mix.

Procedure (see *Plasma Spectrochemistry* ⟨730⟩)—The inductively coupled plasma–mass spectrometer (ICP–MS) is equipped with a quadrupole mass spectrometer and an ion detector maintained under vacuum. The instrument should read all isotopes for the following elements shown in the accompanying table, for the yttrium internal standard (89 amu) and the lutetium internal standard (175 and 176 amu), and should report the total element contents using the most naturally abundant isotopes.

Element	Isotope (amu)
Lead	208
Mercury	201
	202
Chromium	53
Nickel	58
	60
Cadmium	114
Arsenic	75

Instrument performance must be verified to conform to the manufacturer's specifications for resolution and sensitivity. Before analyzing samples, the instrument must pass a suitable performance check. Perform the evaluation using instrument software such as correction equations for interferences and taking the *Internal standard* into account. Generate the calibration curve using the *Blank standard, Standard solution 0.001 ppm,* and *Standard solution 0.01 ppm*: the linear regression coefficient is not less than 0.999.

Aspirate the *Blank solution* and *Test solution*, respectively, at least in duplicate, and report the average reading as each element content of the sample. Determine the concentration C_B, in µg per mL, of each element in the *Blank solution*, and also determine the concentration C_S, in µg per mL, of each element in the *Test solution* using the calibration curve. Calculate the quantity, in µg per g, of each element in the portion of Chitosan taken by the formula:

$$4(100)(C_S - C_B) / W$$

in which 4 is a dilution factor; 100 is the volume, in mL, of the *Test solution*; and W is the weight, in g, of the Chitosan taken to prepare the *Test solution*: not more than 0.1 µg lead per g is found; not more than 0.1 µg mercury per g is found; not more than 0.5 µg chromium per g is found; not more than 1.0 µg nickel per g is found; not more than 0.2 µg cadmium per g is found; not more than 0.1 µg arsenic per g is found.

Limit of iron—

65% Nitric acid—Use ultratrace nitric acid, 65-70% HNO_3, ACS reagent grade.

Blank standard—Use water.

Standard stock solution 100 ppm—Immediately before use, dilute appropriate amount of iron standard[6] with a solution of *65% Nitric acid* (1 in 100) to prepare an acidic solution containing the equivalent of 100 µg of iron per mL.

Standard solutions—Separately transfer 0.1 and 0.5 mL of *Standard stock solution 100 ppm* to 100-mL volumetric flasks, dilute with a solution of *65% Nitric acid* (1 in 100) to volume, and mix. These solutions contain, respectively, 0.1 and 0.5 µg of iron per mL (*Standard solution 0.1 ppm* and *Standard solution 0.5 ppm*).

Test solution—Transfer 10.0 mL of the digestion solution from the test for *Limit of lead, mercury, chromium, nickel, cadmium, and arsenic* to a 100-mL volumetric flask, dilute with water to volume, and mix.

Blank solution—Transfer 10.0 mL of the blank digestion solution from the test for *Limit of lead, mercury, chromium, nickel, cadmium, and arsenic* to a 100-mL volumetric flask, dilute with water to volume, and mix.

[6] Suitable iron standards are available from LGC Promochem (www.lgcpromochem.com) (Single element standard for ICP, Iron 10,000 µg per mL dilute nitric acid) or from Merck KGaA, Frankfurter Str. 250, 64293 Darmstadt, Germany (iron ICP standard, 10000 mg per L in 10% nitric acid).

Procedure (see *Plasma Spectrochemistry* ⟨730⟩)—Iron is determined using an inductively coupled plasma–atomic emission spectrometer (ICP–AES) by measuring the emission at 238.040 nm and 239.562 nm with the settings optimized as directed by the manufacturer.

Instrument performance must be verified to conform to the manufacturer's specifications for resolution and sensitivity. Before analyzing samples, the instrument must pass a suitable performance check. Generate the calibration curve using the *Blank standard, Standard solution 0.1 ppm,* and *Standard solution 0.5 ppm*: the linear regression coefficient is not less than 0.999.

Aspirate the *Blank solution* and *Test solution,* respectively, at least in duplicate, and report the average reading as the iron content of the sample. Determine the concentration, C_B, in µg per mL, of iron in the *Blank solution,* and also determine the concentration, C_S, in µg per mL, of iron in the *Test solution* using the calibration curve. Calculate the quantity, in µg, of iron per g in the portion of Chitosan taken by the formula:

$$2(100)(C_S - C_B) / W$$

in which 2 is a dilution factor; 100 is the volume, in mL, of the *Test solution*; and W is the weight, in g, of the Chitosan taken: not more than 10 µg per g is found.

Degree of deacetylation—

[NOTE—If tetramethylsilane is not used as *NMR reference*, a suitable signal of the solvent itself can be used as a reference.]

Solvent—Use deuterated formic acid.

NMR reference—Use tetramethylsilane.

Test solution—Into a 20-mL scintillation vial with screw cap, dissolve 5 mg to 10 mg of Chitosan in deuterated formic acid containing 0.5% to 1.0% of tetramethylsilane to obtain 1 mL of solution. Tightly close the vial, and dissolve Chitosan using a magnetic stirrer. It needs about 48 hours for complete dissolution and the stirring is stopped when a clear solution with a high viscosity is obtained. Break up any clumps formed during the dissolution process with a spatula, if necessary.

Procedure—Transfer 0.5 mL to 1.0 mL of the *Test solution* to a standard 5-mm NMR spinning tube. Proceed as directed for *Relative Method of Quantitation* under *Nuclear Magnetic Resonance* ⟨761⟩, using the *Test solution* volumes specified here, scanning the region from 0 ppm to 7 ppm, and using the calculation formulas specified here. Record as A_1 the average area of the composite band from about 6 ppm to 3 ppm, representing the seven protons with oxygen neighbors in the sugar ring, and record as A_2 the average area of the signals at about 2 ppm, due to the methyl groups of the acetyl units, with reference to the tetramethylsilane singlet at 0 ppm. Calculate the percentage of deacetylation degree, by weight, in the Chitosan, taken by the formula:

$$100[1 - (7A_2 / 3A_1)]$$

The degree of deacetylation is not less than 70.0%.

Limit of protein content—

Control solution A—Prepare a solution of bovine serum albumin in water to obtain a known concentration of about 1.0 mg per mL.

Control solution B—Prepare a solution of bovine serum albumin in water to obtain a known concentration of about 0.1 mg per mL.

Test solution C—Dissolve about 100 mg of Chitosan, accurately weighed, to 4 mL of 100% formic acid, mix, and stir for about 48 hours at room temperature using a magnetic stirrer. This solution contains 25 mg of Chitosan per mL in 100% formic acid.

Test solutions D, E, F—Dilute aliquots of the solution with water so as to obtain the following solutions with concentrations of 2.5 mg of Chitosan per mL in 10% formic acid, 0.5 mg of Chitosan per mL in 2% formic acid, and 0.25 mg of Chitosan per mL in 1% formic acid.

Molecular weight standard preparation G—Use a commercially available preparation of apparent molecular weight protein standards of 10,000 to 190,000 Da dissolved in the loading buffer consisting of 50 mM of tris(hydroxymethyl)aminomethane hydrochloride (pH 6.8), 5 mM of ethylenediaminetetraacetic acid, 10 mM of dithiothreitol [NOTE—A 2-5% solution of beta-mercaptoethanol can be used to replace dithiothreitol.], 1% (w/v) sodium dodecyl sulfate, 10% (w/v) glycerol.[7] [NOTE—A protein ladder containing the following molecular weight standards in 10, 15, 20, 25, 40, 50, 60, 85, 120 and 190 KDa or other appropriate combinations can be used.]

Sample buffer—Transfer 666 mg of tris(hydroxymethyl)aminomethane hydrochloride, 682 mg of tris(hydroxymethyl)aminomethane, 800 mg of lithium dodecyl sulfate, 6 mg of ethylenediaminetetraacetic acid, 4 g of glycerol, 0.75 mL of 1% solution of Coomassie blue G250, and 0.25 mL of 1% solution of phenol red to a 10-mL volumetric flask, add 8 mL of water to the flask, and mix. If necessary, adjust with hydrochloric acid or sodium hydroxide to pH of 7.2. Dilute with water to volume. [NOTE—Store the buffer at 4°. It is stable for 6 months when stored at 4°.] A commercially available buffer can be equivalently used.[8]

Running buffer—Prepare a solution containing 1 M of tris(hydroxymethyl)-aminomethane, 1 M of 2-(4-morpholinyl) ethanesulfonic acid, 20.5 mM ethylenediaminetetraacetic acid, and 69.3 mM dodecyl sodium sulfate in water. If necessary, adjust with hydrochloric acid or sodium hydroxide to pH of 7.3. The appropriate SDS running buffer of commercially available is equivalently used.[9]

Fixing solution—A solution containing 40% ethanol and 10% acetic acid.

Sensitizing solution—Transfer 10 mL of a solution mainly containing 10–20% of 2-(4-morpholinyl) ethanesulfonic acid, 0.1-1.0% of sodium hydroxide, and 7–13% of *N*,*N*-dimethylformamide into a 100-mL volumetric flask, add 30 mL of alcohol, and dilute with water to volume. Alternatively, follow the instructions of a commercially available silver staining kit[10] to prepare the *Sensitizing solution, Staining solution,* and *Developing solution*.

Staining solution—Transfer 1.0 mL of a solution mainly containing 10-30% silver nitrate into a 100-mL volumetric flask, and dilute with water to volume.

Developing solution—Transfer 10 mL of a solution mainly containing 10-30% sodium carbonate into a 100-mL volumetric flask, add 1 drop of a solution containing 30-60% of formaldehyde, and dilute with water to volume.

Stopping solution—A solution containing 10-30% ethylenediaminetetraacetic acid and 10-30% tris(hydroxymethyl)-aminomethane. *Stopping solution* is commercially available and included into a silver staining kit.

Procedure—Mix 75 µL of each of *Test solutions C, D, E, and F* with 25 µL of *Sample buffer,* and incubate at 70° for 10 minutes. In a suitable device for polyacrylamide-gel electrophoresis (see *Electrophoresis* ⟨726⟩ and *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* ⟨1056⟩) add appropriate volumes of the *Running buffer* in the upper and the lower buffer chambers. Attach a 4%-12% gradient Bis-Tris ready-made polyacrylamide gel sandwiched between two glass plates, such that the wells for sample application are exposed to the *Running buffer* in the upper buffer chamber. Separately apply equal volumes (about 20 µL) of each of the treated *Test solutions C, D, E, and F, Control solution A,* and *Control solution B* onto separate lanes; apply equal volumes (about 10 µL) of the *Molecular weight standard preparation G* to both sides of the gel. [NOTE—Do not apply any solution in the outside lanes.] Connect the lower buffer chamber electrode to the positive terminal and the upper buffer chamber electrode to the

[7] A suitable molecular weight standard preparation is available as BenchMark Prestained Protein Ladder from Invitrogen, product number: 10748010.
[8] A suitable sample buffer is available as 4X NuPAGE LDS sample buffer from Invitrogen, product number: NP0007.
[9] A suitable running buffer is available as NuPAGE MES SDS Running Buffer from Invitrogen, product number: NP0002.
[10] A suitable silver staining kit is available as NuPAGE Silver Staining Kit from Invitrogen, product number: LC6070.

negative terminal of a suitable power supply unit, and carry out the electrophoresis at a constant voltage of about 100 V for about 100 minutes. Remove the gel from the gel assembly. [NOTE—Do not touch the gel with bare hands. Use gloves.]

Place the gel in a clean staining tray of appropriate size. Rinse the gel briefly with water. Fix the gel in 100 mL of *Fixing solution* for 20 minutes with gentle rotation. [NOTE—The gel can be stored in the *Fixing solution* overnight.] Decant the *Fixing solution*, and wash the gel in 30% ethanol for 10 minutes. Decant the ethanol, and add 100 mL of *Sensitizing solution* to the washed gel in the staining container. Incubate the gel in the *Sensitizing solution* for about 10 minutes. [NOTE—All incubations should be performed on a rotary shaker rotating at a speed of 1 revolution per second at room temperature.] Decant the *Sensitizing solution*, and wash the gel in 100 mL of 30% ethanol for 10 minutes. Wash the gel in 100 mL of water for 10 minutes. Incubate the gel in 100 mL of *Staining solution* for 15 minutes. After staining is complete, decant the *Staining solution*, and wash the gel with 100 mL of water for 20 to 60 seconds. [NOTE—Washing the gel for more than one minute will remove silver ion from the gel resulting in decreased sensitivity.] Incubate the gel in 100 mL of *Developing solution* for 4 to 8 minutes until bands start to appear and the desired band intensity is reached. Once the appropriate staining intensity is achieved, immediately add 10 mL of *Stopping solution* directly to the gel still immersed in the *Developing solution*. Gently agitate the gel for 10 minutes. The color changes from pink to colorless indicating that the development has stopped. Decant the colorless solution and wash the gel with 100 mL of water for 10 minutes. Use a gel imaging system, ideally with CCD camera to record the results. Not more than 0.2% protein is found.

Average molecular weight and molecular weight distribution—

Mobile phase—Transfer 12.75 g sodium nitrate to a 1000-mL volumetric flask containing 800 mL water, add a suitable amount of formic acid, dilute with water to volume, mix well, and make a concentration of formic acid of 0.5 M. The *Mobile phase* contains 0.15 M sodium nitrate in 0.5 M aqueous formic acid.

System suitability solution—Prepare a solution having a known concentration of 1.0 mg of ethylene glycol per mL in *Mobile phase*.

Standard solutions—Prepare several sets of mixtures, containing ten polyethylene glycol (PEG) standards of different known molecular weight, which are used to cover the molecular weight range from about 200 to 1,100,000 g per mol.[11] [NOTE—These standards could be mixtures of polyethylene glycols and polyethylene oxides.] Prepare each set of PEG molecular weight standards to have a known concentration of about 1.0 mg per mL for each standard in *Mobile phase*. Allow the *Standard solutions* to stand at room temperature for at least 8 hours. Do not filter before use.

Test solution—Prepare a solution containing 1.0 mg per mL of Chitosan in *Mobile phase*. Cap, and mix well. Allow the solution to stand at room temperature for at least 12 hours. Pass the chitosan solution through a 0.45-µm membrane filter, discard an appropriate volume of the initial filtrate, and use the rest of the filtered solution for analysis.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector maintained at a temperature of 35°, a 7.5-mm × 30-cm analytical column that contains 10-µm packing L38, a 7.5-mm × 30-cm analytical column that contains 17-µm packing L38, and a 7.5-mm × 30-cm analytical column that contains 17-µm packing L38. The flow rate is 1.0 mL per minute for the *System suitability solution*. Chromatograph the *System suitability solution,* and determine the plate count as directed for *Procedure*: the plate count, *N,* is not less than 80% of the value which is certified by the column manufacture for new columns. The flow rate is 0.5 mL per minute for *Standard solutions* and *Test solution*. Chromatograph the *Standard solutions,* and calculate the retention

[11] Suitable polyethylene glycol molecular weight standards are available as ReadyCal kits from Polymer Standards Service (PSS), www.polymer.de.

volume, V_p, at the peak maximum of each individual molecular weight standard in the *Standard solutions* as directed for *Procedure*: the resolution, *R,* between the PEG standards is not less than 1.7.

Procedure—Inject a volume (20 µL) of the *System suitability solution* into the chromatogram, record the chromatogram, and determine the plate count for the ethylene glycol peak. Separately inject equal volumes (about 100 µL) of the *Standard solutions* and the *Test solution* into the chromatograph, record the chromatograms, and determine elution peak maxima and corresponding retention volumes (elution volume), V_p, for the ten PEG standards, corresponding to the specified molecular weight, M_p, at the peak maximum of the standards.

Molecular weight calibration—Analyze each polyethylene glycol standard, and use a suitable gel permeation chromatography or size exclusion chromatography (GPC/SEC) software or an equivalent data handling system to compute the data and calibration. Plot log M_p for each standard in the *Standard solutions* versus its retention volume, V_p, in mL, at each standard peak maximum, and construct the best polynomial line fitting the ten points.

Data analysis for sample—[NOTE—Based on the PEG molecular weight calibration curve, calculate the molecular weight and molecular weight distribution of Chitosan using the slice by slice method.] Analyze the Chitosan sample by identifying retention volumes V_a and V_b corresponding to the beginning and end of the Chitosan chromatogram. The baseline between V_a and V_b is assumed to be linear. [NOTE—Draw a straight line between V_a and V_b.] Data analysis is based on the suitable GPC/SEC computer software or a real-time data acquisition system with either off-line or on-line data processing that is able to provide a means of determining chromatographic peak heights or integrated area segments as prescribed intervals under the SEC chromatogram and handling and reporting the data. The following describes the data processes which can either be computed by the GPC/SEC software or by an equivalent data processing system. Upon acquisition, handle the data under the Chitosan elution peak in discrete segments A_i , integrated area slices, or as digitized chromatogram heights H_i by recording the vertical displacements between the chromatogram trace and the baseline at elution volume, V_i, over designated intervals. A minimum of 40 area segments or heights are required. Obtain the corresponding value of M_i for Chitosan based on its elution volume, V_i, from the molecular weight calibration curve obtained in *Molecular weight calibration*. Calculate the number-, and weight-average molecular weights, M_n and M_w, in g per mol, respectively, using the following formulas.

$$M_n = \frac{\sum_{i=1}^{N} A_i}{\sum_{i=1}^{N}\left(\frac{A_i}{M_i}\right)}$$

$$M_w = \frac{\sum_{i=1}^{N}\left(A_i \bullet M_i\right)}{\sum_{i=1}^{N} A_i}$$

If the elution volume internal ΔV_i , for instance, $V_2 - V_1 = V_3 - V_2$, *etc,* is constant; parameters A_i and M_i are the chromatographic peak slice area and Chitosan molecular weight associated with the elution volume, V_i; and N is the number of data points obtained from the chromatogram between V_a and V_b ($N \geq 40$). [NOTE—If N is sufficiently large, the use of area segments A_i or peak heights H_i will yield equivalent results.]

Calculate the molecular weight distribution or polydispersity for Chitosan using the following expression:

$$M_w / M_n$$

The values of weight-average molecular weight and polydispersity are not less than 85% and not more than 115% of their respective values stated on the label.▲*NF28*

In-Process Revision

BRIEFING

Cystine. Because there is no existing *USP* monograph for this dietary ingredient, a new monograph is being proposed. Interested parties are encouraged to submit comments.

(DSN: C. Phinney) RTS—C62408

Add the following:

▲Cystine

$C_6H_{12}N_2O_4S_2$ 240.30

L-Cystine.

3,3′-disulfanediylbis [(2*R*)-2-aminopropanoic acid]

[*56-89-3*].

» Cystine contains not less than 98.5 percent and not more than 101.5 percent of $C_5H_9NO_4$, as L-Cystine calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers, and store at controlled room temperature.

USP Reference standards ⟨11⟩—*USP Arginine Hydrochloride RS. USP Cystine RS.*

Identification—

A: *Infrared Absorption* ⟨197K⟩.

B: Meets the requirements of the test for *Specific rotation*.

C: The R_F value of the principal spot in the chromatogram of the *Test solution* in the test for *Chromatographic purity* corresponds to that obtained from the *Standard solution*.

Identification, *Infrared Absorption* ⟨197K⟩**.**

Specific rotation ⟨781S⟩: between –215° and –225°, determined at 20°.

Test solution: 20 mg per mL, in 1 N hydrochloric acid.

Loss on drying ⟨731⟩—Dry it at 105° for 3 hours: it loses not more than 0.2% of its weight.

Residue on ignition ⟨281⟩: not more than 0.1%.

Chloride ⟨221⟩—A 0.7-g portion shows no more chloride than corresponds to 0.40 mL of 0.01 N hydrochloric acid: not more than 0.02% is found.

Sulfate ⟨221⟩—A 1.2-g portion shows no more sulfate than corresponds to 0.25 mL of 0.020 N sulfuric acid: not more than 0.02% is found.

Iron ⟨241⟩: 0.001%.

Heavy metals, *Method I* ⟨231⟩: 0.001%.

Chromatographic purity—

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture.

Test solution: Transfer 0.1 g of Cystine to a 10-mL volumetric flask, dissolve in 1 N hydrochloric acid, and dilute with water to volume.

System suitability solution—Dissolve accurately weighed quantities of USP Cystine RS and USP Arginine Hydrochloride RS in 1 mL of 1 N hydrochloric acid, and dilute with water to obtain a solution having a known concentration of about 0.4 mg per mL of each.

Standard solution—Dissolve an accurately weighed quantity of USP Cystine RS in 1 mL of 1 N hydrochloric acid, and dilute with water to obtain a solution having a known concentration of about 0.02 mg per mL.

In-Process Revision

Application volume: 5 µL.

Developing solvent system: a mixture of ammonia and 2-propanol (3 : 7).

Spray reagent—Dissolve 0.2 g of ninhydrin in 100 mL of a mixture of ammonia and 2-propanol (30 : 70).

Procedure—Proceed as directed for *System suitability* under *Chromatography* ⟨621⟩. After air-drying the plate, repeat the development process. After air-drying a second time, spray with *Spray reagent*, and heat between 100° and 105° for about 15 minutes. Examine the plate. The chromatogram obtained from the *System suitability solution* exhibits two clearly separated spots. Any secondary spot in the chromatogram obtained from the *Test solution* is not larger or more intense than the principal spot in the chromatogram obtained from the *Standard solution*: not more than 0.2% of any individual impurity is found, and not more than 2.0% of total impurities is found.

Assay—Transfer about 0.1 g of Cystine, accurately weighed, to a glass-stoppered flask, and dissolve in a mixture of 2 mL of dilute sodium hydroxide (1 in 20) and 10 mL of water. Add 10 mL of potassium bromide solution (200 g/L in water), 50.0 mL of 0.1 N potassium bromate VS, and 15 mL of dilute hydrochloric acid (17 in 100); immediately insert the stopper into the flask, and cool in iced water. Allow to stand protected from light for 10 minutes. Add 1.5 g of potassium iodide, and after 1 minute, titrate with 0.1 N sodium thiosulfate VS, using starch TS as the indicator. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N potassium bromate VS is equivalent to 2.403 mg of $C_6H_{12}N_2O_4S_2$.▲*NF28*

BRIEFING

Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion, *USP 31* page 1132 and page 1247 of *PF* 33(6) [Nov–Dec 2007]. On the basis of comments and data received, it is proposed to make the following revisions.

1. Cancel the proposed test procedure in the *Viscosity* section, which appeared in 33(6), and replace it with an updated procedure that indicates shear rate conditions. This is based on validation data demonstrating that the test solution behaves as a Newtonian fluid under the test conditions for a shear rate of not less than 1 s^{-1} and not more than 100 s^{-1}.
2. In *Coagulum content*, a single-use woven wire cloth is also included, in addition to a stainless sieve.

(EM2: H. Wang) RTS—C65738

Change to read:

Identification— ~~*Infrared Absorption* ⟨197K⟩.~~
~~*Test specimen*—Dry as specified in the *Loss on drying* test.~~

▲Place 1 drop of Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion on a glass plate,[1] and cover the test substance with a water-resistant crystal disk (silver chloride or KRS-5).[2] Gently press on and then remove the crystal disk. Dry the crystal disk at 80° for approximately 15 minutes: the IR absorption spectrum of Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion exhibits maxima corresponding to the same wavelengths as those of a similar preparation of USP Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion RS treated in the same manner.▲*NF27*

Change to read:

Viscosity ⟨911⟩— ~~Equip a suitable rotational viscosimeter with an adapter system consisting of a measuring cylinder and a spindle. The measuring cylinder has an internal diameter of 2.762 cm and a depth of 13.50 cm; the spindle is 2.515 cm in diameter and 9.074 cm in height, and has a shaft that is 0.40 cm in diameter. Mix the Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion, pipet 16 mL into the measuring cylinder, and adjust the temperature of the Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion and the adapter to 20 ± 0.1°. With the spindle rotating at 30 rpm, immediately observe and record the scale reading. Convert the scale reading to centipoises by multiplying the reading by the constant for the viscosimeter, the adapter system, and the speed employed. The viscosity is not more than 50 centipoises.~~

In-Process Revision

[1] A simple glass microscope slide is suitable.

Change to read:

Limit of monomers—

~~*pH 2.0 Phosphate buffer, fortieth molar; Mobile phase;* and *Chromatographic system*—Prepare as directed in the test for *Limit of monomers* under *Methacrylic Acid Copolymer*.~~

~~*Standard solution*—Prepare a solution in methanol having a known concentration of about 2 µg per mL each of methacrylic acid and ethyl acrylate. To 50.0 mL of this solution add 25.0 mL of water, and mix.~~

~~*Test solution*—Dissolve 1.0 g of the Dispersion in 50.0 mL of methanol, add 25.0 mL of water, and mix.~~

~~*Procedure*—Proceed as directed in the test for *Limit of monomers* under *Methacrylic Acid Copolymer*. The total amount of monomers found is not more than 0.01%, based on the weight of the Dispersion taken.~~

▲*Sodium perchlorate solution*—Dissolve 3.5 g of sodium perchlorate in 100 mL of water. This solution has a concentration of 0.25 M.

~~*Phosphate buffer*—Prepare an aqueous solution containing 17.8 g of anhydrous dibasic sodium phosphate and 17.0 g of monobasic potassium phosphate per L. Adjust with phosphoric acid to a pH of 2.0. This buffer has a concentration of 0.125 M.~~

Mobile phase—~~Prepare a solution in methanol containing 800 mL of *Phosphate buffer* per L.~~ Add drop wise phosphoric acid to water to obtain a solution having a pH of 2.0. Prepare a mixture of this acidified water and methanol (80 : 20), and degas.

Standard solution—Dissolve about 0.01 g of methacrylic acid and 0.01 g of ethyl acrylate, accurately weighed, in 5 mL butanol, and add methanol to make exactly 100 mL. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, and dilute with methanol to volume. Mix 5.0 mL of this solution with 5.0 mL of *Sodium perchlorate solution,* accurately measured. This solution contains about 0.5 µg per mL each of methacrylic acid and ethyl acrylate.

Test solution—Transfer a quantity of the Dispersion, equivalent to 3 g of solids on the dried basis, to a 50-mL volumetric flask, dilute with methanol to volume, and mix. Add 5 mL of this solution dropwise while continuously stirring into a beaker that contains 5.0 mL of *Sodium perchlorate solution,* accurately measured. Remove the precipitated polymer by centrifugation. Use the clear supernatant.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 202-nm detector and a 4.0-mm × 12.5-cm column that contains 7-µm packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution,* and identify the components on the basis of the following relative retention times: about 1.0 and 2.6 for methacrylic acid and ethyl acrylate, respectively. Record the peak responses as directed for *Procedure:* the resolution, *R,* between methacrylic acid and ethyl acrylate is not less than 2.0; and the relative standard deviation for replicate injections determined from each analyte is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of each monomer in the solid portion of the Dispersion taken by the formula:

~~$100.0(10^{-4})(C/W)(r_U/r_S)$~~

$$100(10)(10)(10^{-6})(C/W)(r_U/r_S)$$

BRIEFING

Olive Oil, *NF* 26 page 1184. On the basis of comments and data received, and to align with the *Refined Olive Oil* monograph in the *European Pharmacopoeia, 6th Edition*, it is proposed to make the following revisions:

1. Add CAS number.
2. Revise the *Definition*.
3. Revise the *Packaging and storage* section.
4. Add an *Identification* test citing a test for *Fatty acid composition*, and add a *Fatty acid composition* test.
5. Delete the test for *Specific gravity* and move the information to the *Description and Solubility* section (see this issue of *PF*).
6. Delete the tests for *Cottonseed oil*, *Peanut oil*, and *Teaseed oil*; the tests are now unnecessary because of the addition of tests for *Fatty acid composition* and *Sterol composition*.
7. To prevent adulteration with sesame oil, revise the test for *Sesame oil* from a test for sesamolin detection to one for sesamin detection. Both sesamolin and sesamin are specific constitutents of sesame unsaponifiable matter. It is reported that sesamolin is present in crude sesame oil but not in refined sesame oil; however, sesamin is naturally present in both crude and refined sesame oils. In addition, change the title to *Absence of sesame oil*.
8. Replace the test for *Free fatty acid* with a test for *Acid value*.
9. Add a test for *Peroxide value*.
10. Add a test for *Unsaponifiable matter*.
11. Add a test for *Specific absorbance*. References to two chapters in this test will become official in a future Supplement or Book (one is a title change and the other is a new chapter).
12. Delete the tests for *Solidification range of fatty acids*, *Iodine value*, and *Saponification value*; they are now unecessary because of the addition of the *Fatty acid composition* test.
13. Add a test for *Water*.
14. Add a test for *Alkaline impurities*.
15. Add a test for *Sterol composition*.

Other changes are editorial in nature.

▲*NF28*

Delete the following:

▲~~**Specific gravity** ⟨841⟩: between 0.910 and 0.915.~~▲*NF28*

Delete the following:

▲~~**Cottonseed oil**—Mix 5 mL in a test tube with 5 mL of a mixture of equal volumes of amyl alcohol and a 1 in 100 solution of sulfur in carbon disulfide, warm the mixture carefully to expel the carbon disulfide, and immerse the test tube to one third of its length in a boiling, saturated solution of sodium chloride for 2 hours: the mixture develops no reddish color.~~▲*NF28*

Delete the following:

▲~~**Peanut oil**—Saponify 10 g by heating for 1 hour under a reflux condenser with 80 mL of alcoholic potassium hydroxide TS. Add phenolphthalein TS, neutralize with 1 N acetic acid, and wash the solution into 120 mL of boiling lead acetate TS contained in a conical flask. Boil the mixture for 1 minute, and cool by immersing the flask in cold water, rotating the contents occasionally to cause the precipitate to adhere to the walls of the flask. Decant the liquid, wash the precipitate with cold water to remove the excess lead acetate, and then wash with 90 percent (by volume) alcohol. Add 100 mL of ether, stopper the flask, and allow to stand until the precipitate is disintegrated. Connect the flask to a reflux condenser, boil for 5 minutes, cool to about 15°, and allow to stand overnight. Filter, and thoroughly wash the precipitate with ether. With the use of a jet of ether, transfer the precipitate to a 500-mL separator, alternating the jet of ether with 3 N hydrochloric acid at the end if any of the precipitate adheres to the filter paper. Add sufficient 3 N hydrochloric acid to make the total acid layer measure about 100 mL, and add sufficient ether to make the ether layer measure about 100 mL. Shake the mixture vigorously for several minutes, allow the layers to separate, draw off the acid layer, and wash the ether once by shaking with 50 mL of 3 N hydrochloric acid and finally with several portions of water until the last washing is not acid to methyl orange TS. Transfer the ether solution to a dry flask, evaporate the ether, add a small amount of dehydrated alcohol, and evaporate on a steam bath to dryness. Dissolve the residue of dry fatty acids by warming with 60 mL of 90 percent (by volume) alcohol, slowly cool the solution to 15° while shaking frequently, and allow the solution to stand at 15° for 30 minutes: no crystals separate from the solution.~~▲*NF28*

Delete the following:

▲~~**Sesame oil**—Mix 10 mL with 10 mL of hydrochloric acid, add 0.1 mL of a 1 in 50 solution of furfural in alcohol, and shake the mixture vigorously for 15 seconds: no pink to crimson color appears in the acid layer when the emulsion breaks. If any color appears in the acid layer, add 10 mL of water, and again shake the mixture vigorously: in the absence of sesame oil any pink color is evanescent.~~▲*NF28*

Delete the following:

▲~~**Teaseed oil**—In a dry, 18- × 150-mm test tube place 0.8 mL of acetic anhydride, 1.5 mL of chloroform, and 0.2 mL of sulfuric acid, mix, and cool in a water bath to 25°. Add about 200 mg of Olive Oil (about 7 drops), mix, and cool to 25°. If the solution is cloudy, add acetic anhydride, dropwise, shaking after each addition, until the solution suddenly clears. Allow the mixture to remain in the water bath for 5 minutes: it shows a green color by both reflected and transmitted light. Add 10 mL of absolute ether, and mix by inverting the tube: the initial green color fades to a brownish gray. (Before the dilution with ether, the presence of *teaseed oil* will cause a brown color to appear by transmitted light, and after the dilution, a transient red color.) [NOTE—A pink color is regarded as negative, because some olive oils yield this color.]~~▲*NF28*

Add the following:

▲**Absence of sesame oil**—Mix 10 mL of Olive Oil with a mixture of 0.5 mL of a 0.35% (v/v) solution of furfural in acetic anhydride and 4.5 mL of acetic anhydride, and shake the mixture for about 1 minute. Pass through a filter paper previously wetted with acetic anhydride. Add 0.2 mL of sulfuric acid to the filtrate: no bluish-green color develops. ▲*NF28*

Delete the following:

▲~~**Solidification range of fatty acids** ⟨401⟩—The dry, mixed fatty acids of it solidify between 17° and 26°.~~▲*NF28*

Delete the following:

▲~~**Free fatty acids** ⟨401⟩—The free fatty acids in 10 g require for neutralization not more than 5.0 mL of 0.10 N sodium hydroxide.~~▲*NF28*

Add the following:

▲**Acid value** ⟨401⟩**:** not more than 0.3.▲*NF28*

Add the following:

▲**Peroxide value** ⟨401⟩**:** not more than 10.0.▲*NF28*

Add the following:

▲**Unsaponifiable matter** ⟨401⟩**:** not more than 1.5%.▲*NF28*

Add the following:

▲**Specific absorbance**—Dissolve 1.0 g of Olive Oil in cyclohexane, and dilute with cyclohexane to 100 mL. Determine the UV-Vis absorbance using a suitable spectro-

photomer (see *Spectroscopy and Light-Scattering* ⟨851⟩ and *Ultraviolet-Visible Spectroscopy* ⟨857⟩) at a wavelength of 270 nm: the absorbance is not more than 1.20.▲*NF28*

Delete the following:

▲~~**Iodine value** ⟨401⟩: between 79 and 88.~~▲*NF28*

Delete the following:

▲~~**Saponification value** ⟨401⟩: between 190 and 195.~~▲*NF28*

Add the following:

▲**Water,** *Method Ic* ⟨921⟩**:** Not more than 0.1%.▲*NF28*

Add the following:

▲**Alkaline impurities**—Mix 10 mL of acetone and 0.3 mL of water, and add 0.05 mL of bromophenol blue TS. Neutralize the solution to a green color if necessary with 0.01 N hydrochloric acid or 0.01 N sodium hydroxide. Add 10 mL of Olive Oil, shake, and allow to stand. Titrate with 0.01 N hydrochloric acid VS to change the color of the upper layer to yellow: not more than 0.1 mL of 0.01 N hydrochloric acid is required.▲*NF28*

Add the following:

▲**Sterol composition**—Proceed as directed under *Fats and Fixed Oils* ⟨401⟩, the section *Sterol Composition*: Olive Oil exhibits the following composition profiles of sterols.

Component	Percentage (%)
Cholesterol	≤0.5
Campesterol	≤4.0
Δ7-Stigmasterol	≤0.5
Sum of the contents of Δ5,23-stigmastadienol, clerosterol, β-sitosterol, sitostanol, Δ5-avenasterol, and Δ5,24-stigmastadienol	≥93.0

The content of stigmasterol is not greater than that of campesterol.▲*NF28*

BRIEFING

Polyoxyl 15 Hydroxystearate. Because there is no existing *NF* monograph for this excipient, a new monograph, based on validated methods, as well as data and comments received, is being proposed. The liquid chromatographic procedure in the test for *Free polyethylene glycols* is based on analysis performed with the Waters Ultrahydrogel 120 brand of column that contains 6-µm packing L25. The typical retention time for polyethylene glycol 1000 is about 7 minutes.

(EM2: H. Wang; NOM: A. Wilk) RTS—C66478

Add the following:

▲Polyoxyl 15 Hydroxystearate

12-Hydroxyoctadecanoic acid polymer with α-hydro-ω-hydroxypoly(oxy-1,2-ethanediyl).

Polyethylene glycol 15 hydroxystearate [*70142-34-6*].

» Polyoxyl 15 Hydroxystearate results from the reaction of about 15 moles of ethylene oxide with 1 mole of 12-hydroxystearic acid. The product consists mainly of 12-hydroxystearic acid polyethoxylated at both the carboxyl and the hydroxyl groups with polyethylene glycol. It contains free polyethylene glycols.

Packaging and storage—Preserve in tight containers at a temperature below 25°.

USP Reference standards ⟨11⟩—*USP 12-Hydroxystearic Acid RS. USP Polyethylene Glycol 1000 RS. USP Polyoxyl 15 Hydroxystearate RS.*

Identification—

A: *Infrared Absorption* ⟨197F⟩—If the sample is solid or too viscous for thin film formation, the sample should be gently warmed to achieve a mobile liquid, which may then be used to prepare the thin film.

In-Process Revision

B: *Thin-Layer Chromatographic Identification Test* ⟨201⟩—

Test solution—To 1.0 g of Polyoxyl 15 Hydroxystearate add 100 mL of a 100 mg per mL solution of potassium hydroxide, and boil under a reflux condenser for 30 minutes. Acidify the warm solution with 20 mL of hydrochloric acid, and cool to room temperature. Shake the mixture with 50 mL of ether, and allow to stand until a separation of the layers is visible. Separate the clear upper layer, add 5 g of anhydrous sodium sulfate, wait for 30 minutes, filter, and evaporate to dryness on a water bath. Dissolve 50 mg of the residue in 25 mL of ether.

Standard solution—Dissolve 50 mg of USP 12-Hydroxystearic Acid RS in 25 mL of methylene chloride.

Plate: Octadecylsilyl silica gel for chromatography as the coating substance.

Application volume: 2 µL.

Developing solvent system: acetone–glacial acetic acid–methylene chloride (50 : 40 : 10 v/v/v).

Spray reagent—Prepare a solution of 80 mg per mL of phosphomolybdic acid in 2-propanol.

Procedure—Proceed as directed in the chapter. Develop over two-thirds of the plate, and dry in a current of cold air. Then spray the plate with *Spray reagent*, heat the plate at 120° for 1 to 2 minutes, and locate the spots on the plate: the R_F value and color of the principal spot in the chromatogram obtained from the *Test solution* correspond to those obtained from the *Standard solution*.

C: It meets the requirements of the test for *Free polyethylene glycols*.

Acid value ⟨401⟩**:** not more than 1.0, determined on 2.0 g.

Hydroxyl value ⟨401⟩**:** between 90 and 110.

Iodine value, *Method I* ⟨401⟩**:** not more than 2.0.

Peroxide value ⟨401⟩**:** not more than 5.0.

Saponification value ⟨401⟩**:** between 53 and 63.

Total ash ⟨561⟩**:** not more than 0.3%, determined on 1.0 g.

Water, *Method Ia* ⟨921⟩**:** not more than 1.0%, determined on 2.0 g.

Limit of nickel—

Caution—When using closed high-pressure digestion vessels and microwave laboratory equipment, the safety precautions and operating instructions given by the manufacturer must be followed.

[NOTE—If an alternative apparatus is used, adjustment of the instrument parameters may be necessary.]

Nickel standard stock solution—Dilute nickel standard solution TS two-fold with water. This solution contains the equivalent of 5 µg of nickel per mL.

Standard solutions—Transfer 25 µL, 50 µL, 75 µL, and 100 µL of *Nickel standard stock solution* to four identical 25-mL volumetric flasks. To each flask, add 0.5 mL of a 10 mg per mL solution of magnesium nitrate, 0.5 mL of a 100 mg per mL solution of monobasic ammonium phosphate and 6.0 mL of nickel-free nitric acid, dilute with water to volume, and mix well. [NOTE—Content of nickel in the nickel-free nitric acid is not more than 0.005 ppm.] The *Standard solutions* contain, respectively, 0.005 µg per mL, 0.01 µg per mL, 0.015 µg per mL, and 0.02 µg per mL of nickel.

Test solution—Transfer about 250 mg of Polyoxyl 15 Hydroxystearate, accurately weighed, to a suitable high-pressure-resistant digestion vessel (fluoropolymer or quartz glass), and add 6.0 mL of nickel-free nitric acid and 2.0 mL of 30% hydrogen peroxide. Place the closed vessel in a laboratory microwave oven, and digest using an appropriate program, e.g., 1000 W for 40 minutes. Allow the digestion vessel to cool down before opening. Add 2.0 mL of 30% hydrogen peroxide, and repeat the digestion step. Allow the

digestion vessel to cool down before opening. Quantitatively transfer to a 25-mL volumetric flask, add 0.5 mL of a 10 mg per mL solution of magnesium nitrate and 0.5 mL of a 100 mg per mL solution of monobasic ammonium phosphate, dilute with water to volume, and mix well.

Blank solution—Place 6.0 mL of nickel-free nitric acid and 2.0 mL of 30% hydrogen peroxide in a suitable high-pressure-resistant digestion vessel. Proceed as directed under *Test solution*, beginning with "Place the closed vessel in a laboratory microwave oven, and digest using an appropriate program, e.g., 1000 W for 40 minutes".

Zero solution—In a 50-mL volumetric flask, introduce 1.0 mL of a 10 mg per mL solution of magnesium nitrate, 1.0 mL of a 100 mg per mL solution of monobasic ammonium phosphate, and 12.0 mL of nickel-free nitric acid. Dilute with water to volume, and mix well.

Procedure—Concomitantly determine the absorbances of the *Blank solution, Standard solutions,* and the *Test solution* at the nickel emission line of 232.0 nm, using a suitable graphite furnace atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩), equipped with a background compensation system, a coated tube resistant to pyrolysis, and a nickel hollow-cathode lamp. Maintain the drying temperature of the furnace at 120° for 35 seconds after a 5-second ramp; maintain the ashing temperature at 1100° for 10 seconds after a 30-second ramp; maintain the cooling temperature at 800° for 5 seconds after a 5-second decrease; and maintain the atomization temperature at 2600° for 7 seconds. [NOTE—The temperature program may be modified to obtain optimum furnace temperatures.] Use the *Zero solution* to set the instrument to zero. Plot the absorbances of the *Standard solutions* versus concentration, in µg per mL, of nickel, and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration, C_T, in µg per mL, of nickel in the *Test solution*, and determine the concentration, C_B, in µg per mL, of nickel in the *Blank solution*. If necessary, dilute with the *Zero solution* to obtain a reading within the calibrated absorbance range. Calculate the quantity, in µg, of nickel in each g of Polyoxyl 15 Hydroxystearate taken by the formula:

$$25(C_T - C_B) / W$$

in which 25 is the volume, in mL, of the *Test solution* and the *Blank solution*; and W is the weight, in g, of Polyoxyl 15 Hydroxystearate taken to prepare the *Test solution*: not more than 1 µg of nickel per g is found.

Limit of free ethylene oxide and dioxane—

Caution—Ethylene oxide is toxic and flammable. Prepare these solutions in a well-ventilated fume hood, using great care. Protect both hands and face by wearing polyethylene protective gloves and an appropriate face mask. Store all solutions in hermetic containers, and refrigerate at a temperature between 4° and 8°.

[NOTE—Before using the polyethylene glycol 200 in this test, remove any volatile components from it by placing 500 mL of polyethylene glycol 200 in a 1000-mL round-bottom flask, attaching the flask to a rotary evaporator maintained at a temperature of 60° and under a vacuum of 10–20 mm Hg for 6 hours.]

Acetaldehyde solution—Prepare a solution of acetaldehyde in water, containing a known concentration of about 10 µg per mL. [NOTE—Prepare the *Acetaldehyde solution* immediately prior to use.]

Ethylene oxide stock solution—Fill a chilled pressure bottle with liquid ethylene oxide, and store in a freezer when not in use. Use a small piece of polyethylene film to protect the liquid from contact with the rubber gasket. Tare a glass-stoppered conical flask, add about 50 mL of polyethylene glycol 200, and reweigh the flask. Transfer about 5 mL of the liquid ethylene oxide to a 100-mL beaker chilled in a mixture of sodium chloride and ice (1 : 3). Using a gas-tight syringe that has been previously cooled to –10°, transfer about 300 µL (corresponding to about 250 mg) of liquid ethylene oxide to the polyethylene glycol 200, and swirl gently to mix.

Replace the stopper, reweigh the flask, and determine the amount of ethylene oxide absorbed by weight difference. Adjust the weight of the mixture with polyethylene glycol 200 to 100.0 g, replace the stopper, and swirl gently to mix. This stock solution contains about 2.5 mg of ethylene oxide per g. [NOTE—Prepare this stock solution immediately prior to use, and store in a refrigerator.]

Ethylene oxide solution—Tare a glass-stoppered conical flask, and chill it in a refrigerator. Add about 35 mL of polyethylene glycol 200, and reweigh the flask. Using a gas-tight gas chromatographic syringe that has been chilled in a refrigerator, transfer about 1 g of the chilled *Ethylene oxide stock solution,* accurately weighed, to the tared, conical flask. Adjust the weight of the solution with polyethylene glycol 200 to 50.0 g, replace the stopper, and swirl gently to mix. Transfer about 10 g of this solution, accurately weighed, to a 50-mL volumetric flask. Add 30 mL of water, and mix. Dilute with water to volume, and mix to obtain a solution containing about 10 µg of ethylene oxide per mL. [NOTE—Prepare this solution immediately prior to use, and use directly after preparation.]

Dioxane solution—Dissolve about 1.0 g of dioxane, accurately weighed, in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 500 µg of dioxane per mL.

Standard solution A—Transfer 0.1 mL of *Ethylene oxide solution* to a 10-mL pressure headspace vial. [NOTE—Other sizes may be used depending on the operating conditions, however, the same size must be used for *Standard solution A*, *Standard solution B,* and the *Test solution*.] Add 0.1 mL of *Acetaldehyde solution* and 0.1 mL of *Dioxane solution,* seal the vial, and mix.

Standard solution B—Transfer about 1.0 g of Polyoxyl 15 Hydroxystearate, accurately weighed, to another 10-mL pressure headspace vial, add 0.1 mL of *Ethylene oxide solution,* 0.1 mL of *Dioxane solution,* and 1.0 mL of *N,N*-dimethylacetamide. Seal the vial, and mix.

Test solution—Transfer about 1.0 g of Polyoxyl 15 Hydroxystearate, accurately weighed, to a 10-mL pressure headspace vial, add 1.0 mL of *N,N*-dimethylacetamide and 0.2 mL of water, seal the vial, and mix.

Chromatographic system (see *Chromatography* ⟨621⟩)—[NOTE—The use of a headspace apparatus that automatically transfers a measured amount of headspace is allowed.] The gas chromatograph is equipped with a flame-ionization detector, maintained at about 250°, and a 0.32-mm × 30-m glass or quartz capillary column bonded with a 1.0-µm layer of phase G1. The injection port is equipped with a split injection port with a split ratio of 20 : 1, and the temperature is maintained at about 150°. The column temperature is maintained at 50° for 5 minutes after injection, then programmed to increase at the rate of 5° per minute to 180°, then at the rate of 30° per minute to 230°, and then maintained at 230° for 5 minutes. Each vial is heated at a temperature of 90° for 45 minutes, before a suitable portion of its headspace is injected. The carrier gas is helium flowing with a linear velocity of about 20 cm per second. [NOTE—If the headspace apparatus is used, then an injection time of 12 seconds and a transfer line temperature of 150° are recommended.] Chromatograph the gaseous phase of *Standard solution A,* and record the peak responses as directed for *Procedure*: the relative retention times are about 0.94 for acetaldehyde and 1.0 for ethylene oxide; the resolution, *R,* between acetaldehyde and ethylene oxide is not less than 2.0; the dioxane peak is detected with a signal-to-noise ratio of not less than 5; and the relative standard deviation for replicate injections is not more than 15%.

Procedure—Using a heated, gas-tight, gas chromatographic syringe, separately inject equal volumes (about 1 mL) of the gaseous headspace of *Standard solution A*, *Standard solution B*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks: the mean areas of the ethylene oxide and dioxane peaks in the

chromatogram obtained from the *Test solution* are not greater than half the mean areas of the corresponding peaks in the chromatogram obtained from *Standard solution B*.

Calculate the concentration of ethylene oxide, in µg per g, in the portion of Polyoxyl 15 Hydroxystearate taken by the formula:

$$A_E\, r_U / [(r_S W_U) - (r_U / W_S)]$$

in which A_E is the quantity, in µg, of ethylene oxide added to *Standard solution B;* r_U and r_S are the ethylene oxide peak responses obtained from the *Test solution* and *Standard solution B,* respectively; and W_U and W_S are the weights, in g, of the substance under test taken to prepare the *Test solution* and *Standard solution B,* respectively: not more than 1 µg per g is found.

Calculate the concentration of dioxane, in µg per g, in the portion of Polyoxyl 15 Hydroxystearate taken by the formula:

$$A_D\, r_U / [(r_S W_U) - (r_U / W_S)]$$

in which A_D is the amount, in µg, of dioxane added to *Standard solution B;* r_U and r_S are the dioxane peak responses obtained from the *Test solution* and *Standard solution B,* respectively; and W_U and W_S are as defined above: not more than 50 µg per g is found.

Free polyethylene glycols—

Mobile phase: A mixture of methanol and water (8 : 2 v/v).

Standard solution A—Prepare a solution of USP Polyethylene Glycol 1000 RS in *Mobile phase,* containing a known concentration of about 1.6 mg per mL.

Standard solution B—Dilute 50.0 mL of *Standard solution A* with *Mobile phase* to 100.0 mL. The solution contains a known concentration of about 0.8 mg per mL.

Test solution—Transfer about 1.2 g of Polyoxyl 15 Hydroxystearate, accurately weighed, to a 250-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix well.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector, two 4-mm × 12.5-cm precolumns that contain 5-µm packing L1 and a 10-nm pore size, and a 7.8-mm × 30-cm analytical column that contains 6-µm packing L25 and a 12-nm pore size. The flow rate is about 1.1 mL per minute. The column and detector temperatures are maintained at room temperature. Connect both precolumns to the analytical column using a 3-way valve, and switch the *Mobile phase* flow according to the following program. [NOTE—Shown in *Figure 1*, the analysis is started with precolumn 2 and an analytical column in series. After about 114 seconds, the valves, controlled by the detector program, switch over such that the eluent flows past precolumn 2, and direct to precolumn 1 and the analytical column. The columns are switched when the components to be determined, but not the interfering matrix, are ready to reach the analytical column. Simultaneously, precolumn 2 is washed out in the reverse direction by a second pump to remove the unwanted matrix components.]

Time (seconds)	Program
0–114	Precolumn 2 and analytical column
115–end	Precolumn 1 and analytical column
115–420	Reverse flow of precolumn 2

Chromatograph *Standard solution A,* and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 3.0%.

Procedure—Inject a volume (about 50 µL) of *Standard solution A*, *Standard solution B,* and the *Test solution* into the chromatograph, record the chromatogram, and measure the responses for the major peaks. Calculate the percentage of polyethylene glycols in the portion of Polyoxyl 15 Hydroxystearate taken by the formula:

$$100(V)(2C_S / W)[r_U / (r_{S1} + 2r_{S2})]$$

In-Process Revision

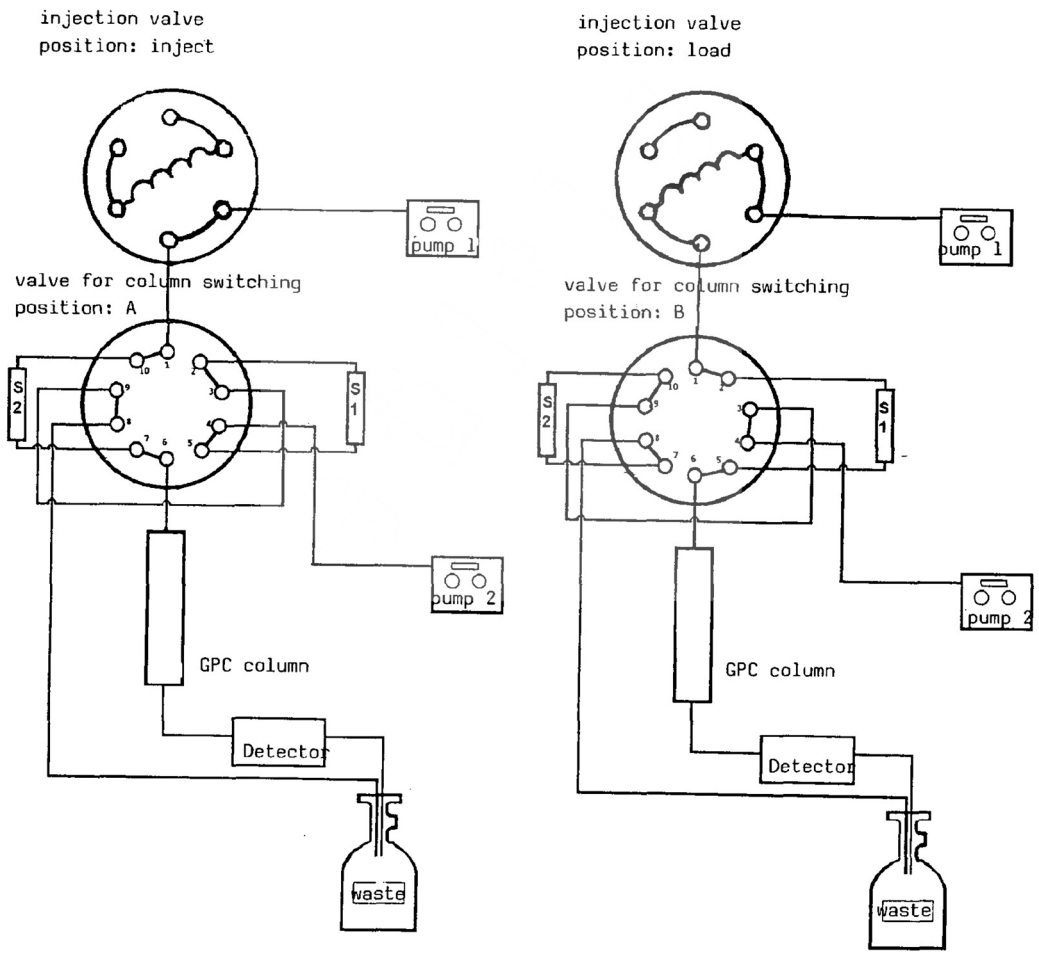

Figure 1. Apparatus

in which V is the volume, in mL, of the *Test solution;* C_S is the concentration, in mg per mL, of USP Polyethylene Glycol 1000 RS in *Standard solution A;* W is the weight, in mg, of Polyoxyl 15 Hydroxystearate taken to prepare the *Test solution*; r_U is the polyethylene glycol peak response obtained from the *Test solution;* and r_{S1} and r_{S2} are the polyethylene glycol 1000 peak responses obtained from *Standard solution A* and *Standard solution B,* respectively: between 27.0% and 39.0% of free polyethylene glycols is found.▲*NF28*

In-Process Revision

BRIEFING

Polyvinyl Acetate Dispersion. On the basis of data and comments received, a new *NF* monograph is being proposed based on the validated methods. The liquid chromatographic procedure in the test for *Limit of vinyl acetate* employs the Thermo Aquasil brand of column that contains 5-µm packing L1. The typical retention times for vinyl acetate and 1-vinylpyrrolidin-2-one are 23.0 and 28.5 minutes, respectively. The liquid chromatographic procedure in the test for *Limit of acetic acid/acetate* is based on analysis performed with the Thermo Aquasil brand of column that contains 5-µm packing L1. The typical retention times for acetic acid and citric acid are 6.0 and 7.4 minutes, respectively.

(EM2: H. Wang; NOM: A. Wilk; MSA: R. Tirumalai) RTS—C57716

Add the following:

▲Polyvinyl Acetate Dispersion

» Dispersion of polyvinyl acetate in water. It contains 25.0 percent to 30.0 percent of polyvinyl acetate. It may contain suitable surface active agents and stabilizers.

Packaging and storage—Preserve in tight containers at a temperature below 25°. Protect from freezing.

Labeling—Label it to indicate the names and quantities of any added surface active agents and stabilizers.

USP Reference standards ⟨11⟩—*USP Polyvinyl Acetate Dispersion RS.*

Identification—

A: Place one drop of sample on a glass plate and allow to dry. A clear and homogeneous film is formed.

B: Place one drop of the Dispersion on a glass plate, and cover the test substance with a water-resistant crystal disk (silver chloride or KRS-5[1]). Gently press on, and then remove the crystal disk. Dry the crystal disk in a drying chamber until a homogeneous film is formed: the IR absorption spectrum of the film so formed exhibits maxima corresponding to the same wavelengths as those of a similar preparation of USP Polyvinyl Acetate Dispersion RS treated in the same manner.

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 1000 cfu per g, and the total combined molds and yeasts count does not exceed 100 cfu per g.

pH ⟨791⟩**:** between 3.0 and 5.5.

Loss on drying ⟨731⟩—Dry 1.0 g of the Dispersion at 110° for 5 hours: it loses between 68.5% and 71.5% of its weight.

Residue on ignition ⟨281⟩—not more than 0.5%, determined on 1.0 g. Heat a silica crucible to redness for 30 minutes, allow to cool in a desiccator, and weigh. Evenly distribute 1.0 g of Polyvinyl Acetate Dispersion in the crucible and weigh. Dry the crucible at 100° to 105° for 1 hour and ignite in a muffle furnace at 600 ± 25°, until the test substance is thoroughly charred. Continue the experiment as directed under *Residue on Ignition* ⟨281⟩ on the residue obtained, beginning with "Moisten the sample with a small amount (usually 1 mL) of sulfuric acid . . ."

Coagulum content—Accurately weigh a stainless steel sieve having 45-µm openings or a suitable single-woven wire cloth with a mesh width of 45 µm, and filter 100 g of the Dispersion through it. [NOTE—Suitable single-woven wire cloth mesh meets the requirements set in ISO 9044.] Wash the sieve or the cloth with distilled water until a clear filtrate is obtained, and dry the sieve or the cloth to constant weight at 100° to 105°: the weight of the residue does not exceed 500 mg (0.5%).

Stabilizers or surface active agents—

POVIDONE—Perform this test only if the dispersion contains this component.

Perform nitrogen determination by sulfuric acid digestion on 0.25 g as directed under *Nitrogen Determination* ⟨461⟩*, Method II.* Calculate the percentage content of povidone using the following formula:

$$N / 0.126$$

[1] KRS-5 consists of 42% thallium(I) bromide and 58% thallium(I) iodine by molecular weight. Suitable disks of silver chloride and of KRS-5 are available from www.photonic.saint-gobain.com, www.almazoptics.com, and www.internationalcrystal.net.

In-Process Revision

in which *N* is the percentage content of nitrogen, and 0.126 is the percentage content, expressed as a decimal number, of nitrogen in vinylpyrrolidone. The content of povidone is not more than 4.0%.

Limit of vinyl acetate—

Mobile phase A: A mixture of water, acetonitrile, methanol (90 : 5 : 5 v/v/v).

Mobile phase B: A mixture of water, acetonitrile, methanol (50 : 45 : 5 v/v/v).

Standard solution—Transfer 50 mg of vinyl acetate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix well. Dilute 5.0 mL of the solution with *Mobile phase A* to 100 mL. Dilute 10.0 mL of this solution with *Mobile phase A* to 100 mL. The *Standard solution* contains about 2.5 µg of vinyl acetate per mL. [NOTE—This solution should be analyzed within 1 hour when store at room temperature.]

System suitability solution—Transfer 50 mg of vinyl acetate and 50 mg of 1-vinylpyrrolidin-2-one to a 50-mL volumetric flask, add 10 mL of methanol, sonicate or gently shake the flask to dissolve the materials. Dilute with *Mobile phase A* to volume. Dilute 10 mL of this solution with *Mobile phase A* to 100 mL. Dilute 5 mL of this solution with *Mobile phase A* to 100 mL. The *System suitability solution* contains about 5 µg per mL each of vinyl acetate and 1-vinylpyrrolidin-2-one.

Test solution—Transfer about 250 mg of the Dispersion, accurately weighed, to a 10-mL volumetric flask, add about 4 mL of methanol, and sonicate. After cooling to ambient temperature, dilute with water to volume, and mix. Centrifuge at 4000 *g* for 10 minutes, and pass through a 0.2-mm membrane filter. [NOTE—This solution should be analyzed within 1 hour when store at room temperature.]

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 205-nm detector, and a 4.0-mm × 25-cm analytical column that contains 5-µm packing L1. The column is maintained at a constant temperature of about 30°. A 4.0-mm × 3-cm pre-column that contains 5-µm packing L1 may be used if a matrix effect is observed. [NOTE—The matrix effect may result in poor reproducibility of the retention times and of the peak shapes.] The flow rate is about 1.0 mL per minute. The gradient elution is programmed as follows.

Time (minutes)	*Mobile phase A* (% v/v)	*Mobile phase B* (% v/v)
0–2	100	0
2–40	100→85	0→15
40–42	85→0	15→100
42–48	0	100
48–51	0→100	100→0

Chromatograph the *System suitability solution,* and identify the components based on their relative retention times, which are 1.0 and 1.2 for vinyl acetate and 1-vinylpyrrolidin-2-one, respectively. Record the peak responses as directed for *Procedure*: the resolution, *R,* between vinyl acetate and 1-vinylpyrrolidin-2-one is not less than 5.0; and the relative standard deviation for replicate injections determined from the 1-vinylpyrrolidin-2-one peak is not more than 5.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution,* the *System suitability solution,* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the vinyl acetate peaks. The response of the vinyl acetate peak obtained from the *Test solution* is not more than that of the vinyl acetate peak obtained from the *Standard solution*: not more than 100 ppm is found.

Limit of acetic acid/acetate—

Mobile phase—5 mM sulfuric acid.

Standard solution—Dissolve accurately weighed quantities of acetic acid and citric acid in *Mobile phase* to make a solution having known concentrations of 0.3 mg per mL for each of acetic acid and citric acid.

Test solution—Transfer 200 mg of the Dispersion, accurately weighed, to a 10-mL volumetric flask, add about 8 mL of water, and sonicate for about 10 minutes. Cool to ambient temperature, and dilute with water to volume.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 205-nm detector and a 4.6-mm × 25-cm anaytical column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. After each injection, rinse the column with a mixture of equal volumes of *Mobile phase* and acetonitrile. Chromatograph the *Standard solution,* and identify the compounds based on their relative retention times, which are 1.0 and 1.2 for acetic acid and citric acid, respectively. Record the peak responses as directed for *Procedure*: the resolution, *R,* between acetic acid and citric acid is not less than 2.0; and the relative standard deviation for replicate injections determined from the acetic acid peak is not more than 5.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the acetic acid peaks. The response of the acetic acid peak obtained from the *Test solution* is not more than that of the acetic acid peak obtained from the *Standard solution*: not more than 1.5% of acetic acid is found.

Assay—Transfer about 1.5 g of the Dispersion, accurately weighed, to a 250-mL borosilicate glass flask fitted with a reflux condenser. Add 25.0 mL of 0.5 M alcoholic potassium hydroxide and a few glass beads. Attach the condenser and heat under reflux for 30 minutes. Add 1 mL of phenolphthalein TS, and titrate immediately (while still hot) with 0.5 N hydrochloric acid VS. Perform a blank determination under the same conditions (see *Residual Titrations* under *Titrimetry* ⟨541⟩). Calculate the saponification value, I_S, by the formula:

$$[56.11(V_B - V_T)N] / W$$

in which 56.11 is the molecular weight of potassium hydroxide; V_B and V_T are the volumes, in mL, of 0.5 N hydrochloric acid consumed in the blank test and in the actual test, respectively; N is the exact normality of the hydrochloric acid; and W is the weight, in g, of the Dispersion taken for the test.

Calculate the percentage content of polyvinyl acetate using the following formula:

$$100(10^{-3})[(86.09)I_S] / 56.11$$

in which 10^{-3} is a factor converting mg to g; and 86.09 and 56.11 are the molecular weights of vinyl acetate and potassium hydroxide, respectively.▲*NF28*

BRIEFING

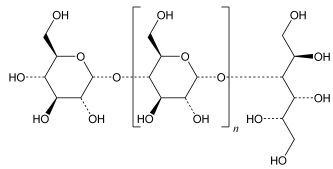
Hydrogenated Starch Hydrolysate. The proposed new monograph for Hydrogenated Starch Hydrolysate, which appeared on page 488 of *PF* 33(3) [May–June 2007], was subsequently canceled. The previous proposal only covered a very limited range of products. On the basis of comments and data received and to replace that monograph, a new monograph for Hydrogenated Starch Hydrolysate is now being proposed. The liquid chromatographic procedures in the tests for *Content of maltitol and sorbitol* and *Hydrogenated polysaccharides* are based on analyses performed with the Polymer Laboratories Hi-Plex brand of L58 column. The typical retention times for maltose, maltitol, dextrose, and sorbitol are 29, 30, 34, and 36 minutes, respectively.

(EM2: H. Wang; MSA: R. Tirumalai) RTS—C57641

Add the following:

▲Hydrogenated Starch Hydrolysate

Hydrogenated Polysaccharides



$C_{12}H_{24}O_{11}(C_6H_{10}O_5)_n$

Polyglucitol.

Polyglycitol syrup [*68425-17-2*].

» Hydrogenated Starch Hydrolysate is a mixture that contains not less than 50% of hydrogenated polysaccharides containing more than 3 D-gluco-

In-Process Revision

pyranosyl units terminated with D-glucityl unit, calculated on the anhydrous basis. Other ingredients can comprise sorbitol, maltitol or other sugar polyols.

Packaging and storage—Preserve in well-closed containers. No storage requirements specified for liquid product; store in a cool and dry place for dried powder product.

Labeling—Label it to indicate *Water* content.

USP Reference standards ⟨11⟩—*USP Dextrose RS. USP Maltitol RS. USP Maltose Monohydrate RS. USP Sorbitol RS.*

Identification—

A: It meets the requirements of the test for *Content of maltitol and sorbitol*.

B: It meets the requirements of the test for *Hydrogenated polysaccharides*.

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 1000 cfu per g, and the total combined molds and yeasts count does not exceed 100 cfu per g. It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli.*

pH ⟨791⟩**:** between 3.0 and 7.0, in a 20% (w/w) solution in freshly boiled and cooled water.

Water, *Method I* ⟨921⟩**:** not less than 90% and not more than 110% of the value stated on the label.

Residue on ignition ⟨281⟩: not more than 0.15%, ignition of a quantity of Hydrogenated Starch Hydrolysate, equivalent to 1.0 g of solid on the anhydrous basis.

Reducing sugars—Dissolve a quantity of Hydrogenated Starch Hydrolysate, equivalent to 1.0 g on the anhydrous basis, in 6 mL of water with the aid of gentle heat, if necessary. Cool, and add 20.0 mL of cupric citrate TS and a few glass beads. Heat so that boiling begins after 4 minutes, and maintain boiling for 3 minutes. Cool rapidly, and add 40 mL of diluted acetic acid, 60 mL of water, and 20.0 mL of 0.05 N iodine VS. With continuous shaking, add 25 mL of a mixture of 6 mL of hydrochloric acid and 94 mL of water. When the precipitate has dissolved, titrate the excess of iodine with 0.05 N sodium thiosulfate VS using 2 mL of starch TS as an indicator, added towards the end of the titration. Not less than 12.8 mL of 0.05 N sodium thiosulfate is required, corresponding to not more than 1% of reducing sugars.

Limit of chloride—

Test solution—Transfer a quantity of Hydrogenated Starch Hydrolysate equivalent to 25 g on the anhydrous basis, to a beaker, add 100 mL of water, and stir until the Hydrogenated Starch Hydrolysate is completely dissolved.

Procedure—Add 1.0 mL of potassium chromate indicator solution (1 in 20) into the *Test solution.* Slowly titrate with 0.1 N silver nitrate VS until a reddish-orange color persists. Calculate the quantity, in µg, of chloride in each g of Hydrogenated Starch Hydrolysate taken by the formula:

$$[(10^3)(35.45)NV] / W$$

in which 10^3 is a factor converting mg to µg; 35.45 is the molar mass of chloride; N is the exact normality of the silver nitrate solution; V is the volume, in mL, of the silver nitrate solution consumed in the titration; and W is the weight, in g, of Hydrogenated Starch Hydrolysate taken to prepare the *Test solution:* not more than 50 µg of chloride per g is found.

Limit of sulfate ⟨221⟩—1.0 g of the solid portion of Hydrogenated Starch Hydrolysate shows no more sulfate than corresponds to 0.10 mL of 0.020 N sulfuric acid: not more than 100 µg of sulfate per g is found.

Limit of nickel—

[NOTE—When water is specified as the diluent, use deionized ultra-filtered water.]

Digester solution (aqua regia)—Add 360 mL of hydrochloric acid and 240 mL of nitric acid to 1200 mL of water.

Blank solution—Add 40 mL of nitric acid to a 2-L volumetric flask, dilute with water to volume, and mix well.

Internal standard solution—Transfer 2.0 mL of commercially prepared yttrium reference standard solution (1000 ppm) to a 1-L volumetric flask, dilute with *Blank solution* to volume, and mix well. The *Internal standard solution* contains 2 µg per mL of ytrrium.

Standard stock solution—[NOTE—Prepare this solution fresh every two months.] Quantitatively dilute an accurately measured volume of a commercially prepared nickel ICP standard (1000 ppm) with *Blank solution* to obtain a solution containing 10 µg of nickel per mL *(Standard stock solution 10 ppm)*.

Standard solutions—[NOTE—Prepare these solutions fresh weekly.] Separately pipet 1.0 mL, 2.0 mL, and 4.0 mL *Standard stock solution,* respectively, into three 200-mL volumetric flasks. Dilute the content in each flask with *Blank solution* to volume, and mix well. These are, respectively, the *Standard nickel solution 50 ppb*, *Standard stock solution 100 ppb,* and *Standard nickel solution 200 ppb*.

Test solution—Transfer a quantity of Hydrogenated Starch Hydrolysate, equivalent to 10.0 g on the anhydrous basis, into a 125-mL conical flask. Add 40 mL of *Digester solution* and place on a hotplate. Heat the solution for about 20 minutes, being careful to prevent the solution from boiling over. The solution will turn a dark caramel color. Transfer into a clean, dry, 50-mL volumetric flask with washings of *Blank solution*. Dilute with *Blank solution* to volume. Filter the sample into a 15-mL centrifuge tube, using a 10-mL BD syringe, fitted with a 0.45-µm syringe filter.

Procedure (see *Plasma Spectrochemistry* ⟨730⟩)—The Inductively Coupled Plasma–Optical Emission Spectroscopy (ICP–OES) is configured in an axial optical alignment. Set the ultraviolet detector to scan nickel at 232.005 nm and yttrium at 371.029 nm, and set the sample read time to 10 seconds minimum and 50 seconds maximum. Three replicate scans are taken with the integration set to one point per peak. Set forward power from the RF generator to 1500 watts. The argon plasma feed gas flows at 15 L per minute with the auxiliary gas (shear gas) set to flow at 0.5 L per minute. A gem cone nebulizer is used with a nebulization gas flow rate of 0.55 L per minute. The sample is delivered to the spray chamber by a multi-channel peristaltic pump set to deliver sample at a rate of 1.00 mL per minute. The *Internal standard solution* is added in-line via a mixing block between the sample probe and spray chamber. Samples are flushed through the system for 30 seconds at a rate of 4.0 mL per minute prior to analysis. A 60-second read delay is also programmed into the sampling routine to allow for fluid flow equilibration after the high-speed flush, prior to the first analytical read of the sample. Between samples the pumping system is washed by flushing the *Blank solution* for 30 seconds at a rate of 4.0 mL per minute.

Instrument performance must be verified to conform to the manufacturer's specifications for resolution and sensitivity. Before analyzing samples, the instrument must pass a suitable performance check.

Generate the calibration curve using the *Blank solution, Standard nickel solution 50 ppb, Standard stock solution 100 ppb,* and *Standard nickel solution 200 ppb* as follows. Scan the *Internal standard solution* while running the *Blank solution* to measure the intensity of the yttrium emission. This value is held constant throughout the remainder of the test. Separately scan the *Blank solution, Standard nickel solution 50 ppb, Standard stock solution 100 ppb,* and the *Standard nickel solution 200 ppb* for nickel and yttrium. [NOTE—The *Internal standard solution* is added via an in-line mixing chamber.] Normalize the yttrium intensity to the value of the *Internal standard solution*. Apply this normalization factor to the nickel intensity, which is then referred to as the corrected nickel intensity. A calibration curve is constructed by plotting the corrected nickel intensity versus the known concentration, in ng per mL, of the nickel: the linear regression coefficient is not less than 0.999.

Similarly, analyze the *Test solution* on the ICP. The intensity of the emission of the *Test solution* is plotted on the calibration curve and the concentration, *C*, in ng per mL,

In-Process Revision

is thus obtained. Calculate the content, in µg per g, of nickel in the solid portion of Hydrogenated Starch Hydrolysate taken by the formula:

$$10^{-3}(50)(C/W)$$

in which 10^{-3} is a factor converting ng to µg; 50 is the volume, in mL, of the *Test solution*; *W* is the weight, in g, of Hydrogenated Starch Hydrolysate calculated on anhydrous basis: the nickel content is not more than 1 µg per g.

Content of maltitol and sorbitol—

Mobile phase—Use degassed water.

Standard solution—Dissolve accurately weighed quantities of USP Maltose Monohydrate RS, USP Maltitol RS, USP Dextrose RS, and USP Sorbitol RS in water to obtain a solution having known concentrations of about 1.0 mg per mL for each, calculated on the anhydrous basis.

Test solution—Transfer a quantity of Hydrogenated Starch Hydrolysate, equivalent to 100 mg on the anhydrous basis, to a 100-mL volumetric flask. Dilute with water to volume, and mix. Transfer approximately 10 mL of the solution into a separate container, shake the solution for 30 seconds, and pass through a filter having a 0.45-µm or finer porosity into a suitable autosampler vial, and seal.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a refractive index detector that is maintained at 40° and a 7.7-mm × 30-cm column that contains packing L58. The column temperature is maintained at 80°, controlled within ±2°, and the flow rate is about 0.3 mL per minute. Chromatograph the *Standard solution,* and identify the components based on their relative retention times which are 0.81, 0.84, 0.94, and 1.00 for maltose, maltitol, dextrose, and sorbitol, respectively. Sorbitol is the last peak to elute on the chromatogram. Record the peak responses as directed for *Procedure:* for the maltitol peak, the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of each component, maltose (P_{M1}), maltitol (P_{M2}), dextrose (P_D), and sorbitol (P_S), in the solid portion of Hydrogenated Starch Hydrolysate taken by the formula:

$$100(100)(C/W)/(r_U/r_S)$$

in which 100 is the volume, in mL, of the *Test solution; C* is the concentration, in mg per mL, of the respective component in the *Standard solution; W* is the weight, in mg, of Hydrogenated Starch Hydrolysate calculated on the anhydrous basis, which was taken to prepare the *Test solution;* and r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution,* respectively: less than 50% of total maltitol and sorbitol are found and less than 1% of total maltose and dextrose are found, on the anhydrous basis.

Hydrogenated polysaccharides—

Mobile phase, Standard solution, and *Chromatographic system*—Prepare as directed in the test for *Content of maltitol and sorbitol*.

Test solution—Prepare as directed in the test for *Content of maltitol and sorbitol*.

Procedure—Inject a volume (about 50 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak areas. The elution pattern includes the higher-molecular-weight hydrogenated polysaccharides containing more than 11 D-glucopyranosyl units, followed by some individual peaks representing hydrogenated polysaccharides containing not more than 10 D-glucopyranosyl units, if this hydrogenated species is present. The higher-molecular-weight hydrogenated polysaccharides containing more than 11 D-glucopyranosyl can be intergrated into one peak, the relative retention time is about 0.29 in relative to the peak of

sorbitol. The relative retention times for hydrogenated polysaccharides containing not more than 10 D-glucopyranosyl units are given in *Table 1*.

Table 1. Relative Retention Times for Several Hydrogenated Species

Hydrogenated Species for DP (Degree of Polymerization)	Relative Retention Time
Sorbitol (HDP 1)	1.00
Maltitol (HDP 2)	0.84
Maltotriitol (HDP 3)	0.72
Maltotetraitol (HDP 4)	0.64
Maltopentaitol (HDP 5)	0.58
Maltohexaitol (HDP 6)	0.53
Maltoheptaitol (HDP7)	0.48
Maltooctaitol (HDP8)	0.45
Maltononaitol (HDP9)	0.42
Maltodecaitol (HDP10)	0.40

Calculate the percentage of hydrogenated polysaccharides containing more than 3 D-glucopyranosyl units in the solid portion of Hydrogenated Starch Hydrolysate taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the sum of peak areas of hydrogenated polysaccharides containing more than 3 D-glucopyranosyl units obtained from the *Test solution*; and r_s is the sum of all the peak areas obtained from the *Test solution*: not less than 50% of hydrogenated polysaccharides containing more than 3 D-glucopyranosyl units are found, on the anhydrous basis.▲*NF28*

In-Process Revision

BRIEFING

Pea Starch. Because there is no existing *NF* monograph for this excipient, a new monograph, based on validated methods, is proposed.

(EM2: H. Wang; NOM: A. Wilk; MSA: R. Tirumalai) RTS—C68459

Add the following:

▲Pea Starch

» Pea Starch is obtained from the seeds of *Pisum sativum L.*

Packaging and storage—Preserve in well-closed containers. Store at room temperature.

Identification—

A: Examined under a microscope using a mixture of equal volumes of glycerin and water, it presents a majority of large elliptical granules, 25–45 µm in size, sometimes irregular, or reniform. It also presents a minority of small rounded granules, 5–8 µm in size. Granules can present cracks or irregularities. Sometimes, granules show barely visible concentric striations. Exceptionally, granules show a slit along the main axis. Between orthogonally oriented polarizing plates or prisms, the granules show a distinct black cross.

B: Suspend 1 g of it in 50 mL of water, boil for 1 minute, and cool: a thin, cloudy mucilage is formed.

C: To 1 mL of the mucilage obtained in *Identification* test *B*, add 0.05 mL of iodine and potassium iodide TS 2: an orange-red to dark blue color is produced, which disappears on heating.

Microbial limits ⟨61⟩—The total aerobic microbial count does not exceed 1000 cfu per g, the total combined molds and yeasts count does not exceed 100 cfu per g, and it meets the requirements of the test for the absence of *Escherichia coli*.

pH ⟨791⟩—Prepare a slurry by weighing 5.0 g of Pea Starch, transferring to a suitable nonmetallic container, and adding 25.0 mL of freshly boiled and cooled water. Agitate continuously at a moderate rate for 1 minute. Stop the agitation, allow to stand for 15 minutes, and shake again. Determine the pH to the nearest 0.1 unit: the pH, determined potentiometrically, is between 5.0 and 8.0.

Loss on drying ⟨731⟩—Dry about 1 g, accurately weighed, at 130° for 90 minutes: it loses not more than 16.0% of its weight.

Residue on ignition ⟨281⟩**:** not more than 0.6%, determined on a 1.0-g test specimen.

Foreign matter—Examine under a microscope, using a mixture of equal volumes of glycerin and water: not more than traces of matter other than starch granules are present. No starch grains of any other origin are present.

Limit of iron—

Standard iron stock solution—Prepare a solution containing the equivalent of 10 µg of iron per mL, as directed under *Iron* ⟨241⟩.

Diluted standard iron solution—Immediately before use, dilute an accurately measured volume of *Standard iron stock solution* quantitatively with water to obtain a solution containing the equivalent of 1 µg of iron per mL.

Test solution—Shake 1.0 g of Pea Starch with 50 mL of 2 N hydrochloric acid, and filter. Transfer 10 mL of the filtrate to a test tube. Add 2 mL of citric acid solution (2 in 10) and 0.1 mL of thioglycolic acid, and mix. Add 10 N ammonium hydroxide until the solution is distinctly alkaline to litmus, dilute with water to 20 mL, and mix.

Procedure—Prepare the *Standard solution* by transferring 10 mL of the *Diluted standard iron solution* to a test tube and proceeding in the same manner as directed for the preparation of the *Test solution*, beginning with "Add 2 mL of citric acid solution (2 in 10)." After 5 minutes, any pink color in the *Test solution* is not more intense than that in the *Standard solution*, corresponding to a limit of 50 µg of iron per g.

Limit of oxidizing substances—Transfer 4.0 g of Pea Starch to a glass-stoppered, 125-mL conical flask, and add 50.0 mL of water. Insert the stopper, and swirl for 5 minutes. Transfer to a glass-stoppered 50-mL centrifuge tube, and centrifuge to clarify. Transfer 30.0 mL of the clear supernatant to a glass-stoppered 125-mL conical flask. Add 1 mL of glacial acetic acid and 0.5 to 1.0 g of potassium iodide. Insert the stopper, swirl, and allow to stand for 25 to 30 minutes in the dark. Add 1 mL of starch TS, and titrate with 0.002 N sodium thiosulfate VS to the disappearance of the starch-iodine color. Perform a blank determination, and make any necessary correction. Each mL of 0.002 N sodium thiosulfate VS is equivalent to 34 µg of oxidant, calculated as hydrogen peroxide. Not more than 1.4 mL of 0.002 N sodium thiosulfate VS is required (20 µg per g, calculated as H_2O_2).

Limit of sulfur dioxide—Not more than 50 µg per g. [NOTE—Perform either *Test 1* or *Test 2*.]

TEST 1—

Reagents—

CARBON DIOXIDE—Use carbon dioxide with a flow regulator that will maintain a flow of 100 ± 10 mL per minute.

HYDROGEN PEROXIDE SOLUTION—Dilute 30% hydrogen peroxide with water to obtain a 3% solution. Neutralize the solution with 0.01 N sodium hydroxide to pH 4.1, determined potentiometrically.

POTASSIUM METABISULFITE SOLUTION—Transfer 0.87 g of potassium metabisulfite ($K_2S_2O_5$) and 0.2 g of edetate disodium to a 1000-mL volumetric flask. Dilute with water to volume before mixing. [NOTE—Edetate disodium is used to protect the sulfite ion from oxidation.]

APPARATUS—In this test, the sulfur dioxide is released from the test specimen in a boiling acid medium and is removed by a stream of carbon dioxide. The separated gas is collected in a dilute hydrogen peroxide solution where the sulfur dioxide is oxidized to sulfuric acid and titrated with standard alkali. A suitable apparatus for sulfur dioxide determination is shown in the accompanying diagram (*Figure 1*).

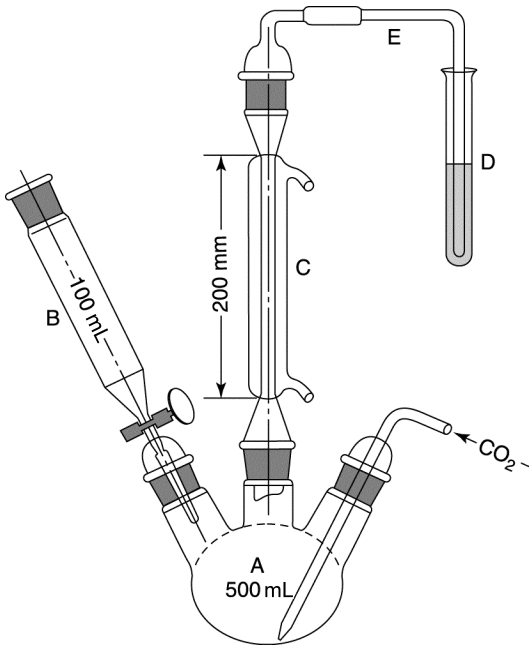


Figure 1

The apparatus consists of a 500-mL three-neck, round-bottom boiling flask, *A;* a separatory funnel, *B,* having a capacity of 100 mL or greater; a gas inlet tube of sufficient length to permit introduction of the carbon dioxide within 2.5 cm of the bottom of the boiling flask; a reflux condenser, *C,* having a jacket length of 200 mm; and a delivery tube, *E,* connecting the upper end of the reflux condenser to the bottom of a receiving test tube, *D.* Apply a thin film of stopcock grease to the sealing surfaces of all the joints except the joint between the separatory funnel and the boiling flask, and clamp the joints to ensure tightness.

System suitability test—

TEST A—Using the *Potassium metabisulfite solution* as the standard, proceed as directed for *Procedure*, except for replacing the 25.0 g of Pea Starch with the 20 mL of the *Potassium metabisulfite solution*. Calculate the content, in µg per mL, of sulfur dioxide in the *Potassium metabisulfite solution* taken by the formula:

$$1000(32.03)VN/V_P$$

in which 1000 is the factor for conversion of mg to µg; 32.03 is the milliequivalent weight of sulfur dioxide; V is the volume, in mL, of titrant consumed; N is the normality of the titrant; and V_P is the volume, in mL, of the *Potassium metabisulfite solution* taken for the test.

TEST B—In a 100-mL conical flask, add 20 mL of 0.02 N iodine solution and 5 mL of 2 N hydrochloric acid. Add 1 mL of starch TS, and titrate with *Potassium metabisulfite solution* until the first discoloration is observed. Calculate the content, in µg per mL, of sulfur dioxide in *Potassium metabisulfite solution* by the formula:

$$1000(32.03)V_IN_I/V_P$$

in which 1000 and 32.03 are as defined in *Test A;* V_I is the volume, in mL, of the iodine solution used in the test; N_I is the normality of the iodine solution; and V_P is the volume, in mL, of the *Potassium metabisulfite solution* consumed.

The difference between the sulfur dioxide contents obtained from *Test A* and *Test B* is not more than 5% of their mean value. *Test B* shall be performed within 15 minutes after the completion of *Test A*. [NOTE—This time limit avoids potential variation in the sulfur dioxide content of the *Potassium bisulfite solution* when stored at room temperature.]

Procedure—Add 150 mL of water to the boiling flask (*A*) (see *Figure 1*). Close the stopcock of the separatory funnel, and begin the flow of carbon dioxide through the apparatus at a rate of 100 ± 5 mL per minute. Start the condenser coolant flow. Place 10 mL of *Hydrogen peroxide solution* in the receiving test tube (*D*). After 15 minutes, without interrupting the flow of carbon dioxide, remove the separatory funnel (*B*) from the boiling flask, and transfer 25.0 g of Pea Starch to the boiling flask with the aid of 100 mL of water. Apply stopcock grease to the outer joint of the separatory funnel, and replace the separatory funnel in the boiling flask. Close the stopcock of the separatory funnel, and add 80 mL of 2 N hydrochloric acid to the separatory funnel. Open the stopcock of the separatory funnel to permit the hydrochloric acid solution to

flow into the boiling flask, guarding against the escape of sulfur dioxide into the separatory funnel by closing the stopcock before the last few mL of hydrochloric acid drain out. Boil the mixture for 1 hour. Open the stopcock of the funnel, stop the flow of carbon dioxide, discontinue heating the flask, and turn off the cooling water in the condenser. Remove the receiving test tube, and transfer its contents to a 200-mL wide-necked conical flask. Rinse the receiving test tube with a small portion of water, add the rinsing to the 200-mL conical flask, and mix. Heat on a water bath for 15 minutes, and allow to cool. Titrate the contents with 0.1 N sodium hydroxide VS until the pH reaches 4.1, determined potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Calculate the content, in µg per g, of sulfur dioxide in the Pea Starch taken by the formula:

$$1000(32.03)VN/W$$

in which 1000 is the factor for conversion of mg to µg; 32.03 is the milliequivalent weight of sulfur dioxide; V is the volume, in mL, of titrant consumed; N is the normality of the titrant; and W is the weight, in g, of the Pea Starch taken.

TEST 2—Determine the content of sulfur dioxide as directed under *Sulfur Dioxide* ⟨525⟩*, Method I*. Use 200 mL of water as a solvent. Then, to 100 mL of the clear filtrate, add 3 mL of starch TS, and titrate with 0.01 N iodine VS to the first permanent blue color.▲*NF28*

Microbiological Tests

BRIEFING

⟨**63**⟩ **Mycoplasma Tests.** This new chapter proposal contains methods to detect Mycoplasma contamination of test articles, tissues and/or cell cultures used to produce test articles, or any other material in which Mycoplasma contamination is suspected.

(MSA: R. Tirumalai) RTS—C69320

Add the following:

▲⟨63⟩ MYCOPLASMA TESTS

INTRODUCTION

The genus Mycoplasma represents a group of minute bacteria which have no cell walls. The genus comprises more than 120 species. They are the smallest self-replicating prokaryotic organisms. The cells vary in size and morphology and cannot be Gram stained, but impressions of colonies on solid agar can be stained with Dienes' stain. Mycoplasma are considered parasites, and many are pathogenic to a variety of animal and plant hosts. In humans, Mycoplasma are usually surface parasites that colonize the epithelial lining of the respiratory and urogenital tracts. Mycoplasma are common and may cause serious contamination in cell and/or tissue cultures used to generate compendial articles. They may also cause contamination of filtered sterilized soybean casein digest broth used in challenge studies to validate industrial sterile equipment for aseptic processing. A cell culture infection may persist for an extended period of time without causing apparent cell damage. Infection of cells in a culture can affect nearly every pathway of cell metabolism, including alteration of the cells' phenotypical characteristics and normal growth. The presence of Mycoplasma species does not always result in turbid growth in cultures or visible alteration of the cells.

Testing for Mycoplasma is a necessary quality control requirement to assure reliably pure biotechnological products and allied materials used to generate these products. This general chapter describes two methods to detect Mycoplasma contamination of test articles, tissues and/or cell cultures used to produce test articles, digest broth, or any other material in which Mycoplasma contamination is suspected. These are: (A) the agar and broth media procedure and (B) the indicator cell culture procedure. These tests require careful aseptic technique and suitable laboratory conditions. In order to ensure correct testing and interpretation of results, personnel should be properly trained and qualified. A validated nucleic acid amplification technique (NAT) or an enzymatic activity based method may be used to detect Mycoplasma, provided such a method is shown to be comparable to both methods (A) and (B). Alternative methods must be suitably validated. Validation requirements for alternate methods will not be addressed in this chapter.

CULTURE METHOD

Choice of Media

The test is carried out using a sufficient number of both solid and liquid media to ensure growth in the chosen incubation conditions of small numbers (approximately 100 colony-forming units, cfu; or 100 color-changing units, ccu) of Mycoplasmas that may be present in the test article/material. Liquid media must contain phenol red. The range of media chosen is shown to have satisfactory nutritive properties for at least the microorganisms shown in *Quality Control Test Strain Organisms* (below). The nutritive properties of each new batch of medium are verified for the appropriate microorganisms in the list. When testing for Mycoplasmas include in each test at least

In-Process Revision

two known Mycoplasma species or strains (listed in *Quality Control Test Strain Organisms*) as positive controls, one of which should be a dextrose fermenter (i.e., *M. pneumoniae* or equivalent species and strain) and one of which should be an arginine hydrolyzer (i.e., *M. orale* or equivalent species and strain). Only when testing insect cell lines should one include a *Spiroplasma* control strain [e.g., *S. citri* ATCC 29747, *S. melliferum* ATCC 29416, or equivalent species and strains]. Additionally, these strains may be a little more fastidious in their nutritional requirements. They require lower incubation temperatures (as do insect cell lines).

Quality Control Test Strain Organisms

Positive control cultures should be not more than 15 passages from isolation. Mycoplasma species or strains suitable for use are listed below:

— *Acholeplasma laidlawii* (vaccines and/or cell-derived materials/cultures for human and veterinary use when an antibiotic has been used during production)

— *M. gallisepticum* (when avian material has been used during production or when the vaccine or cell culture is intended for use in poultry)

— *M. hyorhinis* (nonavian veterinary vaccines or cell cultures)

— *M. orale* (vaccines for human and veterinary use)

— *M. pneumoniae* (vaccines or cell banks for human use) or another suitable species of D-glucose fermenter such as *M. fermentans*

— *M. synoviae* (when avian material has been used during production or when the vaccine or cell bank is intended for use in poultry)

The test strains may be field isolates that have undergone a limited number of subcultures (not more than 15), are stored frozen (–20° or lower) or freeze-dried, and are identified as being of the required species by comparison with type cultures, for example, those shown in *Table 1*.

Incubation Conditions

Incubate liquid media in tightly stoppered containers at 36 ± 1°. Incubate solid media in microaerophilic conditions (nitrogen containing 5%–10% carbon dioxide in nitrogen and/or hydrogen atmosphere containing $< 0.5\%$ oxygen). Sufficient humidity should be available to prevent desiccation of the agar surface) at 36 ± 1°.

Table 1. Type Cultures for Identifying Field Isolates Used as Test Strains

Test Organism	NCTC Number	CIP Number	ATCC Number
A. laidlawii	NCTC 10116	CIP 75.27	ATCC 23206
M. gallisepticum	NCTC 10115	CIP 104967	ATCC 19610
M. fermentans	NCTC 10117	CIP 105680	ATCC 19989
M. hyorhinis	NCTC 10130	CIP 104968	ATCC 17981
M. orale	NCTC 10112	CIP 104969	ATCC 23714
M. pneumoniae	NCTC 10119	CIP 103766	ATCC 15531
M. synoviae	NCTC 10124	CIP 104970	ATCC 25204

Nutritive Properties

Carry out the test for nutritive properties for each new batch of medium. Inoculate the chosen media with the appropriate test microorganisms; use not more than 100 cfu per plate containing at least 9 mL of solid media and per 100-mL container of liquid medium; use a separate plate and container for each species of microorganism. Incubate the media and make subcultures from 0.2 mL of liquid medium to solid medium at the specified intervals (see below under *Test for Mycoplasma in the Test Article/Material*). The solid medium complies with the test if a count within a 0.5 log unit range of the inoculate amount is found for each test microorganism. The liquid medium complies with the test if growth is found on agar plates subcultured from the broth, for at least 1 subculture for each test microorganism. The use of a microscope at 100X or greater may be helpful.

Inhibitory Substances

The test for inhibitory substances is carried out once for a given product and is repeated whenever there is a change in production method that may affect the detection of Mycoplasma. To demonstrate absence of inhibitory substances, carry out the test for nutritive properties in the presence and absence of the test article/material. If growth of a test microorganism occurs more than 1 subculture sooner in the absence of the test article/material than in its presence, inhibitory substances are present. The same is true if plates directly inoculated with the test article/material are not within a 0.5 log unit range of the number of colonies of those inoculated without the test article/material. In both cases, inhibitory substances must be neutralized or their effect otherwise countered, by an appropriate method, for example, by passage in substrates not containing inhibitors or dilution in a larger volume of medium, before the test. If dilution is used, larger medium volumes may be used or the inoculums' volume may be divided among several 100-mL flasks. The effectiveness of the neutralization or other process is checked by repeating the test for inhibitory substances after neutralization.

Test for Mycoplasma in the Test Article/Material

Inoculate no less than 10 mL of the test article/material per 100 mL of each liquid medium. If a significant pH change occurs upon the addition of the test article/material, the liquid medium is restored to its original pH value by the addition of a sterile solution of either sodium hydroxide or hydrochloric acid. Inoculate 0.2 mL of the test article/material on each plate of each solid medium. Incubate liquid media for 20–21 days. Incubate solid media for not less than 14 days, except those plates corresponding to the 20–21 day subculture, which are incubated for 7 days. Concurrently, incubate an uninoculated 100-mL portion of each liquid medium and agar plate, as a negative control. On days 2–4 after inoculation, subculture each liquid medium by inoculating 0.2 mL on at least 1 plate of each solid medium. Repeat the procedure between the 6 and 8 days, again between the 13 and 15 days and again between the 19 and 21 days of the test. Observe the liquid media every 2 or 3 days and if a color change occurs, subculture. If a liquid medium shows bacterial or fungal contamination, the test is invalid. If one or more plate(s) per medium and per inoculation day cannot be read, the test is invalid. Include in the test positive controls prepared by inoculation of not more than 100 cfu of at least 1 test microorganism on agar medium or into broth medium. Where the test for Mycoplasmas is carried out regularly, it is recommended to use the test microorganisms in regular rotation. The test microorganisms used are those listed under *Choice of Media*. Incubate broths and plates in a humidified atmosphere with microaerophilic conditions (5%–10% CO_2).

Interpretation of Results

At the end of the prescribed incubation period, examine all inoculated solid media for the presence of Mycoplasma colonies. The product complies with the test if growth of typical Mycoplasma colonies has not occurred. The product does not comply with the test if growth of typical Mycoplasma colonies has occurred on any of the solid media. The test is invalid if 1 or more of the positive controls do not show growth of Mycoplasmas on at least 1 subculture plate. The test is invalid if 1 or more of the negative controls show growth of Mycoplasmas. If suspect colonies are observed, use a suitable validated method to determine whether they are due to Mycoplasmas.

Recommended Solutions and Media For The Culture Method

NOTE—This section is provided for information.

SOLUTIONS

Beef Heart Infusion Broth

Beef heart (for preparation of the infusion)	500 g
Peptone	10 g
Sodium chloride	5 g
Distilled water	to 1000 mL

Essential Vitamins

Biotin	100 mg
Calcium pantothenate	100 mg
Choline chloride	100 mg
Folic acid	100 mg
i-Inositol	200 mg

Essential Vitamins *(Continued)*

Nicotinamide	100 mg
Pyridoxal hydrochloride	100 mg
Riboflavine	10 mg
Thiamine hydrochloride	100 mg
Distilled water	to 1000 mL

Agar, Purified

A highly refined agar for use in microbiology and immunology, prepared by an ion-exchange procedure that results in a product having superior purity, clarity, and gel strength. It contains the following ingredients:

Water	12.2%
Ash	1.5%
Acid-insoluble ash	0.2%
Chlorine	0
Phosphate (calculated as P_2O_5)	0.3%
Total nitrogen	0.3%
Copper	8 ppm
Iron	170 ppm
Calcium	0.28%
Magnesium	0.32%

Hanks' Balanced Salt Solution (modified)

Sodium chloride	6.4 g
Potassium chloride	0.32 g
Magnesium sulphate heptahydrate	0.08 g
Magnesium chloride hexahydrate	0.08 g
Calcium chloride, anhydrous	0.112 g
Disodium hydrogen phosphate dihydrate	0.0596 g
Potassium dihydrogen phosphate, anhydrous	0.048 g
Distilled water	to 800 mL

Brain Heart Infusion

Calf-brain infusion	200 g
Beef-heart infusion	250 g
Proteose peptone	10 g
Glucose monohydrate	2 g
Sodium chloride	5 g
Disodium hydrogen phosphate, anhydrous	2.5 g
Distilled water	to 1000 mL

PPLO Broth

Beef-heart infusion	50 g
Peptone	10 g
Sodium chloride	5 g
Distilled water	to 1000 mL

MEDIA

The following media are recommended. Other media may be used, provided they meet the criteria given in the sections *Choice of Culture Media, Incubation Conditions, Nutritive Properties,* and *Inhibitory Substances.*

Hayflick Media (Recommended for the General Detection of Mycoplasmas)

Liquid Medium

Beef heart infusion broth	90.0 mL
Horse serum (unheated)	20.0 mL
Yeast extract (250 g/L)	10.0 mL
Phenol red (0.6 g/L solution)	5.0 mL
Penicillin (20,000 IU/mL)	0.25 mL
Deoxyribonucleic acid (2 g/L solution)	1.2 mL
Adjust to pH 7.8	

Hayflick Media (Recommended for the General Detection of Mycoplasmas) *(Continued)*

Solid Medium

Prepare as described above replacing beef heart infusion broth by beef heart infusion agar containing 15 g/L of agar.

Frey Media

(Recommended for the detection of *M. synoviae*)

Liquid Medium

Beef heart infusion broth	90.0 mL
Essential vitamins	0.025 mL
Glucose monohydrate (500 g/L solution)	2.0 mL
Swine serum (inactivated at 56° for 30 min)	12.0 mL
β-Nicotinamide adenine dinucleotide (10 g/L solution)	1.0 mL
Cysteine hydrochloride (10 g/L solution)	1.0 mL
Phenol red (0.6 g/L solution)	5.0 mL
Penicillin (20,000 IU/mL)	0.25 mL

Mix the solutions of β-nicotinamide adenine dinucleotide and cysteine hydrochloride and after 10 min add to the other ingredients. AdjuSt to a pH of 7.8.

Solid Medium

Beef heart infusion broth	90.0 mL
Agar, purified	1.4 g
Adjust to pH 7.8, sterilize by autoclaving then add:	
Essential vitamins	0.025 mL
Glucose monohydrate (500 g/L solution)	2.0 mL
Swine serum (unheated)	12.0 mL
β-Nicotinamide adenine dinucleotide (10 g/L solution)	1.0 mL
Cysteine hydrochloride (10 g/L solution)	1.0 mL
Phenol red (0.6 g/L solution)	5.0 mL
Penicillin (20,000 IU/mL)	0.25 mL

In-Process Revision

Friis Media
(Recommended for the detection of nonavian mycoplasmas)

Liquid Medium

Hanks' balanced salt solution (modified) (4)	800 mL
Distilled water	67 mL
Brain heart infusion (5)	135 mL
PPLO Broth (6)	248 mL
Yeast extract (170 g/L)	60 mL
Bacitracin	250 mg
Meticillin	250 mg
Phenol red (5 g/L)	4.5 mL
Horse serum	165 mL
Swine serum	165 mL

Adjust to a pH of 7.40–7.45

Solid Medium

Hanks' balanced salt solution (modified)	800 mL
DEAE-dextran	200 mg
Agar, purified	15.65 g

Mix well and sterilize by autoclaving. Cool to 100°. Add to 1740 mL of *Liquid Medium* as described above.

INDICATOR CELL CULTURE METHOD

Cell cultures are stained with a fluorescent dye that binds to DNA. Mycoplasmas are detected by their characteristic particulate or filamentous pattern of fluorescence on the cell surface and, if contamination is heavy, in surrounding areas. Mitochondria in the cytoplasm may be stained but are readily distinguished from Mycoplasmas. For viral suspensions, if the interpretation of results is affected by marked cytopathic effects, neutralize the virus using a specific antiserum that has no inhibitory effects on Mycoplasmas, or use a cell culture substrate that does not allow growth of the virus. To demonstrate the absence of inhibitory effects of serum, carry out the positive control tests in the presence and absence of the antiserum.

Verification of the Substrate

Use Vero cells or equivalent cell culture (for example, the production cell line) that is equivalent in effectiveness for detecting Mycoplasmas. Test the effectiveness of the cells to be used by applying the procedure shown below and inoculating not more than 100 cfu or ccu microorganisms of suitable reference strains of *M. hyorhinis* and *M. orale*. The cells are suitable if both reference strains are detected. The indicator cells must be subcultured without an antibiotic before use in the test.

Test Method

NOTE—The following is provided for information.

SOLUTIONS

Phosphate Buffered Saline—

2.0 M Monobasic Potassium Phosphate—Dissolve 13.61 g of anhydrous monobasic potassium phosphate in 50 mL of water.

2.0 M Dibasic Potassium Phosphate—Dissolve 17.42 g of anhydrous dibasic potassium phosphate in 50 mL of water.

Phosphate Buffered Saline Solution (pH 7.4)—Combine 3.6 mL of *2.0 M Monobasic Potassium Phosphate,* 16.4 mL of *2.0 M Dibasic Potassium Phosphate,* 8 g of sodium chloride, and 1 L of water. Mix thoroughly. Adjust the pH if necessary.

Bisbenzimide Stock Solution—Dissolve 5 mg of bisbenzimide in water, and dilute with the same solvent to 100 mL. Store in the dark.

Bisbenzimide Working Solution—Immediately before use, dilute 100 µL of *Bisbenzimide Stock Solution* to 100 mL with *Phosphate Buffered Saline Solution (pH 7.4)*

Phosphate-Citrate Buffer Solution pH 5.5—Mix 56.85 mL of a 28.4 g/L solution of anhydrous disodium hydrogen phosphate and 43.15 mL of a 21 g/L solution of citric acid.

In-Process Revision

METHOD

1. Seed the indicator cell culture at a suitable density (for example, 2×10^4 to 2×10^5 cells/mL, 4×10^3 to 2.5×10^4 cells/cm^2) that will yield confluence after 3 days of growth. Inoculate 1 mL of the product to be examined into the cell culture vessel, and incubate at $36 \pm 1°$.
2. After at least 3 days of incubation, when the cells have grown to confluence, make a subculture on cover slips in suitable containers or on some other surface (for example, chambered slides) suitable for the test procedure. Seed the cells at low density so that they reach 50% confluence after 3–5 days of incubation. Complete confluence impairs visualization of Mycoplasmas after staining and must be avoided.
3. Remove the medium and rinse the indicator cells with phosphate buffered saline, pH 7.4, then add a suitable fixing solution (a freshly prepared mixture of 1 volume of acetic acid, glacial, TS and 3 volumes of methanol, is suitable when bisbenzimide is used for staining).
4. Remove the fixing solution and wash the cells with sterile Purified Water. Dry the slides completely if they are to be stained more than 1 hour later (particular care is needed for staining of slides after drying owing to artifacts that may be produced).
5. Add a suitable DNA stain and allow standing for a suitable time (bisbenzimide working solution and a standing time of 10 minutes are suitable).
6. Remove the stain and rinse the monolayer with Purified Water.
7. Mount each coverslip, where applicable (a mixture of equal volumes of glycerol and *Phosphate-Citrate Buffer Solution pH 5.5* is suitable for mounting). Examine by fluorescence (for bisbenzimide stain a 330 nm/380 nm excitation filter and an LP 440 nm barrier filter are suitable) at 400 × magnification or greater.
8. Compare the microscopic appearance of the test cultures with that of the negative and positive controls, examining for extranuclear fluorescence. Mycoplasmas produce pinpoints or filaments over the indicator cell cytoplasm. They may also produce pinpoints and filaments in the intercellular spaces. Multiple microscopic fields are examined according to the protocol established during validation.

Interpretation of Results

The product to be examined complies with the test if fluorescence typical of Mycoplasmas is not present. The test is invalid if the positive controls do not show fluorescence typical of Mycoplasmas. The test is invalid if the negative controls show fluorescence typical of Mycoplasmas.▲*USP33*

Chemical Tests and Assays

IDENTIFICATION TESTS

BRIEFING

〈**197**〉 **Spectrophotometric Identification Tests,** *USP 31* page 129. The Spectroscopy Advisory Panel recommends that the General Chapters Expert Committee update the general chapter, *Spectrophotometric Identification Tests* 〈197〉. In addition, the advisory panel proposes a title change and revisions to *Spectrophotometry and Light-Scattering* 〈851〉, which also appear in this issue of *Pharmacopeial Forum*. The changes follow an established effort to broaden and update the general chapters already published in USP.

The following changes are proposed for general chapter 〈197〉.

1. A title change is proposed.
2. Technical and editorial revisions are proposed for the *Infrared Absorption* and *Ultraviolet Absorption* sections.
3. A new section, *Identification Methodology*, is proposed to be added.
4. References to alternative USP spectroscopic methods have been added: *Mid-Infrared Spectroscopy* 〈854〉, *Nuclear Magnetic Resonance* 〈761〉, *Spectroscopy and Light-Scattering* 〈851〉 (title change per this issue of *PF*), *X-Ray Diffraction* 〈941〉, *Near-Infrared Spectroscopy* 〈1119〉, *Raman Spectroscopy* 〈1120〉, and *Mass Spectrometry* 〈736〉.

In-Process Revision

Change to read:

⟨197⟩~~SPECTROPHOTOMETRIC IDENTIFICATION TESTS~~

▲SPECTROSCOPIC IDENTIFICATION TESTS▲*USP33*

Change to read:

~~Spectroscopic tests contribute meaningfully toward the identification of many compendial chemical substances. The test procedures that follow are applicable to substances that absorb IR and/or UV radiation (see *Spectroscopy and Light-Scattering* ⟨851⟩).~~

~~The IR absorption spectrum of a substance, compared with that obtained concomitantly for the corresponding USP Reference Standard, provides perhaps the most conclusive evidence of the identity of the substance that can be realized from any single test. The UV absorption spectrum, on the other hand, does not exhibit a high degree of specificity. Conformance with both IR absorption and UV absorption test specifications, as called for in a large proportion of compendial monographs, leaves little doubt, if any, regarding the identity of the specimen under examination.~~▲*USP33*

~~INFRARED ABSORPTION~~

~~Six methods are indicated for the preparation of previously dried test specimens and Reference Standards for analysis. The reference ⟨197K⟩ in a monograph signifies that the substance under examination is mixed intimately with potassium bromide. The reference ⟨197M⟩ in a monograph signifies that the substance under examination is finely ground and dispersed in mineral oil. The reference ⟨197F⟩ in a monograph signifies that the substance under examination is suspended neat between suitable (for example, sodium chloride or potassium bromide) plates. The reference ⟨197S⟩ signifies that a solution of designated concentration is prepared in the solvent specified in the individual monograph, and the solution is examined in 0.1 mm cells unless a different cell path length is specified in the individual monograph. The reference ⟨197A⟩ signifies that the substance under examination is intimately in contact with an internal reflection element for attenuated total reflectance (ATR) analysis. The reference ⟨197E⟩ signifies that the substance under examination is pressed as a thin sample against a suitable plate for IR microscopic analysis. The ATR ⟨197A⟩ and the ⟨197E⟩ techniques can be used as alternative methods for ⟨197K⟩, ⟨197M⟩, ⟨197F⟩, and ⟨197S⟩ where testing is performed qualitatively and the Reference Standard spectra are similarly obtained.~~

~~Record the spectra of the test specimen and the corresponding USP Reference Standard over the range from about 2.6 µm to 15 µm (3800 cm^{-1} to 650 cm^{-1}) unless otherwise specified in the individual monograph. The IR absorption spectrum of the preparation of the test specimen, previously dried under conditions specified for the corresponding Reference Standard unless otherwise specified, or unless the Reference Standard is to be used without drying, exhibits maxima only at the same wavelengths as that of a similar preparation of the corresponding USP Reference Standard.~~

~~Differences that may be observed in the spectra so obtained sometimes are attributed to the presence of polymorphs, which are not always acceptable (see *Procedure* under *Spectrophotometry and Light-Scattering* ⟨851⟩). Unless otherwise directed in the individual monograph, therefore, continue as follows. If a difference appears in the IR spectra of the analyte and the standard, dissolve equal portions of the test specimen and the Reference Standard in equal volumes of a suitable solvent, evaporate the solution to dryness in similar containers under identical conditions, and repeat the test on the residues.~~

~~ULTRAVIOLET ABSORPTION~~

~~The reference ⟨197U⟩ in a monograph signifies that a test solution and a Standard solution are examined spectrophotometrically, in 1-cm cells, over the spectral range from 200 to 400 nm unless otherwise specified in the individual monograph.~~

~~Dissolve a portion of the substance under examination in the designated *Medium* to obtain a test solution having the concentration specified in the monograph for *Solution*. Similarly prepare a Standard solution containing the corresponding USP Reference Standard.~~

~~Record and compare the spectra concomitantly obtained for the test solution and the Standard solution. Calculate absorptivities and/or absorbance ratios where these criteria are included in an individual monograph. Unless otherwise specified, absorbances indicated for these calculations are those measured at the maximum absorbance at about the wavelength specified in the individual monograph. Where the absorbance is to be measured at about the specified wavelength other than that of maximum absorbance, the abbreviations (min) and (sh) are used to indicate a minimum and shoulder, respectively, in an absorption spectrum. The requirements are met if the UV absorption spectra of the test solution and the Standard solution exhibit maxima and minima at the same wavelengths and absorptivities and/or absorbance ratios are within specified limits.~~

▲INTRODUCTION

Spectroscopic tests contribute meaningfully toward the identification of many compendial chemical substances. The test procedures that follow are applicable to substances that absorb IR and/or UV radiation (see *Spectroscopy and Light-Scattering* ⟨851⟩).

The IR absorption spectrum of a substance, compared with that obtained concomitantly for the corresponding USP Reference Standard, provides perhaps the most conclusive evidence of the identity of the substance that can be realized from any single test. The UV absorption spectrum, on the other hand, does not exhibit a high degree of specificity. Conformance with both IR absorption and UV absorption test specifications, as called for in a large proportion of compendial monographs, leaves little doubt, if any, regarding the identity of the specimen under examination.

INFRARED ABSORPTION

Several methods are indicated for the preparation of previously dried test specimens and Reference Standards for analysis by infrared spectroscopy (see *Table 1* and *Mid-Infrared Spectroscopy* ⟨854⟩).

The reference ⟨197K⟩ in a monograph signifies that the substance under examination is mixed intimately with potassium bromide and compressed into a transparent pellet. The refer-

In-Process Revision

ence ⟨197M⟩ in a monograph signifies that the substance under examination is finely ground and dispersed in mineral oil. The reference ⟨197F⟩ in a monograph signifies that the substance under examination is a liquid or semisolid that is suspended neat between suitable (e.g. sodium chloride or potassium bromide) plates. The reference ⟨197S⟩ signifies that a solution of designated concentration is prepared in the solvent specified in the individual monograph. The solution is examined in 0.1-mm cells, unless a different cell path length is specified. The reference ⟨197A⟩ signifies that the substance under examination is intimately in contact with an internal reflection element for attenuated total reflection (ATR) analysis. The reference ⟨197E⟩ signifies that the substance under examination is pressed as a thin sample against a suitable plate for IR microscopic analysis.

In each instance, infrared absorption spectra of both the Reference Standard and the sample are obtained concomitantly using the identical preparation technique and measurement parameters. Record the spectra of the test specimen and the corresponding USP Reference Standard over the range from 4000 cm^{-1} to 400 cm^{-1}, unless otherwise specified in the individual monograph, or unless the window or internal reflection element precludes measurement to 400 cm^{-1}. The IR absorption spectrum of the preparation of the test specimen, prepared as directed in the monograph, exhibits maxima only at the same wavenumbers as that of a similar preparation of the corresponding USP Reference Standard. The source of additional bands in the spectrum of the test specimen not present in the spectrum of the Reference Standard should be investigated and explained.

Differences between the USP Reference Standard spectrum and sample spectrum that may be observed are sometimes attributed to differences in the solid-state form of materials, which are not always acceptable. When spectral differences between the sample and USP Reference Standard are observed, recrystallize both the sample and USP Reference Standard under identical conditions to produce the same solid-state form, unless specific procedures are provided in the individual monographs. Dissolve equal portions of the test specimen and the Reference Standard in equal volumes of a suitable solvent, evaporate the solutions to dryness in similar containers under identical conditions, and repeat the identification test on the residues. Other techniques for recrystallizing the sample and USP Reference Standard based on known scientific principles may be utilized.

ULTRAVIOLET ABSORPTION

The reference ⟨197U⟩ in a monograph signifies that a test solution and a Standard solution are examined spectrophotometrically, in 1-cm cells, over the spectral range from 200 to 400 nm, unless otherwise specified in the individual monograph (see *Ultraviolet–Visible Spectroscopy* ⟨857⟩).

Dissolve a portion of the substance under examination in the designated medium to obtain a test solution having the concentration specified in the monograph for the solution. Similarly, prepare a Standard solution containing the corresponding USP Reference Standard.

Record and compare the spectra concomitantly obtained for the test solution and the Standard solution. Calculate the absorptivities and/or absorbance ratios where these criteria are included in an individual monograph. Unless otherwise specified, absorbances indicated for these calculations are those measured at the maximum absorbance at about the wavelength specified in the individual monograph. Where the absorbance is to be measured at about the specified wavelength other than that of maximum absorbance, the abbreviations (min) and (sh) are used to indicate a minimum and shoulder, respectively, in an absorption spectrum. The requirements are met if the UV absorption spectra of the test solution and the Standard solution exhibit maxima and minima at the same wavelengths, and absorptivities and/or absorbance ratios are within specified limits.

Spectroscopic tests may be utilized for the identification of many compendial chemical substances. The test procedures that follow are applicable to substances that absorb, scatter,

or interact with electromagnetic radiation in a manner that can be utilized for chemical identification (see *Spectroscopy and Light-Scattering* ⟨851⟩).

The IR absorption spectrum of a substance, compared with that obtained concomitantly for the corresponding USP Reference Standard, is the most widely utilized methodology for chemical identication in compendial monographs. Under conditions where the IR absorption spectrum lacks specificity for definitive chemical identification, additional spectroscopic information can be used to supplement chemical identification. For example, conformance with both IR absorption and UV absorption test specifications, as called for in a large proportion of compendial monographs, provide complementary information for the definitive identity of the specimen under examination. In these instances, the combined spectroscopic information enables discrimination between compounds similar in structure that would not be possible from either IR absorption or UV absorption alone.

In addition to IR and UV absorption, several other spectroscopic methodologies can be utilized for the identification of the specimen under examination. The methods cited in this chapter (see *Table 1* for examples) may be utilized for identification of materials under conditions where the alternative methodology has been demonstrated to be suitable for the intended application. Suitable identification tests should be able to discriminate between compounds similar in molecular structure that are likely to be present. The choice of such potentially interfering materials should be based on sound scientific judgment, with consideration of interferences that could occur. It is not always possible to demonstrate that an analytical procedure is specific for a particular analyte (complete discrimination). In this instance, a combination of two or more analytical procedures is recommended to achieve the necessary level of discrimination.

IDENTIFICATION METHODOLOGY

Suitable identification methodology may be utilized for the chemical identification of materials against compendial standards. Implementation of these techniques requires demonstration that the alternative identification methodology is suitable for the intended application (see *Validation of Compendial Procedures* ⟨1225⟩). Identification procedures should be able to discriminate between materials similar in molecular structure; lack of specificity of a single technique may be compensated by other supporting analytical procedure(s).

⟨197S⟩	Solution of designated concentration prepared in specified solvent for infrared absorption	⟨761⟩, ⟨851⟩, ⟨941⟩, ⟨1119⟩, ⟨1120⟩, ⟨736⟩
⟨197A⟩	Substance in intimate contact with internal reflection element for attenuated total reflection for infrared absorption	⟨761⟩, ⟨851⟩, ⟨941⟩, ⟨1119⟩, ⟨1120⟩, ⟨736⟩

Table 1. Examples of Spectroscopic Identification Methodology for Monographs that Refer to Chapter ⟨197⟩ *(Continued)*

Cited in Monograph	Description	Alternative Method
⟨197E⟩	Substance pressed against a suitable plate for microscopic analysis for infrared absorption	⟨761⟩, ⟨851⟩, ⟨941⟩, ⟨1119⟩, ⟨1120⟩, ⟨736⟩
⟨197U⟩	Test solution and standard in 1-cm optical cells examined spectrophotometrically from 200 to 400 nm unless otherwise specified	⟨854⟩, ⟨761⟩, ⟨851⟩, ⟨941⟩, ⟨1119⟩, ⟨1120⟩, ⟨736⟩

For information regarding sample preparation and measurement parameters associated with an alternative identification method, refer to the appropriate general chapter. (see *Mass Spectrometry* ⟨736⟩; *Nuclear Magnetic Resonance* ⟨761⟩; *Spectroscopy and Light-Scattering* ⟨851⟩; *Mid-Infrared Spectroscopy* ⟨854⟩; *X-Ray Diffraction* ⟨941⟩; *Near-Infrared Spectroscopy* ⟨1119⟩; and *Raman Spectroscopy* ⟨1120⟩).

Unless stated otherwise in an individual monograph, the sample spectrum is compared to the USP Reference Standard spectrum obtained concomitantly. Differences between the sample and Reference Standard should be investigated and explained.

As described above, spectral differences between the sample and the USP Reference Standard may be due to differences in solid-state form, and recrystallization of both sample and USP Reference Standard under identical conditions to produce the same solid state form may be required for methods that do not require dissolving the sample prior to analysis.▲*USP33*

LIMIT TESTS

BRIEFING

⟨**223**⟩ **Dimethylaniline**, *USP 31* page 132. Revisions are proposed for the *Chromatographic System* and *Procedure* sections, based on a validated method of analysis, in an effort to modernize this general chapter by changing the packed-column GC method to a capillary GC method. The gas chromatographic procedure is based on analyses performed using the Restek Rtx-35 Amine brand of G## column (see *Chromatographic Reagents* under *Reagents, Indicators, and Solutions*). The typical retention time for dimethylaniline is about 8.5 minutes.

of the *Standard Preparation* and the *Test Preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. The ratio of the response of any dimethylaniline peak to the response of the naphthalene peak obtained from the *Test Preparation* is not greater than that obtained from the *Standard Preparation* (0.002%).

Physical Tests and Determinations

BRIEFING

⟨851⟩ Spectrophotometry and Light-Scattering, *USP 31* page 355. The Spectroscopy Advisory Panel recommends that the General Chapters Expert Committee update this general chapter, ⟨851⟩ *Spectrophotometry and Light-Scattering*, considered by the panel to be the gateway to other spectroscopy chapters. These new spectroscopy chapters, currently being proposed, appear in *PF* 34(5) [Sept.–Oct. 2008]. In addition, the advisory panel proposes revisions to chapter ⟨197⟩ *Spectrophotometric Identification Tests*, which also appears in this issue of *PF*. These changes follow an effort to broaden and update the general chapters already in *USP–NF*.

The following changes are proposed for this chapter:

1. Change the title to ⟨851⟩ *Spectroscopy and Light-Scattering*.
2. Place discussions of ultraviolet-visible, mid-infrared, fluorescence, near-infrared, and Raman spectroscopic techniques in their respective proposed chapters, referred to above.
3. Delete the following sections: *Theory and Terms*; *Apparatus*; and *Procedure*.
4. Make both technical and editorial revisions to the following sections: *Ultraviolet, Visible, Infrared, Atomic Absorption, Fluorescence, Turbidimetry, Nephelometry, and Raman Measurement; Comparative Utility of Spectral Ranges; Use of Reference Standards;* and, in *Light-Scattering Spectroscopy,* the introductory text and the subsection *Visual Comparison*.
5. Add the sections *Atomic Absorption* and *Light-Scattering Spectroscopy.*

⟨851⟩ ~~SPECTROPHOTOMETRY AND LIGHT-SCATTERING~~

▲SPECTROSCOPY AND LIGHT-SCATTERING▲*USP33*

~~ULTRAVIOLET, VISIBLE, INFRARED, ATOMIC ABSORPTION, FLUORESCENCE, TURBIDIMETRY, NEPHELOMETRY, AND RAMAN MEASUREMENT~~

~~*Absorption spectrophotometry* is the measurement of an interaction between electromagnetic radiation and the molecules, or atoms, of a chemical substance. Techniques frequently employed in pharmaceutical analysis include UV, visible, IR, and atomic absorption spectroscopy. Spectrophotometric measurement in the visible region was formerly referred to as *colorimetry;* however, it is more precise to use the term "colorimetry" only when considering human perception of color.~~

~~*Fluorescence spectrophotometry* is the measurement of the emission of light from a chemical substance while it is being exposed to UV, visible, or other electromagnetic radiation. In general, the light emitted by a fluorescent solution is of maximum intensity at a wavelength longer than that of the exciting radiation, usually by some 20 to 30 nm.~~

~~*Light Scattering* involves measurement of the light scattered because of submicroscopic optical density inhomogeneities of solutions and is useful in the determination of weight-average molecular weights of polydisperse systems in the molecular weight range from 1000 to several hundred million. Two such techniques utilized in pharmaceutical analysis are *turbidimetry* and *nephelometry.*~~

~~*Raman spectroscopy* (inelastic light scattering) is a light scattering process in which the specimen under examination is irradiated with intense monochromatic light (usually laser light) and the light scattered from the specimen is analyzed for frequency shifts.~~

~~The wavelength range available for these measurements extends from the short wavelengths of the UV through the IR. For convenience of reference, this spectral range is roughly divided into the UV (190 to 380 nm), the visible (380 to 780 nm), the near IR (780 to 3000 nm), and the IR (2.5 to 40 µm or 4000 to 250 cm^{-1}).~~

~~COMPARATIVE UTILITY OF SPECTRAL RANGES~~

~~For many pharmaceutical substances, measurements can be made in the UV and visible regions of the spectrum with greater accuracy and sensitivity than in the near IR and IR. When solutions are observed in 1-cm cells, concentrations of about 10 µg of the specimen per mL often will produce absorbances of 0.2 to 0.8 in the UV or the visible region. In the IR and near IR, concentrations of 1 to 10 mg per mL and up to 100 mg per mL, respectively, may be needed to produce sufficient absorption; for these spectral ranges, cell lengths of from 0.01 mm to upwards of 3 mm are commonly used.~~

~~The UV and visible spectra of substances generally do not have a high degree of specificity. Nevertheless, they are highly suitable for quantitative assays, and for many substances they are useful as additional means of identification.~~

~~There has been increasing interest in the use of near IR spectroscopy in pharmaceutical analysis, especially for rapid identification of large numbers of samples, and also for water determination.~~

~~The near IR region is especially suitable for the determination of –OH and –NH groups, such as water in alcohol, –OH in the presence of amines, alcohols in hydrocarbons, and primary and secondary amines in the presence of tertiary amines.~~

In-Process Revision

The IR spectrum is unique for any given chemical compound with the exception of optical isomers, which have identical spectra. However, polymorphism may occasionally be responsible for a difference in the IR spectrum of a given compound in the solid state. Frequently, small differences in structure result in significant differences in the spectra. Because of the large number of maxima in an IR absorption spectrum, it is sometimes possible to quantitatively measure the individual components of a mixture of known qualitative composition without prior separation.

The Raman spectrum and the IR spectrum provide similar data, although the intensities of the spectra are governed by different molecular properties. Raman and IR spectroscopy exhibit different relative sensitivities for different functional groups, e.g., Raman spectroscopy is particularly sensitive to C–S and C–C multiple bonds, and some aromatic compounds are more easily identified by means of their Raman spectra. Water has a highly intense IR absorption spectrum, but a particularly weak Raman spectrum. Therefore, water has only limited IR "windows" that can be used to examine aqueous solutes, while its Raman spectrum is almost completely transparent and useful for solute identification. The two major limitations of Raman spectroscopy are that the minimum detectable concentration of specimen is typically 10^{-4} M to 10^{-2} M and that the impurities in many substances fluoresce and interfere with the detection of the Raman scattered signal.

Optical reflectance measurements provide spectral information similar to that obtained by transmission measurements. Since reflectance measurements probe only the surface composition of the specimen, difficulties associated with the optical thickness and the light scattering properties of the substance are eliminated. Thus, reflectance measurements are frequently more simple to perform on intensely absorbing materials. A particularly common technique used for IR reflectance measurements is termed attenuated total reflectance (ATR), also known as multiple internal reflectance (MIR). In the ATR technique, the beam of the IR spectrometer is passed through an appropriate IR window material (e.g., KRS-5, a TlBr-TlI eutectic mixture), which is cut at such an angle that the IR beam enters the first (front) surface of the window, but is totally reflected when it impinges on the second (back) surface (i.e., the angle of incidence of the radiation upon the second surface of the window exceeds the critical angle for that material). By appropriate window construction, it is possible to have many internal reflections of the IR beam before it is transmitted out of the window. If a specimen is placed in close contact with the window along the sides that totally reflect the IR beam, the intensity of reflected radiation is reduced at each wavelength (frequency) that the specimen absorbs. Thus, the ATR technique provides a reflectance spectrum that has been increased in intensity, when compared to a simple reflectance measurement, by the number of times that the IR beam is reflected within the window. The ATR technique provides excellent sensitivity, but it yields poor reproducibility, and is not a reliable quantitative technique unless an internal standard is intimately mixed with each test specimen.

Fluorescence spectrophotometry is often more sensitive than absorption spectrophotometry. In absorption measurements, the specimen transmittance is compared to that of a blank; and at low concentrations, both solutions give high signals. Conversely, in fluorescence spectrophotometry, the solvent blank has low rather than high output, so that the background radiation that may interfere with determinations at low concentrations is much less. Whereas few compounds can be determined conveniently at concentrations below 10^{-5} M by light absorption, it is not unusual to employ concentrations of 10^{-7} M to 10^{-6} M in fluorescence spectrophotometry.

THEORY AND TERMS

The power of a radiant beam decreases in relation to the distance that it travels through an absorbing medium. It also decreases in relation to the concentration of absorbing molecules or ions encountered in that medium. These two factors determine the proportion of the total incident energy that emerge. The decrease in power of monochromatic radiation passing through a homogeneous absorbing medium is stated quantitatively by Beer's law, $\log_{10}(1/T) = A = abc$, in which the terms are as defined below.

Absorbance [Symbol: *A*] — The logarithm, to the base 10, of the reciprocal of the transmittance *(T)*. [NOTE—Descriptive terms used formerly include optical density, absorbancy, and extinction.]

Absorptivity [Symbol: *a*] — The quotient of the absorbance *(A)* divided by the product of the concentration of the substance *(c)*, expressed in g per L, and the absorption path length *(b)* in cm. [NOTE—It is not to be confused with absorbancy index; specific extinction; or extinction coefficient.]

Molar Absorptivity [Symbol: *ε*] — The quotient of the absorbance *(A)* divided by the product of the concentration, expressed in *moles* per L, of the substance and the absorption path length in cm. It is also the product of the absorptivity *(a)* and the molecular weight of the substance. [NOTE—Terms formerly used include molar absorbancy index, molar extinction coefficient, and molar absorption coefficient.]

For most systems used in absorption spectrophotometry, the absorptivity of a substance is a constant independent of the intensity of the incident radiation, the internal cell length, and the concentration, with the result that concentration may be determined photometrically.

Beer's law gives no indication of the effect of temperature, wavelength, or the type of solvent. For most analytical work the effects of normal variation in temperature are negligible.

Deviations from Beer's law may be caused by either chemical or instrumental variables. Apparent failure of Beer's law may result from a concentration change in solute molecules because of association between solute molecules or between solute and solvent molecules, or dissociation or ionization. Other deviations might be caused by instrumental effects such as polychromatic radiation, slit-width effects, or stray light.

Even at a fixed temperature in a given solvent, the absorptivity may not be truly constant. However, in the case of specimens having only one absorbing component, it is not necessary that the absorbing system conform to Beer's law for use in quantitative analysis. The concentration of an unknown may be found by comparison with an experimentally determined standard curve.

Although, in the strictest sense, Beer's law does not hold in atomic absorption spectrophotometry because of the lack of quantitative properties of the cell length and the concentration, the absorption processes taking place in the flame under conditions of reproducible aspiration do follow the Beer relationship in principle. Specifically, the negative log of the transmittance, or the absorbance, is directly proportional to the absorption coefficient, and, consequently, is proportional to the number of absorbing atoms. On this basis, calibration curves may be constructed to permit evaluation of unknown absorption values in terms of concentration of the element in solution.

Absorption Spectrum — A graphic representation of absorbance, or any function of absorbance, plotted against wavelength or function of wavelength.

Transmittance [Symbol: *T*] — The quotient of the radiant power transmitted by a specimen divided by the radiant power incident upon the specimen. [NOTE—Terms formerly used include transmittancy and transmission.]

Fluorescence Intensity [Symbol: *I*] — An empirical expression of fluorescence activity, commonly given in terms of arbitrary units proportional to detector response. The *fluorescence emission spectrum* is a graphical presentation of the spectral distribution of radiation emitted by an activated substance, showing intensity of emitted radiation as ordinate, and wavelength as abscissa. The *fluorescence excitation spectrum* is a graphical presentation of the activation spectrum, showing intensity of radiation emitted by an activated substance as ordinate, and wavelength of the incident (activating) radiation as abscissa. As in absorption spectrophotometry, the important regions of the electromagnetic spectrum encompassed by the fluorescence of organic compounds are the UV, visible, and near IR, i.e., the region from 250 to 800 nm. After a molecule has absorbed radiation, the energy can be lost as heat or released in the form of radiation of the same or longer wavelength as the absorbed radiation. Both absorption and emission of radiation are due to the transitions of electrons between different energy levels, or orbitals, of the molecule. There is a time delay between the absorption and emission of light; this interval, the duration of the excited state, has been measured to be about 10^{-9} second to 10^{-8} second for most organic fluorescent solutions. The short lifetime of fluorescence distinguishes this type of luminescence from phosphorescence, which is a long-lived afterglow having a lifetime of 10^{-3} second up to several minutes.

In-Process Revision

Turbidance [Symbol: *S*]—The light-scattering effect of suspended particles. The amount of suspended matter may be measured by observation of either the transmitted light (turbidimetry) or the scattered light (nephelometry).

Turbidity [Symbol: τ]—In light-scattering measurements, the turbidity is the measure of the decrease in incident beam intensity per unit length of a given suspension.

Raman Scattering Activity—The molecular property (in units of cm^4 per g) governing the intensity of an observed Raman band for a randomly oriented specimen. The scattering activity is determined from the derivative of the molecular polarizability with respect to the molecular motion giving rise to the Raman shifted band. In general, the Raman band intensity is linearly proportional to the concentration of the analyte.

USE OF REFERENCE STANDARDS

With few exceptions, the Pharmacopeial spectrophotometric tests and assays call for comparison against a USP Reference Standard. This is to ensure measurement under conditions identical for the test specimen and the reference substance. These conditions include wavelength setting, slit-width adjustment, cell placement and correction, and transmittance levels. It should be noted that cells exhibiting identical transmittance at a given wavelength may differ considerably in transmittance at other wavelengths. Appropriate cell corrections should be established and used where required.

The expressions, "similar preparation" and "similar solution," as used in tests and assays involving spectrophotometry, indicate that the reference specimen, generally a USP Reference Standard, is to be prepared and observed in a manner identical for all practical purposes to that used for the test specimen. Usually in making up the solution of the specified Reference Standard, a solution of about (i.e., within 10%) the desired concentration is prepared and the absorptivity is calculated on the basis of the exact amount weighed out; if a previously dried specimen of the Reference Standard has not been used, the absorptivity is calculated on the anhydrous basis.

The expressions, "concomitantly determine" and "concomitantly measured," as used in tests and assays involving spectrophotometry, indicate that the absorbances of both the solution containing the test specimen and the solution containing the reference specimen, relative to the specified test blank, are to be measured in immediate succession.

APPARATUS

Many types of spectrophotometers are available. Fundamentally, most types, except those used for IR spectrophotometry, provide for passing essentially monochromatic radiant energy through a specimen in suitable form, and measuring the intensity of the fraction that is transmitted. Fourier transform IR spectrophotometers use an interferometric technique whereby polychromatic radiation passes through the analyte and onto a detector on an intensity and time basis. UV, visible, and dispersive IR spectrophotometers comprise an energy source, a dispersing device (e.g., a prism or grating), slits for selecting the wavelength band, a cell or holder for the test specimen, a detector of radiant energy, and associated amplifiers and measuring devices. In *diode array* spectrophotometers, the energy from the source is passed through the test specimen and then dispersed via a grating onto several hundred light-sensitive diodes, each of which in turn develops a signal proportional to the number of photons at its small wavelength interval; these signals then may be computed at rapid chosen intervals to represent a complete spectrum. Fourier transform IR systems utilize an interferometer instead of a dispersing device and a digital computer to process the spectral data. Some instruments are manually operated, whereas others are equipped for automatic and continuous recording. Instruments that are interfaced to a digital computer have the capabilities also of co-adding and storing spectra, performing spectral comparisons, and performing difference spectroscopy (accomplished with the use of a digital absorbance subtraction method).

Instruments are available for use in the visible, in the visible and UV, in the visible, UV, and near-IR, and in the IR regions of the spectrum. Choice of the type of spectrophotometric analysis and of the instrument to be used depends upon factors such as the composition and amount of available test specimen, the degree of accuracy, sensitivity, and selectivity desired, and the manner in which the specimen is handled.

The apparatus used in atomic absorption spectrophotometry has several unique features. For each element to be determined, a specific source that emits the spectral line to be absorbed should be selected. The source is usually a hollow-cathode lamp, the cathode of which is designed to emit the desired radiation when excited. Since the radiation to be absorbed by the test specimen element is usually of the same wavelength as that of its emission line, the element in the hollow-cathode lamp is the same as the element to be determined. The apparatus is equipped with an aspirator for introducing the test specimen into a flame, which is usually provided by air–acetylene, air–hydrogen, or, for refractory cases, nitrous oxide–acetylene. The flame, in effect, is a heated specimen chamber. A detector is used to read the signal from the chamber. Interfering radiation produced by the flame during combustion may be negated by the use of a chopped source lamp signal of a definite frequency. The detector should be tuned to this alternating current frequency so that the direct current signal arising from the flame is ignored. The detecting system, therefore, reads only the change in signal from the hollow-cathode source, which is directly proportional to the number of atoms to be determined in the test specimen. For Pharmacopeial purposes, apparatus that provides the readings directly in absorbance units is usually required. However, instruments providing readings in percent transmission, percent absorption, or concentration may be used if the calculation formulas provided in the individual monographs are revised as necessary to yield the required quantitative results. Percent absorption or percent transmittance may be converted to absorbance, *A*, by the following two equations:

$$A = 2 - \log_{10}(100 - \%\ \text{absorption})$$

or:

$$A = 2 - \log_{10}(\%\ \text{transmittance})$$

Depending upon the type of apparatus used, the readout device may be a meter, digital counter, recorder, or printer. Both single-beam and double-beam instruments are commercially available, and either type is suitable.

Measurement of fluorescence intensity can be made with a simple *filter fluorometer*. Such an instrument consists of a radiation source, a primary filter, a specimen chamber, a secondary filter, and a fluorescence detection system. In most such fluorometers, the detector is placed on an axis at 90° from that of the exciting beam. This right-angle geometry permits the exciting radiation to pass through the test specimen and not contaminate the output signal received by the fluorescence detector. However, the detector unavoidably receives some of the exciting radiation as a result of the inherent scattering properties of the solutions themselves, or if dust or other solids are present. Filters are used to eliminate this residual scatter. The primary filter selects short-wavelength radiation capable of exciting the test specimen, while the secondary filter is normally a sharp cut-off filter that allows the longer-wavelength fluorescence to be transmitted but blocks the scattered excitation.

Most fluorometers use photomultiplier tubes as detectors, many types of which are available, each having special characteristics with respect to spectral region of maximum sensitivity, gain, and electrical noise. The photocurrent is amplified and read out on a meter or recorder.

A *spectrofluorometer* differs from a filter fluorometer in that filters are replaced by monochromators, of either the prism or the grating type. For analytical purposes, the spectrofluorometer is superior to the filter fluorometer in wavelength selectivity, flexibility, and convenience, in the same way in which a spectrophotometer is superior to a filter photometer.

Many radiation sources are available. Mercury lamps are relatively stable and emit energy mainly at discrete wavelengths. Tungsten lamps provide an energy continuum in the visible region. The high-pressure xenon arc lamp is often used in spectrofluorometers because it is a high-intensity source that emits an energy continuum extending from the UV into the IR.

In spectrofluorometers, the monochromators are equipped with slits. A narrow slit provides high resolution and spectral purity, while a large slit sacrifices these for high sensitivity. Choice of slit size is determined by the separation between exciting and emitting wavelengths as well as the degree of sensitivity needed.

Specimen cells used in fluorescence measurements may be round tubes or rectangular cells similar to those used in absorption spectrophotometry, except that they are polished on all four vertical sides. A convenient test specimen size is 2 to 3 mL, but some instruments can be fitted with small cells holding 100 to 300 µL, or with a capillary holder requiring an even smaller amount of specimen.

Light-scattering instruments are available and consist in general of a mercury lamp, with filters for the strong green or blue lines, a shutter, a set of neutral filters with known transmittance, and a sensitive photomultiplier to be mounted on an arm that can be rotated around the solution cell and set at any angle from −135° to 0° to +135° by a dial outside the light-tight housing. Solution cells are of various shapes, such as square for measuring 90° scattering; semioctagonal for 45°, 90°, and 135° scattering; and cylindrical for scattering at all angles. Since the determination of molecular weight requires a precise measure of the difference in refractive index between the solution and solvent, $[(n - n_s)/c]$, a second instrument, a differential refractometer, is needed to measure this small difference.

Raman spectrometers include the following major components: a source of intense monochromatic radiation (invariably a laser); optics to collect the light scattered by the test specimen; a (double) monochromator to disperse the scattered light and reject the intense incident frequency; and a suitable light-detection and amplification system. Raman measurement is simple in that most specimens are examined directly in melting-point capillaries. Because the laser source can be focused sharply, only a few microliters of the specimen is required.

PROCEDURE

Absorption Spectrophotometry

Detailed instructions for operating spectrophotometers are supplied by the manufacturers. To achieve significant and valid results, the operator of a spectrophotometer should be aware of its limitations and of potential sources of error and variation. The instruction manual should be followed closely on such matters as care, cleaning, and calibration of the instrument, and techniques of handling absorption cells, as well as instructions for operation. The following points require special emphasis.

Check the instrument for accuracy of calibration. Where a continuous source of radiant energy is used, attention should be paid to both the wavelength and photometric scales; where a spectral line source is used, only the photometric scale need be checked. A number of sources of radiant energy have spectral lines of suitable intensity, adequately spaced throughout the spectral range selected. The best single source of UV and visible calibration spectra is the quartz mercury arc, of which the lines at 253.7, 302.25, 313.16, 334.15, 365.48, 404.66, and 435.83 nm may be used. The glass mercury arc is equally useful above 300 nm. The 486.13-nm and 656.28-nm lines of a hydrogen discharge lamp may be used also. The wavelength scale may be calibrated also by means of suitable glass filters, which have useful absorption bands through the visible and UV regions. Standard glasses containing didymium (a mixture of praseodymium and neodymium) have been used widely, although glasses containing holmium were found to be superior. Standard holmium oxide solution has superseded the use of holmium glass.[1] The wavelength scales of near-IR and IR spectrophotometers are readily checked by the use of absorption bands provided by polystyrene films, carbon dioxide, water vapor, or ammonia gas.

For checking the photometric scale, a number of standard inorganic glass filters as well as standard solutions of known transmittances such as potassium dichromate are available.[2]

Quantitative absorbance measurements usually are made on solutions of the substance in liquid-holding cells. Since both the solvent and the cell window absorb light, compensation must be made for their contribution to the measured absorbance. Matched cells are available commercially for UV and visible spectrophotometry for which no cell correction is necessary. In IR spectrophotometry, however, corrections for cell differences usually must be made. In such cases, pairs of cells are filled with the selected solvent and the difference in their absorbances at the chosen wavelength is determined. The cell exhibiting the greater absorbance is used for the solution of the test specimen and the measured absorbance is corrected by subtraction of the cell difference.

With the use of a computerized Fourier-transform IR system, this correction need not be made, since the same cell can be used for both the solvent blank and the test solution. However, it must be ascertained that the transmission properties of the cell are constant.

Comparisons of a test specimen with a Reference Standard are best made at a peak of spectral absorption for the compound concerned. Assays prescribing spectrophotometry give the commonly accepted wavelength for peak spectral absorption of the substance in question. It is known that different spectrophotometers may show minor variation in the apparent wavelength of this peak. Good practice demands that comparisons be made at the wavelength at which peak absorption occurs. Should this differ by more than ± 1 nm from the wavelength specified in the individual monograph, recalibration of the instrument may be indicated.

TEST PREPARATION

For determinations utilizing UV or visible spectrophotometry, the specimen generally is dissolved in a solvent. Unless otherwise directed in the monograph, determinations are made at room temperature using a path length of 1 cm. Many solvents are suitable for these ranges, including water, alcohols, chloroform, lower hydrocarbons, ethers, and dilute solutions of strong acids and alkalies. Precautions should be taken to utilize solvents free from contaminants absorbing in the spectral region being used. It is usually advisable to use water-free methanol or alcohol, or alcohol denatured by the addition of methanol but not containing benzene or other interfering impurities, as the solvent. Solvents of special spectrophotometric quality, guaranteed to be free from contaminants, are available commercially from several sources. Some other analytical reagent-grade organic solvents may contain traces of impurities that absorb strongly in the UV region. New lots of these solvents should be checked for their transparency, and care should be taken to use the same lot of solvent for preparation of the test solution and the standard solution and for the blank.

No solvent in appreciable thickness is completely transparent throughout the near-IR and IR spectrum. Carbon tetrachloride (up to 5 mm in thickness) is practically transparent to 6 µm (1666 cm^{-1}). Carbon disulfide (1 mm in thickness) is suitable as a solvent to 40 µm (250 cm^{-1}) with the exception of the 4.2-µm to 5.0-µm (2381 cm^{-1} to 2000 cm^{-1}) and the 5.5-µm to 7.5-µm (1819 cm^{-1} to 1333 cm^{-1}) regions, where it has strong absorption. Other solvents have relatively narrow regions of transparency. For IR spectrophotometry, an additional qualification for a suitable solvent is that it must not affect the material, usually sodium chloride, of which the cell is made. The test specimen may also be prepared by dispersing the finely ground solid specimen in mineral oil or by mixing it intimately with previously dried alkali halide salt (usually potassium bromide). Mixtures with alkali halide salts may be examined directly or as transparent disks or pellets obtained by pressing the mixture in a

Stds. 76A, 469 (1972) [re: SRM 931, "Liquid Absorbance Standards for Ultraviolet and Visible Spectrophotometry" as well as potassium chromate and potassium dichromate]; NIST Spec. Publ. 260–116 (1994) [re: SRM 930 and SRM 1930, "Glass Filters for Spectrophotometry".

In-Process Revision

die. Typical drying conditions for potassium bromide are 105° in vacuum for 12 hours, although grades are commercially available that require no drying. Infrared microscopy or a mineral oil dispersion is preferable where disproportionation between the alkali halide and the test specimen is encountered. For suitable materials the test specimen may be prepared neat as a thin sample for IR microscopy or suspended neat as a thin film for mineral oil dispersion. For Raman spectrometry, most common solvents are suitable, and ordinary (non-fluorescing) glass specimen cells can be used. The IR region of the electromagnetic spectrum extends from 0.8 to 400 µm. From 800 to 2500 nm (0.8 to 2.5 µm) is generally considered to be the near-IR (NIR) region; from 2.5 to 25 µm (4000 to 400cm^{-1}) is generally considered to be the mid-range (mid-IR) region; and from 25 to 400 µm is generally considered to be the far-IR (FIR) region. Unless otherwise specified in the individual monograph, the region from 3800 to 650 cm^{-1} (2.6 to 15 µm) should be used to ascertain compliance with monograph specifications for IR absorption.

Where values for IR line spectra are given in an individual monograph, the letters *s, m,* and *w* signify strong, medium, and weak absorption, respectively; *sh* signifies a shoulder, *bd* signifies a band, and *v* means very. The values may vary as much as 0.1 µm or 10 cm^{-1}, depending upon the particular instrument used. Polymorphism gives rise to variations in the IR spectra of many compounds in the solid state. Therefore, when conducting IR absorption tests, if a difference appears in the IR spectra of the analyte and the standard, dissolve equal portions of the test substance and the standard in equal volumes of a suitable solvent, evaporate the solutions to dryness in similar containers under identical conditions, and repeat the test on the residues.

In NIR spectroscopy much of the current interest centers around the ease of analysis. Samples can be analyzed in powder form or by means of reflectance techniques, with little or no preparation. Compliance with in-house specifications can be determined by computerized comparison of spectra with spectra previously obtained from reference materials. Many pharmaceutical materials exhibit low absorptivity in this spectral region, which allows incident near-IR radiation to penetrate samples more deeply than UV, visible, or IR radiation. NIR spectrophotometry may be used to observe matrix modifications and, with proper calibration, may be used in quantitative analysis.

In atomic absorption spectrophotometry, the nature of the solvent and the concentration of solids must be given special consideration. An ideal solvent is one that interferes to a minimal extent in the absorption or emission processes and one that produces neutral atoms in the flame. If there is a significant difference between the surface tension or viscosity of the test solution and standard solution, the solutions are aspirated or atomized at a different rate, causing significant differences in the signals generated. The acid concentration of the solutions also affects the absorption processes. Thus, the solvents used in preparing the test specimen and the standard should be the same or as much alike in these respects as possible, and should yield solutions that are easily aspirated via the specimen tube of the burner-aspirator. Since undissolved solids present in the solutions may give rise to matrix or bulk interferences, the total undissolved solids content in all solutions should be kept below 2% wherever possible.

CALCULATIONS

The application of absorption spectrophotometry in an assay or a test generally requires the use of a Reference Standard. Where such a measurement is specified in an assay, a formula is provided in order to permit calculation of the desired result. A numerical constant is frequently included in the formula. The following derivation is provided to introduce a logical approach to the deduction of the constants appearing in formulas in the assays in many monographs.

The Beer's law relationship is valid for the solutions of both the Reference Standard *(S)* and the test specimen *(U)*: in which A_S is the absorbance of the Standard solution of concentration C_S, and A_U is the absorbance of the test specimen solution of concentration C_U. If C_S and C_U are expressed in the same units and the absorbances of both solutions are measured in matching cells having the same dimensions, the absorptivity, *a,* and the cell thickness, *b,* are the same; consequently, the two equations may be combined and rewritten to solve for C_U:

(1) $A_S = abC_S$

(2) $A_U = abC_U$

(3) $C_U = C_S(A_U/A_S)$

Quantities of solid test specimens to be taken for analysis are generally specified in mg. Instructions for dilution are given in the assay and, since dilute solutions are used for absorbance measurements, concentrations are usually expressed for convenience in units of µg per mL. Taking a quantity, in mg, of a test specimen of a drug substance or solid dosage form for analysis, it therefore follows that a volume (V_U), in L, of solution of concentration C_U may be prepared from the amount of test specimen that contains a quantity W_U, in mg, of the drug substance [NOTE—C_U is numerically the same whether expressed as µg per mL or mg per L], such that:

(4) $W_U = V_U C_U$

The form in which the formula appears in the assay in a monograph for a solid article may be derived by substituting C_U of equation (3) into equation (4). In summary, the use of equation (4), with due consideration for any unit conversions necessary to achieve equality in equation (5), permits the calculation of the constant factor (V_U) occurring in the final formula:

(5) $W_U = V_U C_S(A_U/A_S)$

The same derivation is applicable to formulas that appear in monographs for liquid articles that are assayed by absorption spectrophotometry. For liquid dosage forms, results of calculations are generally expressed in terms of the quantity, in mg, of drug substance in each mL of the article. Thus it is necessary to include in the denominator an additional term, the volume *(V)*, in mL, of the test preparation taken.

Assays in the visible region usually call for comparing concomitantly the absorbance produced by the *Assay preparation* with that produced by a *Standard preparation* containing approximately an equal quantity of a USP Reference Standard. In some situations, it is permissible to omit the use of a Reference Standard. This is true where spectrophotometric assays are made with routine frequency, and where a suitable standard curve is available, prepared with the respective USP Reference Standard, and where the substance assayed conforms to Beer's law within the range of about 75% to 125% of the final concentration used in the assay. Under these circumstances, the absorbance found in the assay may be interpolated on the standard curve, and the assay result calculated therefrom.

Such standard curves should be confirmed frequently, and always when a new spectrophotometer or new lots of reagents are put into use.

In spectrophotometric assays that direct the preparation and use of a standard curve, it is permissible and preferable, when the assay is employed infrequently, not to use the standard curve but to make the comparison directly against a quantity of the Reference Standard approximately equal to that taken of the specimen, and similarly treated.

Fluorescence Spectrophotometry

The measurement of fluorescence is a useful analytical technique. *Fluorescence* is light emitted from a substance in an excited state that has been reached by the absorption of radiant energy. A substance is said to be *fluorescent* if it can be made to fluoresce. Many compounds can be assayed by procedures utilizing either their inherent fluorescence or the fluorescence of suitable derivatives.

Test specimens prepared for fluorescence spectrophotometry are usually one-tenth to one-hundredth as concentrated as those used in absorption spectrophotometry, for the following reason. In analytical applications, it is preferable that the fluorescence signal be linearly related to the concentration; but if a test specimen is too concentrated, a significant part of the incoming light is absorbed by the specimen near the cell surface, and the light reaching the center is reduced. That is, the specimen itself acts as an "inner filter." However, fluorescence spectrophotometry is inherently a highly sensitive technique, and

concentrations of 10^{-5} M to 10^{-3} M frequently are used. It is necessary in any analytical procedure to make a working curve of fluorescence intensity versus concentration in order to establish a linear relationship. All readings should be corrected for a solvent blank.

Fluorescence measurements are sensitive to the presence of dust and other solid particles in the test specimen. Such impurities may reduce the intensity of the exciting beam or give misleading high readings because of multiple reflections in the specimen cell. It is, therefore, wise to eliminate solid particles by centrifugation; filtration also may be used, but some filter papers contain fluorescent impurities.

Temperature regulation is often important in fluorescence spectrophotometry. For some substances, fluorescence efficiency may be reduced by as much as 1% to 2% per degree of temperature rise. In such cases, if maximum precision is desired, temperature-controlled specimen cells are useful. For routine analysis, it may be sufficient to make measurements rapidly enough so that the specimen does not heat up appreciably from exposure to the intense light source. Many fluorescent compounds are light-sensitive. Exposed in a fluorometer, they may be photo-degraded into more or less fluorescent products. Such effects may be detected by observing the detector response in relationship to time, and may be reduced by attenuating the light source with filters or screens.

Change of solvent may markedly affect the intensity and spectral distribution of fluorescence. It is inadvisable, therefore, to alter the solvent specified in established methods without careful preliminary investigation. Many compounds are fluorescent in organic solvents but virtually nonfluorescent in water; thus, a number of solvents should be tried before it is decided whether or not a compound is fluorescent. In many organic solvents, the intensity of fluorescence is increased by elimination of dissolved oxygen, which has a strong quenching effect. Oxygen may be removed by bubbling an inert gas such as nitrogen or helium through the test specimen.

A semiquantitative measure of the strength of fluorescence is given by the ratio of the fluorescence intensity of a test specimen and that of a standard obtained with the same instrumental settings. Frequently, a solution of stated concentration of quinine in 0.1 N sulfuric acid or fluorescein in 0.1 N sodium hydroxide is used as a reference standard.

Light Scattering

Turbidity can be measured with a standard photoelectric filter photometer or spectrophotometer, preferably with illumination in the blue portion of the spectrum. Nephelometric measurements require an instrument with a photocell placed so as to receive scattered rather than transmitted light; this geometry applies also to fluorometers, so that, in general, fluorometers can be used as nephelometers, by proper selection of filters. A ratio turbidimeter combines the technology of 90° nephelometry and turbidimetry: it contains photocells that receive and measure scattered light at a 90° angle from the sample as well as receiving and measuring the forward scatter in front of the sample; it also measures light transmitted directly through the sample. Linearity is attained by calculating the ratio of the 90° angle scattered light measurement to the sum of the forward scattered light measurement and the transmitted light measurement. The benefit of using a ratio turbidimetry system is that the measurement of stray light becomes negligible.

In practice, it is advisable to ensure that settling of the particles being measured is negligible. This is usually accomplished by including a protective colloid in the liquid suspending medium. It is important that results be interpreted by comparison of readings with those representing known concentrations of suspended matter, produced under precisely the same conditions.

Turbidimetry or nephelometry may be useful for the measurement of precipitates formed by the interaction of highly dilute solutions of reagents, or other particulate matter, such as suspensions of bacterial cells. In order that consistent results may be achieved, all variables must be carefully controlled. Where such control is possible, extremely dilute suspensions may be measured.

The specimen solute is dissolved in the solvent at several different accurately known concentrations, the choice of concentrations being dependent on the molecular weight of the solute and ranging from 1% for M_w = 10,000 to 0.01% for M_w = 1,000,000. Each solution must be very carefully cleaned before measurement by repeated filtration through fine filters. A dust particle in the solution vitiates the intensity of the scattered light measured. A criterion for a clear solution is that the dissymmetry, 45°/135° scattered intensity ratio, has attained a minimum.

The turbidity and refractive index of the solutions are measured. From the general 90° light scattering equation, a plot of HC/τ versus C is made and extrapolated to infinite dilution, and the weight-average molecular weight, M, is calculated from the intercept, $1/M$.

Visual Comparison

Where a color or a turbidity comparison is directed, color comparison tubes that are matched as closely as possible in internal diameter and in all other respects should be used. For color comparison, the tubes should be viewed downward, against a white background, with the aid of a light source directed from beneath the bottoms of the tubes, while for turbidity comparison the tubes should be viewed horizontally, against a dark background, with the aid of a light source directed from the sides of the tubes.

In conducting limit tests that involve a comparison of colors in two like containers (e.g., matched color comparison tubes), a suitable instrument, rather than the unaided eye, may be used.

▲ULTRAVIOLET, VISIBLE, INFRARED, ATOMIC ABSORPTION, FLUORESCENCE, TURBIDIMETRY, NEPHELOMETRY, AND RAMAN MEASUREMENT

Absorption spectroscopy is the measurement of an interaction between electromagnetic radiation and the molecules, or atoms, of a chemical substance. Spectroscopy techniques frequently employed in pharmaceutical analysis include ultraviolet (UV), visible (see the proposed chapter *Ultraviolet-Visible Spectroscopy* ⟨857⟩), infrared (IR) (see the proposed chapter *Mid-Infrared Spectroscopy* ⟨854⟩), near-infrared (see the official chapter *Near-Infrared Spectrophotometry* ⟨1119⟩), and atomic absorption. Spectrophotometric measurement in the visible region was formerly referred to as *colorimetry*; however, it is more precise to use the term *colorimetry* only when considering human perception of color.

Fluorescence spectroscopy (see the proposed chapter *Fluorescence Spectroscopy* ⟨853⟩) is the measurement of the emission of light from a chemical substance while it is being exposed to UV, visible, or other electromagnetic radiation or during a chemical reaction. In general, the light emitted by a fluorescent solution is of maximum intensity at a wavelength longer than that of the exciting radiation, usually by some 20 to 30 nm.

In-Process Revision

Light-scattering involves measurement of the light scattered because of submicroscopic optical density inhomogeneities of solutions. The technique is useful in the determination of weight-average molecular weights of polydisperse systems in the molecular weight range from 1000 to several hundred million. Two such techniques used in pharmaceutical analysis are *turbidimetry* and *nephelometry.*

Raman spectroscopy (inelastic light-scattering) (see the official chapter *Raman Spectroscopy* ⟨1120⟩) is a light-scattering process in which the specimen under examination is irradiated with intense monochromatic light (usually laser light) and the light scattered from the specimen is analyzed for frequency shifts.

The wavelength range available for these measurements extends from the short wavelengths of UV through near-IR. For convenience of reference, this spectral range is roughly divided into UV (190 to 380 nm), visible (380 to 780 nm), and near-IR (780 to 1400 nm). Raman spectroscopy involves illuminating a sample with a monochromatic (laser) source and measuring the spectrum of the radiation that has been inelastically scattered from the sample. The difference between the wavenumber of the laser and the wavenumbers of the inelastically scattered radiation corresponds to the wavenumber of the vibrational modes of the molecule.

COMPARATIVE UTILITY OF SPECTRAL RANGES

For many pharmaceutical substances, measurements can be made in the UV and visible regions of the spectrum with greater accuracy and sensitivity than in the near-IR and IR regions. When solutions are observed in 1-cm cells, concentrations of about 10 µg of the specimen per mL will often produce absorbances of 0.2 to 0.8 in the UV or the visible region. In the IR and near-IR regions, concentrations of 1 to 10 mg per mL and up to 100 mg per mL, respectively, may be needed to produce sufficient absorption; for these spectral ranges, cell lengths from 0.01 mm to more than 3 mm are commonly used; 0.1 mm is most commonly used for mid-IR measurements.

The UV and visible spectra of substances generally do not have a high degree of specificity. Nevertheless, they are highly suitable for quantitative assays, and for many substances they are useful as additional means of identification.

There has been increasing interest in the use of near-IR spectroscopy in pharmaceutical analysis, especially for rapid identification of large numbers of samples, and also for water determination.

The near-IR region is especially suitable for the determination of –OH and –NH groups, such as water in alcohol, –OH in the presence of amines, alcohols in hydrocarbons, and primary and secondary amines in the presence of tertiary amines.

The IR spectrum is unique for any given chemical compound with the exception of optical isomers, which have identical spectra. However, polymorphism may occasionally be responsible for a difference in the IR spectrum of a given compound in the solid state. Frequently, small differences in structure result in significant differences in the spectra. Because of the large number of maxima in an IR absorption spectrum, it is sometimes possible to quantitatively measure the individual components of a mixture of known qualitative composition without prior separation.

The Raman spectrum and the IR spectrum provide similar data, although the intensities of the spectra are governed by different molecular properties. Raman and IR spectroscopy exhibit different relative sensitivities for different functional groups; for example, Raman spectroscopy is particularly sensitive to C–S as well as C–C multiple bonds, and some aromatic compounds are more easily identified by means of their Raman spectra. Water has a highly intense IR absorption spectrum, but a particularly weak Raman spectrum. Therefore, water has only limited IR ''windows'' that can be used to examine aqueous solutes, whereas its Raman spectrum is almost completely transparent and useful for solute identification. The two major limitations of Raman spectroscopy are that the minimum detectable concentration of specimen is typ-

ically 10^{-1} M to 10^{-2} M and that the impurities in many substances fluoresce and interfere with the detection of the Raman scattered signal.

Optical reflection measurements provide spectral information similar to that obtained by transmission measurements. Because reflection measurements probe only the surface composition of the specimen, difficulties associated with the optical thickness and the light-scattering properties of the substance are eliminated. Thus, reflection measurements are frequently simpler to perform on intensely absorbing materials. A particularly common technique used for IR reflection measurements is termed *attenuated total reflection* (ATR) (see the proposed chapter *Mid-Infrared Spectroscopy* ⟨854⟩*, Attenuated Total Reflection Spectroscopy*). In the ATR technique, the beam of the IR spectrometer is passed through an appropriate IR window material (e.g., zinc selenide, diamond, germanium), which is cut at such an angle that the IR beam enters the first (front) surface of the window, but is totally reflected when it impinges on the second (back) surface (i.e., the angle of incidence of the radiation on the second surface of the window exceeds the critical angle for that material). If a specimen is placed in close contact with the window along the sides that totally reflect the IR beam, the intensity of reflected radiation is reduced at each wavelength (frequency) that the specimen absorbs. By means of appropriate window construction, it is possible to have many internal reflections of the IR beam before it is transmitted out of the window. For accessories with multiple reflections, the ATR technique provides a spectrum in which the absorbance of each band has been increased in intensity, when compared to a single reflection measurement, by the number of times the IR beam is reflected within the window. The ATR technique provides excellent sensitivity, and it can provide good reproducibility, provided that care is taken to ensure good contact between the sample and the internal reflection element.

Fluorescence spectroscopy is often more sensitive than absorption spectroscopy. In absorption measurements, the signal from the radiation that is transmitted through the specimen is compared to the corresponding signal from a blank; and at low concentrations, both solutions give high signals that give rise to high photon shot noise from the detector. Conversely, in fluorescence spectroscopy, the solvent blank has low rather than high output; therefore, the background radiation that may interfere with determinations at low concentrations is much less than in absorption spectroscopy. Whereas few compounds can be determined conveniently at concentrations below 10^{-5} M by light absorption, it is not unusual to employ concentrations of 10^{-7} M to 10^{-8} M in fluorescence spectroscopy.

USE OF REFERENCE STANDARDS

With few exceptions, Pharmacopeial spectrophotometric tests and assays call for comparison against a USP Reference Standard. This requirement is made in order to ensure measurement under conditions that are identical for the test specimen and the reference substance. These conditions include wavelength setting, slit-width adjustment, cell placement and correction, and transmittance levels. It should be noted that cells exhibiting identical transmittance at a given wavelength may differ considerably in transmittance at other wavelengths. Appropriate cell corrections should be established and used where required. The expressions *similar preparation* and *similar solution*, as used in tests and assays involving spectroscopy, indicate that the reference specimen, generally a USP Reference Standard, is to be prepared and observed in a manner identical (for all practical purposes) to that used for the test specimen. Usually in making up the solution of the specified Reference Standard, a solution of about the desired concentration (i.e., within about 10%) is prepared, and the absorptivity is calculated on the basis of the exact amount weighed out; if a previously dried specimen of the Reference Standard has not been used, the absorptivity is calculated on the anhydrous basis.

The expressions *concomitantly determine* and *concomitantly measured*, as used in tests and assays involving spectroscopy, indicate that the absorbances of both the solution containing the test specimen and the solution containing the reference specimen, relative to the specified test blank, are to be measured in immediate succession.

ATOMIC ABSORPTION

The apparatus used in atomic absorption spectroscopy has several unique features. For each element to be determined, a specific source that emits the spectral line to be absorbed should be selected. The source is usually a hollow-cathode lamp, the cathode of which is designed to emit the desired radiation when excited. Since the radiation to be absorbed by the test specimen element is usually of the same wavelength as that of its emission line, the element in the hollow-cathode lamp is the same as the element to be determined. The apparatus is equipped with an aspirator for introducing the test specimen into a flame, which is usually provided by air–acetylene, air–hydrogen, or, for refractory cases, nitrous oxide–acetylene. The flame, in effect, is a heated specimen chamber. A detector is used to read the signal from the chamber. Interfering radiation produced by the flame during combustion may be negated by the use of a chopped source lamp signal of a definite frequency. The detector should be tuned to the modulation frequency so that the direct current signal arising from the flame is ignored. The detecting system, therefore, reads only the change in signal from the hollow-cathode source, which is directly proportional to the number of atoms to be determined in the test specimen. For Pharmacopeial purposes, apparatus that provides the readings directly in absorbance units is usually required. However, instruments providing readings in percent transmission, percent absorption, or concentration may be used if the calculation formulas provided in the individual monographs are revised as necessary to yield the required quantitative results. Percent absorption or percent transmission may be converted to absorbance, A, by the following two equations:

$$A = 2 - \log_{10} (100 - \%\ \text{absorption})$$

or:

$$A = 2 - \log_{10} (\%\ \text{transmission})$$

Depending on the type of apparatus used, the readout device may be a meter, digital counter, recorder, or printer. Both single-beam and double-beam instruments are commercially available, and either type is suitable.

LIGHT-SCATTERING SPECTROSCOPY

Light-scattering instruments consist in general of a mercury lamp, with filters for the strong green or blue lines; a shutter; a set of neutral filters with known transmittance; and a sensitive photocell, to be mounted on an arm that can be rotated around the solution cell and set at any angle from –135° to 0° to +135° by a dial outside the light-tight housing. Solution cells are of various shapes, such as square for measuring 90° scattering; semioctagonal for 45°, 90°, and 135° scattering; and cylindrical for scattering at all angles. The determination of molecular weight requires a precise measure of the difference in refractive index between the solution and solvent, $[(n - n_0)/c]$. Therefore, a second instrument, a differential refractometer, is needed to measure this small difference.

Turbidity can be measured with a standard photoelectric filter photometer or spectrophotometer, preferably with illumination in the blue portion of the spectrum. Nephelometric measurements require an instrument with a photocell placed so as to receive scattered rather than transmitted light. This geometry applies also to fluorometers; therefore, in general, fluorometers can be used as nephelometers by proper selection of

filters. A ratio turbidimeter combines the technology of 90° nephelometry and turbidimetry: it contains photocells that receive and measure scattered light at a 90° angle from the sample as well as receiving and measuring the forward scatter in front of the sample; it also measures light transmitted directly through the sample. Linearity is attained by calculating the ratio of the 90° angle–scattered light measurement to the sum of the forward-scattered light measurement and the transmitted light measurement. The benefit of using a ratio turbidimetry system is that the measurement of stray light becomes negligible.

In practice, it is advisable to ensure that settling of the particles being measured is negligible. This is usually accomplished by including a protective colloid in the liquid suspending medium. It is important that results be interpreted by comparison of readings with those representing known concentrations of suspended matter, produced under precisely the same conditions.

Turbidimetry or nephelometry may be useful for the measurement of precipitates formed by the interaction of highly dilute solutions of reagents or other particulate matter, such as suspensions of bacterial cells. In order that consistent results may be achieved, all variables must be carefully controlled. Where such control is possible, extremely dilute suspensions may be measured.

The specimen solute is dissolved in the solvent at several different accurately known concentrations; the choice of concentrations is dependent on the molecular weight of the solute and ranges from 1% for MW = 10,000 to 0.01% for MW = 1,000,000. Before measurement, each solution must be very carefully cleaned by repeated filtration through fine filters. A dust particle in the solution vitiates the intensity of the scattered light measured. A criterion for a clear solution is that the dissymmetry, 45°/135° scattered intensity ratio, has attained a minimum.

The turbidity (τ) and the refractive index of the solutions are measured. From the general 90° light-scattering equation, a plot of HC/τ versus C, where H is a constant for a given solute–solvent system and C is the concentration of molecules or particles that are dissolved, mixed or suspended in the solutions, is made. It is then extrapolated to infinite dilution; and the weight-average molecular weight, M_W, is calculated from the intercept (on the ordinate, not the abscissa), $1/M_W$.

Visual Comparison

Where a color or a turbidity comparison is directed, color-comparison tubes that match as closely as possible in internal diameter and all other respects should be used. For color comparison, the tubes should be viewed downward, against a white background, with the aid of a light source directed from beneath the bottoms of the tubes; for turbidity comparison, the tubes should be viewed horizontally, against a dark background, with the aid of a light source directed from the sides of the tubes.

In conducting limit tests that involve a comparison of colors in two like containers (e.g., matched color-comparison tubes), a suitable instrument, rather than the unaided eye, may be used.▲*USP33*

▲⟨1113⟩ MICROBIAL IDENTIFICATION

INTRODUCTION

Microorganisms such as bacteria and fungi are frequently identified in pharmaceutical ingredients, water for pharmaceutical use, the manufacturing environment, intermediates, and finished pharmaceutical products (materials/environment). Microbial Identification is essential when the number of microorganisms exceeds alert and/or action levels for the material or manufacturing environment or when microorganisms are found in sterile products. Microbial identification is also an important component of processes that demonstrate microbial control, exclude objectionable microorganisms from nonsterile pharmaceutical drug products, support aseptic processing, and examine product failures.

Microbiological identification systems are based on different analytical techniques, such as phenotypic, genotypic, and strain typing. Each system has limitations due to method and/or database limitations and shortcomings in terms of accuracy, reproducibility, technical complexity, speed, and cost. A decision must be made as to the appropriate technology to use, considering these limitations and the level of identification required (genus, species, and strain). Routine evaluations for recovered organisms might include characterization by colony morphology, cellular morphology (e.g., rods, cocci, mode of sporulation), Gram reaction or other differential staining technique or diagnostic enzyme activity. This level of information may confirm that the microorganisms found are acceptable for that material or manufacturing environment or indicate no change in the level of environmental control in an aseptic processing area. More definitive identification may be needed to assign a species name to establish a historic baseline, during an investigation, for epidemiological purposes, or to aid in the safety evaluation process.

The need for microbial identification is cited in several USP chapters and in an FDA guidance. USP general chapter *Microbiological Examination of Nonsterile Products: Tests for Specified Microorganisms* ⟨62⟩ states that microorganisms demonstrating characteristic cellular and colony morphology on selective and/or diagnostic agar media employed in the tests be confirmed by identification tests. USP general chapter *Sterility Tests* ⟨71⟩ allows for invalidation of the test, if after identification of the microorganisms isolated from the test, the growth of this species (or these species) may be unequivocally ascribed to faults with respect to the material and or the technique used in conducting the sterility test procedure. General information chapter *Microbiological Examination of Nonsterile Products: Acceptance Criteria for Pharmaceutical Preparations and Substances for Pharmaceutical Use* ⟨1111⟩ recommends that manufacturers determine what constitutes an objectionable organism among those recovered. Some level of identification will be required to make such a determination. USP general information chapter *Microbiological Evaluation of Clean Rooms and Other Controlled Environments* ⟨1116⟩ recommends that microbial isolates be identified at an appropriate level to support the environmental monitoring program. The 2004 FDA guidance document on aseptic processing[1] recommends that the use of genotypic microbial identification

[1] FDA *Guidance for Industry: Sterile Drug Products Produced by Aseptic Processing—Current Good Manufacturing Practice, 2004.*

methods is preferred because of the higher accuracy and precision of these methods, especially when investigating process or product failures where establishing the relationship of recovered organisms is a critical part of the investigation.

MICROBIAL ISOLATION

The first step in identifying microbes is to isolate a pure culture for analysis. This purification is normally accomplished by subculturing single colonies one or more times on a nonselective solid medium, e.g., soybean–casein digest agar, to ensure purity. This technique also allows full phenotypic expression of stressed microorganisms and growth of sufficient inoculum for the identification. Expression of the microbial phenotype, (cell size and shape, sporulation, cellular composition, antigenicity, biochemical activity, and sensitivity to antimicrobial agents) may depend on the media and growth conditions (see *Table 1*).

In contrast, the microbial genotype is highly conserved and is independent of culture conditions. Therefore, identification may be conducted on uncultured test material, primary enrichments that increase the amount of nucleic acid available for analysis and primary isolation cultures from microbial limit testing or environmental monitoring plates. A recent publication[2] confirmed the stability of repetitive-sequenced PCR patterns of the bacteria *P. aeruginosa, E. coli, P. aeruginosa, E. faecalis, S. epidermidis,* and *A. baumannii* with respect to both the age of the culture and number of subcultures (5–15). *Table 2* lists genotypic characteristics that can be determined.

Table 1. Phenotypic Characteristics Employed in Microbial Taxonomy

Categories	Characteristics
Culture	Colony morphology, colony color, shape and size, pigment production
Morphological	Cellular morphology, cell size, cell shape, flagella type, reserve material, Gram reaction, spore and acid-fast staining, mode of sporulation
Physiological	Oxygen tolerance, pH range, temperature optimum and range, salinity tolerance
Biochemical	Carbon utilization, carbohydrate oxidation or fermentation, enzyme patterns
Inhibition	Bile salt-tolerance, antibiotic susceptibility, dye tolerance
Serological	Agglutination, fluorescent antibody
Chemo-Taxonomic	Fatty acid profile, microbial toxins, whole cell composition
Ecological	Origin of the organism

Table 2. Genotypic/ Phylogenetic Characteristics That Can Be Employed in Microbial Taxonomy

Categories	Characteristics
Genotypic	DNA base ratio (G + C content), restriction fragment patterns, and DNA probes
Phylogenetic	DNA-DNA hybridization, and 16S and 23S rRNA codon sequences

[2] Kang, H.P. and W.M. Dunne. Stability of Repetitive-Sequence PCR Patterns with Respect to Culture Age and Subculture Frequency. *J. Clin. Microbiol. 41 (6) 2694-2603, 2003.*

The gold standard for the taxonomic classification of bacteria is DNA, detection of which is described in the second edition of *Bergey's Manual of Systematic Bacteriology.*[3] When the DNA from an unknown organism is compared to the DNA from a known organism, the degree of relatedness can be determined. Genotypic identification is accomplished through the use of DNA hybridization, restriction fragment pattern comparisons and/or DNA probes. For example, greater than 70% relatedness with DNA-DNA hybridization indicates the organisms are the same species. Phylogenetic analysis of bacteria is typically performed by comparing the 500 base sequence of a portion of the 16S ribosomal RNA gene. PCR is used to amplify this gene sequence, and the amplified region is then isolated and base sequenced using an electrophoretic method. Comparisons can be made using proprietary databases or those that are available online, such as GenBank. When evaluating microbial identification it should be recognized that, side-by-side comparison of two organisms is a more reliable approach to determine relatedness than comparison to a database. Also, it should be noted that the probability that a database would have information on a specific isolate is rather low, unless such an isolate was previously analyzed.

PRELIMINARY SCREENING OF MICROBIAL ISOLATES

Microorganisms isolated from pharmaceutical ingredients and processes will in all likelihood be physiologically stressed. Such microorganisms will go from a metabolic status suitable for slow or no growth for survival under adverse conditions to rapid growth under laboratory culture conditions. This transition can be managed by careful handling of the isolates. Individual representative colonies from the primary isolation media are streaked onto solid media as described above in preparation for identification. The first step is to Gram stain and determine the cellular morphology of the bacteria isolates. This is a critical step for phenotypic identification schemes. Running positive and negative controls with these tests is recommended. Several common preliminary screening tests are described below.

Gram Staining

Gram staining methods employed include the four-step method: crystal violet (primary stain), iodine (mordant), alcohol (decolorizer), safranin (counterstain); or the three-step method in which the decolorization and counterstaining step is combined. When stained correctly, gram-positive organisms retain the crystal violet stain and appear blue; gram-negative organisms lose the crystal violet stain thus containing only the counter-stain safranin and appear red. Common pitfalls in this method include the following: (a) heat fixation may cause gram-positive cells to stain gram-negative, (b) older cultures or sections of a colony containing older organisms may give gram-variable reaction, (c) using too much decolorizer can result in a false gram-negative result, and (d) not using enough decolorizer may yield a false gram-positive result. The bacterial smear on the microscope slide may be fixed with methanol, rather than using heat fixation, which may give more consistent results.The Gram stain reaction is read under a microscope, allowing evaluation of cell and colony morphology (rod or cocci, single cells or chains, or clumps or clusters).

Spore Staining

Spore staining is done by a two-step method: malachite green (primary stain), and safranin (counterstain). The fixed bacterial smear is stained with 7.6% aqueous malachite green solution for 10 minutes, rinsed, and counterstained with a 0.25% aqueous safranin solution for 15 seconds, rinsed, and blotted dry. This procedure stains the spores green, but vegetative bacterial cells are stained red. In many cases, the presence of spores can be determined in organisms with Gram staining only, but when using sporulation as a diagnostic feature, spore staining is recommended.

[3] *Bergey's Manual of Systematic Bacteriology, 2nd Edition,* 2003.

Biochemical Screening

Biochemical screening tests include (1) the oxidase test to separate gram-negative rod-shaped bacteria into nonfermenters (oxidase positive) and enteric (oxidase negative) bacteria, (2) catalase test to separate *Staphylococci* (catalase positive) from *Streptococci* (catalase negative), and (3) the coagulase test to separate *Staphylococci* into coagulase negative (presumptively nonpathogenic) and coagulase positive (more likely pathogenic) *Staphylococci*.

For many types of investigations, these few tests may provide enough information to describe data. However, there are much more definitive bacterial identification schemes or systems.

MICROBIAL IDENTIFICATION BY PHENOTYPIC METHODS

Phenotypic methods utilize expressed gene products to distinguish among different microorganisms. Generally, these require a large number of recently grown cells in pure culture. Disadvantages of culture methods for microbial enumeration and identification include (1) long incubation times, (2) the inability of many environmental microorganisms to grow on artificial media, (3) specific growth requirements of specific microorganisms, (4) the unintentional inhibition of culture methods, and (5) the need to fully express phenotypic properties of recently isolated stressed microorganisms by subculture from primary isolation on selective or diagnostic media prior to microbial identification. Databases of microbiological identification systems include carbon utilization and biochemical reaction patterns, fatty acid profiles, and whole-cell composition for microbial species. All such identification systems rely on inocula that have been cultured using specific media and incubation conditions (e.g., time, temperature, and oxygen level) in order to achieve consistent identification. Despite these limitations, phenotypic microbial identification methods are successfully employed in routine food, water, clinical, and pharmaceutical microbiological testing laboratories.[4]

MICROBIAL IDENTIFICATION BY GENOTYPIC METHODS

Compared to phenotypic procedures, genotypic microbial identification methods based on nucleic acid analyses are less subjective, less dependent on the culture method, and theoretically are more reliable because nucleic acid sequences are highly conserved by microbial species. These methods include DNA-DNA hybridization, polymerase chain reaction (PCR), 16S and 23S rRNA gene sequencing, and analytical ribotyping. Like the Gram staining procedure, 16S rRNA base sequencing has proved to be a powerful diagnostic tool and has become the gold standard for taxonomic species assignment for bacteria. However, without extensive automation of sample handling and reagent standardization these procedures are technically challenging, are expensive in terms of both equipment and testing costs, and often rely on a technology marketed by a single company. Their use may be limited to critical microbiological investigations associated with direct product failure. In such cases identifications are conducted in a pharmaceutical company's specialized research laboratory or are sent to a contract testing laboratory. It is foreseen that these technologies will be applied to routine microbial identification in the pharmaceutical industry. Clearly, the increased accuracy of identification with rRNA base sequencing and the ability to determine the strain of microorganism via ribotyping are useful tools of molecular epidemiology. rRNA base sequencing may allow determination of the origin of microbial contamination.

[4] O'Hara, C.M., M.P. Weinstein, and J.M. Miller. Manual and automated systems for detection and identification of microorganisms. *ASM Manual of Clinical Microbiology, 8th Edition,* 2003.

VERIFICATION OF MICROBIAL IDENTIFICATION METHODS

Microbial identification tests include serological tests, chemical reagents, cellular strains, instrumentation, and kits. The verification of an identification test system may include one of the following three steps: first, consecutive parallel testing of microbial isolates obtained from routine testing using an existing system during a representative period of time. The minimum number of isolates tested is 50, and any discrepancies in identification should be arbitrated using a referee method. The second step involves testing known representative stock cultures of 12–15 different commonly isolated species for a total of 50 tests. The third step is confirmation that results of 20–50 organism identifications including 15–20 different species agree with the results of testing of a split sample by a reference laboratory.[5] In each case the appropriate quality control organisms, as recommended by the supplier, should be included in the verification process.

With identification systems, both verification of the identity of the species evaluated and the level of agreement should be considered. Greater than 90% agreement should be achieved with microorganisms appropriate for the phenotypic identification system. Groups of organisms that are known to be more challenging to identify, including biochemically-unresponsive nonfermenting bacteria, corynebacteria, and coagulase-negative *Staphylococci* should be evaluated, when appropriate, during the verification process.

The hierarchy of microbial identification errors include the following: (1) misidentification to genera, (2) misidentification to species, and (3) no identification using "best fit" criteria at very low confidence levels. When a system does not identify an isolate, it may be due to the organism not being included in the database, the system parameters not being comprehensive enough to identify the organism, the isolate not being reactive in the system, or the species not being taxonomically described. These isolates should be sent to the supplier of the microbial identification system for identification and addition to their database, or identified, preferably using 16S or 23S rRNA base sequencing, and added to the user's in-house database. Misidentification is more difficult to determine, but any microbial identification should be reviewed for reasonableness in terms of the microorganism's cellular morphology, physiological requirements, and source of isolation. Organisms requiring identification only to genus may include nonpathogenic *Bacillus, Staphylococci, Corynebacteria,* and *Micrococci.*

During base sequencing error may result if the original specimen is not a pure culture, the yield of the labeled amplicon is too low, or the capillary array is malfunctioning. These errors should be apparent as unreadable bases. Ultimately the accuracy of 16S rRNA base sequencing identification depends on the accuracy of the sequences in the database, the association of appropriate names and sequences, and the accuracy of the sequence of the isolate. A database search report would list, for example, the top 5 matches with the related percentage match and number of mismatches and would display a phylogenetic tree based on a nearest neighbor algorithm. Current technology in clinical microbiology suggests that $>99\%$ similarity can be used to define species and $>95\%$ can be used to define genus. However, this rule may not hold true for diverse or less well studied genera and species.[6]

The most important verification tests are accuracy and reproducibility. These measurements can be defined as follows:

Accuracy % = (Number of correct results/Total number of results) × 100

Reproducibility % = (Number of correct results in agreement/Total number of results) × 100

Suitable acceptance criteria for accuracy and reproducibility are $>90\%$ and $>95\%$, respectively.

[5] Cumitech 31. *Verification and Validation of Procedures in the Clinical Microbiology Laboratory.* Elder, B. L., S.A. Hansen, J.A. Kellogg, F.J. Marsik and R. J. Zabransky, ASM, February 1997.

[6] J.E. Clarridge III. The Impact of 16S rRNA Gene Sequencing Analysis for Identification of Bacteria on Clinical Microbiology and Infectious Diseases, *Clin. Microbiol. Rev. 17* (2) 840-862, 2004.

Other measurements are sensitivity, specificity, and positive and negative predictive value. These measurements are best illustrated by an example. A clinical microbiology laboratory compared the frequency of isolation of DNA hybridization probe to a culture method for the sexually transmitted bacterium *Neisseria gonorrhaeae*.[5] The frequency of isolation from clinical specimens was historically 10%. The lab ran 100 split samples, and the results are presented in *Table 3*.

Table 3. Comparison of the Distribution of Negative and Positive Results for the DNA Probe and Culture Methods

	Culture Results	
DNA Probe Results	Positive	Negative
Positive	9	2
Negative	1	88

Sensitivity = [9/(9 + 1)] × 100 = 90%

Specificity = [88/(88 + 2)] × 100 = 97.7%

Positive Predictive Value = [9/(9 + 2)] × 100 = 81.8%

Negative Predictive Value = [88/(88 + 1)] × 100 = 98.9%

The mathematical derivation of these functions is outlined in *Table 4*.

Table 4. A Two-Row by Two-Column Contingency Table with Respect to the Reference Culture Method and the Alternate PCR Method (after ISO 5725-1 and 5725-2 2004)*

	PCR		
Culture	Positive	Negative	Sum
Positive	a	b	a + b
	True Positive	False Negative	
Negative	c	d	c + d
	False Positive	True Negative	
Sum	a + c	b + d	

* ISO 5725-1 : 1994 Accuracy (trueness and precision) of measurement methods and results—Part 1: General principles and definitions and ISO 5725-2 : 1994 Accuracy (trueness and precision) of measurement methods and results—Part 2: Basic methods for the determination of repeatability and reproducibility of standard measurement methods.

Inclusivity (%) = [a/(a + b)] × 100

Exclusivity (%) = [d/(c + d)] × 100

Positive Predictivity (%) = [a/(a + c)] × 100

Negative Predictivity (%) = [d/(b + d)] × 100

Analytical Accuracy (%) = [a + d/(a + b + c + d)] × 100

Kappa Index = 2(ad – bc)/(a + c) × (c + d) + (a + b) × (b + d)

Phylogenetic Identification

The second edition of *Bergey's Manual of Systematic Bacteriology* represented a major departure from the first edition, and also from the eighth and ninth editions of the *Manual of Determinative Bacteriology*. The organization of content in *Bergey's Manual* follows a phylogenetic framework, based on analysis of the nucleotide sequence of the ribosomal small subunit 16S RNA, rather than a phenotypic structure. The comparative base sequencing may be performed instrumentally (MicroSeq 500, Applied Biosystems, Foster City, CA). The procedure involves obtaining a pure isolate, lysing the bacterial cells, extracting and concentrating the DNA, amplifying the 500-base section of the 16S rDNA gene, and sequencing the amplicon using fluorescent di-deoxy terminator cycle chemistry. Fragments then are separated by an automated DNA sequencer, and the data are compared to sequences in the database. The MicroSeq database contains approximately 2000 base sequences derived from type strains (the public database GenBank contains approximately 200,000 base sequences). Although the instrumental approach may result in higher quality sequences, the representation of a single species that may contain numerous strains by a single type strain may be inadequate.

[5] Cumitech 31. *Verification and Validation of Procedures in the Clinical Microbiology Laboratory.* Elder, B. L., S.A. Hansen, J.A. Kellogg, F.J. Marsik and R. J. Zabransky, ASM, February 1997.

Phylogenetic trees show the closest genetically related organisms. In general, organisms with relatedness $>1\%$ generally are considered different species and those with $>3\%$ relatedness are considered different genera.

Polyphasic Identification

Differences in genotype and phenotype are relatively common, e.g., same or very similar genotype shared by microorganisms with different phenotypes, similar phenotypes but different genotypes, and microorganisms that are genotypically too distant to be the same species or genus (*Table 5*). The concept of polyphasic taxonomy[7] that refers to assembly and use of many levels of information, e.g., microbial characterization, phenotypic and genotypic data, and origin of the microorganisms, can be most successfully applied to microbial identification. This avoids decisions made solely using genotypic data that make no sense when the microbial characteristics, testing history, and source of isolation are considered.

Table 5. Examples of Discrepant Relationships Between Genotype and Phenotypes

Relationship	First Strain	Second Strain	Number of Base Pair Differences
Same genotype but different phenotypes	Mycobacterium tuberculosis ATCC 27294	M. bovis ATCC 19210	0
	Bacillus anthracis	B. cereus 30.0 and B. thuringenesis	
	E. coli ATCC 11775	Shigella dysenteriae ATCC 13313	3
Similar genotype but different phenotypes	Streptococcus pneumoniae ATCC 33400	S. mitis ATCC 49456	3
Similar phenotypes but different genotypes	Nocardia asteroids ATCC 19247	N. farcinica ATCC 3318	13
Too distant to be the same species	Enterobacter (Pantoea) agglomerans (bg1)	Enterobacter (Pantoea) agglomerans (bg2)	27
Too distant to be the same genus	Clostridium tetani ATCC 19404	Clostridium innocuum ATCC 14501	about 104

Pathogen Screening

Nucleic acid-based procedures can be used for screening USP-specified microorganisms. The steps associated with this activity are sample collection, nucleic acid extraction, target amplification, hybridization, and detection. The problem of amplifying DNA from nonviable bacterial cells can be overcome by using reverse transcription to convert transitional rRNA to DNA for PCR amplification. The reaction efficiencies of cell lysis, rRNA extraction, and reverse transcription vary with each bacterium and sample matrix. Therefore, nucleic acid standards must be employed in the construction of a calibration curve to determine the cycle number where the fluorescence in the PCR sample increases above the threshold value. In its *Draft Guidance for Industry: Nucleic Acid Based In Vitro Diagnostic Devices for Detection of Microbial Pathogens* (2005), FDA addressed the detection of microbial variants, limits of detection, matrix effects, positive cutoff verification, instrument and system carry-over, diagnostic accuracy, and reproducibility.

Objective of a Microbial Identification Program

The objective of a microbial identification program is to provide information that will help exclude microorganisms from products. Knowing the identity of microbial isolates is useful when manufacturers establish a monitoring baseline and investigate sources of microbial contamination. Alert and action levels in water, pharmaceutical ingredients, and the environment, as well as presterile filtration bioburden monitoring, typically initiate microbial identifications. When a pre-set numerical level for microbial count is exceeded, the predominant microbial isolates are identified for trending purposes (alert levels) or as part of the laboratory and manufacturing investigations (action levels). Critical microbial isolations—when all isolates are identified—may follow failures in media fills, sterility tests, microbial limit tests, and marketed product stability testing, or in response to consumer complaints. The identity of the microbial isolate suggests its origin and may suggest effective preventive action.

Because microbial identification can be costly and time-consuming, manufacturers should develop good microbial identification strategies. These help identify the potentially pathogenic microbes from the nonpathogenic and help manufacturers focus on identifications that support investigations most relevant to actual and/or potential product failure. No single microbial identification procedure is ideal in terms of cost, speed, accuracy, and repeatability. Thus manufacturers should develop preliminary screening programs that characterize microbial isolates and facilitate the selection of the most appropriate microbial identification methods. Such screening programs should be optimized for a general class of microorganisms and should reflect the importance of the isolate in terms of product failure (*Table 6*).

Best practices include retention of environmental monitoring plates until product testing is complete and the establishment of an in-house culture library of critical microbial isolates. The logistics of such a program, especially in a large operation, may necessitate a preliminary screening protocol based on colonial morphology and numbers as the plates are initially read to minimize storage issues.

Table 6. Guidelines for the Characterization, Identification, and Stain Typing of Microbial Isolates from Monitoring Programs

Extent of Characterization	Isolate Origin
Gram reaction and cellular morphology only	Environmental monitoring in ISO 7 and 8 classification areas; isolates from excipient, finished product, environmental and water monitoring with number below the alert level.
Identification to genus	Environmental monitoring in ISO 5 and 6 classification areas with number below the alert level.
Identification to species	Environmental monitoring in ISO 5 classification areas; alert and/or action level isolates from all excipient, finished product, environmental and water monitoring.
Strain typing	Significant product failures, e.g., media fill, sterility test and microbial limit test. Significant adverse trends in environmental and water monitoring.

▲*USP33*

REAGENTS, INDICATORS, AND SOLUTIONS

BRIEFING

Reagents, Indicators, and Solutions, Introduction, *USP 31* page 747. It is proposed to add a definition for *Organic-free water* to the definitions under *Water*.

(HDQ: M. Marques) RTS—C70387

Change to read:

This section deals with the reagents and solutions required in conducting the Pharmacopeial and the National Formulary tests and assays.

As is stated in the *General Notices,* listing of reagents, indicators, and solutions in the Pharmacopeia in no way implies that they have therapeutic utility; thus, any reference to the USP in their labeling is to include the term "reagent" or "reagent grade."

Reagents required in the tests and assays for the Pharmacopeial and National Formulary articles are listed in this section, generally with specifications appropriate to their intended uses. Exceptions to the latter include those reagents for which corresponding specifications are presented in the current edition of *Reagent Chemicals,* published by the American Chemical Society, and reagents for which specifications could not be drafted in time for inclusion here. Thus, where it is directed to "Use ACS reagent grade," it is intended that a grade meeting the corresponding specifications of the current edition of ACS *Reagent Chemicals* shall be used. Where no such specifications exist, and where it is directed to "Use a suitable grade," the intent is that a suitable reagent grade available commercially shall be used. Occasionally, additional test(s) augment the designation "suitable grade," as indicated in the text. Listed also are some, but not all, reagents that are required only in determining the quality of other reagents. For those reagents that are not listed, satisfactory specifications are available in standard reference works.

In those instances in which a reagent required in a Pharmacopeial or National Formulary test or assay need not be of analytical reagent quality, it suffices to refer to the monograph for that article appearing in this Pharmacopeia or the National Formulary or the current edition of the Food Chemicals Codex (FCC). In such cases it is to be understood that the specifications are minimum requirements and that any substance meeting more rigid specifications for chemical purity is suitable.

Where the name of a reagent specified in a test or assay is the same as the title of a *USP* or *NF* article, and it does not appear among the following *Reagent Specifications*, a substance meeting the requirements of the *USP* or *NF* monograph is to be used (e.g., *Benzocaine,* USP; or *Propylparaben,* NF). However, reference is specifically made, under *Reagent Specifications*, to a reagent bearing the name of a *USP* or *NF* article: (1) where there are requirements for a reagent in addition to the *USP* or *NF* monograph requirements (e.g., *Sodium Salicylate,* USP; or *Isopropyl Myristate,* NF), (2) where a source other than the *USP* or *NF* monograph is specified (e.g., *Lactose,* ACS reagent; or *Hydrochloric Acid,* ACS reagent), (3) where complete reagent specifications differ from the *USP* or *NF* monograph standards (e.g., *Calcium Lactate;* or *Thymol),* or (4) where a standard material is included among the reagent specifications (e.g., *Calcium Carbonate,* primary standard; or *Sodium Carbonate,* primary standard).

Reagents and solutions should be preserved in tight containers made of resistant glass or other suitable material. Directions for storage in light-resistant containers should be carefully observed.

Stoppers and stopcocks brought into contact with substances capable of attacking or penetrating their surfaces may be given a protective coating of a thin film of a suitable lubricant unless specifically interdicted.

Where a particular brand or source of a material or piece of equipment, or the name and address of a manufacturer, is mentioned, this identification is furnished solely for informational purposes as a matter of convenience, without implication of approval, endorsement, or certification.

Atomic absorption and flame photometry require the use of a number of metal-ion standard solutions. While the individual monographs usually provide directions for preparation of these solutions, use of commercially prepared standardized solutions of the appropriate ions is permissible, provided that the analyst confirms the suitability of the solutions and has data to support their use.

Reagents are substances used either as such or as constituents of solutions.

Indicators are reagents used to determine the specified end-point in a chemical reaction, to measure hydrogen-ion concentration (pH), or to indicate that a desired change in pH has been effected. They are listed together with indicator test papers.

Buffer Solutions are referred to separately.

Colorimetric Solutions, abbreviated "CS," are solutions used in the preparation of colorimetric standards for comparison purposes.

Test Solutions, abbreviated "TS," are solutions of reagents in such solvents and of such definite concentrations as to be suitable for the specified purposes.

Volumetric Solutions, abbreviated "VS" and known also as **Standard Solutions,** are solutions of reagents of known concentration intended primarily for use in quantitative determinations. Concentrations are usually expressed in terms of normality.

Water—As elsewhere in the Pharmacopeia, where "water," without qualification, is mentioned in the tests for reagents or in directions for preparing test solutions, etc., Purified Water (USP monograph) is always to be used. ■*Carbon dioxide-free water*■1S *(USP31)* is Purified Water that has been boiled vigorously for 5 minutes or more and allowed to cool while protected from absorption of carbon dioxide from the atmosphere, or Purified Water that has a resistivity of not less than 18 Mohm-cm. ■*Deaerated water,*■1S *(USP31)* for purposes other than dissolution and drug release testing, is Purified Water that has been treated to reduce the content of dissolved air by suitable means, such as by boiling vigorously for 5 minutes and cooling or by the application of ultrasonic vibration. ■*Particle-free water* is water that has been passed through a 0.22-µm filter.■1S *(USP31)*

▲*Organic-free water* is Purified Water that produces no significantly interfering peaks when chromatographed as it is indicated in *Identification, Control, and Quantification of Residual Solvents* under *Residual Solvents* ⟨467⟩.▲*USP33*

Chromatographic Solvents and Carrier Gases—The chromatographic procedures set forth in the Pharmacopeia may require use of solvents and gases that have been especially purified for such use. The purpose may be (a) to exclude certain impurities that interfere with the proper conduct of the test procedure, or (b) to extend the life of a column by reducing the build-up of impurities on the column. Where solvents and gases are called for in chromatographic procedures, it is the responsibility of the analyst to ensure the suitability of the solvent or gas for the specific use. Solvents and gases suitable for specific high-pressure or other chromatographic uses are available as specialty products from various reagent supply houses, although there is no assurance that similar products from different suppliers are of equivalent suitability in any given procedure. The reagent specifications provided herein are for general analytical uses of the solvents and gases and not for chromatographic uses for which the especially purified specialty products may be required.

BRIEFING

Phosphorous Acid. It is proposed to add this new reagent used in the monograph for *Pamidronate Disodium*.

(HDQ: M. Marques) RTS—C70109

Add the following:

▲**Phosphorous Acid** *(Phosphonic Acid),* H_3O_3P—**82.00** [*13598-36-2*]—Use a suitable grade with a content of not less than 99%.▲*USP33*

BRIEFING

Potassium Metabisulfite. It is proposed to add this new reagent used in the test for *Limit of sulfur dioxide, Test 1* under *Pea Starch*, a new monograph also being proposed in this issue of *PF*.

(HDQ: M. Marques) RTS—C70101

Add the following:

▲**Potassium Metabisulfite** *(Potassium Disulfite; Potassium Pyrosulfite),* $K_2S_2O_5$—**222.32** [*16731-55-8*]—Use a suitable grade with a content of not less than 98%.▲*USP33*

BRIEFING

Potassium Sodium Tartrate, *USP 31* page 792. It is proposed to correct the CAS number of this reagent.

(HDQ: M. Marques) RTS—C70361

Change to read:

Potassium Sodium Tartrate, $KNaC_4H_4O_6 \cdot 4H_2O$—**282.22** ~~[*304-59-6*]~~

▲[*6381-59-5*]▲*USP33*
—Use ACS reagent grade.

BRIEFING

Sodium Biphenyl, *USP 31* page 797. It is proposed to update the specifications of this reagent to reflect the products currently available on the market.

(HDQ: M. Marques) RTS—C70113

Change to read:

Sodium Biphenyl, $C_{12}H_9Na$—**176.19**~~—Supplied as a solution (10 percent to 30 percent, w/w) in a mixture of dimethoxyethane and toluene or xylene. The solution is a viscous, dark green liquid. [NOTE—The solution deteriorates at a rate of about 10% per month. Use only freshly prepared solution.]~~

▲Available as a solution in 2-ethoxyethyl ether.▲*USP33*

Activity—Place 20 mL of dry toluene in a titration flask equipped with a magnetic stirring bar and a stopper having a hole through which the delivery tip of a weight buret may be inserted. Add a quantity of sodium biphenyl sufficient to produce a blue color in the mixture, and titrate with amyl alcohol, contained in a weight buret, to the disappearance of the blue color. (Disregard the amounts of sodium biphenyl and amyl alcohol used in this adjustment.) Weigh accurately the weight buret containing the amyl alcohol. Transfer the contents of a vial of well-mixed test specimen to the titration flask, and titrate quickly with the amyl alcohol to the disappearance of the blue color. Weigh the buret to determine the weight of amyl alcohol consumed, and calculate the activity, in mEq per vial, by the formula:

$$11.25W$$

in which W is the weight of amyl alcohol consumed. Not less than 10% activity is found.

Iodine content—Add 10 mL to 5 mL of toluene contained in a 125-mL separator fitted with a suitable inert plastic stopcock, and shake vigorously for 2 minutes. Extract gently with three 10-mL portions of dilute phosphoric acid (1 in 3), combining the lower phases in a 125-mL iodine flask. Add sodium hypochlorite TS, dropwise, to the combined extracts until the solution turns brown, then add 0.5 mL in excess. Shake intermittently for 3 minutes, add 5 mL of freshly prepared, saturated phenol solution, mix, and allow to stand for 1 minute, accurately timed. Add 1 g of potassium iodide, shake for 30 seconds, add 3 mL of starch TS, and titrate with 0.1 N sodium thiosulfate VS: not more than 0.1 mL of 0.1 N sodium thiosulfate is consumed.

▲[NOTE—A suitable grade is available as catalog number 277134 from www.sigma-aldrich.com.]▲*USP33*

In-Process Revision

Test Solutions

BRIEFING

Test Solutions, *USP 31* page 814, page 3784 of the *Second Supplement*, and page 811 of *PF* 34(3) [May–June 2008]. It is proposed to make revisions in *Acetic Acid, Glacial*; and *Cupric Citrate TS 2*. It is also proposed to add *Denaturated Alcoholic TS*, used in the new monograph *Polyvinyl Acetate*, previously published in *PF* 34(6) [Nov.–Dec. 2008].

(HDQ: M. Marques) RTS—C70061; C70111; C70116

Change to read:

Acetic Acid, Glacial, TS—Determine the water content of a specimen of glacial acetic acid by the *Titrimetric Method* (see *Water Determination* ⟨921⟩). If the acid contains more than ~~0.05%~~

Perchloric Acid, Tenth-Normal (0.1 N) in Dioxane

Mix 8.5 mL of perchloric acid with sufficient dioxane to make 1000 mL. Standardize the solution as follows.

Accurately weigh about 700 mg of potassium biphthalate, previously crushed lightly and dried at 120° for 2 hours, and dissolve in 50 mL of glacial acetic acid in a 250-mL flask. Add 2 drops of crystal violet TS, and titrate with the perchloric acid solution until the violet color changes to bluish green. Carry out a blank determination. Each ~~20.42~~

▲20.423▲*USP33*
mg of potassium biphthalate is equivalent to 1 mL of 0.1 N perchloric acid.

$$N = \frac{\text{g } KHC_8H_4O_4}{0.20423 \times \text{mL } HClO_4 \text{ solution (corrected for the blank)}}$$

In-Process Revision

Change to read:

Perchloric Acid, Tenth-Normal (0.1 N) in Glacial Acetic Acid
$HClO_4$, **100.46**

10.05 g in 1000 mL

NOTE—Where called for in the tests and assays, this volumetric solution is specified as "0.1 N perchloric acid." Thus, where 0.1 N or other strength of this volumetric solution is specified, the solution in glacial acetic acid is to be used, unless the words "in dioxane" are stated. [See also *Perchloric Acid, Tenth-Normal (0.1 N) in Dioxane*.]

Mix 8.5 mL of perchloric acid with 500 mL of glacial acetic acid and 21 mL of acetic anhydride, cool, and add glacial acetic acid to make 1000 mL. Alternatively, the solution may be prepared as follows. Mix 11 mL of 60 percent perchloric acid with 500 mL of glacial acetic acid and 30 mL of acetic anhydride, cool, and add glacial acetic acid to make 1000 mL.

Allow the prepared solution to stand for 1 day for the excess acetic anhydride to be combined, and determine the water content by *Method I* (see *Water Determination* ⟨921⟩), except to use a test specimen of about 5 g of the 0.1 N perchloric acid that is expected to contain approximately 1 mg of water and the *Reagent* (see *Reagent* under *Method Ia* in *Water Determination* ⟨921⟩) diluted such that 1 mL is equivalent to about 1 to 2 mg of water. If the water content exceeds 0.5%, add more acetic anhydride. If the solution contains no titratable water, add sufficient water to obtain a content of between 0.02% and 0.5% of water. Allow the solution to stand for 1 day, and again titrate the water content. The solution so obtained contains between 0.02% and 0.5% of water, indicating freedom from acetic anhydride.

Standardize the solution as follows.

Accurately weigh about 700 mg of potassium biphthalate, previously crushed lightly and dried at 120° for 2 hours, and dissolve it in 50 mL of glacial acetic acid in a 250-mL flask. Add 2 drops of crystal violet TS, and titrate with the perchloric acid solution until the violet color changes to blue-green. Deduct the volume of the perchloric acid consumed by 50 mL of the glacial acetic acid. Each ~~20.42~~

▲20.423▲*USP33*
mg of potassium biphthalate is equivalent to 1 mL of 0.1 N perchloric acid.

$$N = \frac{\text{g } KHC_8H_4O_4}{0.20423 \times \text{mL } HClO_4 \text{ solution (corrected for the blank)}}$$

Change to read:

Potassium Iodate, Twentieth-Molar (0.05 M)
KIO_3, **214.00**

10.70 g in 1000 mL

Dissolve 10.700 g of potassium iodate, previously dried at 110° to constant weight, in water to make 1000.0 mL.

■Standardize the solution as follows: To 15.0 mL of solution in a 250 mL iodine flask, add 3 g of potassium iodide and 3 mL of hydrochloric acid previously diluted with 10 mL of water. Stopper immediately, and allow to stand in the dark for 5 minutes. Then add 50 mL of cold water, and titrate the liberated iodine with freshly standardized 0.1 N sodium thiosulfate. Add 3 mL of starch indicator solution near the end of the titration, and continue to the absence of the blue-starch-iodine complex.

$$M = \frac{\text{mL} \times \text{N } Na_2S_2O_3}{\text{mL } KIO_3 \times 6}$$

■1S (*USP32*)

Add the following:

■Potassium Thiocyanate, Tenth-Normal (0.1 N)
KSCN, **97.18**

9.72 g in 1000 mL

Weigh exactly 9.72 g of potassium thiocyanate, previously dried for 2 hours at 110°, transfer to a 1-L volumetric flask, dilute with water to volume, and mix well. Standardize as follows: transfer 40.0 mL of freshly standardized 0.1 N silver nitrate VS to a 250-mL Erlenmeyer flask; and add 100 mL of water, 1 mL of nitric acid, and 2 mL of ferric ammonium sulfate TS. Titrate with the potassium thiocyanate solution, with agitation, to a permanent light pinkish-brown color of the supernatant.

$$N = \frac{\text{mL} \times \text{N } AgNO_3}{\text{mL KSCN}}$$

■2S (*USP32*)

Change to read:

Sodium Tetraphenylboron, Fiftieth-Molar (0.02 M)
$NaB(C_6H_5)_4$, **342.22**

6.845 g in 1000 mL

Dissolve an amount of sodium tetraphenylboron, equivalent to 6.845 g of $NaB(C_6H_5)_4$, in water to make 1000 mL, and standardize the solution as follows.

Pipet two 75-mL portions of the solution into separate beakers, and to each add 1 mL of acetic acid and 25 mL of water. To each beaker add, slowly and with constant stirring, 25 mL of potassium biphthalate solution (1 in 20), and allow to stand for 2 hours. Filter one of the mixtures through a filtering crucible, and wash the precipitate with cold water. Transfer the precipitate to a container, add 50 mL of water, shake intermittently for 30 minutes, filter, and use the filtrate as the saturated potassium tetraphenylborate solution in the following standardization procedure. Filter the second mixture

through a tared filtering crucible, and wash the precipitate with three 5-mL portions of saturated potassium tetraphenylborate solution. Dry the precipitate at 105° for 1 hour. Each g of potassium tetraphenylborate (KTPB) is equivalent to 955.1 mg of sodium tetraphenylboron.

▲ ~~$M = \frac{g\ KTPB \times 0.9551 \times 0.075}{342.22}$~~ ▲*USP 31*

■ $M = \frac{g\ KTPB \times 0.9551}{342.22 \times 0.075}$ ■1S (*USP32*)

NOTE—Prepare this solution just before use.

BRIEFING

Chromatographic Reagents, page 3785 of the *Second Supplement* to *USP 31–NF 26*, and pages 1423 and 1559 of *PF* 34(6) [Nov.–Dec. 2008]. It is proposed to change the name of this section to *Chromatographic Columns*, to expand the particle size range in L26 and L48, and to correct the brand name of columns classified as L33, L52, and L59.

(HDQ: M. Marques) RTS—C70085

Change to read:

Chromatographic ~~Reagents~~

▲Columns▲*USP33*

The following list of packings (L), phases (G), and supports (S) is intended to be a convenient reference for the chromatographer. [NOTE—Particle sizes given in this listing are those generally provided. Where other, usually finer, sizes are required, the individual monograph specifies the desired particle size. Within any category of packings or phases listed below, there may be a wide range of columns available. Where it is necessary to define more specifically the chromatographic conditions, the individual monograph so indicates.]

Change to read:

Packings

L1—Octadecyl silane chemically bonded to porous silica or ceramic micro-particles, 1.5 to 10 µm in diameter, or a monolithic silica rod.

L4—Silica gel of controlled surface porosity bonded to a solid spherical core, 30 to 50 µm in diameter.

L5—Alumina of controlled surface porosity bonded to a solid spherical core, 30 to 50 µm in diameter.

L6—Strong cation-exchange packing–sulfonated fluorocarbon polymer coated on a solid spherical core, 30 to 50 µm in diameter.

L7—Octylsilane chemically bonded to totally porous silica particles, 1.5 to 10 µm in diameter, ▲or a monolithic silica rod.▲*USP31*

L8—An essentially monomolecular layer of aminopropylsilane chemically bonded to totally porous silica gel support, 3 to 10 µm in diameter.

L9—Irregular or spherical, totally porous silica gel having a chemically bonded, strongly acidic cation-exchange coating, 3 to 10 µm in diameter.

L10—Nitrile groups chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L11—Phenyl groups chemically bonded to porous silica particles, 1.5 to 10 µm in diameter.

L12—A strong anion-exchange packing made by chemically bonding a quaternary amine to a solid silica spherical core, 30 to 50 µm in diameter.

L13—Trimethylsilane chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L14—Silica gel having a chemically bonded, strongly basic quaternary ammonium anion-exchange coating, 5 to 10 µm in diameter.

L15—Hexylsilane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

L16—Dimethylsilane chemically bonded to porous silica particles, 5 to 10 µm in diameter.

L17—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form, 7 to 11 µm in diameter.

L18—Amino and cyano groups chemically bonded to porous silica particles, 3 to 10 µm in diameter.

L19—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the calcium form, about 9 µm in diameter.

L20—Dihydroxypropane groups chemically bonded to porous silica particles, ~~5 to 10 µm~~

L53—Weak cation-exchange resin consisting of ethylvinylbenzene, 55% cross-linked with divinylbenzene copolymer, 3 to 15 µm diameter. Substrate is surface grafted with carboxylic acid and/or phosphoric acid functionalized monomers. Capacity not less than 500 µEq/column.

[NOTE—Available as IonPac CS14 distributed by Dionex Corp., (www.dionex.com).]

L54—A size exclusion medium made of covalent bonding of dextran to highly cross-linked porous agarose beads, about 13 µm in diameter.

[NOTE—Available as Superdex Peptide HR 10/30 from Amersham Pharmacia Biotech (www.amershambiosciences.com).]

L55—A strong cation-exchange resin made of porous silica coated with polybutadiene–maleic acid copolymer, about 5 µm in diameter.

[NOTE—Available as IC-Pak C M/D from Waters Corp., (www.waters.com).]

L56—Propyl silane chemically bonded to totally porous silica particles, 3 to 10 µm in diameter.

[NOTE—Available as Zorbax SB-C3 from Agilent Technologies (www.agilent.com/chem).]

L57—A chiral-recognition protein, ovomucoid, chemically bonded to silica particles, about 5 µm in diameter, with a pore size of 120 Å.

[NOTE—Available as Ultron ES-OVM from Agilent Technologies (www.agilent.com/chem).]

L58—Strong cation-exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the sodium form, about ■6 to 30 µm■1S *(USP31)* in diameter.

[NOTE—Available as Aminex HPX-87N from Bio-Rad Laboratories, (2000/01 catalog, #125-0143) www.bio-rad.com.]

L59—Packing having the capacity to separate proteins by molecular weight over the range of ■5 to 7000 kDa.■2S *(USP31)* It is spherical ■(5–10 µm),■2S *(USP31)* silica-based, and processed to provide hydrophilic characteristics and pH stability.

[NOTE—Available as ~~TSKgel G3000SW~~

▲TSK-GEL G3000SWxl▲*USP33*
Column (analytical column) and TSKgel Guard ■Column for 7.5 mm SW■2S *(USP31)* from Tosoh Bioscience ~~(part numbers 05789 and 05371, respectively)~~

▲
▲*USP33*
(www.tosohbioscience.com).]

L60—Spherical, porous silica gel, 10 µm or less in diameter, the surface of which has been covalently modified with alkyl amide groups and endcapped.

[NOTE—Available as Supelcosil ~~ABZ~~

▲LC-ABZ▲*USP33*
from Supelco (www.sigmaaldrich.com/supelco).]

L61—A hydroxide selective strong anion-exchange resin consisting of a highly cross-linked core of 13 µm microporous particles having a pore size less than 10 Å units and consisting of ethylvinylbenzene cross-linked with 55% divinylbenzene with a latex coating composed of 85 nm diameter microbeads bonded with alkanol quaternary ammonium ions (6%).

[NOTE—Available as Ion Pac AS-11 and AG-11 from Dionex (www.dionex.com).]

L62—C30 silane bonded phase on a fully porous spherical silica, 3 to 15 µm in diameter.

In-Process Revision

L63—■Glycopeptide teicoplanin linked through multiple covalent bonds to a 100-Å units spherical silica.

[NOTE—Available as Chirobiotic T from Astec (www.astecusa.com).]■1S (*USP31*)

■L64—Strongly basic anion-exchange resin consisting of 8% cross-linked styrene-divinylbenzene copolymer with a quartenary ammonium group in the chloride form, 45 to 180 µm in diameter.

[NOTE—A suitable grade is available as AG 1-X8 resin chloride form from www.discover.bio-rad.com.]

L65—Strongly acidic cation-exchange resin consisting of 8% sulfonated cross-linked styrene-divinylbenzene copolymer with a sulfonic acid group in the hydrogen form, 45 to 250 µm in diameter.

[NOTE—A suitable grade is available as AG 50W-X2 resin hydrogen form from www.discover.bio-rad.com.]

L66—A crown ether coated on a 5-µm particle size silica gel substrate. The active site is *(S)*-18-crown-6-ether.

[NOTE—Available as Crownpak CR(+) from Daicel (www.daicel.com).]■2S (*USP31*)

▲L67—Porous vinyl alcohol copolymer with a C18 alkyl group attached to the hydroxyl group of the polymer, ▲2 µm to 10 µm in diameter.▲*USP33*

[NOTE—Available as apHera C18 from Supelco (www.sigma-aldrich.com).]▲*USP32*

•L68—Spherical, porous silica, 10 µm or less in diameter, the surface of which has been covalently modified with alkyl amide groups and not endcapped.

[NOTE—Available as SUPELCOSIL SUPLEX pKb-100 from Supelco (www.sigma-aldrich.com).]•6

▲L## (Dalteparin Sodium, anion-exchange Dowex 1X8)—Strongly basic (type I) anion exchange resin in the chloride form.

[NOTE—Available as Dowex 1X8.]

L## (Dalteparin Sodium, cation-exchange Dowex 50WX2)—Strong acidic cation exchange resin in the H^+ form.

[NOTE—Available as Dowex 50WX2.]▲*USP33*

L## (Glucosamine, Shodex NH2P-50)—Polyamine chemically bonded to cross-linked polyvinyl alcohol polymer, 5 µm in diameter.

NOTE—Available as Shodex NH2P-50 from Shodex (www.shodex.com).

~~L## (Trehalose, Sugar KS-801)—Strong cation exchange resin consisting of sulfonated cross-linked styrene-divinylbenzene copolymer in the sodium form, 6 to 17 ★30▲*USP34*, µm in diameter.~~

~~[NOTE—Available as Sugar KS-801 from Shodex (www.shodex.com).]~~

▲L## (Ethylhexyl Triazone, Fluofix)—Fluorocarbon chains chemically bonded to 5-µm spherical silica particles.

[NOTE—Available as Wakopak Fluofix from Wako Pure Chemical Ind.]

L## (Nateglinide, Sumichiral OA-3300)—(*R*)-phenylglycine and 3,5-dinitroanaline urea linkage covalently bonded to silica.

[NOTE—Available as Sumichiral OA-3300, distributed by www.phenomenex.com.]

L## (Oxaliplatin and Atorvastatin, Chiralcel OC-H)—Cellulose tris(phenyl carbamate) coated on 5-µm silica.

[NOTE—Available as Chiralcel OC-H from www.chiral tech.com.]

L## (⟨233⟩ *Dimethylaniline*, Rtx-35 Amine)—[To come.]

[NOTE—Available as Rtx-35 Amine from www.restek.com.]

L## (Nateglinide, RSpak DE-613)—A rigid, spherical polymetacrylate, 4 µm to 6 µm in diameter.

[NOTE—Available as RSpak DE-613 from www.shodex.com.]

L## (Polyvinyl Acetate, Jordi-Gel DVB)—A rigid spherical polydivinylbenzene particle, 5 µm to 10 µm in diameter.

[NOTE—Available as Jordi-Gel DBV from www.jordiflp.com.]▲*USP33*

Phases

G1—Dimethylpolysiloxane oil.

G2—Dimethylpolysiloxane gum.

G3—50% Phenyl-50% methylpolysiloxane.

G4—Diethylene glycol succinate polyester.

G5—3-Cyanopropylpolysiloxane.

G6—Trifluoropropylmethylpolysiloxane.

G7—50% 3-Cyanopropyl-50% phenylmethylsilicone.

G8—80% Bis(3-cyanopropyl)-20% 3-cyanopropylphenylpoly-siloxane (percentages refer to molar substitution).

G9—Methylvinylpolysiloxane.

G10—Polyamide formed by reacting a C_{36} dicarboxylic acid with 1,3-di-4-piperidylpropane and piperidine in the respective mole ratios of 1.00 : 0.90 : 0.20.

G11—Bis(2-ethylhexyl) sebacate polyester.

G12—Phenyldiethanolamine succinate polyester.

G13—Sorbitol.

G14—Polyethylene glycol (av. mol. wt. of 950 to 1050).

G15—Polyethylene glycol (av. mol. wt. of 3000 to 3700).

G16—Polyethylene glycol compound (av. mol. wt. about 15,000). A high molecular weight compound of polyethylene glycol with a diepoxide linker.

[NOTE—Available commercially as Polyethylene Glycol Compound 20M, or as Carbowax 20M, from suppliers of chromatographic reagents.]

G17—75% Phenyl-25% methylpolysiloxane.

G18—Polyalkylene glycol.

G19—25% Phenyl-25% cyanopropyl-50% methylsilicone.

G20—Polyethylene glycol (av. mol. wt. of 380 to 420).

G21—Neopentyl glycol succinate.

In-Process Revision

G22—Bis(2-ethylhexyl) phthalate.
G23—Polyethylene glycol adipate.
G24—Diisodecyl phthalate.
G25—Polyethylene glycol compound TPA. A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with terephthalic acid.
[NOTE—Available commercially as Carbowax 20M-TPA from suppliers of chromatographic reagents.]
G26—25% 2-Cyanoethyl-75% methylpolysiloxane.
G27—5% Phenyl-95% methylpolysiloxane.
G28—25% Phenyl-75% methylpolysiloxane.
G29—3,3′-Thiodipropionitrile.
G30—Tetraethylene glycol dimethyl ether.
G31—Nonylphenoxypoly(ethyleneoxy)ethanol (av. ethyleneoxy chain length is 30); Nonoxynol 30.
G32—20% Phenylmethyl-80% dimethylpolysiloxane.
G33—20% Carborane-80% methylsilicone.
G34—Diethylene glycol succinate polyester stabilized with phosphoric acid.
G35—A high molecular weight compound of a polyethylene glycol and a diepoxide that is esterified with nitroterephthalic acid.
G36—1% Vinyl-5% phenylmethylpolysiloxane.
G37—Polyimide.
G38—Phase G1 containing a small percentage of a tailing inhibitor.
[NOTE—A suitable grade is available commercially as "SP2100/0.1% Carbowax 1500" from Supelco, Inc. (www.sigmaaldrich.com/supelco).]
G39—Polyethylene glycol (av. mol. wt. about 1500).
G40—Ethylene glycol adipate.
G41—Phenylmethyldimethylsilicone (10% phenyl-substituted).
G42—35% phenyl-65% dimethylpolysiloxane (percentages refer to molar substitution).
G43—6% cyanopropylphenyl-94% dimethylpolysiloxane (percentages refer to molar substitution).
G44—2% low molecular weight petrolatum hydrocarbon grease and 1% solution of potassium hydroxide.
G45—Divinylbenzene-ethylene glycol-dimethylacrylate.
G46—14% Cyanopropylphenyl-86% methylpolysiloxane.
G47—Polyethylene glycol (av. mol. wt. of about 8000).
G48—Highly polar, partially cross-linked cyanopolysiloxane.

Supports

NOTE—Unless otherwise specified, mesh sizes of 80 to 100 or, alternatively, 100 to 120 are intended.
S1A—Siliceous earth for gas chromatography has been flux-calcined by mixing diatomite with Na_2CO_3 flux and calcining above 900°. The siliceous earth is acid-washed, then water-washed until neutral, but not base-washed. The siliceous earth may be silanized by treating with an agent such as dimethyldichlorosilane [NOTE—Unless otherwise specified in the individual monograph, silanized support is intended.] to mask surface silanol groups.
S1AB—The siliceous earth as described above is both acid- and base-washed. [NOTE—Unless otherwise specified in the individual monograph, silanized support is intended.]
S1C—A support prepared from crushed firebrick and calcined or burned with a clay binder above 900° with subsequent acid-wash. It may be silanized.
S1NS—The siliceous earth is untreated.
S2—Styrene-divinylbenzene copolymer having a nominal surface area of less than 50 m^2 per g and an average pore diameter of 0.3 to 0.4 μm.
S3—Copolymer of ethylvinylbenzene and divinylbenzene having a nominal surface area of 500 to 600 m^2 per g and an average pore diameter of 0.0075 μm.
S4—Styrene-divinylbenzene copolymer with aromatic –O and –N groups, having a nominal surface area of 400 to 600 m^2 per g and an average pore diameter of 0.0076 μm.
S5—40- to 60-mesh, high-molecular weight tetrafluorethylene polymer.
S6—Styrene-divinylbenzene copolymer having a nominal surface area of 250 to 350 m^2 per g and an average pore diameter of 0.0091 μm.
S7—Graphitized carbon having a nominal surface area of 12 m^2 per g.
S8—Copolymer of 4-vinyl-pyridine and styrene-divinylbenzene.
S9—A porous polymer based on 2,6-diphenyl-*p*-phenylene oxide.
S10—A highly polar cross-linked copolymer of acrylonitrite and divinylbenzene.
S11—Graphitized carbon having a nominal surface area of 100 m^2 per g modified with small amounts of petrolatum and polyethylene glycol compound.
[NOTE—Commercially available as SP1500 on Carbopack B from Supelco (www.sigmaaldrich.com/supelco).]
S12—Graphitized carbon having a nominal surface area of 100 m^2 per g.

(HDQ) RTS—C44080; C53875; C57641; C57716; C59275; C64392; C66478; C68459; C68500; C70200

Add the following:

▲**Atorvastatin Calcium:** White to off-white crystalline powder. Freely soluble in methanol; slightly soluble in alcohol; very slightly soluble in distilled water, in pH 7.4 phosphate buffer, and in acetonitrile; and insoluble in aqueous solutions of pH 4 and below.▲*USP33*

Add the following:

▲**Chitosan:** White or almost white powder or granules. Soluble in aqueous solutions of glycolic acid, of formic acid, of acetic acid, of hydrochloric acid, and of lactic acid; and practically insoluble in organic solvents and in water. *NF category:* Coating agent; film forming agent; suspending and/or viscosity increasing agent; vehicle (solid carrier). ▲*NF28*

Add the following:

▲**Diclazuril:** White to yellow powder. Sparingly soluble in dimethylformamide; and practically insoluble in water, in alcohol, and in methylene chloride.▲*USP33*

Change to read:

Mycophenolate Mofetil: White or almost white, crystalline powder.

▲Its melting range is between 94°C and 98°C.▲*USP33*
Freely soluble in acetone; soluble in methanol; sparingly soluble in dehydrated alcohol; and slightly soluble in water.

Delete the following:

▲~~**Norethynodrel:** White or practically white, odorless, crystalline powder. Melts at about 175°, over a range of about 3°. Is stable in air. Very slightly soluble in water and in solvent hexane; freely soluble in chloroform; soluble in acetone; sparingly soluble in alcohol.~~▲*USP33*

Change to read:

Olive Oil: Pale yellow, or light greenish-yellow, oily liquid, having a slight, characteristic odor and taste, with a faintly acrid aftertaste. Slightly soluble in alcohol. Miscible with ether, with chloroform, and with carbon disulfide.

▲*Specific gravity* ⟨841⟩: between 0.910 and 0.915.▲*NF28*
NF category: Vehicle (oleaginous).

Add the following:

▲**Polyoxyl 15 Hydroxystearate:** Yellowish to white waxy mass. Very soluble in water; soluble in alcohol and in 2-propanol; and insoluble in mineral oil. It solidifies at 25°. *NF category*: Tablet and/or capsule lubricant; wetting and/or solubilizing agent; vehicle (oleaginous).▲*NF28*

Add the following:

▲**Polyvinyl Acetate Dispersion:** Opaque, white or off-white, slightly viscous liquid. Miscible with water and with ethanol. It is sensitive to spoilage by microbial contaminants. *NF category:* Coating agent.▲*NF28*

Add the following:

▲**Hydrogenated Starch Hydrolysate:** Concentrated, aqueous solution or spray-dried or dried powder. Very soluble in water; and insoluble in alcohol. *NF category:* Sweetening agent; humectant; tablet binder; tablet and/or capsule diluent.▲*NF28*

Add the following:

▲**Pea Starch:** White or almost white, very fine powder. Practically insoluble in cold water and in alcohol. *NF category:* Suspending and/or viscosity-increasing agent; tablet binder; tablet and/or capsule diluent; tablet disintegrant.▲*NF28*

In-Process Revision

BRIEFING

Atomic Weights, *USP 31* page 895. The following changes to atomic weights are based on new determinations of isotopic abundances and reviews of previous isotopic abundances and atomic masses reported by IUPAC. The table is based on the 2005 table in *Pure Appl. Chem.*, **78**, 2051–2066 (2006) with 2007 changes to the values for lutetium, molybdenum, nickel, ytterbium, and zinc. Temporary names of elements with atomic numbers 110 and 111 have been changed to Darmstadtium and Roentgenium, respectively.

(HDQ) RTS—C68846

ATOMIC WEIGHTS

Change to read:

Standard Atomic Weights of the Elements, Recommended by the Commission on Atomic Weights and Isotopic Abundances of the International Union of Pure and Applied Chemistry ~~(1997) (©1998 IUPAC)~~

▲(2007) (©2008 IUPAC)▲*USP33*

Standard atomic weights ~~1997~~

▲2007▲*USP33*

[In alphabetical order: scaled to A_r(12C) = 12, where ^{12}C is a neutral atom in its nuclear and electronic ground state.]

The atomic weights of many elements are not invariant but depend on the origin and treatment of the material. The standard values of A_r(E) and the uncertainties (in parentheses, following the last significant figure to which they are attributed) apply to elements of natural terrestrial origin. The footnotes to this Table elaborate the types of variation which may occur for individual elements and which may be larger than the listed uncertainties of values of A_r(E). Names of elements with atomic numbers ~~110, 111 and 112,~~

▲112, 113, 114, 115, 116, and 118▲*USP33*

[*] Element has no stable nuclides. One or more well-known isotopes are given in the accompanying table with the appropriate relative atomic mass and half-life. However, three such elements (Th, Pa, and U) do have a characteristic terrestrial isotopic composition, and for these an atomic weight is tabulated.

[†] Commercially available Li materials have atomic weights that are known to range between 6.939 and 6.996; if a more accurate value is required, it must be determined for the specific material.

[g] Geological specimens are known in which the element has an isotopic composition outside the limits for normal material. The difference between the atomic weight of the element in such specimens and that given in the *Table* may exceed the stated uncertainty.

[m] Modified isotopic compositions may be found in commercially available material because it has been subjected to an undisclosed or inadvertent isotopic fractionation. Substantial deviations in atomic weight of the element from that given in the *Table* can occur.

[r] Range in isotopic composition of normal terrestrial material prevents a more precise A_r(E) being given; the tabulated A_r(E) value should be applicable to any normal material.

In-Process Revision

Pending Proposals

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *Pharmacopeial Forum (PF)* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in the *USP–NF,* its *Supplements,* or an *IRA.* Those items that have not yet been adopted are marked as *Pending Proposals.*

The *Pending Proposals* list contains these items separated into the following categories: General Notices and Requirements; *USP* monographs; Dietary Supplements Monographs; General Chapters; Reagents, Indicators, and Solutions; Reference Tables; Excipients; and *NF* Monographs. Each entry in the *Pending Proposals* list contains the monograph title and the citation of the most recent publication of the monograph. Reprints of *PF* proposals may be purchased from USP by sending a written request for information to custsvc@usp.org.

To check the status of a *Pending Proposal,* please contact USP as directed below.

- The briefing accompanying the monograph or general chapter lists the names of the Scientific Liaisons responsible for the proposed revisions. The contact information (phone number and email) for the Scientific Liaison is available in the *Staff Directory* section of *How to Use PF.* For *USP–NF Online* subscribers, the name and contact information for the assigned Scientific Liaison is available in the *Auxiliary Information* portion of each monograph.
- Call USP at 301-816-8344 and ask to speak with the Scientific Liaison assigned to the monograph or general chapter of interest.
- Submit questions by email to stdsmonographs@usp.org. Please indicate the name of the monograph or general chapter in the subject line of the email.

Following these lists the reader will find the *Canceled Proposals* list. These are items that were published in *PF* and were pending, but have since been canceled. This list contains cumulative entries for the six issues per volume of *PF* [i.e., 35(1) through 35(6)]. Note that canceled proposals may be republished in *PF* to be considered for future adoption into the *USP–NF.*

Niacinamide—*Readily carbonizable substances*	34	5	1176
Norethindrone Acetate—*Chromatographic purity*	34	4	969
Norethindrone Acetate and Ethinyl Estradiol Tablets—*Dissolution*	33	3	432
Norethindrone Acetate and Ethinyl Estradiol Tablets—*Identification*	33	6	1194
Octisalate—*Assay*	34	4	970
Ofloxacin—*Chromatographic purity* (delete), *Related compounds* (add)	30	4	1274
Ofloxacin Tablets—*Uniformity of dosage units*	34	6	1467
Olanzapine (new)	34	3	641
Ondansetron Hydrochloride—*Limit of ondansetron related compound D, Assay*	32	1	126
Ondansetron Tablets (new)	34	4	971
Ondansetron Orally Disintegrating Tablets—*Labeling* (add), *Disintegration, Dissolution, Water* (delete)	34	6	1467
Orbifloxacin (new)	34	2	283
Orbifloxacin Tablets (new)	34	2	286
Orlistat Capsules (new)	32	6	1739
Orphenadrine Citrate Extended-Release Tablets (new)	34	3	643
Oseltamivir Phosphate (new)	34	6	1468

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Oseltamivir Phosphate Capsules (new)	34	6	1471
Oxaliplatin (new)	34	4	973
Oxaliplatin for Injection (new)	34	6	1473
Oxcarbazepine (new)	34	5	1177
Oxcarbazepine Tablets (new)	34	6	1478
Oxycodone Hydrochloride—*USP Reference standards, Limit of oxycodone related compound A (14-hydroxycodeinone) and oxycodone related compound C (codeinone)* (add), *Chromatographic purity*	34	6	1480
Oxytocin—*Definition, USP Reference standards, Identification, Vasopressor activity* (delete), *Acetic acid content* (add)	34	3	647
Pamidronate Disodium—*Alcohol content* (delete)	34	5	1179
Pamidronate Disodium for Injection—*Definition*	33	1	81
Pancuronium Bromide Injection (new)	32	4	1097
Paricalcitol—*Identification, Assay*	33	2	252
Pectin—*Identification*	31	3	783
Penicillamine Capsules—*Dissolution*	31	2	436
Pentazocine and Acetaminophen Tablets—*Title, Assay for pentazocine, Assay for acetaminophen*	33	6	1200
Pentobarbital Sodium—*Labeling* (add), *USP Reference standards, Other requirements* (add)	31	1	73
Pergolide Oral Suspension, Veterinary (new)	34	2	289
Permethrin (new)	32	4	1100
Permethrin Cream (new)	34	1	103
Petrolatum (new)—*Harmonization*	28	2	569
White Petrolatum (new)—*Harmonization*	28	2	570
Phenylephrine Hydrochloride—*Assay*	34	2	291
Phenytoin Chewable Tablets (new)	29	6	1965
Physostigmine—*Readily carbonizable substances*	34	5	1179
Physostigmine Salicylate—*Readily carbonizable substances*	34	5	1179
Physostigmine Sulfate—*Readily carbonizable substances*	34	5	1179
Pilocarpine Hydrochloride—*Readily carbonizable substances*	34	5	1179
Pilocarpine Hydrochloride Tablets (new)	34	2	291
Pilocarpine Nitrate—*Readily carbonizable substances*	34	5	1179
Piperacillin and Tazobactam for Injection (new)	34	4	980
Piperazine—*USP Reference standards* (add), *Identification, Primary amines and ammonia* (delete), *Chromatographic purity* (add)	34	1	105
Piperazine Adipate (new)	33	6	1201
Piperazine Citrate—*USP Reference standards* (add) *Identification*, *Primary amines and ammonia* (delete) *Chromatographic purity* (add), *Assay*	34	1	106
Piperazine Dihydrochloride (new)	33	6	1202
Piperazine Phosphate (new)	33	6	1204
Polyethlene Glycol 3350 and Electrolytes for Oral Solution—*Reference standards, Assay for potassium and sodium*	33	6	1205
Polyvinyl Alcohol—*Definition, Packaging and storage, Labeling* (add), *Reference standards* (add), *Identification* (add), *Viscosity, Residue on ignition, Heavy metals* (add), *Acid value* (add), *Water-insoluble substances, Limit of methanol (methyl alcohol) and methyl acetate* (add)	33	6	1206
Potassium and Sodium Bicarbonates and Citric Acid Effervescent Tablets for Oral Solution—*USP Reference standards* (add), *Assay for anhydrous citric acid (delayed implementation to January 1, 2009)*	31	2	440
Potassium Bitartrate—*Heavy metals*	34	5	1180
Potassium Bromide Oral Solution, Veterinary (new)	33	5	936
Potassium Citrate Extended-Release Tablets—*USP Reference standards* (add), *Assay (delayed implementation to January 1, 2009)*	31	2	443
Potassium Citrate and Citric Acid Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	444
Potassium Iodide Delayed-Release Tablets—*Identification* (add), *Other requirements*	34	6	1481
Potassium Iodide Oral Solution—*Definition*	31	3	786
Potassium Sodium Tartrate—*Limit of ammonia*	31	3	787
Pralidoxime Chloride for Injection—*Identification A, B, C* (add), *Other requirements*	34	5	1180
Pravastatin Sodium—*Chromatographic purity, Assay*	34	2	294

In-Process Revision

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Pravastatin Sodium Tablets—*USP Reference standards, Related compounds*	34	5	1180
Prednisolone Sodium Phosphate—*Definition*, *Free prednisolone* (delete) *Related compounds* (add), *Assay*	34	1	108
Proguanil Hydrochloride (new)	34	2	296
Promethazine Hydrochloride—*USP Reference standards, Related compounds*	32	4	1105
Promethazine Hydrochloride Tablets—*USP Reference standards, Related compounds, Assay*	32	4	1107
Propofol Injectable Emulsion (new)	33	6	1208
Propoxycaine and Procaine Hydrochloride and Norepinephrine Bitartrate Injection—*Assay for norepinephrine*	34	1	110
Pseudoephedrine Hydrochloride—*Definition, USP Reference standards, Ordinary impurities* (delete), *Chromatographic purity* (add), *Assay*	34	2	298
Pyrantel Pamoate—*USP Reference standards, Related compounds*	34	6	1482
Quinapril Tablets—*Related compounds*	34	5	1182
Ramipril—*Definition, Assay*	31	3	787
Ranitidine Hydrochloride—*Chromatograpic purity, Assay*	34	2	299
Oral Rehydration Salts—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	5	1399
Risedronate Sodium (new)	34	5	1183
Risedronate Sodium Tablets (new)	34	5	1186
Rocuronium Bromide (new)	34	3	648
Salsalate Tablets—*Assay*	33	6	1211
Secobarbital Sodium—*Chemical structure, Definition, Identification, Related compounds* (add), *Isomer content* (delete), *Assay*	34	4	984
Sertraline Hydrochloride (new)	34	5	1189
Sibutramine Hydrochloride (new)	34	4	986
Simethicone Emulsion—*Assay*	34	3	652
Simethicone Tablets—*Disintegration*	34	3	652
Sodium Bromide Injection, Veterinary (new)	33	5	949
Sodium Bromide Oral Solution, Veterinary (new)	33	5	950
Sodium Chloride—*Identification, Loss on drying, Limit of potassium (postponed indefinitely)*	32	2	264
Sodium Fluoride—*Assay*	34	3	653
Sodium Sulfate—*Assay*	34	5	1192
Soybean Oil—*CAS number* (add), *Labeling, Identification* (add), *Specific gravity* (delete), *Refractive index* (delete), *Heavy metals, Free fatty acids* (delete), *Acid value* (add), *Fatty acid composition, Iodine value* (delete), *Saponification value* (delete), *Cottonseed oil* (delete), *Peroxide value, Water* (add), *Alkaline impurities* (add), *Sterol composition* (add), *Other requirements* (add)	34	4	989
Spectinomycin for Injectable Suspension—*Identification* (add), *Other requirements*	34	5	1193
Stavudine—*Specific rotation*	34	3	653
Streptomycin Injection—*Identification* (add), *Other requirements*	34	5	1193
Sucralfate—*Identification*	33	2	254
Sulfadoxine—*Identification, Assay*	34	2	300
Sulfadoxine and Pyrimethamine Tablets—*Assay*	34	2	301
Sulfamethazine Granulated—*Assay*	31	3	797
Sulfasalazine—*Identification*	34	3	653
Sulfazalazine Tablets—*Identification*	34	3	653
Sulfinpyrazone—*Solubility in acetone* (delete), *Solubility in 0.50 N sodium hydroxide* (delete)	34	6	1483
Tamsulosin Hydrochloride (new)	33	6	1211
Tamsulosin Hydrochloride Capsules (new)	34	5	1193
Tazobactam—*Identification, Specific rotation, Related compounds, Organic volatile impurities* (delete), *Assay*	34	2	302
Terbinafine Hydrochloride—*Melting range*	34	5	1197
Terbutaline Sulfate Inhalation Aerosol—*USP Reference standards, Assay*	31	2	450
Terconazole (new)	34	4	991
Thiabendazole Chewable Tablets (new)	29	6	1991
Thimerosal—*Readily carbonizable substances*	34	5	1197
Thioguanine—*USP Reference standards, Identification, Limit of guanine*	34	2	305
Thioridazine Hydrochloride—*Identification*	31	3	798
Tiagabine Hydrochloride—*Chromatographic purity*	34	2	306
Tilmicosin—*Definition, Related compounds, Assay*	31	3	798

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Tobramycin Inhalation Solution—*Identification* (add), *Osmolarity, Chromatographic purity, Other requirements* (delete), *Assay*	34	2	307
Topiramate Tablets (new)	34	5	1197
Torsemide—*Water*	33	6	1213
Tramadol Hydrochloride (new)	34	5	1200
Tramadol Hydrochloride Tablets (new)	31	2	462
Tranexamic Acid (new)	34	6	1484
Trandolapril (new)	34	2	310
Travoprost (new)	32	4	1115
Travoprost Ophthalmic Solution (new)	32	4	1118
Tretinoin Gel—*Identification, Assay*	34	6	1485
Triamcinolone Acetonide—*USP Reference standards, Assay*	31	3	800
Triamterine Capsules—*USP Reference standards, Related compounds* (add), *Assay*	34	3	654
Tricitrates Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	465
Tryptophan—*Chromatographic purity* (add), *Limit of tryptophan related compound A* (add)	33	6	1214
Tylosin Injection (new)	34	5	1205
Ursodiol Capsules—*Dissolution*	31	3	800
Valganciclovir Tablets (new)	33	1	89
Valrubicin Intravesical Solution—*USP Reference standards, Related compounds*	34	6	1486
Vancomycin Hydrochloride—*Labeling* (add), *USP Reference standards, Chromatographic purity*, *Other requirements* (add)	34	1	111
Vancomycin Hydrochloride Capsules—*Identification*	34	6	1487
Sterile Vancomycin Hydrochloride—(delete the entire monograph)	34	1	112
Vancomycin Hydrochloride for Injection—*Definition, Labeling* (add), *Identification* (add), *Water* (add), *pH* (add), *Uniformity of dosage units* (add), *Chromatographic purity*, *Assay*	34	4	992
Vasopressin—*Chemical information, Definition, USP Reference standards, Oxytocic activity* (delete), *Water* (add), *Acetic acid content* (add), *Assay*	34	4	994
Vasopressin Injection—*Assay*	34	4	995
Vinblastine Sulfate for Injection—*Identification* (add), *Other requirements*	34	4	995
Pure Steam (new)	31	2	467
Water for Hemodialysis—*Bacterial endotoxins*	31	2	468
Sterile Water for Inhalation—*pH* (delete), *Ammonia* (delete), *Calcium* (delete), *Carbon dioxide* (delete), *Chloride* (delete), *Sulfate* (delete), *Conductivity* (add), *Oxidizable substances*	31	3	802
Sterile Water for Injection—*Oxidizable substances*	31	3	803
Sterile Water for Irrigation—*Oxidizable substances*	31	3	804
Sterile Purified Water—*Oxidizable substances*	31	3	804
Xylose—*USP Reference standards, Identification, Chromatographic purity, Assay*	34	4	995
Zidovudine—*Assay*	34	3	656
Zidovudine Capsules—*Related compounds, Assay*	34	3	657
Zidovudine Injection—*Related compounds, Assay*	34	3	658
Zolpidem Tartrate (new)	34	6	1487
Zonisamide (new)	34	6	1489
<u>*Dietary Supplements Monographs*</u>			
Acesulfame Potassium—*Packaging and storage* (add), *Limit of fluoride*	31	3	811
Calcium and Vitamin D with Minerals Tablets—*Assay for calcium; Assay for copper; Assay for magnesium; Assay for manganese; Assay for zinc; Assay for calcium, copper, magnesium, manganese, and zinc, Method 2* (add)	34	6	1491
Calcium Citrate Tablets (new)	34	2	312
Curcuminoids (new)	33	6	1215
Curcuminoids Capsules (new)	33	6	1217
Curcuminoids Tablets (new)	33	6	1218
Fish Oil Containing Omega-3 Acids—*Content of EPA and DHA*	34	5	1207
Asian Ginseng Capsules (new)	30	2	571
Glucosamine Hydrochloride—*Assay*	33	4	691
Glucosamine Sulfate Potassium Chloride—*Assay*	33	4	692
Glucosamine Sulfate Sodium Chloride—*Assay*	33	4	692
Glutamic Acid (new)	34	4	997

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Grape Seeds Oligomeric Proanthocyanidins (new)	34	3	659
Guggul (new)	34	4	1000
Native Guggul Extract (new)	34	4	1002
Purified Guggul Extract (new)	34	4	1003
Guggul Tablets (new)	34	4	1004
Hawthorn Leaf with Flower—*Labeling*	34	5	1209
Powdered Hawthorn Leaf with Flower—*Labeling*	34	5	1209
Ground Limestone (new)	34	4	998
Alpha Lipoic Acid—*Limit of 6,8-epitrithiooctanoic acid* (delete), *Limit of polymer content* (delete), *Chromatographic purity* (add), *Assay*	34	5	1209
Maleic Acid—*Identification*	31	3	815
Maltose—*Water*	31	3	815
Minerals Capsules—*Definition, Assay for calcium; Assay for chromium; Assay for iron; Assay for magnesium; Assay for manganese; Assay for phosphorus; Assay for zinc; Assay for boron, nickel, tin, and vanadium, Method I; calcium, chromium, copper, iron, magnesium, manganese, phosphorus, and zinc, Method 2; molybdenum and selenium, Method 3* (add)	34	6	1493
Minerals Tablets—*Definition, Assay for calcium; Assay for chromium; Assay for copper; Assay for iron; Assay for magnesium; Assay for manganese; Assay for phosphorus; Assay for zinc; Assay for boron, nickel, tin, and vanadium, Method I; calcium, chromium, copper, iron, magnesium, manganese, phosphorus, and zinc, Method 2; molybdenum and selenium, Method 3* (add)	34	6	1495
Olive Oil—*Definition, Labeling* (add), *Teaseed oil*	31	3	815
Omega-3 Acid Triglycerides (new)	34	3	662
Phenoxyethanol—*Chromatographic purity, Assay*	31	3	816
Polyethylene Glycol (new)—*Harmonization*	31	3	897
Polyoxyl 10 Oleyl Ether—*Free ethylene oxide*	31	3	816
Polyoxyl 20 Oleyl Cetostearyl Ether—*Free ethylene oxide*	31	3	817
Potassium Citrate Tablets (new)	34	2	313
Sodium Benzoate—*USP Reference standards* (add), *Identification*	31	3	818
Powdered Soy Isoflavones Extract (new)	33	6	1224
Soy Isoflavones Capsules (new)	33	6	1227
Soy Isoflavones Tablets (new)	33	6	1228
Sucrose (new)—*Harmonization*	31	3	902
Sugar Spheres—*Identification, Specific rotation*	31	3	819
Tagatose (new)	31	3	819
Thymol—*USP Reference standards* (add), *Identification*	31	3	821
Tumeric (new)	33	6	1229
Powdered Tumeric (new)	33	6	1232
Powdered Tumeric Extract (new)	33	6	1232
Ubidecarenone—*USP Reference standards, Assay*	31	1	86
Valerian Capsules (new)	27	1	1825
Oil- and Water-Soluble Vitamins with Minerals Capsules—*Definition, Assay for calcium; Assay for chromium; Assay for copper; Assay for magnesium; Assay for manganese; Assay for phosphorus; Assay for zinc; Assay for boron, nickel, tin, and vanadium, Method I; calcium, chromium, copper, iron, magnesium, manganese, phosphorus, and zinc, Method 2; molybdenum and selenium, Method 3* (add)	34	6	1499
Oil- and Water-Soluble Vitamins with Minerals Tablets—*Definition, Assay for calcium; Assay for chromium; Assay for copper; Assay for iron; Assay for magnesium; Assay for manganese; Assay for phosphorus; Assay for zinc; Assay for boron, nickel, tin, and vanadium, Method I; calcium, chromium, copper, iron, magnesium, manganese, phosphorus, and zinc, Method 2; molybdenum and selenium, Method 3* (add)	34	6	1500

Pending Proposals (*continued*)

Behenoyl Polyoxylglycerides (new)	34	5	1217
Benzalkonium Chloride—*Packaging and storage, Identification, Acidity or alkalinity* (add), *Limit of foreign amines* (delete), *Limit of amines and amine salts* (add)	34	4	1012
Betadex—*Structure* (add), *Packaging and storage, USP Reference standards, Identification, Microbial limits, pH, Heavy metals, Reducing substances, Light-absorbing impurities* (add), *Related compounds* (add), *Assay*	34	1	127
Butylated Hydroxytoluene—*USP Reference standards* (add), *Identification, Related compounds* (add)	34	1	130
Butylparaben—*Harmonization*	34	6	1592
Calcium Propionate (new)	34	6	1517
Caprylocaproyl Polyoxylglycerides—*Title, Definition, Labeling, Identification, Hydroxyl value, Saponification value, Fatty acid composition, Water, Total ash, Heavy metals, Alkaline impurities* (add), *Limit of free glycerol*	34	4	1012
Carbomer 934—*Title, Definition, Packaging and storage, Viscosity*	34	1	131
Carbomer 934P—*Title, Definition, Packaging and storage, Viscosity*	34	1	132
Carbomer 940—*Title, Definition, Packaging and storage, Viscosity*	34	1	133
Carbomer 941—*Title, Definition, Packaging and storage, Viscosity*	34	1	133
Carbomer Copolymer—*Definition, Labeling, Viscosity,Limit of benzene, Limit of acrylic acid*	34	1	134
Carbomer Homopolymer—*Title, Definition, Labeling, Viscosity, Residue on ignition, Limit of benzene, Limit of arylic acid*	34	1	136
Carbomer Interpolymer—*Definition, Labeling,Viscosity, Limit of benzene*, *Limit of acrylic acid*	34	1	138
Enzymatically-Hydrolyzed Carboxymethylcellulose Sodium (new)	34	6	1519
Carmellose (new)—*Harmonization*	33	3	537
Silicified Microcrystalline Cellulose (new)	34	5	1218
Hydrogenated Coconut Oil (new)	34	2	327
Copovidone—*Harmonization*	32	6	1843
Corn Oil—*CAS number* (add), *Labeling* (add), *Identification* (add), *Specific gravity* (delete), *Heavy metals, Cottonseed oil* (delete), *Fatty acid composition, Free fatty acids* (delete), *Acid value* (add), *Peroxide value* (add), *Iodine value* (delete), *Saponification value* (delete), *Water* (add), *Alkaline impurities* (add), *Sterol composition* (add), *Other requirements* (add)	34	5	1220
Corn Syrup (new)	33	6	1240
High Fructose Corn Syrup—*Total solids, Assay*	34	2	329
Cottonseed Oil—*CAS number* (add), *Definition, Labeling* (add), *Identification, Specific gravity* (delete), *Free fatty acids* (delete), *Acid value* (add), *Peroxide value* (add), *Unsaponifiable matter* (add), *Iodine value* (delete), *Water* (add), *Heavy metals, Alkaline impurities* (add), *Other requirements* (add)	34	5	1222
Crospovidone—*Harmonization*	28	4	1257
Desoxycholic Acid (new)	34	6	1523
Egg Phospholipids (new)	33	4	703

Pending Proposals (*continued*)
(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Title and Proposal	*PF Volume, Issue, and Page Numbers of Pending Proposals* *Vol.*	*No.*	*Page(s)*
Erythorbic Acid (new)	33	6	1246
Ethyl Acetate—*Readily carbonizable substances*	34	5	1223
Ethyl Acrylate and Methyl Methacrylate Copolymer Dispersion—*Identification*	33	6	1247
Ethyl Maltol (new)	34	5	1224
Ethylparaben—*Harmonization*	34	6	1594
Liquid Glucose—*CAS number* (add), *Packaging and storage, Labeling* (add), *Reference standards* (add), *Identification, Assay for reducing sugars (dextrose equivalent)* (add)	33	6	1248
Glyceryl Monooleate—*Chemical name, Reference standards, Identification, Saponification value*	33	6	1248
Hydrogenated Palm Oil (new)	34	2	330
Hydrogenated Polydecene (new)	33	3	485
Hydroxyethyl Cellulose (new)—*Harmonization*	34	6	1595
Low-Substituted Hydroxypropyl Cellulose—*Harmonization*	30	1	338
Anhydrous Lactose—*Harmonization*	32	6	1847
Lecithin—*CAS number* (add), *Packaging and storage, Labeling* (add), *Reference standards* (add), *Identification* (add), *Acid value, Peroxide value* (add), *Hexane-insoluble matter, Lead, Heavy metals, Content of acetone-insoluble matter*	33	6	1249
Lanolin Alcohols—*CAS number* (add), *Packaging and storage, Labeling* (add), *Acid value, Hydroxyl value* (add), *Peroxide value* (add)	34	4	1014
Lauroyl Polyoxylglycerides—*Title, Definition, Labeling, Identification, Hydroxyl value, Saponification value, Fatty acid composition, Water, Total ash, Heavy metals, Alkaline impurities* (add)	34	5	1224
Linoleoyl Polyoxylglycerides—*Title, Definition, Labeling, Identification, Fatty acid composition, Refractive index* (delete), *Water, Total ash, Heavy metals, Alkaline impurities* (add)	34	4	1015
Magnesium Stearate—*Harmonization*	30	1	340
Methylacrylic Acid Copolymer—*Definition, Packaging and storage, Labeling, Viscosity, Heavy metals, Limit of monomers*	33	6	1251
Methylacrylic Acid Copolymer Dispersion—*Packaging and storage, Limit of monomers, Coagulum content*	33	6	1254
Methyl Alcohol—*USP Reference standards* (add), *Identification, Readily carbonizable substances, Assay*	34	5	1226
Methylparaben—*Harmonization*	34	6	1601
Light Mineral Oil—*Neutrality*	33	5	972
Nitrogen—*Definition, Packaging and storage, Assay*	31	4	1145
Nitrogen 97 Percent—*Definition, Packaging and storage, Assay*	31	4	1146
Oleoyl Polyoxylglycerides—*Title, Definition, Labeling, Identification, Fatty acid composition, Water, Total ash, Heavy metals, Alkaline impurities* (add)	34	4	1016
Palm Oil (new)	34	4	1018
Peanut Oil—*CAS number* (add), *Definition, Labeling* (add), *Identification, Specific gravity* (delete), *Cottonseed oil* (delete), *Solidification range of fatty acids* (delete), *Free fatty acids* (delete), *Acid value* (add), *Peroxide value* (add), *Iodine value* (delete), *Saponification value* (delete), *Refractive index* (delete) *Heavy metals, Water* (add), *Alkaline impurities* (add), *Other requirements* (add)	34	6	1525
Poloxamer—*Packaging and storage, USP Reference standards* (add), *Identification* (add), *Limit of free ethylene oxide, propylene oxide, and 1,4-dioxane*	33	4	714
Hydrogenated Polydecene—*Readily carbonizable substances*	34	5	1227
Polyethylene Glycol—*Harmonization*	31	3	897
Polypropylene Glycol Monolaurate—*USP Reference standards, Identification*	34	1	140
Polyvinyl Acetate (new)	34	6	1526
Propylene Glycol (new)—*Harmonization*	33	2	317
Propylene Glycol Monolaurate—*USP Reference standards, Identification*	34	1	140
Propylparaben—*Harmonization*	34	6	1603
Silicon Dioxide (new)—*Harmonization*	31	4	1229
Colloidal Silicon Dioxide (new)—*Harmonization*	31	4	1233
Rice Starch (new)—*Harmonization*	30	2	721
Stearoyl Polyoxylglycerides—*Title, Definition, Labeling, Identification, Hydroxyl value, Saponification value, Fatty acid composition, Water, Total ash, Heavy metals, Alkaline impurities* (add)	34	5	1228
Sucrose—*Harmonization*	31	3	902
Tagatose (new)	30	5	1672
Tetrafluoroethane (new)	31	6	1672

HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps **(*Stages*)**.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of Expert Committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues.

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* section. Readers interested in submitting comments should see *Instructions to Authors.*

INSTRUCTIONS TO AUTHORS

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously in any language or medium and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication they will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention (USPC) and may not be subsequently published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

Style and Usage—*Stimuli* articles generally follow the current *Chicago Manual of Style* except in scientific usage (numbers, abbreviations, etc.). For the latter, authors should use the current *AMA Manual of Style* or the current *ACS Style Guide*. Authors may usefully consult a current copy of *Pharmacopeial Forum*.

References—Consult the current *AMA Manual of Style*, which is generally consistent with the National Library of Medicine's *Recommended Formats for Bibliographic Citation*. A current copy of *Pharmacopeial Forum* will offer examples of reference formats.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—USP will designate a Scientific Liaison in the Documentary Standards Division as the corresponding author. This ensures that USP receives all comments generated by the *Stimuli* article. Authors should contact the Scientific Liaison if they would like to receive copies of comments generated by their *Stimuli* articles.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

Pharmacopeial Forum
Executive Secretariat, USP
12601 Twinbrook Pkwy.
Rockville, MD 20852

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

Nomenclature

INDEX

This is a cumulative directory for the content of all issues of *PF* beginning with *PF* 35(1).

CHROMATOGRAPHIC REAGENTS USED IN *USP–NF* AND *PHARMACOPEIAL FORUM*

This is an update based on the proposals published in this issue of *PF*.

Chromatographic Reagents Used in *USP–NF* and *Pharmacopeial Forum*
Jan.–Feb. 2009

AMANTADINE HYDROCHLORIDE CAPSULES (DSD Mgh #2390)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(1)	G1	Rtx-1	Dissolution	Dissolution Test 2. 0.32 mm × 30 m, 0.25 µm. Alternative column in the same dimensions DB-1, manufacturer J&W Scientific. Manufacturer: Restek

ATORVASTATIN CALCIUM (DSD Mgh #6339)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(1)	L51	Chiralpak AD	Enantiomeric purity	4.6 mm × 25 cm. Manufacturer: Chiral Technologies, Inc.
35(1)	L7	ZORBAX RX-C8	Related compounds	4.6 mm × 25 cm, 5 µm. Manufacturer: Agilent Technologies

BRINZOLAMIDE OPHTHALMIC SUSPENSION (DSD Mgh #10208)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L1	Prodigy ODS-2	Assay	4.6 mm × 15 cm, 5 µm. Alternative column Symmetry C18, same dimensions, manufacturer Waters. Manufacturer: Phenomenex

CHITOSAN (DSD Mgh #2141)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(1)	L38	TSK-GEL G3000 PW	Molecular weight distribution and average molecular weight	7.5 mm × 30 cm, 10 µm. Manufacturer: Tosoh Biosciences
35(1)	L38	TSK-GEL G5000 PW	Molecular weight distribution and average molecular weight	7.5 mm × 30 cm, 17 µm. Manufacturer: Tosoh Biosciences
35(1)	L38	TSK-GEL G6000 PW	Molecular weight distribution and average molecular weight	7.5 mm × 30 cm, 17 µm. Manufacturer: Tosoh Biosciences

DICLAZURIL (DSD Mgh #24944)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(1)	L1	Hypersil BDS C-18	Chromatographic purity	4.6 mm × 10 cm, 3 µm. Manufacturer: Thermo Scientific

DILUTED ISOSORBIDE MONONITRATE (DSD Mgh #43610)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L1	LiChrosphere 100 RP-18	Assay	4 mm × 12.5 cm. Manufacturer: Merck KGaA

ECAMSULE SOLUTION (DSD Mgh #3063)

PF	LGS#	Reagent Brand	Type of Test	Comments
34(5)	L1	Inertsil ODS-2	Related compounds	Test for related compounds A to F. 4.6 mm × 15 cm, 5 µm. Manufacturer: GL Sciences
34(5)	L1	LiChrosorb RP-18	Assay and Related compounds	Test for related compound G, ecamsule exo-2-hydroxyecamsule, ecamsule endo-2-hydroxyecamsule, and unspecified impurities. 4.0 mm × 12.5 cm, 5 µm. Manufacturer: Merck KGaA

GANCICLOVIR (DSD Mgh #34666)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L9	Partisil 10 SCX	Assay and Related compounds	4.6 mm × 25 cm. Manufacturer: Whatman Inc.

GINGER (DSD Mgh #34965)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L1	Hypersil-ODS	Content of	Content of gingerols and gingerdiones. 4.6 mm × 25 cm. Manufacturer: Thermo Scientific

HYDROGENATED STARCH HYDROLYSATE (DSD Mgh #581)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(1)	L58	PL Hi-Plex Na	Content of	Content of maltitol and sorbitol. Hydrogenated polysaccharides test. 7.7 mm × 30 cm, 10 µm. Manufacturer: Varian/Polymer Labs

LEVOTHYROXINE SODIUM (DSD Mgh #45000)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(1)	L1	YMC-Pack Pro C18	Related compounds	4.0 mm × 15 cm, 3 µm. Manufacturer: YMC Co., Inc.

NARATRIPTAN HYDROCHLORIDE ORAL SUSPENSION (DSD Mgh #1787)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L11	SphereClone	Assay	4.6 mm × 25 cm, 5 µm. Manufacturer: Phenomenex

PANTOPRAZOLE ORAL SUSPENSION (DSD Mgh #3228)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L1	Inertsil ODS-3	Assay	4.6 mm × 150 mm, 5 µm. Manufacturer: GL Sciences

POLYOXYL 15 HYDROXYSTEARATE (DSD Mgh #66720)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(1)	L1	LiChrosphere 100 RP-18	Free	Free polyethylene glycols. Pre-column. 4 mm × 12.5 cm, 5 µm. Manufacturer: Merck KGaA
35(1)	L25	Ultrahydrogel DP, + 120	Free	Free polyethylene glycols. 7.8 mm × 30 cm, 6 µm. Manufacturer: Waters Corp

POLYVINYL ACETATE DISPERSION (DSD Mgh #3062)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(1)	L1	AQUASIL C18	Limit of	Limit of acetic acid and acetate. 4.6 mm × 25 cm, 5 µm. Manufacturer: Thermo Scientific
35(1)	L1	Nucleosil 120 C18	Limit of	Limit of vinyl acetate. Pre-column. 4.0 mm × 3 cm. Manufacturer: Macherey-Nagel
35(1)	L1	AQUASIL C18	Limit of	Limit of vinyl acetate. Analytical column. 4 mm × 25 cm, 5 µm. Manufacturer: Thermo Scientific

TERBINAFINE ORAL SUSPENSION (DSD Mgh #3232)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L1	Zorbax RX-C18	Assay	4.6 mm × 25 cm, 5 µm. Manufacturer: Phenomenex

TERBUTALINE ORAL SUSPENSION (DSD Mgh #3229)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L11	MicroBondapak Phenyl	Assay	3.9 mm × 30 cm, 10 µm. Manufacturer: Waters Corp

THEOPHYLLINE ORAL SOLUTION (DSD Mgh #82160)

PF	LGS#	Reagent Brand	Type of Test	Comments
25(4)	L1	MicroBondapak C18	Assay	3.9 mm × 30 cm. Alternative columns: 4.6 mm × 25 cm Partisil ODS, manufacturer Whatman; 4.0 mm × 30 cm Chromegabond M C18, manufacturer ES Industries. Manufacturer: Waters Corp.

TIAGABINE HYDROCHLORIDE ORAL SUSPENSION (DSD Mgh #3231)

PF	LGS#	Reagent Brand	Type of Test	Comments
0(0)	L10	Zorbax CN Reliance	Assay	3 mm × 150mm, 5 µm. Manufacturer: Agilent Technologies

USP–NF, 12601 Twinbrook Pkwy.,
Rockville, MD 20852

execsec@usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI)*, in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

Printed in USA by United Book Press, Baltimore, Maryland

ISSN: 0363-4655

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official pharmaceutical standards.

USP publishes *Pharmacopeial Forum* (*PF*) bimonthly and provides interested parties an opportunity to review and comment on the new or revised standards of the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

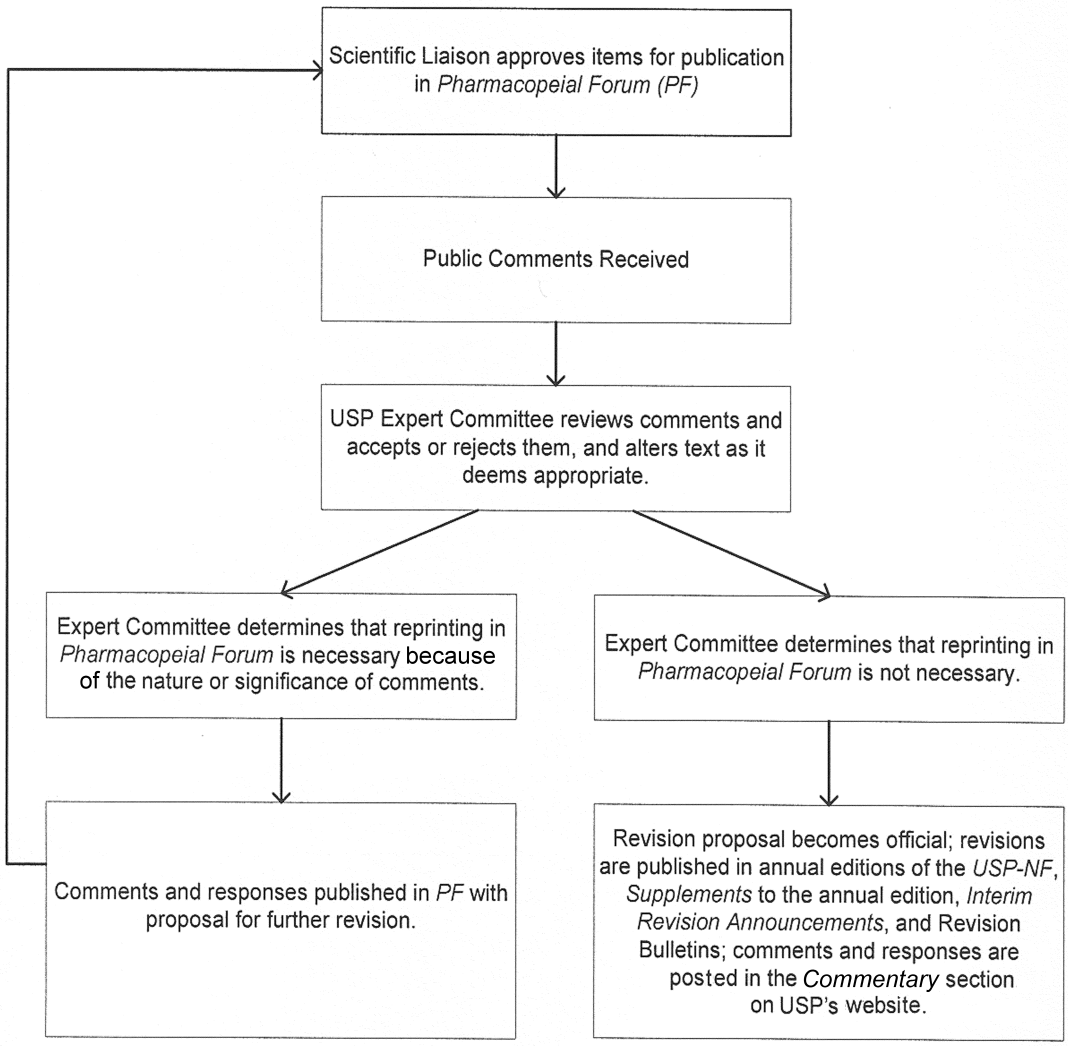
PF includes the following:

1. Potential revisions—entirely new standards, revision ideas, and drafts not yet targeted for official adoption (*Pharmacopeial Previews*)
2. Proposed revisions—new or revised standards targeted for official adoption (*In-Process Revision*)
3. Adopted revisions—new or revised standards that become official and binding before the publication of the next *USP–NF* or *Supplement* (*Interim Revision Announcement*)

USP welcomes comments and data on potential, proposed, or official standards. Comments, along with USP's responses, will be published either in *PF Briefings*, the *Commentary* section of *PF*, the *Commentary* section of *Supplements* to *USP–NF*, or the *Commentary* section of *USP–NF*.

The chart below shows the public review and comment process and its relationship to standards development.

Public Review and Comment Process for *USP-NF* Standards Development



Questions on the process should be addressed to Director, Executive Secretariat, U.S. Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE *PF*

This section provides descriptions of the various parts of *PF.* It also includes *Committee Designations* and the *Staff Directory.*

The content of the different sections of *PF* are briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a *Request for Revision* is available in the *Guideline for Submitting Requests for Revision to the USP–NF* on the USP website (www.usp.org/USPNF/submitMonograph/subGuide.html).

Proposed and Adopted Revisions to the *USP–NF*

Section	Content	How Readers Can Respond
In-Process Revision Revisions targeted for adoption	•BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see *Standards Development*).	Review material and send comments promptly to USP staff liaison (see the *Staff Directory*) identified at the end of the briefing accompanying each item. For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or fax number 301-816-8373. Comment deadlines are found at the end of the *Policies and Announcements* section.
Harmonization Items the Pharmacopeial Discussion Group (PDG) is working to harmonize internationally	•BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. Two stages are printed in the *Pharmacopeial Forum Harmonization* section: Stage 4 is available for comment, whereas Stage 6 is the final official harmonized standard. The stage determines whether an item appears in the *Harmonization* section. •New or revised text to Stage 6 documents is marked with symbols (▪▪) to specify the tentative earliest date on which the revision would be officially adopted.	Review material and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *Preview* or *In-Process Revision.* Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia, with a copy to USP, for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows: EP Secretariat Ms. Lynn Kelso-Eleuterio Central Secretariat European Pharmacopoeia Department European Directorate for the Health Care Council of Europe 7, Allée Kastner CS 30026 67081 Strasbourg France Tel: +33 (3) 88 41 31 48 Fax: +33 (3) 88 41 27 71 lynn.kelso@edqm.eu JP Secretariat Dr. Shigenori Harada Quality Expert Pharmaceuticals and Medical Devices Agency (PMDA) Shin-kasumigaseki Building 3-3-2, Kasumigaseki, Chiyoda-ku Tokyo, 100-0013 Japan Phone: +81-3-3506-9431 Fax: +81-3-3506-9440 harada-shigenori@pmda.go.jp

Proposed and Adopted Revisions to the *USP–NF* (*Continued*)

Section	Content	How Readers Can Respond
Interim Revision Announcement Adopted standards	Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is set off by the symbols ‣•.	Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance.
Pending Proposals	In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *PF* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in the *USP–NF*, its supplements, or an *IRA*. Those items that have not yet been adopted are still pending.	Review items to track pending proposals.
Canceled Proposals	Canceled proposals are items that were published in *PF* and were pending, but have since been canceled. Note that canceled proposals may be republished to be considered in the future for adoption into the *USP–NF*.	Review items to track canceled proposals.

Other Sections

Expert Committee Designations
Names of the Expert Committees (comprising volunteer scientific experts) that work with USP staff on the development of standards

Staff Directory
Names of key USP Standards Division staff members, including scientific liaisons, with contact information

Policies and Announcements
- General scientific and policy issues affecting *USP–NF* standards and processes
- Update on standards-related issues being considered by USP
- Guidelines on how to comment
- Publication and comment schedules

Stimuli to the Revision Process
- Articles on standards development issues authored by the USP Council of Experts, USP staff, or other interested parties
- Discussions of issues on which USP desires public input prior to further development

Nomenclature
- Latest adopted United States Adopted Names (USAN) and International Nonproprietary Names (INN) for drugs
- Revisions to existing names as a supplement to the *USP Dictionary of USAN and International Drug Names*
- Suggested, proposed, and recommended USAN and INN
- Information on how nonproprietary drug names are devised
- Articles relevant to compendial nomenclature issues

Index
Cumulative directory for the content of all issues of *PF* beginning with *PF* 35(1)

Chromatographic Reagents Used in USP–NF and Pharmacopeial Forum
Update of chromatographic reagents based on the proposals published in this issue of *PF*

POLICIES AND ANNOUNCEMENTS

This section provides general information resources for *USP–NF* standards and processes. Information resources include announcements on scientific and policy issues currently under consideration, schedules for USP publications, and schedules for comment periods to proposed standards.

USP REDESIGNS *PHARMACOPEIAL FORUM*. USP has begun implementing a redesigned *Pharmacopeial Forum (PF)* as part of an initiative that will result in a completely online, freely available *PF* beginning in January 2011. Starting with this issue of *PF*, specific changes will include:

1. *Interim Revision Announcements (IRAs)*and *Errata* will join *Revision Bulletins* on www.usp.org in a ''New Official Text'' section, as well as being printed in *PF*.
2. *In-Process Revision*monographs will appear in the new redesigned monograph format.
3. A new *Proposed IRA* section is now added to distinguish proposed IRAs from regular in-process revisions.
4. The ''*Preview*'' section has been removed.

The following sections will ***not*** be removed from the *PF* at this time, as originally reported in 35(1), and will remain in their original locations:

- The Priority New Monograph Items List (Drug Substances, Drug Products, and Excipients)
- The Reference Standards Abeyance List

General information about the USP *Pharmacopeial Forum* redesign initiative can be found at the PF Redesign FAQ page on www.usp.org. Contact Susan de Mars, J.D., USP Chief Legal Officer (sdm@usp.org) with any questions about the *PF* redesign. If you have any questions about *PF* subscriptions, please contact USP Customer Service [custsvc@usp.org or 301-881-0666, 1-800-227-8772 (U.S. and Canada), or 00-800-4875-5555 (Europe)].

USP IMPLEMENTS GUIDELINE ON THE USE OF ACCELERATED PROCESSES FOR REVISIONS TO THE *USP–NF*. Sections 9.02 and 9.03 of the Rules and Procedures of the 2005–2010 Council of Experts specify various processes (Accelerated Revision Processes) that can be used to make revisions to the *USP–NF* official more quickly than through USP's Standard Revision Process. USP, in collaboration with the Compendial Process Improvement Project Team, has posted the Guideline on the Use of Accelerated Processes for Revision to *USP–NF*, with an official date of January 1, 2009. The Guideline is available at www.usp.org.

USP's Standard Revision Process calls for publication of a proposed revision in the *Pharmacopeial Forum (PF)* for a 90-day notice and comment period and, after the revision is approved by the relevant USP Expert Committee, publication in the next *USP–NF* or Supplement, as applicable. Accelerated Revision Processes, which include *Interim Revision Announcements, Revision Bulletins*, and *Errata* do not always require notice and comment and allow for a revision to become official prior to the next *USP–NF* or *Supplement*.

USP has issued this Guideline to delineate the circumstances under which these Accelerated Revision Processes are utilized. The Guideline includes a Decision Tree that specifies the criteria that are applied by USP in considering whether an Accelerated Revision Process is appropriate rather than USP's Standard Revision Process. This Guideline also addresses the use of delayed official dates for revisions made through the Standard Revision Process, where such revisions have broad industry impact and require additional time to implement.

Contact Susan de Mars, J.D., USP Chief Legal Officer (sdm@usp.org), with any questions.

USP ISSUES CALL FOR CANDIDATES FOR 2010–2015 COUNCIL OF EXPERTS, ITS EXPERT COMMITTEES, AND ITS ADVISORY PANELS. In accordance with the Bylaws of the USP Convention, USP is issuing a *Call for Candidates* for the 2010–2015 Council of Experts. The 2010–2015 Council of Experts includes 20 Expert Committees in the areas of Nomenclature, Small Molecules, Biologics and Biotechnology, Excipients, General Chapters, Reference Standards, Compounding, Food Ingredients, and Dietary Supplements. In the 2010–2015 cycle, USP is expanding the number of Expert Panels (formerly Advisory Panels) that report to Expert Committees. These new Expert Committees and Expert Panels align with the new USP Strategic Plan, which focuses on expanding and enhancing USP's core compendial and standards-setting activities.

The ability to add Expert Panels according to the needs of USP introduces flexibility and scalability into USP's activities. USP plans to continue to attract global base experts, and therefore encourages any qualified individual to apply. Importantly, this approach also enables USP to closely align USP's documentary and reference standards activities for a more efficient standards-setting process.

Specific Expert Committees and Expert Panels for which USP is seeking candidates are listed on the 2010–2015 Council of Experts area of the USP website (www.usp.org). The deadline for applications for the Council of Experts is **December 31, 2009**. The deadline for applications for Expert Committee members is **May 15, 2010**. Recruitment for Advisory Panels members will be continuous.

For further information, contact Angela G. Long, Vice President, Volunteer and Organizational Affairs (agl@usp.org or nominate@usp.org).

USP ANNOUNCES REVISIONS TO GALANTAMINE TABLETS. The Biopharmaceutics Expert Committee (BPC EC) has revised the Galantamine Tablets monograph that was proposed in *Pharmacopeial Forum* volume 34(6). The revisions expand the impurities list, add *Dissolution Test 2*, and revise the Q value. The revised monograph was proposed in *Pharmacopeial Forum* volume 34(6) with an intended official date of April 1, 2009. The official text is presented in this *Pharmacopeial Forum* as an *Interim Revision Announcement*.

Contact Margareth R. C. Marques, M. Sc., Ph.D. with any questions (301-816-8106 or mrm@usp.org).

***PHARMACOPEIAL FORUM* PUBLIC REVIEW AND COMMENT PERIOD DEADLINES.** The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. In accordance with the Rules and Procedures of the 2005–2010 Council of Experts, USP has implemented a 90-day comment period by providing a deadline for each issue of *PF* unless otherwise stated in the individual briefing. The listing of comment period deadlines and the targeted official publications appears below.

Pharmacopeial Forum	Comment Deadline	Targeted Official Publication	Release Date	Official Date
PF 34(6)	February 15, 2009	*USP 33–NF 28*	November 2009	May 1, 2010
PF 35(1)	April 15, 2009			
PF 35(2)	June 15, 2009	*USP 33–NF 28 1st Supplement*	February 2010	August 1, 2010
PF 35(3)	August 15, 2009			
PF 35(4)	October 15, 2009	*USP 33–NF 28 2nd Supplement*	June 2010	December 1, 2010
PF 35(5)	December 15, 2009			
PF 35(6)	February 15, 2010	*USP 34–NF 29*	November 2010	May 1, 2011
PF 36(1)	March 31, 2010			

All official revisions are published in the annual edition or *Supplements* to *USP–NF* (twice yearly). Between these publications, official revisions are published in *PF* in the *Interim Revision Announcement* section and incorporated in the upcoming *Supplement* or book. They may also be published as *Revision Bulletins* on www.usp.org in the ''New Official Text'' section. The official publication in which an *IRA* is incorporated will depend upon publication deadlines. See table below. The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement.* The table below outlines the publications and their release and official dates, and the book or supplement which supersedes them.

Publication Schedules

Publication	Release Date	Official Date	Superseded by
USP 32–NF 27	November 1, 2008	May 1, 2009	*1st Supplement to USP 32–NF 27*
IRA [*PF* 35(1)]	January 1, 2009	February 1, 2009	*2nd Supplement to USP 32–NF 27*
1st Supplement to USP 32–NF 27	February 1, 2009	August 1, 2009	*2nd Supplement to USP 32–NF 27*
IRA [*PF* 35(2)]	March 1, 2009	April 1, 2009	*2nd Supplement to USP 32–NF 27*
IRA [*PF* 35(3)]	May 1, 2009	June 1, 2009	*USP 33–NF 28*
2nd Supplement to USP 32–NF 27	June 1, 2009	December 1, 2009	*USP 33–NF 28*
IRA [*PF* 35(4)]	July 1, 2009	August 1, 2009	*1st Supplement to USP 33–NF 28*
IRA [*PF* 35(5)]	September 1, 2009	October 1, 2009	*1st Supplement to USP 33–NF 28*
IRA [*PF* 35(6)]	November 1, 2009	December 1, 2009	*2nd Supplement to USP 33–NF 28*
USP 33–NF 28	November 1, 2009	May 1, 2010	*1st Supplement to USP 33–NF 28*

PRIORITY NEW MONOGRAPH ITEMS. USP is seeking monographs for the following drug substances and drug products that are, or soon will be, off patent and thus are of the highest priority. USP also is seeking monographs for the excipients listed below.

Monographs are marked received upon receipt of monograph proposal. Received monographs are removed from this list upon publication in *PF*. For the most current list, please consult the Priority New Monograph Items List posted at: http://www.usp.org/USPNF/submitMonograph/newMon.html.

Monograph sponsors should consult USP's Guideline for Submitting Requests for Revision to the *USP–NF* at http://www.usp.org/USPNF/submitMonograph/subGuide.html.

For additional information, contact Karen A. Russo, Ph.D., kar@usp.org.

Small Molecules (Drug Substances)—As of December 15, 2008

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:
- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- Newly adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—Text proposed for deletion or replacement is indicated by a strikethrough the affected text. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type (print edition only), as shown in the examples below:

— •new text• if slated for an *Interim Revision Announcement;*
— ▲new text▲ if slated for *USP 33–NF 28*; and
— ■new text■ if slated for a *Supplement* to *USP–NF*

Recent revisions that are already official are indicated by the same symbols but do not have the extra paragraph break and there is no increase in type size on the enclosing text. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •2 indicates that the revision is proposed for the *Interim Revision Announcement* that will appear in issue 2 of a given *PF* volume, ■2S (USP32) indicates that the proposed revision is slated for the *Second Supplement* to *USP 32,* and ▲USP33 and ▲NF28 indicate that the revisions are proposed for *USP 33* and *NF 28*, respectively.

Errata—Errata are considered to be text, erroneously published in the *USP–NF* or its *Supplements,* that does not accurately reflect the intended official requirements of the Council of Experts. Beginning with *PF* 35(2), Errata will be published both in the *Pharmacopeial Forum* and on the usp.org website. At the end of the *Interim Revision Announcement* section in this publication is a list of errata and corrections to *USP 31–NF 26*. The page number indicates where the item is found in *USP–NF.* Errata are updated as necessary in each *Pharmacopeial Forum* issue and monthly on the usp.org website. This information will also be cumulative in future *Supplements,* and will appear in its corrected form in the next annual edition of *USP–NF.* The list of Errata has been relocated to www.usp.org, where updates will be posted monthly.

INTERIM REVISION ANNOUNCEMENT to *USP 31* and to *NF 26*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

John W. Mauger, *Chair*
USP Board of Trustees

Roger L. Williams, M.D., *Executive Vice President, CEO,* and *Chairman, USP Council of Experts*

Darrell R. Abernethy, M.D., Ph.D., *Chief Science Officer*
William F. Koch, Ph.D., FACB, *Chief Metrology Officer*

Released March 1, 2009 **Official April 1, 2009**

All inquiries and comments regarding *USP 31* text and *NF 26* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852 (execsec@usp.org).

New USP Reference Standards

The following USP Reference Standards, which were not available when the associated monograph was made official, have since become available. The respective official date of each *USP 31* or *NF 26* standard, test, or assay requiring the use of the following USP Reference Standards is indicated in parentheses after the name of the Reference Standard.

USP 23-Epi-26-deoxyactein RS (January 1, 2009)
USP Actein RS (January 1, 2009)
USP Mibolerone RS (November 1, 2008)
USP Narasin RS (November 1, 2008)
USP Powdered St. John's Wort Extract RS (November 1, 2008)

Unavailable First-Time Official USP Reference Standards

The official dates of any *USP 31* or *NF 26* standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards. This listing was updated as of December 1, 2008. Please refer to the current USP Catalog for a more up-to-date availability list. The USP Catalog can be accessed online at http://www.uspcatalog.com.

USP *S*-Adenosyl-L-homocysteine RS
USP Albumin Human RS
USP Alteplase RS
USP Amifostine RS
USP Amifostine Thiol RS
USP Antithrombin III Human RS

MONOGRAPHS (USP)

Galantamine Tablets

Change to read:

Related compounds—

Buffer solution, Solution A, Solution B, Mobile phase, and *Diluent*—Prepare as directed in the *Assay.*

Resolution solution—Prepare a solution of USP Galantamine Hydrobromide Related Compounds Mixture RS in *Diluent* having a concentration of 0.6 mg per mL.

Standard solution—Use the *Standard preparation,* prepared as directed in the *Assay.*

Test solution—Use the *Assay preparation.*

Chromatographic system—Prepare as directed in the *Assay.* Chromatograph about 20 µL of the *Resolution solution,* and record the responses as directed for *Procedure*. Identify the impurities using the approximate relative retention times given in *Table 1:* the resolution, *R,* between 6β-hexahydrogalantamine and 6β-octahydrogalantamine is not less than 1.5. Chromatograph the *Standard solution,* and record the responses as directed for *Procedure:* the relative standard deviation for replicate injections is not more than 2.0% for the galantamine peak.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. [NOTE—Ignore the peak due to bromide near the void volume.] Calculate the percentage of each of the galantamine related compounds in the portion of Tablets taken by the formula:

$$100(C_S / C_U)(r_U / r_S)(1/F)$$

in which C_S and C_U are the concentrations, in mg per mL, of galantamine in the *Standard solution* and *Test solution,* respectively; r_U is the peak area of each impurity obtained from the *Test solution;* r_S is the peak area of galantamine obtained from the *Standard solution;* and *F* is the *Relative Response Factor* (see *Table 1* for values) for each of the impurities relative to galantamine.

•Table 1

Compound Name	Relative Retention Time (RRT)	Relative Response Factor (*F*)	Limit (%)
N-Desmethylgalantamine[1]	0.41	1.0	0.5
O-Desmethylgalantamine[2]	0.56	1.0	0.5
6β-Hexahydrogalantamime (also known as galantamine *N*-oxide)[3]	0.73	1.1	0.75
6β-Octahydrogalantamine (also known as lycoramine)†[4]	0.86	—	—
Galantamine hydrobromide	1.00	1.0	—
6α-Hexahydrogalantamine (also known as epigalantamine)[5]	1.15	1.0	0.5
Tetrahydrogalantamine†[6]	2.09	—	—
Individual unspecified degradation product	—	1.0	0.2
Total impurities	—	—	1.5

[NOTE—The impurities marked with "†" are not quantified and are intended for system suitability evaluation only.]

[1] (4a*S*,6*R*,8a*S*)-4a,5,9,10,11,12-Hexahydro-3-methoxy-6*H*-benzofuro[3a,3,2-*ef*][2]benzazepin-6-ol.

[2] (4a*S*,6*R*,8a*S*)-4a,5,9,10,11,12-Hexahydro-11-methyl-6*H*-benzofuro[3a,3,2-*ef*][2]benzazepin-3,6-diol.

[3] [4a*S*-(4aα,6β,8a*R**)]-4a,5,9,10,11,12-Hexahydro-3-methoxy-11-methyl-6*H*-benzofuro[3a,3,2-*ef*][2]benzazepin-6-ol, *N*-oxide.

[4] [4a*S*-(4aα,6β,8a*R**)]-4a,5,7,8,9,10,11,12-Octahydro-3-methoxy-11-methyl-6*H*-benzofuro[3a,3,2-*ef*][2]benzazepin-6-ol.

[5] [4a*S*-(4aα,6α,8a*R**)]-4a,5,9,10,11,12-Hexahydro-3-methoxy-11-methyl-6*H*-benzofuro[3a,3,2-*ef*][2]benzazepin-6-ol.

[6] [4a*S*-(4a*R**,8a*R**)]-9,10,11,12-Tetrahydro-3-methoxy-11-methyl-4a*H*-benzofuro[3a,3,2-*ef*][2]benzazepine.•$_2$

Interim Revision Announcement

ERRATA

Following is a list of errata and corrections to *USP–NF*. The page number indicates where the item is found and in which official or pending official publication of *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be available as a cumulative table in future *Supplements* and will appear in its corrected form in a future annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff is available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

USP32–NF27 **Page**	**Title**	**Section**	**Description**

Interim Revision Announcement

PROPOSED INTERIM REVISION ANNOUNCEMENTS

This section includes proposals for *Interim Revision Announcements* (*IRAs*) that will be published as official *USP* or *NF* standards. There is a 60-day comment period for these proposals, beginning on the 15th of the first month of this *Pharmacopeial Forum*. The approved official text will be published in *Pharmacopeial Forum* 35(4) and additionally in the ''New Official Text'' section of USP's web site (www.usp.org). Readers should review material in this section and provide comments to the Scientific Liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Expert Committee members can consider reader's input as they are deciding whether to advance standards to official status.

Each proposal is preceded by a Briefing that indicates the proposed revisions.

MONOGRAPHS (USP)

BRIEFING

Heparin Sodium, *USP 31* page 2321 and the *Revision Bulletin* posted on the USP website on June 18, 2008. Because of the suspected serious adverse events associated with the contamination of heparin with oversulfated chondroitin sulfate, USP has revised the USP Heparin Sodium monograph. On the basis of comments received on the published and new methods submitted by the industry, it is proposed to make the following changes:

1. Additional requirements are added to cover overall resonance distribution of the 1H NMR *Identification* test. USP Heparin Sodium System Suitability RS has been removed.
2. The capillary electrophoresis *Identification* test is replaced with a strong ion-exchange HPLC method. The liquid chromatographic procedures are based on analyses performed with the Dionex brand of L61 column, IonPac AS11. Typical retention times are about 20 min for dermatan sulfate, 30 min for heparin, and 50 min for oversulfated chondroitin sulfate.
3. Another *Identification* test is added. The ratio of anti-factor Xa activity against anti-factor IIa potency is NLT 0.9 and NMT 1.1.
4. An impurity limit test to measure percent galactosamine in total hexosamine is added. The intent of this assay is to limit dermatan sulfate and other galactosamine containing impurities in heparin. The liquid chromatographic procedures are based on analyses performed with the Dionex CarboPac PA-20.
5. The sheep plasma-based clotting assay has been replaced with a chromogenic anti-factor IIa assay. USP Heparin potency units will be harmonized with International Units as of August 2009.
6. An impurity test to measure nucleotidic impurities is added.
7. A quantitative test to measure residual proteins is added.
8. A requirement to comply with *Residual Solvents* ⟨467⟩ is added.

(BB BBP: A. Szajek.) RTS—C69239

Change to read:

Heparin Sodium

~~» Heparin Sodium is the sodium salt of sulfated glycosaminoglycans present as a mixture of heterogeneous molecules varying in molecular weights. It is present in mammalian tissues and is usually obtained from the intestinal mucosa or other suitable tissues of domestic mammals used for food by man. •The sourcing of heparin material must be specified in compliance with applicable regulatory requirements. The manufacturing process must be validated to demonstrate clearance and inactivation of relevant infectious and adventitious agents (e.g., viruses, TSE agents). See *Viral Safety Evaluation of Biotechnology Products Derived from Cell Lines of Human or Animal Origin* ⟨1050⟩ for general guidance on viral safety evaluation.• (RB 2008 06 18)~~ It is purified to retain a combination of activities against different fractions of the blood clotting sequence. It is composed of polymers of alternating derivatives of •α• (RB 2008 06 18) D-glucosamine (*N*-sulfated, *O*-sulfated, or *N*-acetylated) and uronic acid (•α• (RB 2008 06 18) L-iduronic acid or •β• (RB 2008 06 18) D-glucuronic acid) joined by glycosidic linkages. The component activities of the mixture are in ratios corresponding to those shown by the USP Heparin Sodium Reference Standard. Some of these components have the property of prolonging the clotting time of blood. This occurs mainly through the formation of a complex of each component with the plasma proteins antithrombin III and heparin cofactor II to potentiate the inactivation of thrombin. Other coagulation proteases in the clotting sequence, such as activated factor X, are also inhibited. The potency of Heparin Sodium, calculated on the dried basis, is not less than 140 USP Heparin Units in each mg.

~~NOTE—The USP Heparin Unit is defined by the USP Heparin Sodium Reference Standard and can be independent of International Units. The respective units are not equivalent (see *General Notices*). The Unit for Anti-Factor X_a activity is defined by the USP Heparin Sodium Reference Standard and is equivalent in potency to that Standard.~~

~~**Packaging and storage**—Preserve in tight containers, and store below 40°, preferably at room temperature.~~

~~**Labeling**—Label it to indicate the tissue and the animal species from which it is derived.~~

~~**USP Reference standards**—⟨11⟩—*USP Endotoxin RS*. *USP Heparin Sodium RS*. •*USP Heparin Sodium System Suitability RS*. *USP Heparin Sodium Identification RS*.• (RB 2008 06 18)~~

~~**Identification—**~~

~~•**A:** It meets the requirements under the *Assay*.~~

~~**B:** *^{1}H NMR spectrum* (see *Nuclear Magnetic Resonance* ⟨761⟩)—~~

~~*Standard solution*—Prepare a solution of USP Heparin Sodium Identification RS at not less than 12 mg per mL in deuterium oxide.~~

~~*System suitability solution*—Prepare a solution of USP Heparin Sodium System Suitability RS at not less than 12 mg per mL in deuterium oxide.~~

~~*Test solution*—Prepare a solution containing not less than 12 mg of Heparin Sodium per mL in deuterium oxide.~~

~~*Procedure*—Using a pulsed (Fourier transform) NMR spectrometer operating at not less than 500 MHz for ^{1}H, acquire a free induction decay (FID). Record the ^{1}H NMR spectra of the *Standard solution* and the *System suitability solution* at 25°: the number of transients is adjusted until the signal to noise ratio of the *N*-acetyl heparin signal in the *Standard solution* is at least 200/1 in the region near 2 ppm. The *Standard solution* must be run at least daily when *Test solutions* are being run. For the *Standard solution*, the chemical shift corresponding to *N*-acetyl protons of heparin must be set at 2.04 ppm. The chemical shifts for heparin and over sulfated chondroitin sulfate in the system suitability standard is observed at 2.04 ± 0.02 and 2.16 ± 0.03 ppm, respectively. Record the ^{1}H NMR spectrum of the *Test solution* at 25°. The *N*-acetyl protons of heparin must show a major signal at 2.04 ± 0.02 ppm. A signal, corresponding to *N*-acetyl protons of dermatan sulfate, may show near 2.08 ppm. •Observation of a resonance at~~

Proposed IRA

2.16 ± 0.03 ppm would indicate the presence of over sulfated chondroitin sulfate. Over sulfated chondroitin sulfate has no other resonances between 2.12 and 3.00 ppm.• (RB 2008 06 18)

C: For heparin sodium of porcine origin (see *Biotechnology Derived Articles—Capillary Electrophoresis* ⟨1053⟩)

Standard solution—Prepare a solution of USP Heparin Sodium Identification RS in water having a concentration of 2 mg per mL.

System suitability solution—Prepare a solution of USP Heparin Sodium System Suitability RS in water having a concentration of 2 mg per mL.

Test solution—Reconstitute an accurately weighed quantity of Heparin Sodium in water to obtain a solution that is 2 mg per mL. Filter the solution if necessary.

Capillary electrophoresis buffer—Transfer 1.0 g of monobasic sodium phosphate monohydrate to a beaker, and add 195 mL of water. Adjust with phosphoric acid to a pH of 3.5. Transfer the solution into a 200-mL volumetric flask, and dilute with water to volume. Filter the buffer with a 0.2-µm membrane filter. Degas the buffer before use if necessary.

Electrophoretic system—•[NOTE—Based on instrument requirements, the field applied across the capillary and the conditions for the sample injection may be varied to achieve system suitability.]• (RB 2008 06 18)—The capillary electropherograph is equipped with a 200-nm detector and a 60- to 65-cm (50- to 56-cm effective length) uncoated fused silica capillary, with an internal diameter of 50 µm, with the temperature controlled at 25°. Apply a field strength of 465.1 V per cm for 15 minutes, using the *Capillary electrophoresis buffer* as the electrolyte in both buffer reservoirs. Electropherograph the USP Heparin Sodium System Suitability RS, using a 30-sec injection at 0.7 psi, and record the peak responses as directed for *Procedure:* the migration time for heparin sodium and over-sulfated chondroitin sulfate differs by not less than 4.0% of the heparin migration time, with over sulfated chondroitin sulfate always migrating faster than heparin sodium. The baseline is stable. Rinse the capillary with 0.1 M phosphoric acid for at least 0.5 minutes at 40 psi, followed by water for at least 2 minutes at 40 psi, and then by the *Capillary electrophoresis buffer* for at least 2 minutes at 40 psi between injections.

Procedure—Electropherograph the *Standard solution* and the *Test solution* using a 30-sec injection at 0.7 psi into the anodic end of the capillary, and record the electropherograms. The electropherogram of the *System suitability solution* is comparable to a typical electropherogram provided with the USP Heparin Sodium System Suitability RS. The electropherogram of the *Test solution* is similar to that of the *Standard solution,* and does not exhibit a sharp distinguishable peak that is less than one minute in front of the main heparin peak.

D:• (RB 2008 06 18) It meets the requirements of the flame test for *Sodium* ⟨191⟩.

Bacterial endotoxins ⟨85⟩—It contains not more than 0.03 USP Endotoxin Unit per USP Heparin Unit.

Sterility ⟨71⟩ (where it is labeled as sterile): meets the requirements.

pH ⟨791⟩: between 5.0 and 7.5, in a solution (1 in 100).

Loss on drying ⟨731⟩—Dry it in vacuum at 60° for 3 hours: it loses not more than 5.0% of its weight.

Residue on ignition ⟨281⟩: between 28.0% and 41.0%.

Protein—To 1 mL of a solution (1 in 100) add 5 drops of trichloroacetic acid solution (1 in 5): no precipitate or turbidity forms.

Heavy metals, *Method II* ⟨231⟩: 0.003%.

Anti-factor X_a activity—

pH 8.4 Buffer—Dissolve amounts of tris(hydroxymethyl)aminomethane, edetic acid, and sodium chloride in water containing 0.1% of polyethylene glycol 6000 to obtain a solution having concentrations of 0.050 M, 0.0075 M, and 0.175 M, respectively. Adjust, if necessary, with hydrochloric acid or sodium hydroxide solution to a pH of 8.4.

Antithrombin III solution—Reconstitute an accurately weighed quantity of antithrombin III (see *Reagent Specifications* under *Reagents, Indicators, and Solutions*) in *pH 8.4 Buffer* to obtain a solution having a concentration of 1.0 Antithrombin III Unit per mL.

Factor X_a solution—Reconstitute an accurately weighed quantity of bovine factor X_a (see Factor X_a in *Reagent Specifications* under *Reagents, Indicators, and Solutions*) in *pH 8.4 Buffer* to obtain a solution that gives an absorbance value between 0.65 and 1.25 at 405 nm when assayed as described below but using 30 µL of *pH 8.4 Buffer* instead of 30 µL of the *Standard solutions* or the *Test solutions*.

NOTE—*Factor X_a solution* contains about 3 nanokatalytic units per mL, but can vary depending upon the manufacturer of factor X_a or the substrate used.

Chromogenic substrate solution—Prepare a solution of a suitable chromogenic substrate for amidolytic test (see *Reagent Specifications* under *Reagents, Indicators, and Solutions*) specific for factor X_a in water to obtain a concentration of about 1 mM.

Stopping solution—Prepare a 20% (v/v) solution of acetic acid in water.

Standard solutions—Dilute an accurately measured volume of USP Heparin Sodium RS with *pH 8.4 Buffer* to obtain at least 5 (out of 7 below) solutions having known activities of about 0.375, 0.3125, 0.25, 0.188, 0.125, 0.0625, and 0.0313 USP Heparin Unit per mL.

Test solutions—Dissolve or dilute an accurately measured quantity of Heparin Sodium in *pH 8.4 Buffer,* and dilute with the same buffer to obtain solutions having activities approximately equal to those of the *Standard solutions*.

Procedure—[NOTE—Perform the test with each *Standard solution* and *Test solution* in duplicate.] To each of a series of suitable plastic tubes placed in a water bath set at 37°, transfer 120 µL of *pH 8.4 Buffer.* Then separately transfer 30 µL of the different dilutions of the *Standard solutions* or the *Test solutions* to the tubes. Add 150 µL of *Antithrombin III solution,* prewarmed at 37° for 15 minutes, to each tube, mix, and incubate for 2 minutes. Add 300 µL of *Factor X_a solution,* prewarmed at 37° for 15 minutes, to each tube, mix, and incubate for 2 minutes. Add 300 µL of *Chromogenic substrate solution,* prewarmed at 37° for 15 minutes, to each tube, mix, and incubate for exactly 2 minutes. Add 150 µL of *Stopping solution* to each tube, and mix. Prepare a blank for zeroing the spectrophotometer by adding the reagents in reverse order, starting with the *Stopping solution* and ending with the addition of 150 µL of *pH 8.4 Buffer,* and excluding the *Standard solutions* or the *Test solutions*. Record the absorbance at 405 nm against the blank.

Calculations—Plot the log of the absorbance values of the *Standard solutions* and the *Test solutions* versus heparin concentrations in USP Units. Construct separate straight lines of best fit using least-squares linear regression analyses for the *Standard solutions* and the *Test solutions,* and determine the slope for each regression line. Calculate the potency of Heparin Sodium by the formula:

$$P(S_u / S_s)$$

in which P is the potency of USP Heparin Sodium RS; and S_u and S_s are the slopes of the lines from the *Test solutions* and the *Standard solutions,* respectively. Express the Anti-factor X_a potency of the *Test solution* as a percentage of the heparin concentration determined in the *Assay*. Calculate the percentage of anti-factor X_a activity against activity by the formula:

100(anti-factor X_a potency / anticoagulant potency).

Not less than 80% and not more than 120% is found.

Nitrogen content, *Method I* ⟨461⟩: between 1.3% and 2.5%, calculated on the dried basis, the procedure for *Nitrates and Nitrates Absent* being used.

Assay—

Standard preparation—Determine by preliminary trial, if necessary, approximately the minimum quantity of USP Heparin Sodium RS which, when added in 0.8 mL of saline TS, maintains fluidity in 1 mL of prepared plasma for 1 hour after the addition of 0.2 mL of calcium chloride solution (1 in

100). This quantity is usually between 1 and 3 USP Heparin Units. On the day of the assay prepare a *Standard preparation* such that it contains, in each 0.8 mL of saline TS, the above-determined quantity of the Reference Standard.

Assay preparation— Dissolve about 25 mg of Heparin Sodium, accurately weighed, in sufficient saline TS to give a concentration of 1 mg per mL, and dilute quantitatively to a concentration estimated to correspond to that of the *Standard preparation.*

Preparation of plasma— Collect blood from sheep directly into a vessel containing 8% sodium citrate solution in the proportion of one volume to each 19 volumes of blood to be collected. Mix immediately by gentle agitation and inversion of the vessel. Promptly centrifuge the blood, and pool the separated plasma. To a 1 mL portion of the pooled plasma in a clean test tube add 0.2 mL of calcium chloride solution (1 in 100), and mix. Consider the plasma suitable for use if a solid clot forms within 5 minutes. To store plasma for future use, subdivide the pooled lot into portions not exceeding 100 mL in volume, and store in the frozen state, preventing even partial thawing prior to use. For use in the assay, thaw the frozen plasma in a water bath at a temperature not exceeding 37°. Remove particulate matter by straining the thawed plasma through a coarse filter.

Procedure— To meticulously clean 13 mm × 100 mm test tubes add graded amounts of the *Standard preparation,* selecting the amounts so that the largest does not exceed 0.8 mL and so that they correspond roughly to a geometric series in which each step is approximately 5% greater than the next lower. To each tube so prepared add sufficient saline TS to make the total volume 0.8 mL. Add 1.0 mL of prepared plasma to each tube. Then add 0.2 mL of calcium chloride solution (1 in 100), note the time, immediately insert a suitable stopper in each tube, and mix the contents by inverting three times in such a way that the entire inner surface of the tube is wet.

In the same manner set up a series using the *Assay preparation,* completing the entire process of preparing and mixing the tubes of both the *Standard preparation* and the *Assay preparation* within 20 minutes after the addition of the prepared plasma. One hour, accurately timed, after the addition of the calcium chloride, determine the extent of clotting in each tube, recognizing three grades (0.25, 0.50, and 0.75) between zero and full clotting (1.0). If the series does not contain 2 tubes graded more than 0.5 and 2 tubes graded less than 0.5, repeat the assay, using appropriately modified *Standard preparation* and *Assay preparation.*

Calculation— Convert to logarithms the volumes of *Standard preparation* used in the successive 5 or 6 tubes that bracket a grade of clotting of 0.5, including at least 2 tubes with a larger and 2 tubes with a smaller grade than 0.5. Number and list the tubes serially, and tabulate for each the grade of clotting observed in each tube. From the log volumes, x_i, and separately from their corresponding grades of clotting, y_i, compute the paired averages x_i and y_i of Tubes 1, 2, and 3, of Tubes 2, 3, and 4, of Tubes 3, 4, and 5, and, where the series consists of 6 tubes, of Tubes 4, 5, and 6, respectively. If for one of these paired averages the average grade, y_u, is exactly 0.50, the corresponding x_i is the median log volume of the *Standard preparation,* x_s. Otherwise, interpolate x_s from the paired values of y_u, x_i, and y_{i-1}, x_{i-1}, that fall immediately below and above grade 0.5 as

$$x_s = x_i + (y_i - 0.5)(x_{i-1} - x_i) / (y_i - y_{i-1}).$$

From the paired data on the tubes of the *Assay preparation,* compute similarly its median log volume x_u.

The log potency of the *Assay preparation* is

$$M = x_s - x_u + \log R,$$

where $R = v_s / v_u$ is the ratio of the USP Heparin Units (v_s) per mL of the *Standard preparation* to the mg (v_u) of Heparin Sodium per mL of the *Assay preparation.*

Repeat the assay independently, and average the two or more values of M to obtain $\overline{M}$. If the second determination of M differs by more than 0.05 from the first determination, continue the assay until the log confidence interval computed as directed under *Confidence Intervals for Individual Assays* in *Design and Analysis of Biological Assays* ⟨111⟩ does not exceed 0.20. The potency of Heparin Sodium in USP Heparin Units per mg is P^u = antilog $\overline{M}$.

•DEFINITION

Heparin Sodium is the sodium salt of sulfated glycosaminoglycans present as a mixture of heterogeneous molecules varying in molecular weights that retains a combination of activities against different factors of the blood clotting cascade. It is present in mammalian tissues and is usually obtained from the intestinal mucosa or other suitable tissues of domestic mammals used for food by man. The sourcing of heparin material must be specified in compliance with applicable regulatory requirements. The manufacturing process should be validated to demonstrate clearance and inactivation of relevant infectious and adventitious agents (e.g., viruses, TSE agents). See *Viral Safety Evaluation of Biotechnology Products Derived From Cell Lines of Human or Animal Origin* ⟨1050⟩ for general guidance on viral safety evaluation. It is composed of polymers of alternating derivatives of α-D-glucosamido (*N*-sulfated, *O*-sulfated, or *N*-acetylated) and *O*-sulfated uronic acid (α-L-iduronic acid or β-D-glucuronic acid). The component activities of the mixture are in ratios corresponding to those shown by the USP Heparin Sodium RS. Some of these components have the property of prolonging the clotting time of blood. This occurs mainly through the formation of a complex of each component with the plasma proteins antithrombin and heparin cofactor II to potentiate the inactivation of thrombin (factor IIa). Other coagulation proteases in the clotting sequence, such as activated factor X (factor Xa), are also inhibited. The ratio of anti-factor Xa activity to anti-factor IIa potency is between 0.9 and 1.1. The potency of Heparin Sodium, calculated on the dried basis, is NLT 180 USP Heparin Units in each mg.

IDENTIFICATION

A. ^{1}H NMR Spectrum

(See *Nuclear Magnetic Resonance* ⟨761⟩.)

Standard solution A: NLT 20 mg/mL of USP Heparin Sodium Identification RS in deuterium oxide with 0.02% (w/v) deuterated trimethylsilylpropionic (TSP) acid sodium salt

Standard solution B: 2 mg/mL of USP Oversulfated Chondroitin Sulfate (OSCS) RS in deuterium oxide

System suitability solution: 1% (v/v) of *Standard solution B* diluted with *Standard solution A*

Sample solution: NLT 20 mg/mL of Heparin Sodium in deuterium oxide with 0.02% (w/v) deuterated TSP

Analysis

Samples: *Standard solution A* and *System suitability solution*

Using a pulsed (Fourier transform) NMR spectrometer operating at NLT 500 MHz for ^{1}H, acquire a free induction decay (FID) using NLT 16 scans using a 90° pulse and 20 s delay. Record the ^{1}H NMR spectra of *Standard solution A* and the *System suitability solution* at 25°. Collect the ^{1}H NMR spectrum with a spectral window of at least 10 to –2 ppm and without spinning. The number of transients should be adjusted until the signal-to-noise of the *N*-acetyl heparin signal in the standard solution is at least 1000/1 in the region near 2 ppm. *Standard solution A* shall be run at least daily when *Sample solutions* are being run. For all samples, the TSP methyl signal should be set to 0.00 ppm. The ppm values for heparin and oversulfated chondroitin sulfate in the *System suitability solution* should be observed at 2.04 ± 0.02 and 2.16 ± 0.03 ppm, respectively. Record the ^{1}H NMR spectrum of the *Sample solution* at 25°. Draw a baseline from 8.00 ppm to 0.10 ppm. The ppm values for H1 of GlcNAc/GlcNS, 6S (signal 1), H1 of IdoA2S (signal 2), the H2 of GlcNS (signal 3), and the methyl of GlcNAc (signal 4) of heparin are present at 5.42, 5.23, 3.28 (doublet centered at 3.28 ppm), and 2.05 ppm, respectively.[1] The ppm values of these signals do not differ by more than ± 0.03 ppm. Measure the signal heights above the baseline of signal 1 and signal 2 and calculate the mean of these signal heights. Other signals of variable heights and ppm values, attributable to heparin and HOD, may be seen between signal 2 and 4.55 ppm. Residual solvent signals may be observed in the 0.10–3.00 range. Heparin Sodium must meet the requirements stated in *Residual Solvents* ⟨467⟩.

Acceptance criteria: No unidentified signals greater than 4% of the mean of signal height of 1 and 2 are present in the following ranges: 0.10–2.00, 2.10–3.20, and 5.70–8.00 ppm. No signals greater than 200% signal height of the mean of the signal height of 1 and 2 are present in the 3.35–4.55 ppm for porcine heparin.

B. Chromatographic Identity

Solution A: Dissolve 0.8 g of NaH_2PO_4 in 2 L of water and adjust with phosphoric acid to a pH of 3.0. Filter the solution through a 0.45-μm membrane and degas prior to use.

Solution B: Dissolve 0.8 g of NaH_2PO_4 and 280 g of $NaClO_4$ in 2 L of water and adjust with phosphoric acid to a pH of 3.0. Filter the solution through a 0.45-μm membrane and degas prior to use.

Mobile phase: See the gradient table below.

Time (min)	*Solution A* (%)	*Solution B* (%)	Elution
0	80	20	Equilibration
60	10	90	Linear gradient
61	80	20	Linear gradient
75	80	20	Re-equilibration

[1] GlcNAc, *N*-acetylated glucosamine; GlcNS, *N*-sulfated glucosamine; S, Sulfate; IdoA, iduronic acid; GlcN, glucosamine; GalN, galactosamine.

Dermatan sulfate standard solution: 20 mg/mL of USP Dermatan Sulfate RS in water

Oversulfated chondroitin sulfate standard solution: 20 mg/mL of USP Oversulfated Chondroitin Sulfate RS in water

Standard solution: NLT 20 mg/mL of USP Heparin Sodium Identification RS in water

System suitability solution: 1% (v/v) solution of each *Dermatan sulfate standard solution* and *Oversulfated chondroitin standard solution* in *Standard solution*

Sample solution: NLT 20 mg/mL of Heparin Sodium in water

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 202 nm

Column: 2-mm × 25-cm; packing L61

Guard column: 2-mm × 50-mm; packing L61

Flow rate: 0.22 mL/min

Injection size: 10 µL

System suitability

Sample: *System suitability solution*

NOTE—The retention times for dermatan sulfate, heparin, and oversulfated chondroitin sulfate are about 20, 30, and 50 min, respectively.

Suitability requirements

Resolution: NLT 1.0 between the dermatan sulfate and the heparin peaks, and NLT 1.5 between the heparin and the oversulfated chondroitin sulfate

Relative standard deviation: NMT 2% for the heparin peak determined from three replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Record the chromatograms, and measure the retention times for the major peaks.

Acceptance criteria: The retention time of the major peak from the *Sample solution* corresponds to that from the *Standard solution*.

C. ANTI-FACTOR Xa TO ANTI-FACTOR IIa RATIO

Anti-factor Xa activity

pH 8.4 buffer: Dissolve amounts of tris(hydroxymethyl)aminomethane, edetic acid, and sodium chloride in water containing 0.1% of polyethylene glycol 6000 to obtain a solution having concentrations of 0.050 M, 0.0075 M, and 0.175 M, respectively. Adjust, if necessary, with hydrochloric acid or sodium hydroxide solution to a pH of 8.4.

Antithrombin solution: Reconstitute a vial of antithrombin (see *Reagents, Indicators, and Solutions—Reagent Specifications*) as directed by the manufacturer and further dilute with *pH 8.4 buffer* to obtain a solution having a concentration of 1.0 Antithrombin IU/mL.

Factor Xa solution: Reconstitute bovine factor Xa as directed by the manufacturer (see *Factor Xa* in *Reagent Specifications* under *Reagents, Indicators, and Solutions*) and further dilute in *pH 8.4 buffer* to obtain a solution that gives an absorbance value between 0.65 and 1.25 at 405 nm when assayed as described below but using 30 µL of *pH 8.4 buffer* instead of 30 µL of the *Standard solutions* or the *Sample solutions*. [NOTE—*Factor Xa solution* contains about 3 nanokatalytic units/mL, but can vary depending upon the manufacturer of factor Xa or the substrate used.]

Chromogenic substrate solution: Prepare a solution of a suitable chromogenic substrate for amidolytic test (see *Reagents, Indicators, and Solutions—Reagent Specifications*) specific for factor Xa in water to obtain a concentration of 1 mM.

Stopping solution: 20% (v/v) solution of acetic acid

Standard solutions: Reconstitute the contents of 1 ampule of USP Heparin Sodium RS with water and dilute with *pH 8.4 buffer* to obtain at least 5 (out of 7 below) solutions having known activities of about 0.375, 0.3125, 0.25, 0.188, 0.125, 0.0625, and 0.0313 USP Heparin Unit/mL.

Sample solutions: Dissolve or dilute an accurately measured quantity of Heparin Sodium in *pH 8.4 buffer*, and dilute with the same buffer to obtain solutions having activities approximately equal to those of the *Standard solutions*.

Analysis

NOTE—Perform the test with each *Standard solution* and *Sample solution* in duplicate.

To each of a series of suitable plastic tubes placed in a water bath set at 37°, transfer 120 µL of *pH 8.4 buffer*. Then separately transfer 30 µL of the different dilutions of the *Standard solutions* or the *Sample solutions* to the tubes. Add 150 µL of *Antithrombin solution*, prewarmed at 37° for 15 min, to each tube, mix, and incubate for 2 min. Add 300 µL of *Factor Xa solution*, prewarmed at 37° for 15 min, to each tube, mix, and incubate for 2 min. Add 300 µL of *Chromogenic substrate solution*, prewarmed at 37° for 15 min, to each tube, mix, and incubate for exactly 2 min. Add 150 µL of *Stopping solution* to each tube, and mix. Prepare a blank for zeroing the spectrophotometer by adding the reagents in reverse order, starting with the *Stopping solution* and ending with the addition of 150 µL of *pH 8.4 buffer*, and excluding the *Standard solutions* or the *Sample solutions*. Record the absorbance at 405 nm against the blank.

Calculations: Plot the log of the absorbance values of the *Standard solutions* and the *Sample solutions* versus heparin concentrations in USP Units. Construct separate straight lines of best fit using least-squares linear regression analyses for the *Standard solutions* and the *Sample solutions*, and determine the slope for each regression line. Calculate the anti-factor Xa activity of Heparin Sodium by the formula:

$$A \times (S_T/S_S)$$

A = the activity of USP Heparin Sodium RS

S_T = slope of the line from the *Sample solutions*

S_S = slope of the line from the *Standard solutions*

Express the anti-factor Xa activity of the *Sample solution* as USP Heparin Units/mg, calculated on the dried basis. Calculate the ratio of anti-factor Xa activity against anti-factor IIa potency (see *Assay* below) by the formula:

anti-factor Xa activity/anti-factor IIa potency

Acceptance criteria: NLT 0.9 and NMT 1.1

D. IDENTIFICATION TESTS—GENERAL, *SODIUM* ⟨191⟩: It meets the requirements of the flame test for sodium.

ASSAY

ANTI-FACTOR IIa POTENCY

pH 8.4 buffer: Dissolve 6.10 g of tris(hydroxymethyl)aminomethane, 10.20 g of sodium chloride, 2.80 g of edetate sodium, and, if suitable, 10.00 g of polyethylene glycol 6000 and/or 2.00 g of bovine serum albumin in 800 mL of water. [NOTE—2.00 g of human albumin may be substituted for 2.00 g of bovine serum albumin.] Adjust with hydrochloric acid to a pH of 8.4, and dilute with water to 1000 mL.

Antithrombin solution: Reconstitute a vial of antithrombin (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to obtain a solution of 5 Antithrombin IU/mL. Dilute this solution with *pH 8.4 buffer* to obtain a solution having a concentration of 0.125 Antithrombin IU/mL.

Thrombin human solution: Reconstitute thrombin human (factor IIa) (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to give 20 Thrombin IU/mL, and dilute with *pH 8.4 buffer* to obtain a solution having a concentration of 5 Thrombin IU/mL. [NOTE—The thrombin should have a specific activity of NLT 750 IU/mg.]

Chromogenic substrate solution: Prepare a solution of a suitable chromogenic thrombin substrate for amidolytic test (see *Reagents, Indicators, and Solutions—Reagent Specifications*) in water to obtain a concentration of 1.25 mM.

Stopping solution: 20% (v/v) solution of acetic acid

Standard solutions: Reconstitute the contents of 1 ampule of USP Heparin Sodium RS with water and dilute with *pH 8.4 buffer* to obtain at least four dilutions in the concentration range between 0.005 and 0.03 USP Heparin Unit/mL.

Sample solutions: Proceed as directed for *Standard solutions* to obtain concentrations of Heparin Sodium similar to those obtained for the *Standard solutions*.

Analysis

[NOTE—The procedure can also be performed using alternative platforms.]

For each dilution of the *Standard solutions* and the *Sample solutions*, at least duplicate samples should be tested. Label a suitable number of tubes depending on the number of replicates to be tested. For example, if five blanks are to be used: B1, B2, B3, B4, and B5 for the blanks; T1, T2, T3, and T4 each at least in duplicate for the dilutions of the *Sample solutions*; and S1, S2, S3, and S4 each at least in duplicate for the dilutions of the *Standard solutions*. Distribute the blanks over the series in such a way that they accurately represent the behavior of the reagents during the experiments. [NOTE—Treat the tubes in the order B1, S1, S2, S3, S4, B2, T1, T2, T3, T4, B3, T1, T2, T3, T4, B4, S1, S2, S3, S4, B5.] Note that after each addition of a reagent, the incubation mixture should be mixed without allowing bubbles to form. Add a double volume (100–200 µL) of *Antithrombin solution* to each tube containing one volume (50–100 µL) of either the *pH 8.4 buffer* or an appropriate dilution of the *Sample solutions* or the *Standard solutions*. Mix, but do not allow bubbles to form. Incubate at 37° for at least 1 min. Add to each tube 25–50 µL of *Thrombin human solution*, and incubate for at least 1 min. Add 50–100 µL of *Chromogenic substrate solution*. Please note that all reagents, *Standard solutions*, and *Sample solutions* should be pre-warmed to 37° just prior to use.

Two different types of measurements can be recorded:

1. Endpoint Measurement: Stop the reaction after at least 1 min with 50–100 µL of *Stopping solution*. Measure the absorbance of each solution at 405 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩). The RSD over the blank readings is less than 10%.
2. Kinetic Measurement: Follow the change in absorbance for each solution over 1 min at 405 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩). Calculate the change in absorbance/min (ΔOD/min). The blanks for kinetic measurement are also expressed as ΔOD/min and should give the highest values as they are carried out in the absence of heparin. The RSD over the blank readings is less than 10%.

Calculations: The statistical models for *Slope ratio assay* or *Parallel-line assay* can be used depending on which model best describes the correlation between concentration and response.

Parallel-line assay: For each series, calculate the regression of the absorbance or change in absorbance/min against log concentrations of the *Sample solutions* and the *Standard solutions*, and calculate the potency of Heparin Sodium in USP Units/mL using statistical methods for parallel-line assays. Express the potency of Heparin Sodium/mg, calculated on the dried basis.

Slope ratio assay: For each series, calculate the log regression of the absorbance or the log change in absorbance/min against concentrations of the *Sample solutions* and of the *Standard solutions*, and calculate the

potency of Heparin Sodium in USP Units/mL using statistical methods for slope ratio assays. Express the potency of Heparin Sodium/mg, calculated on the dried basis.

Acceptance criteria: The potency of Heparin Sodium, calculated on the dried basis, is NLT 180 USP Heparin Units in each mg.

INORGANIC IMPURITIES

RESIDUE ON IGNITION ⟨281⟩**:** Between 28.0% and 41.0%

NITROGEN DETERMINATION, *Method I, Nitrates and Nitrites Absent* ⟨461⟩*:* Between 1.3% and 2.5%, calculated on the dried basis

HEAVY METALS, *Method II* ⟨231⟩*:* NMT 30 ppm

ORGANIC IMPURITIES

LIMIT OF GALACTOSAMINE IN TOTAL HEXOSAMINE (a measure of dermatan sulfate and other galactosamine containing impurities)

Mobile phase: 14 mM potassium hydroxide

Glucosamine standard solution: 1.6 mg/mL of USP Glucosamine Hydrochloride RS in 5 N hydrochloric acid

Galactosamine standard solution: 16 μg/mL of USP Galactosamine Hydrochloride RS in 5 N hydrochloric acid

Standard solution: Mix equal volumes of *Glucosamine standard solution* and *Galactosamine standard solution*.

Hydrolyzed standard solution: Transfer 5 mL of the *Standard solution* to a 7-mL screw cap test tube, cap, and heat for 6 h at 100°. Cool to room temperature and quantitatively transfer the solution to a 500-mL volumetric flask, and dilute with water to volume.

Sample solution: Transfer 12 mg of Heparin Sodium to a 7-mL screw cap test tube, dissolve in 5 mL of 5 N hydrochloric acid, and cap.

Hydrolyzed sample solution: Heat the *Sample solution* for 6 h at 100°. Cool to room temperature and quantitatively transfer the solution to a 500-mL volumetric flask, and dilute with water to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*)

Mode: HPIC

Detector: Pulsed amperometric detector, set to the following waveform:

Step	Time (s)	Potential (V)	Integration
1	0.00	+0.1	—
2	0.20	+0.1	Begins
3	0.40	+0.1	Ends
4	0.41	–2.0	—
5	0.42	–2.0	—
6	0.43	+0.6	—
7	0.44	–0.1	—
8	0.50	–0.1	—

Column: 3-mm × 30-mm amino acid trap column in series with 3 × 30-mm guard column and a 3-mm × 15-cm column that contains packing L##

Column temperature: Maintain columns at 30°

Flow rate: 0.5 mL/min

Pre-equilibration: At least 60 min with *Mobile phase*

Injection size: 10 μL

Elution: 10 min with *Mobile phase*

Column cleaning: At least 10 min with 100 mM KOH

Equilibration: At least 10 min with *Mobile phase* before each injection

System suitability

Sample: *Hydrolyzed standard solution*

Suitability requirements

Resolution: NLT 2 between the galactosamine and glucosamine peaks

Column efficiency: NLT 2000 theoretical plates for glucosamine

Tailing factor: Between 0.8 and 2.0 for the galactosamine and glucosamine peaks

Analysis

Samples: *Hydrolyzed standard solution* and *Hydrolyzed sample solution*

Record the chromatograms, and measure the responses for the peaks at the retention time of galactosamine and glucosamine. Calculate the response ratio of galactosamine to glucosamine ($GalN_R$) in the *Hydrolyzed standard solution*:

$$(GalN_B/GalN_W) \times (GlcN_W/GlcN_B)$$

$GalN_B$ = galactosamine peak area from the *Hydrolyzed standard solution*

$GalN_W$ = weight of galactosamine for the *Standard solution*

$GlcN_B$ = glucosamine peak area from the *Hydrolyzed standard solution*

$GluN_W$ = weight of glucosamine for the *Standard solution*

Calculate the percentage of galactosamine in the portion of total hexosamine taken:

$$[(GalN_U/GalN_R)]/[(GalN_U/GalN_R) + GlcN_U] \times 100$$

$GalN_U$ = galactosamine peak area from the *Hydrolyzed sample solution*

$GalN_R$ = galactosamine response ratio

$GlcN_U$ = glucosamine peak area from the *Hydrolyzed sample solution*

Acceptance criteria: The percent galactosamine peak area of the total hexosamine of the *Hydrolyzed sample solution* must be NMT 1%.

NUCLEOTIDIC IMPURITIES: *Biotechnology-Derived Articles—Total Protein Assay* ⟨1057⟩, *Method I* with the following modifications.

Analysis: Dissolve 40 mg of Heparin Sodium in 10 mL of water. Measure the absorbance of this solution at 260 nm using the light scattering correction procedure of *Biotechnology-Derived Articles—Total Protein Assay* ⟨1057⟩, *Method I*.

Acceptance criteria: The absorbance of this solution at 260 nm is NMT 0.20.

ABSENCE OF OVERSULFATED CHONDROITIN SULFATE

A: Proceed as directed in *Identification* test *A*. No features associated with oversulfated chondroitin sulfate are found between 2.12 and 3.00 ppm.

B: Proceed as directed in *Identification* test *B*. No peaks corresponding to oversulfated chondroitin sulfate should be detected eluting after the heparin peak.

PROTEIN IMPURITIES

Standard stock solution: 0.032 mg/mL of bovine serum albumin in water

Standard solutions: Dilute portions of the *Standard stock solution* with water to obtain NLT 5 standard solutions having concentrations between 0.0016 and 0.032 mg/mL of bovine serum albumin, the concentrations being evenly spaced.

Sample solution: 30 mg/mL of Heparin Sodium in water. Prepare in triplicate.

Blank: Water

Lowry reagent A: Prepare a solution of 10 g/L NaOH in water and a solution of 50 g/L Na_2CO_3 in water. Mix equal volumes (2V:2V) of each solution and dilute with water to 5V.

Lowry reagent B: Prepare a solution of 29.8 g/L disodium tartrate dihydrate in water. Prepare a solution of 12.5 g/L $CuSO_4 \cdot 5H_2O$ in water. Mix equal volumes of both solutions (2V:2V) and dilute with water to 5V.

Lowry reagent C: Mix 50 volumes of *Lowry reagent A* with 1 volume of *Lowry reagent B*.

Diluted Folin-Ciocalteu's Phenol reagent: Dilute *Folin-Ciocalteu's Phenol reagent* 2–4 times with water, as determined by titration.

Analysis

Samples: *Standard solutions, Sample solution,* and *Blank*

To 1 mL of each *Standard solution, Sample solution,* and *Blank*, add 5 mL of *Lowry reagent C*. Allow to stand at room temperature for 10 min. Add 0.5 mL of *Diluted Folin-Ciocalteu's Phenol reagent* to each solution, and mix immediately. Proceed as directed in *Biotechnology-Derived Articles—Total Protein Assay* ⟨1057⟩, *Method 2*.

Calculations: See *Biotechnology-Derived Articles—Total Protein Assay* ⟨1057⟩, *Method 2*.

Acceptance criteria: NMT 1.0% is found.

RESIDUAL SOLVENTS ⟨467⟩**:** It meets the requirements.

SPECIFIC TESTS

pH ⟨791⟩*:* 5.0–7.5, (1 in 100) solution

BACTERIAL ENDOTOXINS TEST ⟨85⟩*:* NMT 0.03 USP Endotoxin Unit/USP Heparin Unit

STERILITY TESTS ⟨71⟩*:* Where it is labeled as sterile, it meets the requirements.

LOSS ON DRYING ⟨731⟩*:* Dry under vacuum at 60° for 3 h. It loses NMT 5.0% of its weight.

ADDITIONAL REQUIREMENTS

PACKAGING AND STORAGE*:* Preserve in tight containers, and store below 40°, preferably at room temperature.

LABELING*:* Label it to indicate the tissue and the animal species from which it is derived.

BRIEFING

Heparin Sodium Injection, *USP 31* page 2322 and the *Revision Bulletin* posted on the USP website on June 18, 2008. Because of comments received from the *Revision Bulletin* for the *USP* Heparin Sodium monograph, the final product monograph is revised to include a proposed chromogenic *Anti-Factor IIa Assay.* This assay is intended to replace the currently official sheep plasma-based clotting assay. In addition, *USP* Heparin potency units will be harmonized with International Units as of August 2009.

(BB BBP: A. Szajek.) RTS—C72034

Change to read:

Heparin Sodium Injection

~~» Heparin Sodium Injection is a sterile solution of Heparin Sodium in Water for Injection. It exhibits a potency not less than 90.0 percent and not more than 110.0 percent of the potency stated on the label in terms of USP Heparin Units per mL.~~

~~NOTE—The USP Heparin Unit is defined by the USP Heparin Sodium Reference Standard, independent of International Units. The respective units are not equivalent (see *General Notices*).~~

~~**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, and store at a temperature below 40°, preferably at room temperature.~~

~~**Labeling**—Label it to indicate the volume of the total contents and the potency in terms of USP Heparin Units only per mL, except that single-dose containers may be labeled additionally to indicate the single-unit dose volume and the total number of USP Heparin Units. Where it is labeled with total content, the label states also that the entire contents are to be used or, if not, any remaining portion is to be discarded. Label it to indicate also the tissue and the animal species from which it is derived.~~

~~**USP Reference standards** ⟨11⟩—*USP Heparin Sodium RS. USP Endotoxin RS.*~~

~~**Bacterial endotoxins** ⟨85⟩—It contains not more than 0.03 USP Endotoxin Unit per USP Heparin Unit.~~

~~**pH** ⟨791⟩: between 5.0 and 7.5.~~

~~**Particulate matter** ⟨788⟩: meets the requirements for small-volume injections.~~

Proposed IRA

~~**Other requirements**—It meets the requirements under *Injections* ⟨1⟩.~~

~~**Assay**—Proceed as directed in the *Assay* under *Heparin Sodium*, substituting the Injection for the solution of heparin sodium prepared as directed under *Assay preparation*. Under *Calculation*, v_u in the equation for *R* is the volume, in mL, of the Injection per mL of the *Assay preparation*. The potency of Heparin Sodium Injection in USP Heparin Units per mL is $P^* =$ antilog *M*.~~

•DEFINITION

Heparin Sodium Injection is a sterile solution of Heparin Sodium in Water for Injection. It exhibits a potency NLT 90.0% and NMT 110.0% of the potency stated on the label in terms of USP Heparin Units/mL.

ASSAY

ANTI-FACTOR IIa ACTIVITY

NOTE—Allow alternative platforms.

pH 8.4 Buffer: Dissolve 6.10 g of tris(hydroxymethyl)aminomethane, 10.20 g of sodium chloride, 2.80 g of edetate sodium, and, if suitable, 10.00 g of polyethylene glycol 6000 and/or 2.00 g of bovine serum albumin in 800 mL of water. [NOTE—2.00 g of human albumin may be substituted for 2.00 g of bovine serum albumin.] Adjust with hydrochloric acid to a pH of 8.4, and dilute with water to 1000 mL.

Antithrombin solution: Reconstitute a vial of antithrombin (see *Reagents, Indicators, and Solutions—Reagents Specifications*) in water to obtain a solution of 5 Antithrombin IU/mL. Dilute this solution with *pH 8.4 Buffer* to obtain a solution having a concentration of 0.125 Antithrombin IU/mL.

Thrombin human solution: Reconstitute thrombin human (factor IIa) (see *Reagents, Indicators, and Solutions—Reagents Specifications*) in water to give 20 Thrombin IU/mL, and dilute with *pH 8.4 Buffer* to obtain a solution having a concentration of 5 Thrombin IU/mL. [NOTE—The thrombin should have a specific activity of NLT 750 IU/mg.]

Chromogenic substrate solution: Prepare a solution of a suitable chromogenic thrombin substrate for amidolytic test (see *Reagents, Indicators, and Solutions—Reagents Specifications*) in water to obtain a concentration of 1.25 mM.

Stopping solution: 20% (v/v) solution of acetic acid

Standard solutions: Reconstitute the contents of 1 ampule of USP Heparin Sodium RS with water and dilute with *pH 8.4 Buffer* to obtain at least four dilutions in the concentration range between 0.005 and 0.03 USP Heparin Unit/mL.

Sample solutions: Proceed as directed for *Standard solutions* to obtain concentrations of Heparin Sodium similar to those obtained for the *Standard solutions*.

Analysis

[NOTE—The procedure can also be performed using alternative platforms.]

For each dilution of the *Standard solutions* and *Sample solutions*, at least duplicate samples should be tested. Label a suitable number of tubes depending on the number of replicates to be tested. For example, if five blanks are to be used: B1, B2, B3, B4, and B5 for the blanks; T1, T2, T3, and T4 each at least in duplicate for the dilutions of the *Sample solutions*; and S1, S2, S3, and S4 each at least in duplicate for the dilutions of the *Standard solutions*. Distribute the blanks over the series in such a way that they accurately represent the behavior of the reagents during the experiments. [NOTE—Treat the tubes in the order B1, S1, S2, S3, S4, B2, T1, T2, T3, T4, B3, T1, T2, T3, T4, B4, S1, S2, S3, S4, B5.] Note that after each addition of a reagent, the incubation mixture should be mixed without allowing bubbles to form. To each tube add the double volume (100–200 µL), of *Antithrombin solution* and one volume (50–100 µL), of either the *pH 8.4 Buffer* or an appropriate dilution of the *Sample solutions* or the *Standard solutions*. Mix, but do

not allow bubbles to form. Incubate at 37° for at least 1 min. Add to each tube 25–50 µL of *Thrombin human solution*, and incubate for at least 1 min. Add 50–100 µL of *Chromogenic substrate solution*. Please note that all reagents, *Standard solutions*, and *Sample solutions* should be pre-warmed to 37° just prior to use.

Two different types of measurements can be recorded:

1. ENDPOINT MEASUREMENT: Stop the reaction after at least 1 min with 50–100 µL of *Stopping solution*. Measure the absorbance of each solution at 405 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩). The RSD over the blank readings is less than 10%.
2. KINETIC MEASUREMENT: Follow the change in absorbance for each solution over 1 min at 405 nm using a suitable spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩). Calculate the change in absorbance/min (ΔOD/min). The blanks for kinetic measurement are also expressed as ΔOD/min and should give the highest values as they are carried out in the absence of heparin. The RSD over the blank readings is less than 10%.

Calculations: The statistical models for *Slope ratio assay* or *Parallel-line assay* can be used depending on which model best describes the correlation between concentration and response.

Parallel-line assay: For each series, calculate the regression of the absorbance or change in absorbance/min against log concentrations of the *Sample solutions* and the *Standard solutions*, and calculate the potency of Heparin Sodium in USP Units/mL using statistical methods for parallel-line assays. Express the activity of Heparin Sodium/mg, calculated on the dried basis.

Slope ratio assay: For each series, calculate the log regression of the absorbance or the log change in absorbance/min against concentrations of the *Sample solutions* and of the *Standard solutions*, and calculate the potency of Heparin Sodium in USP Units/mL using statistical methods for slope ratio assays. Express the activity of Heparin Sodium/mg, calculated on the dried basis.

Acceptance criteria: NLT 90.0% and NMT 110.0% of the potency stated on the label in terms of USP Heparin Units/mL.

SPECIFIC TESTS

Bacterial Endotoxins Test ⟨85⟩**:** It contains NMT 0.03 USP Endotoxin Unit/USP Heparin Unit.

Particulate Matter in Injections ⟨788⟩**:** Meets the requirements for small-volume injections

pH ⟨791⟩*:* 5.0–7.5

Other Requirements: It meets the requirements under *Injections* ⟨1⟩.

ADDITONAL REQUIREMENTS

Labeling: Label it to indicate the volume of the total contents and the potency in terms of USP Heparin Units only per mL, except that single-dose containers may be labeled additionally to indicate the single unit-dose volume and the total number of USP Heparin Units. Where it is labeled with total content, the label states also that the entire contents are to be used or, if not, any remaining portion is to be discarded. Label it to indicate also the tissue and the animal species from which it is derived.

Packaging and Storage: Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, and store at a temperature below 40°, preferably at room temperature.

USP Heparin Sodium RS$_{\bullet 4}$

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) items that previously appeared under *Pharmacopeial Previews* and are now formally proposed as revisions, (2) proposed revisions placed directly under *In-Process Revision,* or (3) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

> **Name of Item**, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
>
> (DSN: L. Evans.) RTS—C55678

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type (print edition only), as shown in the examples below:

•new text•

if slated for an *Interim Revision Announcement to USP 30–NF 25* (*IRA*);

▲new text▲$_{USP31}$

if slated for *USP 31–NF 26*; and

■new text■

if slated for a *Supplement to USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •$_2$ indicates that the revision is proposed for the *Interim Revision Announcement* that will appear in issue 2 of a given *PF* volume, ■2S ($_{USP\ 30}$) indicates that the proposed revision is slated for the *Second Supplement to USP 30*, and ▲$_{USP31}$ and ▲$_{NF26}$ indicate that the revisions are proposed for *USP 31* and *NF 26*, respectively.

Official Title Changes Where the specification ''***Monograph title change***'' is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

MONOGRAPHS (USP)

BRIEFING

Diclofenac Sodium Delayed-Release Tablets, *USP 32* page 2124. It is proposed to correct the preparation of the *Standard solution* in the *Buffer stage* in the *Dissolution* test.

(BPC: M. Marques.) RTS—C70890

Diclofenac Sodium Delayed-Release Tablets

DEFINITION

Diclofenac Sodium Delayed-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of diclofenac sodium ($C_{14}H_{10}Cl_2NNaO_2$).

IDENTIFICATION

- **A.** The retention time of the diclofenac peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B. IDENTIFICATION TESTS—GENERAL,** *Sodium* ⟨**191**⟩**:** Meet the requirements of the flame test

ASSAY

- **PROCEDURE**

Solution A: Mix equal volumes of 0.01 M phosphoric acid and 0.01 M monobasic sodium phosphate. If necessary, adjust with additional portions of the appropriate component to a pH of 2.5 ± 0.2.

Mobile phase: Methanol and *Solution A* (7:3)
[NOTE—Increasing the proportion of buffer increases resolution.]

Diluent: Methanol and water (7:3)

System suitability solution: 20 µg/mL of diethyl phthalate, 7.5 µg/mL of USP Diclofenac Related Compound A RS, and 0.75 mg/mL of USP Diclofenac Sodium RS in *Diluent*

Standard solution: 0.75 mg/mL of USP Diclofenac Sodium RS in *Diluent*

Sample solution: Transfer 20 Tablets to a volumetric flask of such capacity that when filled to volume, a concentration of 0.75 mg/mL of diclofenac sodium is obtained. Add *Diluent* to about 70% of the capacity of the flask, and shake by mechanical means for NLT 30 min to disintegrate the Tablets. Cool to room temperature, and dilute with *Diluent* to volume. Pass a portion of the solution through a filter having a 0.5-µm or finer porosity, and use the filtrate as the *Sample solution*.

Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4.6-mm × 25-cm; packing L7 (end-capped)
Flow rate: 1 mL/min
Injection size: 10 µL

System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—The relative retention times for diethyl phthalate, diclofenac related compound A, and diclofenac are 0.5, 0.6, and 1.0, respectively.]

Suitability requirements
Resolution: NLT 2.2 between the diethyl phthalate and diclofenac related compound A peaks; NLT 6.5 between the diclofenac related compound A and diclofenac peaks, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{14}H_{10}Cl_2NNaO_2$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of diclofenac from the *Sample solution*
r_S = peak response of diclofenac from the *Standard solution*
C_S = concentration of USP Diclofenac Sodium RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of diclofenac sodium in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Change to read:

- **DISSOLUTION** ⟨**711**⟩**:** Proceed as directed for *Procedure*, *Apparatus 1 and Apparatus 2*, *Delayed-Release Dosage Forms*, *Method B* to determine the amount of $C_{14}H_{10}Cl_2NNaO_2$ dissolved.

Acid stage
Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 2: 50 rpm, paddles constructed of (or coated with) polytef being used
Time: 2 h
Detector: UV 276 nm
Standard solution: Transfer 68 mg of USP Diclofenac Sodium RS to a 100-mL volumetric flask, add 10.0 mL of 0.1 N sodium hydroxide, and dilute with water to volume. Transfer 2.0 mL of this solution to a second 100-mL volumetric flask, dilute with a mixture of 0.1 N hydrochloric acid and 5 N sodium hydroxide (900:20) to volume, and mix. This *Standard solution* contains 13.6 µg/mL of USP Diclofenac Sodium RS.
Sample solution: At the end of 2 h, remove each Tablet, or the major portion thereof if the Tablet is not intact, from the individual vessels, and subject them to the test under *Buffer stage*. To the 0.1 N hydrochloric acid remaining in each vessel, add 20.0 mL of 5 N sodium hydroxide, and stir for 5 min.

Buffer stage
Medium: *pH 6.8 phosphate buffer*; 900 mL
Apparatus 2: 50 rpm
Time: 45 min
Detector: UV 276 nm
Solution A: 76 mg/mL of tribasic sodium phosphate
pH 6.8 phosphate buffer: *Solution A* and 0.1 N hydrochloric acid (1:3), adjusted with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of 6.8 ± 0.05, if necessary
~~**Standard solution:** Transfer 68 mg of USP Diclofenac Sodium RS to a 100-mL volumetric flask, add 10.0 mL of 0.1 N sodium hydroxide, and dilute with water to volume. Transfer 2.0 mL of this solution to a second 100-mL volumetric flask, and dilute with *Medium* to volume. This *Standard solution* contains about 0.02 mg/mL of USP Diclofenac Sodium.~~
■**Standard solution:** Transfer 68 mg of USP Diclofenac Sodium RS to a 100-mL volumetric flask. Add 10.0 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix. Transfer 3.0 mL of this solution to a 100-mL volumetric flask, dilute with *Buffer stage Medium* to volume, and mix. The final concentration is 0.22 mg/mL of diclofenac sodium.■1S (*USP33*)
Sample solution: Sample per *Dissolution* ⟨711⟩. Dilute with *Medium* to a concentration that is similar to the *Standard solution*.
Tolerances: NLT 75% (Q) of the labeled amount of $C_{14}H_{10}Cl_2NNaO_2$ is dissolved.

In-Process Revision

• **UNIFORMITY OF DOSAGE UNITS ⟨905⟩:** Meet the requirements

IMPURITIES

Organic Impurities

• **PROCEDURE**

Solution A, Mobile phase, Diluent, System suitability solution, Sample solution, Chromatographic system and **System suitability:** Proceed as directed in the *Assay*.

Standard solution: 0.8 mg/mL of USP Diclofenac Related Compound A RS in methanol. Prepare 4 µg/mL from this solution with *Diluent*.

Analysis: Measure the peak responses over a period of 40 min.

Calculate the percentage of diclofenac related compound A in relation to the quantity of diclofenac sodium in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of diclofenac related compound A from the *Sample solution*

r_S = peak response of diclofenac related compound A from the *Standard solution*

C_S = concentration of USP Diclofenac Related Compound A RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of diclofenac sodium in the *Sample solution* (mg/mL)

Calculate the percentage of each other impurity, other than diethyl phthalate, if present, in relation to the diclofenac sodium in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for each impurity from the *Sample solution*

r_S = peak response for each impurity from the *Standard solution*

C_S = concentration of USP Diclofenac Related Compound A RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of diclofenac sodium in the *Sample solution* (mg/mL)

Acceptance criteria

Individual impurities: NMT 0.5% of diclofenac related compound A; NMT 1.0% of any other individual impurity

Total impurities: NMT 1.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS ⟨11⟩**

USP Diclofenac Sodium RS

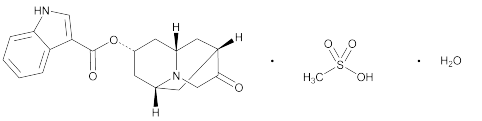
USP Diclofenac Related Compound A RS

BRIEFING

Dolasetron Mesylate, *USP 31* page 2009. On the basis of comments received, it is proposed to establish a reporting level for impurities.

(MD-GRE: E. Gonikberg.) RTS—C69725

Dolasetron Mesylate



$C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$ 438.50

1*H*-Indole-3-carboxylic acid, octahydro-3-oxo-2,6-methano-2*H*-quinolizin-8-yl ester, (2α,6α,8α,9a*β*)-, monomethanesulfonate monohydrate;

Indole-3-carboxylic acid, ester with (8*r*)-hexahydro-8-hydroxy-2,6-methano-2*H*-quinolizin-3(4*H*)-one, monomethanesulfonate monohydrate [115956-13-3].

DEFINITION

Dolasetron Mesylate contains NLT 98.0% and NMT 102.0% of $C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$, calculated on the as-is basis.

IDENTIFICATION

• **A. INFRARED ABSORPTION ⟨197K⟩**

• **B. PROCEDURE**

Sample solution: 1 mg/mL

Analysis: Transfer 5–10 mg of 5,5′-methylenedisalicylic acid to a clean crucible, and heat in an oven at 150° for 5 min. Remove from the oven, and add 10 drops of the *Sample solution*. Return to the oven, and evaporate to dryness.

Acceptance criteria: A red or pink color (presence of methanesulfonic acid) develops in the white residue.

ASSAY

• **PROCEDURE**

Mobile phase: Acetonitrile, water, and 1 M ammonium formate (450:440:110), adding 0.19 mL of triethylamine to the acetonitrile portion

Standard solution: 0.04 mg/mL and 0.004 mg/mL, respectively, of USP Dolasetron Mesylate RS and indole-3-carboxylic acid in *Mobile phase*

Sample solution: 0.04 mg/mL of Dolasetron Mesylate in *Mobile phase*

Chromatographic System

(See *Chromatography ⟨621⟩, System Suitability*.)

Mode: LC

Detector: UV 285 nm

Column: 4.6-mm × 15-cm; packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 4 between indole-3-carboxylic acid and dolasetron mesylate

Tailing factor: NMT 1.8

Relative standard deviation: NMT 1.5% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$ in the portion of Dolasetron Mesylate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

In-Process Revision

r_S = peak area from the *Standard solution*
C_S = concentration of USP Dolasetron Mesylate RS in the *Standard solution* (mg/mL)
C_U = nominal concentration in the *Sample solution* (mg/mL)

Acceptance criteria: NLT 98.0% and NMT 102.0%

IMPURITIES

Change to read:

Organic Impurities

• **PROCEDURE**

0.01 M Dibasic ammonium phosphate solution: 1.32 mg/mL of dibasic ammonium phosphate. Adjust with 2.0 M phosphoric acid to a pH of 7.0.

Diluent: Acetonitrile and water (1:4)

Solution A: Acetonitrile and *0.01 M Dibasic ammonium phosphate solution* (53:1000), filtered and degassed

Solution B: Acetonitrile and 0.*01 M Dibasic ammonium phosphate solution* (795:295), filtered and degassed

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
28	0	100
38	0	100
40	100	0
50	100	0

System suitability solution: 0.004 mg/mL and 0.03 mg/mL, respectively, of indole and USP Dolasetron Mesylate RS in *Diluent*

Standard solution A: 0.03 mg/mL of USP Dolasetron Mesylate RS in *Diluent*

Standard solution B: 6 mg/mL and 0.0072 mg/mL, respectively, of USP Dolasetron Mesylate RS and USP Dolasetron Mesylate Related Compound A RS in *Diluent*

Sample solution: 6 mg/mL of Dolasetron Mesylate in *Diluent*

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 25-cm; packing L7

Flow rate: 1.5 mL/min

Injection size: 100 µL

System suitability

Suitability requirements

Resolution: NLT 1.5 between the first eluting peak, indole, and the second eluting peak, dolasetron mesylate from the *System suitability solution* [NOTE—If the dolasetron mesylate peak is found to elute before the indole peak, condition the column as follows: fill up the column with *Solution A*, plug the column, and place the column in a convection oven at 105° for about 16 h. Retest the column.]

Relative standard deviation: NMT 5.0% for replicate injections of *Standard solution A*

Analysis

Samples: *Standard solution A, Standard solution B,* and *Sample solution*

Calculate the percentage of dolasetron mesylate related compound A in the portion of Dolasetron Mesylate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area for dolasetron mesylate related compound A from the *Sample solution*
r_S = peak area for dolasetron mesylate related compound A from *Standard solution B*
C_S = concentration of USP Dolasetron Mesylate Related Compound A RS in *Standard solution B* (mg/mL)
C_U = concentration of Dolasetron Mesylate in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of dolasetron mesylate related compound A base, 181.2
M_{r2} = molecular weight of dolasetron mesylate related compound A hydrochloride, 217.8

Acceptance criteria: NMT 0.1%

Calculate the percentage of each impurity (other than dolasetron mesylate related compound A) in the portion of Dolasetron Mesylate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area for each impurity from the *Sample solution*
r_S = peak area for dolasetron mesylate from *Standard solution A*
C_S = concentration of USP Dolasetron Mesylate RS in *Standard solution A* (mg/mL)
C_U = nominal concentration of dolasetron mesylate in the *Sample solution* (mg/mL)

Acceptance criteria

USP Dolasetron Mesylate Related Compound A RS

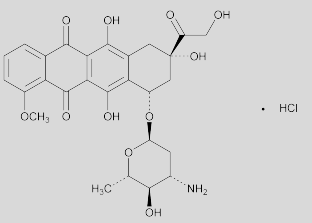
BRIEFING

Epirubicin Hydrochloride. Because there is no existing *USP* monograph for this drug substance, a new monograph is proposed based on the current *European Pharmacopoeia* monograph. The liquid chromatographic procedures in the test for *Organic Impurities, Procedure 1* and in the *Assay* are based on analyses performed using a Zorbax TMS brand of L13 column. The typical retention times for doxorubicin and epirubicin are about 7.6 and 9.5 minutes, respectively.

(MD-ANT: A. Wise; . MSA : R. Tirumalai.) RTS—C49304

Add the following:

▪Epirubicin Hydrochloride



$C_{27}H_{29}NO_{11} \cdot HCl$ 579.98

5,12-Naphthacenedione, 10-[(3-amino-2,3,6-trideoxy-α-L-*arabino*-hexopyranosyl)oxy]-7,8,9,10-tetrahydro-6,8,11-trihydroxy-8-(hydroxyacetyl)-1-methoxy-, hydrochloride, (8*S*-*cis*)-; (1*S*,3*S*)-3-Glycoloyl-1,2,3,4,6,11-hexahydro-3,5,12-trihydroxy-10-methoxy-6,11-dioxo-1-naphthacenyl-3-amino-2,3,6-trideoxy-α-L-*arabino*-hexopyranoside hydrochloride. [56390-09-1].

DEFINITION

Epirubicin Hydrochloride contains NLT 97.0% and NMT 102.0% of $C_{27}H_{29}NO_{11} \cdot HCl$, calculated on the anhydrous and solvent-free basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** ⟨197M⟩
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution,* as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL,** *Chloride* ⟨191⟩**:** A 10 mg/mL solution in a mixture of nitric acid and water (1:1) meets the requirements.

ASSAY

- **PROCEDURE**

[NOTE—Allow the *Standard solution*, *System suitability solution,* and the *Sample solution* to stand for 3 h before use.]

Solution A: Dissolve 3.7 g of sodium lauryl sulfate in 950 mL of water. To the resulting solution, add 28 mL of 10% phosphoric acid, and dilute with water to 1000 mL.

Mobile phase: Acetonitrile, methanol and *Solution A* (29:17:54)

System suitability solution: 0.1 mg/mL each of USP Epirubicin Hydrochloride RS and USP Doxorubicin Hydrochloride RS in *Mobile phase*

Standard solution: 1 mg/mL USP Epirubicin Hydrochloride RS in *Mobile phase*

Sample solution: 1 mg/mL of Epirubicin Hydrochloride in *Mobile phase*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm column; 6-µm packing L13

Temperature: 35°

Flow rate: 2.5 mL/min

Injection size: 10 µL

Run time: About 3.5 times the retention time of the epirubicin peak

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 2.0 between doxorubicin and epirubicin

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{27}H_{29}NO_{11} \cdot HCl$ in the portion of Epirubicin Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–102.0%

IMPURITIES

Organic Impurities

- **PROCEDURE 1**

[NOTE—Allow the *Standard solution*, *System suitability solution,* and *Sample solution* to stand for 3 h before use.]

Mobile phase, System suitability solution, Sample solution, Chromatographic system, and **System suitability:** Proceed as directed in the *Assay*.

Standard solution: 0.01 mg/mL of USP Epirubicin Hydrochloride RS in *Mobile phase*

Peak identification solution: Dissolve 10 mg of USP Doxorubicin Hydrochloride RS in 10 mL of a mixture of water and phosphoric acid (1:1). Allow to stand for 30 min. Adjust with 2 N sodium hydroxide solution to a pH of 2.6. Add 15 mL of acetonitrile and 10 mL of methanol, and mix.

Analysis

Samples: *Peak identification solution, Standard solution,* and *Sample solution*

Calculate the percentage of each impurity in the portion of Epirubicin Hydrochloride taken:

$$\text{Result} = (r_U/r_s) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of the impurity peak from the *Sample solution*

r_S = peak response of the epirubicin peak from the *Standard solution*

C_S = concentration of USP Epirubicin Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Epirubicin Hydrochloride in the *Sample solution* (mg/mL)

F = relative response factor (see *Impurity Table 1*)

Acceptance criteria

Individual impurities: See *Impurity Table 1*.

Total impurities: NMT 3.0%

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT %
Doxorubicinone	0.3	1.4	1.0
Daunorubicinone	0.4	1.0	0.5

BRIEFING

Lamivudine and Zidovudine Tablets. Because there is no existing *USP* monograph for this dosage form, a new monograph based on submitted data is being proposed. The liquid chromatographic procedure in the *Procedure* under *Organic Impurities* and in the *Assay* is based on analysis performed with the Keystone ODS-A brand of column containing 5-µm packing L1. The typical retention times for lamivudine and zidovudine are about 18 and 36 min, respectively.

(MD-AA: L. Santos, B. Davani. BPC: M. Marques.) RTS—C46270

Add the following:

▪Lamivudine and Zidovudine Tablets

DEFINITION
Lamivudine and Zidovudine Tablets contains NLT 90.0% and NMT 110.0% of the labeled amount of lamivudine ($C_8H_{11}N_3O_3S$) and zidovudine ($C_{10}H_{13}N_5O_4$).

IDENTIFICATION
- The retention times of the lamivudine and zidovudine peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**

Solution A: 25 mM of ammonium acetate. Adjust the pH to 4.0 with glacial acetic acid.
Solution B: Methanol
Solution C: Acetonitrile
Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)	Solution C (%)
0	95	5	0
15.0	95	5	0
30.0	70	30	0
38.0	70	30	0
38.1	0	0	100
45.0	0	0	100
45.1	95	5	0
60.0	95	5	0

Diluent: *Solution A* and *Solution B* (19:1)
System suitability solution: 0.17 mg/mL of USP Lamivudine Resolution Mixture B RS in *Diluent*
Standard solution: 0.15 mg/mL of USP Lamivudine RS and 0.30 mg/mL of USP Zidovudine RS in *Diluent*
Sample stock solution: Transfer a counted number of Tablets, equivalent to 1500 mg of zidovudine and 750 mg of lamivudine, into a 500-mL volumetric flask. Add 250 mL of water, and disintegrate completely by shaking for a minimum of 15 min. Dilute with water to volume, and mix. Pass a portion of the solution through a 0.45-µm filter, discarding the first 2–3 mL. Accurately transfer 5.0 mL of the filtrate into a 50-mL volumetric flask, and dilute with *Diluent* to volume.
Sample solution: Pass a portion of the solution through a 0.45-µm filter, discarding the first 2–3 mL. Further dilute the filtrate to obtain 0.15 mg/mL of lamivudine and 0.30 mg/mL of zidovudine in *Diluent.*
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 270 nm
Column: 3-mm × 25-cm column; packing L1
Flow rate: 0.5 mL/min
Injection size: 10 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—The relative retention times for lamivudine-*trans* and lamivudine are 0.50 and 0.52, respectively.]
Suitability requirements
Resolution: NLT 1.5 between lamivudine-*trans* and lamivudine, *System suitability solution*
Relative standard deviation: NMT 2.0% for zidovudine and lamivudine, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_8H_{11}N_3O_3S$ and $C_{10}H_{13}N_5O_4$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = response of the zidovudine or lamivudine peak from the *Sample solution*
r_S = response of the zidovudine or lamivudine peak from the *Standard solution*
C_S = concentration of USP Zidovudine RS or USP Lamivudine RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of zidovudine or lamivudine in the *Sample solution* (mg/mL)
Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
- **DISSOLUTION** ⟨**711**⟩

Medium: 0.1 N hydrochloric acid; 900 mL, deaerated
Apparatus 2: 75 rpm
Time: 15 min
Lamivudine response factor solutions: 0.167 mg/mL of USP Lamivudine RS in *Medium*. [NOTE—Prepare in duplicate.]
Zidovudine response factor solutions: 0.333 mg/mL of USP Zidovudine RS in *Medium*. [NOTE—Prepare in duplicate.]
Sample solution: Pass a portion of the solution under test through a suitable (PTFE, PVDF, or equivalent) 0.45-µm filter.
Detector: UV 240 nm to 300 nm
Blank: *Medium*
Cell length: 0.02-cm flowcell
Analysis: The calculations of the percentages dissolved are done using a multicomponent analysis software.
Tolerances: NLT 85% (Q) of the labeled amount of zidovudine and lamivudine is dissolved.
- **UNIFORMITY OF DOSAGE UNITS** ⟨**905**⟩**:** Meet the requirements for zidovudine and lamivudine

IMPURITIES
Organic Impurities

  Suitability requirements
  Resolution: NLT 3.0 between meloxicam related compound A and meloxicam
  Tailing factor: NMT 2.0 for meloxicam peak
  Relative standard deviation: NMT 2.0%
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of $C_{14}H_{13}N_3O_4S_2$ in the portion of Meloxicam taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Meloxicam RS in the *Standard solution* (mg/mL)
C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 99.0%–100.5%

IMPURITIES
Inorganic Impurities

- **HEAVY METALS,** *Method II* **⟨231⟩:** NMT 10 ppm

Change to read:

Organic Impurities
[NOTE—Perform either *Procedure 1* or *Procedure 2* depending on the manufacturing process used.]
- **PROCEDURE 1**
  Solution A: 0.1% (w/v) solution of monobasic potassium phosphate adjusted with 1 N sodium hydroxide to a pH of 6.0
  Solution B: Methanol
  Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	60	40
2	60	40
10	30	70
15	30	70
15.1	60	40
18	60	40

System suitability solution: Transfer 4 mg of USP Meloxicam RS and 4 mg each of USP Meloxicam Related Compound A RS and USP Meloxicam Related Compound B RS into a 50-mL volumetric flask, dissolve in 5 mL of methanol and 0.3 mL of 1 N sodium hydroxide, and dilute with methanol to volume.
Standard stock solution: Transfer 12 mg of USP Meloxicam RS into a 20-mL volumetric flask, dissolve in 5 mL of methanol and 0.3 mL of 1 N sodium hydroxide, and dilute with methanol to volume.
Standard solution: Transfer 2 mL of *Standard stock solution* to a 100-mL volumetric flask, and dilute with methanol to volume.
Sample solution: Transfer 80 mg of Meloxicam into a 20-mL volumetric flask, dissolve in 5 mL of methanol and 0.3 mL of 1 N sodium hydroxide, and dilute with methanol to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 260 nm and 350 nm (variable wavelength or multi-wavelength detector)
Column: 4.6-mm × 15-cm column; 5-µm packing L1
Temperature: 45°
Flow rate: 1 mL/min
Injection size: 5 µL
System suitability
Samples: *Standard solution* and *System suitability solution*
[NOTE—The relative retention times are listed in *Impurity Table 1*.]
Suitability requirements
Resolution: NLT 3.0 between meloxicam related compound A and meloxicam at 350 nm, *System suitability solution*
NLT 3.0 between meloxicam related compound B and meloxicam at 260 nm, *System suitability solution*

Relative standard deviation: NMT 10%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Meloxicam taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of meloxicam at 350 nm from the *Standard solution*

C_S = concentration of USP Meloxicam RS in the *Standard solution* (mg/mL)

C_U = concentration of Meloxicam in the *Sample solution* (mg/mL)

F = relative response factor (see *Impurity Table 1*)

[NOTE—For the specified impurities, calculate the percentage content of each impurity, using the *Sample solution* peak responses recorded at the detection wavelength given in *Impurity Table 1*. For an unknown impurity, calculate the percentage content, using peak responses recorded at the wavelength that gives the greater response.]

BRIEFING

Nateglinide Tablets. Because there is no existing *USP* monograph for this dosage form, a new monograph, based on validated methods of analysis, is proposed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with the Symmetry 300 C18 brand of L1 column. The typical retention time for the nateglinide peak is about 6 min. The liquid chromatographic procedure in the test for *Dissolution* is also based on analyses performed with the Symmetry 300 C18 brand of L1 column. The typical retention time for the nateglinide peak is about 2 min.

(MDGRE: E. Gonikberg; . BPC: M. Marques.) RTS—C61576

Add the following:

■Nateglinide Tablets

DEFINITION
Nateglinide Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of nateglinide ($C_{19}H_{27}NO_3$).

IDENTIFICATION
- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Diluent: Acetonitrile and water (11:9)

Mobile phase: Acetonitrile and 0.05% solution of trifluoroacetic acid (23:27)

Standard solution: 0.72 mg/mL of USP Nateglinide RS prepared as follows. Transfer USP Nateglinide RS to a suitable volumetric flask, and add acetonitrile to 40% of the volume of the flask. [NOTE—Sonicate to dissolve.] Add water equivalent to 30% of the final volume, mix, cool the solution to room temperature, and dilute with *Diluent* to volume.

Sample solution: Place 20 Tablets into a 500-mL volumetric flask, and add 60 mL of water to disintegrate the Tablets. [NOTE—Sonicate with cooling, if necessary.] Add 280 mL of acetonitrile, and shake by mechanical means for at least 30 min. Dilute with *Diluent* to volume. Filter a portion using a 0.45-µm glass microfiber filter, discarding the first 10 mL of the filtrate, or use centrifugation to obtain a clear solution. Dilute an aliquot of this solution with *Diluent* to obtain a solution having a concentration of 0.72 mg/mL based on the label claim.

Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 210 nm
Column: 4.6-mm × 15-cm column; 5-µm packing L1
Flow rate: 1.5 mL/min
Injection size: 10 µL

System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.8
Relative standard deviation: NMT 2.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled quantity of $C_{19}H_{27}NO_3$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

- **DISSOLUTION ⟨711⟩**

Medium: 0.01 N hydrochloric acid containing 0.5% (w/v) of sodium lauryl sulfate; 1000 mL

Apparatus 2: 50 rpm

Time: 30 min

Determine the quantity of $C_{19}H_{27}NO_3$ dissolved by employing the following method.

Solution A: 6.9 mg/mL of monobasic sodium phosphate. Adjust with phosphoric acid to a pH of 2.5.

Mobile phase: Acetonitrile and *Solution A* (45:55)

Sample solution: Sample per *Dissolution* ⟨711⟩. Pass through a suitable 0.7-µm filter.

Standard stock solution: 0.3 mg/mL of USP Nateglinide RS prepared as follows. Transfer USP Nateglinide RS to a suitable volumetric flask, dissolve in acetonitrile using 5% of the final volume, and dilute with *Medium* to volume.

Standard solution: 0.12 mg/mL USP Nateglinide RS in *Medium*, from *Standard stock solution*

Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 210 nm
Column: 4.6-mm × 5-cm column; 5-µm packing L1
Flow rate: 1.5 mL/min
Injection size: 10 µL

System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{19}H_{27}NO_3$ dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S \times V)/(100/L)$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
V = volume of *Medium*, 1000 mL
L = label claim (mg/tablet)

Tolerances: NLT 80% (Q) of the labeled amount of $C_{19}H_{27}NO_3$ is dissolved.

- **UNIFORMITY OF DOSAGE UNITS ⟨905⟩:** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS ⟨11⟩**
USP Nateglinide RS■1S *(USP33)*

BRIEFING

Olanzapine Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The liquid chromatographic method in the *Procedure* for *Organic Impurities* and in the *Assay* is based on analyses performed with either the Zorbax RX-C8 or Zorbax SB-C8 brand of L7 column manufactured by Agilent Technologies. The typical retention time of the olanzapine peak is about 13 min in the gradient elution method used in the *Procedure* for *Organic Impurities.* The retention time for olanzapine is about 6.7 min in the isocratic method used in the *Assay*. The chromatographic procedure in the test for *Dissolution* is based on analysis performed with a Zorbax SB-CN brand of L10 column. The typical retention time for olanzapine is 2.3 min.

(MD-PP: D. Vicchio, R. Ravichandran. BPC: M. Marques.)
RTS—C66222

In-Process Revision

Add the following:

▪Olanzapine Tablets

DEFINITION
Olanzapine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of olanzapine ($C_{17}H_{20}N_4S$).

IDENTIFICATION
• **INFRARED ABSORPTION ⟨197S⟩**
Standard solution: 1 mg/mL of USP Olanzapine RS in chloroform
Sample solution: Dissolve a quantity of powdered Tablets, equivalent to 30 mg of olanzapine, in 30 mL of chloroform, and filter. Evaporate completely to dryness with the aid of a current of air. Redissolve the residue in 1 mL of chloroform.

ASSAY
• **PROCEDURE**
Buffer 1: 6.9 g/L of monobasic sodium phosphate. Adjust the pH to 2.5 with phosphoric acid.
Buffer 2: 12 g/L of sodium dodecyl sulfate in *Buffer 1*
Mobile phase: Acetonitrile and *Buffer 2* (1:1)
System suitability solution: 0.1 mg/mL of USP Olanzapine RS and 0.01 mg/mL of USP Olanzapine Related Compound A RS in *Mobile phase*
Standard solution: 0.1 mg/mL of USP Olanzapine RS in *Mobile phase*
Sample solution: Transfer a known quantity of Tablets, equivalent to NLT 25 mg of olanzapine, to a suitable volumetric flask. Dilute with *Mobile phase* to volume, mix, and sonicate for 10 min. Centrifuge a portion of this solution, and dilute the clear supernatant with *Mobile phase* to obtain a solution containing about 0.1 mg/mL of olanzapine. [NOTE—Agitation of the flask may be necessary prior to sonication to prevent Tablets from adhering to the flask, making disintegration and dissolution difficult.]
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 260 nm
Column: 4.6-mm × 15-cm column; 5-µm packing L7
Flow rate: 1.5 mL/min
Injection size: 20 µL
System suitability
Sample: *System suitability solution* and *Standard solution*
[NOTE—The relative retention times for olanzapine related compound A and olanzapine are 0.89 and 1.0, respectively.]
Suitability requirements
Resolution: NLT 2.0 between olanzapine and olanzapine related compound A, *System suitability solution*
Tailing factor: NMT 1.8, *Standard solution*
Relative standard deviation: NMT 2.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{17}H_{20}N_4S$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Olanzapine RS in the *Standard solution* (mg/mL)
C_U = concentration of olanzapine the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
• **DISSOLUTION ⟨711⟩**
Medium: 0.1 N hydrochloric acid; 900 mL
Apparatus 2: 50 rpm
Time: 30 min
Sample solution: Pass a portion of the solution under test through a suitable 0.45-µm filter. Transfer 5.0 mL of the filtrate to a tube and add 2.0 mL of *Mobile phase*.
Standard solution: An amount, in mg, corresponding to the Tablet label claim, of USP Olanzapine RS in 1000 mL of *Medium*. Transfer 5.0 mL of this solution to a tube and add 2.0 mL of *Mobile phase*.
Mobile phase: 10 g/L of ammonium acetate in a mixture of methanol and water (2:3). Adjust the pH to 4.0 with hydrochloric acid.
Chromatographic system
(See *Chromatography* ⟨621⟩*, System suitability*.)
Mode: LC
Detector UV 260 nm
Column: 4.6 mm × 15 cm column, 5-µm packing L10
Flow rate: 1.5 mL/min
Injection size: 50 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 2.0%
Calculate the percentage of olanzapine dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S \times 900/L) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Olanzapine RS in the *Standard solution* (mg/mL)
900 = volume of *Medium*
L = label claim (mg/Tablet)
Tolerances: NLT 80% (Q) of the labeled amount of olanzapine is dissolved in 30 min.
• **UNIFORMITY OF DOSAGE UNITS ⟨905⟩:** Meet the requirements

IMPURITIES
Organic Impurities
• **PROCEDURE**
Buffer 1: 3.3 mL/L of phosphoric acid. Adjust the pH to 2.5 with 50% NaOH.
Buffer 2: 8.7 g/L of sodium dodecyl sulfate in *Buffer 1*
Buffer 3: 18.6 mg/L of edetate disodium (EDTA) in *Buffer 2*
Solution A: Acetonitrile: *Buffer 2* (12:13)
Solution B: Acetonitrile: *Buffer 2* (7:3)
Diluent: Acetonitrile: *Buffer 3* (2:3)
System suitability solution: 20 µg/mL of USP Olanzapine RS, and 2 µg/mL each of USP Olanzapine Related Compound B RS and USP Olanzapine Related Compound C RS in *Diluent*
Standard solution: 2 µg/mL of USP Olanzapine RS in *Diluent*
Sensitivity solution: 0.4 µg/mL of USP Olanzapine RS in *Diluent*, from the *Standard solution*
Sample solution: Transfer a known quantity of Tablets to a suitable volumetric flask, and dilute with *Diluent* to volume to obtain a solution containing either 375 or 500 µg/mL of olanzapine (based on the label claim). Centrifuge a portion of this solution and use the supernatant. [NOTE—Immediate agitation of the flask may be necessary to prevent Tablets from adhering to the flask, making dissolution and disintegration difficult. [CAUTION—Do not sonicate.] The *Sample solution* is stable for 12 h at room temperature and 48 h if refrigerated.]

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
10	100	0
20	0	100

BRIEFING

Oxaliplatin Injection. Because there is no existing *USP* monograph for this drug product, a new monograph based on validated methods of analysis is proposed. The liquid chromatographic procedures in the proposed monograph are based on analyses performed with the following columns.
1. *Assay*: Thermo Electron Corporation Hypersil C18 brand of L1 column. The typical retention time reported for oxaliplatin is about 8 min.
2. *Limit of Oxalic Acid*: Thermo Electron Corporation Hypersil BDS C18 brand of L1 column. The typical retention time reported for oxalic acid is about 4.5 min.
3. *Limit of (SP-4-2)-Diaqua[(1R,2R)-cyclohexane-1,2-diamine-N,N′]platinum and Unspecified Impurities*: Thermo Electron Corporation Hypersil BDS C18 brand of L1 column. The typical retention time reported for (*SP*-4-2)-diaqua[(1*R*,2*R*)-cyclohexane-1,2-diamine-*N*,*N*′]platinum is about 18.5 min.

(MD-OOD: F. Mao; . MSA: R. Tirumalai.) RTS—C64375

Add the following:

■Oxaliplatin Injection

DEFINITION
Oxaliplatin Injection is a sterile solution of Oxaliplatin in Water for Injection. It contains NLT 95.0% and NMT 105.0% of the labeled amount of oxaliplatin ($C_8H_{14}N_2O_4Pt$).

  Sample solution: 100 µg/mL
  Medium: Water
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay.*

ASSAY

[Note—All HPLC autosampler vials should be made of polypropylene.]

- **Procedure**
  Acidified water: Adjust pH of water to 3.0 with phosphoric acid.
  Mobile phase: Acetonitrile and *Acidified water* (1:99)
  System suitability solution: 0.1 mg/mL of USP Oxaliplatin RS and 0.1 mg/mL of USP Oxaliplatin System Suitability RS in water. [Note—USP Oxaliplatin System Suitability RS is [*SP*-4-2-(1*R-trans*)]-(1,2-cyclohexanediamine-*N*,*N*′) dichloridoplatinum(II).]
  Standard solution: 0.1 mg/mL of USP Oxaliplatin RS in water
  Sample solution: 0.1 mg/mL of oxaliplatin in water, from the combined contents of NLT three vials of Injection
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 210 nm
  Column: 4.6-mm × 25-cm column; 5-µm packing L1
  Column temperature: 40°
  Flow rate: 1.2 mL/min
  Injection size: 20 µL
  System suitability
  Sample: *System suitability solution*
  [Note—The relative retention times for USP Oxaliplatin System Suitability RS and oxaliplatin are 0.9 and 1.0, respectively.]
  Suitability requirements
  Resolution: NLT 2.0 between USP Oxaliplatin System Suitability RS and oxaliplatin
  Tailing factor: NMT 2.0, oxaliplatin peak
  Relative standard deviation: NML 1.0%, oxaliplatin peak
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of $C_8H_{14}N_2O_4Pt$ in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

  r_U = peak response from the *Sample solution*
  r_S = peak response from the *Standard solution*
  C_S = concentration of oxaliplatin in the *Standard solution* (mg/mL)
  C_U = nominal concentration of oxaliplatin in the *Sample solution* (mg/mL)
  Acceptance criteria: 95.0%–105.0%

IMPURITIES

Organic Impurities

- **Procedure 1: Limit of Oxalic Acid** [Note—All HPLC autosampler vials should be made of polypropylene.]
  Solution A: Dissolve 1.36 g of monobasic potassium phosphate in 10 mL of 10% tetrabutylammonium hydroxide, dilute with water to 1 L, and adjust the pH to 6.0 with phosphoric acid.
  Mobile phase: Acetonitrile and *Solution A* (1:4)
  Standard solution: 35 µg/mL of USP Oxaliplatin Related Compound A RS in water. [Note—USP Oxaliplatin Related Compound A RS is available as dihydrate oxalic acid.]
  System suitability solution: 0.1 mg/mL of succinic acid in *Standard solution*
  Sample solution: Combined contents of NLT three vials of Injection
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 210 nm
  Column: 4.6-mm × 25-cm column; 5-µm packing L1
  Column temperature: 40°
  Flow rate: 2 mL/min
  Injection size: 10 µL
  System suitability
  Samples: *Standard solution* and *System suitability solution*
  [Note—The relative retention times for succinic acid and oxalic acid are 0.8 and 1.0, respectively.]
  Suitability requirements
  Resolution: NLT 2.0 between succinic acid and oxalic acid, *System suitability solution*
  Tailing factor: Between 0.5 and 2.0, oxalic acid peak, *System suitability solution*
  Relative standard deviation: NML 3.0%, *Standard solution*
  Analysis
  Sample: *Standard solution* and *Sample solution*
  Calculate the percentage of each impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

  r_U = response of oxalic acid from the *Sample solution*
  r_S = response of oxalic acid from the *Standard solution*
  C_S = concentration of USP Oxaliplatin Related Compound A RS in the *Standard solution* (mg/mL)
  C_U = concentration of oxaliplatin in the *Sample solution* (mg/mL)
  M_{r1} = molecular weight of anhydrous oxalic acid, 90.03
  M_{r2} = molecular weight of oxaliplatin related compound A, 126.07
  Acceptance criteria
  Oxalic acid: NMT 0.30%
- **Limit of (*SP*-4-2)-Diaqua[(1*R*,2*R*)-cyclohexane-1,2-diamine-*N*,*N*′]platinum and Unspecified Impurities**
  [Note—All HPLC autosampler vials should be made of polypropylene.]
  Solution A: Dissolve 1.36 g of monobasic potassium phosphate and 0.55 g of sodium heptanesulphonate in 1 L of water. Adjust to pH 3.0 with phosphoric acid.
  Solution B: Methanol and *Solution A* (19:81)
  Solution C: Methanol and *Solution A* (50.5:49.5)
  Mobile phase: See the gradient table below.

Time (min)	Solution B (%)	Solution C (%)
0	100	0
45.0	0	100
45.5	100	0
53.0	100	0

  System suitability solution: 2 mg/mL of USP Oxaliplatin RS in 0.005 M sodium hydroxide. Allow this solution to stand at room temperature for at least 5 days. Transfer 5 mL of this solution into a 50-mL volumetric flask, and dilute with water to volume. [Note—The preparation of the *System suitability solution* forms (*SP*-4-2)-diaqua[(1*R*,2*R*)-cyclohexane-1,2-diamine-*N*,*N*′]platinum and diaquodiaminocyclohexaneplatinum dimer.]
  Standard stock solution: Transfer a weighed quantity of USP Oxaliplatin Related Compound B RS into a suitable volumetric flask, add a volume of methanol equivalent to about 25% of the final volume, and sonicate for approximately 2 min to disperse the solids. Add a volume of 0.01 M nitric acid equivalent to about 65% of the final volume, and sonicate for approximately 30 min to dissolve. Allow to cool if

necessary, and dilute with 0.01 M nitric acid to volume to obtain a solution having a known concentration of about 0.125 mg/mL.

Standard solution: 31.25 µg/mL of USP Oxaliplatin Related Compound B RS in 0.01 M nitric acid, from *Standard stock solution*. [NOTE—USP Oxaliplatin Related Compound B RS is converted to (*SP*-4-2)-diaqua[(1*R*,2*R*)-cyclohexane-1,2-diamine-*N*,*N*′]platinum in *Standard solution* preparation.]

Sample solution: Combined contents of NLT three vials of Injection

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 7.5-cm column; 3-µm packing L1

Column temperature: 10°

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Samples: *System suitabiluty solution* and *Standard solution*

Suitability requirements

Resolution: NLT 8.0 between the peaks of (*SP*-4-2)-diaqua[(1*R*,2*R*)-cyclohexane-1,2-diamine-*N*,*N*′]platinum and diaquodiaminocyclohexaneplatinum dimer, *System suitability solution*.

Tailing factor: NMT 2.0, (*SP*-4-2)-diaqua[(1*R*,2*R*)-cyclohexane-1,2-diamine-*N*,*N*′]platinum peak, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times (1/F) \times 100$$

r_U = response of each impurity from the *Sample solution*

r_S = response of (*SP*-4-2)-diaqua[(1*R*,2*R*)-cyclohexane-1,2-diamine-*N*,*N*′]platinum from the *Standard solution*

C_S = concentration of USP Oxaliplatin Related Compound B RS in the *Standard solution* (mg/mL)

C_U = concentration of oxaliplatin in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of (*SP*-4-2)-diaqua[(1*R*,2*R*)-cyclohexane-1,2-diamine-*N*,*N*′]platinum, 345.30

M_{r2} = molecular weight of oxaliplatin related compound B, 433.28

F = relative response factor for each individual impurity, see *Impurity Table 1*

Acceptance criteria

Individual impurities: See *Impurity Table 1*.

Total impurities: NMT 2.45%, *Limit of oxalic acid* and *Limit of (SP-4-2)-Diaqua[(1R,2R)-cyclohexane-1,2-diamine-N,N′]platinum and Unspecified Impurities*

Impurity Table 1

Name	Relative Retention Time (RRT)	Relative Response Factor (F)	Limit (%)
(*SP*-4-2)-Diaqua[(1*R*,2*R*)-cyclohexane-1,2-diamine-*N*,*N*′]platinum	1.0	1.0	0.65
Diaquodiaminocyclohexaneplatinum dimer[a]	1.4	2.5	0.50
Any individual unspecified impurity	—	4.0	0.20
Total unspecified impurities	—	—	1.00

SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST ⟨85⟩:** It contains NMT 1.0 USP Endotoxin Units/mg of oxaliplatin.
- **STERILITY TESTS ⟨71⟩:** It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to Be Examined*.
- **pH ⟨791⟩:** Between 4.0 and 7.0 using a polymer combination electrode
- **PARTICULATE MATTER IN INJECTIONS ⟨788⟩:** It meets the requirements for small-volume injections.
- **OTHER REQUIREMENTS:** It meets the requirements under *Injections* ⟨1⟩.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light. Store at controlled room temperature.
- **LABELING:** Label it to indicate that it is to be diluted with water for injection or a 5% dextrose solution. Oxaliplatin Injection must not be diluted in sodium chloride solutions or in chloride-containing solutions.
- **USP REFERENCE STANDARDS ⟨11⟩**
  USP Endotoxin RS
  USP Oxaliplatin RS

BRIEFING

Oxazepam Capsules, *USP 31* page 2868. On the basis of comments received, it is proposed to revise the *Dissolution* test to include instructions for the preparation of the *Standard solution* and the *Sample solution*. It was reported that oxazepam is not stable in the conditions currently used in the test.

(BPC: M. Marques.) RTS—C71173

Oxazepam Capsules

DEFINITION

Oxazepam Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of $C_{15}H_{11}ClN_2O_2$.

IDENTIFICATION

- The solution prepared for measurement of absorbance in the *Assay* exhibits a maximum at 229 ± 2 nm.

ASSAY

- **PROCEDURE**

Standard solution: 4 µg/mL of USP Oxazepam RS in alcohol

Sample solution: Remove, as completely as possible, the contents of NLT 20 Capsules, and weigh. Transfer a portion of the mixed powder, nominally equivalent to 50 mg of oxazepam,

In-Process Revision

to a medium-porosity, sintered-glass funnel that is fitted into a small suction flask. Add 25 mL of alcohol, mix with the aid of a stirring rod, and after about 5 min apply gentle suction to remove the extract. Repeat the extraction with four additional 25-mL portions of alcohol, transfer the extracts to a 250-mL volumetric flask, and dilute with alcohol to volume. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, and dilute with alcohol to volume.

Spectrometric conditions
Cell: 1 cm
Detector: UV 229 nm
Blank: Alcohol

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{15}H_{11}ClN_2O_2$ in the portion of Capsules taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the solution from the Capsules
A_S = absorbance of the solution from the *Standard solution*
C_S = concentration of the *Standard solution* (µg/mL)
C_U = concentration of the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

BRIEFING

Pectin, *USP 31* page 2923. It is proposed to make the following revisions, on the basis of comments and data received and to align with the Pectins monograph in the *Food Chemicals Codex, 6th Edition*. Interested parties are encouraged to comment on the proposal.

1. A chemical structure for this material is proposed.
2. The *Definition* for Pectin is updated.
3. The empirical *Identification* tests based on precipitations are replaced by a highly specific *Identification* procedure using Pectate Lyase.
4. The *Assay* for *Methoxy Groups* is replaced by the *Assay* for *Degree of Esterification* and subsequently the *Assay* for *Methoxy Groups* is added. In both procedures, a calculation formula is provided.
5. In the *Assay* for *Degree of Esterification*, 0.1 N sodium hydroxide VS is used instead of 0.5 N sodium hydroxide VS, in order to improve the precision for titration using sodium hydroxide.
6. The *Assay* for *Galacturonic Acid* is accordingly updated and a calculation formula is provided.
7. The *Lead* test is replaced by a *Lead* test using ICP, based on the method published in the *Food Chemicals Codex, 6th Edition*.
8. A test for *Sulfur Dioxide* is proposed in the monograph. See the revision to *Sulfur Dioxide* ⟨525⟩, proposed elsewhere in this issue of *PF*.
9. A test for *Methanol, Ethanol, and Isopropanol* is added to the monograph. Thus, USP Methyl Alcohol RS, USP Alcohol RS, USP 2-Propanol RS, and USP 2-Butanol RS are introduced into the monograph. The gas chromatographic procedure is based on analysis performed with the Phenomenex Zebron ZB-624 brand of capillary column or Varian CP-PoraBond Q brand of capillary column. The typical retention times for methanol, ethanol, 2-propanol, and 2-butanol are 2.1, 2.5, 2.8, and 4.2 min, respectively.
10. The *Microbial Enumeration Tests* ⟨61⟩ and *Tests for Specified Microorganisms* ⟨62⟩ specifications are revised to be consistent with the general requirement for drug substances and excipients recommended by the USP Microbiology and Sterility Assurance Expert Committee.
11. A storage condition is proposed in the *Packaging and Storage* section.
12. The *Labeling* section is updated to align with proposed changes to the *Definition* section.
13. A *USP Reference Standards* section is added.

Other changes are editorial in nature.

Pectin [9000-69-5].

In-Process Revision

DEFINITION

Change to read:

~~Pectin is a purified carbohydrate product obtained from the dilute acid extract of the inner portion of the rind of citrus fruits or from apple pomace. It consists chiefly of partially methoxylated polygalacturonic acids.~~

~~Pectin yields NLT 6.7% of methoxy groups (=OCH_3) and NLT 74.0% of galacturonic acid ($C_6H_{10}O_7$), calculated on the dried basis.~~

~~[NOTE—Commercial pectin for the production of jellied food products is standardized to the convenient "150 jelly grade" by addition of dextrose or other sugars, and sometimes contains sodium citrate or other buffer salts. This monograph refers to the pure pectin to which no such additions have been made.]~~

■Pectin is a purified carbohydrate polymer consisting mainly of a linear backbone of partially methoxylated alpha (1-4) linked D-galacturonic acid. It is obtained from the dilute acid extract of the rind of citrus fruits or from apple pomace. No organic solvents other than methanol, ethanol, and isopropanol are used during its production. Pectin yields NLT 74.0% of galacturonic acid ($C_6H_{10}O_7$), calculated on the dried basis.

[NOTE—Commercial pectin for the production of jellied food products is standardized to the convenient "150 jelly grade" by addition of dextrose or other sugars, and sometimes contains sodium citrate or other buffer salts. This monograph refers to the pectin to which no such additions have been made.]■1S (*USP33*)

IDENTIFICATION

Delete the following:

~~■• **A.** Heat 1 g with 9 mL of water on a steam bath until a solution is formed, replacing water lost by evaporation. it forms a stiff gel on cooling.~~■1S (*USP33*)

Delete the following:

~~■• **B.** To a 1:100 solution add an equal volume of alcohol. a translucent, gelatinous precipitate is formed (distinction from most gums).~~■1S (*USP33*)

Delete the following:

~~■• **C.** To a 1:100 solution add 2 N sodium hydroxide (5:1), and allow to stand at room temperature for 15 min. a gel or semigel forms (distinction from tragacanth).~~■1S (*USP33*)

Delete the following:

~~■• **D.** Acidify the gel from the preceding test with 3 N hydrochloric acid, and shake. a voluminous, colorless, gelatinous precipitate forms, which upon boiling becomes white and flocculent (pectic acid).~~■1S (*USP33*)

Add the following:

■• **PROCEDURE**

Sample stock solution: Transfer a quantity of Pectin, equivalent to 0.05 g on the dried basis, to a suitable container, and moisten with 250 µL of 2-propanol. Add 50 mL of water to the container, and mix the solution using a magnetic stirrer. Use 0.5 N sodium hydroxide to adjust the pH of the solution to 12, stop the stirrer, and allow the solution to stand undisturbed at room temperature for 15 min. Adjust the pH of the solution to 7.0 using 0.5 N hydrochloric acid. Dilute with water to 100 mL.

Tris buffer solution: Transfer 6.055 g of Tris(hydroxylmethyl)aminomethane and 0.147 g of calcium chloride ($CaCl_2 \cdot H_2O$) to a 1000-mL volumetric flask containing 950 mL of water. Adjust the pH of the solution to 7.0 with 1 N hydrochloric acid. Dilute with water to volume.

Enzyme solution: Mix pectate lyase[1] with *Tris buffer solution* to make a solution (1 in 100).

Sample blank: Mix 0.5 mL of *Tris buffer solution*, 1.0 mL of *Sample stock solution*, and 1.0 mL of water in a quartz cuvette.

Enzyme blank: Mix 0.5 mL of *Tris buffer solution*, 1.5 mL of water, and 0.5 mL of *Enzyme solution* in a quartz cuvette.

Sample solution: Mix 0.5 mL of *Tris buffer solution*, 1.0 mL of *Sample stock solution*, 0.5 mL of water, and 0.5 mL of *Enzyme solution* in a quartz cuvette.

Analysis

Samples: *Enzyme blank*, *Sample blank*, and *Sample solution*

Perform the test with the *Samples* using a suitable ultraviolet/visible spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) and using water as a blank. Measure the absorbance at 235 nm immediately after mixing the solutions well, and record the value at time 0 for the *Enzyme blank*, $A_{0\text{-}EB}$; for the *Sample blank*, $A_{0\text{-}TB}$; and for the *Sample solution*, $A_{0\text{-}TS}$. After incubation at room temperature for 10 min, determine the absorbance again at 235 nm for the *Enzyme blank*, $A_{10\text{-}EB}$; for the *Sample blank*, $A_{10\text{-}TB}$; and for the *Sample solution*, $A_{10\text{-}TS}$. Calculate the corrected absorbance A_0 at time 0 and the corrected absorbance A_{10} at 10 min:

$$A_0 = A_{0\text{-}TS} - (A_{0\text{-}EB} + A_{0\text{-}TB})$$

$$A_{10} = A_{10\text{-}TS} - (A_{10\text{-}EB} + A_{10\text{-}TB})$$

Calculate the quantity of unsaturated product produced:

$$\text{Result} = (A_{10} - A_0)/(\varepsilon_{235} \times L)$$

ε_{235} = molar extinction coefficient of the reaction product (4600 $M^{-1} \cdot cm^{-1}$)

L = path length of the reaction cuvette, 1 cm

Acceptance criteria: The amount of unsaturated product is NLT 0.5×10^{-5} M.■1S (*USP33*)

ASSAY

Change to read:

• ~~**METHOXY GROUPS**~~■**DEGREE OF ESTERIFICATION**■1S (*USP33*)

Sample: 5.0 g

Analysis: Transfer the *Sample* to a suitable beaker, and stir for 10 min with a mixture of 5 mL of hydrochloric acid and 100 mL of 60% alcohol. Transfer to a sintered-glass filter (30- to 60-mL crucible or Büchner type, coarse), and wash with six 15-mL portions of the hydrochloric acid–60% alcohol mixture, followed by 60% alcohol until the filtrate is free from chlorides. Finally wash with 20 mL of alcohol, dry for 1 h at 105°, cool, and weigh. Transfer exactly one-tenth of the total net weight of the dried *Sample* (representing 500 mg of the original unwashed *Sample*) to a 250-mL conical flask, and moisten with 2 mL of alcohol. Add 100 mL of carbon dioxide-free water, insert the stopper, and swirl occasionally until the Pectin is completely dissolved. ~~Add 5 drops of phenolphthalein TS, titrate with 0.5 N sodium hydroxide VS, and record the results as the initial titer. Add 20.0 mL of 0.5 N sodium hydroxide VS, insert the stopper, shake vigorously, and allow to stand for 15 min. Add 20.0 mL of 0.5 N hydrochloric acid VS, and shake until the pink color disappears. Add phenolphthalein TS, and titrate with 0.5 N sodium hydroxide VS to a faint~~

[1] A suitable pure enzyme is available from Megazyme International Ireland Ltd., Bray Business Park, Bray, Co. Wicklow, Ireland (www.megazyme.com).

In-Process Revision

~~pink color that persists after vigorous shaking: record this value as the saponification titer. Each mL of 0.5 N sodium hydroxide used in the saponification titer is equivalent to 15.52 mg of $-OCH_3$.~~■Add 5 drops of phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS. Perform a blank determination, and make any necessary correction. Record the results as the initial titer, V_I (mL). Add 20.0 mL of 0.5 N sodium hydroxide VS, insert the stopper, shake vigorously, and allow to stand for 15 min. Add 20.0 mL of 0.5 N hydrochloric acid VS, and shake until the pink color disappears. Add phenolphthalein TS, and titrate with 0.1 N sodium hydroxide VS to a faint pink color that persists after vigorous shaking. Perform a blank determination, and make any necessary correction. Record this value as the saponification titer, V_S (mL). Calculate the degree of esterification:

$$\text{Result} = [V_S/(V_I + V_S)] \times 100$$ ■1S *(USP33)*

Acceptance criteria: ~~NLT 6.7%~~■The value for *Degree of Esterification* is within the range stated on the label.■1S *(USP33)*

Change to read:

• **GALACTURONIC ACID:** ~~Each mL of 0.5 N sodium hydroxide used in the total titration (the initial titer added to the saponification titer) in the *Assay* for *Methoxy Groups* is equivalent to 97.07 mg of $C_6H_{10}O_7$.~~■Each mL of 0.1 N sodium hydroxide used in the total titration (the initial titer added to the saponification titer) in the *Assay* for *Degree of Esterification* is equivalent to 19.41 mg of $C_6H_{10}O_7$. Calculate the percentage of galacturonic acid in the portion of Pectin taken:

$$\text{Result} = 19.41 \times [(V_I + V_S)/W] \times 100$$

W = weight of the original unwashed and dried Pectin taken to prepare the solution for titration (mg)

■1S *(USP33)*

Acceptance criteria: NLT 74.0%

Add the following:

■• **METHOXY GROUPS:** Each mL of 0.1 N sodium hydroxide used in the saponification titer in the *Assay* for *Degree of Esterification* is equivalent to 3.10 mg of $-OCH_3$. Calculate the percentage of methoxy groups in the portion of Pectin taken:

$$\text{Result} = 3.10 \times (V_S/W) \times 100$$

W = weight of the original unwashed and dried Pectin taken to prepare the solution for titration (mg)

Acceptance criteria: The percentage of methoxy groups is within the range stated on the label.■1S *(USP33)*

Change to read:

Inorganic Impurities

• **ARSENIC,** *Method II* ⟨**211**⟩**:** NMT 3 ppm

• ~~**LEAD** ⟨251⟩~~

~~**Sample:** 2.0 g~~

~~**Analysis:** Add the *Sample* to 20 mL of nitric acid in a 250-mL conical flask, mix, and heat the contents carefully until the Pectin is dissolved. Continue the heating until the volume is reduced to about 7 mL. Cool rapidly to room temperature, transfer to a 100-mL volumetric flask, and dilute with water to volume. Transfer 50 mL and follow the *Procedure* outlined in *Lead* ⟨251⟩ with the following exceptions. Use 15 mL of *Ammonium Citrate Solution*, 3 mL of *Potassium Cyanide Solution*, and 500 µL of *Hydroxylamine Hydrochloride Solution*. After the first dithizone extractions, wash the combined chloroform layers with 5 mL of water, discarding the water layer and continuing in the usual manner by extracting with 20 mL of dilute nitric acid (1 in 100).~~

~~**Acceptance criteria:** NMT 5 µg of lead (corresponding to NMT 5 ppm)~~

■• **LEAD**

Standard stock solution: 1000 µg/mL of lead. [NOTE—Use a commercially available certified solution.]

Standard solution: 2 µg/mL of lead, prepared immediately before use by pipetting 0.10 mL of *Standard stock solution* into a 50-mL volumetric flask containing 30 mL of water, 4 mL of 20% hydrochloric acid, and 4 mL of 0.1 M EDTA. Dilute with water to volume, and mix.

Reference solution: 0.4 µg/mL of lead, prepared by pipetting 5.0 mL of the *Standard solution* into a 25-mL volumetric flask containing 10 mL of water, 2 mL of 20% hydrochloric acid, and 2 mL of 0.1 M EDTA. Dilute with water to volume, and mix.

Blank solution: Add 30 mL of water, 4 mL of 20% hydrochloric acid, and 4 mL of 0.1 M EDTA into a 50-mL volumetric flask. Dilute with water to volume, and mix.

Sample solution: Transfer 2.0 g of Pectin to a clean, 100-mL glass beaker, add 25 mL of 70% nitric acid, cover with a watch glass, and heat at low to moderate heat on a hot plate in a fume hood for 2 h. Remove the watch glass, and continue to heat until the sample is dry with no visible fumes. Add 0.5 mL of 70% nitric acid, and heat to dryness. Cool to room temperature, and add 2 mL of 20% hydrochloric acid and 2 mL of 0.1 M EDTA. Quantitatively transfer the solution to a 25-mL volumetric flask, dilute with water to volume, and mix.

Analysis: Lead is determined using an inductively coupled plasma–atomic emission spectrometer (ICP–AES) (see *Plasma Spectrochemistry* ⟨730⟩) by measuring the emission at 220.35 nm with the settings optimized as directed by the manufacturer.

Instrument performance must be verified to conform to the manufacturer's specifications for resolution and sensitivity. Before analyzing samples, the instrument must pass a suitable performance check. Calibrate the instrument with the *Blank solution* and the *Standard solution*. Then analyze the *Reference solution* and the *Sample solution*.

Acceptance criteria: The concentration in the *Sample solution* is NMT that in the *Reference solution*, corresponding to NMT 5 ppm of lead.■1S *(USP33)*

Organic Impurities

• **PROCEDURE 1: SUGARS AND ORGANIC ACIDS**

Sample: 1 g

Analysis: ~~Moisten the *Sample* with 3–5 mL of alcohol, pour in rapidly 100 mL water, shake, and allow to stand until the solution is complete. To this solution add 100 mL of alcohol containing 0.3 mL of hydrochloric acid, mix, and filter rapidly. Measure 25 mL of the filtrate into a tared dish, evaporate the liquid on a steam bath, and dry the residue in a vacuum oven at 50° for 2 h.~~ ■Place the *Sample* in a 500-mL flask, moisten with 3–5 mL of alcohol, rapidly pour in 100 mL of water, shake, and allow to stand until the solution is complete. To this solution add 100 mL of alcohol containing 0.3 mL of hydrochloric acid, mix, and filter rapidly. Measure 25 mL of the filtrate into a tared dish, evaporate the liquid on a steam bath, and dry the residue in a vacuum oven at 50° for 2 h.■1S *(USP33)*

Acceptance criteria: The weight of the residue does not exceed 20 mg, ■corresponding to NMT 16% of sugars and organic acids.■1S *(USP33)*

In-Process Revision

■• **PROCEDURE 2: SULFUR DIOXIDE,** *Method V* ⟨**525**⟩
Sample: 100 g
Analysis: Suspend the *Sample* in 500 mL of methanol, then transfer this mixture to the flask (C). Prepare a mixture of 20 mL of hydrochloric acid and 10 mL of water, and transfer it to the separatory funnel (B). Add 10 mL of hydrogen peroxide solution to the vessel (G). Perform the refluxing for 2 h before removing the vessel (G).
Acceptance criteria: NMT 50 ppm

• **PROCEDURE 3: METHANOL (METHYL ALCOHOL), ETHANOL (ALCOHOL), AND ISOPROPANOL (2-PROPANOL)**
[NOTE—Residual alcohols are volatile. They should be stored in a cool and dry place. When preparing the *Standard stock solution*, *Standard solutions*, and *Internal standard stock solution* for residual alcohols, mix thoroughly and keep the solutions at 20° when diluting with water to volume.]
Standard stock solution: 5000 µg/mL each for USP Methyl Alcohol RS, USP Alcohol RS, and USP 2-Propanol RS
Internal standard stock solution: 5000 µg/mL of USP 2-Butanol RS. [NOTE—This solution can be stored at 5–8° for 3 months.]
Standard solution: To a 250-mL volumetric flask add 2.5 mL of *Standard stock solution* and 2.5 mL of *Internal standard stock solution*. Dilute with water to volume, and mix. This solution contains 50 µg/mL each for USP Methyl Alcohol RS, USP Alcohol RS, USP 2-Propanol RS, and USP 2-Butanol RS. [NOTE—This solution can be stored at 5–8° for 3 months.] Transfer 1.0 g of this solution to a 10-mL headspace vial.
Sample solution: Transfer 1.0 g of Pectin and 5 g of sucrose to a stoppered 100-mL Erlenmeyer flask containing 90 mL of water, add 1.0 mL of *Internal standard stock solution*, and dilute with water to 100 mL. Mix the solution using a magnetic stirrer. Continue stirring until all Pectin has been completely dissolved; typically it takes about 1–2 h. This solution contains 50 µg/mL for USP 2-Butanol RS. Transfer 1.0 g of this solution to a 10-mL headspace vial.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: Headspace GC
Detector: Flame ionization
Column: 0.32-mm × 30-m capillary column; 1.8-µm layer of phase G43. [NOTE—An alternative column such as a 0.32-mm × 25-m capillary column bonded with a 5-µm layer of phase S3 can be used as long as the system suitability requirements are met.]
Temperature
Detector: 280°
Column: 70°
Injection port: 200°
Carrier gas: Nitrogen
Flow rate: 1.5 mL/min
Make up gas: Nitrogen
Split flow rate: 30 mL/min
Injection size: 1 mL (the gaseous headspace)
Injection type: Split ratio 20:1
Balanced pressure automatic headspace sampler
Equilibration time: 10 min
Equilibration temperature: 70°
Agitation speed: 500 rpm
Agitation on time: 5 s
Agitation off time: 90 s
Syringe tempertature: 80°
Syringe size: 2.5 mL
Fill speed: 100 µL/s
Pull-up delay: 2.0 s
GC run time: 10.5 min
[NOTE—These GC conditions should be optimized according to the instruments used.]

System suitability
Sample: *Standard solution*
[NOTE—See the relative retention times table below.]

Component	Relative Retention Time (RRT)
Methanol	0.5
Ethanol	0.6
2-Propanol	0.7
2-Butanol	1.0

Suitability requirements
Resolution: NLT 1.5, between each pair of analytes
Relative standard deviation: NMT 10%, determined from each analyte
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of methanol, ethanol, and 2-propanol in the portion of Pectin taken:

$$\text{Result} = (R_U/R_S) \times (C/W) \times F \times V \times 100$$

R_U = ratio of the peak area of the respective alcohol to the peak area of the internal standard peak from the *Sample solution*
R_S = ratio of the peak area of the respective alcohol to the peak area of the internal standard peak from the *Standard solution*
C = concentration of the respective residual alcohol (methanol, or ethanol, or 2-propanol) in the *Standard solution* (µg/mL)
W = weight of Pectin taken to prepare the *Sample solution* (g)
F = conversion factor (10^{-6} g/µg)
V = volume of the *Sample solution*, 100 mL
Acceptance criteria: NMT 1% for total methanol, ethanol, and isopropanol■1S *(USP33)*

SPECIFIC TESTS

Change to read:

• **MICROBIAL ENUMERATION TESTS** ⟨**61**⟩**:** ~~It meets the requirements of the test for absence of *Salmonella* species.~~■The total aerobic microbial count is NMT 1000 cfu/g, and the total combined molds and yeasts count is NMT 100 cfu/g.■1S *(USP33)*

• **LOSS ON DRYING** ⟨**731**⟩**:** Dry a sample at 105° for 3 h: it loses NMT 10.0% of its weight.

ADDITIONAL REQUIREMENTS

BRIEFING

Praziquantel Tablets, *USP 32* page 3363. It is proposed to include a *Dissolution* test for veterinary products. The chromatographic procedure in this test was validated using an Ultracarb ODS brand of packing L1.

(BPC: M. Marques.) RTS—C62946

Praziquantel Tablets

DEFINITION
Praziquantel Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of $C_{19}H_{24}N_2O_2$.

IDENTIFICATION
• **PROCEDURE**
Sample solution: Equivalent to 30 mg of praziquantel from a quantity of powdered Tablets, in a centrifuge tube. Add 5 mL of methanol, agitate for 5 min, and centrifuge. Use the clear supernatant.
Standard solution: 6 mg/mL of USP Praziquantel RS in methanol
Chromatographic system
(See *Chromatography* ⟨621⟩*, Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
Application volume: 10 µL
Developing solvent system: Ethyl acetate
Analysis
Samples: *Standard solution* and *Sample solution*
Apply separately the *Sample solution* and *Standard solution*, each as 1-cm wide bands, to a chromatographic plate. Proceed as directed in the general chapter. Develop the chromatogram in an unsaturated chamber, using the *Developing solvent system*, until the solvent front has moved 8 cm. Remove the plate from the chamber, air-dry, and examine under short-wavelength UV light.
Acceptance criteria: The R_F value of the principal band of the *Sample solution* corresponds to that of the *Standard solution.*

ASSAY
• **PROCEDURE**
Mobile phase: Acetonitrile and water (3:2)
Standard solution: 0.18 mg/mL of USP Praziquantel RS in *Mobile phase*
Sample stock solution: Transfer an equivalent to 150 mg of praziquantel, from finely powdered Tablets (NLT 20), to a 100-mL volumetric flask. Add 70 mL of *Mobile phase*, sonicate for 5 min, dilute with *Mobile phase* to volume, mix, and filter.
Sample solution: Transfer 3.0 mL of the filtrate to a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 210 nm
Column: 4-mm × 25-cm; 10-µm packing L1
Flow rate: 1.5 mL/min
Injection size: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 1.5
Relative standard deviation: NMT 1.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{19}H_{24}N_2O_2$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Praziquantel RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of praziquantel in the *Sample solution* (mg/mL)
Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Change to read:

• **DISSOLUTION** ⟨711⟩

BRIEFING

Promethazine Hydrochloride and Codeine Phosphate Oral Solution. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The liquid chromatographic procedure in the *Assay* was validated with a GL Sciences Intersil ODS-3 brand of L1 column, in which codeine elutes at about 21 min and promethazine elutes at about 39 min. The liquid chromatographic procedure in *Procedure 1* under *Organic Impurities* was validated with a Waters Symmetry brand of L1 column, in which promethazine elutes at about 10 min. The liquid chromatographic procedure in *Procedure 2* under *Organic Impurities* was validated with a GL Sciences Intersil ODS-3 brand of L1 column, in which promethazine elutes at about 39 min.

(MD-CCA: D. Vicchio, C. Anthony. MSA: R. Tirumalai.)
RTS—C62808

Add the following:

■Promethazine Hydrochloride and Codeine Phosphate Oral Solution

DEFINITION
Promethazine Hydrochloride and Codeine Phosphate Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of both promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$) and codeine phosphate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot {}^1/_2H_2O$). It may contain suitable preservatives.

IDENTIFICATION
• The retention times of the promethazine hydrochloride and codeine phosphate peaks of the sample solutions correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY
• **PROCEDURE**
[NOTE—At all times, protect the sample and standard solutions by using low-actinic glassware.]
Solution A: Dissolve 2.0 g of monobasic potassium phosphate and 1.0 g of heptane sulfonic acid sodium salt monohydrate in 950 mL of water, carefully add 50 mL of acetonitrile, and mix. Adjust the apparent pH to 3.0 with phosphoric acid.
Solution B: Dissolve 2.0 g of monobasic potassium phosphate and 1.0 g of heptane sulfonic acid sodium salt monohydrate in 500 mL of water, carefully add 500 mL of acetonitrile, and mix. Adjust the apparent pH to 3.0 with phosphoric acid.
Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
1.0	100	0
50.0	0	100
50.1	100	0
55.0	100	0

Standard stock solution A: 1.8 mg/mL of USP Promethazine Hydrochloride RS and 2.8 mg/mL of USP Codeine Phosphate RS in *Solution A*
Standard stock solution B: Dissolve USP Methylparaben RS, USP Propylparaben RS, and USP Sodium Benzoate RS into a volume of acetonitrile equivalent to 40% of the total volume of the flask. Dilute with *Solution A* to volume, to obtain a solution containing 1.4 mg/mL of USP Sodium Benzoate RS, 2.5 mg/mL of USP Methylparaben RS, and 0.28 mg/mL of USP Propylparaben RS.
Standard solution: Transfer 5.0 mL each of *Standard stock solution A* and *Standard stock solution B* to a 50-mL volumetric flask, and dilute with *Solution A* to volume. This solution contains 0.18 mg/mL of USP Promethazine Hydrochloride RS, 0.28 mg/mL of USP Codeine Phosphate RS, 0.14 mg/mL of USP Sodium Benzoate RS, 0.25 mg/mL of USP Methylparaben RS, and 0.028 mg/mL of USP Propylparaben RS.
Promethazine hydrochloride sample solution: Equivalent to 0.18 mg/mL, based on the label claim, of promethazine hydrochloride in *Solution A*
Codeine phosphate sample solution: Equivalent to 0.28 mg/mL, based on the label claim, of codeine phosphate in *Solution A*
Chromatographic system
(See *Chromatography ⟨621⟩, System Suitability*.)
Mode: LC
Detector: UV 280 nm
Column: 4.6-mm × 25-cm column; 5-µm packing L1
Column temperature: 40°
Flow rate: 1.5 mL/min
Injection size: 15 µL
System suitability
Sample: *Standard solution*
[NOTE—The relative retention times for benzoate, methylparaben, and propylparaben are 0.59, 0.64, and 1.05, respectively.]
Suitability requirements
Resolution: NLT 4.5 between benzoate and methylparaben; NLT 1.5 between promethazine and propylparaben
Relative standard deviation: NMT 2.0% for both promethazine and codeine
Analysis
Samples: *Standard solution* and *Promethazine hydrochloride sample solution*
Calculate the quantity, in percent of label claim, of $C_{17}H_{20}N_2S \cdot HCl$ in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

In-Process Revision

r_U = promethazine peak response from the *Promethazine hydrochloride sample solution*
r_S = promethazine peak response from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = concentration of the *Promethazine hydrochloride sample solution* (mg/mL)

Samples: *Standard solution* and *Codeine phosphate sample solution*

Calculate the quantity, in percent of label claim, of $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot {}^1/_2H_2O$ in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (Mr_1/Mr_2) \times 100$$

r_U = codeine peak response from the *Codeine phosphate sample solution*
r_S = codeine peak response from the *Standard solution*
C_S = concentration, on the dried basis, of USP Codeine Phosphate RS in the *Standard solution* (mg/mL)
C_U = concentration of the *Codeine phosphate sample solution* (mg/mL)
Mr_1 = molecular weight of codeine phosphate, 406.37
Mr_2 = molecular weight of anhydrous codeine phosphate, 397.37

Acceptance criteria: 90.0%–110.0% for both promethazine hydrochloride and codeine phosphate

IMPURITIES

Organic Impurities

• **PROCEDURE 1**

[NOTE—At all times, protect the sample and standard solutions by using low-actinic glassware.]

Solution C: Dissolve 4.36 g of dibasic potassium phosphate in 1 L of water, add 2.0 mL of triethylamine, and adjust the pH to 6.4 with phosphoric acid.

5 N phosphoric acid: Carefully dilute 12 mL of phosphoric acid with water to 100 mL.

Diluent: Methanol, water, and *5 N phosphoric acid* (5:95:1)

Mobile phase: Acetonitrile, methanol, and *Solution C* (3:2:5)

Standard solution: 3.5 µg/mL of USP Promethazine Hydrochloride RS in *Diluent*

Sensitivity solution: 0.18 µg/mL of USP Promethazine Hydrochloride RS in *Diluent*, from the *Standard solution* [NOTE—Prepare at time of use.]

Promethazine hydrochloride sample solution: Equivalent to 175 µg/mL of promethazine hydrochloride in *Diluent*

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 15-cm column; 5-µm packing L1

Flow rate: 1.5 mL/min

Injection size: 10 µL

Run time: 2 times the retention time of promethazine for Standards; 6 times the retention time of promethazine for samples

System suitability

Samples: *Standard solution* and *Sensitivity solution*

Suitability requirements

Tailing factor: NMT 1.5 for the promethazine peak, *Standard solution*

Relative standard deviation: NMT 7.5% for the promethazine peak, *Standard solution*

Sensitivity: Signal-to-noise NLT 10 for the promethazine peak, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Promethazine hydrochloride sample solution*

Calculate the percentage of each impurity in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (100/F)$$

r_U = peak response of the impurity from the *Promethazine hydrochloride sample solution*
r_S = promethazine hydrochloride peak response from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = concentration of the *Promethazine hydrochloride sample solution* (µg/mL)
F = relative response factor for each impurity shown in *Impurity Table 1*

Acceptance criteria

Individual impurities: See *Impurity Table 1*.

Impurity Table 1

Name	Relative Retention Time (RRT)	Relative Response Factor (F)	Limit (%)
Promethazine	1.0	1.0	—
Phenothiazine	2.4	2.0	0.5
Methylphenothiazine[a]	4.2	2.0	0.5

[a]10-Methylphenothiazine.

• **PROCEDURE 2**

[NOTE—At all times, protect the sample and standard solutions by using low-actinic glassware.]

Solution A, Solution B, and **Mobile phase:** Proceed as directed in the *Assay.*

Standard stock solution A: 88 µg/mL of USP Promethazine Hydrochloride RS in *Solution A*

Standard stock solution B: Proceed as directed in the *Assay.*

Standard solution: Transfer 5.0 mL of *Standard stock solution A* and 5.0 mL of *Standard stock solution B* into a 50-mL volumetric flask, and dilute with *Solution A* to volume. This solution contains 8.8 µg/mL of USP Promethazine Hydrochloride RS, 140 µg/mL of USP Sodium Benzoate RS, 250 µg/mL of USP Methylparaben RS, and 28 µg/mL of USP Propylparaben RS.

Sensitivity solution: 0.18 µg/mL of USP Promethazine Hydrochloride RS in *Solution A*, from *Standard stock solution A* [NOTE—Prepare at time of use.]

Promethazine hydrochloride sample solution: Proceed as directed in the *Assay.*

[NOTE—Use this solution to determine promethazine specified and unidentified impurities, and any unspecified impurities.]

Codeine phosphate sample solution: Proceed as directed in the *Assay.*

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm column; 5-µm packing L1

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection size: 50 µL

System suitability

Samples: *Standard solution* and *Sensitivity solution*

[NOTE—The relative retention times for benzoate, methylparaben, and propylparaben are 0.59, 0.64, and 1.05, respectively.]

Suitability requirements

Resolution: NLT 4.5 between benzoate and methylparaben; NLT 1.5 between promethazine and propylparaben, *Standard solution*

Relative standard deviation: NMT 7.5% for promethazine, *Standard solution*

Signal-to-noise ratio: NLT 10 for promethazine, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Promethazine hydrochloride sample solution*

Using the data in *Impurity Table 2*, calculate the percentage of promethazine specified and unidentified impurities, and any unspecified impurities, in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (100/F)$$

r_U = peak response of the impurity from the *Promethazine hydrochloride sample solution*
r_S = promethazine hydrochloride peak response from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = concentration of the *Promethazine hydrochloride sample solution* (µg/mL)
F = relative response factor for each impurity shown in *Impurity Table 2*

Samples: *Standard solution* and *Codeine phosphate sample solution*

Identify the codeine impurities using the relative retention times given in *Impurity Table 2*. Calculate the percentage of each codeine impurity in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (100/F)$$

r_U = peak response of the impurity from the *Codeine phosphate sample solution*
r_S = promethazine hydrochloride peak response from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = concentration of the *Codeine phosphate sample solution* (µg/mL)
F = relative response factor for each impurity shown in *Impurity Table 2*

Acceptance criteria

Individual impurities: See *Impurity Tables 1* and *2*.
Total codeine impurities: NMT 1.0%
Total unspecified impurities: NMT 1.5%
Total specified and unidentified promethazine impurities: NMT 5.0%
Total impurities: NMT 7.5% [NOTE—Sum of total codeine impurities, total promethazine specified and unidentified impurities, and *Total unspecified impurities*.]

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** ⟨**61**⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨**62**⟩**:** The total aerobic microbial limit does not exceed 100 cfu/mL. The total yeasts and molds count does not exceed 10 cfu/mL. It meets the requirements for absence of *Escherichia coli.*
- **pH** ⟨**791**⟩**:** 4.1–5.1
- **ALCOHOL DETERMINATION** (if present)**,** *Method II* ⟨**611**⟩**:** Between 90.0% and 110.0% of the labeled quantity of C_2H_5OH
- **DELIVERABLE VOLUME** ⟨**698**⟩**:** Meets the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light resistant containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** ⟨**11**⟩
  USP Codeine Phosphate RS
  USP Methylparaben RS
  USP Promethazine Hydrochloride RS
  USP Propylparaben RS
  USP Sodium Benzoate RS

BRIEFING

Promethazine Hydrochloride and Dextromethorphan Hydrobromide Oral Solution. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The liquid chromatographic procedure for the *Assay* was validated with a GL Sciences Intersil ODS-3 brand of L1 column, in which dextromethorphan elutes at about 36 min and promethazine elutes at about 39 min. The liquid chromatographic procedure in *Procedure 1* under *Organic Impurities* was validated with a Waters Symmetry brand of L1 column, in which promethazine elutes at about 10 min. The liquid chromatographic procedure in *Procedure 2* under *Organic Impurities* was validated with a GL Sciences Intersil ODS-3 brand of L1 column, in which promethazine elutes at about 39 min.

(MD-CCA: D. Vicchio, C. Anthony. MSA: R. Tirumalai.) RTS—C62808

Add the following:

■Promethazine Hydrochloride and Dextromethorphan Hydrobromide Oral Solution

DEFINITION

Promethazine Hydrochloride and Dextromethorphan Hydrobromide Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of both promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$) and dextromethorphan hydrobromide ($C_{18}H_{25}NO \cdot HBr \cdot H_2O$). It may contain suitable preservatives.

IDENTIFICATION

- The retention times of the promethazine hydrochloride and dextromethorphan hydrobromide peaks of the sample solutions correspond to those of the *Standard solution* as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

[NOTE—At all times, protect the sample and standard solutions by using low actinic glassware.]

Solution A: Dissolve 2.0 g of monobasic potassium phosphate and 1.0 g of heptane sulfonic acid sodium salt monohydrate in 950 mL of water, carefully add 50 mL of acetonitrile, and mix. Adjust the apparent pH to 3.0 with phosphoric acid.
Solution B: Dissolve 2.0 g of monobasic potassium phosphate and 1.0 g of heptane sulfonic acid sodium salt monohydrate in 500 mL of water, carefully add 500 mL of acetonitrile, and mix. Adjust the apparent pH to 3.0 with phosphoric acid.
Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
1.0	100	0
50.0	0	100
50.1	100	0
55.0	100	0

Standard stock solution A: 1.8 mg/mL of USP Promethazine Hydrochloride RS and 4.2 mg/mL of USP Dextromethorphan Hydrobromide RS in *Solution A*
Standard stock solution B: Dissolve USP Methylparaben RS, USP Propylparaben RS, and USP Sodium Benzoate RS into a volume of acetonitrile equivalent to 40% of the total volume of the flask. Dilute with *Solution A* to volume to obtain a solution containing 1.4 mg/mL of USP Sodium Benzoate RS, 2.5 mg/mL of USP Methylparaben RS, and 0.28 mg/mL of USP Propylparaben RS.
Standard solution: Transfer 5.0 mL each of *Standard stock solution A* and *Standard stock solution B* to a 50-mL volumetric flask, and dilute with *Solution A* to volume. This solution contains 0.18 mg/mL of USP Promethazine Hydrochloride RS, 0.42 mg/mL of anhydrous USP Dextromethorphan Hydrobromide RS, 0.14 mg/mL of USP Sodium Benzoate RS, 0.25 mg/mL of USP Methylparaben RS, and 0.028 mg/mL of USP Propylparaben RS.
Promethazine hydrochloride sample solution: Equivalent to 0.18 mg/mL of promethazine hydrochloride in *Solution A*
Dextromethorphan hydrobromide sample solution: Equivalent to 0.42 mg/mL of dextromethorphan hydrobromide in *Solution A*
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 280 nm
Column: 4.6-mm × 25-cm column; 5-µm packing L1
Column temperature: 40°
Flow rate: 1.5 mL/min
Injection size: 15 µL
System suitability
Sample: *Standard solution*
[NOTE—The relative retention times for benzoate, methylparaben, and propylparaben are 0.59, 0.64, and 1.05, respectively.]

In-Process Revision

Suitability requirements
Resolution: NLT 4.5 between benzoate and methylparaben; NLT 1.5 between promethazine and propylparaben
Relative standard deviation: NMT 2.0% for both promethazine and dextromethorphan
Analysis
Samples: *Standard solution* and *Promethazine hydrochloride sample solution*
Calculate the quantity, in percent of label claim, of $C_{17}H_{20}N_2S \cdot HCl$ in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = promethazine peak response from the *Promethazine hydrochloride sample solution*
r_S = promethazine peak response from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = concentration of the *Promethazine hydrochloride sample solution* (mg/mL)

Samples: *Standard solution* and *Dextromethorphan hydrobromide sample solution*
Calculate the quantity, in percent of label claim, of $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (Mr_1/Mr_2) \times 100$$

r_U = dextromethorphan peak response from the *Dextromethorphan hydrobromide sample solution*
r_S = dextromethorphan peak response from the *Standard solution*
C_S = concentration, on the anhydrous basis, of USP Dextromethorphan Hydrobromide RS in the *Standard solution* (mg/mL)
C_U = concentration of the *Dextromethorphan hydrobromide sample solution* (mg/mL)
Mr_1 = molecular weight of dextromethorphan hydrobromide monohydrate, 370.32
Mr_2 = molecular weight of anhydrous dextromethorphan hydrobromide, 352.32

Acceptance criteria: 90.0%–110.0% for both promethazine hydrochloride and dextromethorphan hydrobromide

IMPURITIES

Organic Impurities

• **PROCEDURE 1**

[NOTE—At all times, protect the sample and standard solutions by using low actinic glassware.]
Solution C: Dissolve 4.36 g of dibasic potassium phosphate in 1 L of water, add 2.0 mL of triethylamine, and adjust the pH to 6.4 with phosphoric acid.
5 N phosphoric acid: Carefully dilute 12 mL of phosphoric acid with water to 100 mL.
Diluent: Methanol, water, and *5 N phosphoric acid* (5:95:1)
Mobile phase: Acetonitrile, methanol, and *Solution C* (3:2:5)
Standard solution: 3.5 µg/mL of USP Promethazine Hydrochloride RS in *Diluent*
Sensitivity solution: 0.18 µg/mL of USP Promethazine Hydrochloride RS in *Diluent*, prepared from the *Standard solution.* [NOTE—Prepare at time of use.]
Promethazine hydrochloride sample solution: Equivalent to 175 µg/mL of promethazine hydrochloride in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4.6-mm × 15-cm column; 5-µm packing L1
Flow rate: 1.5 mL/min
Injection size: 10 µL
Run time: 2 times the retention time of promethazine for Standards; 6 times the retention time of promethazine for samples
System suitability
Samples: *Standard solution* and *Sensitivity solution*
Suitability requirements
Tailing factor: NMT 1.5 for the promethazine peak, *Standard solution*
Relative standard deviation: NMT 7.5% for the promethazine peak, *Standard solution*
Sensitivity: Signal to noise NLT 10 for the promethazine peak, *Sensitivity solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (100/F)$$

r_U = peak response of the impurity from the *Promethazine hydrochloride sample solution*
r_S = promethazine hydrochloride peak response from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = concentration of the *Promethazine hydrochloride sample solution* (µg/mL)
F = relative response factor for each impurity shown in *Impurity Table 1*

Acceptance criteria
Individual impurities: See *Impurity Table 1*.

Impurity Table 1

Name	Relative Retention Time (RRT)	Relative Response Factor (F)	Limit (%)
Promethazine	1.0	1.0	—
Phenothiazine	2.4	2.0	0.5
Methylphenothiazine[a]	4.2	2.0	0.5

[a]10-Methylphenothiazine.

• **PROCEDURE 2**

[NOTE—At all times, protect the sample and standard solutions by using low actinic glassware.]
Solution A, Solution B, and **Mobile phase:** Proceed as directed in the *Assay.*
Standard stock solution A: 88 µg/mL of USP Promethazine Hydrochloride RS in *Solution A*
Standard stock solution B: Proceed as directed in the *Assay.*
Standard solution: Transfer 5.0 mL of *Standard stock solution A* and 5.0 mL of *Standard stock solution B* into a 50-mL volumetric flask, and dilute with *Solution A* to volume. This solution contains 8.8 µg/mL of USP Promethazine Hydrochloride RS, 140 µg/mL of USP Sodium Benzoate RS, 250 µg/mL of USP Methylparaben RS, and 28 µg/mL of USP Propylparaben RS.
Sensitivity solution: 0.18 µg/mL of USP Promethazine Hydrochloride RS in *Solution A.* Prepared from *Standard stock solution A.* [NOTE—Prepare at time of use.]
Promethazine hydrochloride sample solution: Proceed as directed in the *Assay.*
[NOTE—Use this solution to determine promethazine related compounds and specified and unknown impurities.]
Dextromethorphan hydrobromide sample solution: Proceed as directed in the *Assay.*
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)

In-Process Revision

Mode: LC
Detector: UV 280 nm
Column: 4.6-mm × 25-cm column; 5-µm packing L1
Column temperature: 40°
Flow rate: 1.5 mL/min
Injection size: 50 µL

System suitability
Samples: *Standard solution* and *Sensitivity solution*
[NOTE—The relative retention times for benzoate, methylparaben, and propylparaben are 0.59, 0.64, and 1.05, respectively.]
Suitability requirements
Resolution: NLT 4.5 between benzoate and methylparaben; NLT 1.5 between promethazine and propylparaben, *Standard solution*
Relative standard deviation: NMT 7.5% for promethazine, *Standard solution*
Signal to noise ratio: NLT 10 for promethazine, *Sensitivity solution*

Analysis
Samples: *Standard solution* and *Promethazine hydrochloride sample solution*
Using the data in *Impurity Table 2*, calculate the percentage of promethazine specified and unidentified impurities, and any unspecified impurities in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (100/F)$$

r_U = peak response of the impurity from the *Promethazine hydrochloride sample solution*
r_S = promethazine hydrochloride peak response from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = concentration of the *Promethazine hydrochloride sample solution* (µg/mL)
F = relative response factor for each impurity shown in *Impurity Table 2*

Samples: *Standard solution* and *Dextromethorphan hydrobromide sample solution*
Identify the dextromethorphan impurities using the relative retention times given in *Impurity Table 2*. Calculate the percentage of each dextromethorphan impurity in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (100/F)$$

r_U = peak response of the impurity from the *Dextromethorphan hydrobromide sample solution*
r_S = promethazine hydrochloride peak response from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = concentration of the *Dextromethorphan hydrobromide sample solution* (µg/mL)
F = relative response factor for each impurity shown in *Impurity Table 2*

Acceptance criteria
Individual impurities: See *Impurity Tables 1* and *2*.
Total unspecified impurities: NMT 1.0%
Total specified and unidentified promethazine impurities: NMT 5.0%
Total impurities: NMT 6.2% [NOTE—Total includes phenothiazine and methylphenothiazine from *Procedure 1* and dextromethorphanone.]

Add the following:

■Promethazine and Phenylephrine Hydrochloride Oral Solution

DEFINITION
Promethazine and Phenylephrine Hydrochloride Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$) and phenylephrine hydrochloride ($C_9H_{13}NO_2 \cdot HCl$). It may contain suitable preservatives.

IDENTIFICATION
- The retention times of the promethazine hydrochloride and phenylephrine hydrochloride peaks of the sample solutions correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**

[NOTE—At all times, protect the sample and standard solutions by using low actinic glassware.]

Solution A: Dissolve 2.0 g of monobasic potassium phosphate and 1.0 g of heptane sulfonic acid sodium salt monohydrate in 950 mL of water, carefully add 50 mL of acetonitrile, and mix. Adjust the apparent pH to 3.0 with phosphoric acid.

Solution B: Dissolve 2.0 g of monobasic potassium phosphate and 1.0 g of heptane sulfonic acid sodium salt monohydrate in 500 mL of water, carefully add 500 mL of acetonitrile, and mix. Adjust the apparent pH to 3.0 with phosphoric acid.

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
1.0	100	0
50.0	0	100
50.1	100	0
55.0	100	0

Standard stock solution A: 1.8 mg/mL of USP Promethazine Hydrochloride RS and 1.4 mg/mL of USP Phenylephrine Hydrochloride RS in *Solution A*

Standard stock solution B: Dissolve USP Methylparaben RS, USP Propylparaben RS, and USP Sodium Benzoate RS into a volume of acetonitrile equivalent to 40% of the total volume of the flask. Dilute with *Solution A* to volume, to obtain a solution containing 1.4 mg/mL of USP Sodium Benzoate RS, 2.5 mg/mL of USP Methylparaben RS, and 0.28 mg/mL of USP Propylparaben RS

Standard solution: Transfer 5.0 mL each of *Standard stock solution A* and *Standard stock solution B* to a 50-mL volumetric flask, and dilute with *Solution A* to volume. This solution contains 0.18 mg/mL of USP Promethazine Hydrochloride RS, 0.14 mg/mL of USP Phenylephrine Hydrochloride RS, 0.14 mg/mL of USP Sodium Benzoate RS, 0.25 mg/mL of USP Methylparaben RS, and 0.028 mg/mL of USP Propylparaben RS.

Promethazine hydrochloride sample solution: Equivalent to 0.18 mg/mL of promethazine hydrochloride in *Solution A*

Phenylephrine hydrochloride sample solution: Equivalent to 0.14 mg/mL of phenylephrine hydrochloride in *Solution A*

Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability.*)
Mode: LC
Detector: UV 280 nm
Column: 4.6-mm × 25-cm column; 5-µm packing L1
Column temperature: 40°
Flow rate: 1.5 mL/min
Injection size: 15 µL

System suitability
Sample: *Standard solution*
[NOTE—The relative retention times for benzoate, methylparaben, and propylparaben are 0.59, 0.64, and 1.05, respectively.]
Suitability requirements
Resolution: NLT 4.5 between benzoate and methylparaben; NLT 1.5 between promethazine and propylparaben
Relative standard deviation: NMT 2.0% for both promethazine and phenylephrine

Analysis
Samples: *Standard solution* and *Promethazine hydrochloride sample solution*

In-Process Revision

Calculate the quantity, in percent of label claim, of $C_{17}H_{20}N_2S \cdot HCl$ in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = promethazine peak response from the *Promethazine hydrochloride sample solution*
r_S = promethazine peak response from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = concentration of the *Promethazine hydrochloride sample solution* (mg/mL)

Samples: *Standard solution* and *Phenylephrine hydrochloride sample solution*

Calculate the quantity, in percent of label claim, of $C_9H_{13}NO_2 \cdot HCl$ in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = phenylephrine peak response from the *Phenylephrine hydrochloride sample solution*
r_S = phenylephrine peak response from the *Standard solution*
C_S = concentration of USP Phenylephrine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = concentration of the *Phenylephrine hydrochloride sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% for both promethazine hydrochloride and phenylephrine hydrochloride

IMPURITIES

Organic Impurities

• **PROCEDURE 1**

[NOTE—At all times, protect the sample and standard solutions by using low actinic glassware.]

Solution C: Dissolve 4.36 g of dibasic potassium phosphate in 1 L of water, add 2.0 mL of triethylamine, and adjust the pH to 6.4 with phosphoric acid.

5 N phosphoric acid: Carefully dilute 12 mL of phosphoric acid with water to 100 mL.

Diluent: Methanol, water, and *5 N phosphoric acid* (5:95:1)

Mobile phase: Acetonitrile, methanol, and *Solution C* (3:2:5)

Standard solution: 3.5 µg/mL of USP Promethazine Hydrochloride RS in *Diluent*

Sensitivity solution: 0.18 µg/mL of USP Promethazine Hydrochloride RS in *Diluent*, from the *Standard solution*. [NOTE—Prepare at time of use.]

Promethazine hydrochloride sample solution: Equivalent to 175 µg/mL of promethazine hydrochloride in *Diluent*

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)

Phenylephrine hydrochloride sample solution: Proceed as directed in the *Assay.*

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 280 nm
Column: 4.6-mm × 25-cm column; 5-µm packing L1
Column temperature: 40°
Flow rate: 1.5 mL/min
Injection size: 50 µL

System suitability
Samples: *Standard solution* and *Sensitivity solution*
[NOTE—The relative retention times for benzoate, methylparaben, and propylparaben are 0.59, 0.64, and 1.05, respectively.]
Suitability requirements
Resolution: NLT 4.5 between benzoate and methylparaben; NLT 1.5 between promethazine and propylparaben, *Standard solution*

Relative standard deviation: NMT 7.5% for promethazine, *Standard solution*
Signal-to-noise ratio: NLT 10 for promethazine, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Phenylephrine hydrochloride sample solution*

Identify the phenylephrine impurities using the relative retention times given in *Impurity Table 2*. Calculate the percentage of each phenylephrine impurity in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (100/F)$$

r_U = peak response of the impurity from the *Phenylephrine hydrochloride sample solution*
r_S = promethazine hydrochloride peak response from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = concentration of the *Phenylephrine hydrochloride sample solution* (µg/mL)
F = relative response factor for each impurity shown in *Impurity Table 2*

Samples: *Standard solution* and *Promethazine hydrochloride sample solution*

Using the data in *Impurity Table 3*, calculate the percentage of promethazine specified and unidentified impurities, and any unspecified impurities in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (100/F)$$

r_U = peak response of the impurity from the *Promethazine hydrochloride sample solution*
r_S = promethazine hydrochloride peak response from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = concentration of the *Promethazine hydrochloride sample solution* (µg/mL)
F = relative response factor for each impurity shown in *Impurity Table 3*

Acceptance criteria

Individual impurities: See *Impurity Tables 1*, *2*, and *3*.
Total unspecified impurities: NMT 1.0%
Total specified and unidentified phenylephrine impurities: NMT 10.0%
Total specified and unidentified promethazine impurities: NMT 5.0%
Total impurities: NMT 16.0% [NOTE—Sum of total specified and unidentified impurities from *Impurity Table 2*, total specified and unidentified from *Impurity Table 3*, and total unspecified impurities from *Impurity Table 3*.]

Impurity Table 2

Name	Relative Retention Time (RRT)	Relative Response Factor (F)	Limit (%)
Unidentified impurity 1	0.32	1.4	0.6
Unidentified impurity 2	0.33	1.4	0.5
3-Hydroxyindole dione[a]	0.34	1.4	2.6
Norphenylephrine[b]	0.37	1.4	3.5

[a]3-Hydroxy-1-methyl-2,3-dihydro-1*H*-indole-5,6-dione.
[b](*R*)-3-(2-Amino-1-hydroxyethyl)phenol.
[c]7-Hydroxy-1-methyl-1*H*-indole-3,5,6(2*H*)-trione.
[d]4-Hydroxy-1-methyl-1*H*-indole-3,5,6(2*H*)-trione, and two 3-{[2-hydroxy-2-(3-hydroxyphenyl)ethyl](methyl)amino}benzene-1,2-diol isomers.
[e](*R*)-3-{2-[Benzyl(methyl)amino]-1-hydroxyethyl}phenol.
[f]Phenylephrine synthetic impurity. Do not quantify.

Impurity Table 2 *(continued)*

Name	Relative Retention Time (RRT)	Relative Response Factor (F)	Limit (%)

[e]*N*-Methyl-1(10*H*-phenothiazin-10-yl)propan-2-amine.
[f]Promethazine synthetic impurity. Do not quantify.
[g]Includes phenothiazine and methylphenothiazine from *Procedure 1*.

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** ⟨**61**⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨**62**⟩**:** The total aerobic microbial limit does not exceed 100 cfu/mL. The total yeasts and molds count does not exceed 10 cfu/mL. It meets the requirements for absence of *Escherichia coli.*
- **pH** ⟨**791**⟩**:** 3.7–4.7
- **ALCOHOL DETERMINATION** (if present)**,** *Method II* ⟨**611**⟩**:** Between 90.0% and 110.0% of the labeled quantity of C_2H_5OH
- **DELIVERABLE VOLUME** ⟨**698**⟩**:** Meets the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light resistant containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** ⟨**11**⟩
  USP Methylparaben RS
  USP Phenylephrine Hydrochloride RS
  USP Promethazine Hydrochloride RS
  USP Propylparaben RS
  USP Sodium Benzoate RS■1S *(USP33)*

BRIEFING

Promethazine and Phenylephrine Hydrochloride and Codeine Phosphate Oral Solution. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The liquid chromatographic procedure in the *Assay* was validated with a GL Sciences Intersil ODS-3 brand of L1 column, in which phenylephrine elutes at about 16 min, codeine elutes at about 21 min, and promethazine elutes at about 39 min. The liquid chromatographic procedure under *Organic Impurities*, *Procedure 1*, was validated with a Waters Symmetry brand of L1 column, in which promethazine elutes at about 10 min. The liquid chromatographic procedure under *Organic Impurities*, *Procedure 2*, was validated with a GL Sciences Intersil ODS-3 brand of L1 column, in which promethazine elutes at about 39 min.

(MD-CCA: C. Anthony. MSA: R. Tirumalai.) RTS—C62808

Add the following:

■Promethazine and Phenylephrine Hydrochloride and Codeine Phosphate Oral Solution

DEFINITION

Promethazine and Phenylephrine Hydrochloride and Codeine Phosphate Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$), phenylephrine hydrochloride ($C_9H_{13}NO_2 \cdot HCl$), and codeine phosphate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot {}^1/_2H_2O$). It may contain suitable preservatives.

IDENTIFICATION

- The retention times of the promethazine hydrochloride, phenylephrine hydrochloride, and codeine phosphate peaks from the *Sample solutions* correspond to those from the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE** [NOTE—At all times, protect the *Sample solution* and the *Standard solution* by using low-actinic glassware.]
  Solution A: Dissolve 2.0 g of monobasic potassium phosphate and 1.0 g of heptanesulfonic acid sodium salt monohydrate in 950 mL of water, carefully add 50 mL of acetonitrile, and mix. Adjust the apparent pH with phosphoric acid to 3.0.
  Solution B: Dissolve 2.0 g of monobasic potassium phosphate and 1.0 g of heptanesulfonic acid sodium salt monohydrate in 500 mL of water, carefully add 500 mL of acetonitrile, and mix. Adjust the apparent pH with phosphoric acid to 3.0.
  Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
1.0	100	0
50.0	0	100
50.1	100	0
55.0	100	0

Standard stock solution A: 1.8 mg/mL of USP Promethazine Hydrochloride RS, 1.4 mg/mL of USP Phenylephrine Hydrochloride RS, and 2.8 mg/mL USP Codeine Phosphate RS in *Solution A*
Standard stock solution B: Dissolve USP Methylparaben RS, USP Propylparaben RS, and USP Sodium Benzoate RS in a volume of acetonitrile equivalent to 40% of the total volume of the flask. Dilute with *Solution A* to volume to obtain a solution containing 1.4 mg/mL of USP Sodium Benzoate RS, 2.5 mg/mL of USP Methylparaben RS, and 0.28 mg/mL of USP Propylparaben RS.
Standard solution: Transfer 5.0 mL each of *Standard stock solution A* and *Standard stock solution B* to a 50-mL volumetric flask, and dilute with *Solution A* to volume. This solution contains 0.18 mg/mL of USP Promethazine Hydrochloride RS, 0.14 mg/mL of USP Phenylephrine Hydrochloride RS, 0.28

mg/mL of USP Codeine Phosphate RS, 0.14 mg/mL of USP Sodium Benzoate RS, 0.25 mg/mL of USP Methylparaben RS, and 0.028 mg/mL of USP Propylparaben RS.

Promethazine hydrochloride sample solution: Equivalent to 0.18 mg/mL, based on the label claim, of promethazine hydrochloride in *Solution A*

Phenylephrine hydrochloride sample solution: Equivalent to 0.14 mg/mL, based on the label claim, of phenylephrine hydrochloride in *Solution A*

Codeine phosphate sample solution: Equivalent to 0.28 mg/mL, based on the label claim, of codeine phosphate in *Solution A*

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm column; 5-µm packing L1

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection size: 15 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for benzoate, methylparaben, and propylparaben are 0.59, 0.64, and 1.05, respectively.]

Suitability requirements

Resolution: NLT 4.5 between benzoate and methylparaben; NLT 1.5 between promethazine and propylparaben

Relative standard deviation: NMT 2.0% for promethazine, phenylephrine, and codeine

Analysis

Samples: *Standard solution* and *Promethazine hydrochloride sample solution*

Calculate the percentage of the label claim of $C_{17}H_{20}N_2S \cdot HCl$ in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = promethazine peak response from the *Promethazine hydrochloride sample solution*

r_S = promethazine peak response from the *Standard solution*

C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of the *Promethazine hydrochloride sample solution* (mg/mL)

Samples: *Standard solution* and *Phenylephrine hydrochloride sample solution*

Calculate the percentage of the label claim of $C_9H_{13}NO_2 \cdot HCl$ in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = phenylephrine peak response from the *Phenylephrine hydrochloride sample solution*

r_S = phenylephrine peak response from the *Standard solution*

C_S = concentration of USP Phenylephrine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of the *Phenylephrine hydrochloride sample solution* (mg/mL)

Samples: *Standard solution* and *Codeine phosphate sample solution*

Calculate the percentage of the label claim of $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot {}^1/_2H_2O$ in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = codeine peak response from the *Codeine phosphate sample solution*

r_S = codeine peak response from the *Standard solution*

C_S = concentration of USP Codeine Phosphate RS, on the dried basis, in the *Standard solution* (mg/mL)

C_U = concentration of the *Codeine phosphate sample solution* (mg/mL)

M_{r1} = molecular weight of codeine phosphate, 406.37

M_{r2} = molecular weight of anhydrous codeine phosphate, 397.37

Acceptance criteria: 90.0%–110.0% for promethazine hydrochloride, phenylephrine hydrochloride, and codeine phosphate

IMPURITIES

Organic Impurities

• **PROCEDURE 1** [NOTE—At all times, protect the sample and the standard solutions by using low-actinic glassware.]

Solution C: Dissolve 4.36 g of dibasic potassium phosphate in 1 L of water, add 2.0 mL of triethylamine, and adjust the pH with phosphoric acid to 6.4.

5 N phosphoric acid: Carefully dilute 12 mL of phosphoric acid with water to 100 mL.

Diluent: Methanol, water, and *5 N phosphoric acid* (5:95:1)

Mobile phase: Acetonitrile, methanol, and *Solution C* (3:2:5)

Standard solution: 3.5 µg/mL of USP Promethazine Hydrochloride RS in *Diluent*

Sensitivity solution: 0.18 µg/mL of USP Promethazine Hydrochloride RS in *Diluent*, prepared from the *Standard solution* [NOTE—Prepare at time of use.]

Sample solution: Equivalent to 175 µg/mL of promethazine hydrochloride in *Diluent*

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 15-cm column; 5-µm packing L1

Flow rate: 1.5 mL/min

Injection size: 10 µL

Run time: *Standard solution*, 2 times the retention time of promethazine; *Sample solution*, 6 times the retention time of promethazine

System suitability

Samples: *Sensitivity solution* and *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5 for promethazine, *Standard solution*

Relative standard deviation: NMT 7.5% for promethazine, *Standard solution*

Sensitivity: Signal-to-noise ratio, NLT 10 for promethazine, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100/F$$

r_U = impurity peak response from the *Sample solution*

r_S = promethazine hydrochloride peak response from the *Standard solution*

C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)

C_U = concentration of the *Promethazine hydrochloride sample solution* (µg/mL)

F = relative response factor for each impurity shown in *Impurity Table 1*

In-Process Revision

Acceptance criteria
Individual impurities: See *Impurity Table 1* below.

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor (F)	Limit (%)
Promethazine	1.0	1.0	—
Phenothiazine	2.4	2.0	0.5
Methylphenothiazine[a]	4.2	2.0	0.5

[a] 10-Methylphenothiazine.

• **PROCEDURE 2** [NOTE—At all times, protect the sample and standard solutions by using low-actinic glassware.]
Solution A, Solution B, Mobile phase, Standard stock solution B, Codeine phosphate sample solution, and **Phenylephrine hydrochloride sample solution:** Proceed as directed in the *Assay*.
Standard stock solution A: 88 µg/mL of USP Promethazine Hydrochloride RS in *Solution A*
Standard solution: Transfer 5.0 mL of *Standard stock solution A* and 5.0 mL of *Standard stock solution B* to a 50-mL volumetric flask, and dilute with *Solution A* to volume. This solution contains 8.8 µg/mL of USP Promethazine Hydrochloride RS, 140 µg/mL of USP Sodium Benzoate RS, 250 µg/mL of USP Methylparaben RS, and 28 µg/mL of USP Propylparaben RS.
Sensitivity solution: 0.18 µg/mL of USP Promethazine Hydrochloride RS in *Solution A*, prepared from *Standard stock solution A* [NOTE—Prepare at time of use.]
Promethazine hydrochloride sample solution: Proceed as directed in the *Assay*. [NOTE—Use this solution to determine promethazine related compounds and specified and unknown impurities.]
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 280 nm

Relative standard deviation: NMT 7.5% for promethazine, *Standard solution*
Signal-to-noise ratio: NLT 10 for promethazine, *Sensitivity solution*
Analysis
Samples: *Standard solution* and *Phenylephrine hydrochloride sample solution*
Identify the phenylephrine impurities using the relative retention times given in *Impurity Table 2* below. Calculate the percentage of each phenylephrine impurity in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100/F$$

r_U = peak response of each impurity from the *Sample solution*
r_S = promethazine hydrochloride peak response from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = concentration of the *Phenylephrine hydrochloride sample solution* (µg/mL)
F = relative response factor for each impurity shown in *Impurity Table 2*

Samples: *Standard solution* and *Promethazine hydrochloride sample solution*
Using the data in *Impurity Table 3* below, calculate the percentage of each promethazine impurity, unspecified impurities, and unidentified impurities in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100/F$$

r_U = peak response of each impurity from the *Sample solution*
r_S = promethazine hydrochloride peak response from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = concentration of the *Promethazine hydrochloride sample solution* (µg/mL)
F = relative response factor for each impurity shown in *Impurity Table 3*

Samples: *Standard solution* and *Codeine phosphate sample solution*
Identify the codeine impurities using the relative retention times given in *Impurity Table 3*. Calculate the percentage of each codeine impurity in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100/F$$

r_U = peak response of each impurity from the *Sample solution*
r_S = promethazine hydrochloride peak response from the *Standard solution*
C_S = concentration of USP Promethazine Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = concentration of the *Codeine phosphate sample solution* (µg/mL)
F = relative response factor for each codeine impurity shown in *Impurity Table 3*

Acceptance criteria
Individual impurities: See *Impurity Tables 2* and *3*.
Total codeine impurities: NMT 1.0%
Total phenylephrine specified and unidentified impurities: NMT 10.0%
Total promethazine specified and unidentified impurities: NMT 5.0%
Total impurities: NMT 17.0%
[NOTE—Sum of total codeine impurities, total promethazine specified and unidentified impurities, total phenylephrine specified and unidentified impurities, and total unspecified impurities]

  USP Methylparaben RS
  USP Phenylephrine Hydrochloride RS
  USP Promethazine Hydrochloride RS
  USP Propylparaben RS
  USP Sodium Benzoate RS■1S *(USP33)*

BRIEFING

Psyllium Husk, *USP 31* page 3131. It is proposed to add limits for pesticides and heavy metals, on the basis of comments received.

(DSB: M. Sharaf.) RTS—C72071

In-Process Revision

Psyllium Husk

DEFINITION

Psyllium Husk is the cleaned, dried seed coat (epidermis) separated by winnowing and thrashing from the seeds of *Plantago ovata* Forssk., known in commerce as Blond Psyllium, Indian Psyllium, or Ispaghula, or from *Plantago arenaria* Waldst. & Kit. (*Plantago psyllium* L.) known in commerce as Spanish or French Psyllium (Fam. *Plantaginaceae*), in whole or in powdered form.

IDENTIFICATION

- **A. Mounted in Cresol:** Cells, viewed microscopically, are composed of polygonal prismatic cells having 4–6 straight or slightly wavy walls.
- **B. Mounted in Alcohol and Irrigated with Water:** Viewed microscopically, the mucilage in the outer part of the epidermal cells swells rapidly and goes into solution.

IMPURITIES

Change to read:

Inorganic Impurities

- **Articles of Botanical Origin,** *Acid-Insoluble Ash* ⟨**561**⟩**:** NMT 1.0%
- **Heavy Metals,** *Method II* ⟨**231**⟩**:** 2 ppm, use 10 g of Psyllium Husk■1S (*USP33*)

Change to read:

Organic Impurities

- **Procedure 1: Light Extraneous Matter**

  [NOTE—Perform this test in a well-ventilated hood.]

  Sample: 99–101 g of Psyllium Husk, weighed to 0.1-g accuracy

  Analysis: Transfer the *Sample* to a 1000-mL tall-form beaker. Add 800 mL of trichloroethylene, previously adjusted to a temperature of 24°–26°, and maintain this temperature throughout the test. Stir the husk for 5 s, and allow it to settle while protecting the surface from drafts in the hood. Remove the floating material with a spoon made of 50-mesh screen, and transfer the material to a piece of filter paper in a dish. Stir the husk mixture again, allow it to settle, remove the floating material again, and combine it with the material on the paper. Repeat this procedure until no more material appears on the surface. Dry the removed material with the paper in a hood and then in an oven at 40° for 3 h. Cool to room temperature. Weigh the filter paper with the material. Brush the material off the paper, weigh the paper, and then calculate the percentage of light extraneous matter.

  Acceptance criteria: NMT 5%

- **Procedure 2: Insect Infestation**

  Sample: 25 g

  Analysis: Transfer the *Sample* to a 250-mL beaker, add sufficient solvent hexane to saturate, add an additional 75–100 mL of solvent hexane, and allow to stand for 10 min, stirring occasionally with a stirring rod. Wet a sheet of filter paper with alcohol, and filter the mixture with the aid of vacuum. Discard the filtrate. Transfer the residue to the original beaker with the aid of alcohol. Add alcohol to bring the volume to 150 mL above the level of the transferred residue. Boil for 10 min. Filter through alcohol-wetted paper as above. Prepare a trap flask consisting of a 2000-mL graduated, narrow-mouth conical flask into which is inserted a rubber disk supported on a stiff metal rod 4 mm in diameter and longer than the height of the flask, the rod being threaded at the lower end and furnished with nuts and washers to hold the disk in place, and the disk being of the proper shape and size to prevent liquid in the body of the flask from spilling when it is pressed up against the neck from the inside. Transfer the residue to the trap flask, completing the transfer with the aid of hot water. Add sufficient hot water to bring the volume to 1000 mL. Add 20 mL of hydrochloric acid. Raise the rod, and support it so that the rubber disk is held above the liquid level. Rinse the rubber disk with hot water. Spray the inside of the neck of the flask with an antifoam spray. Boil for 30 min, and cool to room temperature. Add 40 mL of solvent hexane, and agitate for 1 min by tilting the flask and moving the rod vertically with wrist action. Allow to stand for 5 min. Add water to bring the level of liquid to the neck of the flask, and allow to stand for 20 min. Simultaneously rotate the disk to free it from settled material, and raise it as far as possible into the neck of the flask. Prepare a sheet of ruled filter paper with lines approximately 5 mm apart for filtration by moistening it with water and placing it on a vacuum funnel. Transfer the material trapped in the neck of the flask to the filter with the aid of water. If necessary, wash the paper with alcohol to remove traces of hexane. Place the paper on a 100-mm petri dish that has been wetted with a solution containing equal volumes of glycerin and alcohol. Add 35 mL of solvent hexane to the flask, and gently stir with the trapping rod. Add water to bring the liquid level into the neck of the flask. Allow to stand for 15 min. Using the same technique as before, transfer the trapped material onto a separate paper. Examine the papers at 30× magnification.

  Acceptance criteria

  Powdered Psyllium Husk: NMT 400 insect fragments, including mites and psocids

  Whole Psyllium Husk: NMT 100 insect fragments, including mites and psocids

- **Procedure 3: Articles of Botanical Origin,** *Pesticide Residues* ⟨**561**⟩**:** Meets the requirements■1S (*USP33*)

SPECIFIC TESTS

- **Botanic Characteristics**

  Histology—Husk: The epidermis is composed of large cells having transparent walls filled with mucilage, and the cells swell rapidly in aqueous mounts and appear polygonal to slightly rounded in a surface view when viewed from above (from below they appear elongated to rectangular). The swelling takes place mainly in the radial direction. The mucilage of the epidermal cells stains red with ruthenium red and lead acetate TS. The very occasional starch granules that are present in some of the epidermal cells, and that may be found embedded in the mucilage, are small and simple or compounded with four or more components.

  Powdered psyllium seed husk: It is a pale to medium buff-colored powder having a slight pinkish tinge and a weak characteristic odor. Occasional single and 2- to 4-compound starch granules, the individual grains being spheroidal plano to angular convex from 2–10 µm in diameter, are found embedded in the mucilage. Entire or broken epidermal cells are filled with mucilage. In surface view, the epidermal cells appear polygonal to slightly rounded. Mucilage stains red with ruthenium red TS and lead acetate TS. Some of the elongated and rectangular cells representing the lower part of epidermis and also radially swollen epidermal cells can be found.

- **Microbial Enumeration Tests** ⟨**61**⟩ and **Tests for Specified Microorganisms** ⟨**62**⟩**:** The total combined molds and yeasts count does not exceed 1000 cfu/g, and it meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.
- **Articles of Botanical Origin,** *Total Ash* ⟨**561**⟩**:** NMT 4.0%
- **Water Determination,** *Method II* ⟨**921**⟩**:** NMT 12.0%
- **Swell Volume**

  Sample: 3.5 g of Psyllium Husk

  Analysis: Transfer 250 mL of simulated intestinal fluid TS without enzymes to a glass-stoppered 500-mL graduated cylinder. Gradually, with shaking, add the *Sample* until a uniform, smooth suspension is obtained. Dilute with the same fluid to 500 mL. Shake the cylinder for 1 min every 30 min for 8 h. Allow the gel to settle for 16 h (total time is 24 h). Determine the volume of the gel.

Acceptance criteria
Powdered Psyllium Husk: NLT 40 mL/g
Whole Psyllium Husk: NLT 35 mL/g

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed containers, secured against insect attack (see *General Notices—Vegetable and Animal Substances, Preservation*).

BRIEFING

Repaglinide Tablets, *USP 31* page 3166. On the basis of comments received, it is proposed to delete the test for *Loss on Drying* as formulation specific.

(MD-GRE: E. Gonikberg.) RTS—C71505

Repaglinide Tablets

DEFINITION
Repaglinide Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of repaglinide ($C_{27}H_{36}N_2O_4$).

IDENTIFICATION
- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST ⟨201⟩**
Sample solution: To 10 mg of repaglinide from powdered Tablets, add 10 mL of a mixture of methanol and methylene chloride (1:1), shake for 15 min, and centrifuge.
Developing solvent system: Toluene, methylene chloride, and methanol (2:2:1)
- **B.** The retention time and UV spectrum of the major peak of the *Sample solution* correspond to those of the *Standard solution,* as obtained in the *Assay.*

ASSAY
- **PROCEDURE**
Solution A: Monobasic ammonium phosphate solution (2 in 1000). Adjust with phosphoric acid to a pH of 4.0.
Solution B: Monobasic ammonium phosphate solution (2 in 1000). Adjust with phosphoric acid to a pH of 2.5.
Diluent: Methanol and *Solution A* (7:3)
Mobile phase: Methanol and *Solution B* (7:3)
Standard solution 1: 800 µg/mL of USP Repaglinide RS in methanol
Standard solution 2: Dilute 5.0 mL of *Standard solution 1* with *Diluent* to 50.0 mL.
System suitability stock solution: 80 µg/mL of USP Repaglinide Related Compound A RS in methanol
System suitability solution: Transfer 1.0 mL of *System suitability stock solution* to a 50-mL volumetric flask, add 5.0 mL of *Standard solution 1*, and dilute with *Diluent* to volume.
Sample solution: 80 µg/mL from dilution of 8 whole Tablets with *Diluent.* [NOTE—Stir the solution for 20 min, and filter a portion of the solution.]
Chromatographic system
(See *Chromatography ⟨621⟩, System Suitability.*)
Mode: LC

USP Repaglinide RS
USP Repaglinide Related Compound A RS

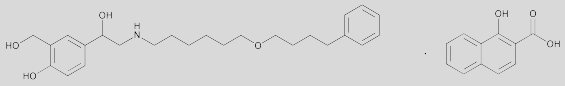
BRIEFING

Salmeterol Xinafoate. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed. The liquid chromatographic procedures in the *Assay* and in the *Procedure* under *Organic Impurities* are based on analyses performed with the Spherisorb ODS-2 brand of L1 column, in which salmeterol elutes at 14 min.

(AER-05: K. Zaidi.) RTS—C64168

Add the following:

■Salmeterol Xinafoate



$C_{25}H_{37}NO_4 \cdot C_{11}H_8O_3$ 603.75

1,3-Benzenedimethanol, 4-hydroxy-α¹-[[[6-(4-phenylbutoxy) hexyl]amino]methyl]-, (±)-, 1-hydroxy-2-naphthalenecarboxylate (salt);
(±)-4-Hydroxy-α¹-[[[6-(4-phenylbutoxy)hexyl]amino]methyl]-*m*-xylene-α,α′-diol 1-hydroxy-2-naphthoate (salt) [94749-08-3].

DEFINITION
Salmeterol Xinafoate contains NLT 98.0% and NMT 102.0% of $C_{25}H_{37}NO_4 \cdot C_{11}H_8O_3$, calculated on the water- and solvent-free basis.

IDENTIFICATION
• **A. INFRARED ABSORPTION** ⟨**197M**⟩

BRIEFING

Sennosides, *USP 32* page 3551. On the basis of comments received, it is proposed to add a stability-indicating HPLC procedure for the *Content of Sennosides A and B* test. The procedure has been validated using a Hypersil Gold C18 brand of L1 column. The typical retention times for sennoside B and sennoside A are 30.0 and 34.0, respectively.

(DSB: M. Sharaf.) RTS—C70307

In-Process Revision

Sennosides

DEFINITION

Sennosides is a partially purified natural complex of anthraquinone glucosides, isolated from senna leaflets and/or senna pods, *Senna alexandrina* Mill (*Cassia acutifolia* or *C. angustifolia*), as calcium salts. It contains NLT 90.0% and NMT 110.0% of the labeled amount of sennosides. The labeled amount is NLT 60.0% (w/w), calculated on the dried basis.

IDENTIFICATION

• **THIN-LAYER CHROMATOGRAPHY**

Solution A: Ethyl acetate, *n*-propyl alcohol, and water (1:1:1). Shake well and discard the upper layer.

Standard solution: 1 mg/mL of USP Sennosides RS in *Solution A*

Sample solution: 1 mg/mL of Sennosides in *Solution A*

Chromatographic system

(See *Chromatography* ⟨621⟩*, Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 20 µL

Developing solvent system: Ethyl acetate, *n*-propyl alcohol, and water (4:4:3)

Analysis: Proceed as directed in the chapter. Apply the solutions, as 1-cm streaks, on a line 2.5 cm from the bottom edge of a thin-layer chromatographic plate. Examine the plate under long-wavelength UV light. Expose the plate to ammonium hydroxide vapor until color develops (about 5 min). Cover the plate with a piece of glass, and heat at 120° for 5 min.

Acceptance criteria: The two most prominent spots from the *Sample solution* correspond in color and mobility to those of the *Standard solution*.

ASSAY

• **PROCEDURE**

Solution A: 9.08 mg/mL of monobasic potassium phosphate

Solution B: 9.46 mg/mL of anhydrous dibasic sodium phosphate

Solution C: Mix *Solution A* and *Solution B* (38.9:61.1). Adjust dropwise, if necessary, with *Solution B* to a pH of 7.0.

Solution D: 37.9 mg/mL of sodium borate

Solution E: 15 mg/mL of sodium dithionite

Standard solution: 1 mg/mL of USP Sennosides RS in *Solution C*

Sample solution: 1 mg/mL of Sennosides in *Solution C*

Fluorometric conditions

Excitation wavelength: 392 nm

Emission wavelength: 505 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Pipet 1-mL portions of the *Standard solution* and the *Sample solution* into separate 100-mL volumetric flasks, and dilute with *Solution D* to volume. Transfer 5.0-mL portions of each of the resulting solutions to separate, low-actinic glass, 50-mL volumetric flasks. Add 15.0 mL of *Solution D* and 15.0 mL of *Solution E*. Pass nitrogen through the solutions, seal the flasks with nitrogen-filled balloons, and heat in a water bath for 30 min. Cool the flasks for 15 min in a water bath thermostatically controlled at 20°. Dilute the solutions with *Solution D* to volume. Determine, without delay, the fluorescence intensities of the resulting solutions, the time elapsed between the addition of *Solution E* and the measurement being the same for the two solutions.

Calculate the percentage of sennosides in the portion taken:

$$\text{Result} = (I_U/I_S) \times (C_S/C_U) \times 100$$

I_U = fluorescence value observed in the *Sample solution*

I_S = fluorescence value observed in the *Standard solution*

C_S = concentration of USP Sennosides RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of Sennosides in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES

Inorganic Impurities

• **RESIDUE ON IGNITION** ⟨**281**⟩**:** 5.0%–8.0%, ignited at 800 ± 25°, the use of sulfuric acid being omitted

• **HEAVY METALS,** *Method II* ⟨**231**⟩**:** 60 ppm

SPECIFIC TESTS

Add the following:

■• **CONTENT OF SENNOSIDES A AND B**

Solvent: Use 1% sodium acetate solution in water.

Buffer solution: Dissolve 3.6 g of dibasic sodium phosphate dodecahydrate in 50 mL of water, add to a solution of 6.2 g sodium dihydrogen phosphate dihydrate in 200 mL of water, mix, and adjust the pH to 5.0. Dilute the final solution 1:10 in water.

Solution A: Use a filtered and degassed mixture of *Buffer solution* and acetonitrile (1:1), containing 0.5% of benzyldimethylstearylammonium chloride.

Solution B: Use filtered and degassed acetonitrile.

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)	Elution
0–35	100	0	isocratic
35–40	100→30	0→70	linear gradient
40–50	30	70	isocratic
50–55	30→100	70→0	linear gradient
55–60	100	0	isocratic

Standard solution 1: 0.3 mg/mL of USP Sennosides RS in *Solvent*. Pass through a membrane filter having a 0.45-µm porosity before injection, discarding the first few mL of the filtrate.

Standard solution 2: 0.1 mg/mL of USP Sennoside A RS in *Solvent*. Pass through a membrane filter having a 0.45-µm porosity before injection, discarding the first few mL of the filtrate.

Standard solution 3: 0.1 mg/mL of USP Sennoside B RS in *Solvent*. Pass through a membrane filter having a 0.45-µm porosity before injection, discarding the first few mL of the filtrate.

Sample solution: 0.3 mg/mL of Sennosides in *Solvent*. Pass through a membrane filter having a 0.45-µm porosity before injection, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

Mode: LC

Detector: UV 360 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: Adjusted so the retention time of the sennoside B peak is 30 min

Column temperature: 40°

Injection size: 10 µL

System suitability

Sample: *Standard solution 1*

Suitability requirements: The chromatogram obtained is similar to the Reference chromatogram provided with the lot of USP Sennosides RS being used; the resolution, R, between the sennoside B peak and the peak before, between the sennoside B and sennoside A peaks, and between the sennoside A peak and the peak after is NLT 1.5; and the relative standard deviation determined for the sum of the areas of the

sennoside A and sennoside B peaks for replicate injections is NMT 2.0%.

Analysis

Samples: *Standard solution 1*, *Standard solution 2*, *Standard solution 3*, and *Sample solution*

Record the chromatograms. Using the chromatograms of *Standard solution 2* and *Standard solution 3*, identify the peaks corresponding to sennoside A and sennoside B in the *Sample solution* chromatogram. Separately calculate the percentages of sennoside A and sennoside B in the portion of Sennosides taken:

$$\text{Result} = (r_U/r_S)\,(C/W) \times 100 \times F$$

r_U = peak areas for sennoside A or B from the *Sample solution*

r_S = peak areas for sennoside A or B from the corresponding *Standard solution*

C = concentration of USP Sennoside A RS or Sennoside B RS in the corresponding *Standard solution* (mg/mL)

V = final volume of the *Sample solution* (mL)

W = weight of Sennosides, corrected for the loss on drying, taken to prepare the *Sample solution* (mg)

F = conversion factor for the molecular weights of sennoside A or sennoside B to the corresponding calcium salt, 1.044

Calculate the total percentage of sennoside A and sennoside B by adding the individual percentages calculated.

Acceptance criteria: The total percentage of sennoside A and sennoside B is NLT 55% of the labeled amount of sennosides.■1S *(USP33)*

- **pH** ⟨**791**⟩**:** 6.3–7.3, in a solution (1 in 10)
- **Loss on Drying** ⟨**731**⟩**:** Dry a sample in a vacuum at 100° to constant weight: it loses NMT 5.0% of its weight.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers. Store protected from light and moisture, at controlled room temperature.

Change to read:

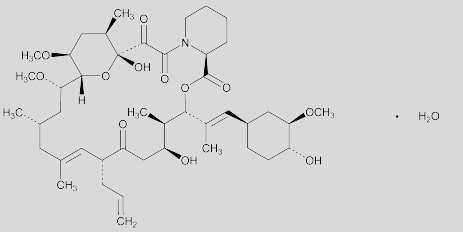
Briefing

Tacrolimus. Because there is no existing *USP* monograph for this drug substance, a new monograph is proposed based on validated methods. The *Assay* is based on analyses performed using a TSKgel ODS-80TM column. The typical retention time for tacrolimus is about 10 min. The *Procedure* for *Organic Impurities* is based on analyses performed using a Supelcosil LC-diol column. The typical retention time for tacrolimus is about 15 min.

(MD-ANT: A. Wise.) RTS—C53605

Add the following:

■Tacrolimus



$C_{44}H_{69}NO_{12} \cdot H_2O$ 822.03

15,19-Epoxy-3*H*-pyrido[2,1-*c*][1,4]oxaazacyclotricosine-1,7,20,21(4*H*,23*H*)-tetrone-5,6,8,11,12,13,14,15,16,17,18,19,24,25,26,26a-hexadecahydro-5,19-dihydroxy-3-[2-(4-hydroxy-3-methoxycyclohexyl)-1-methylethenyl]-14,16-dimethoxy-4,10,12,18-tetramethyl-8-(2-propenyl)-, monohydrate, [3*S*-[3*R**,*E*(1*S**,3*S**,4*S**)],4*S**,5*R**,8*S**,9*E*,12*R**,14*R**,15*S**,16*R**,18*S**,19*S**,26a*R**]]-;

(–)-(3*S*,4*R*,5*S*,8*R*,9*E*,12*S*,14*S*,15*R*,16*S*,18*R*,19*R*,26a*S*)-8-Allyl-5,6,8,11,12,13,14,15,16,17,18,19,24,25,26,26a-hexadecahydro-5,19-dihydroxy-3-[(*E*)-2-[(1*R*,3*R*,4*R*)-4-hydroxy-3-methoxycyclohexyl]-1-methylvinyl]-14,16-dimethoxy-4,10,12,18-tetramethyl-15,19-epoxy-3*H*-pyrido[2,1-*c*][1,4]oxaazacyclotricosine-1,7,20,21(4*H*,23*H*)-tetrone, monohydrate [109581-93-3].

DEFINITION

Tacrolimus contains NLT 98.0% and NMT 102.0% of $C_{44}H_{69}NO_{12}$, calculated on the anhydrous basis.

IDENTIFICATION

- **A. Infrared Absorption** ⟨**197M**⟩
- **B.** Dissolve 5 mg of Tacrolimus in 1 mL of alcohol, add 1 mL of a solution of 1,3-dinitrobenzene in alcohol (1 in 100) and 1 mL of sodium hydroxide TS and shake: a red-purple color develops.
- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution* as obtained in the *Assay*.

ASSAY

- **Procedure**

[Note—Allow the *Standard solution* and the *Sample solution* to stand for 6 h at 25° before use.]

Mobile phase: Isopropanol, tetrahydrofuran, and water (2:2:5)

Internal standard solution: 0.75 mg/mL solution of heptyl parahydroxybenzoate in dehydrated alcohol

Standard solution: Dissolve an accurately weighed quantity of USP Tacrolimus RS in dehydrated alcohol, using about 30% of the final volume, add 20% of the final volume of *Internal standard solution,* and dilute with water to volume to obtain a solution having a final concentration of about 0.5 mg of tacrolimus/mL.

Sample solution: Dissolve a quantity of Tacrolimus in dehydrated alcohol, using about 30% of the final volume, add

In-Process Revision

20% of the final volume of *Internal standard solution,* and dilute with water to volume to obtain a solution having a nominal concentration of about 0.5 mg of tacrolimus/mL.

BRIEFING

Tacrolimus Capsules. Because there is no existing *USP* monograph for this drug product, a new monograph is proposed based on validated methods. The liquid chromatographic procedure in the *Assay* is based on analyses performed using a TSKgel ODS-80TM brand of L1 column. The typical retention time for tacrolimus is about 10 min. The liquid chromatographic procedure in the test for *Dissolution* is based on analyses performed using a Nucleosil 100-5C8 brand of L7 column. The typical retention time for tacrolimus is about 14 min. The liquid chromatographic procedure for *Organic Impurities* is based on analyses performed using a Supelcosil LC-diol brand of L20 column. The typical retention time for tacrolimus is about 15 min.

(MD-ANT: A. Wise. BPC: M. Marques.) RTS—C53605

Add the following:

▪Tacrolimus Capsules

DEFINITION

Tacrolimus Capsules contain NLT 93.0% and NMT 105.0% of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$).

IDENTIFICATION

- **A. PROCEDURE**

  Analysis: Transfer the contents of Capsules, equivalent to 5 mg of tacrolimus, into a centrifuge tube. Add 2 mL of alcohol, shake for 10 min, and centrifuge. To 1 mL of the supernatant, add 0.5 mL of a solution of 1,3-dinitrobenzene in alcohol (1 in 100) and 0.5 mL of sodium hydroxide TS, shake, and allow to stand for 3 min.

  Acceptance criteria: A light red-purple color develops.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution* as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

  [NOTE—Allow the *Standard solution* and *Sample solution* to stand for 6 h at 25° before use.]

  Mobile phase: Isopropanol, tetrahydrofuran, and water (2:2:5)

  Internal standard solution: 0.75 mg/mL solution of heptyl parahydroxybenzoate in dehydrated alcohol

  Standard solution: Dissolve a quantity of USP Tacrolimus RS in dehydrated alcohol, using about 30% of the final volume, add 20% of the final volume of *Internal standard solution*, and dilute with water to volume to obtain a solution having a concentration of about 0.5 mg/mL of tacrolimus.

  Sample solution: Using *Table 1*, transfer a quantity of the contents of Capsules into a suitable centrifuge tube, add dehydrated alcohol and *Internal standard solution*. Shake the centrifuge tube for a few min, and sonicate in an ultrasonic bath for 10 min. Centrifuge this suspension. Pipet 5 mL of the supernatant, and add 5 mL of water.

Table 1

Capsule Strength (mg)	Number of Capsules	Equivalent to Tacrolimus (mg)	Volume of Dehydrated Alcohol (mL)	Volume of Internal Standard (mL)
0.5	50	25	15.0	10.0
1	25	25	15.0	10.0
5	10	50	30.0	20.0

[NOTE—For products with strengths other than those listed in *Table 1*, adjust the number of Capsules and volumes to obtain concentrations equivalent to those in the *Standard solution*.]

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 15-cm column; 5-µm packing L1

Temperature: 50°

Flow rate: 0.8 mL/min. [NOTE—Adjust the flow rate so that the retention time of tacrolimus is approximately 10 min. The flow rate may not be adjusted by more than ± 10%.]

Injection size: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 3000 theoretical plates

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{44}H_{69}NO_{12}$ in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of tacrolimus to heptyl parahydroxybenzoate from the *Sample solution*

R_S = peak response ratio of tacrolimus to heptyl parahydroxybenzoate from the *Standard solution*

C_S = concentration of USP Tacrolimus RS in the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 93.0%–105.0%

PERFORMANCE TESTS

- **DISSOLUTION** ⟨**711**⟩

  Medium: Hydroxypropylcellulose in water ($1:2 \times 10^4$) adjusted to a pH of 4.5 with phosphoric acid; 900 mL

  Apparatus 2: 50 rpm with sinker (See *Dissolution* ⟨711⟩, *Figure 2a*.)

  Mobile phase: Acetonitrile, methanol, water, and 6% phosphoric acid (46:18:36:0.1)

  Standard stock solution: L/400 mg/mL in acetonitrile [NOTE—L = label claim (mg/Capsule)]

  Standard solution: To 20.0 mL of the *Standard stock solution* add 50.0 mL of *Medium* and mix to obtain solutions with known concentrations as indicated in *Table 2*. Allow the solution to stand for NLT 6 h at 25° before use.

  Sample solution: Pass 10 mL of the solution under test through a G4 glass filter. To 5.0 mL of the filtrate, add 2.0 mL of acetonitrile and mix. Allow the solution to stand for NLT 1 h at 25° before use.

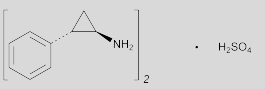
BRIEFING

Tranylcypromine Sulfate. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed. The liquid chromatographic procedure in the *Assay* was validated with a Phenomenex Synergi Polar RP brand of L11 column, in which tranylcypromine elutes at about 7 min. The liquid chromatographic procedure under *Organic Impurities* was validated with a Waters Atlantis brand of L1 column, in which tranylcypromine elutes at about 7 min.

(MD-PP: D. Vicchio, R. Ravichandran.) RTS—C62528

Add the following:

■Tranylcypromine Sulfate



$(C_9H_{11}N)_2 \cdot H_2SO_4$ 364.46
Cyclopropanamine, 2-phenyl-, *trans*-(±)-, sulfate (2:1); (±)-*trans*-2-Phenylcyclopropylamine sulfate (2:1) [13492-01-8].

DEFINITION

Tranylcypromine Sulfate contains NLT 98.0% and NMT 102.0% of $(C_9H_{11}N)_2 \cdot H_2SO_4$, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** ⟨197K⟩
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, prepared as directed in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL,** *Sulfate* ⟨191⟩

ASSAY

- **PROCEDURE**

Buffer: Dissolve 3.4 g of monobasic ammonium phosphate into a 1-L volumetric flask containing about 900 mL of water. Adjust the pH of the solution to 2.2 ± 0.1 with phosphoric acid. Dilute with water to volume.
Mobile phase: Methanol and *Buffer* (3:7)
0.05 N sulfuric acid: Cautiously add 1.3 mL of sulfuric acid into 100 mL of water, cool to room temperature, and dilute to 1000 mL.
Diluent: Methanol, water, and 0.05 N sulfuric acid (1:3:1)
Standard stock solution: Using a sonicator, dissolve USP Tranylcypromine Sulfate RS in *0.05 N sulfuric acid* and methanol (about 30% of the final volume of each solvent). Dilute with *Diluent* to obtain a 400 µg/mL solution.
Standard solution: 40 µg/mL of USP Tranylcypromine Sulfate RS in *Diluent*, prepared from *Standard stock solution*
Sample stock solution: Using a sonicator, dissolve tranylcypromine sulfate in methanol and *0.05 N sulfuric acid* (about 30% of the final volume of each solvent). Dilute with *Diluent* to obtain a 400 µg/mL solution.
Sample solution: 40 µg/mL tranylcypromine sulfate in *Diluent*, prepared from *Sample stock solution*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 25-cm column; 4-µm packing L11
Temperature: 30°
Flow rate: 1 mL/min
Injection size: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $(C_9H_{11}N)_2 \cdot H_2SO_4$ in the portion taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Tranylcypromine Sulfate RS in the *Standard solution* (µg/mL)
C_U = concentration of tranylcypromine sulfate in the *Sample solution* (µg/mL)

In-Process Revision

Acceptance criteria: 98.0%–102.0%

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION ⟨281⟩:** NMT 0.1%
- **HEAVY METALS** *Method II*, **⟨231⟩:** NMT 20 ppm

Organic Impurities

- **PROCEDURE**

Buffer: Proceed as directed in the *Assay*.
0.05 N sulfuric acid: Proceed as directed in the *Assay*.
Diluent: Proceed as directed in the *Assay*.
Solution A: Methanol and *Buffer* (3:17)
Solution B: Methanol and *Buffer* (3:7)
Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
20	100	0
25	0	100
37	0	100
39	100	0
45	100	0

Standard stock solution: 14 µg/mL of USP Tranylcypromine Sulfate RS, and 60 µg/mL each of USP Tranylcypromine Related Compound A RS and USP Tranylcypromine Related Compound B RS in *Diluent*. [NOTE—Sonicate as needed.]
Standard solution: Transfer a portion of *Standard stock solution* to a suitable volumetric flask containing methanol and *0.05 N sulfuric acid* (30% of the final volume of each solvent). Dilute with *Diluent* to volume to obtain a solution containing 0.7 µg/mL of USP Tranylcypromine Sulfate RS and 3.0 µg/mL each of USP Tranylcypromine Related Compound A RS and USP Tranylcypromine Related Compound B RS.
Sample solution: Using a sonicator, dissolve tranylcypromine sulfate in methanol and *0.05 N Sulfuric acid* (about 30% of the final volume of each solvent). Dilute with *Diluent* to obtain a solution containing 680 µg/mL of tranylcypromine sulfate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 249 for tranylcypromine related compound B; 220 nm for all other specified and unspecified impurities
Column: 4.6-mm × 15-cm column; 3 -µm packing L1
Temperature: 35°
Flow rate: 1.2 mL/min
Injection size: 25 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0 for tranylcypromine, determined at 220 nm
Resolution: NLT 2.0 between tranylcypromine and tranylcypromine related compound A, determined at 220 nm
Relative standard deviation: NMT 6.0% for tranylcypromine and tranylcypromine related compound A, determined at 220 nm. NMT 6.0% for tranylcypromine related compound B, determined at 249 nm
Analysis
Samples: *Sample solution* and *Standard solution*
[NOTE—Disregard the signal for related compound B observed at 220 nm.]
Identify related compound A, *cis*-hydrazide, *trans*-hydrazide, and any unspecified impurity using the data in *Impurity Table 1*. Calculate the percentage of each impurity in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100/F$$

r_U = peak response of the impurity from the *Sample solution*
r_S = peak response of tranylcypromine sulfate from the *Standard solution*
C_S = concentration of USP Tranylcypromine Sulfate RS in the *Standard solution* (µg/mL)
C_U = concentration of tranylcypromine sulfate in the *Sample solution* (µg/mL)
F = response factor relative to tranylcypromine sulfate

Samples: *Sample solution* and *Standard solution*
Calculate the percentage of tranylcypromine related compound B in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response at 249 nm of related compound B from the *Sample solution*
r_S = peak response at 249 nm of related compound B from the *Standard solution*
C_S = concentration of USP Tranylcypromine Related Compound B RS in the *Standard solution* (µg/mL)
C_U = concentration of tranylcypromine sulfate in the *Sample solution* (µg/mL)
Mr_1 = molecular weight of 3-phenylallylamine free base, 133.19
Mr_2 = molecular weight of 3-phenylallylamine hydrochloride (USP Tranylcypromine Related Compound B RS), 169.66

Acceptance criteria
Individual impurities: See *Impurity Table 1*. [NOTE—Related compound B is determined at 249 nm. All other specified and unspecified impurities are determined at 220 nm.]
Total impurities: NMT 1.0% [NOTE—Sum of related compound A, related compound B, *cis*-hydrazide, *trans*-hydrazide, and any unspecified impurity.]

Impurity Table 1

Name	Relative Retention Time (RRT)	Relative Response Factor (F)	Limit (%)
Tranylcypromine related compound A[a]	0.82	0.84	0.50
Tranylcypromine sulfate	1.0	1.0	—
Tranylcypromine related compound B[b]	1.2	—	0.50
cis-Hydrazide[c]	1.4	0.86	0.50
trans-Hydrazide[d]	2.5	1.1	0.50
Any unspecified impurity	—	1.0	0.10

[a] (±)-*cis*-2-phenylcyclopropanamine (Ciscypromine).
[b] 3-Phenylallylamine (Cinnamylamine), monitored at 249 nm.
[c] (±)-*cis*-2-Phenylcyclopropanecarbohydrazide.
[d] (±)-*trans*-2-Phenylcyclopropanecarbohydrazide.

SPECIFIC TESTS

- **LOSS ON DRYING ⟨731⟩:** Dry in vacuum at 60° for 2 h: it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS ⟨11⟩**
USP Tranylcypromine Sulfate RS
USP Tranylcypromine Related Compound A RS
USP Tranylcypromine Related Compound B RS■1S (*USP33*)

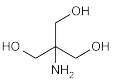
In-Process Revision

BRIEFING

Tromethamine, *USP 31* page 3479. On the basis of comments received, it is proposed to specify the drying conditions under the test for *Melting Range or Temperature*.

(MD-OOD: F. Mao.) RTS—C62475

Tromethamine



$C_4H_{11}NO_3$ 121.14
1,3-Propanediol, 2-amino-2-(hydroxymethyl)-;
2-Amino-2-(hydroxymethyl)-1,3-propanediol [77-86-1].

DEFINITION
Tromethamine contains NLT 99.0% and NMT 101.0% of $C_4H_{11}NO_3$, calculated on the dried basis.

IDENTIFICATION
- **A. INFRARED ABSORPTION** ⟨**197M**⟩
- **B. PROCEDURE**
  Sample solution: 1 in 5
  Analysis: To 4.5 mL of a saturated solution of salicylaldehyde, add 0.5 mL of glacial acetic acid, and mix. Add 4.0 mL of the *Sample solution*, and mix.
  Acceptance criteria: A yellow color is produced.
- **C. PROCEDURE**
  Sample solution: 1 in 5
  Analysis: To 0.5 mL of a solution (4 in 10) of ceric ammonium nitrate in 2 N nitric acid, add 3 mL of water and 0.5 mL of the *Sample solution*, and mix.
  Acceptance criteria: The color changes from light yellow to orange.

ASSAY
- **PROCEDURE**
  Sample: 250 mg
  Analysis: Dissolve the *Sample* in 100 mL of water, add bromocresol purple TS, and titrate with 0.1 N hydrochloric acid VS to a yellow endpoint (see *Titrimetry* ⟨541⟩). Each mL of 0.1 N hydrochloric acid is equivalent to 12.11 mg of $C_4H_{11}NO_3$.
  Acceptance criteria: 99.0%–101.0%

IMPURITIES
Inorganic Impurities
- **RESIDUE ON IGNITION** ⟨**281**⟩**:** NMT 0.1%
- **HEAVY METALS,** *Method II* ⟨**231**⟩**:** NMT 10 ppm

SPECIFIC TESTS

- **pH** ⟨**791**⟩**:** 10.0–11.5, in a solution (1 in 20)
- **LOSS ON DRYING** ⟨**731**⟩**:** Dry it at 105° for 3 h: it loses NMT 1.0% of its weight.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** ⟨**11**⟩
  USP Tromethamine RS

BRIEFING

Water for Injection, *USP 31* page 3523. The currently official monograph provides tests for the form of the article that is packaged in bulk for commercial use elsewhere. In this official monograph, the tests for the packaged bulk article are cross-referenced to the tests for Sterile Purified Water, and in the monograph itself there is also a *Bacterial Endotoxins Test*. However, the Sterile Purified Water monograph contains higher conductivity limits than those for bulk Water for Injection. In addition, the Sterile Purified Water monograph contains an *Oxidizable Substances* test, as opposed to the test in Water for Injection for *Total Organic Carbon*. These chemical tests are inconsistent with the specifications for Water for Injection, whether in bulk form (i.e., produced on site for use in manufacturing) or in packaged bulk form.
Therefore the following changes are proposed:
1. Make the specifications consistent for the bulk form (i.e., produced on site for use in manufacturing) and the packaged bulk form.
2. Add requirements for *Sterility, Packaging and Storage,* and *Labeling* to the packaged bulk form.
3. For the bulk form, remove the test for *Total Organic Carbon* and make changes in the specification for *Water Conductivity*.
4. Remove the cross-references to Sterile Purified Water.

The requirements for the bulk article are unchanged.

(PW: A. Hernandez-Cardoso.) RTS—C72119

Water for Injection

DEFINITION

Change to read:

[NOTE—For microbiological guidance, see the general information chapter *Water for Pharmaceutical Purposes* ⟨1231⟩.]
Water for Injection is water purified by distillation or a purification process that is equivalent or superior to distillation in the removal of chemicals and microorganisms. It is prepared from water complying with the U.S. Environmental Protection Agency National Primary Drinking Water Regulations or with the drinking water regulations of the European Union or Japan, or with the World Health Organization's Guidelines for Drinking Water Quality. It contains no added substance.
[NOTE—Water for Injection is intended for use in the preparation of parenteral solutions. Where used for the preparation of parenteral solutions subject to final sterilization, use suitable means to minimize microbial growth, or first render the Water for Injection sterile and, thereafter, protect it from microbial contamination. For parenteral solutions that are prepared under aseptic conditions and are not sterilized by appropriate filtration or in the final container, first render the Water for Injection sterile and, thereafter, protect it from microbial contamination. ~~The tests for *Total Organic Carbon* and *Water Conductivity* apply to Water for Injection produced on site for use in manufacturing.~~ ■■1S *(USP33)* Water for Injection packaged in bulk for commercial use elsewhere meets the ~~requirement of the test for *Bacterial Endotoxins*~~■ additional requirements of the test for *Sterility Tests* in *Specific Tests*, as well as those for *Packaging and Storage* and *Labeling*,■1S *(USP33)* as indicated ~~below and the requirements of all the tests under *Sterile Purified Water*, except *Labeling*~~■ in *Additional Requirements*.■1S *(USP33)*]

USP Sucrose RS

BRIEFING

Purified Water, *USP 31* page 3524. This proposal makes the specifications for bulk and packaged Purified Water consistent. Also, it adds packaging, storage, and labeling requirements for the packaged form. Last, the proposal removes the cross references to *Sterile Purified Water*. The requirements for bulk Purified Water are unchanged. The monograph for Purified Water provides for a "packaged in bulk for commercial use elsewhere" form of the article. At present, the *Specific Tests* for this form of the article are cross-referenced to the specification for *Sterile Purified Water*. However, the *Sterile Purified Water* monograph contains higher conductivity limits than for Purified Water. In addition, the *Sterile Purified Water* monograph contains an *Oxidizable Substances Test* as opposed to the *Total Organic Carbon* ⟨643⟩ test for Purified Water. These chemical tests are inconsistent with the specifications for Purified Water, whether the form of the article is in bulk or packaged form.

(PW: A. Hernandez-Cardoso.) RTS—C72119

Purified Water

H_2O 18.02

DEFINITION

Change to read:

[NOTE—For microbiological guidance, see *Water for Pharmaceutical Purposes* ⟨1231⟩.]
Purified Water is water obtained by a suitable process. It is prepared from water complying with the U. S. Environmental Protection Agency National Primary Drinking Water Regulations or with the drinking water regulations of the European Union, Japan, or with the World Health Organization's Guidelines for Drinking Water Quality. It contains no added substance.
[NOTE—Purified Water is intended for use as an ingredient of official preparations and in tests and assays unless otherwise specified (see ~~*Water* in *Ingredients and Processes* and in *Tests and Assays* under~~■ *8.230. Water* under *8. Terms and Definitions* in the■1S *(USP33)* *General Notices and Requirements*). Where used for sterile dosage forms, other than for parenteral administration, process the article to meet the requirements under *Sterility Tests* ⟨71⟩, or first render the Purified Water sterile and thereafter protect it from microbial contamination. Do not use Purified Water in preparations intended for parenteral administration. For such purposes use *Water for Injection*, *Bacteriostatic Water for Injection*, or *Sterile Water for Injection*. ~~The tests for *Total Organic Carbon* and *Conductivity* apply to Purified Water produced on site for use as an ingredient of official preparations and in tests and assays.~~ ■1S *(USP33)* Purified Water packaged in bulk for commercial use elsewhere meets the ■additional■1S *(USP33)* requirements ~~of all of the tests under *Sterile Purified Water*, except *Labeling* and *Sterility* ⟨71⟩~~ ■for *Packaging and Storage* and *Labeling* as indicated under *Additional Requirements*.■1S *(USP33)*]

MONOGRAPHS (NF)

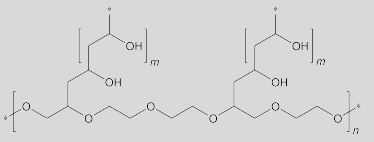
BRIEFING

Ethylene Glycol and Vinyl Alcohol Graft Copolymer. Because there is no existing *NF* monograph for this excipient, a new monograph is being proposed, based on validated methods of analysis. The gas chromatographic procedure for *Procedure 1: Ethylene Oxide and Dioxane* employs a J & W Scientific DB-1 brand of G1 column. The typical retention times for acetaldehyde and ethylene oxide are 5 and 5.4 min, respectively. The liquid chromatographic procedure for *Procedure 2: Vinyl Acetate* employs a Thermo Aquasil brand of column that contains 5-µm packing L1. The typical retention times for vinyl acetate and 1-vinylpyrrolidin-2-one are 19 and 26 min, respectively. The liquid chromatographic procedure for *Procedure 3: Acetic Acid/Acetate* is based on analysis performed with a Thermo Aquasil brand of column that contains 5-µm packing L1. The typical retention times for acetic acid and citric acid are 5 and 7 min, respectively.

(EM2: H. Wang.) RTS—C68850

Add the following:

▪Ethylene Glycol and Vinyl Alcohol Graft Copolymer



Polyethylene glycol-graft-polyvinyl alcohol;
Graft-copoly(ethylene glycol-vinyl alcohol)
[121786-16-1].

DEFINITION

Ethylene Glycol and Vinyl Alcohol Graft Copolymer is a graft copolymer of ethylene glycol and vinyl alcohol. It consists of about 75% of vinyl alcohol (–$CH_2CH(OH)$–) units and 25% of ethylene glycol (–CH_2CH_2O–) units. The Copolymer is produced by using polyethylene glycol and vinyl acetate as starting materials. Polyethylene glycol forms the polymer backbone on which polyvinyl acetate is grafted. Hydrolysis of polyvinyl acetate side chains leads to formation of polyvinyl alcohol grafted chains. Ethylene Glycol and Vinyl Alcohol Graft Copolymer may contain glidant to improve flowability.

IDENTIFICATION

• **INFRARED ABSORPTION**

Sample: 200 mg of Ethylene Glycol and Vinyl Alcohol Graft Copolymer

Analysis: Dissolve the *Sample* in 5–10 mL of water. Spread 1 mL of this solution on a thallium bromoiodide window.[1] Totally moisten the surface area of the window. Dry the window at 110° for approximately 30 min, and allow the window to cool to room temperature.

Acceptance criteria: The IR absorption spectrum of Ethylene Glycol and Vinyl Alcohol Graft Copolymer exhibits maxima corresponding to the same wavelengths as those of a similar preparation of USP Ethylene Glycol and Vinyl Alcohol Graft Copolymer RS treated in the same manner.

IMPURITIES

Inorganic Impurities

• **RESIDUE ON IGNITION ⟨281⟩**

Sample: 10.0 g

Acceptance criteria: NMT 3.0%

Organic Impurities

• **PROCEDURE 1: ETHYLENE OXIDE AND DIOXANE**

[**CAUTION**—Ethylene oxide is toxic and flammable. Prepare these solutions in a well-ventilated fume hood, using great care. Protect both hands and face by wearing polyethylene protective gloves and an appropriate face mask. Store all solutions in hermetic containers, and refrigerate at a temperature between 4° and 8°.]

[NOTE—Before using polyethylene glycol 200 in this test, remove any volatile components from it by placing 500 mL of polyethylene glycol 200 in a 1000-mL round-bottom flask, and attaching the flask to a rotary evaporator maintained at a temperature of 60° and under a vacuum of 10–20 mm Hg for 6 h.]

Acetaldehyde solution: 10 µg/mL of acetaldehyde. [NOTE—Prepare the *Acetaldehyde solution* immediately prior to use.]

Ethylene oxide stock solution: Introduce 300 µL (corresponding to 250 mg) of gaseous ethylene oxide to the polyethylene glycol 200. Determine the absorbed mass of ethylene oxide via the weight of the solution before and after the absorption. Dilute the solution with the polyethylene glyol 200 to 100 g. This stock solution contains 2.5 mg/g of ethylene oxide. [NOTE—Prepare this stock solution immediately prior to use, and store in a refrigerator after preparation.]

Ethylene oxide solution: 100 µg/g of ethylene oxide in polyethylene glycol 200 from *Ethylene oxide stock solution*. Transfer 5 g of 100 µg/g ethylene oxide in polyethylene glycol 200 to a 50-mL volumetric flask filled with 30 mL of water. Dilute with water to volume, and mix to obtain a solution containing 10 µg/mL of ethylene oxide. [NOTE—Prepare this solution immediately prior to use, and use the solution directly after preparation.]

Dioxane solution: 500 µg/mL of dioxane

Standard solution A: Transfer 0.1 mL of *Ethylene oxide solution* to a 10-mL pressure headspace vial. [NOTE—Other sizes such as 22-mL may be used depending on the operating conditions, however, the same size must be used for *Standard solution A*, *Standard solution B*, and the *Sample solution*.] Add 0.1 mL of *Acetaldehyde solution* and 0.1 mL of *Dioxane solution*, seal the vial, and mix.

Standard solution B: Transfer 1.0 g of Ethylene Glycol and Vinyl Alcohol Graft Copolymer to a 10-mL pressure headspace vial, add 0.1 mL of *Ethylene oxide solution*, 0.1 mL of *Dioxane solution*, and 1.0 mL of *N,N*-dimethylacetamide. Seal the vial, and mix.

Sample solution: Transfer 1.0 g of Ethylene Glycol and Vinyl Alcohol Graft Copolymer to a 10-mL pressure headspace vial, add 1.0 mL of *N,N*-dimethylacetamide and 0.2 mL of water, seal the vial, and mix.

[1]Thallium bromoiodide, also known as KRS-5, consists of 42% thallium(I) bromide and 58% thallium(I) iodine by molecular weight. Suitable disks of KRS-5 are available from www.photonic.saint-gobain.com, www.almazoptics.com, and www.internationalcrystal.net.

In-Process Revision

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
[NOTE—Use a headspace apparatus that automatically transfers a measured amount of headspace.]
Mode: GC
Detector: Flame ionization
Detector temperature: 250°
Column: 0.25-mm × 30-m glass or quartz capillary column; 1.0-µm layer of phase G1
Column temperature: See the temperature program table below.

Temperature (°)	Rate (°/min)	Hold Time (min)
50	—	5
50→180	5	—
180→230	30	—
230	—	5

Carrier gas: Helium
Flow rate: 0.8 mL/min
Injection size: 1 mL (the gaseous headspace)
Injection type: Split ratio 20:1
Injection port temperature: 250°
Headspace sampler
Equilibration time: 45 min
Equilibration temperature
Standard solution A: 70°
Standard solution B: 90°
Sample solution: 90°
Transfer line temperature: 150°
Pressurization time: 1 min
Final headspace pressure: 0.7 bar
Injection time: 12 s
System suitability
Sample: *Standard solution A*
[NOTE—The relative retention times for acetaldehyde and ethylene oxide are 0.94 and 1.0, respectively.]
Suitability requirements
Resolution: NLT 1.5 between acetaldehyde and ethylene oxide
Signal-to-noise: NLT 5 determined from the dioxane peak
Relative standard deviation: NMT 15%
Analysis
Samples: *Standard solution B* and *Sample solution*
Calculate the content of ethylene oxide, in ppm, in the portion of Ethylene Glycol and Vinyl Alcohol Graft Copolymer taken:

$$\text{Result} = A_E \times r_U/[(r_S \times W_U) - (r_U \times W_S)]$$

A_E = quantity of ethylene oxide added to *Standard solution B* (µg)
r_U = ethylene oxide peak response from the *Sample solution*
r_S = ethylene oxide peak response from the *Standard solution B*
W_U = weight of Ethylene Glycol and Vinyl Alcohol Graft Copolymer taken to prepare the *Sample solution* (g)
W_S = weight of Ethylene Glycol and Vinyl Alcohol Graft Copolymer taken to prepare *Standard solution B* (g)

Calculate the content of dioxane, in ppm, in the portion of Ethenylene Glycol and Vinyl Alcohol Graft Copolymer taken:

$$\text{Result} = A_D \times r_U/[(r_S \times W_U) - (r_U \times W_S)]$$

A_D = quantity of dioxane added to *Standard solution B* (µg)
r_U = dioxane peak response from the *Sample solution*
r_S = dioxane peak response from *Standard solution B*
W_U = weight of Ethylene Glycol and Vinyl Alcohol Graft Copolymer taken to prepare the *Sample solution* (g)
W_S = weight of Ethylene Glycol and Vinyl Alcohol Graft Copolymer taken to prepare *Standard solution B* (g)

Acceptance criteria: NMT 1 ppm of ethylene oxide; NMT 10 ppm of dioxane

• **PROCEDURE 2: VINYL ACETATE**
Solution A: Acetonitrile, methanol, and water (5:5:90)
Solution B: Acetonitrile, methanol, and water (45:5:50)
Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0–2	100	0
2–40	100→85	0→15
40–42	85→0	15→100
42–48	0	100
48–51	0→100	100→0

System suitability solution: Transfer 50 mg of vinyl acetate and 50 mg of 1-vinylpyrrolidin-2-one to a 50-mL volumetric flask, add 10 mL of methanol, and sonicate or gently shake the flask to dissolve the materials. Dilute with *Solution A* to volume. Dilute 10 mL of this solution with *Solution A* to 100 mL. Dilute 5 mL of this solution with *Solution A* to 100 mL. The *System suitability solution* contains about 5 µg/mL each of vinyl acetate and 1-vinylpyrrolidin-2-one.
Standard solution: Transfer 50 mg of vinyl acetate to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix well. Dilute 5.0 mL of the solution with *Solution A* to 100 mL. Dilute 10.0 mL of this solution with *Solution A* to 100 mL. The *Standard solution* contains about 2.5 µg/mL of vinyl acetate. [NOTE—This solution should be analyzed within 1 h when stored at room temperature.]
Sample solution: Transfer 250 mg of Ethylene Glycol and Vinyl Alcohol Graft Copolymer to a 10-mL volumetric flask, and add 1–2 mL of methanol, using an ultrasonic bath if necessary. After cooling to ambient temperature, dilute with water to volume, and mix. Pass through a 0.2-mm membrane filter. [NOTE—This solution should be analyzed within 1 h when stored at room temperature.]
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 205 nm
Column: 4.0-mm × 25-cm analytical column; 5-µm packing L1. A 4.0-mm × 3-cm pre-column; 5-µm packing L1 may be used if a matrix effect is observed. [NOTE—The matrix effect may result in poor reproducibility of the retention times and of the peak shapes.]
Column temperature: 30°
Flow rate: 1 mL/min
Injection size: 10 µL
System suitability
Sample: *System suitability solution*
[NOTE—The relative retention times for vinyl acetate and 1-vinylpyrrolidin-2-one are 1.0 and 1.4, respectively.]
Suitability requirements
Resolution: NLT 5.0 between vinyl acetate and 1-vinylpyrrolidin-2-one
Relative standard deviation: NMT 5.0% determined from the 1-vinylpyrrolidin-2-one peak
Analysis
Samples: *Standard solution* and *Sample solution*
Acceptance criteria: The response of the vinyl acetate peak from the *Sample solution* is NMT that of the vinyl acetate peak from the *Standard solution*, corresponding to NMT 100 ppm of vinyl acetate.

- **PROCEDURE 3: ACETIC ACID/ACETATE**
  Mobile phase: 5 mM sulfuric acid
  Standard solution: 0.3 mg/mL for each of acetic acid and citric acid in *Mobile phase*
  Sample solution: 20 mg/mL of Ethylene Glycol and Vinyl Alcohol Copolymer
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 205 nm
  Column: 4.6-mm × 25-cm column; 5-µm packing L1
  Column clean: After each injection, rinse the column with a mixture of equal volumes of *Mobile phase* and acetonitrile.
  Column temperature: Ambient
  Flow rate: 1 mL/min
  Injection size: 20 µL
  System suitability
  Sample: *Standard solution*
  [NOTE—The relative retention times for acetic acid and citric acid are 1.0 and 1.3, respectively.]
  Suitability requirements
  Resolution: NLT 2.0 between acetic acid and citric acid
  Relative standard deviation: NMT 5.0% determined from the acetic acid peak
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Acceptance criteria: The response of the acetic acid peak from the *Sample solution* is NMT that of the acetic acid peak from the *Standard solution*, corresponding to NMT 1.5% of acetic acid.

SPECIFIC TESTS

- **FATS AND FIXED OILS,** *Ester Value* ⟨**401**⟩**:** 10–75
- **LOSS ON DRYING** ⟨**731**⟩**:** Dry 1.0 g of Ethylene Glycol and Vinyl Alcohol Graft Copolymer in a vacuum at 140° for 1 h: it loses NMT 5.0% of its weight.
- **pH** ⟨**791**⟩**:** 5.0–8.0, in a solution of 20% (w/w) in carbon dioxide-free water
- **VISCOSITY** ⟨**912**⟩**:** After determining the *Loss on Drying*, weigh a quantity of undried Ethylene Glycol and Vinyl Alcohol Graft Copolymer, equivalent to 100.0 g on the dried basis. Transfer the sample to a short form, 600-mL beaker (internal diameter about 80 mm and height 120 mm), and add water to make the mixture weigh 500 g. Ensure a homogeneous solution by gently stirring at room temperature for 48 h. Afterwards allow the container to stand for 24 h to let the entrapped air dissipate. [NOTE—Ensure that the concentration of this solution is 20% (w/w).] Determine the viscosity of this solution at 23 ± 0.1° using a suitable rotational viscometer with a spindle having a cylinder 4.7 cm in diameter and 0.2 cm high attached to a shaft 0.3 cm in diameter, the distance from the top of the cylinder to the lower tip of the shaft being 2.7 cm, and the immersion depth being 4.9 cm.[2] Operate the viscometer at 100 rpm. Follow the instrument manufacturer's directions to measure the apparent viscosity.
  Acceptance criteria: 25–250 mPa · s

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at a temperature below 25°.
- **LABELING:** Label it to indicate the viscosity, giving the viscosity measurement parameters, concentration of the solution, and the type of equipment used. The labeling also indicates the name and quantity of any added substance.
- **USP REFERENCE STANDARDS** ⟨**11**⟩
  USP Ethylene Glycol and Vinyl Alcohol Graft Copolymer RS■1S (*NF28*)

[2] A commercial instrument is available as an RV2 spindle from Brookfield.

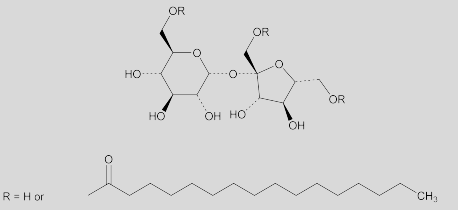
BRIEFING

Sucrose Palmitate. Because there is no existing *NF* monograph for this article, it is proposed to add a new monograph based on the Sucrose Monopalmitate monograph in the *European Pharmacopoeia* 6.2. The proposed liquid chromatographic procedure for *Free Sucrose* under *Organic Impurities* is based on analysis performed using a Waters high-performance carbohydrate cartridge with a Nova-Pak NH2 brand of 5-µm L8 column. The typical retention time is 26 min. The proposed liquid chromatographic procedure for the *Assay* is based on analysis performed using a Phenomenex PLgel brand of 4-µm L21 column.

(EM1: R. Lafaver; NOM: A. Wilk.) RTS—C66403

Add the following:

■Sucrose Palmitate



$C_{28}H_{52}O_{12}$ 580.17
$C_{44}H_{82}O_{13}$ 819.11
$C_{60}H_{112}O_{14}$ 1057.52
Sucrose monopalmitate;
Sucrose hexadecanoate [26446-38-8].

DEFINITION

Sucrose Palmitate is a mixture of sucrose monoesters, mainly sucrose monopalmitate, obtained by transesterification of palmitic acid methyl esters of vegetable origin with sucrose. The manufacture of the fatty acid methyl esters includes a distillation step. It contains variable quantities of mono- and diesters as set forth in the following table:

Content of Monoesters (%)	Content of Diesters (%)	Sum of Triesters and Polyesters (%)
NLT 55.0	NMT 40.0	NMT 20.0

IDENTIFICATION

- **A.** It meets the requirements of the *Fatty Acid Composition* test.
- **B.** It meets the requirements of the *Assay*.

ASSAY

- **PROCEDURE**
  Mobile phase: Tetrahydrofuran
  Sample solution: 15 mg/mL of Sucrose Palmitate in tetrahydrofuran

In-Process Revision

Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC, size-exclusion
Detector: Differential refractometer
Column: 7-mm × 60-cm column; packing L21, 100Å
[NOTE—Two 7-mm × 30-cm L21 columns may be used in place of one 60-cm column, provided system suitability requirements are met.]
Flow rate: 1.2 mL/min
Injection size: 20 µL
Analysis
Sample: *Sample solution*
[NOTE—The relative retention time with reference to the monoester peak is 0.92 and 0.90 for diesters and for triesters and polyesters, respectively.]
[NOTE—Disregard solvent peaks and peaks having a signal-to-noise ratio less than 10.]
Calculate the percentage of monoesters in the portion of Sucrose Palmitate taken:

$$\text{Result} = A \times (100 - D - S - E)/100$$

A = percentage of monoesters determined by peak normalization
E = percentage of water (below)
S = percentage of free sucrose (below)
D = percentage of free fatty acids, using the following formula:

$$\text{Result} = AV \times 256/561.1$$

where AV = acid value
Calculate the percentage of diesters in the portion of Sucrose Palmitate taken:

$$\text{Result} = B \times (100 - D - S - E)/100$$

B = percentage of diesters determined by peak normalization
E = percentage of water (below)
S = percentage of free sucrose (below)
D = percentage of free fatty acids (below)
Calculate the percentage of triesters and polyesters in the portion of Sucrose Palmitate taken:

$$\text{Result} = C \times (100 - D - S - E)/100$$

C = percentage of triesters and polyesters determined by peak normalization
E = percentage of water (below)
S = percentage of free sucrose (below)
D = percentage of free fatty acids (below)

OTHER COMPONENTS

- **FATTY ACID COMPOSITION:** Sucrose Palmitate exhibits the following composition profiles of fatty acids, as determined under *Fats and Fixed Oils, Fatty Acid Composition* ⟨401⟩.

Fatty Acid	Percentage (%)
Lauric acid	NMT 3.0
Myristic acid	NMT 3.0
Palmitic acid	70.0 to 85.0
Stearic acid	10.0 to 25.0
Sum of the contents of palmitic acid and stearic acid	NLT 90.0

IMPURITIES

Inorganic Impurities

- **FATS AND FIXED OILS,** *Acid Value* ⟨**401**⟩**:** NMT 6.0%, determined on a 3-g sample. Use a freshly neutralized mixture of 2-propanol and water (2:1), and gently heat.

Organic Impurities

- **PROCEDURE: FREE SUCROSE**
Solution A: 10 µg/mL of ammonium acetate in acetonitrile
Solution B: 10 µg/mL of ammonium acetate in tetrahydrofuran and water (90:10)
Diluent: Tetrahydrofuran and water (87.5:12.5)
System suitability solution: 10 µg/mL of USP Sucrose RS in *Diluent*
Standard solutions: 0.50 mg/mL, 1.0 mg/mL, 2.0 mg/mL, and 2.5 mg/mL of USP Sucrose RS in *Diluent*
Sample solution: 50 mg/mL of Sucrose Palmitate in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: Evaporative light-scattering [NOTE—If the detector has different setting parameters, adjust the detector settings so that they comply with the *System suitability* requirements.]
Carrier gas: Nitrogen
Detector temperature: 45°
Nebulizer temperature: 40°
Column: 4.6-mm × 0.25-m column; packing L8
Injection size: 20 µL
Mobile phase: See gradient table below.

Time (min)	Solution A (%)	Solution B (%)	Flow Rate (mL/min)
1	100	0	1.0
8	0	100	1.0
7	0	100	1.0
0.01	0	100	2.5
15.99	0	100	2.5

3	100	0	1.0

System suitability
Sample: *System suitability solution*
[NOTE—The retention time is about 26 min for sucrose palmitate.]
Analysis
Samples: *Standard solutions* and *Sample solution*
Prepare a standard curve by plotting the peak response versus concentration of sucrose in the *Standard solutions*. Calculate the amount of free sucrose in Sucrose Palmitate.
Acceptance criteria: NMT 4.0%

SPECIFIC TESTS

- **WATER DETERMINATION,** *Method Ia* ⟨**921**⟩**:** NMT 4.0%, on a 0.20-g sample
- **TOTAL ASH**
Sample: 1.0 g
Analysis: Heat a silica or platinum crucible to redness for 30 min, allow to cool in a desiccator and weigh. Transfer the *Sample* into the crucible. Dry at 100° to 105° for 1 h and ignite to constant weight in a muffle furnace at 600° ± 25°, allowing the crucible to cool in a desiccator after each ignition. Flames should not be produced at any time during the procedure. If after prolonged ignition the ash still contains black particles, add hot water, filter through an ashless filter paper, and ignite the residue and the filter paper. Combine the filtrate with the ash, carefully evaporate to dryness and ignite to constant weight.
Acceptance criteria: NMT 1.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in a well-closed container. Protect from humidity and avoid high temperatures.
- **USP REFERENCE STANDARDS** ⟨**11**⟩
USP Sucrose RS■1S *(NF28)*

In-Process Revision

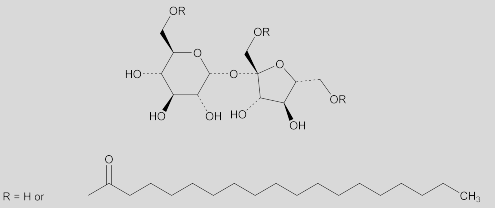
BRIEFING

Sucrose Stearate. Because there is no existing *NF* monograph for this article, it is proposed to add a new monograph based on the Sucrose Stearate monograph in the *European Pharmacopoeia* 6.2. The proposed liquid chromatographic procedures in the test for *Free Sucrose* are based on analysis performed using a Waters high performance analysis carbohydrate cartridge with Nova-Pak NH2 brand of 5-µm, L8 column. The typical retention time is 26 min. The proposed liquid chromatographic procedures in the *Assay* are based on analysis performed using a Phenomenex PLgel brand of 4-µm, L21 column.

(EM1: R. Lafaver; . NOM: A. Wilk.) RTS—C66404

Add the following:

▪Sucrose Stearate



$C_{30}H_{56}O_{12}$ 608.72
$C_{48}H_{90}O_{13}$ 875.22
$C_{66}H_{124}O_{14}$ 1141.68
Sucrose monostearate;
Sucrose octadecanoate [25168-73-4].

DEFINITION
Sucrose Stearate is a mixture of sucrose esters, mainly sucrose stearate, obtained by transesterification of stearic acid methyl esters derived from vegetable origin with sucrose. The manufacture of the fatty acid methyl esters includes a distillation step. The mono- and diesters requirements differ for the two types of sucrose stearate as set forth in the following table.

	Content of Monoesters (%)	Content of Diesters (%)	Sum of Triesters and Polyesters (%)
Type I	NLT 50.0	NMT 40.0	NMT 25.0
Type II	20.0–45.0	30.0–40.0	NMT 30.0

IDENTIFICATION
- **A.** It meets the requirements of the *Fatty Acid Composition* test.
- **B.** It meets the requirements of the *Assay*.

ASSAY
- **PROCEDURE**

Mobile phase: Tetrahydrofuran
Sample solution: 15 mg/mL of Sucrose Stearate in tetrahydrofuran
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC, size-exclusion
Detector: Differential refractometer
Column: 7-mm × 60-cm column; packing L21, 100Å
[NOTE—Two 7-mm × 30-cm L21 columns may be used in place of one 60-cm column, provided system suitability requirements are met.]
Flow rate: 1.2 mL/min
Injection size: 20 µL
Analysis
Sample: *Sample solution*
[NOTE—The relative retention time with reference to the monoester peak is about 0.92 for diesters, and about 0.90 for triesters and polyesters.]
[NOTE—Disregard solvent peaks and peaks having a signal-to-noise ratio less than 10.]
Calculate the percentage of monoesters in the portion of sucrose palmitate taken:

$$\text{Result} = A \times (100 - D - S - E)/100$$

A = percentage of monoesters determined by peak normalization
D = percentage of free fatty acids, using the following formula
S = percentage of free sucrose (above)
E = percentage of water (above)

$$\text{Result} = AV \times 284.5/561.1$$

AV = acid value
Calculate the percentage of diesters in the portion of sucrose palmitate taken:

$$\text{Result} = B \times (100 - D - S - E)/100$$

B = percentage of diesters determined by peak normalization
D = percentage of free fatty acids (above)
S = percentage of free sucrose (above)
E = percentage of water (above)
Calculate the percentage of triesters and polyesters in the portion of sucrose palmitate taken:

$$\text{Result} = C \times (100 - D - S - E)/100$$

C = percentage of triesters and polyesters determined by peak normalization
D = percentage of free fatty acids (above)
S = percentage of free sucrose (above)
E = percentage of water (above)

COMPOSITION
- **FATTY ACID COMPOSITION:** Sucrose Stearate exhibits the following composition profiles of fatty acids, as determined in *Fats and Fixed Oils* ⟨401⟩, *Fatty Acid Composition*.

Fatty Acid	Percentage (%)
Lauric acid	NMT 3.0
Myristic acid	NMT 3.0
Palmitic acid	25.0–40.0
Stearic acid	55.0–75.0
Sum of the contents of palmitic acid and stearic acid	NLT 90.0

Apparatus for Tests and Assays

BRIEFING

⟨**41**⟩ **Weights and Balances,** *USP 31* page 67 and page 682 of *PF* 34(3) [May–Jun. 2008]. On the basis of comments received, it is proposed to replace the table for *Weights Used for Verification of Accuracy* with a general requirement that these weights have a maximum tolerance that is one third of the limit for the accuracy test.

(GC: H. Pappa) RTS—C68773; C68777; C68911

Change to read:

~~The intent of this section is to bring the requirements for weights into conformity with American National Standard ANSI/ASTM E617, "Laboratory Weights and Precision Mass Standards." This standard is incorporated by reference and should be consulted for full descriptions and information on the tolerances and construction of weights.[1]~~

~~Pharmacopeial tests and assays require balances that vary in capacity, sensitivity, and reproducibility. Unless otherwise specified, when substances are to be "accurately weighed" for *Assay*, the weighing is to be performed with a weighing device whose measurement uncertainty (random plus systematic error) does not exceed 0.1% of the reading. Measurement uncertainty is satisfactory if three times the standard deviation of not less than ten replicate weighings divided by the amount weighed, does not exceed 0.001. Unless otherwise specified, for titrimetric limits tests, the weighing shall be performed to provide the number of significant figures in the weight of the analyte that corresponds to the number of significant figures in the concentration of the titrant.~~

~~The class designations below are in order of increasing tolerances.~~

~~Class 1.1 weights are used for calibration of low capacity, high sensitivity balances. They are available in various denominations from 1 to 500 mg. The tolerance for any denomination in this class is 5 µg. They are recommended for calibration of balances using optical or electrical methods for accurately weighing quantities below 20 mg.~~

~~Class 1 weights are designated as high precision standards for calibration. They may be used for weighing accurately quantities below 20 mg. (For weights of 10 g or less, the requirements of class 1 are met by *USP XXI* class M.)~~

~~Class 2 weights are used as working standards for calibration, built in weights for analytical balances, and laboratory weights for routine analytical work. (The requirements of class 2 are met by *USP XXI* class S.)[2]~~

~~Class 3 and class 4 weights are used with moderate precision laboratory balances. (Class 3 requirements are met by *USP XXI* class S 1; class 4 requirements are met by *USP XXI* class P.)[2]~~

~~A weight class is chosen so that the tolerance of the weights used does not exceed 0.1% of the amount weighed. Generally, class 2 may be used for quantities greater than 20 mg, class 3 for quantities of greater than 50 mg, and class 4 for quantities of greater than 100 mg. Weights should be calibrated periodically, preferably against an absolute standard weight.~~

▪INTRODUCTION

Pharmacopeial ~~tests and assays~~ procedures require balances that vary in capacity, sensitivity, and repeatability. This chapter applies to balances used in Pharmacopeial procedures with a reportable value expressed in at least three significant figures[1] (see §7.10 *Interpretation of Requirements* in §7 *Test Results* under *General Notices and Requirements*), ~~. Analytical methods with less strict requirements need not necessarily follow this standard.~~ when substances are to be "accurately weighed". Measurement uncertainty from the balance is only one contribution to overall weighing errors.~~[1]~~ [2]~~Other~~ Additional contributions include changes in water content of samples during weighing and a static charge on the sample.

~~[1] Copies of ASTM Standard E 617-81 (Reapproved 1985) may be obtained from the American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103.~~

~~[2] Note that the designations S and P no longer designate weight classes but rather weight grades, that is, design limitations such as range of density of materials, surface area, surface finish, corrosion resistance, and hardness.~~

[1] Zeros within a number are always significant. Zeros that do nothing but set the decimal point are not significant. Trailing zeros that are not needed to hold the decimal point are significant. Cases and examples in which this requirement would apply, and examples of these cases follow. (1) Procedures with specification limits (e.g, 90.0% to 110.0%, 98.0% to 102.0%). (2) Procedures in which the result is reported in mg (e.g., mg limits for a 5-mg tablet for which the specification is 90.0% to 110.0% are 4.50 mg to 5.50 mg). (3) Limits expressed with three significant figures (e.g., not more than 1.50%; not more than 0.00100%). Cases and their examples where this requirement would not necessarily apply follow. (1) Procedures with specification limits (e.g., 90% to 110%. (2) Limits expressed with less than three significant figures (e.g., not more than 1.5%; not more than 0.0010%; not more than 150 ppm).

[2] Sources of measurement uncertainties with laboratory balances are (including, but not limited to) readability, repeatability, nonlinearity, sensitivity, temperature, and buoyancy.

This chapter ~~addresses the control of the analytical balance for routine operation.~~ controls the use of an analytical balance for routine operation with ~~Unless otherwise specified, when substances are to be ''accurately weighed'' (for example, in an *Assay* analysis), the weighing is to be performed with a weighing device.~~

~~Assessment of measurement uncertainty is typically done prior to the balance being placed in operation (e.g., during IQ/OQ/PQ) and periodically thereafter. Two steps are performed in measuring uncertainty: (1) measurement of repeatability and (2) verification of accuracy against certified weights. does not exceed 0.1% of the reading. There are three requirements for control of the analytical balance: assessment of measurement uncertainty (represented mainly by the repeatability of the measurement), verification of accuracy, and a calibration check. that meets~~ the following three requirements: repeatability of the measurement, ~~to within 0.1%~~ verification of accuracy, ~~to within 0.1%~~ and a weight check. The first two requirements are typically performed prior to placing the balance in operation ~~(e.g., during IQ/OQ/PQ)~~ and periodically thereafter according to applicable standard operating procedures. The ~~calibration~~ weight check is typically performed each day ~~or prior to each series of weighings.~~ on which the balance is used or at appropriate intervals based on applicable standard operating procedures.

REPEATABILITY

~~Assessment of repeatability may be performed using either *Method A* or *Method B*.~~

~~*Method A*—In this method, repeatability~~ Repeatability is determined ~~at the lower end of the desired operating range (i.e., the range of weights~~ within the range of sample mass for which the balance has been qualified to meet the requirements of this chapter. The measurement of repeatability using this method is satisfactory if two times the standard deviation of not less than 10 replicate weighings divided by the ~~amount weighed~~ nominal mass does not exceed 0.001, as shown in the formula:

$$2s/w \leq 0.001$$

in which s is the standard deviation of not less than 10 replicate weighings; and w is the nominal mass ~~, in mg,~~ of the weight used. Because of display resolution, it is possible to make measurements in which every replicate measurement result is the same value. A true repeatability standard deviation of zero is not statistically possible, although the standard deviation may be less than one display increment d. In this situation, the standard deviation of the balance can be estimated as

$$s = \frac{d}{2\sqrt{3}} = 0.29d$$

~~*Method B Calculation of Minimum Weight*—This method may be used to determine the low end of the operating range (e.g., minimum weight). Minimum weight can be derived from the following formula:[2]~~

~~$(2/U_{rel})s$~~

~~[2] Derived from the expanded uncertainty equation in NISTIR 6919, Recommended Guide for Determining and Reporting Uncertainties for Balances and Scales, January 2002.~~

In-Process Revision

~~in which U_{ur} represents the uncertainty factor of 0.001; and s is the standard deviation from the repeatability measurements, of not less than 10 replicate measurements of a mass near the low end of the operating range in mg. Minimum weight may be used to define the low end of the operating range. Because of scale resolution, it is possible to make measurements in which every one results in the same value. A true scale standard deviation of zero is not statistically possible, although the standard deviation may be less than one display increment d. In this situation, the standard deviation of the scale can be estimated as~~

~~$$s = \frac{d}{\sqrt{3}} = 0.577d$$~~

~~$$s = \frac{d}{2\sqrt{3}} = 0.29d$$~~

VERIFICATION OF ACCURACY

Using ~~multiple~~ weights of suitable ~~accuracy~~ tolerances, ~~Weights Used for Calibration Check of Balances *Weights Used for Verification of Accuracy,*~~ the ~~measured weight is~~ indicated weighing value by the balance must remain within 0.1% of the certified value of the weight over the operating range of the balance. The operating range refers to the range used for performing ~~the assay,~~ analytical procedures under this chapter, and not necessarily to the operating range for other weighing operations. The tolerance of weights used for testing accuracy is considered suitable if the maximum tolerance is one third of the limit for the accuracy test or less.[3]

~~CALIBRATION CHECK~~ WEIGHT CHECK

Analytical balances vary greatly in the features they offer to ensure that the balance is maintained in a calibrated state. A ~~calibration~~ weight check ~~to ensure~~ using an internal or external check weight ensures that the balance is ~~in a calibrated state is performed each day or before each series of weighings. Typically, the calibration check uses internal or external weights to verify that the balance is still in a calibrated state.~~ suitable to use. The weight check is typically performed each day the balance is used or at appropriate intervals based on applicable standard operating procedures, and the measured weight is within 0.1% of its nominal value.

[3] Applicable standards are: ASTM E617 (available from www.astm.org) and OIML R111 (available from www.oiml.org).

OTHER TESTS AND ASSAYS

BRIEFING

〈**467**〉 **Residual Solvents,** *USP 31* page 170 and page 1232 of *PF* 34(5) [Sept.–Oct. 2008]. On the basis of information collected at USP laboratories, it is proposed to clarify the preparation of the *Class 1 Standard Solutions* in *Procedure A* for *Water-Soluble Articles*. The *Standard Solution* for *Procedure C* under *Water-Soluble Articles* is renamed *Standard Stock Solution* for consistency with the procedures under *Water-Insoluble Articles*. Also, under *Procedure C* for *Water-Insoluble Articles* the *Note* is modified for consistency with the *Water-Soluble Articles* procedure. On the basis of comments received, it is indicated that in order to use loss on drying to control residual solvents, the limit in the monograph needs to be 0.5% or less.

(GC: H. Pappa) RTS—C69220; C70440

Change to read:

IDENTIFICATION, CONTROL, AND QUANTIFICATION OF RESIDUAL SOLVENTS

Whenever possible, the substance under test needs to be dissolved to release the residual solvent. Because the USP deals with drug products, as well as active ingredients and excipients, it may be acceptable that in cases some of the components of the formulation will not dissolve completely. In those cases, the drug product may first need to be pulverized into a fine powder so that any residual solvent that may be present can be released. This operation should be as fast as possible to prevent the loss of volatile solvents during the procedure.

NOTE—The organic-free water specified in the following procedures produces no significantly interfering peaks when chromatographed.

Class 1 and Class 2 Residual Solvents

The following procedures are useful to identify and quantify residual solvents when the information regarding which solvents are likely to be present in the material is not available. When the information about the presence of specific residual solvents is available, only *Procedure C* is needed to quantify the amount of residual solvents present.

■A flow diagram for the application of the residual solvent limit tests is shown in *Figure 1*.■1S (*USP32*)

WATER-SOLUBLE ARTICLES

Procedure A—
Class 1 Standard Stock Solution—

■[NOTE—When transferring solutions, place the tip of the pipette just below the surface of the liquid. Mix each solution using a magnetic stirrer for 10 to 15 minutes.]■1S (*USP33*)
Transfer 1.0 mL of USP Class 1 Residual Solvents Mixture RS to a 100-mL volumetric flask, ~~add~~

■previously filled with about■1S (*USP33*)
9 mL of dimethyl sulfoxide, dilute with water to volume, and mix. Transfer 1.0 mL of this solution to a 100-mL volumetric flask,

In-Process Revision

■previously filled with about 50 mL of water,■1S (*USP33*) dilute with water to volume, and mix. Transfer ~~1.0 mL of this solution to a 10-mL volumetric flask~~

■10 mL of this solution to a 100-mL volumetric flask, previously filled with about 50 mL of water,■1S (*USP33*) dilute with water to volume, and mix.

Class 1 Standard Solution—Transfer 1.0 mL of *Class 1 Standard Stock Solution* to an appropriate headspace vial, ~~add 5.0 mL of water~~

■containing 5.0 mL of water (place the tip of the pipette just below the surface of the liquid for dispensing),■1S (*USP33*) apply the stopper, cap, and mix.

Class 2 Standard Stock Solutions—Transfer 1.0 mL of USP Residual Solvents Class 2—Mixture A RS to a 100-mL volumetric flask, dilute with water to volume, and mix. This is *Class 2 Standard Stock Solution A.* Transfer 1.0 mL of USP Residual Solvents Class 2—Mixture B RS to a 100-mL volumetric flask, dilute with water to volume, and mix. This is *Class 2 Standard Stock Solution B.*

Class 2 Mixture A Standard Solution—Transfer 1.0 mL of *Class 2 Standard Stock Solution A* to an appropriate headspace vial, add 5.0 mL of water, apply the stopper, cap, and mix.

Class 2 Mixture B Standard Solution—Transfer 5.0 mL of *Class 2 Standard Stock Solution B* to an appropriate headspace vial, add 1.0 mL of water, apply the stopper, cap, and mix.

Test Stock Solution—Transfer about 250 mg of the article under test, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

Test Solution—Transfer 5.0 mL of *Test Stock Solution* to an appropriate headspace vial, add 1.0 mL of water, apply the stopper, cap, and mix.

Class 1 System Suitability Solution—Transfer 1.0 mL of *Class 1 Standard Stock Solution* to an appropriate headspace vial, add 5.0 mL of *Test Stock Solution,* apply the stopper, cap, and mix.

Chromatographic System (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica column coated with a 1.8-μm layer of phase G43 or a 0.53-mm × 30-m wide-bore column coated with a 3.0-μm layer of phase G43. The carrier gas is nitrogen or helium with a linear velocity of about 35 cm per second, and a split ratio of 1 : 5. [NOTE—Split ratio can be modified in order to optimize sensitivity.] The column temperature is maintained at 40° for 20 minutes, then raised at a rate of 10° per minute to 240°, and maintained at 240° for 20 minutes. The injection port and detector temperatures are maintained at 140° and 250°, respectively. Chromatograph the *Class 1 Standard Solution, Class 1 System Suitability Solution,* and *Class 2 Mixture A Standard Solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio of 1,1,1-trichloroethane in the *Class 1 Standard Solution* is not less than 5; the signal-to-noise ratio of each peak in the *Class 1 System Suitability Solution* is not less than 3; and the resolution, *R,* between acetonitrile and methylene chloride in the *Class 2 Mixture A Standard Solution* is not less than 1.0.

Procedure—

■[NOTE—It is recommended to increase the temperature of the transfer line between runs to eliminate any potential condensation of solvents.]■1S (*USP32*) Separately inject (following one of the headspace operating parameter sets described in the table below) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution, Class 2 Mixture A Standard Solution, Class 2 Mixture B Standard Solution,* and the *Test Solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. If a peak response of any peak, other than a peak for 1,1,1-trichloroethane, in the *Test Solution* is greater than or equal to a corresponding peak in either the *Class 1 Standard Solution* or either of the two *Class 2 Mixture Standard Solutions,* or a peak response of 1,1,1-trichloroethane is greater than or equal to 150 times the peak response corresponding to 1,1,1-trichloroethane in the *Class 1 Standard Solution,* proceed to *Procedure B* to verify the identity of the peak; otherwise the article meets the requirements of this test.

■

* Or follow the instrument manufacturer's recommendations, as long as the method criteria are met. Injecting less than this amount is allowed as long as adequate sensitivity is achieved.■1S (*USP32*)

Procedure B—

Class 1 Standard Stock Solution, Class 1 Standard Solution, Class 2 Standard Stock Solutions, Class 2 Mixture A Standard Solution, Class 2 Mixture B Standard Solution, Test Stock Solution, Test Solution, and *Class 1 System Suitability Solution*—Prepare as directed for *Procedure A.*

Chromatographic System (see *Chromatography* ⟨621⟩)—The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica column coated with a 0.25-μm layer of phase G16, or a 0.53-mm × 30-m wide-bore column coated with a 0.25-μm layer of phase G16. The carrier gas is nitrogen or helium with a linear velocity of about 35 cm per second and a split ratio of 1 : 5. [NOTE—Split ratio can be modified in order to optimize sensitivity.] The column temperature is maintained at 50° for 20 minutes, then raised at a rate of 6° per minute to 165°, and maintained at 165° for 20 minutes. The injection port and detector temperatures are maintained at 140° and 250°, respectively. Chromatograph the *Class 1 Standard Solution* and the *Class 1 System Suitability Solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio of benzene in the *Class 1 Standard Solution* is not less than 5; the signal-to-noise ratio of each peak in the *Class 1 System Suitability Solution* is not less than 3; and the resolution, *R,* between acetonitrile and *cis*-dichloroethene in the *Class 2 Mixture A Standard Solution* is not less than 1.0.

Procedure—

■[NOTE—It is recommended to increase the temperature of the transfer line between runs to eliminate any potential condensation of solvents.]■1S *(USP32)*
Separately inject (following one of the headspace operating parameter sets described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution,* the *Class 2 Mixture A Standard Solution,* the *Class 2 Mixture B Standard Solution,* and the *Test Solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. If the peak response(s) in the *Test Solution* of the peak(s) identified in *Procedure A* is/are greater than or equal to a corresponding peak(s) in either the *Class 1 Standard Solution* or either of the two *Class 2 Mixture Standard Solutions,* proceed to *Procedure C* to quantify the peak(s); otherwise the article meets the requirements of this test.

Procedure C—

Class 1 Standard Stock Solution, Class 1 Standard Solution, Class 2 Standard Stock Solution A, Class 2 Mixture A Standard Solution, Test Stock Solution, Test Solution, and *Class 1 System Suitability Solution*—Prepare as directed for *Procedure A.*

~~*Standard Solution*~~

■*Standard Stock Solution*—■1S *(USP33)*
[NOTE—Prepare a separate ~~*Standard Solution*~~
■*Standard Stock Solution*■1S *(USP33)*
for each peak identified and verified by *Procedures A* and *B.* For the Class 1 solvents other than 1,1,1-trichloroethane, prepare the first dilution as directed for the first dilution under *Class 1 Standard Stock Solution* in *Procedure A.*] Transfer an accurately measured volume of each individual USP Reference Standard corresponding to each residual solvent peak identified and verified by *Procedures A* and *B* to a suitable container, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a final concentration of 1/20 of the value stated in *Table 1* or *2* (under *Concentration Limit*). ~~Transfer 1.0 mL of this solution to an appropriate headspace vial, add 5.0 mL of water, apply the stopper, cap, and mix.~~

■*Standard Solution*—Transfer 1.0 mL of this solution to an appropriate headspace vial, add 5.0 mL of water, apply the stopper, cap, and mix.■1S *(USP33)*

Spiked Test Solution—[NOTE—Prepare a separate *Spiked Test Solution* for each peak identified and verified by *Procedures A* and *B.*] Transfer 5.0 mL of *Test Stock Solution* to an appropriate headspace vial, add 1.0 mL of the ~~*Standard Solution,*~~

■*Standard Stock Solution,*■1S *(USP33)*
apply the stopper, cap, and mix.

Chromatographic System (see *Chromatography* ⟨621⟩)—[NOTE—If the results of the chromatography from *Procedure A* are found to be inferior to those found with *Procedure B,* the *Chromatographic System* from *Procedure B* may be substituted.] The gas chromatograph is equipped with a flame-ionization detector, a 0.32-mm × 30-m fused-silica column coated with a 1.8-μm layer of phase G43 or a 0.53-mm × 30-m wide-bore column coated with a 3.0-μm layer of phase G43. The carrier gas is nitrogen or helium with a linear velocity of about 35 cm per second, and a split ratio of 1 : 5. [NOTE—The split ratio can be modified in order to optimize sensitivity.] The column temperature is maintained at 40° for 20 minutes, then raised at a rate of 10° per minute to 240°, and maintained at 240° for 20 minutes. The injection port and detector temperatures are maintained at 140° and 250°, respectively. Chromatograph the *Class 1 Standard Solution,* the *Class 1 System Suitability Solution,* and the *Class 2 Mixture A Standard Solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio of 1,1,1-trichloroethane in the *Class 1 Standard Solution* is not less than 5; the signal-to-noise ratio of each peak in the *Class 1 System Suitability Solution* is not less than 3; and the resolution, *R,* between acetonitrile and methylene chloride in the *Class 2 Mixture A Standard Solution* is not less than 1.0.

Procedure—

■[NOTE—It is recommended to increase the temperature of the transfer line between runs to eliminate any potential condensation of solvents.]■1S *(USP32)*
Separately inject (following one of the headspace operating parameters described in *Table 5*) equal volumes of headspace (about 1.0 mL) of the *Standard Solution,* the *Test Solution,* and the *Spiked Test Solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in ppm, of each residual solvent found in the article under test by the formula:

$$5(C/W)[r_U/(r_{ST} - r_U)]$$

in which *C* is the concentration, in μg per mL, of the appropriate USP Reference Standard in the ~~*Standard Solution;*~~

■*Standard Stock Solution;* ■1S *(USP32)*
W is the weight, in g, of the article under test taken to prepare the *Test Stock Solution;* and r_U and r_{ST} are the peak responses of each residual solvent obtained from the *Test Solution* and the *Spiked Test Solution,* respectively.

In-Process Revision

WATER-INSOLUBLE ARTICLES

Procedure A—[NOTE—Dimethyl sulfoxide may be substituted as an alternative solvent to dimethylformamide.]

Class 1 Standard Stock Solution—Transfer 1.0 mL of USP Class 1 Residual Solvents Mixture RS to a 100-mL volumetric flask previously filled with about 80 mL of dimethylformamide, dilute with dimethylformamide to volume, and mix. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, previously filled with about 80 mL of dimethylformamide, dilute with dimethylformamide to volume, and mix (reserve a portion of this solution for the *Class 1 System Suitability Solution*). Transfer 1.0 mL of this solution to a 10-mL volumetric flask, dilute with dimethylformamide to volume, and mix.

Class 1 Standard Solution—Transfer 1.0 mL of *Class 1 Standard Stock Solution* to an appropriate headspace vial, containing 5.0 mL of water, apply the stopper, cap, and mix.

Class 2 Standard Stock Solutions—Transfer 1.0 mL of USP Residual Solvents Class 2—Mixture A RS to a 100-mL volumetric flask, previously filled with about 80 mL of dimethylformamide, dilute with dimethylformamide to volume, and mix. This is *Class 2 Standard Stock Solution A.* Transfer 0.5 mL of USP Residual Solvents Class 2—Mixture B RS to a 10-mL volumetric flask, dilute with dimethylformamide to volume, and mix. This is *Class 2 Standard Stock Solution B.*

Class 2 Mixture A Standard Solution—Transfer 1.0 mL of *Class 2 Standard Stock Solution A* to an appropriate headspace vial, containing 5.0 mL of water, apply the stopper, cap, and mix.

Class 2 Mixture B Standard Solution—Transfer 1.0 mL of *Class 2 Standard Stock Solution B* to an appropriate headspace vial, containing 5.0 mL of water, apply the stopper, cap, and mix.

Test Stock Solution—Transfer about 500 mg of the article under test, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with dimethylformamide to volume, and mix.

Test Solution—Transfer 1.0 mL of *Test Stock Solution* to an appropriate headspace vial, containing 5.0 mL of water, apply the stopper, cap, and mix.

Class 1 System Suitability Solution—Mix 5 mL of *Test Stock Solution* with 0.5 mL of the intermediate dilution reserved from *Class 1 Standard Stock Solution.* Transfer 1.0 mL of this solution to an appropriate headspace vial, containing 5.0 mL of water, apply the stopper, cap, and mix.

Chromatographic System (see *Chromatography* ⟨621⟩—The gas chromatograph is equipped with a flame-ionization detector, a 0.53-mm × 30-m wide-bore column coated with a 3.0-μm layer of phase G43. The carrier gas is helium with a linear velocity of about 35 cm per second, and a split ratio of 1 : 3 [NOTE—Split ratio can be modified in order to optimize sensitivity.] The column temperature is maintained at 40° for 20 minutes, then raised at a rate of 10° per minute to 240°, and maintained at 240° for 20 minutes. The injection port and detector temperatures are maintained at 140° and 250°, respectively. Chromatograph the *Class 1 Standard Solution, Class 1 System Suitability Solution,* and *Class 2 Mixture A Standard Solution,* and record the peak responses as directed for *Procedure:* the signal-to-noise ratio of 1,1,1-trichloroethane in the *Class 1 Standard Solution* is not less than 5; the signal-to-noise ratio of each peak in the *Class 1 System Suitability Solution* is not less than 3; and the resolution, *R,* between acetonitrile and methylene chloride in the *Class 2 Mixture A Standard Solution* is not less than 1.0.

Procedure—

■[NOTE—It is recommended to increase the temperature of the transfer line between runs to eliminate any potential condensation of solvents.]■1S *(USP32)*
Separately inject (use headspace operating parameters 3 in *Table 5* with a vial pressure of 10 psi) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution, Class 2 Mixture A Standard Solution, Class 2 Mixture B Standard Solution,* and *Test Solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. If a peak response of any peak, other than a peak for 1,1,1-trichloroethane, in the *Test Solution* is greater than or equal to a corresponding peak in either the *Class 1 Standard Solution* or either of the two *Class 2 Mixture Standard Solutions,* or a peak response of 1,1,1-trichloroethane is greater than or equal to 150 times the peak response corresponding to 1,1,1-trichloroethane in the *Class 1 Standard Solution,* proceed to *Procedure B* to verify the identity of the peak; otherwise the article meets the requirements of this test.

Procedure B—

Class 1 Standard Stock Solution, Class 1 Standard Solution, Class 1 System Suitability Solution, Class 2 Standard Stock Solutions, Class 2 Mixture A Standard Solution, and *Class 2 Mixture B Standard Solution, Test Stock Solution,* and *Test Solution*—Proceed as directed for *Procedure A.*

Chromatographic System—Proceed as directed for *Procedure B* under *Water-Soluble Articles* with a split ratio of 1 : 3. [NOTE—The split ratio can be modified in order to optimize sensitivity.]

Procedure—

■[NOTE—It is recommended to increase the temperature of the transfer line between runs to eliminate any potential condensation of solvents.]■1S *(USP32)*
Separately inject (use headspace operating parameters 3 in *Table 5* with a vial pressure of 10 psi) equal volumes of headspace (about 1.0 mL) of the *Class 1 Standard Solution, Class 2 Mixture A Standard Solution, Class 2 Mixture B Standard Solution,* and *Test Solution,* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. If the peak response(s) in *Test Solution* of the peak(s) identified in *Procedure A* is/are greater than or equal to a corresponding peak(s) in either the *Class 1 Standard Solution* or any of the two *Class 2 Mixture Standard Solutions,* proceed to *Procedure C* to quantify the peak(s); otherwise the article meets the requirements of this test.

Procedure C—

Class 1 Standard Stock Solution, Class 1 Standard Solution, Class 1 System Suitability Solution, Class 2 Standard Stock Solution A, and *Class 2 Mixture A Standard Solution*—Proceed as directed for *Procedure A.*

Standard Stock Solution—[NOTE—Prepare a separate ~~*Standard Solution*~~

■*Standard Stock Solution*■1S *(USP33)*
for each peak identified and verified by *Procedures A* and *B.*

In-Process Revision

■For the Class 1 solvents other than 1,1,1-trichloroethane, prepare the first dilution as directed for the first dilution under *Class 1 Standard Stock Solution* in *Procedure A.*]■1S (*USP33*)
Transfer an accurately measured volume of each individual USP Reference Standard corresponding to each residual solvent peak identified and verified by *Procedures A* and *B* to a suitable container, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a final concentration of 1/20 of the value stated in *Table 1* or *Table 2* (under *Concentration Limit*).

Standard Solution—Transfer 1.0 mL of the *Standard Stock Solution* to an appropriate headspace vial, containing 5.0 mL of water, apply the stopper, cap, and mix.

Test Stock Solution—Proceed as directed for *Procedure A.*

Test Solution—Transfer 1.0 mL of the *Test Stock Solution* to an appropriate headspace vial, containing 5.0 mL of water, apply the stopper, cap, and mix.

Spiked Test Solution—[NOTE—Prepare a separate *Spiked Test Solution* for each peak identified and verified by *Procedures A* and *B.*] Transfer 1.0 mL of *Test Stock Solution* to an appropriate headspace vial, add 1 mL of *Standard Stock Solution* and 4.0 mL of water, apply the stopper, cap, and mix.

Chromatographic System—Proceed as directed for *Procedure C* under *Water-Soluble Articles.*

Procedure—

■[NOTE—It is recommended to increase the temperature of the transfer line between runs to eliminate any potential condensation of solvents.]■1S (*USP32*)
Separately inject (use headspace operating parameters 3 in *Table 5* with a vial pressure of 10 psi) equal volumes of headspace (about 1.0 mL) of the *Standard Solution, Test Solution,* and *Spiked Test Solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in ppm, of each residual solvent found in the article under test by the formula:

$$10(C/W)[r_U/(r_{ST} - r_U)]$$

in which C is the concentration, in μg per mL, of the appropriate USP Reference Standard in the ~~*Standard Solution;*~~

■*Standard Stock Solution;*■1S (*USP32*)
W is the weight, in g, of the article under test taken to prepare the *Test Stock Solution;* and r_U and r_{ST} are the peak responses of each residual solvent obtained from *Test Solution* and *Spiked Test Solution,* respectively.

Class 3 Residual Solvents

If Class 3 solvents are present, the level of residual solvents may be determined as directed under *Loss on Drying* ⟨731⟩ when the monograph for the article under test contains a loss on drying procedure

■specifying an upper limit of no more than 0.5% (per *Option 1*),■1S (*USP33*)
or a specific determination of the solvent may be made. If there is no loss on drying procedure in the monograph for the article under test or if a Class 3 solvent limit in an individual monograph is greater than 50 mg per day (corresponding to 5000 ppm or 0.5% under *Option 1*), the individual Class 3 residual solvent or solvents present in the article under test should be identified and quantified, and the procedures as described above, with appropriate modifications to the standard solutions, are to be applied wherever possible. Otherwise an appropriate validated procedure is to be employed. USP Reference Standards, where available, should be used in these procedures. ~~A flow diagram for the application of residual solvent limit tests is shown in *Figure 1.*~~

■■1S (*USP32*)

In-Process Revision

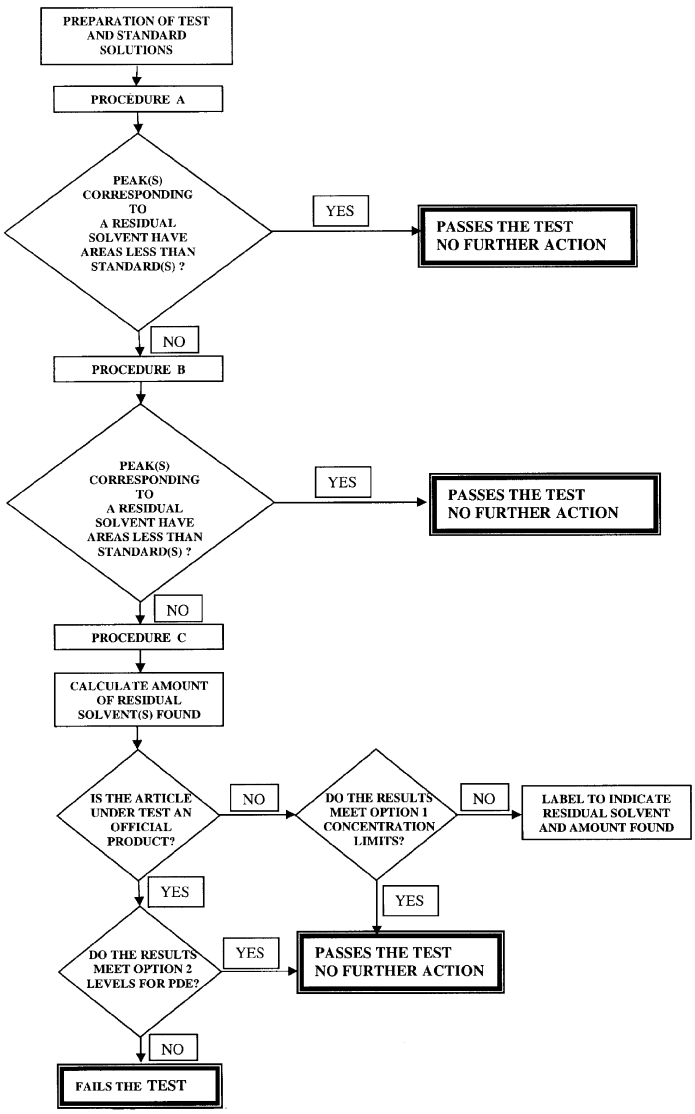

Figure 1. Diagram relating to the identification of residual solvents and the application of limit tests.

Delete the following:

▪~~OTHER ANALYTICAL PROCEDURES~~

~~The following procedures, with any necessary variations, are used where specified in the individual monographs.~~

~~Method I~~

~~A gas chromatograph capable of temperature programming and equipped with a wide-bore, wall-coated open tubular column and a flame-ionization detector is used in the following procedure.~~

~~**Standard Solution**— Prepare a solution, in organic-free water, or the solvent specified in the monograph, containing in each mL, 12.0 µg of methylene chloride, 7.6 µg of 1,4-dioxane, 1.6 µg of trichloroethylene, and 1.2 µg of chloroform. [NOTE—Prepare fresh daily.]~~

~~**Test Solution**— Dissolve in organic-free water, or the solvent specified in the monograph, an accurately weighed portion of the material to be tested to obtain a final solution having a known concentration of about 20 mg of the test material per mL.~~

~~**Chromatographic System** (see *Chromatography* ⟨621⟩)— The gas chromatograph is equipped with a flame-ionization detector, a 0.53-mm × 30-m fused-silica analytical column coated with a 5-µm chemically cross-linked G27 stationary phase and a 0.53-mm × 5-m silica guard column deactivated with phenylmethyl siloxane. The carrier gas is helium with a linear velocity of about 35 cm per second. [NOTE—When a makeup gas is used, nitrogen is recommended.] The injection port temperature and the detector temperature are maintained at 70° and 260°, respectively. The column temperature is programmed as follows. Initially, the column temperature is maintained at 35° for 5 minutes, then increased at a rate of 8° per minute to 175°, followed by an increase at a rate of 35° per minute to 260°, and maintained at 260° for at least 16 minutes.~~

~~Inject the *Standard Solution*, and record the peak responses as directed for *Procedure*: a suitable system is one that yields chromatograms in which all of the components in the *Standard Solution* are resolved; the resolution, *R*, between any two components is not less than 1.0; and the relative standard deviation of the individual peak responses from replicate injections is not more than 15%.~~

Procedure— Separately inject equal volumes (about 1 µL) of the *Standard Solution* and the *Test Solution* into the chromatograph, record the chromatograms, and measure the peak responses.

Identify, on the basis of retention time, any peaks present in the chromatogram of the *Test Solution*. The identity and peak response in the chromatogram may be established as being from any of the organic volatile impurities listed in the table shown below or from some other volatile impurity eluting with a comparable retention time as determined by mass spectrometric relative abundance procedures or by the use of a second validated column containing a different stationary phase.

Unless otherwise specified in the individual monograph, the amount of each organic volatile impurity present in the material does not exceed the limit given in the table shown below.

Organic Volatile Impurity	Limit (µg per g)
Chloroform	60
1,4-Dioxane	380
Methylene Chloride	600
Trichloroethylene	80

Method IV

Standard Solution— Prepare as directed for *Standard Solution* in *Method I*. Pipet 5 mL of the solution into a vial fitted with a septum and crimp cap, containing 1 g of anhydrous sodium sulfate, and seal. Heat the sealed vial at 80° for 60 minutes.

Test Solution— Transfer 100 mg, accurately weighed, of the material under test to a vial, add 5.0 mL of water, or the solvent specified in the monograph, and 1 g of anhydrous sodium sulfate, and seal with a septum and crimp cap. Heat the sealed vial at 80° for 60 minutes, or as specified in the individual monograph.

Chromatographic System and Procedure— [NOTE—The use of headspace apparatuses that automatically transfer a measured amount of headspace is allowed. Also, the use of a guard column in this headspace procedure is not necessary.] Proceed as directed for *Method V*, except to inject, using a heated gas-tight syringe, 1 mL of the headspace.

Method V

Standard Solution and Test Solution— Prepare as directed for *Method I*.

Chromatographic System ⟨see *Chromatography* ⟨621⟩⟩— The gas chromatograph is equipped with a flame-ionization detector, a 0.53-mm × 30-m fused silica analytical column coated with a 3.0-µm G43 stationary phase, and a 0.53-mm × 5-m silica guard column deactivated with phenylmethyl siloxane. The carrier gas is helium with a linear velocity of about 35 cm per second. The injection port and detector temperatures are maintained at 140° and 260°, respectively. The column temperature is programmed according to the following steps: It is maintained at 40° for 20 minutes, then increased rapidly to 240°, and maintained at 240° for 20 minutes.

Inject the *Standard Solution*, and record the peak responses as directed for *Procedure*: a suitable system is one that yields chromatograms in which all of the components in the *Standard Solution* are resolved; the resolution, *R*, between any two components is not less than 3; and the relative standard deviation of the individual peak responses from replicate injections is not more than 15%.

Procedure— Proceed as directed for *Method I*, the injection volume being about 1 µL.

Method VI

Standard Solution and Test Solution— Prepare as directed for *Method I*.

Chromatographic System ⟨see *Chromatography* ⟨621⟩⟩— The gas chromatograph is equipped with a flame-ionization detector. The column and column temperature conditions, as chosen from the list below (see *Table 6*), are specified in the individual monograph. The carrier gas, linear velocity or flow rate, and detector and injection port temperatures are appropriate to the column dimensions and column temperatures chosen from the list below.

Inject the *Standard Solution*, and record the peak responses as directed for *Procedure*: a suitable system is one that yields the chromatograms in which all of the components in the *Standard Solution* are resolved; the resolution, *R*, between any two components is not less than 1.0; and the relative standard deviation of the individual peak responses from replicate injections is not more than 15%.

Procedure— Proceed as directed for *Method I*, the injection volume being about 1 µL.

Table 6. Chromatographic Conditions for Method VI

Chromatographic Conditions	USP Column Designation	Column Size	Column Temperature
A	S3	3 mm × 2 m	190°
B	S2	3 mm × 2.1 m	160°
C	G16	0.53 mm × 30 m	40°
D	G39	3 mm × 2 m	65°
E	G16	3 mm × 2 m	70°
F	S4	2 mm × 2.5 m	Hold 120° (35 min.) Gradient 120°–200° (2°/min.) Hold 20 min.
H	G14	2 mm × 2.5 m	Hold 45° (3 min.) Gradient 45°–120° (8°/min.) Hold 15 min.
I	G27	0.53 mm × 30 m	Hold 35° (5 min.) 35°–175° (8° /min.) 175°–260° (35°/min.) Hold 16 min.
J	G16	0.33 mm × 30 m	Hold 50° (20 min.) 50°–165° (6°/min.) Hold 20 min.

■2S (*USP32*)

In-Process Revision

BRIEFING

⟨**525**⟩ **Sulfur Dioxide,** page 3697 of the *Second Supplement.* On the basis of comments and data received, it is proposed to make the following revisions:

1. Add *Method IV,* which is being used extensively in many starch monographs as the current method. *Method I* does not work well for modified starches.
2. Add *Method V,* which is being widely used in excipient monographs that also have applications in the food industry. Sulfur dioxide, a potential allergenic agent as stated in federal regulations, is limited by the food industry. In general, the labeling is required to indicate the presence of sulfur dioxide if the residual sulfur dioxide concentration is greater than 10 ppm.

(EGC: H. Wang.) RTS—C70002

Add the following:

▪METHOD IV

In this test, sulfur dioxide is released from the test specimen in a boiling acid medium and is removed by a stream of carbon dioxide. The separated gas is collected in a dilute hydrogen peroxide solution, in which the sulfur dioxide is oxidized to sulfuric acid and titrated with standard alkali, using a pH meter to control the pH value and titration. This test is performed under conditions such that the requirements specified in the system suitability test are met.

Special Reagents

Carbon Dioxide—Use carbon dioxide with a flow regulator that will maintain a flow of 100 ± 10 mL per minute.

Hydrogen Peroxide Solution—Dilute 30% hydrogen peroxide with water to obtain a 3% solution. Neutralize the 3% hydrogen peroxide solution with 0.01 N sodium hydroxide to a pH of 4.1 determined potentiometrically.

Potassium Metabisulfite Solution—Transfer 0.87 g of potassium metabisulfite ($K_2S_2O_5$) and 0.2 g of edetate disodium to a 1000-mL volumetric flask. Dilute with water to volume before mixing. [NOTE—Edetate disodium is used to protect sulfite ion from oxidation.]

Apparatus

A suitable apparatus for sulfur dioxide determination is shown in the accompanying diagram (*Figure 1*). The apparatus consists of a 500-mL three-neck, round-bottom boiling flask, *A;* a separatory funnel, *B,* having a capacity of 100 mL or greater; a gas inlet tube of sufficient length to permit introduction of the carbon dioxide within 2.5 cm of the bottom of the boiling flask; a reflux condenser, *C,* having a jacket length of 200 mm; and a delivery tube, *E,* connecting the upper end of the reflux condenser to the bottom of a receiving test tube, *D.* Apply a thin film of stopcock grease to the sealing surfaces of all joints except the joint between the separatory funnel and the boiling flask, and clamp the joints to ensure tightness.

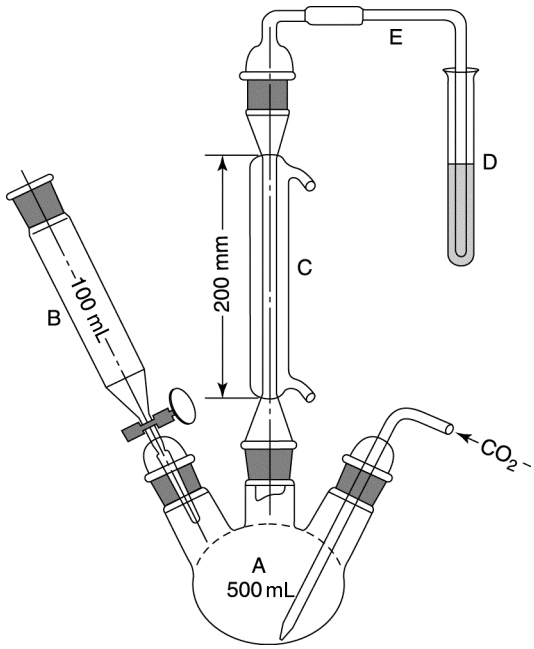

Figure 1. Apparatus for Method IV

System Suitability Test

Test A—Using the *Potassium Metabisulfite Solution* as the standard, proceed as directed for *Procedure*, except replace the 25.0 g of test substance with 20 mL of *Potassium Metabisulfite Solution*. Calculate the content, in μg per mL, of sulfur dioxide in the *Potassium Metabisulfite Solution* taken by the formula:

$$1000(32.03)VN / V_P$$

in which the factor 1000 converts mg to μg; 32.03 is the milliequivalent weight of sulfur dioxide; V is the volume, in mL, of titrant consumed; N is the normality of the titrant; and V_P is the volume, in mL, of the *Potassium Metabisulfite Solution* taken for the test.

Test B—In a 100-mL conical flask, add 20 mL of 0.02 N iodine solution and 5 mL of 2 N hydrochloric acid. Add 1 mL of starch TS, and titrate with the *Potassium Metabisulfite Solution* until the first discoloration is observed. Calculate the content, in μg per mL, of sulfur dioxide in the *Potassium Metabisulfite Solution* by the formula:

$$1000(32.03)V_IN_I / V_P$$

in which 1000 and 32.03 are defined above; V_I is the volume, in mL, of the iodine solution used in the test; N_I is the normality of the iodine solution; and V_P is the volume, in mL, of the *Potassium Metabisulfite Solution* consumed.

The difference between the sulfur dioxide contents obtained from *Test A* and *Test B* is not more than 5% of their mean value. *Test B* shall be performed within 15 minutes after completion of *Test A*. [NOTE—This avoids a potential variation of the sulfur dioxide content in the *Potassium Metabisulfite Solution* when stored at room temperature.]

Procedure

Add 150 mL of water to the boiling flask (*A*). Close the stopcock of the separatory funnel, and begin the flow of carbon dioxide at a rate of 100 ± 5 mL per minute through the apparatus. Start the condenser coolant flow. Place 10 mL of *Hydrogen Peroxide Solution* in the receiving test tube (*D*). After 15 minutes, without interrupting the flow of carbon dioxide, remove the separatory funnel (*B*) from the boiling flask, and transfer 25.0 g of the test specimen to the boiling flask with the aid of 100 mL of water. Apply stopcock grease to the outer joint of the separatory funnel, and replace the separatory funnel in the boiling flask. Close the stopcock of the separatory funnel, and add 80 mL of 2 N hydrochloric acid to the separatory funnel. Open the stopcock of the separatory funnel to permit the hydrochloric acid solution to flow into the boiling flask, guarding against escape of sulfur dioxide into the separatory funnel by closing the stopcock before the last few mL of hydrochloric acid drain out. Boil the mixture for 1 hour. Open the stopcock of the funnel, stop the flow of carbon dioxide, discontinue heating the flask, and turn off the cooling water in the condenser. Remove the receiving test tube, and transfer

its contents to a 200-mL wide-necked, conical flask. Rinse the receiving test tube with a small portion of water, add the rinsing to the 200-mL conical flask, and mix. Heat on a water bath for 15 minutes, and allow to cool. Add 0.1 mL of bromophenol blue TS, and titrate the contents with 0.1 N sodium hydroxide VS until the color changes from yellow to violet-blue, with the color change lasting for at least 20 seconds. Perform a blank determination and make any necessary correction (see *Titrimetry* ⟨541⟩). Calculate the content, in μg per g, of sulfur dioxide in the test specimen taken by the formula:

$$1000(32.03)VN/W$$

in which the factor 1000 converts mg to μg; 32.03 is the milliequivalent weight of sulfur dioxide; *V* is the volume, in mL, of titrant consumed; *N* is the normality of the titrant; and *W* is the weight, in g, of the test specimen taken. ■1S (*USP33*)

Add the following:

▪METHOD V

In this method, similar to *Method IV,* sulfur dioxide is released from the test specimen in a boiling acid medium and is removed by a stream of nitrogen. The separated gas is collected in a dilute hydrogen peroxide solution, in which the sulfur dioxide is oxidized to sulfuric acid and titrated with standard alkali, using methyl red as an indicator. This test is performed under conditions such that the requirements specified in the system suitability test are met.

Special Reagents

Hydrogen Peroxide Solution—Dilute a portion of 30 percent hydrogen peroxide with water to obtain a 3% solution. Just before use, add 3 drops of methyl red TS, and neutralize to a yellow endpoint with 0.01 N sodium hydroxide. Do not exceed the endpoint.

Nitrogen—Use high-purity nitrogen with a flow regulator that will maintain a flow of 200 ± 10 mL per minute. Guard against the presence of oxygen by passing the nitrogen through a scrubber, such as alkaline pyrogallol, prepared as follows: add 4.5 g of pyrogallol to a gas-washing bottle, purge the bottle with nitrogen for 3 minutes, and add a solution containing 85 mL of water and 65 g of potassium hydroxide while maintaining an atmosphere of nitrogen in the bottle.

Potassium Metabisulfite Solution—Transfer 0.87 g of potassium metabisulfite ($K_2S_2O_5$) and 0.2 g of edetate disodium to a 1000-mL volumetric flask. Dilute with water to volume before mixing. [NOTE—Edetate disodium is used to protect sulfite ion from oxidation.]

Apparatus

The apparatus (see *Figure 2*) is designed to effect the selective transfer of sulfur dioxide from the specimen in boiling aqueous hydrochloric acid to the *Hydrogen Peroxide Solution* in vessel *G.* The backpressure is limited to the unavoidable pressure due to the height of the *Hydrogen Peroxide Solution* above the tip of the bubbler, *F.* Keeping the backpressure as low as possible reduces the likelihood that sulfur dioxide will be lost through leaks. Preboil vinyl and silicone tubing. Apply a thin film of stopcock grease to the sealing surfaces of all joints, except the joint between the separatory funnel and the flask, and clamp the joints to ensure tightness. The separatory funnel, *B,* has a capacity of 100 mL or greater. The inlet adapter,

A, with a hose connector, provides a means of applying headpressure over the solution. [NOTE—A pressure-equalizing dropping funnel is not recommended because condensate, which may contain sulfur dioxide, is deposited in the funnel and the side arm.]

The round-bottom flask, *C,* is a 1000-mL flask with three 24/40 tapered joints. The gas inlet tube, *D,* is long enough to permit introduction of the nitrogen to within 2.5 cm of the bottom of the flask. The Allihn condenser, *E,* has a jacket length of 300 mm. The bubbler, *F* (see *Figure 3*), is fabricated from glass according to the dimensions given in *Figure 3.* The *Hydrogen Peroxide Solution* is contained in a vessel, *G,* having an inside diameter of about 2.5 cm and a depth of about 18 cm. Circulate coolant, such as a mixture of water and methanol (4 : 1) maintained at 5°, to chill the condenser.

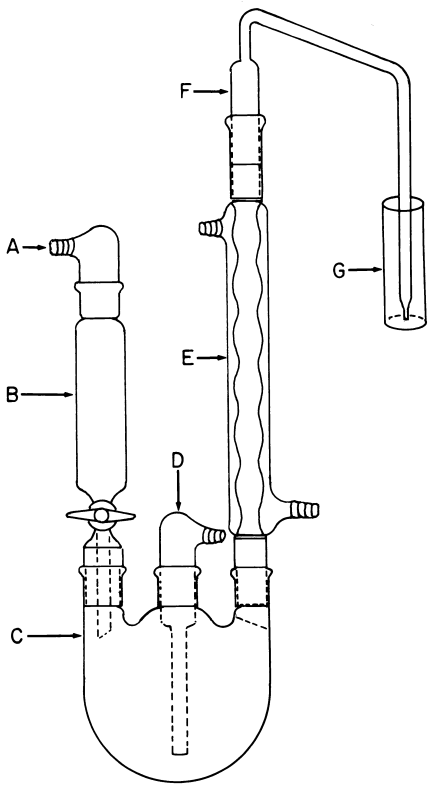

Figure 2. Apparatus for Method V

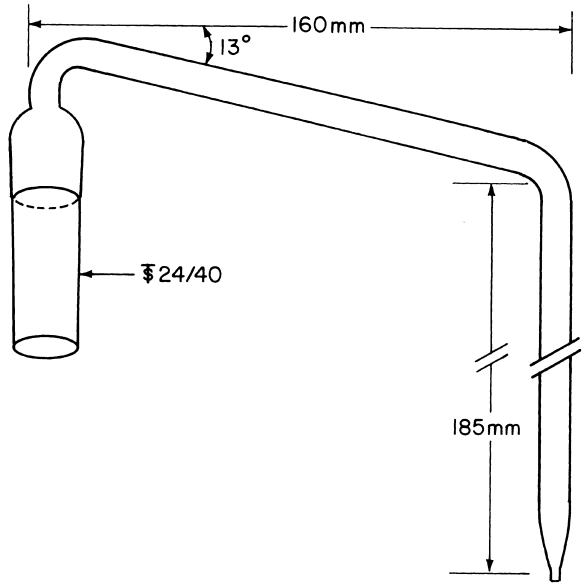

Figure 3. Bubbler (F) for apparatus in Method V

System Suitability Test

Test A—Using the *Potassium Metabisulfite Solution* as the standard, proceed as directed for *Procedure*, except replace the 50.0 g of test substance with 20 mL of *Potassium Metabisulfite Solution*. Calculate the content, in μg per mL, of sulfur dioxide in the *Potassium Metabisulfite Solution* taken by the formula:

$$1000(32.03)VN / V_P$$

in which the factor 1000 converts mg to μg; 32.03 is the milliequivalent weight of sulfur dioxide; *V* is the volume, in mL, of titrant consumed; *N* is the normality of the titrant; and V_P is the volume, in mL, of *Potassium Metabisulfite Solution* taken for the test.

Test B—In a 100-mL conical flask, add 20 mL of 0.02 N iodine solution and 5 mL of 2 N hydrochloric acid. Add 1 mL of starch TS, and titrate with the *Potassium Metabisul-*

fite Solution until the first discoloration is observed. Calculate the content, in μg per mL, of sulfur dioxide in the *Potassium Metabisulfite Solution* by the formula:

$$1000(32.03)V_I N_I / V_P$$

in which 1000 and 32.03 are defined above; V_I is the volume, in mL, of iodine solution used in the test; N_I is the normality of the iodine solution; and V_P is the volume, in mL, of *Potassium Metabisulfite Solution* consumed.

The difference between the sulfur dioxide contents obtained from *Test A* and *Test B* is not more than 5% of their mean value. *Test B* shall be performed within 15 minutes after completion of *Test A*. [NOTE—This avoids a potential variation of the sulfur dioxide content in the *Potassium Metabisulfite Solution* when stored at room temperature.]

Procedure

Position the apparatus in a heating mantle controlled by a power-regulating device. Add 400 mL of water to the flask. Close the stopcock of the separatory funnel, and add 90 mL of 4 N hydrochloric acid to the separatory funnel. Begin the flow of nitrogen at a rate of 200 ± 10 mL per minute. Start the condenser coolant flow. Add 30 mL of *Hydrogen Peroxide Solution* to the vessel *(G).* After 15 minutes, remove the separatory funnel, and transfer a mixture of 50.0 g of the test specimen, accurately weighed, and 100 mL of alcohol solution (5 in 100) to the flask. Apply stopcock grease to the outer joint of the separatory funnel, return the separatory funnel to the tapered joint flask, and concomitantly resume the nitrogen flow. Apply headpressure above the hydrochloric acid solution in the separatory funnel with a rubber bulb equipped with a valve. Open the stopcock of the separatory funnel to permit the hydrochloric acid solution to flow into the flask. Continue to maintain sufficient pressure above the hydrochloric acid solution to force it into the flask. [NOTE—The stopcock may be temporarily closed, if necessary, to increase the pressure.] To guard against escape of sulfur dioxide into the separatory funnel, close the stopcock before the last few mL of hydrochloric acid drain out. Apply power to the heating mantle sufficient to cause about 85 drops of reflux per minute. After refluxing for 1.75 hours, remove the vessel *(G),* add 3 drops of methyl red TS, and titrate the contents with 0.01 N sodium hydroxide VS, using a 10-mL buret with an overflow tube and a hose connection to a carbon dioxide-absorbing tube, to a yellow endpoint that persists for at least 20 seconds. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Calculate the quantity, in μg, of SO_2 in each g of the test specimen taken by the formula:

$$1000(32.03)VN / W$$

in which the factor 1000 converts mg to μg; 32.03 is the milliequivalent weight of sulfur dioxide; V is the volume, in mL, of titrant consumed; N is the normality of the titrant; and W is the weight, in g, of the test specimen taken.■1S (*USP33*)

Physical Tests and Determinations

BRIEFING

⟨**921**⟩ **Water Determination,** *USP 31* page 370, and page 761 of *PF* 34(3) [May–June 2008]. On the basis of comments received, in the *Procedure* sections under *Method 1a (Direct Titration)* and *Method 1b (Residual Titration),* it is proposed to change the text to reflect the transfer of 30 to 40 mL of methanol or suitable solvent to the titration vessel, ensuring that the volume is sufficient to cover the electrodes. The following revisions are proposed for *Method Ic (Coulometric Titration)*: under *Principle*, it is proposed to revise the text to indicate that introduction of solids into the cells may require precautions; under *Test Preparation*, it is proposed to revise the text to accommodate various sample handling techniques; and under *Procedure*, it is proposed to revise the text to accommodate sample introduction and blank determination, as needed, and make any necessary corrections.

(GC: A. Hernandez-Cardoso.) RTS—C66277

Change to read:

METHOD I (TITRIMETRIC)

Determine the water by *Method Ia,* unless otherwise specified in the individual monograph.

Method Ia (Direct Titration)

Principle—The titrimetric determination of water is based upon the quantitative reaction of water with an anhydrous solution of sulfur dioxide and iodine in the presence of a buffer that reacts with hydrogen ions.

In the original titrimetric solution, known as Karl Fischer Reagent, the sulfur dioxide and iodine are dissolved in pyridine and methanol. The test specimen may be titrated with the *Reagent* directly, or the analysis may be carried out by a residual titration procedure. The stoichiometry of the reaction is not exact, and the reproducibility of a determination depends upon such factors as the relative concentrations of the *Reagent* ingredients, the nature of the inert solvent used to dissolve the test specimen, and the technique used in the particular determination. Therefore, an empirically standardized technique is used in order to achieve the desired accuracy. Precision in the method is governed largely by the extent to which atmospheric moisture is excluded from the system. The titration of water is usually carried out with the use of anhydrous methanol as the solvent for the test specimen; however, other suitable solvents may be used for special or unusual test specimens.

Apparatus—Any apparatus may be used that provides for adequate exclusion of atmospheric moisture and determination of the endpoint. In the case of a colorless solution that is titrated directly, the endpoint may be observed visually as a change in color from canary yellow to amber. The reverse is observed in the case of a test specimen that is titrated residually. More commonly, however, the endpoint is determined electrometrically with an apparatus employing a simple electrical circuit that serves to impress about 200 mV of applied potential between a pair of platinum electrodes immersed in the solution to be titrated. At the endpoint of the titration a slight excess of the reagent increases the flow of current to between 50 and 150 microamperes for 30 seconds to 30 minutes, depending upon the solution being titrated. The time is shortest for substances that dissolve in the reagent. With some automatic titrators, the abrupt change in current or potential at the endpoint serves to close a solenoid-operated valve that controls the buret delivering the titrant. Commercially available apparatus generally comprises a closed system consisting of one or two automatic burets and a tightly covered titration vessel fitted with the necessary electrodes and a magnetic stirrer. The air in the system is kept dry with a suitable desiccant, and the titration vessel may be purged by means of a stream of dry nitrogen or current of dry air.

Reagent—Prepare the Karl Fischer Reagent as follows. Add 125 g of iodine to a solution containing 670 mL of methanol and 170 mL of pyridine, and cool. Place 100 mL of pyridine in a 250-mL graduated cylinder, and, keeping the pyridine cold in an ice bath, pass in dry sulfur dioxide until the volume reaches 200 mL. Slowly add this solution, with shaking, to the cooled iodine mixture. Shake to dissolve the iodine, transfer the solution to the apparatus, and allow the solution to stand overnight before standardizing. One mL of this solution when freshly prepared is equivalent to approximately 5 mg of water, but it deteriorates gradually; therefore, standardize it within 1 hour before use, or daily if in continuous use. Protect from light while in use. Store any bulk stock of the reagent in a suitably sealed, glass-stoppered container, fully protected from light, and under refrigeration.

A commercially available, stabilized solution of Karl Fischer type reagent may be used. Commercially available reagents containing solvents or bases other than pyridine or alcohols other than methanol may be used also. These may be single solutions or reagents formed in situ by combining the components of the reagents present in two discrete solutions. The diluted *Reagent* called for in some monographs should be diluted as directed by the manufacturer. Either methanol or other suitable solvent, such as ethylene glycol monomethyl ether, may be used as the diluent.

Test Preparation—Unless otherwise specified in the individual monograph, use an accurately weighed or measured amount of the specimen under test estimated to contain 2 to 250 mg of water. The amount of water depends on the water equivalency factor of the *Reagent* and on the method of endpoint determination. In most cases, the minimum amount of specimen, in mg, can be estimated using the formula:

$$FCV / KF$$

in which *F* is the water equivalency factor of the *Reagent,* in mg per mL; *C* is the used volume, in percent, of the capacity of the buret; *V* is the buret volume, in mL; and *KF* is the limit or reasonable expected water content in the sample, in percent. *C* is

■generally■2S (*USP32*) between 30% and 100% for manual titration, and between 10% and 100% for the instrumental method endpoint determination.

■Note ■it is recommended■1S (*USP33*) that the product of *FCV* ~~must~~ ■■1S (*USP33*) be greater than or equal to 200 for the calculation to ensure that the minimum amount of water titrated is greater than or equal to 2 mg.■2S (*USP32*)

Where the specimen under test is an aerosol with propellant, store it in a freezer for not less than 2 hours, open the container, and test 10.0 mL of the well-mixed specimen. In titrating the specimen, determine the endpoint at a temperature of 10° or higher.

Where the specimen under test is capsules, use a portion of the mixed contents of not fewer than 4 capsules.

In-Process Revision

Where the specimen under test is tablets, use powder from not fewer than 4 tablets ground to a fine powder in an atmosphere of temperature and relative humidity known not to influence the results.

Where the monograph specifies that the specimen under test is hygroscopic, use a dry syringe to inject an appropriate volume of methanol, or other suitable solvent, accurately measured, into a tared container, and shake to dissolve the specimen. Using the same syringe, remove the solution from the container and transfer it to a titration vessel prepared as directed for *Procedure.* Repeat the procedure with a second portion of methanol, or other suitable solvent, accurately measured, add this washing to the titration vessel, and immediately titrate. Determine the water content, in mg, of a portion of solvent of the same total volume as that used to dissolve the specimen and to wash the container and syringe, as directed for *Standardization of Water Solution for Residual Titrations,* and subtract this value from the water content, in mg, obtained in the titration of the specimen under test. Dry the container and its closure at 100° for 3 hours, allow to cool in a desiccator, and weigh. Determine the weight of specimen tested from the difference in weight from the initial weight of the container.

Standardization of the Reagent—Place enough methanol or other suitable solvent in the titration vessel to cover the electrodes, and add sufficient *Reagent* to give the characteristic endpoint color, or 100 ± 50 microamperes of direct current at about 200 mV of applied potential.

For determination of trace amounts of water (less than 1%), it is preferable to use *Reagent* with a water equivalency factor of not more than 2.0.

■*Purified Water,* sodium tartrate dihydrate, ■a USP Reference Standard,■1S (*USP33*) or commercial standards with a certificate of analysis traceable to a national standard may be used to standardize the *Reagent.* The reagent equivalency factor, the recommended titration volume, ~~and the amount of standard to measure are factors to consider when deciding which standard and how much~~■buret size, and amount of standard to measure are factors to consider when deciding which standard and how much■1S (*USP33*) to use.[1] For *Purified Water* or water standards, quickly add the equivalent of between 2 and 250 mg of water. Calculate the water equivalency factor, *F,* in mg of water per mL of reagent, by the formula:

$$W / V$$

in which *W* is the weight, in mg, of the water contained in the aliquot of standard used; and *V* is the volume, in mL, of the *Reagent* used in the titration.■2S (*USP32*)
~~Sodium tartrate may be used as a convenient water reference substance. Quickly add 75~~

■For sodium tartrate, quickly add 20■2S (*USP32*) to 125 mg of sodium tartrate ($C_4H_4Na_2O_6 \cdot 2H_2O$), accurately weighed by difference, and titrate to the endpoint. The water equivalence factor *F,* in mg of water per mL of *Reagent,* is given by the formula:

$$2(18.02/230.08)(W/V)$$

in which 18.02 and 230.08 are the molecular weights of water and sodium tartrate dihydrate, respectively; *W* is the weight, in mg, of sodium tartrate dihydrate; and *V* is the volume, in mL, of the *Reagent* consumed in the second titration.

■Note that the solubility of sodium tartrate dihydrate in methanol is such that fresh methanol may be needed for additional titrations of the sodium tartrate dihydrate standard.■2S (*USP32*)

~~For the precise determination of significant amounts of water (1% or more), use *Purified Water* as the reference substance. Quickly add between 25 and 250 mg of water, accurately weighed by difference, from a weighing pipet or from a precalibrated syringe or micropipet, the amount taken being governed by the reagent strength and the buret size, as referred to under *Volumetric Apparatus* ⟨31⟩. Titrate to the endpoint. Calculate the water equivalence factor, *F,* in mg of water per mL of reagent, by the formula:~~

~~W/V~~

~~in which *W* is the weight, in mg, of the water; and *V* is the volume, in mL, of the reagent required.~~

■■2S (*USP32*)

Procedure—Unless otherwise specified, transfer ~~35~~

■30■1S (*USP33*) to 40 mL of methanol or other suitable solvent to the titration vessel,

■ensuring that the volume is sufficient to cover the electrodes,■1S (*USP33*) and titrate with the *Reagent* to the electrometric or visual endpoint to consume any moisture that may be present. (Disregard the volume consumed, since it does not enter into the calculations.) Quickly add the *Test Preparation,* mix, and again titrate with the *Reagent* to the electrometric or visual endpoint. Calculate the water content of the specimen, in mg, taken by the formula:

$$SF$$

in which *S* is the volume, in mL, of the *Reagent* consumed in the second titration; and *F* is the water equivalence factor of the *Reagent.*

[1] ~~Consider a setup in which the reagent equivalency factor is 5 mg per mL, and the buret volume is 5 mL. Also, what must be considered is an instrumental endpoint.~~ ■Consider a setup in which the reagent equivalency factor is 5 mg/mL, and the buret volume is 5 mL and an instrumental endpoint.■1S (USP33) Standard amounts equivalent to between 2.5 mg and 22.5 mg of water (10 to 90% of buret capacity) could be used based on the buret and the reagent equivalency factor. The upper end of this range would involve an excessive amount of sodium tartrate dihydrate. If Purified Water or a standard is weighed, an analytical balance appropriate to the amount weighed is required.

Method Ib (Residual Titration)

Principle—See the information given in the section *Principle* under *Method Ia.* In the residual titration, excess *Reagent* is added to the test specimen, sufficient time is allowed for the reaction to reach completion, and the unconsumed *Reagent* is titrated with a standard solution of water in a solvent such as methanol. The residual titration procedure is applicable generally and avoids the difficulties that may be encountered in the direct titration of substances from which the bound water is released slowly.

Apparatus, Reagent, and Test Preparation—Use *Method Ia.*

Standardization of Water Solution for Residual Titration—Prepare a *Water Solution* by diluting 2 mL of water with methanol or other suitable solvent to 1000 mL. Standardize this solution by titrating 25.0 mL with the *Reagent,* previously standardized as directed under *Standardization of the Reagent.* Calculate the water content, in mg per mL, of the *Water Solution* taken by the formula:

$$V'F/25$$

in which V' is the volume of the *Reagent* consumed, and F is the water equivalence factor of the *Reagent.* Determine the water content of the *Water Solution* weekly, and standardize the *Reagent* against it periodically as needed.

Procedure—Where the individual monograph specifies that the water content is to be determined by *Method Ib,* transfer ~~35~~ ■30■1S (*USP33*) to 40 mL of methanol or other suitable solvent to the titration vessel, ■ensuring that the volume is sufficient to cover the electrodes,■1S (*USP33*) and titrate with the *Reagent* to the electrometric or visual endpoint. Quickly add the *Test Preparation,* mix, and add an accurately measured excess of the *Reagent.* Allow sufficient time for the reaction to reach completion, and titrate the unconsumed *Reagent* with standardized *Water Solution* to the electrometric or visual endpoint. Calculate the water content of the specimen, in mg, taken by the formula:

$$F(X' - XR)$$

in which F is the water equivalence factor of the *Reagent; X′* is the volume, in mL, of the *Reagent* added after introduction of the specimen; X is the volume, in mL, of standardized *Water Solution* required to neutralize the unconsumed *Reagent;* and R is the ratio, $V'/25$ (mL *Reagent*/mL *Water Solution*), determined from the *Standardization of Water Solution for Residual Titration.*

Method Ic (Coulometric Titration)

Principle—The Karl Fischer reaction is used in the coulometric determination of water. Iodine, however, is not added in the form of a volumetric solution but is produced in an iodide-containing solution by anodic oxidation. The reaction cell usually consists of a large anode compartment and a small cathode compartment that are separated by a diaphragm. Other suitable types of reaction cells (e.g., without diaphragms) may also be used. Each compartment has a platinum electrode that conducts current through the cell. Iodine, which is produced at the anode electrode, immediately reacts with water present in the compartment. When all the water has been consumed, an excess of iodine occurs, which usually is detected electrometrically, thus indicating the endpoint. Moisture is eliminated from the system by pre-electrolysis. Changing the Karl Fischer solution after each determination is not necessary since individual determinations can be carried out in succession in the same reagent solution. A requirement for this method is that each component of the test specimen is compatible with the other components, and no side reactions take place. Samples are usually transferred into the vessel as solutions by means of injection through a septum. Gases can be introduced into the cell by means of a suitable gas inlet tube. Precision in the method is predominantly governed by the extent to which atmospheric moisture is excluded from the system; thus, the introduction of solids into the cell ~~is not recommended, unless elaborate precautions are taken,~~ ■may require precautions,■1S (*USP33*) such as working in a glove-box in an atmosphere of dry inert gas. Control of the system may be monitored by measuring the amount of baseline drift. This method is particularly suited to chemically inert substances like hydrocarbons, alcohols, and ethers. In comparison with the volumetric Karl Fischer titration, coulometry is a micro-method.

Apparatus—Any commercially available apparatus consisting of an absolutely tight system fitted with the necessary electrodes and a magnetic stirrer is appropriate. The instrument's microprocessor controls the analytical procedure and displays the results. Calibration of the instrument is not necessary, as the current consumed can be measured absolutely.

Reagent—See ~~*Reagent* under *Method Ia.*~~ ■manufacturer's recommendations.■2S (*USP32*)

~~**Test Preparation**—Where the specimen is a soluble solid, dissolve an appropriate quantity, accurately weighed, in anhydrous methanol or other suitable solvents. Liquids may be used as such or as accurately prepared solutions in appropriate anhydrous solvents.~~

~~Where the specimen is an insoluble solid, the water may be extracted using a suitable anhydrous solvent from which an appropriate quantity, accurately weighed, may be injected into the anolyte solution. Alternatively an evaporation technique may be used in which water is released and evaporated by heating the specimen in a tube in a stream of dry inert gas, this gas being then passed into the cell.~~

~~**Procedure**—Using a dry syringe, quickly inject the *Test Preparation,* accurately measured and estimated to contain 0.5 to 5 mg of water, or as recommended by the instrument manufacturer into the anolyte, mix, and perform the coulometric titration to the electrometric endpoint. Read the water content of the *Test Preparation* directly from the instrument's display, and calculate the percentage that is present in the substance. Perform a blank determination, and make any necessary corrections.~~

■**Test Preparation**—Where the specimen is a soluble solid, an appropriate quantity, accurately weighed, may be dissolved in anhydrous methanol or other suitable solvents.

In-Process Revision

Where the specimen is an insoluble solid, an appropriate quantity, accurately weighed, may be extracted using a suitable anhydrous solvent, and may be injected into the anolyte solution. Alternatively, an evaporation technique may be used in which water is released and evaporated by heating the specimen in a tube in a stream of dry inert gas. The gas is then passed into the cell.

Where the specimen is to be used directly without dissolving in a suitable anhydrous solvent, an appropriate quantity, accurately weighed, may be introduced into the chamber directly.

Where the specimen is a liquid, and is miscible with anhydrous methanol or other suitable solvents, an appropriate quantity, accurately weighed, may be added to anhydrous methanol or other suitable solvents.

Procedure—Using a dry device, inject or add directly an accurately measured amount of the sample or sample preparation estimated to contain between 0.5 to 5 mg of water, or an amount recommended by the instrument manufacturer into the anolyte, mix, and perform the coulometric titration to the electrometric endpoint. Read the water content of the liquid *Test Preparation* directly from the instrument's display, and calculate the percentage that is present in the substance. Perform a blank determination, as needed, and make any necessary corrections.■1S (*USP33*)

GENERAL CHAPTERS

General Information

BRIEFING

⟨**1033**⟩ **Biological Assay Validation.** Because there is currently no information in *USP* regarding this topic, it is proposed to add this new general information chapter to provide perspective on bioassay validation.

(STAT: T. Morris.) RTS—C65692

Add the following:

■⟨1033⟩ BIOLOGICAL ASSAY VALIDATION

INTRODUCTION

[NOTE—See the *Definitions* section for terms used throughout this chapter.]

Biological assays (bioassays) are an integral part of the quality assessment required for the development and manufacturing of biological and biotechnological drugs. Rather than relying on classical or instrumental chemical methods, bioassay procedures rely on methods that measure biochemical or physiological activities in whole animals, tissues, and cells, including enzymatic reaction rates or biological responses induced by immunological interactions, and ligand- and receptor-binding assays (ICH Guideline Q6B, section 2.1.2). While bioassays may be used for a variety of purposes in the development and manufacture of biological and biotechnological products, the bioassay tests addressed in this chapter are those used for estimation of relative potency. Bioassays display variability that stems from the influences of

multiple operational and biological factors. This variability usually exceeds that of chemical-based measurements. As new biological products and new technologies emerge, these definitions are likely to expand; therefore, this chapter will emphasize validation approaches in a study protocol that provide flexibility for adoption of new bioassay procedures and methods, new biological product types, or both together, for assessment of drug potency.

U.S. Food and Drug Administration current Good Manufacturing Practice (cGMP) regulations [21 CFR 211.194(a)] require that test methods used for assessing compliance of pharmaceutical products meet appropriate standards for accuracy and reliability. Assay validation is the process of demonstrating and documenting that the performance characteristics of the method meet the requirements for the intended application and that the assay is thereby suitable for its intended use. *USP* general information chapter *Validation of Compendial Procedures* ⟨1225⟩ describes the assay performance characteristics that should be evaluated during chemical assay validation. Although these validation parameters are straightforward for many types of analytical methods, for some types of bioassays the interpretation and applicability of these validation parameters have not been clearly delineated. Because of the nature of bioassays arising from their use in practice, the validation described in ⟨1225⟩ may be difficult to execute. Although there is disagreement about establishing accuracy in bioassays, some laboratories may use dilutional linearity to verify the relative accuracy of the method. Dilutions of the reference provide a series of levels to establish relative accuracy and range. Alternatively, similarity of dilution response in the presence of process intermediates, stressed samples, and the reference demonstrates selectivity of the method.

This general information chapter *Biological Assay Validation* ⟨1033⟩ describes validation goals pertaining to relative potency assays in which a test sample is compared to a designated reference sample to yield a sample relative potency. Specifically, relative accuracy or selectivity, intermediate precision, and range will be discussed. This chapter also describes proper approaches for validation design (sample selection and replication strategy), validation acceptance criteria, data analysis and interpretation, and finally assay performance monitoring.

FUNDAMENTALS OF A VALIDATION STUDY FOR RELATIVE POTENCY ASSAYS

The goals of a validation study for relative potency bioassays are to confirm the operating characteristics of the procedure in order to make informed decisions about a test sample. For bioassays that measure relative potency, multiple doses (concentrations) of both the test sample and the reference are included in a single assay run. The amount of activity (potency) of the reference typically is assigned 1.0 or 100%, and the potency of the test sample is calculated by relating the dose-response curves for the test sample and reference pairs. This results in a unitless measure, the potency of the test sample relative to that of the reference. In some cases the reference is assigned a value according to another property such as protein concentration. In that case, the potency of the test sample is reported as the relative potency times the assigned value of the reference. The parallel line bioassay assumes that the dose-response curves that are generated using a reference and a test sample have similar (parallel) curve shapes that are distinguished only by a horizontal shift in the log dose. For slope ratio bioassay, the curves generated for reference and test sample should be linear and should pass through a common intercept. The curves are thus distinguished only by their slopes.

Sample materials that represent some relative potency significantly different from the reference may be created by concentration or dilution of the initial reference material, prior to adjustment to assay doses. Dilutional linearity is observed when measured relative potencies are proportional to the initial manipulation of the reference material. Dilutional linearity may be used to establish the validity of the procedure by demonstration of reliable potency measurement across a range. Alternatively, the analyst may choose to demonstrate similarity of dose response to the reference using samples that have different matrix components or experimentally varied potencies following deliberate degradation.

In addition, the validation study should be directed toward obtaining a representative estimate of the variability of the relative potency determination. Because the assay potentially can be influenced by factors such as multiple analysts, instruments, or reagent sources, the design of the bioassay validation study should include these factors in order to effectively evaluate their impact on overall biological assay variability. The overall variability from these combined elements defines the intermediate precision of the biological assay. Although the effects of intra-assay (robustness) factors usually are determined during assay development, key factors such as incubation time and temperature may be included in the validation in order to establish the interactions between these and other inter-assay (ruggedness) factors. An appropriate study of the variability of the biological assay, including the impact of intra-assay and inter-assay factors, can help the laboratory establish an adequate testing strategy. This enables forecast of the inherent variability of the reportable value (which may be the average of multiple potency determinations), as well as the sizes of differences that can be distinguished between samples tested in the biological assay for various numbers of replicate assays.

BIOLOGICAL ASSAY VALIDATION STUDY PROTOCOL

A biological assay validation protocol should state the number and types of samples that will be studied in the validation, the study design (including ruggedness and robustness factors), the replication strategy, the intended validation parameters, justified target acceptance criteria for each parameter, and a proposed data analysis plan. Failure to find a statistically significant effect is not an appropriate basis for defining acceptable performance in a bioassay. Conformance to acceptance criteria should be evaluated using an equivalence approach.

In addition, assay and sample validity criteria such as system suitability and parallelism should be specified before the formal validation exercise. Depending on how extensively the bioassay has been developed, these criteria may be proposed as tentative values that will be updated with data from the validation. Assay or sample failures may be reassessed in an appropriate fashion and, with sound justification, included in the overall validation assessment. Additional validation trials may be required to support changes to the procedure.

The assay validation study protocol should include target acceptance criteria for the proposed validation parameters. Failure to meet a target acceptance criterion may result in a limit on the range of potencies that can be measured in the assay or a modification to the replication strategy in the assay procedure.

DESIGN OF A BIOLOGICAL ASSAY STUDY VALIDATION PROTOCOL

The bioassay validation should include samples that are representative of materials that will be tested in the assay. In addition, the validation protocol should establish the performance characteristics of the procedure. If relative accuracy is to be explored, sample concentrations should bracket the range of potencies expected of

materials that will be tested in the assay. Thus samples covering a wide range of potencies might be studied for a drug or biological that is inherently unstable, but a narrower range can be studied for a more stable product. A minimum of three potency levels is required, and five are recommended for a reliable assessment of the behavior of a bioassay. The potency levels chosen will constitute the range of the assay if the criteria for relative accuracy and intermediate precision are met during the validation. A limited range will result when concentrations at the lower or higher end of the range fail to meet their target acceptance criteria. Alternatively, a range of potencies may be generated by stressing a high-potency sample to a range of levels that may be observed in routine practice. Where there is no clear expectation regarding how a sample might behave in the bioassay (compared to a reference), similarity to the reference (selectivity) and intermediate precision may be used to validate the assay. In addition, the influences of the sample matrix (excipients, process constituents, or combination components) can be studied by intentionally varying these together with the target analyte using a multifactorial approach.

The replication strategy used in the validation study should reflect knowledge of the factors that may influence the measurement of potency. Intra-run variability may be affected by a variety of biological assay operating factors (temperature, pH, incubation times, etc.) as well as by the biological assay design (number of animals, number of dilutions, replicates per dilution, dilution spacing, etc.). Operating restrictions and assay design (intra- and inter-run formulae that result in a reportable value for a test material) are usually determined during development and become a part of the biological assay operating procedure. Intermediate precision is studied during the validation by independent runs of the procedure, which may be varied on the basis of an experimental design to evaluate factors that may have long-term impact on the performance of the procedure. Multifactor design of experiments (DOE) and nested designs can be utilized to help identify important sources of variability in the procedure, as well as to ensure a representative estimate of the long-term variability of the procedure. Replication in the inter-run configuration required to achieve the reportable value for a test sample is not needed. A well-designed validation study can be used to estimate the independent components of the biological assay variability, which can then be used to verify or forecast the variability of the test sample format.

A thorough analysis of the validation data includes graphical and statistical summaries that address the validation parameters and their conformance to target acceptance criteria. The analysis should follow the specifics of the data analysis plan outlined in the validation study protocol. In most cases, log potency is analyzed in order to satisfy the assumptions of the statistical methods used in the analysis (see *Statistical Considerations, Scale of Analysis*). Those assumptions include normality of the distribution from which the data were sampled and homogeneity of variability across the range of results observed in the validation. These assumptions can be explored using graphical and inferential techniques such as box plots, probability plots, and statistical tests of normality. Alternative methods of analysis should be sought when the assumptions of normality and/or homogeneity are not met. Confidence intervals are calculated for the validation parameters using methods described here and in the general information chapter *Analytical Data—Interpretation and Treatment* ⟨1010⟩.

VALIDATION STRATEGIES FOR ASSAY PERFORMANCE CHARACTERISTICS

Parameters that should be verified in a bioassay are relative accuracy or selectivity, intermediate precision, and range. Following are strategies for addressing these parameters.

Relative Accuracy

The concept of relative accuracy in a relative potency assay applies to the relationship between measured log relative potency and known log relative potency. Relative accuracy in bioassay refers to a linear relationship with unit slope between log measured relative potency and log known relative potency. The most common approach to demonstrating relative accuracy for relative potency biological assays is by construction of ''known'' levels by dilution of the reference material or a test sample with known potency. This type of study is often referred to as a dilutional linearity study. The results from a dilutional linearity study can be assessed from the estimated relative bias at individual levels or by trends in relative bias across levels. The relative bias at individual levels is calculated as:

$$\textit{Relative Bias} = 100 \cdot \left(\frac{\textit{Measured Potency}}{\textit{Target Potency}} - 1 \right) \%$$

If there is no trend in relative bias across levels, the estimated relative bias at each level may be held to a target acceptance criterion that has been defined in the study validation protocol (see *A Bioassay Study Validation Example*).

Selectivity

When validation samples come from intermediates or as a result of chemical, physical, or temperature stress, selectivity may be explored by similarity (parallelism) of the dose-response profiles of the test samples and the reference. One or more measures of similarity, such as the ratio of slopes, should be held to a target acceptance criterion that has been defined under selectivity in the validation protocol.

Intermediate Precision

Because factors such as analysts, instruments, or reagent lots can potentially influence results from biological assays, the bioassay validation study protocol should include evaluation of these factors to capture their impact on bioassay variability. The variability from measurements taken under a variety of normal test conditions within a laboratory defines the intermediate precision of the biological assay. Intermediate precision is commonly referred to as ''inter-assay'' variability and is called ruggedness in *USP* text.

Intermediate precision measures the influence of factors that vary over time. Intermediate precision is distinguished from robustness, which measures the influence of intra-assay factors (e.g., ranges of operating factors) that can and should be controlled if they affect the assay. Although robustness studies normally are conducted during assay development, key robustness factors such as incubation time and temperature may be included in the validation using multifactor design of experiment (DOE) approaches in order to capture the interactions between these and other inter-assay (ruggedness) factors. An appropriate study of the variability of the bioassay, including the impact of intra-assay and inter-assay factors, can help the laboratory confirm an adequate test strategy for purposes of control. This allows forecast of

the inherent variability of the reportable value as well as critical differences that can be distinguished between samples tested in the biological assay.

When the validation has been planned using multifactor DOE, the contribution of each factor first may be explored graphically to establish important contributions to the variability of the strategic qualification procedures for inter-assay factors such as analysts and instruments.

Variability of the reportable value also can be controlled by a strategic test plan. Contributions of validation study factors to the overall intermediate precision of the biological assay can be determined by performing a variance component analysis (5) on the validation results. Variance component analysis is best carried out using a statistical software package that is capable of performing a mixed model analysis with restricted maximum likelihood (REML) estimation.

A variance component analysis yields variance component estimates such as:

$$\hat{\sigma}^2_{\text{Intra}} \text{ and } \hat{\sigma}^2_{\text{Inter}}$$

corresponding to intra- and inter-run variation. These can be used to estimate the intermediate precision of the bioassay, as well as forecast the variability of the reportable value (format variability) for different assay designs. Intermediate precision expressed as percent geometric relative standard deviation (%GRSD) is given by (using the natural log of the relative potency in the analysis):

$$\textit{Intermediate Precision} = 100 \cdot \left(e^{\sqrt{\hat{\sigma}^2_{Inter} + \hat{\sigma}^2_{Intra}}} - 1 \right) \%$$

The variability of the reportable value from testing performed with *n* replicates in each of *k* runs (format variability) is equal to:

$$\textit{Format Variability} = 100 \cdot \left(e^{\sqrt{\hat{\sigma}^2_{\text{Inter}}/k + \hat{\sigma}^2_{\text{Intra}}/n \cdot k}} - 1 \right) \%$$

Range

The range of the bioassay is defined as the true or known potencies for which it has been demonstrated that the analytical procedure has a suitable level of relative accuracy and intermediate precision. The range normally is derived from the dilutional linearity study and must minimally cover the product specification range for potency. However, for purposes of stability testing and to avoid diluting hyper- or hypo-potent test samples into the functional assay range and retesting after an unsupported value is obtained, there is value in validating the assay over a broad range.

VALIDATION TARGET ACCEPTANCE CRITERIA

The validation target acceptance criteria should be determined by the uses made of the bioassay measurements or by ''the capability of the art'' of the procedure. When a product specification exists, acceptance criteria may be justified on the basis of the risk that measurements may fall outside of the acceptance criteria. Considerations from a process capability index (Cpk) can be used to establish bounds on the relative bias (RB) and the intermediate precision of the biological assay (4):

$$Cpk = \min\left(\frac{Mean - LSL}{3\cdot\sqrt{\hat{\sigma}^2_{Product} + RB^2 + \hat{\sigma}^2_{Assay}}}, \frac{USL - Mean}{3\cdot\sqrt{\hat{\sigma}^2_{Product} + RB^2 + \hat{\sigma}^2_{Assay}}}\right)$$

where *USL* and *LSL* are the upper and lower limits of the acceptance criteria, *Mean* is the process mean, *RB* is a bound on the degree of RB in the assay, and

$$\hat{\sigma}^2_{Product} \text{ and } \hat{\sigma}^2_{Assay}$$

are product and assay variances, respectively. This formula requires prior knowledge regarding product variability or the inclusion of a random selection of lots to estimate this characteristic as part of the validation. The choice of a bound on Cpk is a business decision and is related to the risk of obtaining an out-of-specification (OOS) result. Some laboratories require process capability corresponding to Cpk $\geq$1.3. This corresponds to a 1 in 10,000 chance that a lot with potency at the center of the specification range will be OOS. The proportion of lots that are predicted to be OOS is a function of Cpk.

When acceptance criteria have not yet been established, criteria based on relative bias or intermediate precision can be formulated on the basis of the ''capability of the art'' of the bioassay technology. For example, although chemical assays and immunoassays often are capable of achieving near-single-digit %GRSD, more liberal acceptance criteria might be placed on biological assays, such as animal potency assays, that operate with much larger %GRSD. Alternatively, the goal of the bioassay validation might be to characterize the method using the validation results to establish an inter-run assay format that is predicted to yield reliable product measurements. In either case a sound scientific justification for target acceptance criteria or use of characterization should be included in the validation protocol.

BIOASSAY MAINTENANCE

A validated bioassay procedure is used to assess the potency of a biological or biotechnological product. The performance of a bioassay should be reassessed periodically. This is most easily accomplished by maintaining statistical process control (SPC) charts on assay suitability parameters, including control sample potency. These charts help the analyst to identify any shift or drift in the assay at an early stage. If trending occurs in an SPC chart, the reason for the trending should be identified. If the resolution requires a modification to the assay or if a serious modification of the assay has occurred for other reasons (e.g., a major technology change), the modified assay should be revalidated or linked to the original assay by an adequately designed bridging study.

STATISTICAL CONSIDERATIONS

Several statistical considerations are associated with the design of a bioassay validation study protocol and analysis of the data. These relate to the properties of bioassay measurements, as well as the statistical tools that can be used to summarize and interpret bioassay validation results.

Scale of Analysis

The scale of analysis studied during bioassay validation must be maintained in order to obtain meaningful conclusions from the study. This general information chapter ⟨1033⟩ assumes that appropriate methods are already in place to reduce the raw bioassay response data to relative potency (see general chapter *Design and Analysis of Biological Assays* ⟨111⟩). Relative potency measurements are

generally log-normally distributed. Log-normally distributed measurements are skewed and are characterized by heterogeneity of variability such that the standard deviation is proportional to the level of response. The statistical methods outlined in this chapter require that the data be symmetric, approximating a normal distribution, and some of the procedures require homogeneity of variability in measurements across the potency range. Log transformation provides data that more closely fulfill both of these requirements. The base of the log transformation does not matter as long as the same base is maintained throughout the analysis. For example, if the natural log (log to the base *e*) is used to transform relative potency measurements, summary results are converted back to the assay scale utilizing base *e*.

As a consequence of the log transformation of relative potency measurements, there are advantages (balance and representativeness) if the levels selected for the validation study are geometrically scaled. An example of geometric scaling with five levels would be 0.50, 0.71, 1.00, 1.41, and 2.00. The range should approximate the expected range of potencies for product tested in the bioassay. Intermediate levels are obtained as the geometric mean (GM) of two adjacent levels. For example, the *GM* between 0.50 and 1.00 is derived as follows:

$$GM = \sqrt{0.50 \cdot 1.00} = 0.71$$

Similarly to relative potency measurements, validation summary measures conform to the log-normal distribution. Average response should be reported as the GM of individual relative potency measurements, and variability expressed as %GRSD. An example of the calculation of GM and associated RB, with %GRSD, is presented in *Table 1* for a series of relative potency (RP) measurements performed on samples tested at the 1.00 level (taken from an example that follows). The log base *e* is used in the illustration. Here the *GM* of the relative potency measurements is calculated as the antilog of the average of the log relative potency measurements then expressed as *RB*, the percent deviation from the target potency:

$$GM = e^{\text{Average}} = e^{0.0485} = 1.050$$

$$RB = 100 \cdot \left(\frac{GM}{\text{Target}} - 1 \right) = 100 \cdot \left(\frac{1.050}{1.00} - 1 \right)\% = 5.0\%$$

and the *%GRSD* is calculated as:

$$\%GRSD = 100 \cdot (e^{SD} - 1)\% = 100\ (e^{0.0715} - 1)\% = 7.2\%$$

Table 1. Illustration of Calculations of GM and %GRSD

RP	log RP	
1.1299	0.1221	
0.9261	-0.0768	
1.1299	0.1221	
1.0143	0.0142	
1.0027	0.0027	
1.0316	0.0311	
1.1321	0.1241	
1.0499	0.0487	
Average	0.0485	GM = 1.050
		RB = 5.0%
SD	0.0715	%GRSD = 7.2%

Reporting Validation Results Using Confidence Intervals

An estimate of a bioassay validation parameter should be presented as a point estimate together with its confidence interval. A point estimate is the numerical value obtained from statistical calculations, such as the geometric mean or %GRSD. A confidence interval, the inter-

val estimate, represents the likely range of the true value of the validation parameter. The previous example yields a 90% confidence interval on average log relative potency as follows:

$$CI_{\ln=} \bar{x} \pm t_{df} \cdot s / \sqrt{n}$$

$$= 0.0485 \pm 1.89 \cdot 0.0358 / \sqrt{8}$$

$$= (0.0128, 0.0843)$$

$$CI_{RB} = 100 \cdot \left(\frac{e^{0.0128}}{1.00} - 1 \right), 100 \cdot \left(\frac{e^{0.0843}}{1.00} - 1 \right) = (1.3\%, 8.8\%)$$

The statistical constant (1.89) is from a table of *t* values, with degrees of freedom (df) equal to the number of measurements minus one (df = 8 – 1 = 7). Thus the true relative bias falls between 1.3% and 8.8% with 90% confidence. A confidence interval for intermediate precision or format variability can be formulated using methods described in Burdick (2).

Assessing Conformance to Acceptance Criteria

Bioassay validation study results are compared to target acceptance criteria to demonstrate that the bioassay is fit for use. The process of establishing conformance of validation parameters to validation acceptance criteria should not be confused with establishing conformance of relative potency measurements to product specifications. Product specifications should inform the process of setting validation acceptance criteria (see *Validation Target Acceptance Criteria*).

A common practice is to apply acceptance criteria to the estimated validation parameter. This does not account, however, for the uncertainty in the estimated validation parameter. A solution is to hold the confidence interval on the validation parameter to the acceptance criterion. This is a standard statistical approach used to demonstrate conformance to expectation and is called an equivalence test (1). An equivalence test should not be confused with the practice of performing a significance test, such as a *t* test, that seeks to establish a difference from some target value (e.g., 0% relative bias). A significance test that yields a P value > 0.05 (equivalent to a confidence interval that includes the target value for the parameter) indicates that there is insufficient evidence to conclude that the parameter is different from the target value. This is not the same as concluding that the parameter conforms to its target value. The study design may have too few replicates, or the validation data may be too variable to discover a meaningful difference from the target. Additionally, a significance test may detect a small deviation from the target that is practically insignificant. These scenarios are illustrated in *Figure 1*.

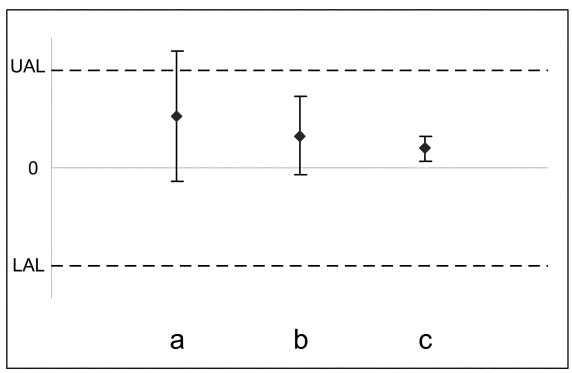

Figure 1. Illustration of use of confidence intervals to establish conformance of validation results to an acceptance criterion.

The solid horizontal line represents the target value (perhaps 0% relative bias), and the dashed lines depict the lower (LAL) and upper (UAL) acceptance limits. In scenario *a*, the confidence bound includes the target; one might conclude there is insufficient evidence to conclude a difference from the target (the significance test approach). However, although the point estimate (the solid diamond) falls within the acceptance range, the interval estimate falls outside the range demarcated by the

LAL and UAL, signifying that the true relative bias may be an unacceptable value. In scenario *b*, the interval estimate falls within the acceptance range, signifying conformance to the acceptance criterion. In scenario *c*, although the interval estimate excludes the target, it falls within the acceptance range, thus yielding an acceptable result.

Using the 90% confidence interval calculated previously, we can establish whether the assay has acceptable relative bias at the 1.00 level against a target acceptance criterion of no greater than 12% relative bias. Because the 90% confidence interval (1.3%, 8.8%) falls within

$$100 \cdot [(1/1.12) - 1]\% = -11\% \text{ and } 12\%$$

we conclude that there is acceptable relative bias at the 1.00 level. Note that the interval excludes 1.00. As discussed previously, this does not indicate a failure to meet the acceptance criterion. Note also that a 90% confidence interval is used in an equivalence test rather than a conventional 95% confidence interval. This is common practice and is the same as the two 1-sided t-test (with 5% test on both sides) approach seen in pharmaceutical bioequivalence testing (2).

Risks in Decision Making and Number of Validation Runs

All statistical tests, including the assessment of conformance of a validation parameter to its acceptance criteria, involve risk. There is the risk that the parameter will not meet its acceptance criterion when the property associated with that parameter is satisfactory (type II error), as well as a risk that the parameter conforms when the parameter is unsatisfactory (type I error). A consideration related to these risks is sample size. The two types of risk can be simultaneously controlled by strategic design, including determining the number of runs that will be conducted during the validation. Specifically, the number of runs needed to establish conformance to an acceptance criterion on relative bias is given by:

$$n \geq \frac{\left(t_{\alpha,\mathrm{df}} + t_{\beta,\mathrm{df}}\right)^2 \sigma_{\mathrm{IP}}^2}{\Delta^2}$$

where $t_{\alpha,\,\mathrm{df}}$ and $t_{\beta,\,\mathrm{df}}$ are distributional points from a Student's t distribution, α and β are the one-sided type I and type II errors, respectively, df are the degrees of freedom associated with the study design (usually $n - 1$),

$$\hat{\sigma}_{\mathrm{IP}}$$

is a preliminary estimate of intermediate precision, and Δ is the acceptable deviation (target acceptance criterion).

For example, if the acceptance criterion on relative bias is ± 0.10 log (i.e., $\Delta = 0.10$) and the bioassay variability is

$$\hat{\sigma}_{\mathrm{P}} = 0.071 \log$$

using $t_{\alpha,\,\mathrm{df}} = t_{\beta,\,\mathrm{df}} = 2$ ($\alpha = \beta \approx 0.05$),

$$n \geq \frac{(2+2)^2\, 0.071^2}{0.10^2} = 8 - runs$$

These eight runs can be designed in a factorial manner to incorporate key robustness and ruggedness factors.

Modeling Validation Study Results Using Mixed Effects Models

Many of the analyses associated with bioassay validation studies must account for multiple design factors. The factors in a typical bioassay validation are composed

of fixed effects such as potency level, as well as random effects such as operator, run, and replicate. Models composed of both fixed and random effects are called mixed effects models and usually require sophisticated statistical software for analysis. The results of the analysis may be summarized in an analysis of variance (ANOVA) table or a table of variance component estimates. The primary goal of the analysis is to estimate critical parameters rather than establish the significance of an effect.

The mixed effects model output provides parameter estimates with their standard errors, which can be used to establish conformance of a validation parameter to its acceptance criterion. An example is given by the analysis of RB. The mixed effects model provides an average and associated variability for RB at each level of the effect ''dose''. These confidence intervals are compared to RB acceptance criteria, and whether or not confidence intervals across doses can be pooled, can be determined. If it is established that variances across levels can be pooled, statistical modeling also can determine the overall relative bias and intermediate precision by combining information across levels performed in the validation. Similarly, mixed effects models can be utilized to obtain variance components for validation study factors and to combine results across validation study samples and levels.

Statistical Design

Statistical design, such as multifactor DOE or nesting can be used to organize runs in a bioassay validation. Such designs are useful for evaluating factors that are believed to influence the assay and that vary throughout long-term use of the procedure. These also are used to better characterize the sources of variability and to develop a strategic test plan that can be used to describe the variability of the bioassay.

An example of a multifactor DOE that incorporates multiple analysts, multiple cell culture preparations, and multiple reagent lots into the validation plan is illustrated in *Table 2*. In this design each analyst performs the bioassay with both cell preparations and both reagent lots. This is an example of a full factorial design because all combinations of the factors are performed in the validation study. In order to reduce the number of runs in the study, fractional factorial designs (3) can be employed when more than three factors have been identified. To mitigate the potential influences of run order or time, validation runs should be randomized whenever possible.

Table 2. Example of a Multifactor DOE Involving Three Factors

Run	Analyst	Cell Prep	Reagent Lot
1	1	1	1
2	1	1	2
3	1	2	1
4	1	2	2
5	2	1	1
6	2	1	2
7	2	2	1
8	2	2	2

An example of a validation using nesting is illustrated in *Figure 2*.

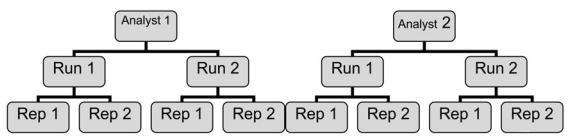

Figure 2. Example of a nested design using two analysts.

Full and fractional factorial designs as well as combinations of the two can be used to estimate components of variability. These estimates can identify significant sources of variability and contribute to the development of an assay format that meets the procedure's requirements for precision.

A BIOASSAY STUDY VALIDATION EXAMPLE

An example illustrates the principles described in this chapter. The bioassay will be utilized to support a specification range of 0.7 to 1.4 for the product. Use the process capability index described in the section on *Validation Target Acceptance Criteria* is used to derive a table showing the projected rate of OOS results for various restrictions on RB and intermediate precision. In the calculations product variability is assumed to be equal to 0. This shows that acceptable performance ($<$1% chance of obtaining an OOS result due to bias and variability of the bioassay) may be expected if the intermediate precision is $\leq$8% and the relative bias is $\leq$12% (*Table 3*). The sample size formula given in the section on *Risks in Decision Making and Number of Validation Runs* can be used to derive the number of runs required to establish conformance to a relative bias equal to 12% (using σ_{IP} = 8%):

$$n \geq \frac{(2.0+2.0)^2 \cdot \log(1.08)^2}{\log(1.12)^2} = 7.4$$

Thus eight runs would be needed to have a 95% chance of passing the target acceptance criterion for relative bias if the true relative bias is 0.

Table 3. CP and Probability of OOS for Various Restrictions on RB and Intermediate Precision

LSL–USL	Intermediate Precision (%)	RB (%)	CP	Prob (OOS)
0.7–1.43	20.0	20.0	0.56	(9.30%)
0.7–1.43	8.0	12.0	0.98	(0.33%)
0.7–1.43	10.0	5.0	1.62	(0.0001%)

Five levels of the target analyte are studied in the validation: 0.5, 0.71, 1.00, 1.41, and 2.00. Runs are generated by two trained analysts using two cell preparations. Each analyst performs two independent runs using each cell preparation. A run consists of a single titration of the reference and two titrations of the test sample. This yields duplicate measurements of relative potency at each level in each validation run. The example dataset is presented in *Table 4*.

Table 4. A Bioassay Validation Example Using Two Analysts and Two Cell Preparations

	Analyst/Cell Preparation							
Level	1/1	1/1	1/2	1/2	1/1	1/1	1/2	1/2
0.50	0.52	0.45	0.57	0.51	0.52	0.52	0.53	0.51
0.50	0.50	0.45	0.56	0.54	0.50	0.51	0.54	0.55
0.71	0.76	0.67	0.68	0.70	0.70	0.75	0.69	0.74
0.71	0.71	0.62	0.82	0.71	0.64	0.69	0.77	0.74
1.00	1.11	0.98	1.15	0.99	1.09	1.03	1.15	1.03
1.00	1.16	0.88	1.11	1.04	0.92	1.03	1.12	1.07
1.41	1.52	1.28	1.53	1.45	1.42	1.35	1.47	1.50

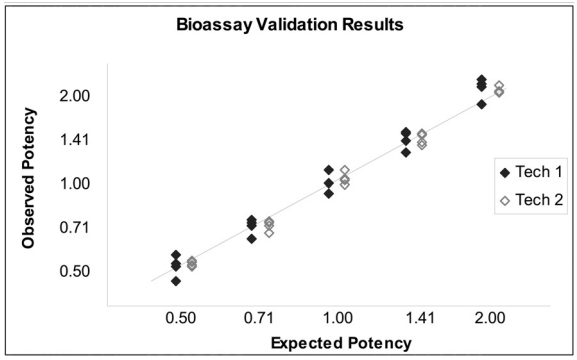

Figure 3. Plot of the validation results vs. the sample levels.

The plot (*Figure 3*) reveals potential irregularities in the experimental results. In particular, a properly prepared plot can reveal a failure in agreement of validation results with validation levels, as well as heterogeneity of variability across levels (see discussion of the log transformation in *Statistical Considerations*). The example plot includes the unit line (line with slope equal to 1, passing through the origin).

A formal analysis of the validation data could be undertaken in a stepwise manner: first, variability (intermediate precision) is assessed in order to establish conformance to the assumption of poolability of variances across sample levels; second, relative accuracy is evaluated either at separate levels or using a combined analysis, depending on whether or not variability can be pooled across levels. These steps will be demonstrated using the example validation data and for illustrative purposes will include some details of the calculations. [NOTE—The calculations illustrated in the following sections are appropriate only with a balanced dataset. Unbalanced designs or datasets with missing relative potency measurements should be analyzed using a mixed model analysis with restricted maximum likelihood estimation (REML).]

Intermediate Precision

Data at each level can be analyzed using variance component analysis (5). *Table 5* presents an example of the calculation performed at a single level (0.50) based on the output of a standard statistical package.[1] The top of the table represents a standard analysis of variance (ANOVA). The expected mean square is the linear combination of variance components that generates the measured mean square for each source. The variance component estimates are derived by solving the equation ''Expected Mean Square = Mean Square'' for each component. To start, the mean square for Error estimates VAR(Error), the within-run component of variability:

$$\text{Var(Error)} = \text{MS(Error)} = 0.00076$$

The between-run component of variability, Var(Run), is subsequently calculated by setting the mean square for *Run* to the mathematical expression for the expected mean square, then solving the equation for *Var(Run)* as follows:

$$MS(Run) = Var(Error) + 2 \cdot Var(Run) = 00076 + 2 \cdot Var(Run)$$

$$Var(Run) = \frac{MS(Run) - Var(Error)}{2}$$

$$= \frac{0.0079 - 0.00076}{2} = 0.00357$$

These variance component estimates are combined to establish the overall intermediate precision of the assay at 0.50:

[1] For example: SAS, Cary, NC.

$$\text{Overall Variability} = 100 \cdot \left(e^{\sqrt{\text{Var(Run)} + \text{Var(Error)}}} - 1 \right)$$

$$= 100 \cdot \left(e^{\sqrt{0.00357 + 0.00076}} - 1 \right) = 6.8\%$$

The same analysis is performed at each level of the validation, and resulting data are presented in *Table 6*.

A combined analysis can be performed if it can be established that the variance components are similar across levels. Similarity is arbitrarily defined. For example, one might restrict the estimate of the ratio of the maximum variance to the minimum variance to no greater than 10-fold; i.e., the ratio of the maximum variance to the minimum variation can be no more than 10 (10-fold is used because of the limited number of runs performed in the validation). In the current example, the ratio associated with the between-run variance component is 0.00364/0.00065 = 5.6, and the ratio associated with the within-run component is 0.0043/0.00058 = 7.4. These ratios (5.6 and 7.4) do not differ by a factor of 10 or more and thus meet the less than 10-fold criterion. If the ratio exceeded 10 and was due to excess variability in one or the other of the extremes in the levels tested, that extreme would be eliminated from further analysis and the range accordingly would be limited to exclude that level.

The analysis could be performed utilizing statistical software that is capable of applying a mixed effects model to the validation results. That analysis should account for any imbalance in the design, as well as other random effects such as analyst and cell preparation (see *Modeling Validation Study Results Using Mixed Effects Models* in *Statistical Considerations*). Variance components can be determined separately for analyst and cell preparation in order to characterize their contributions to the overall variability of the bioassay.

Table 5. Variance Component Analysis Performed on Log Relative Potency Measurements at the 0.5 Level.

Source	DF	Sum of Squares	Mean Square	Expected Mean Square
Run	7	0.05533	0.0079	Var(Error) + 2 Var(Run)
Error	8	0.00612	0.00076	Var(Error)
Corrected Total	15	0.06145	—	—

	Variance Component Estimate
Var(Run)	0.00357
Var(Error)	0.00076

Table 6. Variance Component Estimates and Overall Variability for Each Validation Level and the Average.

	Level					
Component	0.50	0.71	1.00	1.41	2.00	Average
Var(Run)	0.00357	0.00065	0.00364	0.00314	0.00262	0.00272
Var(Error)	0.00076	0.0043	0.00295	0.00058	0.00226	0.00217
Overall	6.8%	7.3%	8.5%	6.3%	7.2%	7.2%

In the example, variance components can be averaged across levels to show the intermediate precision of the bioassay. This method of combining estimates is exact only if a balanced design has been employed in the validation (i.e., an equal number of replicates has been performed at each level) and is approximate if an unbalanced design has been employed. A balanced design was employed for the example validation; thus the intermediate precision can be reported as 7.2% GRSD.

Relative Accuracy

The analysis may proceed with an assessment of relative accuracy at each level. *Table 7* shows the average and 90% confidence interval of validation results in the log scale, as well as corresponding potency and relative bias. The analysis has been performed on the average of the duplicates from each run (n = 8 runs). Because duplicate measurements are correlated within a run they should not be considered separately. A plot of relative bias vs. level can be used to look for patterns in the experimental results and to establish conformance to the target acceptance criterion on relative bias (12%; see *Figure 4*).

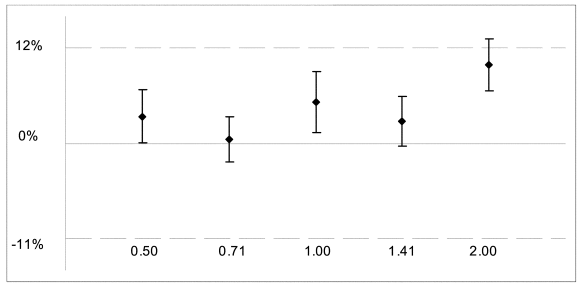

Figure 4. Plot of 90% confidence intervals on relative bias vs. the acceptance criterion.

[NOTE—The lower acceptance criterion is equal to $100 \cdot [(1/1.12) - 1]\% = -11\%$.]

Figure 4 shows an overall average positive bias across sample levels (i.e., the average relative bias is positive at all levels). This is due in part to the lack of independence of assay results across levels. In addition, there does not appear to be a trend in relative bias across levels. A trend in relative bias would indicate that a comparison of samples with different measured relative potency such as stability samples is biased, resulting perhaps in an erroneous conclusion. The lowest estimated relative bias occurs at an intermediate level (0.5% at 0.71), and the highest estimated relative bias occurs at an extreme (9.7% at 2.00). The estimated trend across these levels is thus $(100.0 - 9.7/(100.0 - 0.5) = 0.096$ (9.6% per 2.00/0.71 = 2.8-fold range). This might be held to an acceptance criterion such as no greater than 15% difference in relative bias across the range. A more formal analysis could be performed using a regression of log relative potency vs. log level (4).

Table 7. Average Potency and Relative Bias at Individual Levels.

Level	n[a]	log Potency		Potency		Relative Bias	
		Average	(90% CI)	Average	(90% CI)	Average	(90% CI)
0.50	8	–0.6613	(–0.6928, –0.6299)	52%	(50, 53)	3.2%	(0, 6.5)
0.71	8	–0.3419	(–0.3684, –0.3154)	71%	(69, 73)	0.5%	(-2.2, 3.2)
1.00[b]	8	0.0485	(0.0128, 0.0843)	105%	(101, 109)	5.0%	(1.3, 8.8)

Table 7. Average Potency and Relative Bias at Individual Levels. *(Continued)*

Level	n[a]	log Potency		Potency		Relative Bias	
		Average	(90% CI)	Average	(90% CI)	Average	(90% CI)
1.41	8	0.3723	(0.343, 0.4016)	145%	(141, 149)	2.6%	(-0.4, 5.7)
2.00	8	0.7859	(0.7553, 0.8166)	219%	(213, 226)	9.7%	(6.4, 13.1)

[a] Analysis performed on averages of duplicates from each run.
[b] Calculation illustrated in section on *Statistical Considerations, Scale of Analysis.*

After the lack of a trend across levels has been established, relative accuracy at each level may be assessed. The assay has acceptable relative bias at levels from 0.50 to 1.41, yielding 90% confidence bounds (equivalent to a two one-sided t test) that fall within the acceptance region of –11% to 12% relative bias. The 90% confidence interval at 2.00 falls outside the acceptance region, indicating that the relative bias may exceed 12%.

A combined analysis can be performed utilizing statistical software that is capable of applying a mixed effects model to the validation results. That analysis accurately accounts for the validation study design. The analysis also accommodates random effects such as operator, cell preparation, and run (see *Modeling Validation Study Results Using Mixed Effects Models* in *Statistical Considerations*).

Range

The conclusions derived from the assessment of intermediate precision together with those for relative accuracy can be used to establish the assay range that demonstrates satisfactory performance. Using the acceptance criterion for intermediate precision of 8% GRSD (see *Table 6*) and for relative bias of 12% (see *Table 7*), the range of the assay is determined to be 0.50 to 1.41. This range is slightly higher than the acceptable intermediate precision ($\leq$ 8.0%) observed at 1.0, which may be due to the variability of the estimate that results from the small dataset.

Use of Validation Results for Bioassay Characterization

When the validation protocol states that the study has been performed to estimate the characteristics of the assay (characterization), the variance component estimates also can be used to predict the variability for different assay formats and thereby determine a format that has a desired level of precision. The predicted variability for *k* independent runs, with *n* individual dilution series of the test preparation within a run, is given by the following formula for format variability:

$$Format\ \ Variability = 100 \cdot \left(e^{\sqrt{Var(Run)/k + Var(Error)/n \times k}} - 1 \right)$$

For example, if the assay is performed in three independent runs, with a single dilution series of the test within each run, the predicted variability of the reportable value (geometric mean of the replicate relative potency results) is equal to:

$$Format\ \ Variability = 100 \cdot \left(e^{\sqrt{0.00272/3 + 0.00217/3}} - 1 \right) = 4.1\%$$

In-Process Revision

This calculation can be expanded to include various combinations of runs and replicates within runs as in *Table 8*:

Table 8. Format Variability for Different Combinations of Number of Runs (*k*) and Number of Replicates Within Run (*n*)

	Number of Runs (*k*)			
Replicates (*n*)	1	2	3	6
1	7.2%	5.1%	4.1%	2.9%
2	6.4%	4.5%	3.6%	2.6%
3	6.0%	4.2%	3.4%	2.4%
6	5.7%	4.0%	3.3%	2.3%

The most effective means of reducing the variability of the reportable value (the geometric mean potency across runs and replicates) is through independent runs of the assay procedure. In addition, a confidence interval can be calculated for the overall variability, using methods for confidence intervals on variance components (2).

APPENDIX I

DEFINITIONS

Analysis of Variance (ANOVA)—A statistical tool used to assess contributions of variability from experimental factors.

Bioassay Format—Intra-run and inter-run elements including number of independent runs that form the basis for a reportable value.

Biological Assay/Bioassay—Analysis (as of a drug) to quantify the biological activity(ies) of one or more components by determining its capacity for producing an expected biological activity, expressed in terms of units.

Characterization—Validation strategy where the study is intended to characterize the properties of the bioassay.

Confidence Interval—A statistical interval expressing the likely value of a parameter.

Design of Experiments (DOE)—A systematic approach for studying multiple factors in a validation study.

Dilutional Linearity—Conformance to relative bias using a dilution series of a test sample or reference.

Equivalence Test—A test of conformance to interval-based target acceptance criteria.

Expected Mean Square—A mathematical expression of variances estimated by an ANOVA mean square.

Fixed Effect—An experimental factor that can be reproduced exactly, such as dose.

Format Variability—Predicted variability for a particular assay format.

General Linear Model—A statistical model that relates study factors to experimental responses.

Geometric Relative Standard Deviation (%GRSD)—Similar to relative standard deviation; the variability in log normal response expressed as a percent.

Heterogeneity of Variability—The property of changes in variability with change in level of a factor(s) or response.

Intermediate Precision—The precision of an assay, including ruggedness factors that create variability over long term performance.

Log Normal Distribution—A skewed distribution, characterized by increased variability with increased level of response; a normal distribution is generated by taking the log of the response.

Mean Square—A calculation in ANOVA representing the variability associated with an experimental factor.

Mixed Effects Model—A statistical model including both fixed and random effects.

Multiplicity—The property of compound risk with multiple independent events, all with fixed risk.

Nested Design/Nesting—A statistical design in which some factors are embedded in others, such as analyst within laboratory.

Out of Specification—The property of a measurement in which it falls outside its acceptable range.

P **Value (Significance Probability)**—A statistical calculation representing the probability associated with observing an experimental outcome that is different from expectation.

Point Estimate—A single-value estimate obtained from statistical calculations, such as the average and standard deviation.

Random Effect—An experimental factor that varies randomly, such as analyst and instrument.

Range—The range of potencies that have been demonstrated in the validation to have acceptable relative bias and precision.

Relative Accuracy—Relative accuracy in bioassay refers to linear relationship with unit slope between log measured relative potency versus known log level.

Relative Bias—Degree of difference from the true value expressed as a percent.

Repeatability—A measure of intra-run variability.

Replicate—A within-run repeat of a dilution series of a test sample and/or reference.

Reportable Value—The measured value for a test sample; it represents complete testing of the sample and is compared to the specification.

Run—The enactment of the assay, including independent preparations of a test sample and reference.

Sample Size—The number of independent runs of the validation experiment that are performed.

Selectivity—The ability of an assay to measure the analyte of interest in the presence of other constituents in the sample.

Similarity—In parallel line bioassay, similarity of shape of dilution kinetics between the test and reference samples.

Standard Error of Estimate—The variability associated with an estimate of a reportable value or other parameter.

Statistical Process Control (SPC)—A set of statistical tools used to monitor for shifts and trends in a process.

Two One-Sided T Test—A test procedure associated with equivalence testing.

Type I Error (α)—The error made in judging data analysis, wherein the alternative hypothesis is accepted when it is false.

Type II Error (β)—The error made in judging data analysis, wherein the alternative hypothesis is rejected when it is true.

Variance Component Analysis—A statistical analysis that divides total variability into its component parts.

BRIEFING

⟨**1097**⟩ **Bulk Powder Sampling Procedures.** Because there is no information in *USP–NF* on this subject, it is proposed to add this general information chapter that discusses the theory and practice of sampling. The chapter is the result of a combined effort between the Statistics and the Excipient General Chapters Expert Committees.

■⟨1097⟩ BULK POWDER SAMPLING PROCEDURES

INTRODUCTION

The purpose of a sampling plan is to obtain a representative sample of a population so that reliable inferences about the population sampled can be drawn to a certain level or degree of confidence. Acquiring a representative sample from a lot is critical because without a representative sample all further analyses and data interpretations about the lot are in doubt. A perfect sampling process is a process in which every particle or at least every equal-size portion of the population has an equal probability of being chosen in the sample. In addition, sampling procedures should be reproducible, i.e., if the sampling protocol were repeated, a high probability should exist of obtaining similar results. Also, the integrity of the sample should be preserved during and after sampling. The details of how to sample depend on a variety of factors. For example, criteria for sampling to evaluate particle segregation may differ from criteria for evaluating moisture content or identification.

Because of the propensity of a powder to segregate, heterogeneous powder systems can make it difficult to obtain a perfect sample. Thus, to extract representative samples requires careful development of a sampling plan that accounts for and mitigates the segregation tendencies of a particular powder system. Developing a general guidance for bulk powder sampling is challenging because every situation is different, and therefore different approaches must be used to deal with each situation. Thus, the goal of this general information chapter is to outline recommended steps for developing a sampling scheme or plan for a particular system that is consistent with good sampling practices.

The primary difficulty in acquiring a representative sample is that the size of the sample for measurement, typically a few milligrams to grams, must be withdrawn from a large population on the order of hundreds to thousands of kilograms. The few milligrams analyzed in a laboratory must be taken from a large population of particles in a warehouse in such a manner that the measurement sample is representative of all the particles in the lot. Any bias or error in the sampling process will cause all future inferences to be in error. Over the years methods have been developed and refined to attempt to ensure that the measurement sample is representative of the whole population. A typical strategy is shown in *Figure 1*. The strategy is to sample in stages, starting with the initial gross or primary sample withdrawn directly from the received containers. In the laboratory, the gross sample must be reduced in size until it is the appropriate size for measurement. This should be done in a manner that minimizes the introduction of sampling errors. Randomness is the key to reducing the sampling error because it ensures that every particle of the population has an equal probability of being included in the sample. However, because of segregation or the nonrandom nature of powders, many obstacles can cause bias and contribute to sampling errors. Following the flow chart in *Figure 1* and the steps outlined in subsequent discussions will help to minimize sampling errors.

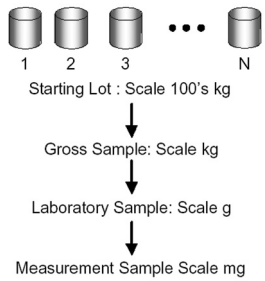

Figure 1. Overall sampling strategy for reducing the sample size from the hundreds of kg scale to the mg scale.

To acquire a representative sample, a suitable sampling plan must be developed and implemented. A good sampling plan includes (1) population determination and sample size selection, (2) a sample collection procedure and a method for sample size reduction, and (3) summary calculations that demonstrate that the sampling plan will yield samples that accurately characterize the population. In addition, an infrastructure is needed to maintain the integrity of the samples and sampled materials.

This chapter begins with a brief introduction to sampling theory and terminology. The technical content of the chapter requires a basic scientific understanding of physical particle characteristics (e.g., mass, density, shape, and size) and statistics (e.g., acceptance sampling and binomial distribution).

SAMPLING THEORY AND TERMINOLOGY

Fundamental Sample Size (Sample Mass)

Sample size is considered from two perspectives: (1) the mass of the sample intended to represent the entire population, sometimes termed the composite sample, and (2) the number of samples taken with a mass sufficient to independently evaluate, compare, or provide confidence to ensure the reproducibility of the composite or the uniformity of the population. The key to obtaining a good sample is to understand and account for the degree of heterogeneity of the characteristic being evaluated in the system under study. For example, heterogeneity of a particle system arises from two sources: the intrinsic, constitutive, or compositional heterogeneity and the spatial distribution heterogeneity. The intrinsic heterogeneity of the powder system reflects the fundamental differences in the individual particles. Statistical heterogeneity (differences between individuals), or variance, is expected to maintain assumed properties. For a normal population the general expression for a statistical sample size suggests that the number of independent samples is proportional to the square of the confidence level (Z) and the bell-shaped population variation (σ) and is inversely proportional to the square of the difference required (δ), as shown in equation 1:

$$n \propto \frac{Z^2\sigma^2}{\delta^2} \qquad (1)$$

For a heterogeneous bulk material, such as a bulk powder, the sample mass required to ensure adequate representation of the intrinsic or fundamental population heterogeneity or variation is determined by the size, shape, and density of the particles. The total sampling error (*TSE*), or fundamental sampling error for a perfect sampling method, measures the difference between the analyte sample concentration (a_{sample}) and the analyte lot concentration (a_{lot}) relative to the average analyte lot concentration (a_{lot}), as shown in equation 2:

$$TSE = \frac{a_{sample} - a_{lot}}{a_{lot}} \qquad (2)$$

The fundamental sampling error (S_{fse}^2) has been experientially estimated in particle size applications by characterizing the critical particle mass, heterogeneity, size (diameter), shape, density, and weights of the material. Experiential estimates require a thorough and complete knowledge of the material and process. Established material characterization and methods are critical aspects of avoiding unacceptable estimates. As shown in equation 3 below:

$$S_{fse}^{\ 2} \propto f_{shape}\, g_{CF}\, c_{max}\, l\, d_{max}^{\ 3} \left(\frac{1}{m_{sample}} - \frac{1}{m_{lot}} \right) \qquad (3)$$

where f_{shape} is a measure of cubicity or shape factor of the analyte particles; g_{Cf}, the granulometric factor, is an experiential correction factor of differences in diameter of the particles; c_{max} is the compositional maximum heterogeneity and is expressed when the analyte or particle exists as two fractions; l, the liberation factor, is an experiential factor representing the proportion of critical content particles within the particles of the lot; d_{max} is the maximum particle diameter; m_{sample} is the mass of the sample; and m_{lot} is the mass of the lot being sampled. [NOTE—A liberation factor is needed when the analyte is not completely liberated. A high liberation value (1.0) suggests heterogeneity of particles. A low liberation value (0.05) suggests very homogeneous particles. See *Appendix I* for examples of potential applications of equation 3 in the estimation of the fundamental sample mass needed to account for constitutional heterogeneity of the powder mixture.]

Segregation Error

Distribution heterogeneity is the difference between samples or groups of particles spatially or temporally. For example, small particles are located preferentially in the lower portion of a powder bed. This type of situation can arise as a result of powder bed segregation and is common in some particle systems with a broad particle size distribution. In other words, smaller particles may not be randomly distributed throughout the lot. This spatial heterogeneity introduces variation in the sample and is a source of variation that contributes to the total variation. Together, fundamental and segregation error give rise to sampling error, which dictates how variable the samples will be, how large the sample size and numbers of samples should be (e.g., 10 containers, sampled at top and bottom, with sample sizes of 50 g each), and how hard it will be to obtain a representative sample.

Minimizing the effects of segregation error during lot material characterization while still ensuring a representative sample mass requires collecting many small samples that average out the variation of the segregation error. Segregation error is difficult to control because segregation may be the result of changes in particle size, shape, and density, as well as inputs into the determination of sample mass. Minimizing the effects of segregation error when reducing the primary sample size requires adequate physical mixing or randomization of the primary samples before analysis, thus providing equal selection probability.

Total Sampling Method Error

Intrinsic or compositional heterogeneity is a function of the powder system and represents the true characteristics of the material (e.g., equation 3). Thus, intrinsic heterogeneity is often the minimal variance a system can have. The difference between the true state of the system and what is actually measured is called the fundamental error (equation 2). The total sampling error (s_{Total}^2) is represented in equation 4 as the sum of all error components:

$$s_{Total}^2 = s_{fundamental}^2 + s_{segregation}^2 + s_{extraction}^2 + s_{delimitation}^2 + s_{preparation}^2 + s_{trends,\,shifts}^2 + s_{cycles}^2 + s_{analytical\ method}^2 \qquad (4)$$

Total error can be reduced by correct sampling. Correct sampling will limit or adjust for the effects of error contributed by particle segregation, extraction error created by the sampling device, delimitation error created by not considering the three-dimensional nature of the bulk material, and sample preparation and handling errors such as product degradation. The total variation is the sum of these sources of error, illustrated in equation 4 as independent, additive components. To the end of reducing these errors, an important goal of material characterization by sampling is the determination of the relevant errors within the bulk sample. Knowing the source of the error helps determine how to best minimize these errors.

Fundamental error is the intrinsic distributional variation of particles within a sample of the material population. Reducing fundamental error requires changing the intrinsic characteristics of the material, such as subsampling or reducing the particle size by milling or grinding. Segregation or grouping error is the spatial distributional error of particles across the population and this type of error can be minimized by mixing or randomization. Segregation error is affected by the characteristics of fundamental error. Additionally, for the determination of both fundamental and segregation error, it is assumed that mechanical sampling is carried out correctly and is not invasive, i.e., that mechanical sampling does not alter the characteristics being measured and provides a true representation. In instances where sampling of the bulk material does not provide a true representation or is so invasive that it alters material characteristics, then, in order to obtain noninvasive, true samples, operators may need to change sampling from a bulk form to a stream form of processing, either upstream or downstream from the sample point (see *Appendix 2*). The mechanical sampler may need to mix the sample sufficiently to facilitate random sampling with equal probability of selection in order to obtain an accurate representation of the entire bulk lot. The process may also require mixing or sampling from a location in the process that will provide a random sample from material that is susceptible to segregation.

Extraction, delimitation, and preparation or handling errors occur as a result of the mechanical sampler and sample handling prior to analysis, which also are affected by fundamental error. Trends, shifts, and cycles are temporal sources of error that affect fundamental error. The analytical error of the method of analysis contributes to the total error of the reported result. In addition to obtaining representative subsamples from the bulk material, the method must also obtain a representative subsample from the particulate laboratory sample before analysis.

Sampling Strategy

A typical sampling strategy consists of two basic steps: (1) the primary or gross sample, followed by (2) the secondary sample, which reduces the primary sample to a size that is suitable for laboratory measurement. In short, the goal is to select from the lot a quantity of material suitable for measurement without significantly changing the attribute for which one is sampling. In parallel with the sample size reduction, sample size calculations must be done in such a way that the sampling strategy has sufficient statistical power to determine whether the attributes of interest lie within the specification ranges with a reasonable degree of certainty. Each step must be done correctly, or the sampling strategy as a whole will not provide a sample that is representative of the original population.

To successfully withdraw a sample from a bulk container that is representative of the population, one needs to have an idea of the population's heterogeneity, i.e., how segregated or stratified the system is. Knowing what factors can accentuate segregation and knowing the patterns of segregation that are likely will help one to account for segregation in a powder bed and to take better samples. Many factors can affect the degree of powder bed segregation. For segregation to occur, sufficient energy needs to be put into the powder bed to induce motion between particles. When a sufficient amount of energy is supplied, segregation can occur via three modes: percolation (in the powder bed), rolling (on the free surfaces of a powder bed), and free flight (when the powder bed is fluidized). These modes are illustrated in *Figure 2*.

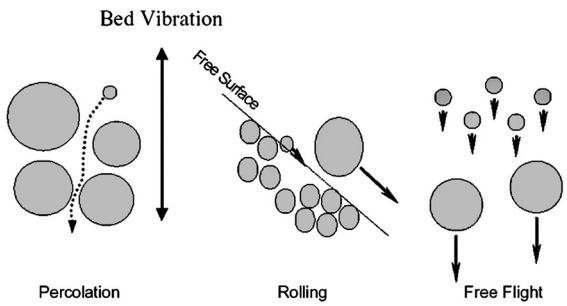

Figure 2. Illustration of the three modes of particle segregation: percolation, rolling, and free flight.

Within the powder bed, segregation can occur by means of percolation, also called sifting segregation, as well as through the movement of coarse particles to the top via vibration. During sifting segregation, smaller particles acting under the influence of gravity can more easily migrate downward into the void spaces between larger particles when the particle bed is perturbed. The net effect of these movements is that the smaller particles percolate down into the powder bed, resulting in the top of the powder bed having a higher proportion of larger particles. A common example of sifting segregation is unpopped corn kernels that are found at the bottom of a bag of popped popcorn.

For free surfaces, rolling segregation can occur any time that particles can roll down a free surface. In other words, segregation can occur on any nonlevel surface that allows the relative movement of particles. When particles roll down these free surfaces, larger particles tend to tumble farther down the surface than the smaller particles (see *Figure 3*). For example, if a conical heap or pile is formed in the middle of a hopper during loading, larger particles are more likely to roll farther down the heap, toward the outer edge of the hopper. This creates a situation in which the smaller particles tend to be in the center of the hopper, and the larger particles accumulate toward the outer wall of the hopper. The formation of these free surfaces can be a major factor in segregation.

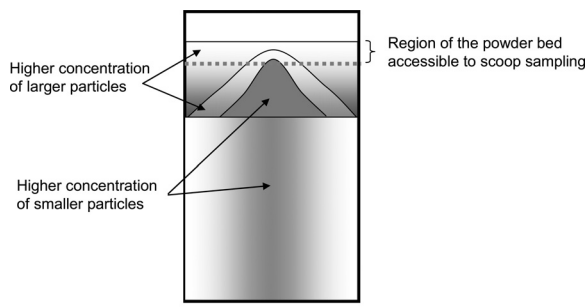

Figure 3. Example of extensive powder segregation within a drum.

When powder beds are fluidized, a large amount of air is incorporated into the powder bed and, when this air is moving, the air velocity may exceed the terminal velocity of the smaller particles. When this happens, the fine particles are suspended in the air stream while the coarse particles settle out. The fine particles eventually settle on top of the powder bed, forming a top layer that has a higher concentration of fine particles. This type of segregation, sometimes called elutriation segregation, can

occur when a powder is discharged from a hopper, or is poured into the top of a hopper, and a large volume of air is displaced.

In summary, for a highly segregating system, the powder bed could have a particle distribution similar to that shown in *Figure 3*, where, as a result of elutriation segregation, a layer of fine particles on the top overlies larger particles deposited by percolation segregation, and a radial distribution of larger particles appears toward the outer wall as a result of rolling segregation.

In general, the primary factors that affect segregation are particle size and size distribution, density, and shape and shape distribution. Of secondary importance are surface roughness, surface coefficient of friction, moisture content, and container shape and design. Particle size is the most important single factor, and subtle differences in particle size can cause measurable segregation. If the attribute of interest is associated with particle size, then this attribute will segregate along with the different particle sizes. For example, if a manufacturer makes a granulation in which the larger particles contain more drug than the smaller particles, then drug content can be very prone to segregation—i.e., drug content will show segregation patterns similar to those associated with particle size segregation.

Segregation can notably increase sampling error because it decreases the probability that certain particle types will be in the sample. In addition, the powder bed may already be segregated when material is received, and poor sample handling can also cause segregation. To avoid further segregation during sample handling, the operator should avoid situations that promote segregation, such as the following: pouring where the powder forms a sloping surface, pouring into the core of a hopper, vibrations, shaking, and stirring (unless done to promote mixing). In addition, the use of mass flow hoppers reduces segregation.

Two basic strategies help ensure that every element of the population of segregating systems has an equal probability of being in the sample: (1) use of a sampling thief and (2) sampling from a moving powder stream.

A sampling thief is a long spearlike probe that can be inserted into the powder bed and, once inserted, can collect powder samples from points adjacent to the spear. With a sampling thief, particles from almost any point in the powder bed can be included in the sample.

The second method relies on fundamental principles of sampling, namely that (1) a powder should always be sampled when in motion, and (2) the whole stream of powder should be sampled for many short periods rather than sampling a part of the stream for a longer period. For example, if the container to be sampled is emptied onto a conveyer belt, all the material will pass by a single point that can be sampled. Thus, no matter how segregated the system is, the collection of the powder at random time points ensures that every particle has an equal probability of being included in the sample. The second fundamental principle accounts for material segregation on the conveyer belt: by collecting the entire stream, one gets a cross section of all the particles, no matter how much segregation occurs on the conveyer belt.

Many methods are available for obtaining a sample from a powder system. Unfortunately, many of these methods involve setting the powder bed in motion or performing in-process sampling. Because of concerns about cross-contamination and containment of potentially toxic materials, most of these methods are impractical for the bulk sampling required for compliance with current Good Manufacturing Practices (cGMPs). Hence, most of the sampling done in the pharmaceutical industry is static sampling, done by either (1) scoop or grab sampling or (2) stratified sampling, typically employing a sampling thief. The choice of method is dictated by the distribution of the attribute being sampled in the container, as discussed below.

GENERAL SAMPLE COLLECTION: CONSIDERATIONS AND TOOLS

Types of Systems and General Considerations

Homogeneous Systems—For powder systems where the attribute of interest is uniformly distributed throughout the container—so that any sample is a true representation of the entire container, lot, or population of interest—scoop sampling is adequate. Scoop sampling is a straightforward procedure in which the operator, after selecting representative containers for sampling, opens a container, scoops out a sufficient amount of material from the top of the powder bed, and then seals the container. If a thin layer of material on top of the powder bed is suspected of being different from the bulk, samples should be taken from a point below this top layer. For example, in cases of elutriation segregation, a thin layer of fine particles may lie on top of the powder bed, and the operator should dig down into the powder bed to avoid sampling from this layer. The scoop should be large enough that no material is lost during handling, because lost material may result in sample bias. In other words, one should avoid the use of a heaping scoop from which material can roll off the sides. The advantages of scoop sampling are convenience and cost, and, for highly potent materials, low-cost disposable scoops that can be used to minimize cross-contamination.

Heterogeneous Systems—If the attribute of interest is spatially distributed in a heterogeneous manner throughout the sample, then scoop sampling is prone to potentially significant errors. Scoop sampling is a nonprobabilistic method because only the most accessible fraction of the container is sampled. Obviously, only the material in the top layer can be reached with a scoop. For example, a sample from the top outer edge of the drum shown in *Figure 3* could be biased because, in this example, the larger particles are preferentially distributed toward the top and outer edges of the drum. Hence the smaller particles have a lower probability of appearing in the sample. As a result, the smaller particles will be underrepresented in the sample, and any analysis of particle size will not reflect the true particle size distribution of the original population.

For heterogeneous systems, the initial primary sample is the most difficult to obtain. Use of a sampling thief, sometimes called a grain probe or sampling spear, is needed. The advantage of a sampling thief is that much more of the powder bed is accessible because the sampling thief can sample from different points in the powder bed, thus helping to reduce sampling bias. Many types of sampling thieves are available, including (1) the concentric sleeve with slotted compartments, (2) the concentric sleeve with grooves, sometimes called the open-handled probe, (3) the end sampler, and (4) the core sampler. Each type has its own unique operating procedures, as described below.

The concentric sleeve with slotted compartments is probably the most popular type of sampling thief used in the pharmaceutical industry. This type consists of two concentric tubes or cylinders in which the inner tube is divided into compartments. This design makes it possible to detect differences in the attribute of interest across the depth of the container. To collect a sample, the operator closes the compartments and inserts the sampling thief into the powder bed with the collection zone openings facing upward. The handle is turned to open the sample zones, then the handle is moved up and down with two quick short strokes to help fill the compartments. The sampling thief is then closed and removed from the powder bed. The operator should visually inspect the powder bed through its depth before emptying the sampling thief. The powder from the individual compartments can be combined on a clean sur-

face or in a collection container. In certain situations the material from each compartment may be analyzed separately, that is, without mixing.

In the concentric sleeve with grooves (open-handled probe), the inner tube is not divided into compartments. The probe is first inserted into the powder bed with the groove open, the outer sleeve is rotated to close, and the sampling thief is then withdrawn from the powder bed. The probe's contents are emptied from the handle end by holding the probe upright and letting the sample slide out from the handle, a method more convenient than the one using the thief with slotted compartments. However, this type of thief makes it more difficult to perform visual inspection to examine for material inconsistencies according to depth.

An end sampler probe, often used to sample slurries, has a single entry zone at the bottom of the sampling thief. Frequently the end sampling zone is larger than the rest of the sampling thief. This feature is a disadvantage because the larger the probe, the more it perturbs the powder bed, possibly resulting in the introduction of sampling bias.

Core samplers have a hollow outer cylinder with a tapered outer wall on the open end. This probe is inserted into the powder bed, and the intrinsic cohesion of the particles keeps them from flowing out when the probe is withdrawn. The contents of the cylinder are then emptied into a clear container.

General Considerations—The most reliable and reproducible results in powder size measurements are obtained when the particle size ranges from 2 to 10 μm; otherwise, the powder is too cohesive and does not flow properly into the sampling thief. In addition, particles larger than about one-third the width of the slot give poor results. Samples should be taken from several sites throughout the container. The probe should be long enough to penetrate at least three-quarters of the depth of the powder bed, ensuring that material from all depths can be captured in the sample. The choice of sites should be dictated by an understanding (often subjective) of the powder bed's degree of heterogeneity, which may have been caused by handling or movement during transport. Sampling plans can call for the insertion of the probe either at random locations and random angles or at predetermined locations and angles. For example, the plan may call for the probe to be inserted at the center and at two locations near the edges. Also, many operators recommend that probes always be inserted at a 10° angle from vertical, which increases the range of locations sampled.

Some of the disadvantages of sampling thieves include the labor-intensive nature of the procedure. The probe must be physically inserted into the powder bed, often multiple times; the contents of the probe must be emptied; and then the probe must be thoroughly cleaned. For settled powder beds, the sampling probe can be difficult to insert. In addition, the sampling probe can introduce errors as a result of the following: fine particles can lodge between the inner and outer tubes; particles can fracture; fines can compact and not flow well into the sampling compartments; segregation can occur during flow into the sampling zone; and the act of inserting the probe can disrupt the powder bed by dragging powder from the top layers of the bed down through the bed.

Representative Lot Sampling

The number of samples should be of sufficient mass to give the desired accuracy. Statistically-based sampling plans are based on statistical principles and depend on the population's spatial heterogeneity and intrinsic variability. Statistically-based plans are efficient and allow the collection of a sufficient number of samples to yield the desired degree of certainty without collecting too many or too few samples for the test method, scale, product variation, risk requirements, and tolerance for a stated product's quality level or specification. For example, the $\sqrt{N} + 1$ sampling plan given in *Table 1* may result in collection of too few samples for small populations and too many samples for large populations. However, the primary advantage of convenience sampling is that sample size can be chosen with little forethought or a priori knowledge of the population to be sampled.

The sample size selection scheme shown in *Figure 4* can be used to determine the sample size. The first choice is whether to use a statistical or nonstatistical sampling plan. Statistical plans are preferred when a variable attribute like particle size or drug content is being determined. General sampling approaches are outlined in USP general information chapter *Analytical Data—Interpretation and Treatment* ⟨1010⟩. Statistically based lot acceptance sampling plans require a valid rationale with known quality levels for the determination of product lot characteristics. As noted, the application of statistical sampling plans, including lot acceptance sampling plans, requires specific and thorough knowledge of the material being sampled. Reference statistical sampling plans state the rationale for sampling as part of the sampling scheme. Manufacturers who use a statistically-based lot acceptance sampling method should refer to an appropriate standard such as ANSI/ASQ Z1.9-2003 for bulk materials or ANSI/ASQ Z1.4-2003 for multiunit or discrete populations. These standards are readily available via sources such as the American Society for Quality (http://www.asq.org/) or the American National Standards Institute (http://www.ansi.org/).

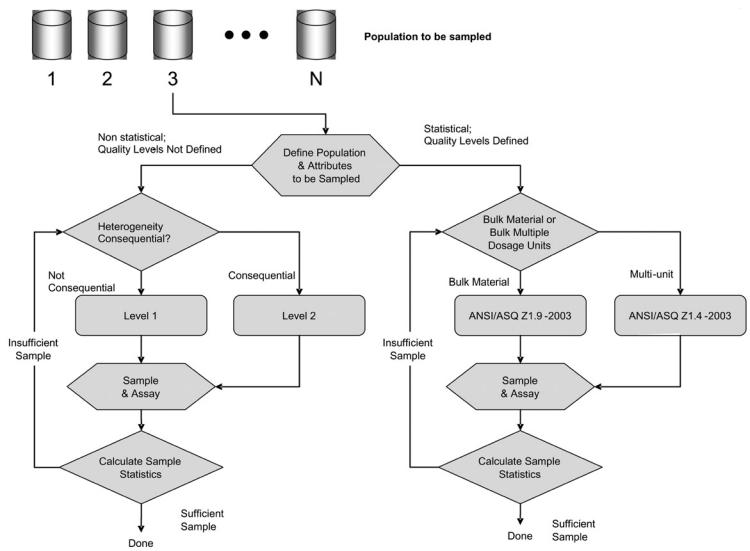

Figure 4. Sample size selection scheme.

In-Process Revision

If one is developing a nonstatistical sampling plan for which the quality level is not known, *Table 1* gives suggested sample sizes for the number of containers in the lot that should be sampled.

The *Level 1* sampling plan is relevant to materials when heterogeneity does not affect the analysis and the customer seeks to sample more than one container, when the sampling plan can be proportional to the square root of the number of containers received, and when the material comes from a known and trusted source. In such cases, the sample can be withdrawn from any point in the container. For homogenous systems, scoop sampling from the top of the container is suitable.

The *Level 2* sampling plan involves a 50% increase in sample size when compared with *Level 1* and is used when a larger proportion of the number of containers is needed, for example, when a material's heterogeneity is suspected of being consequential and acceptance sampling quality levels are not defined, or when the material comes from a less trusted source. Depending on the material's degree of heterogeneity, a sampling thief may be used. However, if the degree of heterogeneity will not significantly affect the results for the attribute being sampled, then scoop sampling from the top of the drum may still be suitable.

Table 1 shows the number of containers, *n*, to be sampled for a lot size *N.* Note that the value of *n* from the formula is rounded at 0.5 up to the next higher integer. For example, if $N = 6$: for *Level 1,* $n = \sqrt{6} + 1 = 3.45$ rounds to $n = 3$; for *Level 2,* $n = 1.5 \times \sqrt{6} = 3.67$, which rounds to $n = 4$.

Table 1

N (Population Size)	Sample Size *n*	
	Level 1	Level 2
$N \leq 3$	All	All
$N \geq 4$	$\sqrt{N} + 1$	$1.5 \times \sqrt{N}$

These initial decisions, as illustrated in *Figure 4*, are often difficult and sometimes must be made without sufficient information. If there is uncertainty about which method or level is appropriate, sometimes a quick, small-scale informal test of the system may help determine the best way to proceed. In addition, for some systems and attributes, the *Level 1* and *Level 2* sampling plans may result in oversampling. For example, when one is sampling for identification from the same lot, the suggested levels may result in collecting more samples than are statistically needed; in such cases, the statistically-based sampling plans referenced in *Figure 4* can be used.

Sample Collection

Acquiring a representative sample from a lot of bulk powder is a difficult procedure that requires special consideration, and the basic procedures for acquiring a representative sample are discussed below. Note that every situation requires techniques that are appropriate for the given population to be sampled. The methods presented here are applicable to the sampling of static powders stored in midsize bulk containers such as 1-ton super sacks, 50-kg drums, or 50-pound bags. These methods are not necessarily applicable to the sampling of liquids, large storage containers such as train cars or silos, or in-process systems such as blenders or moving conveyer belts. In addition, the procedures described here are most applicable to particles in the size range

from approximately ~1 μm to approximately ~1000 μm. Significantly smaller or larger particles require special procedures that are not covered here.

PRIMARY SAMPLE COLLECTION

Lot acceptance samples are generally transferred or delivered in containers. To collect a representative primary or gross sample (see *Figure 1*), the appropriate container or containers must first be selected from the population of *N* containers; second, a representative sample must be withdrawn from each of the selected containers.

Container Selection

To avoid bias and other sampling errors, the containers to be sampled must be randomly selected. To make a random selection, first number all containers in the lot, then use a random number table (or computer-generated random numbers) to choose from which container or containers to withdraw the samples. (See *Appendix 3* for an example showing the use of random number tables.)

For systems in which containers are grouped together in such a manner that many of the individual containers are not practically accessible (e.g., 50-pound bags stacked and bound in shrink wrap on a pallet), the sampling plan may need to take into accout the larger container, in addition to the smaller container, as a sampling unit, in order to ensure a representative sample.

Withdrawing Sample from a Container

Container Types—The three most popular container types are the bag, drum, and super sack. Because bags are generally closed and not resealable, special sampling thieves, sometimes called bag triers, have been designed to puncture the bag. If the system to be sampled is heterogeneous, the samples should be obtained from the bottom, center, and top of the bag; and, depending on how the bags are stacked on the pallet, they should also be sampled from the front and the back. When sampling from bags, particular attention should be paid to the corners, because they can disproportionately trap fine particles. If no bag trier is available, use a knife to cut open the bag for sampling. When sampling from a bag, be sure to clean the external surface sufficiently that the sample is not contaminated and foreign material is not introduced into the bulk material. Once the sample has been taken, place a compatible material over the hole in the bag, then fix this patch with an appropriate adhesive tape. Depending on the heterogeneity of the drum, a scoop or a sampling thief is used. Super sacks are large sack containers that usually have a fill spout on the top and a discharge spout on the bottom. For homogeneous material, scoop sampling is appropriate; but if there is any concern about the heterogeneity of the material, a thief should be used. The large size of super sacks makes the use of a thief more important for representative sampling than in the case of a drum or bag, in order to limit potential delimitation error.

Sample Handling

The samples collected can be either assayed individually or combined; then a subset of the gross sample can be assayed, as depicted in *Figure 1* and described below. Sample increments should be combined on a clean, dry surface or in a suitable container or bag. All containers with which the sample comes into contact should be inert and should not chemically or physically react with the sample. In addition, samples should be accurately labeled and good records kept. A portion should be kept for possible future analysis.

PRIMARY SAMPLE SIZE REDUCTION

As mentioned above, the primary sample typically consists of multiple samples taken from containers and mixed together. To obtain an analysis or measurement sample (*Figure 1*), the gross or primary sample must be reduced to a size appropriate for the analytical method. Gross or primary sample size reduction is an often overlooked aspect of a sampling plan, but it is an important step. The factors that cause segregation in a container can also cause segregation in the primary sample, and any bias in the size reduction method for the primary sample will lead to erroneous results. The advantage of secondary samples is that the mass has been reduced to a point at which it is much easer to obtain a representative unbiased sample because every element in the powder bed is readily accessible. Such accessibility makes it easier to adhere to sampling best practices. Generally speaking, sample measurement takes place under either wet or dry conditions; the choice is dictated by the requirements of the analytical method. For example, the Coulter counter requires that samples be uniformly suspended in an electrolyte, but other methods, like sieving, are typically performed with dry powders.

Before dividing an agglomerated sample, the agglomerates should be broken apart by a suitable technique such as sieving.

Dry Analysis Methods

Many laboratory devices are available for the reduction of the primary sample to an analytical sample. The three most important methods used in the pharmaceutical industry are (1) scoop sampling, (2) cone and quartering, and (3) the spinning riffler or rotary sample divider (manual method of fractional shoveling); see *Figure 5*.

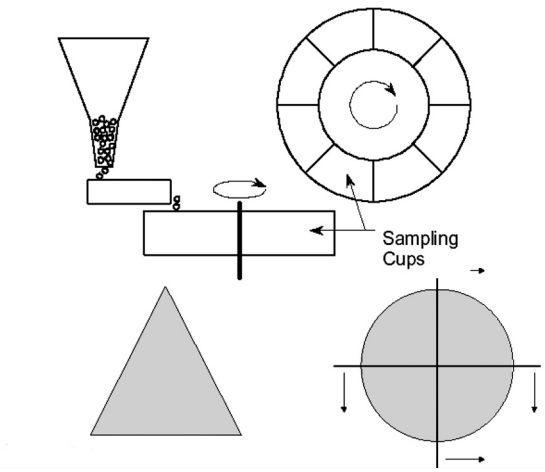

Figure 5. Two procedures for dividing samples. *Top:* spinning riffler, in which a circular holder rotates at a constant speed, and the sample is loaded at a constant rate into the containers via a vibratory chute, which is fed by a mass-flow hopper. *Bottom:* cone and quartering. (Cone, left, is flattened and quartered; quarters can be formed into cones and further subdivided.)

Scoop Sampling—Scoop sampling is done as previously described, but generally with a smaller scoop or spatula. Great care must be taken when removing material from the primary sample, because this material could be highly segregated as a result of handling. Scoop sampling is appropriate for homogeneous or cohesive powders. However, if the powder is prone to segregation, scoop sampling can introduce significant errors. Moreover, scoop sampling has several serious disadvantages. First, the method depends on the operator's deciding from which part of the primary sample to scoop the material and what quantity of the sample to extract, features that can introduce operator bias. Second, in scoop sampling, operators have a natural tendency to withdraw the sample from the free surface, which is highly prone to segregation and is not representative of the bulk. Third, operators need to avoid creating a heap where rolling segregation can occur, because material could fall off the edges of the spatula or scoop and bias the sample. Ideally, the operator should make some attempt to mix

the primary sample before using the scoop, but this too can exacerbate segregation problems and should be done only with great caution.

Cone and Quartering—Cone and quartering is done by pouring the primary sample into a symmetric cone on a flat surface. The cone is then flattened by a flat surface such as a spatula and is divided into four identical quarters (*Figure 5*). One quarter is taken as the sample. This procedure can be repeated (e.g., quarter-samples can be subdivided into quarters) until the desired sample size is obtained. The theory of this method is that when a symmetric cone is created, all the segregation processes also occur symmetrically around the cone, and hence symmetry is used to mitigate the effect of segregation. In practice, it is very difficult to actually make a symmetric powder cone, and the method becomes very operator-dependent and often unreliable. Differences in how operators form the heap and subdivide it can lead to a lack of precision and significant errors. In addition, if the method is done more than once, errors can propagate each time the cone and quartering is performed. Some experts do not recommend this method.

Spinning Riffler—A spinning riffler (*Figure 5*) includes a series of containers mounted on a circular holder. The circular holder rotates at a constant speed, and the sample is loaded at a constant rate into the containers via a vibratory chute, which is fed by a mass-flow hopper. Once the material has been divided among the different holders, an individual holder can be removed for testing or further sample division. The angular velocity of the circular holders and the amplitude of the vibratory feeder can be controlled to accommodate powders with different flow properties. The holder velocity and feed rate should be adjusted so that the containers fill uniformly and so that a heap does not form on the vibratory feeder. Spinning rifflers are available in different sizes, making possible subdivisions of powders ranging from a few milligrams to hundreds of grams. The only drawbacks of the spinning riffler are the time required to process the sample and the capital expense. Despite these minor disadvantages, the spinning riffler is by far the best method for subdivision of free-flowing powders.

Fractional shoveling is the manual version of the spinning riffler. In this method, scoop samples are taken from the original sample and placed into a sufficient number of aliquots, and then subsequent scoops are taken from the original sample and placed into one of the aliquots in sequential order. This process is repeated until the original samples are gone. Then one of the aliquots is randomly taken as the reduced sample. As is the case with all manual methods, operator error and variability can be significant factors.

Wet Analysis Methods

Wet analysis methods require dispersing the sample in a liquid suitable for analysis and then withdrawing an aliquot using a syringe or pipet. Effective secondary sampling requires making a stable homogenous suspension (i.e., the sample must be stable from the time of formation of a suspension to the time when the analysis is complete). Some important factors in wet analysis are sample solubility in the dispersion vehicle, aggregation of sample, the use of suspending agents, and deaggregation of primary particles in the dispersion vehicle. Even though a uniform suspension is created, the sample should be homogenized, typically by shaking, immediately before withdrawing the sample with a syringe or pipet. The diameter of the syringe or pipet should be large enough so that particles are not excluded and clogging does not occur. The diameters of the largest particles should not exceed 40% of the syringe or pipet tip diameter. If for practical reasons the amount of material from the primary sample is too large, the sample size should be reduced before a suspension is made. To reduce the sample size, use the methods described above in the

Dry Analysis Methods section. As a precaution, collect and retain enough sample to repeat all tests a minimum of five times.

APPENDIX 1: SUBSAMPLING EXAMPLES

The examples provided below describe the importance of material particle characterization during the selection of an appropriate sample mass. Four examples are presented. In the first example, similarity in the fundamental or intrinsic material characteristics is assumed. In the second example, the density of the heavy metal analyte being measured is changed. In the third example, the effect of changing the particle size is evaluated. In the fourth example, the adequacy of the fundamental particle characteristics in a formulation needed for a given unit dose or mass is evaluated.

Example 1. Sample Mass Determination

Assuming the lot size is 1 kg, the maximum particle diameter is 1000 μm, and the concentration of the analyte is expected to be 1%, what sample mass of round, equal-sized and -shaped 1000-μm particles with a density of 1 g/cm^3 would be needed to estimate the average concentration of the analyte with a percent relative standard deviation (%RSD) of 5%?

Rearranging equation 3, one can estimate the sample mass as shown in equation 5:

$$m_{sample} \approx \frac{1}{\frac{s_{fse}^{\,2}}{f_{shape}\, g_{CF}\, c_{max} / d_{max}^{\,3}} + \frac{1}{m_{lot}}} \qquad (5)$$

The compositional maximum heterogeneity (c_{max}) can be estimated by considering the analyte and matrix density (λ_a and λ_m, respectively) and analyte concentration (a_L) (equation 6):

$$c_{max} \approx \frac{(1-a_L)^2 \lambda_a \lambda_m}{\bar{a}_L} \qquad (6)$$

For low analyte concentrations, the compositional maximum heterogeneity is simplified by equation 7:

$$c_{max} \approx \lambda_a / a_L \qquad (7)$$

For high analyte concentrations, the compositional maximum heterogeneity is simplified by equation 8:

$$c_{max} \approx \lambda_m (1-a_L) \qquad (8)$$

The shape factor is approximated by equation 9:

$$f_{shape} \approx Volume / d^3 \qquad (9)$$

For a sphere, the shape factor is [(4/3)π/8], or approximately 0.5.

The granulometric factor can be approximated by the typical minimum diameter noted as the 5th percentile size, divided by the typical maximum diameter noted as the 95th percentile size, as shown in equation 10:

$$g_{CF} \approx {}^{d_{5\%}} / _{d_{95\%}} \qquad (10)$$

Because all particles are the same size, the granulometric factor, (g_{CF}), is 1.0. Because the analyte exists in a state liberated from the matrix particles, the liberation factor is also 1.0. The sample mass for a 5% RSD (using equation 5) is then:

$$m_{sample} = \frac{1}{\frac{0.05^2}{1x1x100x1x0.1^3} + \frac{1}{1000}} = 19.6\,g$$

A sample mass of 19.6 g will provide a sampling error of approximately 5% RSD. Note that in this example the particle characteristics are simplified to demonstrate that a lot mass of 1000 g contains 2×10^6 particles of 0.5 mg mass. The sample mass of 19.6 g contains approximately 39,216 particles, yielding a 5% RSD, using the binomial distribution where p is the concentration of the analyte (a_L) and n is the number of particles sampled, as shown in equation 11.

$$Binomial\ RSD = \sqrt{(1-p)/np} = \sqrt{(1-0.01)/39,216 \times 0.01} = 0.0498 \approx 0.05 \qquad (11)$$

(See *Table 2* for a summary of calculations.)

In determining the required sample mass, it is assumed that the sample is representative of the population. Moreover, when using a single representative sample, it is assumed that the uniformity of the sample mass is consistent with the remaining population. Note that the granulometric and liberation factors allow proportional adjustment of the sample size, depending on the nature of the particles. The inclusion of a liberation factor in the equation allows for particles to exist with a proportion of the analyte residing within every particle or a proportion thereof. The granulometric factor permits adjustment of the sample mass by accounting for the relationship in size between the smallest and largest particles represented in the lot.

Table 2. Summary of Calculations for *Example 1*, Equal-Sized and -Shaped Particles

m_{Lot} (g)	d (cm)	f_{shape}	g_{CF}	c_{max}	a_L	λ_a (g/cm³)	l	m_s (g)
1000	0.1	0.5	1	100.0	0.01	1	1	19.6

Mass per Particle P_s	Particles in 19.6 g	Binomial RSD
$d^3 f_{shape} \lambda_a$	$m_s/(P_s/g_{CF})$	$p = a(L) = 0.01$
		n = 32,916 (Eq. 11)
0.005	39,216	0.05

In-Process Revision

This approximation also can be applied to liquid suspensions in which each particle is considered discrete and the sample can be characterized with respect to size, density, mass, and volume.

Example 2. Heavy Metal

In this example, it is assumed that the analyte is the heavy metal lead, with a density of 11.34 g/cm^3, with a limit of not more than 50 ppm, where the shapes of the particles are cubes (f_{shape} = 1.0), the particles are approximately 50 μm, and a 5-g sample is taken from screened material (g_{CF} = 0.55). On the basis of equation 3, the %RSD is 17.7%. Using equation 5, one finds that a sample mass of approximately 60 g is needed to achieve a 5% RSD, assuming that a_L is equal to the limit allowed and that the analyte cannot be assumed to be liberated from the material (l = 1.0). (See *Table 3* for a summary of calculations.)

If the sample were assumed to be homogeneous (l = 0.1) with respect to presence of the analyte with all particles, then a sample mass of 6.2 g would be required. Moreover, if the shape of the particles were between round and cubic (f_{shape} = 0.8), then a sample mass of 5 g would be required to complete the analysis.

Example 3. Subsampling

Correct sampling, as noted earlier, is fundamental to understanding the important role of subsampling. In many instances it is desirable to reduce the sample size in a manner that results in a representative sample and lessens the need to test a large sample mass. In some cases the particle size and compositional heterogeneity can result in an unwieldy sample mass. This may occur with larger-sized particles or when a composite sample of many containers is required. Samples with larger-sized particles may need to be physically reduced.

For example, using *Example 2* above, if the maximum particle size were 1000 μm or 1 mm, then a 997-g sample would be suggested by equation 3. Reducing the particle size by grinding and subsampling to achieve a predetermined sampling %RSD may require subsampling more than once to achieve the desired particle size. For example, the entire sample may be reduced to 100 μm to reduce the %RSD to approximately 3%; then, with correct sampling, a subsample could be selected and entirely reduced to 50 μm to achieve a 5% RSD. Finally, a 5-g subsample could be correctly taken and tested. If certain particles have a large size with high concentration of the analyte, then samples should be selected to ensure that at least 1, but preferably at least 5–6, particles would be selected with 95% probability or chance of selection.

Example 4. Minimum Unit Dosage Mass

A formulator would like to know the minimum mass required for a dosage form to ensure with 95% confidence a unit dosage of 1% active drug powder. The drug and the excipient have a similar round shape (f_{shape} = 0.5) and a density of 0.33 g/cm^3. The active drug is milled to 1 μm, but the size of excipients can be as large as 200 μm. The value for g_{CF} is taken from equation 10 using the expected range of the excipient that accounts for 99% of the formulation, as 10 μm/200 μm, or g_{CF} = 0.05. The quantity c_{max} from equation 7 is taken as 0.33/0.01. The drug particles are completely liberated from the excipient. The batch size is 100 kg.

Table 3. Summary of Calculations for *Example 2,* Heavy Metal

m_{Lot} (g)	*d (cm)*	f_{shape}	g_{CF}	c_{max}	a_L	λ_a (g/cm³)	*l*	m_S (g)
1000	0.005	1.0	0.55	2.3×10^6	5×10^{-6}	11.34	1.0	58.71
Mass per Particle P_S			Particles in 58.7 g			Binomial RSD		
$d^3 f_{shape} \lambda_a$			$m_s/(P_s/g_{CF})$			$p = a_L = 5 \times 10^{-6}$		
						n = 75,303,331		
0.0000014175			75,303,331			0.0515		

Table 4. Summary of Calculations for *Example 4*, Minimum Unit Dose Mass

m_{Lot} (g)	*d (cm)*	f_{shape}	g_{CF}	c_{max}	a_L	λ_a (g/cm³)	*l*	m_S (g)
10^5	0.02	0.5	0.05	33	0.01	0.33	1.0	0.00264
Mass per Particle P_s				Number of Particles in 2.64 mg			Binomial RSD	
$d^3 f_{shape} \lambda_a$				$m_s / (P_s/g_{CF})$			n=40,000; p=a_L=0.01	
0.000001326				40,000			0.0497	

A minimum sample mass of approximately 3 mg is needed to ensure with 95% confidence (2 RSDs) that the average drug content is 0.9% to1.1%. The proposed dosage form has an active concentration of 100 μm per 10 mg total unit mass. The unit dosage form mass is adequate, but the formulation requires that the mixing process, unit dosage production, bulk sampling device, and lab sample preparation or subsampling from bulk samples result in equal probability of selection of drug particles. Only if these conditions for mixing, production, sampling, and testing are met can it be reliably demonstrated that the unit dosage and test determination acceptance criteria of 1% (0.01 μg/mg) are met. Acceptable outcomes of such testing also indicate that the particle size, shape, and density must be controlled. For example, an increase in the sizes of particles to 500 μm results in a need for a 42-mg sample mass and dose. Assuming a cubic, as opposed to a rounded, particle increases the sample mass to 5 mg, which for a fixed dosage form mass may result in less room for the variation contributed by other characteristics, or in lesser confidence. If the acceptance criteria were changed to 0.95% to 1.05%, requiring a 1% RSD, then the minimum sample mass would increase to approximately 70 mg. (See *Table 4* for a summary of calculations.)

APPENDIX 2: MATERIAL CHARACTERIZATION AND SAMPLING

Specific and thorough knowledge of the material's synthesis, composition, and usage is critical to developing a bulk material sampling plan. Material characterization is important because bulk material can exist in many forms throughout the material process flow. As illustrated in *Figure 6*, the type of sampling can vary by process step and ultimately affects the use of the material in the drug pro-

duct. Appropriate material characterization considers the material process step, the type of sampling, the objective of the process step, and ultimately the drug product.

For example, material can be synthesized or mixed in a large container where sampling may be limited or ideal for the characteristic needed. If the characteristic is important but the sampling conditions are not ideal, perhaps because of the heterogeneity of a powder mixture, then sampling for that characteristic may be more appropriately performed at a different stage upstream or downstream to assess the heterogeneity of the contents and ensure correct sampling. Correct sampling is the technique that results in equal probability of selection, using truly random representative samples to accurately measure the population. This is sometimes referred to as reducing the sampling dimension to measure material characteristics. Reducing the sampling dimension allows for the application of simple random sampling of subgroups or sampling from a stream or conveyer belt that represents the three-dimensional bulk container.

Acceptance attributes (see *Table 5*) depend on material characterization and process. Acceptance attributes may be applicable throughout the life of the bulk material. Both the number and size of samples require an understanding of the material's variation.

Table 5. Examples of Acceptance Attributes

APPENDIX 3: RANDOM NUMBER TABLES

1. Number all containers in the lot to be sampled.
2. Choose the random number table page, or generate the random numbers.
3. Choose a direction to read—up, down, right, or left.
4. To get a starting point, close your eyes and choose a point on the table.
5. Read numbers from the table in that predetermined direction. If the digits that you selected are between 01 and *N,* then this is the first sample element. If not, keep going in the preset direction until you find a suitable number.
6. Continue to move in the preset direction until you find the next number between 01 and *N*. That is the second element. Continue in this manner until you have enough samples. See *Table 6* for an example.

Table 6. Random Number Table

N^a = 500	*N* = 100
n^b= 50	*n* = 10
6977	69**77**
8**377**	8377 ←Sampling without replacement
3**034**	30**34**
9903	99**03**
6955	69**55**
5**483**	54**83**
5733	57**33**
0**126**	01**26**
4**329**	43**29**
3776	37**76**
etc.	etc.

Table 6. Random Number Table *(Continued)*

N^a = 500	*N* = 100
n^b= 50	*n* = 10
Containers to be sampled:	Containers to be sampled:
377, 34, 483, 126, 329, ...	77, 34, 3, 55, 83, 33, 26, 29, 76, ...

[a] *N* = population size.
[b] *n* = sample size.

BRIEFING

⟨**1180**⟩ **Human Plasma.** Because there is no information in *USP* regarding human plasma, this new general information chapter provides consolidated information on plasma classification, nomenclature, collection and processing procedures required for ensuring product safety, details of specific plasmas, and quality systems relating to plasma collection. This chapter emphasizes U.S. practices, but provides information regarding the requirements of the European Union, the United Kingdom, and Australia.

(BB BBP: A. Szajek) RTS—C55355

Add the following:

■⟨1180⟩ HUMAN PLASMA

SCOPE

This chapter provides a consolidated source of information regarding human plasma, with emphasis on plasma for fractionation. Specifically, the chapter addresses plasma classification and nomenclature; collection and processing procedures required for ensuring product safety; details of specific plasmas; and quality systems relating to plasma collection. The chapter also includes, at the end of the text sections, a glossary; a list of abbreviations used in the chapter; and appendices that provide plasma definitions, donor selection criteria, and testing requirements.

Plasma originating from US-licensed collection facilities provides the major supply for the global plasma derivative market. The U.S. Food and Drug Administration (FDA) regulates the collection and processing of plasma used for further manufacture. Title 21 of the Code of Federal Regulations (CFR) details Good Manufacturing Practice (GMP) requirements and product standards to protect the health of the blood donor and to ensure the safety and efficacy of blood products. CFR regulations are updated periodically, but between revisions, existing regulations may not address the most current issues and scientific developments. Therefore, the FDA periodically publishes guidance documents.[1] (For further information, see *Quality Systems*, below).

This chapter emphasizes U.S. practices, but because plasma and its derivatives are shipped globally, it is important to recognize that there are regional differences in recommendations, requirements, and regulations. Therefore this chapter provides information regarding the European Union (EU), the United Kingdom (UK), and Australia.

OVERVIEW

Composition of Plasma

Plasma constitutes approximately 55% of the total blood volume. It is a clear, straw-colored, complex liquid that is 7% protein, 91% water, and 0.9% mineral salts. The majority (approximately 70%) of total plasma protein is albumin. Additional plasma proteins relevant to fractionation include immunoglobulins, coagulation factors, fibrinolytic proteins, proteases, and protease inhibitors. These constituent plasma proteins can be isolated on the basis of the different solubility characteristics of each protein when subjected to specific conditions of pH, temperature, ionic strength, and ethanol concentration. The major products derived from fractionation are listed in *Table 1*.

Table 1. The Major Fractions and Products from the Cohn Process

Fraction	Product
Cryoprecipitate	Antihemophilic factor (FVIII)
Cryosupernatant	Antithrombin III, factor IX complex
Fraction I	Fibrinogen, factor XIII
Fraction II	Immune globulin G (IgG)
Fraction III	IgA, IgM, prothrombin, plasminogen

Fraction	Product
Fraction IV-1	Factor IX complex, activated factor IX complex
Fraction IV-4	Plasma protein fraction, alpha-1 proteinase inhibitor
Fraction V	Albumin

Plasma for Manufacture of Derivative Products

The two methods for collection of human plasma are automated apheresis (for definitions, see the *Glossary* preceding the appendices) and centrifugation of whole blood donations. Source plasma collected by apheresis constitutes the majority of plasma used in the manufacture of plasma derivatives in the United States. Plasma collected for transfusion but not so used (i.e., recovered plasma) also may be used for manufacture. Flow charts delineating how apheresis and whole blood–derived plasma can be used in the manufacture of plasma derivatives in the United States and Europe are presented in *Figures 1* and *2*, respectively.

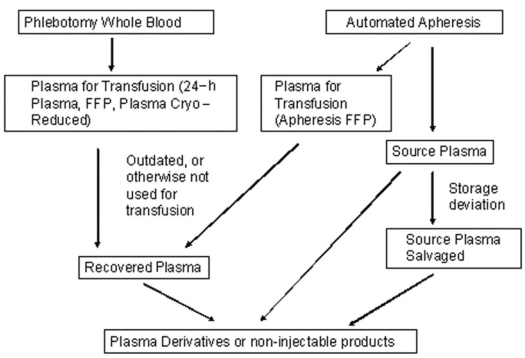

Figure 1. U.S. plasma derivative manufacture: FDA standards.

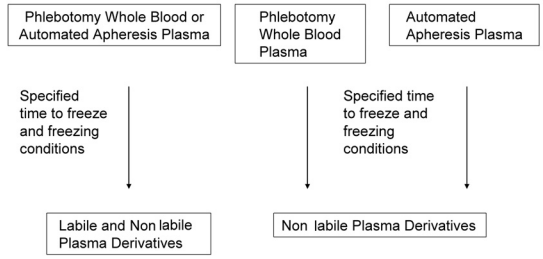

Figure 2. EU plasma derivative manufacture: EU standards.

Regardless of the collection method, plasma for fractionation should be a clear to slightly turbid liquid without visible sign of hemolysis; it may vary in color from light yellow to green; it should be $\pm$10% of the stated volume; and it should show no sign of clots. Residual cells should comply with the following limits: red cells $< 6.0 \times 10^9$/L; leukocytes $< 0.1 \times 10^9$/L; platelets $< 50 \times 10^9$/L.

Source Plasma

Licensed Source Plasma may be manufactured only in collection centers that are approved by the FDA for the collection and distribution of Source Plasma in interstate commerce. Federal regulations governing the manufacture of Source Plasma, including minimal requirements for donors, are found in 21 CFR 640, Subpart G. By definition, Source Plasma is plasma intended for further manufacture. Source Plasma donors can donate as often as twice a week and may be compensated. In addition to FDA requirements, most plasma collectors and fractionators also comply with voluntary standards established by the Plasma Protein Therapeutics Association (PPTA), a trade and standards-setting organization.[2] PPTA voluntary standards address several areas of donor, plasma unit, plasma pool, and center management, and are designed to supplement existing regulatory requirements.

[2] PPTA. www.pptaglobal.org.

Plasma for Transfusion

Plasma for transfusion is not intended for further manufacture but for direct transfusion to patients. It may be collected by either whole blood or apheresis donation. In the United States, plasma for transfusion comes from unpaid volunteer donors. Blood collecting facilities that collect plasma for transfusion comply with requirements of both the CFR and a voluntary trade organization, the American Association of Blood Banks (AABB). Sections 640.3 and 640.31 of 21 CFR outline requirements for donors of whole blood and therefore govern most donors of plasma for transfusion, regardless of the collection method. AABB voluntary standards include information contained in FDA regulations and guidance pertaining to blood and plasma, as well as additional standards.[3] Plasma for transfusion may be converted to recovered plasma, an unlicensed product that may be used for further manufacture.

Plasma for Ancillary Use in Biologics Manufacturing

Human plasma and its derivatives are used in the manufacture of other biologic products. In this role, the plasma or plasma derivative falls into the category of ancillary use. This is defined as use of a reagent or material as a processing or purification aid or a reagent that exerts an effect on the therapeutic substance but is not intended to be part of the final product formulation (see the *USP* general information chapter *Ancillary Materials for Cell, Gene, and Tissue-Engineered Products* ⟨1043⟩).

Human plasma is commonly used in manufacturing processes that involve primary human cells or cell lines intended for therapeutic applications. In these applications, plasma provides a source of protein and possibly other factors that enhance expansion and differentiation of cell populations. A variety of methods have been used to prepare human plasma and derivatives for ancillary use, but the practices are not standardized. Allogeneic plasma typically is obtained from either apheresis or whole blood, using citrate anticoagulation. Allogeneic plasma typically is collected from paid donors who, like Source Plasma donors, have been screened for the absence of transfusion-transmissible diseases. Preferred donors may be blood type group AB, because they lack anti-A and anti-B isohemagglutinins. Other preferred donors include untransfused males, because this group is unlikely to have human leukocyte antigen (HLA) antibodies that could react with cells in a given culture system. Serum is prepared either from nonanticoagulated whole blood that has been allowed to clot or by the addition of calcium to plasma obtained from citrated whole blood or apheresis. Heating plasma or serum to 56° inactivates heat-labile complement and other proteins.

Although there are no standardized specifications for plasma products used as ancillary materials, assays often include safety testing associated with general biologics (e.g., bacterial/fungal cultures, endotoxin, and mycoplasma). In addition, characterization of the products may include tests for irregular erythrocyte and HLA antibodies, osmolality, pH, total protein and immunoglobulin concentrations, hemoglobin concentration, and chemistries such as Na, K, Cl, Ca, and glucose.

In some instances, plasma from bovine sources has been used instead of human plasma. The differences between bovine and human plasma products include factors relevant to their efficacy as ancillary materials, as well as safety of the final manufactured product when administered to humans (see the forthcoming *USP* general information chapter *Bovine Serum* ⟨1024⟩). Fetal bovine serum is preferred to human serum for some applications because it may be superior in promoting human cell growth *in vitro*. Safety considerations,

[3] AABB. *Standards for Blood Banks and Transfusion Services*. 25th ed. Bethesda, MD: AABB; 2008.

especially the risk of transmissible spongiform encephalopathy and allergic reactions related to antibovine antibodies, have led to recommendations that human plasma sources be used whenever possible instead of bovine sources. However, substitution of human for bovine plasma does not completely eliminate the risk of infectious and immunologic sequelae, even when human plasma is used as an ancillary material.

PLASMA COLLECTION AND PROCESSING

This section discusses the standard principles involved in plasma collection and the methods used to ensure the safety of the plasma and subsequently manufactured plasma derivatives. Principles for screening and testing of donors are presented in other parts of this chapter.

Collection

Source Plasma is collected by apheresis. Recovered plasma can be obtained either by apheresis or as a by-product of whole blood collection. Collection should take place via an FDA-approved, closed, sterile, pyrogen-free collection system that contains an anticoagulant. No antibacterial or antifungal agent should be added to the plasma. Donations must be collected aseptically. The skin of the donor must be prepared by a method known to ensure a sterile product. Source plasma is collected using 4% sodium citrate as the anticoagulant. The composition of sodium citrate is given in *Table 2*.

Three anticoagulant solutions are licensed in the United States for collection of whole blood: citrate phosphate dextrose (CPD), citrate phosphate double dextrose (CP2D), and citrate phosphate dextrose adenine (CPDA-1). The composition of blood collection bags containing these anticoagulants is shown in *Table 3*. Plasma for transfusion or further manufacture can be made from a unit of whole blood collected in any of the three anticoagulant solutions. Regulations relating to plasma make no distinction among the three anticoagulant solutions. Consequently, collection, storage, and transport requirements are identical regardless of the anticoagulant solution used in the primary collection.

Labeling

The labeling for Source Plasma should comply with 21 CFR 640.70. The labeling for whole blood should comply with 21 CFR 606.121 and 606.122.

A unique identification number is assigned so that the donation can be related to the individual donor records and test results. The origin of each donation in a plasma pool and the results of the corresponding donation and laboratory tests must be traceable while the required degree of confidentiality concerning the donor's identity is maintained. Whole blood must be labeled ''This Product may transmit infectious agents'' [21 CFR 121(c)(9)]. Source Plasma or recovered plasma must be labeled ''Caution: For Manufacturing Use Only'' if the product is intended for use in fractionation. For plasma to be used as a reagent or for in vitro use, the required labeling statement is ''Caution: For Use in Manufacturing Noninjectable Products Only'' [21 CFR 121(e)(5)(ii)].

Table 2. Anticoagulant Solution for Collection of Source Plasma by Apheresis (4% Sodium Citrate)

Volume	Sodium citrate dihydrate	Citric acid anhydrous	pH (25°)	Ratio of solution to whole blood
250 mL or 500 mL	40 g/L	As required for pH adjustment	6.4–7.5	1 : 16

Table 3. Anticoagulant Solutions Used during Whole Blood Collection for Recovery of Plasma (500-mL collection bags)

Anticoagulant	CPD[a]	CP2D[b]	CPDA-1[c]
Volume (mL)	70	63	63
Dextrose (mg)	1780	3220	2010
Sodium citrate dihydrate (mg)	1840	1660	1660
Citric acid anhydrous (mg)	209	206	206
Monobasic sodium phosphate (mg)	155	140	140
Adenine (mg)	—	—	17.3
pH (25°)	5.3–5.9	5.3–5.9	5.3–5.9
Ratio of solution to whole blood	1.4 : 10	1.4 : 10	1.4 : 10

Note: Collection of source plasma typically involves the use of sodium citrate as the anticoagulant. The specification for sodium citrate is given in *Table 2.* Plasma for transfusion is stored at 2° to 8° after collection. Plasma collected by apheresis should be frozen immediately at –18° or colder.
[a] Citrate phosphate dextrose.
[b] Citrate phosphate double dextrose.
[c] Citrate phosphate dextrose adenine.

Storage

Plasma for fractionation should be stored at or below –20°. The plasma can still be used for fractionation if its temperature exceeds –20° on (at most) one occasion for not more than 72 hours and if the plasma has been maintained at a temperature of –5° or lower at all times. Storage temperatures must be maintained during transport.

PLASMA SAFETY CONSIDERATIONS

Plasma is protected by five overlapping safeguards that the FDA has termed the ''Five-Layer Safety Net'': donor screening, blood testing, donor deferral, quarantine, and investigation.

Voluntary measures that provide an additional margin of safety include recruitment and retention of suitable donors, donor site locations in epidemiologically favorable environments, and inventory hold procedures. In the manufacture of plasma-derived products, steps taken for viral clearance are very important for ensuring safety.

None of these measures is sufficient by itself; the safety net is the overlapping combination of the activities.

Donor Screening

The selection of a suitable site for blood and plasma donation activities is a first and very important step to ensure safe donations. Areas with low disease prevalence are preferred as locations for donation centers, thereby reducing the likelihood of collecting plasma from an infected donor.

One of the PPTA voluntary standards is the viral marker standard, which requires plasma centers to report the prevalence of viral markers for human immunodeficiency virus (HIV), hepatitis B virus (HBV), and hepatitis C virus (HCV) in the donor populations. The prevalence at an individual center is compared to the industry average. Alert limits are set to take into account the

number of annual donations in the center. If a center exceeds the limit for any of these viruses or the aggregate of all three, the center must implement corrective actions that will bring the center into compliance with the standard.

Appropriate donor selection helps provide a safe plasma supply. A detailed donor history questionnaire in conjunction with a careful medical examination allows center personnel to recognize unsuitable donors whose behavior puts them at risk for transfusion-transmitted disease or who have underlying medical conditions that preclude donation.

An additional measure put in place by centers that collect source plasma is the PPTA National Donor Deferral Registry (NDDR). It lists donors throughout the United States who have been previously deferred from donation (although it provides no information about the reason for deferral). Other countries have different systems depending on their national regulations concerning personal data gathering. Any individual who tests positive for HIV, HBV, or HCV is entered into the national database (the National Donor Deferral Registry) used by all U.S. plasma centers that are certified under the International Quality Plasma Program (IQPP). All individuals who present at a U.S. plasma center for the first time are checked against the NDDR. In this manner, patients who have previously been deferred for positive test results at any participating facility can be identified and rejected quickly. This standard ensures that donors deferred for positive test results do not donate in other facilities.

A voluntary safety initiative, the Qualified Donor Standard, implemented by the plasma fractionation industry, builds on the fact that many plasmapheresis donors contribute plasma frequently. A donor who enters a plasmapheresis center for the first time is called an Applicant Donor, and the first donation is used for further manufacturing only if the donor returns a second time. Potential donors must pass two separate medical screenings and testing for HIV, HBV, and HCV on two different occasions. Only after satisfactory screenings and negative test results does that person become a Qualified Donor. If a donor does not return within 6 months, that person loses his/her Qualified Donor status and must qualify again. This standard means that plasma from a one-time-only donor (even when all test results are negative) cannot be used for further manufacture. This standard results in committed donors and eliminates the risk that plasma centers will accept so-called test seekers. The interval between permitted donations of whole blood is too long to allow a similar screening program, although quite a number of donors in whole-blood donor centers are regular and repetitive donors.

Another PPTA voluntary standard addresses donor management criteria. The Community-Based Donor Standard allows only donors who permanently reside within its defined donor recruitment area to donate at a given center. In addition, a Donor Education Standard requires new donors to engage in an educational program and follow-up assessment regarding HIV/acquired immune deficiency syndrome (AIDS) and activities that place them at risk for HIV/AIDS.

In addition to donor management strategies and standards, PPTA has issued a plasma unit management standard called Inventory Hold. This standard states that collected plasma will be held in inventory for at least 60 days from the time of collection. This allows the retrieval of units as a result of post-donation information (information that was not known at the time of donation) that would have disqualified the donor. This information could include admitting high-risk behavior; becoming reactive for HIV, HBV, or HCV; or providing incorrect information about international travel.

Blood Testing

Testing of donations is an important safety measure both for plasma intended for transfusion and plasma intended for further manufacturing. Both enzyme-linked immunosorbent assays (ELISA) and nucleic acid amplification technologies (NAT) are used to screen donations for the presence of infectious disease. Automation provides the necessary throughput to screen every donation for a variety of potential pathogens.

Testing strategies differ depending on whether the plasma donation is intended for transfusion or further manufacture. Plasma for transfusion requires more extensive infectious disease testing, because there are no pathogen inactivation/removal technologies licensed for this product in the United States. On the other hand, plasma for further manufacture is subjected to several pathogen inactivation/removal steps during manufacture, thereby obviating the need for some disease testing. *Table 4* outlines current infectious disease tests required by the FDA for plasma donations collected in the United States. *Appendix 3* compares EU and U.S. disease testing and donor deferral requirements.

NAT, of which polymerase chain reaction (PCR) is the most widely used form, does not rely on the detection of antibodies produced by the infected host after exposure, but targets the nucleic acid of the infecting agent. By means of the selection of suitable priming molecules (the so-called primers), the assay is highly specific for the infecting virus (see the *USP* general information chapter *Nucleic Acid-Based Techniques—Amplification* ⟨1127⟩). Through several cycles of amplification, the polymerase enzyme can repetitively generate copies of the targeted fragment of the viral nucleic acid, providing an exponential amplification of a very short stretch of the viral deoxyribonucleic acid (DNA) [or ribonucleic acid (RNA)]. The exponential amplification leads to the generation of many copies of the target molecule and allows the subsequent detection of this virus-specific fragment, even if the original viral load was exceedingly low. This methodology has brought a new degree of safety.

NAT testing, because of its complexity and expense, is difficult to conduct on individual donations. Generally, aliquots from several donations are combined into a single pool, often called a minipool. Testing in pooled format remains more sensitive than serological ELISA screening of individual donations. In addition, the NAT principle circumvents several of the limitations in detecting pathogens by means of serological methods. Pooling can influence overall sensitivity, depending on the pool size and the analytical sensitivity of the NAT assay employed.

In many countries, the maximal load of a pathogen acceptable for a single donation defines the overall NAT sensitivity required. Assays of higher analytical sensitivity can use larger pools, but those of lower analytical sensitivity must test smaller pools in order to comply with regulations. The availability of commercial NAT test kits with defined analytical sensitivity has made minipools of 12 or 24 very common, because these pool sizes, in combination with the analytical sensitivity of the assays used, comply with common regulations on overall sensitivity.

Effective NAT screening requires that the viral load of the plasma pool at the beginning of production be less than the inactivation capacity of the process. Differences between the plasma transfusion and fractionation industries have led to different applications of NAT. For individual donations intended for transfusion, where there is no inactivation process and where testing is the only method to interdict a contaminated donation, the safety of each individual donation must be ensured by testing with the most sensitive assays possible. Plasma intended for further manufacturing, in contrast, is pooled and serves as the starting material for a multistep process that has built-in pathogen inactivation method-

Table 4. FDA Disease Test Requirements for Plasma for Transfusion and Plasma for Further Manufacturing

Disease	Plasma for Transfusion	Plasma for Further Manufacturing[a]
Hepatitis B	Hepatitis B surface Antigen (HBsAg) Hepatitis B core antibody	HBsAg
Hepatitis C	Anti-HCV HCV RNA	Anti-HCV HCV RNA
HIV	Anti-HIV I/II HIV RNA	Anti-HIV I/II HIV RNA
Human T-lymphotropic virus (HTLV) I/II	Anti-HTLV I/II	Not required
Syphilis	Serologic test for syphilis, every donation	Serologic test for syphilis, every 4 months
West Nile virus (WNV)[b]	WNV RNA	Not required

[a] The FDA also encourages in-process NAT testing for parvovirus B19 and hepatitis A. HBV NAT testing also is performed on most Source Plasma.
[b] Testing for WNV is recommended in an FDA draft guidance. The FDA is considering recommendations regarding testing for *Trypanosoma cruzi* (Chagas disease).

ologies. Therefore, NAT screening for plasma for further manufacture is focused on ensuring safe donations and limiting the viral load of the plasma pool to levels less than the known viral inactivation/removal capacity of the inactivation process.

To avoid the loss of large amounts of plasma from a reactive pool, the fractionation industry has implemented a prescreening strategy, the minipool screening concept mentioned earlier. Aliquots of plasma donations are combined to form minipools, and the minipools are tested by NAT. If a minipool is reactive for a virus tested, the individual donation that gave rise to this positive result can be identified and interdicted. The other donations demonstrated to be free of infection can be used for further manufacturing. The donations are then combined into a production pool, a sample of which is subjected to NAT testing as required by regulations.

As indicated, the NAT test portfolio is not uniform and depends on the intended use of the donation and the regulatory environment. Although screening for HCV RNA is done in most countries, screening for HIV is not universally required. NAT detection of HBV is used mainly for plasma for manufacturing. Screening for B19 virus or hepatitis A virus (HAV) is performed only on plasma for manufacturing. HBV screening using NAT detection is more widespread in European and Asian countries than in the United States.

Donor Deferral

A donor may be deferred from further donation as a result of answers provided on the donor history questionnaire, a medical examination performed at the time of donation, or positive tests for infectious diseases. These processes ensure both the eligibility of the donor and the suitability of the donation. In the event that either is not acceptable, standard processes permanently remove the donor and interdict unused units previously donated. The donor registries mentioned earlier are one means of ensuring that a donor deferred at one center cannot donate elsewhere.

Quarantine

Each individual unit of plasma, whether for transfusion or further manufacture, is held in quarantine until all the required tests have been completed. If all required tests have been performed and found acceptable, the unit can be released; if not, the unit must be destroyed. The plasma industry has voluntarily implemented the Inventory Hold protocol (also discussed in the previous section *Donor Screening*) for plasma for further manufacture. According to inventory hold requirements, during a 60-day hold period an individual plasma donation cannot be used for further manufacture. The rationale for the hold is that donors who have been recently infected with a pathogen may not have developed levels of antibody at the time of donation, thereby donating an infectious unit despite negative disease tests. The hold provides sufficient time for an infectious donor to develop levels of antibody that will be detected during a subsequent donation if the plasma was intended for transfusion. The 60-day hold also reduces the chance of releasing an infectious unit into the manufacturing process.

The introduction of NAT may have decreased the need for inventory hold, because NAT targets the infecting virus directly and thus does not rely on the time-delayed production of antibodies. Because NAT cannot detect all viruses and because even NAT has a certain (although very low) limit of detection, inventory hold is still of value and thus remains in place in the plasma fractionation industry.

Investigation

Each plasma donation must be traceable from donation to ultimate disposition in order to minimize the potential transmission of an infectious agent. Traceability encompasses all data concerning donation site, donor identifying information, test results, and data regarding transport, storage, and consignee(s).

Look-back is a process to identify and interdict (quarantine) previous donations from a donor who, at a subsequent donation event, has been found to be (1) infected with a transmissible agent or (2) unsuitable for donating plasma because of history, physical examination, or post-donation information. Although look-back strategies are similar in most countries, specific procedures may vary.

QUALITY SYSTEMS

The intent of this section is to outline the general principles and regulations that are the basis of quality systems relating to plasma collection. Collection centers must follow cGMPs that originate in CFR and are elaborated in FDA regulations, guidance documents, and industry standards.

The GMP guidelines specifically governing plasma are found in 21 CFR 600, Biological Products: General; and 606, Current Good Manufacturing Practice (cGMP) for Blood and Blood Components. More general cGMP regulations are found in 21 CFR 210, Current Good

Manufacturing Practice in Manufacturing, Processing, Packing, or General Holding of Drugs, General; and 21 CFR 211, Current Good Manufacturing Practice for Finished Pharmaceuticals. Although quality systems regulations are part of 21 CFR for medical devices, they have been extended to other manufacturing as part of the ''c'' in cGMP and FDA Guidance documents.[4]

The quality system is divided into four major parts: management responsibility, resources, manufacturing operations, and evaluation activities. These are the foundation of the five manufacturing systems: production, facilities and equipment, laboratory control, materials, and packaging and labeling. The procedures of each system are designed to allow operations that facilitate implementation of cGMP requirements. In many instances, these requirements relate to providing facilities and expertise to achieve the requirements for the Five-Layer Safety Net (donor screening, blood testing, donor deferral, quarantine, and investigation), discussed above.

Management responsibilities include providing leadership; building a quality system for the organization that meets requirements; establishing policies, objectives, and plans; and reviewing the quality systems with defined frequency. Resources include having sufficient resources for operational activities, personnel development plans, adequate facilities, and suitable equipment; and controlling outsourced operations. Manufacturing includes designing, developing, and documenting product and processes, performing and monitoring operations, and addressing nonconformities. Evaluation activities include analyzing data for trends, conducting internal audits, and initiating corrective and preventive actions.

A number of required routine activities related to collection and release of plasma or blood units are linked to both cGMP guidelines and quality systems. These include the requirement for having SOPs to cover all aspects of collection, testing, and release. It is also necessary to validate equipment and systems used by the collection center, including temperature-controlled areas, laboratory equipment, water systems, and computer systems. The design and operation of the facility must be adequate to perform the tasks at hand and prevent cross-contamination. Plasma collection facilities must have an adequate number of knowledgeable and trained staff as well as procedures for acceptance and release of raw materials. The requirements for a collection facility do not differ from those for a pharmaceutical manufacturing facility.

GLOSSARY

Apheresis—A method of obtaining one or more blood components by machine processing of whole blood; the residual components of the blood are returned to the donor during or at the end of the process.

Blood component—A therapeutic constituent of human blood: red cells, white cells, platelets, or plasma.

Blood establishment—Any structure or organization responsible for any aspect of the collection and testing of human blood or blood components, whatever their intended purpose, and their processing, storage, and distribution. This does not include hospital transfusion services.

Blood product—Any therapeutic product derived from human blood or plasma.

[4] FDA. Guidance for Industry: Quality Systems Approach to Pharmaceutical cGMP Regulations. 2006. Available at www.fda.gov/cber/gdlns/qualsystem.htm.

Center—Collection site or location where blood or plasma is collected (and also may be processed and stored). *Center* is also applicable to a testing *Site* (see entry in this glossary).

Cryoprecipitate—A plasma component prepared from fresh-frozen plasma by freeze-thaw precipitation of proteins and subsequent concentration and resuspension of the precipitated proteins in a small volume of the plasma.

Deferral—Temporary or permanent suspension of the eligibility of an individual to donate blood or blood components.

Distribution—The act of delivery of blood and blood components to other blood establishments, hospital blood banks, and manufacturers of blood products.

Manufacturing pool—A combination of a specified number of plasma donations used as the first step in the manufacture of plasma derivatives.

Donation minipool—A combination of a small number of units or samples representative of donations used for pretesting prior to full-scale manufacture.

Quarantine—The physical isolation of blood components or incoming materials/reagents over a variable period of time while awaiting acceptance, issuance, or rejection of the blood components or incoming material/reagents.

Site—Any location at which a blood establishment carries out blood collection, not including any location not owned or managed by the blood establishment at which blood is collected or any mobile blood collection unit.

Validation—The establishment of documented and objective evidence that the particular requirements for a specific intended use can be consistently fulfilled.

ABBREVIATIONS

AABB	American Association of Blood Banks
AIDS	Acquired immune deficiency syndrome
ALT	Alanine aminotransferase
CFR	Code of Federal Regulations
CJD	Creutzfeldt-Jakob disease
CMV	Cytomegalovirus
CNS	Central nervous system
DNA	Deoxyribonucleic acid
EBV	Epstein-Barr virus
EIA	Enzyme immunoassay
EU	European Union
FBS	Fetal bovine serum
FDA	Food and Drug Administration
FFP	Fresh-frozen plasma
FP24	Plasma frozen within 24 hours after phlebotomy
cGMP	Current Good Manufacturing Practice
HAV	Hepatitis A virus
HBsAg	Hepatitis B virus surface antigen
HBV	Hepatitis B virus
HCT	Hematocrit
HCV	Hepatitis C virus
HIV	Human immunodeficiency virus
HLA	Human leukocyte antigen
HTLV	Human T-lymphotropic virus
IgA, IgG, IgM	Immunoglobulins A, G, and M, respectively
IOPP	International Quality Plasma Program
IU	International Unit
NAT	Nucleic acid amplification technology
NDDR	National Donor Deferral Registry
PCR	Polymerase chain reaction
PPTA	Plasma Protein Therapeutics Association
PRP	Platelet-rich plasma
RNA	Ribonucleic acid
SARS	Severe acute respiratory syndrome
TEP	Therapeutic exchange plasma
WBDP	Whole blood-derived plasma
WNV	West Nile virus

APPENDICES

Appendix 1

NOTE—The collection, processing, and uses of plasma have generated a large number of terms and definitions that reflect the diversity of operations. In addition to these FDA standards and terms, industrywide voluntary standards are discussed in the *Plasma Safety Considerations* section.

Advisory Note: These terms are not meant as regulatory definitions, because plasma term definitions can vary from region to region and among industry sectors. The reader is advised to consult with regulatory authorities responsible for the region and industry sector. Often specific process variables must be considered.

Appendix 1: Plasma Types and Specifications as Assigned by Regulatory Agencies in Selected Jurisdictions

Plasma Type and Agency or Agency Type	Specification
Recovered plasma	
CFR	Plasma derived from single units of whole blood as a by-product in the preparation of blood components from whole blood collection and intended for further manufacturing. Compliance Policy Guides Manual (CPG 7134.12), Sec. 230.100.
AABB	Plasma for use in manufacturing and prepared from allogenic donations. Plasma selected for manufacture that has been collected from whole blood or apheresis plasma collected for transfusion that has expired.
Inter-region, Inter-sector	Plasma separated from whole blood most often by manual centrifugation or by apheresis. The priority for the blood collected is usually for the production of red blood cells. However, the plasma can be suitable for further manufacture of biotherapeutics and transfusion. The time from collection to freezing can vary depending on the distance of collection and processing sites. Volunteer donors typically are used.
Source plasma	
CFR	Fluid portion of human blood collected by plasmapheresis and intended as source material for further manufacturing use (21 CFR 640.60).
Inter-region, Inter-sector	Plasma separated from whole blood by plasmapheresis where the cellular components can be returned to the donor. The priority for the plasma usually is for further manufacture of biotherapeutic products. However, the plasma can be suitable for transfusion. It is rapidly frozen after collection.

Appendix 1: Plasma Types and Specifications as Assigned by Regulatory Agencies in Selected Jurisdictions *(continued)*

Plasma Type and Agency or Agency Type	Specification
Fresh-frozen plasma (FFP)	
CFR	Fresh-frozen plasma shall be prepared from blood collected by a single uninterrupted venipuncture with minimal damage to and minimal manipulation of the donor's tissue. The plasma shall be separated from the red blood cells and placed in a freezer within 8 hours or within the timeframe specified in the directions for use for the blood collecting, processing, and storage system and stored at –18° or colder [21 CFR 640.34(b)].
AABB	Plasma separated from the blood of an individual donor and placed at –18° or colder within 6 to 8 hours of collection from the donor or within the timeframe specified by the manufacturer's instructions.
Inter-region, Inter-sector	Plasma that is collected and frozen quickly after preparation. Transfusion is the primary intended use. However, FFP can be suitable for further manufacture of biotherapeutic products.
Council of Europe	A component for transfusion or for fractionation prepared either from whole blood or from plasma collected by apheresis, frozen within a period of time and to a temperature that will adequately maintain labile coagulation factors in a functional state (Chapter 21).
UK	Supernatant plasma separated from a whole blood donation or plasma collected by apheresis, frozen, and stored.
Australia	Plasma separated from whole blood and frozen within 18 hours after collection of whole blood. FFP also is prepared from anticoagulated blood that is separated into components by a suitable apheresis machine with retention of the plasma and return of the remaining elements to the donor. Freezing commences within 6 hours of collection. Storage takes place at –25° or below.
Concurrent plasma	
Inter-region, Inter-sector	Plasma collected concurrently with cellular components. Concurrent plasma may be suitable for transfusion or for further manufacture of biotherapeutics.

Appendix 1: Plasma Types and Specifications as Assigned by Regulatory Agencies in Selected Jurisdictions *(continued)*

Plasma Type and Agency or Agency Type	Specification
Applicant plasma	
Inter-region, Inter-sector	Source Plasma obtained during the first collection from a new donor. The plasma is reserved for testing, and any remainder or products derived from the remainder are not allowed for use in humans or are quarantined until the donor passes appropriate tests and returns for a second donation.
Platelet-rich plasma (PRP)	
CFR	PRP shall be prepared from blood collected by a single uninterrupted venipuncture with minimal damage to and manipulation of the donor's tissue. The plasma shall be separated from the red blood cells by centrifugation within 4 hours after completion of the phlebotomy or within the timeframe specified in the directions for use for the blood collecting, processing, and storage system. The time and speed of the centrifugation shall have been shown to produce a product with at least 250,000 platelets per µL. The plasma shall be stored at a temperature between 20° and 24° immediately after filling the final container. A gentle and continuous agitation of the product shall be maintained throughout the storage period if stored at a temperature of 20° to 24° [21CFR 640.34(d)].
Inter-region, Inter-sector	Plasma that is a product of the first centrifugation of blood where it is separated from red cells. Platelets are fractionated into the plasma layer.
Platelet-poor plasma	
Inter-region, Inter-sector	Plasma that is further purified from platelets by a second centrifugation of PRP.
Cryo-poor plasma	
CFR	Plasma that remains after both platelets and cryoprecipitated AHF have been removed may be labeled "Plasma, Cryoprecipitate Reduced" [21CFR 640.34(e)(2)].

Appendix 1: Plasma Types and Specifications as Assigned by Regulatory Agencies in Selected Jurisdictions *(continued)*

Plasma Type and Agency or Agency Type	Specification
AABB	Plasma Cryoprecipitate Reduced; Fresh-frozen Plasma from which cryoprecipitate has been removed.
Inter-region, Inter-sector	Plasma that has been thawed by maintaining the temperature just above freezing (usually 4°). A large portion of certain plasma proteins (e.g., FVIII, cryoprecipitate, fibrinogen, fibronectin, or FXIII) has been precipitated from the plasma.
Council of Europe	Plasma, Fresh-Frozen, Cryoprecipitate-Depleted (Chapter 23). A component prepared from plasma by the removal of cryoprecipitate.
UK	Plasma cryoprecipitate-depleted for transfusion means a plasma component prepared from a unit of plasma, fresh-frozen. It comprises the residual portion after the cryoprecipitate has been removed.
Australia	Cryo-depleted Plasma is the supernatant remaining after cryoprecipitate has been removed from fresh-frozen plasma. It contains most clotting factors in amounts similar to those in FFP but is deficient in Factor VIII, fibrinogen, von Willebrand factor, Factor XIII, and fibronectin. Storage: 12 months at –25° or below.
Cryo-rich plasma	
Inter-region, Inter-sector	Plasma that has been thawed by gentle heat input (e.g., in a 37° water bath) where the cryoprecipitate remains dissolved.
Plasma for labile products	
Inter-region, Inter-sector	Plasma that has been collected and best maintains the activity and integrity of labile plasma proteins as exemplified by clotting Factor VIII. Generally the time from collection through processing to freezing is rapid.

Appendix 1: Plasma Types and Specifications as Assigned by Regulatory Agencies in Selected Jurisdictions *(continued)*

Plasma Type and Agency or Agency Type	Specification
Plasma for stable products	
Inter-region, Inter-sector	Plasma that has been collected where conditions for preservation of labile products was not achieved, however conditions were sufficiently moderate so relatively stable products like IgG and albumin would not be impacted.
Less than 6-hour plasma	
Inter-region, Inter-sector	This is generally recovered plasma that has been collected, processed, and frozen prior to 6 hours after collection. This plasma generally is considered to be acceptable for the production of labile products.
6- to 12-hour plasma	
Inter-region, Inter-sector	Generally this is recovered plasma that has been collected, processed, and frozen more than 6 hours and less than 12 hours after collection. This plasma is generally considered to be acceptable for the production of labile products but is inferior to less than 6-hour plasma for this purpose.
12- to 24-hour plasma	
Inter-region, Inter-sector	Generally this is recovered plasma that has been collected, processed, and frozen more than 12 hours and less than 24 hours after collection. This plasma may be acceptable for the production of labile products but is inferior to less than 6-hour plasma and 6- to 12-hour plasma for this purpose.
Less than 12-hour plasma	
Inter-region, Inter-sector	Generally this is recovered plasma that has been collected, processed, and frozen less than 12 hours after collection. This plasma may be acceptable for the production of labile products but is inferior to less than 6-hour plasma and 6- to 12-hour plasma for this purpose.

Appendix 1: Plasma Types and Specifications as Assigned by Regulatory Agencies in Selected Jurisdictions *(continued)*

Plasma Type and Agency or Agency Type	Specification
More than 24-hour plasma	
Inter-region, Inter-sector	Generally this is recovered plasma that has been collected, processed, and frozen more than 24 hours after collection and usually less than 72 hours after collection. This plasma generally is not acceptable for the production of labile products.
Pooled plasma	
Inter-region, Inter-sector	Plasma that has been pooled from several donors. Some plasma pools for further manufacture of biotherapeutic products can be derived from several hundred to a few thousand donors.
Single-donor plasma	
Inter-region, Inter-sector	Plasma derived from a single donor. It can be a single unit or a pool of several units derived from multiple collections from the same donor.
Hyperimmune plasma	
Inter-region, Inter-sector	Plasma derived from donors with high titers to specific disease agents. Titers are elevated in these donors mostly as a result of immunization with a vaccine (e.g., hepatitis B, tetanus, or rabies) or exposure to disease agents (e.g., HCV or SARS). Hyperimmune plasma usually is intended for the preparation of IgG to provide passive immunity against target disease agents.
S/D plasma	
Inter-region, Inter-sector	Plasma that has been treated with solvent/detergent, an inactivation method effective against envelope virus disease agents (e.g., HIV, HBV, or HCV). Some plasma protein components are inactivated or damaged by the process (e.g., alpha-1 proteinase inhibitor, Protein S, anti-plasmin, or FVIII).

Appendix 1: Plasma Types and Specifications as Assigned by Regulatory Agencies in Selected Jurisdictions *(continued)*

Plasma Type and Agency or Agency Type	Specification
EU (PharmEuropa)	Human Plasma Pooled and Treated for Virus Inactivation is a frozen or freeze-dried, sterile, nonpyrogenic preparation obtained from human plasma derived from donors belonging to the same ABO blood group. The preparation is thawed or reconstituted before use to give a solution for infusion. The human plasma used complies with the monograph on Human Plasma for Fractionation.
Therapeutic exchange plasma (TEP)	
Inter-region, Inter-sector	Similar to Source Plasma in its collection. However, the donors are patients who are having their plasma replaced with electrolytes, protein solutions, or plasma from another donor. The objective usually is to remove disease elements from the patient's plasma. Generally, TEP is not advisable for further manufacture of biotherapeutic products. However, there may be cases where a specialty product may propose a specific TEP as a source material.
Quarantine plasma	
Inter-region, Inter-sector	Plasma that has been collected and stored as part of a controlled donor program. The donor is retested for disease agents (e.g., 6 months after collection). If the donor again is negative for the tested disease agents, then the plasma is released for use for further manufacture and/or use in humans.
Quarantine residual plasma	
Inter-region, Inter-sector	Plasma that has been collected and stored as part of a controlled donor program. The donor was not retested for disease agents (e.g., 6 months after collection). An example would be that the donor did not return to the collection facility to permit the later test. Quarantine Residual Plasma is not recommended for further manufacture and/or use in humans.

Appendix 1: Plasma Types and Specifications as Assigned by Regulatory Agencies in Selected Jurisdictions *(continued)*

Plasma Type and Agency or Agency Type	Specification
Salvaged plasma	
Inter-region, Inter-sector	Plasma that has experienced a storage or transport temperature deviation but may still be useful for the preparation of nonlabile products such as albumin or IgG.
Plasma for fractionation	
Australia	The liquid part of human blood remaining after separation of the cellular elements from blood collected in a receptacle containing an anticoagulant or separated by continuous filtration or centrifugation of anticoagulated blood in an apheresis procedure. It is intended for the manufacture of plasma-derived products. When the plasma is intended for the recovery of proteins that are labile in plasma, it is cooled rapidly at –30° or below as soon as possible and at the latest within 24 hours of collection. When the plasma is intended for nonlabile proteins, the plasma should be frozen at –20° or below as soon as possible and at the latest within 72 hours of collection.

Appendix 1: Plasma Types and Specifications as Assigned by Regulatory Agencies in Selected Jurisdictions *(continued)*

Plasma Type and Agency or Agency Type	Specification
EU (PharmEuropa)	Human Plasma for Fractionation is the liquid part of human blood remaining after separation of the cellular elements from blood collected in a receptacle containing an anticoagulant or separated by continuous filtration or centrifugation of anticoagulated blood in an apheresis procedure. It is intended for the manufacture of plasma-derived products. When obtained by plasmapheresis or from whole blood (after separation from cellular elements), plasma intended for the recovery of proteins that are labile in plasma is frozen within 24 hours of collection by cooling rapidly in conditions validated to ensure that a temperature of –25° or below is attained at the core of each plasma unit within 12 hours after it is placed in the freezing apparatus. When obtained by plasmapheresis, plasma intended solely for the recovery of proteins that are not labile in plasma is frozen by cooling rapidly in a chamber at –20° or below as soon as possible and at the latest within 24 hours of collection. When obtained from whole blood, plasma intended solely for the recovery of proteins that are not labile in plasma is separated from cellular elements and is frozen in a chamber at –20° or below as soon as possible and at the latest within 72 hours of collection. Frozen plasma is stored and transported in conditions designed to maintain the temperature at or below –20°. For accidental reasons, the storage temperature may rise to above –20° on one or more occasions during storage and transport, but the plasma is nevertheless considered suitable for fractionation if all the following conditions are fulfilled: the total period of time during which the temperature exceeds –20° does not exceed 72 hours; the temperature does not exceed –15° on more than one occasion; the temperature at no time exceeds –5°.
Plasma frozen within 24 hours after phlebotomy	
CFR	Plasma manufactured from whole blood should be frozen within 24 hours after phlebotomy. Blood component must be labeled “Plasma Frozen Within 24 Hours after Phlebotomy.”

Appendix 2: Donor Criteria

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
General criteria for blood donation				
Appearance	Donor should appear to be in good health (AABB)	Donor should be in good health	Only donors in good health accepted	Nothing specific noted
Underlying medical conditions	Most serious medical conditions are grounds for deferral under United States, EU, and UK guidelines. FDA guidelines require deferral only if a person has used bovine insulin manufactured from UK cattle. However, AABB guidelines require deferral for cancer, heart, liver, or lung disease, and bleeding tendency unless approved by a medical director. Cancer and cardiac disease and diabetes treated with insulin require permanent deferral under EU and UK guidelines			Most serious medical conditions are grounds for deferral. Cancer: accepted 5 years of remission. Cardiac disease: varies depending on clinical condition. Diabetes: acceptable if controlled.

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
Age	≥16 or conform to applicable state law (AABB)	Between 18 and 65; donation at 17 permitted if in accord with national legislation; first-time donors >60 only if permitted by physician	Whole blood: between 17 and 65; no first-time donors. >60 Apheresis: first-time donors between 18 and 60; may donate up to age 65	Whole blood: can start at 16–17 with consent of parents and continue to 80, but medical review required at > 70. Apheresis: accept new donors 18–65, with medical evaluation required when >60. Existing donors require annual medical review if >65.
Weight	None stated: no more than 10.5 mL/kg may be withdrawn (AABB) FDA requires Source Plasma donors to weigh at least 110 lb	Whole blood: ≥50 kg Apheresis: no specific weight requirement	Whole blood: ≥50 kg Apheresis: ≥50 kg	<45 kg—defer. Medical opinion required for unexplained weight loss

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
Blood pressure	Systolic ≤180 mm Hg Diastolic ≤100 mm Hg (AABB)	Systolic ≤180 mm Hg Diastolic ≤100 mm Hg	No specified blood pressure parameters; donors with high blood pressure may donate provided (1) they have not suffered any complications caused by high blood pressure, (2) they are taking only beta blockers and/or diuretics, and (3) their disease is stable.	Acceptable ranges: Systolic 90–180 mm Hg. Diastolic 60–180 mm Hg. Hypertension 180–100—defer. Hypotension 90–60—defer.
Pulse	Between 50 and 100 beats per minute and regular; lower pulses acceptable at discretion of physician (AABB)	Between 50 and 100 beats per minute and regular	No specific pulse rate parameters stated	Regular pulse between 50 and 100: accept Pulse between 40 and 49: accept if donor is physically fit and not on medication
Temperature	≤37.5° taken orally at time of donation (AABB)	Donors who have had a temperature of ≥38° may not donate for 2 weeks	Donors who have had a temperature of ≥38° or flu-like symptoms may not donate for 2 weeks	No requirement

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
HgB/HCT	≥125 g/L or Hct 38%	Males: ≥135 g/L Females: ≥125 g/L	Males: ≥135 g/L Females: ≥125 g/L	Whole blood females, 120–165 g/L; males, 130–185 g/L. Apheresis females, 115–165 g/L; males, 125–185 g/L. If high, defer. If low, defer for 6 months and test for ferritin.
Skin examination	Free of infectious skin disease at site of phlebotomy; no skin punctures or scars indicative of addiction to self-injected narcotics (CFR) Free of infectious diseases (AABB)	Skin at venipuncture site should be clear of lesions, including eczema	There should be no skin disease at venipuncture site	Avoid venesection where there is evidence of inflammation or infection

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
Pregnancy	Defer for 6 weeks after delivery (AABB)	Defer 6 months after delivery	Defer for 1 week for every completed week of pregnancy	Current: defer 9 months from estimated date of confinement. After third-trimester delivery: defer 9 months. Miscarriage or termination: defer 3, 6, or 9 months, respectively for 1st, 2nd, and 3rd trimester.
Underlying medical conditions that require deferral and that do not pose a risk of transfusion-transmissible infection				
Cancer	Permanent deferral unless deemed suitable by medical director (AABB)	Permanent deferral although physician may make exceptions. Permitted after cervical cancer or basal cell carcinoma if successfully treated	Malignant neoplasms, including leukemias and myeloproliferative disorders, are cause for permanent deferral; exceptions may be made for certain conditions after successful therapy	Permanent deferral for haematological malignancies. Skin cancer–basal–basal cell carcinoma: accept. Other cancers: defer 5 years after completion of treatment

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
Cardiac disease	Free of major organ disease (heart, liver, and lungs) unless deemed suitable by medical director (AABB)	Permanent deferral for persons with a history of heart disease, especially coronary disease, angina pectoris, severe cardiac arrhythmia, arterial thrombosis, or recurrent venous thrombosis. 2-year deferral for rheumatic heart disease with no evidence of chronic disease	Permanent deferral for persons with active or past serious cardiovascular disease, except congenital abnormalities with complete cure	Permanent deferral for arrhythmias, endocarditis, ischaemic heart disease, heart surgery, myocardial disease. Accept: congenital heart disease if surgically corrected. Heart murmurs: accept, subject to medical opinion. Accept after full recovery: pericardial disease, rheumatic heart disease.
Cerebrovascular diseases	No specific guideline other than that the donor must be free of major organ disease (AABB)	Permanent deferral for history of cerebrovascular diseases	Permanent deferral for donors with a history of serious CNS disease	Permanent deferral

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
Epilepsy	No deferral	Must be free of epileptic attack for 3 years and have been taken off all medication	Permanent deferral unless at least 3 years have elapsed since the date that donor last took anticonvulsant medication and there has been no recurrence of symptoms	Defer for 2 years from last seizure
Gastrointestinal disease	No specific deferral; free of major organ disease unless deemed suitable by medical director (AABB)	No specific deferral	Deferral (not noted to be a permanent deferral) for disease that renders the individual liable to impaired iron absorption or blood loss	Ulcers: defer indefinitely

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
Genitourinary and renal disease	No specific deferral. Free of major organ disease unless deemed suitable by medical director (AABB)	Five-year deferral after complete recovery from acute glomerulonephritis	Permanent deferral for donor with serious genitourinary or renal disease	Permanent deferral: chronic pyelonephritis, chronic kidney infection, chronic dialysis. Accept if resolved: haematuria, acute kidney infection. Urinary catheter present: plasma only for fractionation if underlying condition acceptable. Acute dialysis: defer for 12 months. Acute glomerulonephritis: defer 5 years after recovery.

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
Diabetes	No specific deferral except that receipt of bovine insulin manufactured in the UK requires permanent deferral (FDA). Free of major organ disease unless deemed suitable by medical director	Permanent deferral if insulin therapy required	Permanent deferral for donors on insulin treatment	Permanent deferral if diabetes-associated complications present Accept if disease is controlled, even if patient is taking insulin

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
Respiratory disease	Free of acute respiratory disease (CPR). Free of major organ disease (lungs) unless deemed suitable by medical director (AABB)	Permanent deferral for chronic bronchitis; common cold acceptable	Permanent deferral for serious disease	Permanent deferral: chronic abscess, bronchiectasis, or emphysema with respiratory insufficiency. Accept if mild and controlled: asthma, bronchiectasis without respiratory insufficiency Plasma for fractionation only: chronic bronchitis. Acute bronchitis: defer 2 weeks after recovery and being off antibiotics for 5 days. Pleurisy, pneumonia: defer 4 weeks after recovery. Acute pulmonary embolism: defer 12 months after recovery

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
Hematologic disorders	Free of abnormal bleeding tendency unless determined suitable by medical director (AABB) Free of major organ disease (cancer) unless deemed suitable by medical director (AABB)	No specific deferral. Donors who are heterozygous for beta thalassemia eligible if HGB values are within normal limits	Permanent deferral for donors with serious hematologic diseases	Permanent deferral: donors with serious hematologic diseases (sickle cell disease, thalassaemia major). Accept: thalassaemia minor. Defer: anaemia Plasma for fractionation only: elliptocytosis, glucose-6-phosphate dehydrogenase (G6PD) deficiency, spherocytosis. Apheresis only permitted for patients with G6PD deficiency

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
Immunologic disorders	No specific deferral. Free of major organ disease unless deemed suitable by medical director (AABB)	Permanent deferral for donors with autoimmune disease that affects more than one organ. Defer: documented history of anaphylaxis	Permanent deferral for donors with serious immunologic diseases	Permanent deferral: autoimmune disorders. Accept: If asymptomatic, only one organ system involved, not on immunosuppressive therapy. Accept: Sjogren's syndrome
Metabolic disease	No specific deferral. Free of major organ disease unless deemed suitable by medical director (AABB)	No specific deferral	Permanent deferral for serious metabolic disease	No specific reference
Bone disease	No specific deferral. Free of major organ disease unless deemed suitable by medical director (AABB)	Two-year deferral after having been declared cured of osteomyelitis	No specific deferral	No specific reference

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
Surgery	No specific deferral unless blood was transfused; in which case, a 12-month deferral applies (CFR)	Major surgery requires evaluation of risk for transfusion-transmissible disease	Permanent deferral for persons with history of resection of the stomach. Major surgery requires a 6-month deferral; minor surgery requires a 1-week deferral	Minor (e.g., skin lesions, arthroscopy): defer until recovered. Routine minor (e.g., appendectomy, laparoscopy): defer for 2 months. Major surgery (if donor received autologous blood only): defer 6 months. Neurosurgery; medical assessment required.
Medications that require deferral				

Appendix 2: Donor Criteria *(continued)*

	Region			
Criterion	**United States**	**United Kingdom**	**European Union**	**Australia**
Antibiotics	As defined by medical director (AABB)	Donors treated with any prescribed drug should be deferred for a period consistent with the pharmacokinetic properties of the drug	Defer for 2 weeks from full recovery or 1 week from cessation of antibiotic therapy, whichever is longer	Acute treatment: defer until recovered and off antibiotics for 5 days. Prophylactic: accept plasma only for fractionation. Topical: accept if skin is unbroken and not infected.

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
Drugs with teratogenic potential	Etretinate: permanent deferral (FDA). Acitretin: 3-year deferral from last dose (FDA). Dutasteride: 6-month deferral from last dose (FDA). Isotretinoin: 1-month deferral from last dose (FDA). Finasteride: 1-month deferral from last dose (FDA).	Donors treated with drugs with proven teratogenic effect should be deferred for a period consistent with the pharmacokinetic properties of the drug	Donors taking drugs that are proven or potential teratogens or who are taking drugs that accumulate in the tissues over long periods of time should not be used as blood donors	Raloxifene (Evista): defer for 6 months after completion of treatment. Acitretin (Neotigason): defer for 3 years after completion of treatment. Etretinate (Tigason): permanent deferral. Finasteride (Proscar): 7 days after completion of treatment. Isotretinoin: defer for 8 weeks after completion of treatment.
Growth hormone from human pituitary glands	Permanent deferral (FDA)			Permanent deferral

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
Other drugs	No other deferrals by FDA or AABB. Any other deferral at discretion of medical director of blood center (AABB). Warfarin: 7-day deferral for plasma donation (AABB).	Recommended that a list of commonly used drugs with rules for acceptability of donors, approved by the medical staff of the transfusion center, be available.	Other drugs acceptable as long as the underlying condition for which the drug is taken is acceptable.	Most medications that are taken by donors are not harmful to recipients; therefore people taking medications can be acceptable as blood donors. Eligibility is based on the assessment of the underlying condition and specific medication guidelines.
Insulin	Permanent deferral: bovine insulin made in UK (FDA).	Permanent deferral if treated with insulin	Permanent deferral if treated with insulin	Defer if diabetes is poorly controlled
Immunizations				
Toxoids	No deferral	No deferral	No deferral	
Licensed killed bacterial vaccines	No deferral	No deferral		No deferral
Licensed inactivated viral vaccines	No deferral	No deferral	No deferral except 1-week deferral after hepatitis B vaccination	No deferral except 1-week deferral after hepatitis B vaccination

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
Unlicensed killed vaccines	1-year deferral (AABB)			Defer 3 months after vaccination
Inactivated rickettsial vaccines	No deferral	No deferral		
Live attenuated bacterial and viral vaccines	4 weeks for varicella and rubella 2 weeks for rubeola, yellow fever, mumps, polio (oral), typhoid (oral) (AABB)	4 weeks	8 weeks	Plasma only for fractionation for 4 weeks after vaccination
Transfusion-transmissible infections that require deferral				

Appendix 2: Donor Criteria *(continued)*

	Region			
Criterion	**United States**	**United Kingdom**	**European Union**	**Australia**
HIV infection/AIDS and sexual partners	Permanent deferral if present or past clinical or laboratory evidence of HIV infection/AIDS: positive EIA with positive or indeterminate confirmatory test; positive NAT test; clinical signs include unexplained weight loss, night sweats, blue or purple spots in mouth or on skin, white spots or unusual sores in the mouth, swollen lymph nodes for more than 1 month, persistent cough or shortness of breath, persistent diarrhea, fever for more than 10 days; sexual partners deferred for 1 year from time of last contact (FDA)	Permanent deferral for donors found to have a confirmed positive marker for HIV. Donors found to have a repeat positive marker for HIV that cannot be confirmed should be informed according to the nationally agreed algorithm.	Donors with HIV I or II must be permanently deferred	Infection: permanent deferral. Relevant symptoms within the last 6 months: defer for 12 months. Sexual contact with HIV-positive partner: defer for 12 months after last sexual contact.

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
Hepatitis and sexual partners and household contacts	Permanent deferral for the following: History of viral hepatitis after the 11th birthday. Confirmed positive test for HBsAg. Positive test for anti-HBc on more than 1 occasion (testing is not required for Source Plasma donors). Present or past laboratory or clinical evidence of infection with HCV. Sexual partners of patients with hepatitis deferred for 1 year from last contact; household contacts of persons with hepatitis B deferred for 1 year from last contact	Permanent deferral for donors whose blood gives a positive reaction for the presence of HBsAg and/or anti-HCV. Donors with a history of jaundice or hepatitis may, at the discretion of the appropriate competent medical authority, be accepted as blood donors, provided that an approved test for HBsAg and anti-HCV is negative.	Permanent deferral for hepatitis B and C: donors with history of hepatitis B may donate after 12 months after recovery, provided that all markers are negative or core antibody positive, HBsAg is negative, and anti-HbS ≥100 IU/L; donors with documented current or past infection with hepatitis C are permanently deferred; donors with hepatitis A are deferred for 12 months.	Hepatitis B acute or past infection: defer for 12 months after recovery, then perform hepatitis testing. Hepatitis B chronic carrier: permanent deferral. Hepatitis B contact, sexual, mucosal, household: defer for 12 months from last exposure unless immune. Hepatitis B other contact: accept. Hepatitis C positive past infection: permanent deferral. Hepatitis C contact, sexual, mucosal, household: defer for 12 months from last exposure; other contact: accept.

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
	(CFR).			
HTLV	Present or past clinical or laboratory evidence of infection with HTLV I/II (positive EIA on 2 occasions). [HTLV not tested in source plasma donors] (FDA)	Permanent deferral for carriers of HTLV I/II	Permanent deferral for donors with HTLV I/II	Infection: permanent deferral. Repeat reactive status: plasma only for fractionation. Sexual contact: defer for 12 months after last contact. Household contact: accept.

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
West Nile virus	Donors with symptoms suspicious of or actual diagnosis of WNV deferred for 120 days. Donor testing positive on WNV NAT deferred for 120 days. Donor who develops symptoms of WNV within 2 weeks of donation should be deferred for 120 days. Donors implicated in possible transfusion-transmitted WNV infection should be deferred for 120 days (FDA).	Defer for 28 days after donor leaves an area with ongoing transmission to humans.	Defer for 6 months if donor was in area endemic for WNV and was diagnosed with or had symptoms consistent with WNV. Defer for 28 days after donor returns from endemic area, provided donor has no symptoms of WNV.	Infection: defer for 3 months after full recovery. Area exposure: plasma only for fractionation for 8 weeks after leaving risk area.

Appendix 2: Donor Criteria *(continued)*

	Region			
Criterion	**United States**	**United Kingdom**	**European Union**	**Australia**
Chagas disease and babesiosis	Permanent deferral for history of Chagas disease; current FDA regulations do not require testing for Chagas disease. However, although not required, most facilities collecting blood for transfusion perform EIA test for Chagas and permanently defer following positive test. (AABB) FDA probably will not require antibody screening for fractionated or recovered plasma used for further manufacture. FDA has granted exemptions and permitted the collection and distribution of source plasma for further	Permanent deferral for individuals with Chagas disease or history of Chagas disease; blood of persons who were born or have been transfused in areas where the disease is endemic should be used only for plasma fractionation products unless a validated test for infection is negative	Permanent deferral for individuals with Chagas disease. Individuals in the following categories may donate 6 months after leaving an endemic area, provided that a validated test for Chagas disease is negative (if a validated test is positive or not performed, the donor is permanently deferred): born in South or Central America, mother born in South or Central America, transfused in South or Central America; lived or worked in a rural subsistence community in South or Central America for 4 weeks or more	Infection: permanent deferral. Contact: accept. Chagas disease area resident: plasma only for fractionation, permanently. Chagas disease area visitor: plasma only for fractionation for 12 months after leaving endemic area

Surgery or use of endoscope with biopsy	No specific deferral criteria; general health and transfusion criteria apply	Six-month deferral for major surgery; stomach resection requires permanent deferral; 1-week deferral for minor surgery; 6-month deferral for endoscope with biopsy; if NAT test for hepatitis C is negative, may donate after 4 months	Six-month deferral for major surgery or procedure using an endoscope; 1-week deferral for minor surgery	Defer 6 months
Nonsterile skin penetration or mucous membrane exposure to blood or body fluids not the donor's own	Twelve-month deferral	Six-month deferral; if NAT test for hepatitis C is negative, may donate after 4 months	Twelve-month deferral	Defer 12 months
Acupuncture, tattoo, body piercing, etc.	Twelve-month deferral unless performed by a state-regulated entity, using sterile needles and disposable dyes	Six-month deferral; if NAT test for hepatitis C is negative, may donate after 4 months; exception can be made according to national risk assessment	Twelve-month deferral; 6-month deferral if validated test for hepatitis B core antibody is negative; for acupuncture, no deferral if performed by state-regulated entity	If using single-use items: plasma only for fractionation for 12 months If not single-use or unsure: defer for 12 months

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
Injection of medications or steroids not prescribed by a physician	Permanent deferral; sexual partner deferred for 1 year	All blood donors should be provided with accurate and updated information about HIV transmission and AIDS so that persons who have unsafe sex practices or other risk behavior exposing them to potential infection will refrain from donating. The information provided may vary among countries according to local epidemiological data.	Permanent deferral if donor ever injected or has been injected with drugs; sexual partner deferred for 1 year	Permanent deferral
Males who have sexual contact with another male	Permanent deferral for sexual contact, even once, since 1977; female sexual partner deferred for 1 year from last contact		Permanent deferral for oral or anal sexual contact even if protection used; female sexual partner deferred for 1 year from last contact.	Defer for 12 months after last sexual contact
Accepted money or drugs or other payment in exchange for sex since 1977	Permanent deferral; sexual partner deferred for 1 year from last contact		Permanent deferral; sexual partner deferred for 1 year from last contact.	Defer for 12 months after last sexual contact

Appendix 2: Donor Criteria *(continued)*

Criterion	Region			
	United States	**United Kingdom**	**European Union**	**Australia**
Incarceration for more than 72 hours in the past year	One-year deferral		No deferral	Defer for 12 months after release
Born in or lived in Africa	Permanent deferral if born or lived in countries where HIV I subtype O is endemic (Cameroon, Central African Republic, Chad, Congo, Equatorial Guinea, Gabon, Niger, Nigeria); sexual partner deferred for 1 year from last contact guidance unless tested with a test validated to detect Group O		No specific deferral for Africa; malaria rules apply; however, sexual partners of persons who were sexually active in areas where HIV is endemic deferred for 1 year from last contact	No specific deferral: donors who have visited a malaria-endemic area are subject to a plasma-only restriction period of at least 12 months. The restriction period is extended to 3 years if residence has been for 6 continuous months or more within the past 3 years. With a negative malaria test, the restriction period can be reduced to 4 months. Donors who have traveled to an HIV risk area must be asked if they had sexual contact with a resident of that area.

Appendix 3: Disease Testing

Disease Test	United States	European Union
Hepatitis		
HBsAg	Permanent deferral for confirmed positive test results (FDA)	*European Pharmacopoeia:* **Human Plasma for Fractionation**
Hepatitis B core antibody	Permanent deferral if reactive on 2 or more separate occasions; permanent deferral if core antibody positive results are coupled with prior or concurrent repeatedly reactive HBsAg test (FDA). Testing is not required for Source Plasma donors	Laboratory tests are carried out for each donation to detect the following viral markers: (1) antibodies against HIV-1 (anti-HIV-1). (2) antibodies against HIV-2 (anti-HIV-2). (3) hepatitis B surface antigen (HBsAg). (4) antibodies against hepatitis C virus (anti-HCV). If a repeat-reactive result is found in any of these tests, the donation is not accepted.
Hepatitis C antibody EIA	Permanent deferral if repeatedly reactive for hepatitis C antibody; may reenter donor after 6 months if confirmatory test is negative (FDA)	**Blood Directive 2002/98/EC (Annex IV): Basic Testing Requirements for Whole Blood and Plasma Donations**

Appendix 3: Disease Testing *(continued)*

Disease Test	United States	European Union
Hepatitis C NAT testing	Permanent deferral if positive on single testing (FDA)	The following tests must be performed for whole blood and apheresis donations, including autologous predeposit donations: ABO group (not required for plasma intended only for fractionation). Rh D group (not required for plasma intended only for fractionation). Testing for the following infections is required in donors: Hepatitis B (HBsAg), Hepatitis C (Anti-HCV), HIV 1 and 2 (Anti-HIV 1 and 2). Additional tests may be required for specific components or donors or epidemiological situations. **Blood Directive 2004/33/EC (Annex III): Permanent Deferral Criteria (excerpt):** Hepatitis B, except for HBsAg-negative persons who are demonstrated to be immune Hepatitis C HIV 1 or 2

BRIEFING

〈**1225**〉 **Validation of Compendial Procedures,** *USP 31* page 683 and page 794 of *PF* 34(3) [May–June 2008]. The General Chapters Expert Comittee proposes to include in this informational chapter, references to the validation of physical tests procedures. Other minor changes are also introduced.

(GC: H. Pappa) RTS—C70462; C68775

Change to read:

VALIDATION

Validation of an analytical procedure is the process by which it is established, by laboratory studies, that the performance characteristics of the procedure meet the requirements for the intended analytical applications. Typical analytical performance characteristics that should be considered in the validation of the types of procedures described in this document are listed in *Table 1*. Because opinions may differ with respect to terminology and use, each of the performance characteristics is defined in the next section of this chapter, along with a delineation of a typical method or methods by which it may be measured.

■The definitions refer to ''test results.'' The description of the analytical procedure should define what the test results for the procedure are. As noted in ISO 5725-1 and 3534-1, a test result is ''the value of a characteristic obtained by carrying out a specified test method. The test method should specify that one or a number of individual measurements be made, and their average, or another appropriate function (such as the median or the standard deviation), be reported as the test result. It may also require standard corrections to be applied, such as correction of gas volumes to standard temperature and pressure. Thus, a test result can be a result calculated from several observed values. In the simple case, the test result is the observed value itself.'' A test result also can be, but need not be, the final, reportable value that would be compared to the acceptance criteria of a specification.■1S (*USP32*)

■Validation of physical property methods may involve the assessment of chemometric models. However, the typical analytical characteristics used in method validation can be applied to the methods derived from the use of the chemometric models.

The effects of processing conditions and potential for segregation of materials should be considered when obtaining a representative sample to be used for validation of procedures.■1S (*USP33*)

Table 1. Typical Analytical Characteristics Used in Method Validation

Accuracy
Precision
Specificity
Detection Limit
Quantitation Limit
Linearity
Range
Robustness

In the case of compendial procedures, revalidation may be necessary in the following cases: a submission to the USP of a revised analytical procedure; or the use of an established general procedure with a new product or raw material (see below in *Data Elements Required for Validation*).

The ICH documents give guidance on the necessity for revalidation in the following circumstances: changes in the synthesis of the drug substance; changes in the composition of the drug product; and changes in the analytical procedure.

■Chapter 〈1225〉 is intended to provide information that is appropriate to validate a wide range of compendial analytical procedures. The validation of compendial procedures may use some or all of the suggested typical analytical characteristics used in method validation as outlined in *Table 1* and categorized by type of analytical method in *Table 2*. For some compendial procedures the fundamental principles of validation may extend beyond characteristics suggested in chapter 〈1225〉. For these procedures the user is referred to the individual compendial chapter for those specific analytical validation characteristics and any specific validation requirements.■1S (*USP33*)

In-Process Revision

Analytical Performance Characteristics

ACCURACY

Definition—The accuracy of an analytical procedure is the closeness of test results obtained by that procedure to the true value. The accuracy of an analytical procedure should be established across its range.

■[NOTE—The definition of accuracy in ⟨1225⟩ and ICH Q2 corresponds to unbiasedness only. In the International Vocabulary of Metrology (VIM) and documents of the International Organization for Standardization (ISO), ''accuracy'' has a different meaning. In ISO, accuracy combines the concepts of unbiasedness (termed ''trueness'') and precision.]■1S (*USP32*)

Determination—In the case of the assay of a drug substance, accuracy may be determined by application of the analytical procedure to an analyte of known purity (e.g., a Reference Standard) or by comparison of the results of the procedure with those of a second, well-characterized procedure, the accuracy of which has been stated or defined.

In the case of the assay of a drug in a formulated product, accuracy may be determined by application of the analytical procedure to synthetic mixtures of the drug product components to which known amounts of analyte have been added within the range of the procedure. If it is not possible to obtain samples of all drug product components, it may be acceptable either to add known quantities of the analyte to the drug product (i.e., ''to spike'') or to compare results with those of a second, well-characterized procedure, the accuracy of which has been stated or defined.

In the case of quantitative analysis of impurities, accuracy should be assessed on samples (of drug substance or drug product) spiked with known amounts of impurities. Where it is not possible to obtain samples of certain impurities or degradation products, results should be compared with those obtained by an independent procedure. In the absence of other information, it may be necessary to calculate the amount of an impurity based on comparison of its response to that of the drug substance; the ratio of the responses of equal amounts of the impurity and the drug substance (relative response factor) should be used if known.

Accuracy is calculated as the percentage of recovery by the assay of the known added amount of analyte in the sample, or as the difference between the mean and the accepted true value, together with confidence intervals.

The ICH documents recommend that accuracy should be assessed using a minimum of nine determinations over a minimum of three concentration levels, covering the specified range (i.e., three concentrations and three replicates of each concentration).

Assessment of accuracy can be accomplished in a variety of ways, including evaluating the recovery of the analyte (percent recovery) across the range of the assay, or evaluating the linearity of the relationship between estimated and actual concentrations. The statistically preferred criterion is that the confidence interval for the slope be contained in an interval around 1.0, or alternatively, that the slope be close to 1.0. In either case, the interval or the definition of closeness should be specified in the validation protocol. The acceptance criterion will depend on the assay and its variability and on the product. Setting an acceptance criterion based on the lack of statistical significance of the test of the null hypothesis that the slope is 1.0 is not an acceptable approach.

■Accuracy of physical property methods may be assessed through the analysis of standard reference materials, or alternatively, the suitability of the above approaches may be considered on a case-by-case basis.■1S (*USP33*)

PRECISION

Definition—The precision of an analytical procedure is the degree of agreement among individual test results when the procedure is applied repeatedly to multiple samplings of a homogeneous sample. The precision of an analytical procedure is usually expressed as the standard deviation or relative standard deviation (coefficient of variation) of a series of measurements. Precision may be a measure of either the degree of reproducibility or of repeatability of the analytical procedure under normal operating conditions. In this context, reproducibility refers to the use of the analytical procedure in different laboratories, as in a collaborative study. Intermediate precision (also known as ruggedness) expresses within-laboratory variation, as on different days, or with different analysts or equipment within the same laboratory. Repeatability refers to the use of the analytical procedure within a laboratory over a short period of time using the same analyst with the same equipment.

Determination—The precision of an analytical procedure is determined by assaying a sufficient number of aliquots of a homogeneous sample to be able to calculate statistically valid estimates of standard deviation or relative standard deviation (coefficient of variation). Assays in this context are independent analyses of samples that have been carried through the complete analytical procedure from sample preparation to final test result.

The ICH documents recommend that repeatability should be assessed using a minimum of nine determinations covering the specified range for the procedure (i.e., three concentrations and three replicates of each concentration

■) ■1S (*USP33*)
or using a minimum of six determinations at 100% of the test concentration.~~)~~

■■1S (*USP33*)

SPECIFICITY

Definition—The ICH documents define specificity as the ability to assess unequivocally the analyte in the presence of components that may be expected to be present, such as impurities, degradation products, and matrix components. Lack of specificity of an individual analytical procedure may be compensated by other supporting analytical procedures. [NOTE—Other reputable international authorities (IUPAC, AOAC-I) have preferred the term ''selectivity,'' reserving ''specificity'' for those procedures that are completely selective.] For the tests discussed below, the above definition has the following implications:

Identification Tests: ensure the identity of the analyte.

Purity Tests: ensure that all the analytical procedures performed allow an accurate statement of the content of impurities of an analyte (e.g., related substances test, heavy metals limit, organic volatile impurities).

Assays: provide an exact result, which allows an accurate statement on the content or potency of the analyte in a sample.

Determination—In the case of qualitative analyses (identification tests), the ability to select between compounds of closely related structure that are likely to be present should be

demonstrated. This should be confirmed by obtaining positive results (perhaps by comparison to a known reference material) from samples containing the analyte, coupled with negative results from samples that do not contain the analyte and by confirming that a positive response is not obtained from materials structurally similar to or closely related to the analyte.

In the case of analytical procedures for impurities, specificity may be established by spiking the drug substance or product with appropriate levels of impurities and demonstrating that these impurities are determined with appropriate accuracy and precision.

In the case of the assay, demonstration of specificity requires that it can be shown that the procedure is unaffected by the presence of impurities or excipients. In practice, this can be done by spiking the drug substance or product with appropriate levels of impurities or excipients and demonstrating that the assay result is unaffected by the presence of these extraneous materials.

If impurity or degradation product standards are unavailable, specificity may be demonstrated by comparing the test results of samples containing impurities or degradation products to a second well-characterized procedure (e.g., a Pharmacopeial or other validated procedure). These comparisons should include samples stored under relevant stress conditions (e.g., light, heat, humidity, acid/base hydrolysis,

■and■1S (*USP33*)
oxidation). In the case of the assay, the results should be compared; in the case of chromatographic impurity tests, the impurity profiles should be compared.

The ICH documents state that when chromatographic procedures are used, representative chromatograms should be presented to demonstrate the degree of selectivity, and peaks should be appropriately labeled. Peak purity tests (e.g., using diode array or mass spectrometry) may be useful to show that the analyte chromatographic peak is not attributable to more than one component.

■For validation of specificity for qualitative and quantitative determinations by spectroscopic methods, chapters related to topics such as near-infrared spectrophotometry, raman spectroscopy, and X-ray powder diffraction should be consulted.■1S (*USP33*)

DETECTION LIMIT

Definition—The detection limit is a characteristic of limit tests. It is the lowest amount of analyte in a sample that can be detected, but not necessarily quantitated, under the stated experimental conditions. Thus, limit tests merely substantiate that the amount of analyte is above or below a certain level. The detection limit is usually expressed as the concentration of analyte (e.g., percentage, parts per billion) in the sample.

Determination—For noninstrumental procedures, the detection limit is generally determined by the analysis of samples with known concentrations of analyte and by establishing the minimum level at which the analyte can be reliably detected.

For instrumental procedures, the same approach may be used as for noninstrumental procedures. In the case of procedures submitted for consideration as official compendial procedures, it is almost never necessary to determine the actual detection limit. Rather, the detection limit is shown to be sufficiently low by the analysis of samples with known concentrations of analyte above and below the required detection level. For example, if it is required to detect an impurity at the level of 0.1%, it should be demonstrated that the procedure will reliably detect the impurity at that level.

In the case of instrumental analytical procedures that exhibit background noise, the ICH documents describe a common approach, which is to compare measured signals from samples with known low concentrations of analyte with those of blank samples. The minimum concentration at which the analyte can reliably be detected is established. Typically acceptable signal-to-noise ratios are 2 : 1 or 3 : 1. Other approaches depend on the determination of the slope of the calibration curve and the standard deviation of responses. Whatever method is used, the detection limit should be subsequently validated by the analysis of a suitable number of samples known to be near, or prepared at, the detection limit.

QUANTITATION LIMIT

Definition—The quantitation limit is a characteristic of quantitative assays for low levels of compounds in sample matrices, such as impurities in bulk drug substances and degradation products in finished pharmaceuticals. It is the lowest amount of analyte in a sample that can be determined with acceptable precision and accuracy under the stated experimental conditions. The quantitation limit is expressed as the concentration of analyte (e.g., percentage, parts per billion) in the sample.

Determination—For noninstrumental procedures, the quantitation limit is generally determined by the analysis of samples with known concentrations of analyte and by establishing the minimum level at which the analyte can be determined with acceptable accuracy and precision.

For instrumental procedures, the same approach may be used as for noninstrumental procedures. In the case of procedures submitted for consideration as official compendial procedures, it is almost never necessary to determine the actual quantitation limit. Rather, the quantitation limit is shown to be sufficiently low by the analysis of samples with known concentrations of analyte above and below the quantitation level. For example, if it is required that an analyte be assayed at the level of 0.1 mg per tablet, it should be demonstrated that the procedure will reliably quantitate the analyte at that level.

In the case of instrumental analytical procedures that exhibit background noise, the ICH documents describe a common approach, which is to compare measured signals from samples with known low concentrations of analyte with those of blank samples. The minimum concentration at which the analyte can reliably be quantified is established. A typically acceptable signal-to-noise ratio is 10 : 1. Other approaches depend on the determination of the slope of the calibration curve and the standard deviation of responses. Whatever approach is used, the quantitation limit should be subsequently validated by the analysis of a suitable number of samples known to be near, or prepared at, the quantitation limit.

LINEARITY AND RANGE

Definition of Linearity—The linearity of an analytical procedure is its ability to elicit test results that are directly, or by a well-defined mathematical transformation, proportional to the concentration of analyte in samples within a given range. Thus, in this section, ''linearity'' refers to the linearity of the relationship of concentration and assay measurement. In some cases, to attain linearity, the concentration and/or the measurement may be transformed. (Note that the weighting factors used in the regression analysis may change when a transformation is applied.) Possible transformations may include log, square root, or reciprocal, although other transformations are acceptable. If linearity is not attainable, a nonlinear model may be used. The goal is to have a model, whether linear or nonlinear, that describes closely the concentration-response relationship.

Definition of Range—The range of an analytical procedure is the interval between the upper and lower levels of analyte (including these levels) that have been demonstrated to be determined with a suitable level of precision, accuracy, and linearity

using the procedure as written. The range is normally expressed in the same units as test results (e.g., percent, parts per million) obtained by the analytical procedure.

Determination of Linearity and Range—Linearity should be established across the range of the analytical procedure. It should be established initially by visual examination of a plot of signals as a function of analyte concentration of content. If there appears to be a linear relationship, test results should be established by appropriate statistical methods (e.g., by calculation of a regression line by the method of least squares). Data from the regression line itself may be helpful to provide mathematical estimates of the degree of linearity. The correlation coefficient, *y*-intercept, slope of the regression line, and residual sum of squares should be submitted.

The range of the procedure is validated by verifying that the analytical procedure provides acceptable precision, accuracy, and linearity when applied to samples containing analyte at the extremes of the range as well as within the range.

ICH recommends that, for the establishment of linearity, a minimum of five concentrations normally be used. It is also recommended that the following minimum specified ranges should be considered:

Assay of a Drug Substance (or a finished product): from 80% to 120% of the test concentration.

Determination of an Impurity: from 50% to 120% of the acceptance criterion.

For Content Uniformity: a minimum of 70% to 130% of the test concentration, unless a wider or more appropriate range based on the nature of the dosage form (e.g., metered-dose inhalers) is justified.

For Dissolution Testing: ±20% over the specified range (e.g., if the acceptance criteria for a controlled-release product cover a region from ~~20%~~

■30%,■1S (*USP33*)
after 1 hour, and up to 90%, after 24 hours, the validated range would be ~~0%~~

■10%■1S (*USP33*)
to 110% of the label claim).

■The traditional definition of linearity, i.e. the establishment of a linear or mathematical relationship between sample concentration and response is not applicable to particle size analysis. For particle size analysis, a concentration range is defined (instrument- and particle size-dependent) such that the measured particle-size distribution is not affected by changes in concentration within the defined concentration range. Concentrations below the defined concentration range may introduce an error due to poor signal-to-noise ratio, and concentrations exceeding the defined concentration range may introduce an error due to multiple scattering.■1S (*USP33*)

ROBUSTNESS

Definition—The robustness of an analytical procedure is a measure of its capacity to remain unaffected by small but deliberate variations in procedural parameters listed in the procedure documentation and provides an indication of its suitability during normal usage. Robustness may be determined during development of the analytical procedure.

SYSTEM SUITABILITY

If measurements are susceptible to variations in analytical conditions, these should be suitably controlled, or a precautionary statement should be included in the procedure. One consequence of the evaluation of robustness and ruggedness should be that a series of system suitability parameters is established to ensure that the validity of the analytical procedure is maintained whenever used. Typical variations are the stability of analytical solutions, different equipment, and different analysts. In the case of liquid chromatography, typical variations are the pH of the mobile phase, the mobile phase composition, different lots or suppliers of columns, the temperature, and the flow rate. In the case of gas chromatography, typical variations are different lots or suppliers of columns, the temperature, and the flow rate.

System suitability tests are based on the concept that the equipment, electronics, analytical operations, and samples to be analyzed constitute an integral system that can be evaluated as such. System suitability test parameters to be established for a particular procedure depend on the type of procedure being evaluated. They are especially important in the case of chromatographic procedures. Submissions to the USP should make note of the requirements under the *System Suitability* section in the general test chapter *Chromatography* ⟨621⟩.

Data Elements Required for Validation

Compendial test requirements vary from highly exacting analytical determinations to subjective evaluation of attributes. Considering this broad variety, it is only logical that different test procedures require different validation schemes. This chapter covers only the most common categories of tests for which validation data should be required. These categories are as follows:

Category I—Analytical procedures for quantitation of major components of bulk drug substances or active ingredients (including preservatives) in finished pharmaceutical products.

Category II—Analytical procedures for determination of impurities in bulk drug substances or degradation compounds in finished pharmaceutical products. These procedures include quantitative assays and limit tests.

Category III—Analytical procedures for determination of performance characteristics (e.g., dissolution, drug release,

■etc.■1S (*USP33*)
).

Category IV—Identification tests.

For each category, different analytical information is needed. Listed in *Table 2* are data elements that are normally required for each of these categories.

Table 2. Data Elements Required for Validation

Analytical Performance Characteristics	Category I	Category II		Category III	Category IV
		Quantitative	Limit Tests		
Accuracy	Yes	Yes	*	*	No
Precision	Yes	Yes	No	Yes	No
Specificity	Yes	Yes	Yes	*	Yes

Table 2. Data Elements Required for Validation *(Continued)*

Analytical Performance Characteristics	Category I	Category II		Category III	Category IV
		Quantitative	Limit Tests		
Detection Limit	No	No	Yes	*	No
Quantitation Limit	No	Yes	No	*	No
Linearity	Yes	Yes	No	*	No
Range	Yes	Yes	*	*	No

* May be required, depending on the nature of the specific test.

Already established general procedures (e.g., titrimetric determination of water, bacterial endotoxins) should be ▲verified to establish their suitability for use, such as▲*USP31* their accuracy (and absence of possible interference) when used for a new product or raw material.

■When validating physical property methods, consider the same performance characteristics required for any analytical procedure. Evaluate use of the performance characteristics on a case-by-case basis, with the goal of determining that the procedure is suitable for its intended use. The specific acceptance criteria for each validation parameter should be consistent with the intended use of the method.

Physical methods may also be classified into the four validation categories. For example, validation of a quantitative spectroscopic method may involve evaluation of *Category I* or *Category II Analytical Performance Characteristics*, depending on the method requirements. Qualitative physical property measurements, such as particle size, surface area, bulk and tapped density, which could impact performance characteristics, often best fit in *Category III*. *Category IV Analytical Performance Characteristics* usually applies to validation of qualitative identification spectroscopic methods. However, the various techniques may be used for different purposes, and the specific use of the method and characteristics of the material being analyzed should be considered when definitively applying a category to a particular type of method.■1S *(USP33)*

The validity of an analytical procedure can be verified only by laboratory studies. Therefore, documentation of the successful completion of such studies is a basic requirement for determining whether a procedure is suitable for its intended application(s). Current compendial procedures are also subject to regulations that require demonstration of suitability under actual conditions of use ▲(see *Verification of Compendial Procedures* ⟨1226⟩ for principles relative to the verification of compendial procedures).▲*USP31* Appropriate documentation should accompany any proposal for new or revised compendial analytical procedures.

BRIEFING

⟨**1251**⟩ **Weighing on an Analytical Balance,** *USP 31* page 712 and page 798 of *PF* 34(3) [May–June 2008]. On the basis of comments received, it is proposed to make additional changes to this general information chapter.

Change to read:

~~Weighing is a frequent step in analytical procedures, and the balance is an essential piece of laboratory equipment in most analyses. In spite of this, weighing is a common source of error that can be difficult to detect in the final analytical results. The procedure described here applies directly to electronic balances; therefore, certain portions of the procedure are not applicable to other types of balance. The weighing procedure can be separated into three basic steps: planning, checking the balance, and weighing the material.~~

~~PLANNING~~

~~The initial step is to assemble the proper equipment, such as containers for weighing, receiving vessels, forceps, pipets, spatulas of proper size, and so forth. Use containers of size such that the loading capacity of the balance is not exceeded. Make sure that the containers selected to receive the weighed material are clean and dry. Assemble the necessary chemicals if solutions or reagents are required.~~

~~Preparation of the material to be weighed is often necessary. The material may require grinding or drying. Some materials may have been heated or stored in a refrigerator. Materials must be brought to the temperature of the balance before they are weighed. To avoid condensation of moisture, refrigerated materials must be allowed to come to room temperature before the container is opened.~~

~~CHECKING THE BALANCE~~

~~In the next step it is important to remember that, unless the balance is checked before each weighing operation is performed, errors can easily occur, resulting in faulty analytical da-~~

In-Process Revision

ta. The balance user should check the *Balance Environment*, *Calibration*, and *Balance Uncertainties*. Do not assume that the balance has been left in the proper operating condition by the previous user.

Balance Environment

The balance is placed in a suitable location with sufficiently low levels of vibration and air current. It must have a constant electrical supply. The balance and the surrounding work area have to be kept neat and tidy. It is good practice to use a camel's hair brush or its equivalent to dust the balance pan before any weighing so as to remove any materials that may have been left by the previous operator. [NOTE—Individuals must clean up debris, dispose of any spilled materials or paper, and remove the vessels and apparatus used in making the measurements.] When a balance is moved, it must be allowed to adjust to the temperature of its new environment and be recalibrated.

Calibration

If necessary, turn on the power, and allow the balance to equilibrate for at least 1 hour before proceeding with the calibration. (Microbalances may require up to 24 hours to reach equilibrium.) If the balance power has gone off and then has come back on, as in a power outage, certain types of balance may display a message indicating that the balance must be calibrated before a weighing is made. If the operator touches the balance bar, the message may be cleared and the balance may display zeros; however, the balance will not give the correct weighing until it has been calibrated. Electronic analytical balances have an internal calibration system based on an applied load. The calibration applies for the current ambient temperature.

Balance Uncertainties

DRIFT REDUCTION

Drift is one of the most common errors, and it is also one of the easiest to reduce or eliminate. Balance drift can be present without the operators being aware of the problem. Check the sample, the balance, and the laboratory environment for the following causes of errors, and eliminate them:

1. A balance door is open.
2. Temperatures of the balance and the material to be weighed are not the same.
3. The sample is losing or gaining weight.
4. The balance has been recently moved but has not been allowed to equilibrate to its surroundings or has not been recalibrated.
5. Air currents are present in the laboratory.
6. Temperatures in the laboratory vary.
7. The balance is not properly leveled.
8. Laboratory operations are causing vibration.
9. Hysteresis of the mechanical parts occurs during weighing.

MECHANICAL HYSTERESIS

Hysteresis in the balance is caused by excessive stretching of the springs, and it is primarily due to overloading or to the accidental dropping of an object onto the pan. Microbalances are very sensitive to overload and shock. When using a microbalance, set the lever to the rest position when adding or removing material; turn the lever to the weigh position to register the weight. In some cases, drift due to hysteresis can be eliminated by allowing the balance to stand without weighing long enough for it to recover. If stretching of the springs is excessive, an expensive balance overhaul may be needed. In the case of electronic force restoration balances, springs are replaced by flextures, and the term *creep* is more appropriate than *hysteresis*.

QUALITY ASSURANCE PROCEDURE FOR MEASUREMENT OF BALANCE DRIFT

Over an extended period of time, balance drift and other day-to-day variations are monitored by weighing a fixed check weight on a regular basis; this check should be performed after the balance has been calibrated at the ambient laboratory temperature. The check should be made before the first weighing of the day or after any event that might disturb the balance's calibration (power failure, moving the balance to a new location, etc.). The check weight may be any object whose mass remains constant and does not exceed the load limit of the balance. A balance weight makes a reliable check weight. Each balance should be provided with a check weight, which should be stored in a protective container near the balance.

Perform the following procedures to reduce balance errors and the possibility of an incorrect reading because of drift:

1. Make certain that the electrical power to the balance is on and that the level bubble is in the center of the indicator.
1. Calibrate the analytical balance or the microbalance. [NOTE—Some balances have a calibration lever, which must be returned fully to its original weighing position. Do not depend upon any prior calibration.]
3. The first person to use the balance each day should weigh the check weight and record the weight in the log book for comparison with previous readings. If a deviation greater than those indicated below for *Analytical Balances* and *Microbalances* is observed, the balance should be reported for service. [NOTE—Check weights tend to gain weight upon standing because of mishandling and exposure to contaminants in the atmosphere. These weights can be cleaned by wiping with a lint-free cloth moistened with a small amount of an appropriate solvent such as diethyl ether.]

Analytical Balances—Select a check weight of an appropriate mass to examine an analytical balance. If possible, set the balance to read to 5 decimal places. Follow the manufacturer's operating instructions. Pick up the check weight with a forceps, place it carefully on the balance pan, and weigh it. [NOTE—Do not drop the weight on the balance pan, because damage to the balance could result.] Place the weight in the center of the pan to eliminate corner weighing differences. The accuracy of the weight is not important; the only factor of interest is whether any drift has occurred. If no drift has taken place, the value should remain constant. Periodic weighing of a fixed weight will determine whether the boards (or knife edges in mechanical balances) in the instrument are defective. The check for drift at the most sensitive position will show whether a problem exists; the variation in the observed weight does not exceed ±0.2 mg. For example, with a 20-g weight, if the mean value of the readings were 19.9984, the tolerance would be from 19.9982 to 19.9986 g. Thus, several readings must be taken before one can establish a tolerance. [NOTE—The check weight need not be of high accuracy, but it is essential that its mass remain constant. In addition, the tolerance does not correspond to the value of 0.1%, specified under *Weights and Balances* ⟨41⟩, for weighing material accurately. Rather, the tolerance is purposefully tight to reveal possible drift or calibration errors; this tolerance is readily achievable with modern electronic balances.]

Microbalances—Proceed as directed for *Analytical Balances*, but use a check weight appropriate for the particular balance. For example, a 100-mg check weight might be selected for a balance that has a load limit of 150 mg; or a 10-mg check weight might be used for an ultramicrobalance with a load limit of 15 mg. (The operator must know the maximum capacity of the balance to select the correct check weight.) The balance in-

dicates the weight in milligrams. Record the weight as soon as the reading is stable for a few seconds. The variation in weighings ought to be within a range commensurate with the specifications given by the balance manufacturer, but not greater than 0.1% of the amount of material typically weighed on the particular balance. For example, if 10-mg samples are routinely weighed, the variation in the weighings of the check-weight cannot exceed 0.01 mg.

WEIGHING THE MATERIAL

In this final step, select the number of decimal places required for the analytical procedure. In most pharmaceutical analyses small quantities of material are used, requiring the balance reading to be set to the fifth decimal place to achieve the necessary accuracy. Weighing read with four decimal places is preferred for weighing near-gram quantities. Do not allow the material to remain on the balance for an extended period of time because changes, caused by interaction with atmospheric water or carbon dioxide, may take place.

Load Limit

Select the appropriate balance for the quantity and accuracy needed. Each balance has a load limit, which should not be exceeded. Each balance manufacturer supplies the maximum loading condition, and this limit varies with the type of balance. The operator should know this limit so that the balance will not be damaged. [NOTE—Electronic balances operate on a ''load cell'' principle that produces an electrical output proportional to the movement of the strain gauge and is linear over the range.]

Receivers

The proper receiver for the material must be selected. The receiver's weight plus the weight to be measured must not exceed the maximum load for the balance; the size and shape of the receiver should permit it to fit into the space and on the balance pan without interfering with any operation. It is important that the receiver be clean and dry. Common receivers are weighing bottles, weighing funnels, flasks, and weighing paper. The correct receiver depends upon the quantity and type of material (liquid, solid, or powder) to be weighed. All other things being equal, a vessel of low mass should be chosen when small amounts of material are to be weighed. It is recommended that gloves, forceps, or another type of gripping device be used when handling receivers, because oils from the hands will add weight.

The weighing funnel is often the most satisfactory receiver, because it can function as both a weighing dish and a transfer funnel, allowing easy transfer to volumetric flasks. Weighing funnels come in various sizes; the size suitable for the operation should be selected.

Weighing paper may be used for solids. Paper receivers must be handled by hand, and great care must be used to prevent spills.

Weighing by Difference

Weighing is usually done by difference. The following methods are acceptable for good analytical results.

METHOD 1

Tare the empty receiver as follows. Place the receiver on the balance in the center of the pan, and press the appropriate tare key on the balance. This operation electrically sets the signal from the strain gauge to zero so that the weight of the receiver is no longer indicated. Add the material to the receiver, and record the weight. Transfer the weighed material to the final flask or receiver; then reweigh the original weighing receiver by placing it in the same position on the pan. [NOTE—Do not change the set tare of the balance between these two weighings.] The second weight represents the untransferred material and is subtracted from the total material weight to determine the weight of the transferred material.

METHOD 2

If the empty receiver is not going to be tared, add the material to the receiver, and place the receiver on the balance in the center of the pan. Record the weight, and transfer the weighed material to the final flask or receiver; then reweigh the original weighing receiver by returning it to the same position on the pan. The second weight represents the sum of the weights of the receiver and the untransferred material; subtract this sum from the sum of the total material weight and the receiver weight to determine the weight of the transferred material.

METHOD 3

This method may be described as quantitative transfer. The material is added to the tared receiver, the amount is determined by difference, and then the whole amount is transferred quantitatively (e.g., by using a solvent) to the final receiver.

Materials-Handling Safety Procedures

The operator must be familiar with precautions described in the Material Safety Data Sheet for the substance before weighing it. Hazardous materials must be handled in an enclosure having appropriate air filtration. Many substances are extremely toxic, are possibly allergenic, and may be liquids or finely divided particles. A mask that covers the nose and mouth should be used to prevent any inhalation of chemical dust. Gloves should be used to prevent any contact with the skin. [NOTE—The use of gloves is good practice for handling any chemical. If it is necessary to handle the container being weighed, the operator should put on gloves, not only for self-protection but also to prevent moisture and oils from being deposited on the weighed container.] During a weighing, the operator may be exposed to high concentrations of the pure substance; therefore, the operator must carefully consider these possibilities at all times.

Weighings are made on many different types of materials, such as large solids, finely divided powders, and liquids (viscous or nonviscous, volatile or nonvolatile). Each type of material requires its own special handling.

Weighing Solids

Solids come in two forms: large chunks, with or without powdery surface, and finely divided powders or small crystals. If large chunks with a powdery surface are to be weighed, at least a piece of weighing paper must be placed on the balance pan to protect it from damage. Large nonreactive chunks that have no powdery surface may be placed directly on the pan (for example, a coated tablet). [NOTE—Solid pieces must be handled with forceps, never by hand.]

STATIC CHARGE

Fine powders have a tendency to pick up static charge, which will cause the particles to fly around. This static charge must be eliminated before a suitable weighing can be made. An antistatic device may be used to minimize this problem. [NOTE—Such devices may use piezoelectric components or a very small amount of a radioactive element (typically polonium) to generate a stream of ions that dissipate the static charge when passed

~~over the powder to be weighed.] The static charge depends upon the relative humidity of the laboratory, which in turn depends upon the atmospheric conditions. In certain conditions, static charge is caused by the type of clothing worn by the operator; this charge causes large errors in the weighing when discharged.~~

~~WEIGHING PROCEDURE~~

~~Place the receiver on the balance pan, close the balance door, and weigh as indicated for *Weighing by Difference*, with the following additions. Carefully add the powdered material from a spatula until the desired amount is added. Use care to avoid spilling. Close the balance door, and record the weight as soon as the balance shows a stable reading.~~

~~SPILLS~~

~~If solids are spilled, remove the receiver, and sweep out all of the spilled material from the balance. The spilled material must be properly disposed of and must not be swept out onto the balance table where other operators may come in contact with the chemical. Then either start the process over or reweigh the remaining material. [NOTE—Never return any excess material to the original container. Any excess material must be disposed of in a proper manner.]~~

~~Weighing Liquids~~

~~Liquids may be volatile or nonvolatile and viscous or nonviscous. Each type requires special attention.~~

~~WEIGHING PROCEDURE~~

~~Weigh as directed for *Weighing by Difference*, with the following additions. Liquids should always be weighed into a container that can be closed so that none of the material is lost. It is best if the liquid can be added to its receiving container outside the balance because of the possibility of a spill. [NOTE—Liquids spilled within the balance housing can cause serious damage to the balance, and they may be difficult to remove.]~~

~~Nonviscous liquids can be handled with a Pasteur capillary pipet equipped with a small rubber bulb such as a medicine dropper bulb. The liquid is discharged into its receiver, the top is closed or stoppered, and the receiver and contents are weighed. Small quantities of viscous liquids can be handled by touching a glass stirring rod to the surface of the liquid and then carefully touching the rod to the side of the receiving vessel, which allows some of the material to be transferred.~~

~~Weighing Corrosive Materials~~

~~Many chemicals, such as salts, are corrosive, and materials of this nature should not be spilled on the balance pan or inside the balance housing. Extreme care is essential when materials of this nature are being weighed.~~

~~CONCLUSION~~

~~By carefully following the procedures outlined above, laboratory personnel will eliminate many errors that might be introduced into weighing procedures. However, it is important for each balance to be serviced and calibrated regularly by a specially trained internal or external service person. The balance should be tested using weights traceable to standardization by the National Institute of Standards and Technology. No repairs should be made to any balance by anyone other than a qualified maintenance person.~~

▪INTRODUCTION

Weighing is a frequent step in analytical procedures, and the balance is an essential piece of laboratory equipment in most analyses. In spite of this, weighing is a common source of error that can be difficult to detect in the final analytical results. The general information described here applies directly to electronic balances used in analytical procedures, and certain portions of the chapter are not applicable to other types of balances. This chapter should not be considered all-inclusive, and there are other sources of information that may be useful and applicable (e.g., NIST, FDA, and balance manufacturers)[1] when performing a weighing operation or implementing a weighing procedure. The recommendations in this chapter are not intended to meet all the standards stated in *Weights and Balances* ⟨41⟩ but instead to provide for recommendations for balances used in all analytical procedures.

QUALIFICATION

Users are advised to consult *Analytical Instrument Qualification* ⟨1058⟩, standard operating procedures, and recommendations from manufacturers in devising qualification plans.

Installation

A balance's performance is dependent on the conditions of the facility where it is installed. Information provided by the manufacturer should be consulted prior to installing a balance.

[1] Also see: Ted Scorer, Michael Perkin, and Mike Buckley, ''Good Practice Guide No. 70, Weighing in the Pharmaceutical Industry,'' National Physical Laboratory, Teddington, Middlesex, United Kingdom, for additional details. Nomenclature in this chapter tends to follow this document, except where in conflict with USP terms.

SUPPORT SURFACE

The balance should be ~~mounted~~ installed on a solid, level, nonmagnetic surface that minimizes the transmission of vibration (e.g., a floor-mounted, ~~polished~~ granite weigh bench). If a metallic support surface is used, the surface should be grounded in order to prevent the buildup of static electricity.

LOCATION

The balance should be located in a room that is temperature and humidity controlled. The location should have a clean, consistent electrical power supply. The location should be free of drafts and should not be near ovens, furnaces, air conditioner ducts, or cooling fans from equipment or computers. The balance should be positioned away from outside windows so that direct sunlight does not strike the balance. The balance should not be installed near sources of electromagnetic radiation such as radio frequency generators, electric motors, hand-held communication devices (including cordless telephones, cellular telephones, and walkie-talkies). The balance should not be located near magnetic fields induced by laboratory instrumentation or other equipment.

In some situations, it may not be possible to position the balance in an optimum environment. Examples of potential facility issues include the following:

1. Air currents are sometimes present in the laboratory.
2. Temperatures in the laboratory vary excessively (check manufacturer's literature on temperature sensitivity).
3. Humidity is either very low or very high. Either condition may increase the rate at which the sample weight varies due to pickup or loss of water. Low humidity increases buildup of static electricity.
4. Adjacent facility operations are causing vibration.
5. Corrosive materials are used nearby or are routinely weighed.
6. The balance is located within a fume hood because it is used to weigh corrosive or hazardous materials.
7. The balance is adjacent to equipment producing a magnetic field (e.g., a magnetic stirrer).

In these cases, the performance of the balance should be assessed following installation and prior to use in order to demonstrate adequate performance. In situations where the balance is located near equipment or systems that induce vibration, drafts, electromagnetic radiation, magnetic fields, or changes in temperature or humidity, the assessment should be conducted with those systems operating in order to duplicate a worst-case scenario.

Qualification and Routine Checks

Calibration is defined as a set of operations that establish, under specified conditions, the relationship between values of quantities indicated by a measuring instrument or measuring system, or values represented by a material measure or a reference material, and the corresponding values realized by standards.

~~If necessary, turn~~ Turn on the power and allow the balance to equilibrate according to the manufacturer's instructions (1 to 24 hours, depending on type of balance) prior to ~~performing calibrations~~ use.

Several types of electronic analytical balances use internal weights for automatic calibration adjustment. This adjustment can also be applied for changes in the ambient temperature and is intended to reduce the effect of the drift of the balance over time. If the balance system does not provide any clear indication regarding the state of calibration, the calibrated state can only be verified by use of external weights with known masses.

Calibration is normally performed prior to any other qualification measurements and periodically prior to use of the balance. In *Weights and Balances* ⟨41⟩, a check of the state of calibration is typically performed each day the balance is used or at appropriate intervals based on applicable standard operating procedures. ~~and the measured weight is within 0.1% of the certified value.~~

Operational Qualification

Operational qualification is often performed by the manufacturer of the analytical balance but may also include specific requirements not tested by the manufacturer. Depending on the balance model, these tests may include testing of the following:

- tare facility
- maximum capacity of the balance
- autocalibration feature
- operation of ancillary equipment, e.g., printer

Performance Qualification

Table 1 provides examples for accomplishing performance qualification requirements. The examples in the table are not all-inclusive. Any procedures used should be consistent with in-house standard operating procedures, applicable for the specific balance, and adequately justified. If there is evidence that linearity, hysteresis, and eccentricity deviations are negligible in the operating range of the balance, these tests may be skipped.Performance qualification would be performed before placing the balance into routine use and then periodically as described in standard operating procedures.

Table 1. Suggested Performance Qualification Tests

Test	Example	Considerations for Criteria
Linearity	From 3 to 10 points over the range of the balance.	No more than 0.1% deviation where *Weight and Balances* ⟨41⟩ is applicable; for other uses consider how the balance is used, but errors should not exceed 0.1% of load.
Repeatability	10 replicates (test weight a few percent of the maximum capacity of the balance).	Manufacturer's specification; *Weights and Balances* ⟨41⟩ requirements, as applicable.
Hysteresis	Three measurements covering the range of the balance, e.g., 1) 0% of load 2) 50% of load 3) 100% of load	Consider how the balance is used, but errors should not exceed 0.1% of load.
Eccentricity	Eccentricity test should be performed at four ~~corners~~ quadrants of the balance pan at approximately 50% load.	Consider how the balance is used, but errors should not exceed 0.1% of load.

Quality Control Checks (Weight Check)

Analytical balances vary greatly in the features they offer to ensure that the balance is maintained in a calibrated state. A weight check using an internal or external check weight ensures that the balance is suitable to use. The weight check is typically performed each day the balance is used or at appropriate intervals based on applicable standard operating procedures. ~~and the measured weight~~ The test is passed if the weighing value indicated by the balance is within 0.1% of ~~the certified value~~its nominal value. Before weighing, the weight should be placed ~~by the balance~~ in the vicinity of the balance for at least thirty minutes to reach thermal equilibrium prior to testing. *Table 2* provides suggested information on balance checks using check-weights.

Routine weight checks using external weights should be recorded in a manner where the data can be used to easily track balance performance in order to allow for setting of meaningful action and failure limits (such as control charts) and to assist in laboratory investigations as needed.

The check weights that are used should be stored and handled in such a manner as to minimize contamination. Procedures should be in place to address check-weight results that are observed to be outside acceptable ranges and to provide assurance that the balance cleanliness and environment have not affected the result. Also, a procedure for removing a balance from service due to observed results outside acceptable ranges should be in place.

Table 2. Suggested Balance Checks

Topic	Example	Criteria
Type of material	Stable but not necessarily a NIST-traceable external weight.	Possible need for calibration certificate or weight history.
Mass of weight	Large enough to minimize variation from handling, e.g., 200 mg for a 4- or 5-place balance, near the upper limit for microbalances (6–7 place).	Below the maximum weight for the balance and above the minimum weight for the balance (if established).
Frequency of use	Time-of-use, daily, or other periodic check.	A justified fixed interval needs to be used.
Measurement result	Statistical process control, ~~and~~ control charts with limits based on measured performance, and log books	Justified action limit (e.g., no more than 0.1% deviation from check weight) based on control charts with the failure limit based on balance application.

In-Process Revision

Minimum Weight

In addition, *Weights and Balances* ⟨41⟩ gives specific requirements for balances used in pharmacopeial procedures with a reportable value expressed in at least three significant figures[2] (see §7.1 *Interpretation of Requirements* under §7 *Test Results* in the *General Notices*), when substances are to be ''accurately weighed''. The information used for repeatability requirements in ⟨41⟩ may also be used to calculate a minimum weight from the formula:

$$(k / U_{rel})s$$

in which k is the coverage factor ($\geq$2); U_{rel} represents the required maximum relative uncertainty ~~factor of~~ 0.001; and s is the standard deviation~~, in mg,~~ (in a mass unit e.g., in mg), of not less than 10 replicate measurements of a mass ~~near the low end of the operating range~~ of a few percent of the capacity of the balance or less. The relative uncertainty ~~factor~~ of 0.001 is for a reportable value expressed in at least three significant figures. ~~and corresponding uncertainty factors~~ Corresponding relative uncertainties of 0.01 and 0.1 could be used for reportable values with two and one significant figures; respectively. An example of minimum weights are shown in the *Table 3*.

An amount of sample (i.e., net weight), equal to or larger than the minimum weight, satisfies the required weighing uncertainty. The minimum weight applies to the sample weight, not to the tare or gross weight.

~~**Table 3.**~~

~~Reportable limit (number of significant figures)~~	~~s = 0.002~~	~~s = 0.02~~	~~s = 0.2~~
~~3~~	~~4~~	~~40~~	~~400~~
~~2~~	~~0.4~~	~~4~~	~~40~~
~~1~~	~~0.04~~	~~0.4~~	~~4~~

Table 3.

Reportable Limit (number of significant figures	Relative Uncertainty	Relative Uncertainty (%)	Standard Deviation (mg) s = 0.002	s = 0.02	s = 0.2
			Minimum Sample Weight (mg)		
3	0.001	0.1%	4	40	400
2	0.01	1%	0.4	4	40
1	0.1	10%	0.04	0.4	4

[2] Zeros within a number are always significant. Zeros that do nothing but set the decimal point are not significant. Trailing zeros that aren't needed to hold the decimal point are significant.
Examples of where this requirement would apply are (1) procedures with specification limits: 90.0% to 110.0%, 98.0% to 102.0%; (2) procedures where the result is reported in mg: mg limits for 5-mg tablet where the specification is 90.0% to 110.0% are 4.50 mg to 5.50 mg; (3) limits expressed with three significant figures: not more than 1.50%, not more than 0.00100%.
Examples of where this requirement would not necessarily apply are procedures with specification limits: 90% to 110%; and limits expressed with less than three significant figures: not more than 1.5%, not more than 0.0010%, not more than 150 ppm.

OPERATION OF THE ANALYTICAL BALANCE

Select the appropriate balance for the quantity and accuracy needed. *Weights and Balances* ⟨41⟩ provides requirements when the reportable value from a Pharmacopeial analysis is expressed on at least three significant figures.

The balance user should check the balance environment (vibration, air currents, cleanliness) and status of calibration.

Receivers

To ensure suitable accuracy in measuring the weight of a specimen, consideration should be given to selecting a proper receiver for the material.

GENERAL CHARACTERISTIC

All receivers must be clean, dry, and inert. The total weight of the receiver plus the specimen must not exceed the weight capacity of the balance. With a properly maintained and adjusted laboratory balance, weighing uncertainty is essentially determined by the repeatability for ''small samples'', i.e., net weights with a mass not exceeding typically a few percent of the capacity of the balance. However, repeatability is dependent on the gross load, and even more on the size and surface area of the weighed object; for that reason large or heavy receivers introduce a deviation from the conditions where the repeatability was determined (see *Weights and Balances* ⟨41⟩). Therefore, receivers of a low mass and small surface are the most desirable, especially in cases where specimens of low weight are being measured. Receivers should be constructed from nonmagnetic materials in order to prevent magnetic interference of electronic balance components. Receivers should be at ambient temperature in order to prevent the formation of air currents within the balance cell.

SOLID SAMPLES

Receivers for weighing solid materials include weighing paper, weighing dishes, weighing funnels, or enclosed vessels, including bottles, vials, and flasks. Papers that are hygroscopic in nature are not recommended for weighing because they may have a detrimental effect on the observed results.

Weighing dishes are typically constructed from a polymer or from aluminum. Specialty ''anti-static'' weighing dishes are available for measuring the weights of materials that retain static electricity.

Weighing funnels are typically constructed from glass or from a polymer. The design of this type of receiver combines attributes of a weighing dish and a transfer funnel, which can simplify the analytical transfer of a weighed powder to a narrow-necked vessel, such as a volumetric flask.

For solid samples that are volatile or deliquescent, it is necessary to weigh the material into an enclosed vessel. Where practical, an enclosed vessel with a small opening should be used in order to reduce sample weight loss from volatilization or weight gain from the adsorption and absorption of water from the atmosphere.

LIQUID SAMPLES

Receivers for liquid samples will typically be inert, enclosed vessels. For liquid samples that are volatile or deliquescent, an enclosed vessel with a small opening should be used, and the enclosure should be replaced rapidly following the transfer of material. Special precautions should be taken to be certain that the receiver and the enclosure are constructed from a material that is compatible with the liquid sample. The receiver and enclosure must have a seal sufficient to prevent leaks from a liquid that is of low viscosity or has low surface tension or a low boiling point.

Types of Weighing

QUANTITATIVE ANALYSIS

The initial step for many quantitative analyses is to accurately weigh a specified amount of a sample. Errors introduced during the weighing of a sample will affect the accuracy of all subsequent analytical measurements.

ADDITION WEIGHING

Addition weighings are typically used for the weighing of solid samples. The receiver is placed on the balance. After the balance display stabilizes, tare the balance. Add the desired amount of material to the receiver, and allow the balance display to stabilize. Record the weight, and quantitatively transfer the material to an appropriate vessel.

DISPENSE WEIGHING

Dispense weights are typically used for the weighing of emulsions or viscous liquids such as a topical ointment. In these situations, it is not practical to weigh the material into a typical receiver. Tare the balance. Fill a small transfer pipet or a syringe with an amount of sample greater than the desired specimen weight. Wipe the outside of the pipet or syringe clean and place on the balance. After the balance display stabilizes, record the weight. Transfer the desired amount of sample to an appropriate receiving vessel, such as a volumetric flask. Place the pipet or syringe back onto the balance. The difference in the two weighings is equal to the weight of the transferred specimen.

Alternatively, the sample can be weighed directly into a tared vessel such as a volumetric flask, provided that the weight of the vessel is sufficiently small to allow an accurate tare and that the total weight of the vessel and the sample specimen do not exceed the accurate range of the balance.

Problem Samples

ELECTRICALLY CHARGED SAMPLESAND RECEIVERS

Dry, finely divided powders may be charged with static electricity. The static charge will make the powder either attracted to or repelled by the receiver or the balance. This can cause inaccurate weight measurements and specimen loss during transfer. A ~~rapid change~~ drift in the balance readings should alert the operator to the possibility that the material has a static charge. Commercially available balances with a built-in anti-static device can be used to remedy the problem. Such devices may use piezoelectric components or a very small amount of a radioactive element (typically polonium) to generate a stream of ions that dissipate the static charge when passed over the powder to be weighed. Anti-static weigh boats, anti-static guns, and anti-static screens are also commercially available. The static charge depends also on the relative humidity of the laboratory, which in turn depends on atmospheric conditions. In certain conditions, static charge is caused by the type of clothing worn by the operator; this charge causes large errors in the weighing. ~~Plastic containers will have a greater tendency~~ Borosilicate glassware and plastic receivers are notorious for picking up a static charge, especially at low relative humidity. The gloves used to protect the operator may also increase the potential for a static charge problem. Placing the ~~plastic~~ container in a metal holder may help to ~~dissipate~~shield the static charge; special anti-static gloves also may help to alleviate the problem.

VOLATILE SAMPLES

When weighing a liquid that has a low boiling point, the specimen must be received in a vessel with a gas-tight enclosure of small diameter. Tare the vessel and enclosure. Add the desired amount of sample, and replace the enclosure. After the balance display stabilizes, record the specimen weight.

WARM OR COOL SAMPLES

Samples that are warm or cool should be equilibrated in the laboratory, or the weight readings may be erroneous. With regard to warm samples, the apparent weight will be ~~higher~~ smaller than the true weight because of heat convection. For example, a flask warmer than its ambient air warms up this air, which then flows upwards along the flask and reduces its apparent weight by viscous friction.

HYGROSCOPIC SAMPLES

Hygroscopic materials readily absorb moisture from the atmosphere and will steadily gain weight if left exposed. Therefore, hygroscopic samples must be either weighed promptly or placed in a vessel with a gas-tight enclosure. For a gas-tight vessel, tare the vessel and enclosure. Add the desired amount of sample and replace the enclosure. After the balance display stabilizes, record the specimen weight.

ASEPTIC OR BIOHAZARDOUS SAMPLES

The weighing of sterile or biohazardous samples will take place within the confines of a ~~laminar flow hood~~ clean bench, biosafety cabinet, isolator or similar containment ~~cabinet.~~ device. The flow of air within the hood will potentially cause balance instability. It is recommended that, upon installation of the balance in the hood, a rigorous qualification study be performed with suitable weight artifacts (see *Weights and Balances* ⟨41⟩) in order to determine the acceptability of the balance performance in this environment.

WEIGHING CORROSIVE MATERIALS

Many chemicals, such as salts, are corrosive, and materials of this nature should not be spilled on the balance pan or inside the balance housing. Extreme care is essential when materials of this nature are being weighed. The use of sealed containers such as weighing bottles or syringes should be considered. In the event of a spill, requalification of balance may be necessary, depending on the nature of the spill.

SAFETY CONSIDERATIONS WHEN WEIGHING

During a weighing, the operator may be exposed to high concentrations of the pure substance. The operator must carefully consider this possibility at all times and should be familiar with the precautions described in the Material Safety Data Sheet for a substance before weighing it. Hazardous materials should be handled in an enclosure having appropriate air filtration. Many extremely toxic—and possibly allergenic—substances present as liquids or finely divided particles. When weighing these substances, a mask that covers the nose and mouth should be used to prevent any inhalation of the substance, and gloves should be used to prevent any contact with the skin. [NOTE—The use of gloves is good practice for handling any chemical. If it is necessary to handle the container being weighed, the operator should put on gloves, not only for self-protection but also to prevent moisture and oils from being deposited on the weighed container.]

BUOYANCY CORRECTION

Buoyancy corrections are not generally needed for typical pharmaceutical applications; however, this information is provided as a guide to users that may have a need to apply abuoyancy correction to their weighing operation. In general, buoyancy corrections are applied to mass measurements by calculating the difference in volume between the material being weighed and the weight standard, multiplying the volume difference by the density of air (which is dependent on temperature, relative humidity, and atmospheric pressure) at the balance or scale, and adding the product to the mass of the standard. The correction also depends on the type of balance and method of calibration.[3]

For powders, the buoyancy correction strictly applies only to the true density (gas pycnometer) and not the bulk density. The true density of most organic solids is greater than 1 g/cm^3. Many balances have a program to correct for buoyancy that uses a value for sample density provided by the user. The manufacturer's instructions should be consulted for the proper way to correct for buoyancy. For single-pan electronic balances, the error is generally $\leq$0.1% for densities $\geq$1 g/cm^3. Buoyancy corrections are crucial only when the weighing error must be minimized or when the densities of the weighed materials are low. Examples of buoyancy errors for a single-pan electronic balance are shown in the accompanying table.

Table 4

Density (g/cm^3)	Error (%)
2	0.05
0.8	0.1
0.5	0.2
0.4	0.3
0.2	0.6
0.1	1

REAGENTS, INDICATORS, AND SOLUTIONS

Reagent Specifications

BRIEFING

Heptyl *p*-Hydroxybenzoate. It is proposed to add this new reagent used as an internal standard in the monographs for *Tacrolimus* and *Tacrolimus Capsules*, which appear elsewhere in this issue.

(HDQ: M. Marques) RTS—C70856

Add the following:

▪**Heptyl *p*-Hydroxybenzoate** *(Heptyl 4-Hydroxybenzoate; n-Heptyl 4-Hydroxybenzoate; Benzoic Acid, 4-Hydroxy-, Heptyl Ester),* $C_{14}H_{20}O_3$—**236.31** [*1085-12-7*]—Use a suitable grade with a content of NLT 98%.▪1S *(USP33)*

BRIEFING

Pectate Lyase. It is proposed to add this new reagent used in the *Identification* test in the monograph for *Pectin*.

(HDQ: M. Marques) RTS—C72151

Add the following:

▪**Pectate Lyase** [*9015-75-2*]—An enzyme obtained from *Aspergillus sp*. Light brown, viscous liquid. Specific gravity is about 1.5. It is readily soluble in water. It is supplied at approximately 14 units per mL (at pH 8.0 in Tris-HCl buffer [50 mM of Tris(hydroxymethyl)aminomethane containing 1 mM of $CaCl_2$, pH 8.0] in a solution of 50% glycerol and 0.02% sodium azide. One unit is defined as the enzyme activity that produces 1 μmol of unsaturated product per minute.

Activity

Pectin solution—Transfer a quantity of Pectin [NOTE—Pectin has a molecular weight of 103,000 Da; its degree of esterification (percentage of galacturonic acid groups substituted with methyl) is 12.], equivalent to 0.05 g on the dried basis, to a 100-mL volumetric flask. Moisten with 0.1 mL of 2-propanol. Add 50 mL of water to the flask, and mix the solution with a magnetic stirrer. Use 0.5 N sodium hydroxide to adjust the solution to a pH of 12. Stop the stirrer, and allow the solution to stand undisturbed at room temperature for 15 minutes. Adjust the solution with 0.5 N hydrochloric acid to a pH of 8.0. Dilute with water to volume.

Tris buffer solution—Transfer 6.055 g of Tris(hydroxymethyl)aminomethane and 0.147 g of calcium chloride ($CaCl_2 \cdot H_2O$) to a 1000-mL volumetric flask containing 950 mL of water, and mix. Adjust the solution with 1 N hydrochloric acid to a pH of 8.0. Dilute with water to volume.

Diluted pectate lyase—Transfer 0.5 mL of Pectate Lyase to a 50-mL volumetric flask, dilute with *Tris buffer solution* to volume, and mix.

Procedure—Add the solutions set forth in the table below to quartz cuvettes. Perform the test on the solutions so obtained, using a suitable ultraviolet/visible spectrophotometer (see *Spectrophotometry and Light-Scattering* ⟨851⟩) and using water as the blank. Mix the solutions well at time 0, and immediately measure the absorbances at 235 nm. Record the value for the *Enzyme blank*, A_{0-EB}; for the *Test blank*, A_{0-TB}; and for the *Test solution*, A_{0-TS}. After incubation at room temperature for 30 minutes, determine the absorbance again at 235 nm for the *Enzyme blank*, A_{30-EB}; for the *Test blank*, A_{30-TB}; and for the *Test solution*, A_{30-TS}. One unit is defined as the enzymatic activity that produces 1 μmol of unsaturated

Label	*Tris buffer solution* (mL)	*Pectin solution* (mL)	*Diluted pectate lyase* (mL)	Water (mL)
Enzyme blank	0.5	1.0	0	1.0
Test blank	0.5	0	0.5	1.5
Test solution	0.5	1.0	0.5	0.5

product from pectin per minute. Calculate the Pectate Lyase activity, in units per mL, using the following formula:

$$50(10^3)[(A_{30-TS} - A_{30-EB} - A_{30-TB}) - (A_{0-TS} - A_{0-EB} - A_{0-TB})]/30\epsilon_{235}L$$

in which 50 is the volume, in mL, of *Diluted pectate lyase*; 10^3 is the unit conversion factor; 30 is the time, in minutes, of the reaction; ϵ_{235} is the molar extinction coefficient, in M^{-1} cm^{-1}, of the reaction product (4600 M^{-1} cm^{-1}); and L is the path length, in cm, of the reaction cuvette (1 cm). Alternatively, these solutions, after being mixed in the cuvettes, can be immediately measured at 235 nm continuously in a recording UV-Vis spectrophotometer set up for kinetic assays. The result is obtained by correcting the blank determination, using the *Enzyme blank* and the *Test blank*.■1S (*USP33*)

BRIEFING

Sodium Acetate, *USP 31*, page 796. It is proposed to correct the CAS number of this reagent.

Add the following:

▪**Epirubicin Hydrochloride:** Orange-red powder. Soluble in water and in methanol; slightly soluble in anhydrous ethanol; practically insoluble in acetone.▪1S (*USP33*)

Add the following:

▪**Ethylene Glycol and Vinyl Alcohol Graft Copolymer:** White or slightly yellowish powder. Very soluble in water; practically insoluble in anhydrous alcohol, and in acetone. It dissolves in dilute acids and dilute solutions of alkali hydroxides. *NF category:* Coating agent; tablet binder.▪1S (*NF28*)

Add the following:

▪**Salmeterol Xinafoate:** White to off-white powder. Soluble in methanol; slightly soluble in alcohol, in isopropanol, and in chloroform; practically insoluble in water (pH 8), and in saline solution (0.9% w/w).▪1S (*USP33*)

Add the following:

▪**Sucrose Palmitate:** White or almost white, unctuous powder. Sparingly soluble in ethanol (96%); very slightly soluble in water. *NF category:* Suspending and/or viscosity-increasing agent.▪1S (*NF28*)

Add the following:

▪**Sucrose Stearate:** White or almost white, unctuous powder. Sparingly soluble in ethanol (96%); very slightly soluble in water. *NF category:* Tablet and/or capsule lubricant; emulsifying and/or solubilizing agent.▪1S (*NF28*)

Add the following:

▪**Tacrolimus:** White crystals or white crystalline powder. Very soluble in methanol; freely soluble in *N*,*N*-dimethylformamide, and in alcohol; practically insoluble in water.▪1S (*USP33*)

Add the following:

▪**Tranylcypromine Sulfate:** White or almost white crystalline powder. Freely soluble in water; very slightly soluble in alcohol and in ether; practically insoluble in chloroform.▪1S (*USP33*)

Change to read:

Tromethamine: White, crystalline powder, having a slight, characteristic odor. Freely soluble in water. ~~and in low molecular weight aliphatic alcohols; practically insoluble in chloroform, in benzene, and in carbon tetrachloride.~~

▪▪1S (*USP33*)

In-Process Revision

Pending Proposals

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *Pharmacopeial Forum (PF)* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in the *USP–NF,* its *Supplements,* or an *IRA.* Those items that have not yet been adopted are marked as *Pending Proposals.*

The *Pending Proposals* list contains these items separated into the following categories: General Notices and Requirements; *USP* monographs; Dietary Supplements Monographs; General Chapters; Reagents; Indicators; and Solutions; Reference Tables; Excipients; and *NF* Monographs. Each entry in the *Pending Proposals* list contains the monograph title and the citation of the most recent publication of the monograph. Reprints of *PF* proposals may be purchased from USP by sending a written request for information to custsvc@usp.org.

To check the status of a *Pending Proposal,* please contact USP as directed below.

- The briefing accompanying the monograph or general chapter lists the names of the Scientific Liaisons responsible for the proposed revisions. The contact information (phone number and email) for the Scientific Liaison is available in the *Staff Directory* section of *How to Use PF.* For *USP–NF Online* subscribers, the name and contact information for the assigned Scientific Liaison is available in the *Auxiliary Information* portion of each monograph.
- Call USP at 301-816-8344 and ask to speak with the Scientific Liaison assigned to the monograph or general chapter of interest.
- Submit questions by email to stdsmonographs@usp.org. Please indicate the name of the monograph or general chapter in the subject line of the email.

Following these lists the reader will find the *Canceled Proposals* list. These are items that were published in *PF* and were pending, but have since been canceled. This list contains cumulative entries for the six issues per volume of *PF* [i.e., 35(1) through 35(6)]. Note that canceled proposals may be republished in *PF* to be considered for future adoption into the *USP–NF.*

Acetylcysteine—*USP Reference standards, Assay*	31	3	726
Albendazole—*Assay*	34	1	69
Albumin Human—*Definition, Packaging and storage, Expiration date, Labeling, USP Reference standards* (add), *Identification A, B* (add), *Bacterial endotoxins* (add), *Safety* (add), *Sterility* (add), *pH* (add), *Molecular size distribution* (add), *Heat stability* (add), *Incubation* (add) *Prekallikrein activator* (add), *Protein content* (add), *Heme content* (add), *Potassium content* (add), *Sodium content* (add)	31	5	1338
Albuterol Sulfate—*USP Reference standards, Assay*	34	2	242
Albuterol Tablets—*Assay*	31	3	726
Alendronate Sodium Tablets—*Dissolution*	35	1	59
Alfuzosin Hydrochloride (new)	34	1	69
Allopurinol—*Related compounds, Limit of hydrazine* (add)	34	1	70
Alprazolam Tablets—*Assay*	33	1	41
Alumina, Magnesia, and Calcium Carbonate Chewable Tablets (new)	29	6	1836
Aluminum Acetate Topical Solution—*Identification*	34	2	242
Aluminum Subacetate Topical Solution—*Identification*	34	2	242
Amantadine Hydrochloride Capsules—*Labeling* (add), *Dissolution*	35	1	61
Amifostine—*X-ray diffraction* (delete)	34	5	1136
Aminophylline—*CAS number*	34	1	72
Amiodarone Hydrochloride (new)	34	6	1429
Amlodipine Besylate—*Chemical information, Definition, Labeling* (add), *Water*	34	5	1136
Amlodipine Besylate Tablets (new)	35	1	62
Amodiaquine Hydrochloride—*USP Reference standards, Identification, Chromatographic purity, Assay*	34	2	243

Pending Proposals (*continued*)

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Arginine Tablets (new)	33	6	1161
Aspirin—*Readily carbonizable substances*	34	5	1143
Atenolol Tablets—*Dissolution*	35	1	66
Atorvastatin Calcium (new)	35	1	66
Atovaquone—*Assay*	34	2	247
Atovaquone Oral Suspension—*Assay*	34	2	247
Atracurium Besylate Injection—*Related compounds*	34	4	905
Aurothioglucose Injectable Suspension—*Bacterial endotoxins* (add), *Sterility* (add)	34	4	906
Azithromycin—*USP Reference standards, Limit of related substances* (delete), *Related compounds* (add)	34	3	559
Azithromycin for Injection (new)	34	3	562
Azithromycin Tablets (new)	34	5	1143
Aztreonam for Injection—*Assay*	34	4	906
Benzocaine—*Readily carbonizable substances*	34	5	1147
Benzoic Acid—*Readily carbonizable substances*	34	5	1147
Benzoin—*Botanic characteristics, Identification*	35	1	70
Betamethasone Oral Solution—*Packaging and storage, Thin-layer chromatographic identification test* (delete), *Identification A, B* (add), *Microbial limits* (add), *pH* (add), *Deliverable volume* (add), *Related compounds* (add), *Assay*	34	3	567
Bicalutamide Tablets (new)	34	5	1147
Bisoctrizole (new)	32	2	309
Bisoprolol Fumarate Tablets—*Dissolution*	34	3	570
Bleomycin for Injection—*Identification A, B* (add), *Other requirements*	34	5	1150
Budesonide—*Related compounds*	34	4	907
Bupivacaine Hydrochloride—*CAS number*	34	1	75
Bupropion Hydrochloride Extended-Release Tablets—*Dissolution, Related compounds*	35	1	70
Buspirone Hydrochloride—*Content of chloride*	31	3	742
Cabergoline (new)	34	1	75
Cabergoline Tablets (new)	34	3	572
Caffeine—*Identification B, Melting range* (delete), *Readily carbonizable substances* (delete), *Other alkaloids* (delete)	34	5	1150
Camphor—*Water*	31	3	742
Capecitabine Tablets—*Dissolution*	35	1	72
Carbidopa—*Specific rotation*	35	1	73
Carbidopa and Levodopa Extended-Release Tablets (new)	34	6	1433
Cefaclor Capsules—*Identification, Related compounds, Assay*	34	2	248
Cefazolin Sodium—*Chemical information, Related compounds* (add)	34	6	1438
Cefdinir (new)	33	6	1162
Cefdinir for Oral Suspension (new)	34	1	81
Cefixime for Oral Suspension—*Water* (delete)	34	6	1441
Ceftazidime Injection—*USP Reference standards, Pyrogen* (delete), *Bacterial endotoxins* (add)	34	4	907
Ceftiofur Hydrochloride (new)	34	4	908
Ceftiofur Sodium (new)	34	4	912
Chloral Hydrate—*Readily carbonizable substances*	34	5	1150
Chlorhexidine Acetate (new)	34	3	582
Chlorhexidine Gluconate Oral Rinse—*Labeling, USP Reference standards*	34	2	250
Chlorhexidine Gluconate Solution—*USP Reference standards, Limit of p-chloroaniline, Assay*	34	2	250
Chlorhexidine Hydrochloride (new)	34	3	585
Chloroquine—*Assay*	34	1	86

Chloroquine Phosphate—*USP Reference standards, Identification, Assay*	34	2	251
Chloroquine Phosphate Tablets—*USP Reference standards, Identification, Assay*	34	3	587
Cilostazol—*Loss on drying*	34	3	589
Cisapride (new)	34	2	253
Citalopram Hydrobromide—*Identification, Related compounds*	34	4	917
Anhydrous Citric Acid *(Harmonization)*—*Sulfate*	31	3	749
Anhydrous Citric Acid—*Readily carbonizable substances*	34	5	1150
Citric Acid Monohydrate *(Harmonization)*—*Sulfate*	31	3	750
Citric Acid Monohydrate—*Readily carbonizable substances*	34	5	1151
Citric Acid, Magnesium Oxide, and Sodium Carbonate Irrigation—*USP Reference standards, Assay for citric acid (delayed implementation to January 1, 2009)*	31	2	394
Cladribine—*Specific rotation, Related compounds*	33	1	49
Clarithromycin Tablets—*Dissolution*	35	1	73
Clavulanate Potassium—*Limit of aliphatic amines, Limit of 2-ethylhexanoic acid*	34	6	1441
Climbazole (new)	33	5	891
Clindamycin Palmitate Hydrochloride—*Chemical information, Assay*	34	6	1442
Clonazepam Orally Disintegrating Tablets (new)	34	2	254
Clopidogrel Tablets—*Related compounds*	33	1	50
Cloprostenol Injection (new)	34	4	918
Cloprostenol Sodium (new)	34	4	920
Clozapine Tablets—*Uniformity of dosage units* (add)	34	3	589
Cocaine—*Readily carbonizable substances*	34	5	1151
Cocaine Hydrochloride—*Readily carbonizable substances*	34	5	1151
Codeine—*Readily carbonizable substances*	34	5	1151
Codeine Sulfate—*Readily carbonizable substances*	34	5	1151
Dalteparin Sodium (new)	30	5	1598
Dantrolene Sodium Capsules—*Packaging and storage*	34	5	1151
Dapsone—*Assay*	31	3	750
Desmopressin Nasal Spray Solution (new)	31	4	1059
Dextroamphetamine Sulfate—*Definition, USP Reference standards, Identification, Chromatographic purity* (delete), *Related compounds* (add), *Organic volatile impurities* (delete), *Assay*	34	4	921
Dextrose—*Harmonization*	34	6	1585
Diazepam Extended-Release Capsules—*USP Reference standards, Assay*	32	2	330
Diclazuril (new)	35	1	73
Diclofenac Potassium—*Identification*	34	1	87
Diclofenac Sodium Delayed-Release Tablets—*Identification*	31	3	751
Dicyclomine Hydrochloride—*Readily carbonizable substances*	34	5	1152
Didanosine—*USP Reference standards, Related compounds*	34	1	87
Didanosine for Oral Solution—*Assay*	34	6	1443
Dihydroxyaluminum Sodium Carbonate Chewable Tablets (new)	29	6	1873
Diethylstilbestrol Diphosphate (delete entire monograph)	33	6	1165
Diethylstilbestrol Diphosphate Injection (delete entire monograph)	33	6	1167
Dimethyl Sulfoxide—*Definition*, *Congealing temperature* (delete), *Substances darkened by potassium hydroxide* (delete), *Limit of dimethyl sulfone* (delete), *Limit of nonvolatile residue, Related compounds* (add), *Assay* (add)	34	1	88
Dipivefrin Hydrochloride—*Assay*	34	1	89
Disopyramide Phosphate—*Assay*	34	1	90
Dopamine Hydrochloride—*Readily carbonizable substances*	34	5	1152
Doxazosin Mesylate—*Assay*	34	5	1152
Doxycycline Hyclate Delayed-Release Tablets (new)	34	3	589
Dronabinol—*Packaging and storage, Related compounds, Assay*	34	1	90
Dyclonine Hydrochloride—*Chemical information*	33	6	1167
Ecamsule Solution (new)	34	5	1153
Egg Phospholipids (new)	31	3	757
Enalaprilat Injection (new)	34	3	593
Endotoxin Indicator for Depyrogenation (new)	34	6	1444
Enrofloxacin (new)	34	4	924
Epinephrine—*Assay*	34	1	91
Erythromycin Pledgets—*Identification* (add), *Other requirements*	34	5	1157
Sterile Erythromycin Ethylsuccinate—*Identification* (add), *Other requirements*	34	5	1158

Potassium Citrate Extended-Release Tablets—*USP Reference standards* (add), *Assay (delayed implementation to January 1, 2009)*	31	2	443
Potassium Citrate and Citric Acid Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	444
Potassium Iodide Delayed-Release Tablets—*Identification* (add), *Other requirements*	34	6	1481
Potassium Iodide Oral Solution—*Definition*	31	3	786
Potassium Sodium Tartrate—*Limit of ammonia*	31	3	787
Pralidoxime Chloride for Injection—*Identification A, B, C* (add), *Other requirements*	34	5	1180
Pravastatin Sodium—*Chromatographic purity, Assay*	34	2	294
Pravastatin Sodium Tablets—*USP Reference standards, Related compounds*	34	5	1180
Prednisolone Sodium Phosphate—*Definition*, *Free prednisolone* (delete) *Related compounds* (add), *Assay*	34	1	108
Proguanil Hydrochloride (new)	34	2	296
Propafenone Hydrochloride—*USP Reference standards, Chromatographic purity* (delete), *Related compounds* (add)	35	1	94
Propofol Injectable Emulsion (new)	33	6	1208
Propoxycaine and Procaine Hydrochloride and Norepinephrine Bitartrate Injection—*Assay for norepinephrine*	34	1	110
Pseudoephedrine Hydrochloride—*Definition, USP Reference standards, Ordinary impurities* (delete), *Chromatographic purity* (add), *Assay*	34	2	298
Pyrantel Pamoate—*USP Reference standards, Related compounds*	34	6	1482
Quinapril Tablets—*Related compounds*	34	5	1182
Ramipril—*Definition, Assay*	31	3	787
Ranitidine Hydrochloride—*Chromatograpic purity, Assay*	34	2	299
Oral Rehydration Salts—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	5	1399
Risedronate Sodium (new)	34	5	1183
Risedronate Sodium Tablets (new)	34	5	1186
Ritonavir—*Identification*	35	1	95
Rocuronium Bromide (new)	34	3	648
Salsalate Tablets—*Assay*	33	6	1211
Secobarbital Sodium—*Chemical structure, Definition, Identification, Related compounds* (add), *Isomer content* (delete), *Assay*	34	4	984
Sertraline Hydrochloride (new)	34	5	1189
Sibutramine Hydrochloride (new)	34	4	986
Simethicone Emulsion—*Assay*	34	3	652

Pending Proposals (*continued*)

(Items from earlier numbers of *PF* that have not yet been adopted and become official)

Simethicone Tablets—*Disintegration*	34	3	652
Sodium Bromide Injection, Veterinary (new)	33	5	949
Sodium Bromide Oral Solution, Veterinary (new)	33	5	950
Sodium Chloride—*Identification, Loss on drying, Limit of potassium (postponed indefinitely)*	32	2	264
Sodium Fluoride—*Assay*	34	3	653
Sodium Sulfate—*Assay*	34	5	1192
Soybean Oil—*CAS number* (add), *Labeling, Identification* (add), *Specific gravity* (delete), *Refractive index* (delete), *Heavy metals, Free fatty acids* (delete), *Acid value* (add), *Fatty acid composition, Iodine value* (delete), *Saponification value* (delete), *Cottonseed oil* (delete), *Peroxide value, Water* (add), *Alkaline impurities* (add), *Sterol composition* (add), *Other requirements* (add)	34	4	989
Spectinomycin for Injectable Suspension—*Identification* (add), *Other requirements*	34	5	1193
Stavudine—*Specific rotation*	34	3	653
Streptomycin Injection—*Identification* (add), *Other requirements*	34	5	1193
Sucralfate—*Identification*	33	2	254
Sulfadoxine—*Identification, Assay*	34	2	300
Sulfadoxine and Pyrimethamine Tablets—*Assay*	34	2	301
Sulfamethazine Granulated—*Assay*	31	3	797
Sulfasalazine—*Identification*	34	3	653
Sulfazalazine Tablets—*Identification*	34	3	653
Sulfinpyrazone—*Solubility in acetone* (delete), *Solubility in 0.50 N sodium hydroxide* (delete)	34	6	1483
Tamsulosin Hydrochloride (new)	33	6	1211
Tamsulosin Hydrochloride Capsules (new)	34	5	1193
Tazobactam—*Identification, Specific rotation, Related compounds, Organic volatile impurities* (delete), *Assay*	34	2	302
Terbinafine Hydrochloride—*Melting range*	34	5	1197
Terbinafine Oral Suspension (new)	35	1	96
Terbutaline Oral Suspension (new)	35	1	97
Terbutaline Sulfate Inhalation Aerosol—*USP Reference standards, Assay*	31	2	450
Terconazole (new)	34	4	991
Thiabendazole Chewable Tablets (new)	29	6	1991
Thimerosal—*Readily carbonizable substances*	34	5	1197
Thioguanine—*USP Reference standards, Identification, Limit of guanine*	34	2	305
Thioridazine Hydrochloride—*Identification*	31	3	798
Tiagabine Hydrochloride—*Chromatographic purity*	34	2	306
Tiagabine Hydrochloride Oral Suspension (new)	35	1	98
Tilmicosin—*Definition, Related compounds, Assay*	31	3	798
Tobramycin Inhalation Solution—*Identification* (add), *Osmolarity, Chromatographic purity, Other requirements* (delete), *Assay*	34	2	307
Topiramate Tablets (new)	34	5	1197
Torsemide—*Water*	33	6	1213
Tramadol Hydrochloride (new)	34	5	1200
Tramadol Hydrochloride Tablets (new)	31	2	462
Tranexamic Acid (new)	34	6	1484
Trandolapril (new)	34	2	310
Travoprost (new)	32	4	1115
Travoprost Ophthalmic Solution (new)	32	4	1118
Trenbolone Acetate—*Definition, USP Reference standards, Identification, Chromatographic purity* (delete), *Limit of trenbolone acetate 17α-isomer* (delete), *Related compounds* (add), *Assay*	35	1	100
Tretinoin Gel—*Identification, Assay*	34	6	1485
Triamcinolone Acetonide—*USP Reference standards, Assay*	31	3	800
Triamterine Capsules—*USP Reference standards, Related compounds* (add), *Assay*	34	3	654
Tricitrates Oral Solution—*USP Reference standards* (add), *Assay for citrate (delayed implementation to January 1, 2009)*	31	2	465
Tryptophan—*Chromatographic purity* (add), *Limit of tryptophan related compound A* (add)	33	6	1214
Tylosin Injection (new)	34	5	1205
Ursodiol Capsules—*Dissolution*	31	3	800
Valganciclovir Tablets (new)	33	1	89

HARMONIZATION

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization is composed of several steps **(*Stages*)**.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of Expert Committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues.

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* section. Readers interested in submitting comments should see *Instructions to Authors.*

INSTRUCTIONS TO AUTHORS

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously in any language or medium and that they are not simultaneously under consideration by any other publication.

All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication they will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention (USPC) and may not be subsequently published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

Style and Usage—*Stimuli* articles generally follow the current *Chicago Manual of Style* except in scientific usage (numbers, abbreviations, etc.). For the latter, authors should use the current *AMA Manual of Style* or the current *ACS Style Guide*. Authors may usefully consult a current copy of *Pharmacopeial Forum*.

References—Consult the current *AMA Manual of Style*, which is generally consistent with the National Library of Medicine's *Recommended Formats for Bibliographic Citation*. A current copy of *Pharmacopeial Forum* will offer examples of reference formats.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Contact Person—USP will designate a Scientific Liaison in the Documentary Standards Division as the corresponding author. This ensures that USP receives all comments generated by the *Stimuli* article. Authors should contact the Scientific Liaison if they would like to receive copies of comments generated by their *Stimuli* articles.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

A Discussion of Net Water Gain for Water Vapor Transmission Rate Determinations

S. Yoon, *Eli Lilly and Company*, D. Sparks, *Eli Lilly and Company*, S. Selke, *Michigan State University*[a]

ABSTRACT This *Stimuli* article discusses the USP General Chapter *Containers—Permeation* ⟨671⟩ method to determine net water gain. This article introduces a proposal to change the procedure based on an analysis of the steady-state conditions of the plastic walls of containers. The analysis discussed in this paper shows that the plastic walls of *controls* have a higher water concentration than do the plastic walls of *test containers* and that the current Water Vapor Transmission Rate calculation in *USP* ⟨671⟩ is not theoretically correct. Although this proposal does not have an important impact on test results, this method change advances the scientific basis by providing more accurate test results.

INTRODUCTION

USP General Chapter *Containers—Permeation* ⟨671⟩ (*1*) provides a method to determine the net water gain of anhydrous calcium chloride or other desiccant in a plastic bottle container–closure system. The net water gain is used to calculate water vapor transmission rate (WVTR) of the sealed container–closure system. The current method employs test container–closure systems filled with desiccant (*test containers*) and container–closure systems filled with glass beads (*controls*). The net water gain is determined by subtracting the weight gain of *controls* from the weight gain of *test containers*. This is then used as the weight gain of desiccant only. This method is based on two assumptions: 1) the glass beads do not absorb water, and 2) the *test container* walls and *control* walls absorb the same amount of water.

However, the net water gain calculated in this manner is not theoretically correct because the water content of the plastic walls of the *controls* is not the same as the water content of the plastic walls of *test containers*. Theoretically, the plastic walls of *controls* achieve a higher water concentration than do the plastic walls of *test containers* at the steady-state conditions of the test. Therefore, the subtraction of a higher water concentration in *controls* from the lower concentration in *test containers* results in a net water gain that is lower than the actual net water gain. Further, this would result in a WVTR that is lower than the actual WVTR.

Plastic (e.g., polyethylene and polypropylene) container walls reach a steady state of water concentration. The steady-state condition is a gradient that depends on the storage conditions and the conditions of the headspace in the container. This gradient is maintained as constant during testing if the conditions of storage and the container headspace are constant. This *Stimuli* article proposes an alternative approach for determining net water gain and calculating WVTR of plastic container–closure systems (bottles and blisters).

DISCUSSION

1. Water Vapor Transmission into Plastic Container Walls

Theory—Water vapor from a high vapor pressure environment permeates plastic container walls of a sealed container that has a low water vapor pressure internal environment. This is described by Equation (1), Fick's Second Law of Diffusion:

$$\frac{\partial C}{\partial t} = D\frac{\partial^2 C}{\partial x^2} \qquad (1)$$

where C is the concentration of water in the plastic container wall, t is time, D is the diffusion coefficient, and x is the spatial coordinate in the direction of transfer (*2*,*3*). >

Figure 1 describes Fick's Second Law of Diffusion graphically and shows a graphical representation of water concentration across the plastic container wall as a function of time (t). The total change in water concentration across the plastic container wall with time is directly proportional to the change in concentration gradient with the permeant penetration depth. At a steady-state rate of water transmission, the concentration gradient remains constant across the plastic wall.

[a] Correspondence should be addressed to: Desmond G. Hunt, PhD, Scientist, Documentary Standards Division, US Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852-1790; tel. 301.816.8341; e-mail dgh@usp.org.

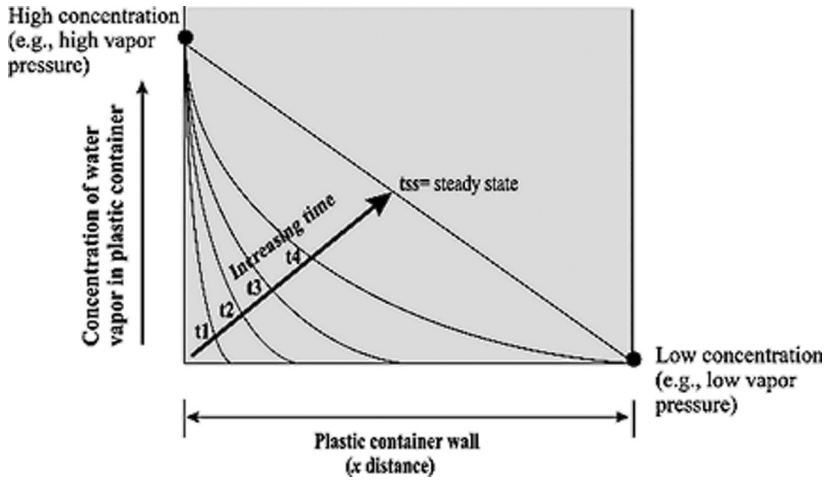

Figure 1. Graphical representation of water concentration across the plastic container wall as a function of time (*t*).

Example—In the standard test, *test containers* with desiccant and *controls* with glass beads are prepared at ambient conditions [e.g., 21 °C, 30% relative humidity (RH)] with the following assumptions:

- The container itself reaches equilibrium at 21 °C/30% RH.
- The desiccant is completely dried.

A sufficient amount of desiccant is inserted in the *test containers* to achieve and maintain an atmosphere inside the container close to 0% RH during the test. RH is used to express the water concentration in the headspace and in the walls of the container. *Figure 2* shows the initial water concentration across the plastic wall of a *test container* and a control. Because the plastic wall does not provide a good temperature barrier, the temperature across the plastic wall, inside and outside, is 21 °C.

Desiccant is assumed to absorb the water immediately in the headspace of *test containers*. Therefore, the RH of *test container* headspace with desiccant is close to 0% and the RH of the plastic wall of *test containers* is close to 30%. It is assumed that glass beads do not absorb water in *controls*. Therefore, the RH of the *control* headspace with glass beads is close to 30% and the RH of the plastic wall of the *controls* is close to 30%.

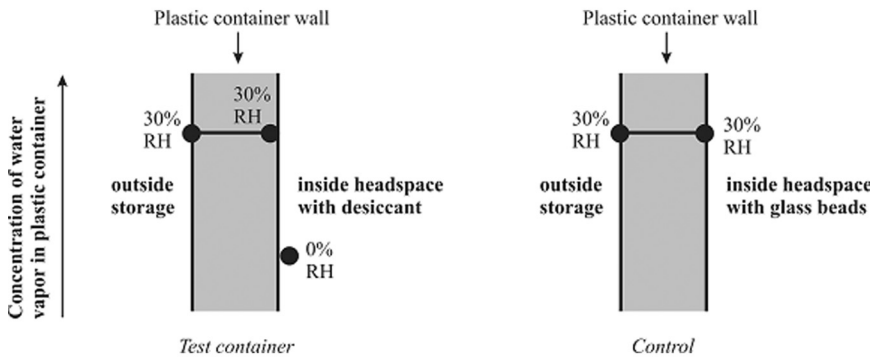

Figure 2. Diagram showing initial RH (i.e., water concentration) outside the container, across the plastic container wall, and inside the plastic container: initial state at sample preparation.

In the standard test, *test containers* and *controls* are placed in a storage chamber (e.g., 23 °C/75% RH) to allow study of the weight gain of desiccant due to water transmission into the containers and absorption of water by the desiccant. *Figure 3* shows the water concentration across the plastic wall of the *test containers* and *controls* after the containers are placed in the 23 °C/75% RH chamber. The water in the storage chamber first adsorbs on the surface of the plastic container wall. Therefore, the RH of the surface will change immediately to that of the storage RH condition (75% RH). Because the plastic walls do not provide a good temperature barrier, the temperature across the plastic wall, inside and outside, reaches 23 °C essentially immediately.

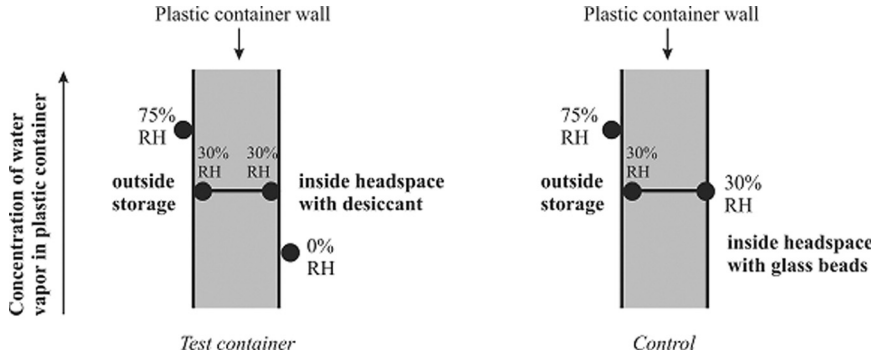

Figure 3. Diagram showing RH (i.e., water concentration) outside the container, across the plastic container wall, and inside the plastic container immediately after containers are placed in the 23° C/75% RH chamber: initial state upon storage.

Water will transmit through the plastic wall because the vapor pressure outside the container is greater than the vapor pressure of the wall itself and of that inside the container. *Figure 4* shows the water transmission and the resulting water concentration across the plastic wall. The arrows show a progression with increasing time. For *test containers*, the plastic material has a lower water concentration than the storage condition and has a higher water concentration than the container headspace. Therefore, the plastic wall absorbs water from the 75% RH chamber environment and desorbs water to the 0% RH headspace. The absorbed water diffuses through the plastic wall. The diffused water desorbs from the plastic wall to the 0% RH container headspace, where it is immediately absorbed by the desiccant, maintaining the container headspace at 0% RH. This results in the water concentration gradient shown in *Figure 4*. This water concentration gradient across the plastic walls may reach a steady-state condition (equilibrium) within a few days for typical pharmaceutical packages such as high-density polyethylene (HDPE) bottles and polychlorotrifluoroethylene (PCTFE) blisters. See *Appendix* for more information about the equilibrium time.

For *controls*, the plastic material has a lower water concentration than the storage condition and has the same water concentration as the container headspace. Therefore, the plastic wall absorbs water from the 75% RH chamber environment, and initially there is no transfer between the plastic wall and package headspace. The absorbed water diffuses through the plastic wall. The diffused water desorbs from the plastic wall to the container headspace, where it is not absorbed by the glass beads, resulting in the water concentration gradient shown in *Figure 4*. The water concentration gradient across the plastic wall reaches a steady-state condition (equilibrium). The time to reach equilibrium for *controls* is longer than for *test containers* because the water concentration gradient changes dynamically as the inside vapor pressure increases. It is assumed that the equilibrium time for *controls* is not more than 2 weeks. At the equilibrium condition, the water concentration across the plastic wall is constant at 75% RH.

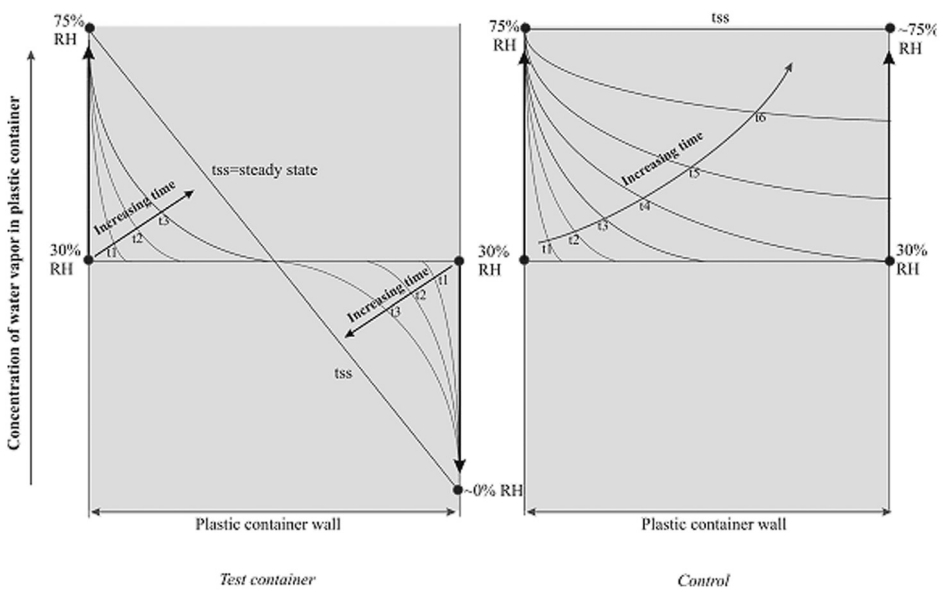

Figure 4. Graphical representation of water concentration across the plastic container wall as a function of time (*t*) after containers are placed in the 23 °C/75% RH chamber.

Conclusion, Part 1—*USP* ⟨671⟩ uses 14 days or 28 days to determine the net weight gain. After 14 or 28 days of storage, the water concentration gradient in the plastic material itself reaches steady-state condition. The water concentration (hence, the weight gain) of the plastic wall of *controls* is greater than the concentration (hence, the weight gain) of the plastic wall of *test containers*. Practically, for small or thin-walled containers, the moisture gain of container walls may not be significant and may not affect the accuracy of experimental results provided by *USP* ⟨671⟩.

2. Correction of Current Net Water Weight Gain Equation

The analysis of the water weight gain of plastic bottle container–closure systems has been important to the pharmaceutical industry for many years. *USP* ⟨671⟩ prescribes this analysis, currently, through the use of Equation (2) to calculate the net water gain of containers. The weight gain of *controls* (*C*) filled with glass beads is subtracted from the weight gain of *test containers* (*T*) filled with desiccant:

$$W_{net} = (T_F - T_I) - (C_F - C_I) \qquad (2)$$

where W_{net} is the net weight gain determined by subtracting the difference between the final (C_F) and initial (C_I) weights of the *controls* from the difference between the final (T_F) and initial (T_I) weights of *test containers*.

Equation (2) assumes that the water concentrations in the plastic walls of *test containers* and *controls* are equal at the same time of storage. However, the water concentration is not equal, as explained in the previous section. The plastic wall of *controls* has a higher water concentration than the plastic wall of *test containers*. Therefore, it is not correct to subtract the water weight gain of *controls* from the water weight gain of *test containers* to determine the net water gain of the *test containers*. That is, the water gain of containers calculated by Equation (2) results in a value that is less than actual. Hence, Equation (2) is not theoretically correct.

Instead, the steady-state (equilibrium) condition of *test containers* described in the previous section can be utilized in this determination without using the water weight gain of *controls* to determine the net water gain of containers. *Test containers* are placed at the desired condition for preconditioning to achieve a steady-state concentration gradient. (See *Test container* in *Figure 4*.) Typical plastic containers [e.g., HDPE, PP, polyethylene terephthalate (PET), and PCTFE] used in the pharmaceutical industry can achieve the steady-state concentration gradient within 1 or 2 days. When a sufficient amount of completely dried desiccant is used in *test containers*, the preconditioning does not affect the water vapor pressure of the container headspace. The constant water vapor pressure difference can be achieved during the test. Therefore, the net water gain can be measured by Equation (3) after preconditioning.

$$W_{net} = (T_F - T_{IC}) \qquad (3)$$

where W_{net} is the net weight gain determined from the difference between the final (T_F) and initial (T_{IC}) weights of *test containers*. The initial weight (T_{IC}) is determined after preconditioning.

CONCLUSION

This article has reviewed the use of *controls* to determine the net water gain for plastic container–closure systems provided in *USP* ⟨671⟩ and has shown that the procedure is not theoretically correct. Theoretically, the net water weight gain would be underestimated by subtracting the weight gain of *controls* from the weight gain of *test containers*. Therefore, it may result in a WVTR that is lower than the actual WVTR. The newly proposed simple equation with preconditioning of plastic containers determines net water gain more accurately, theoretically, and offers an improvement to the precision of the WVTR method.

ACKNOWLEDGMENTS

The authors would like to acknowledge Drs. Maria Rubino and Rafael Auras at Michigan State University for the WVTR experiments using the moisture analyzer equipped with a microbalance as referenced in this paper. The authors also would like to thank Randy Thackrey (Eli Lilly and Company) for constructive technical comments that have been incorporated in this paper.

APPENDIX: MOISTURE PERMEATION OF 2-MIL PCTFE BLISTERS

Moisture permeation of 2-mil PCTFE blisters has been determined with a VTI moisture analyzer. The analyzer can maintain constant environmental conditions and weigh the sample during the storage time. If the sample package contains adequate desiccant to maintain the inside vapor pressure consistently at 0, then a constant vapor pressure difference between inside and outside of the package can be achieved. This is identical with the approach in *USP* ⟨671⟩ and ASTM E96 gravimetric WVTR methods. The benefit of this method is that the sample can be weighed without taking the sample out of the chamber. Therefore, the analyzer can show the weight change immediately after the sample is mounted on the balance. It shows the weight change from a dynamic (unsteady) state to the steady state. The time to reach the steady-state condition can be estimated from this experiment.

Materials and Equipment

The 2-mil PCTFE film (supplied by TekniPlex,) is structured as 2-mil PCTFE/2-mil PE/7.5-mil PVC. The lidding foil (supplied by Alcan) is structured as paper/adhesive/polyester/adhesive/1-mil aluminum foil/heat-seal coating. The size of the individual blister cavity is 11 mm diameter × 5 mm height. A 4-Å molecular sieve desiccant (supplied by SudChemie) was used.

A symmetrical gravimetric analyzer (SGA 100) was newly equipped with a CAHN 200 microbalance at Michigan State University. The moisture analyzer and balance can measure the weight change of the sample with ±5 μg accuracy, control the temperature with ±0.5 °C accuracy, and control the RH with ±1% RH accuracy.

Methods

Blister samples were prepared with a Klockner EAS blistering machine. The 2-mil PCTFE film was thermoformed, and completely dried molecular sieve desiccant tablets were inserted manually into the blister cavities. The desiccant-filled blisters were heat-sealed immediately with aluminum foil lidding.

Moisture permeation of 2-mil PCTFE blisters was determined gravimetrically by using the VTI moisture analyzer equipped with a microbalance. The blister sample (6 cavities, approximately 4 g weight) was mounted on the weighing dish in the chamber, which is connected to the microbalance. The system was set up to maintain the relative humidity at 60% and the temperature at 30 °C for 2000 minutes (1.4 days), and data were collected every 2 minutes. The test was replicated with 2 different samples.

Results

The system maintained the desired RH and temperature consistently during the entire testing period. The temperature was maintained between 29.83 °C and 29.91 °C, and the RH was maintained between 59.6% and 60.3% for 2000 minutes. *Figure 5* shows the weight change of samples stored at 30 °C/60% RH. Initially, the weight change rate was in an unsteady state, but the weight change rate reached a steady state before 0.5 day for both samples.

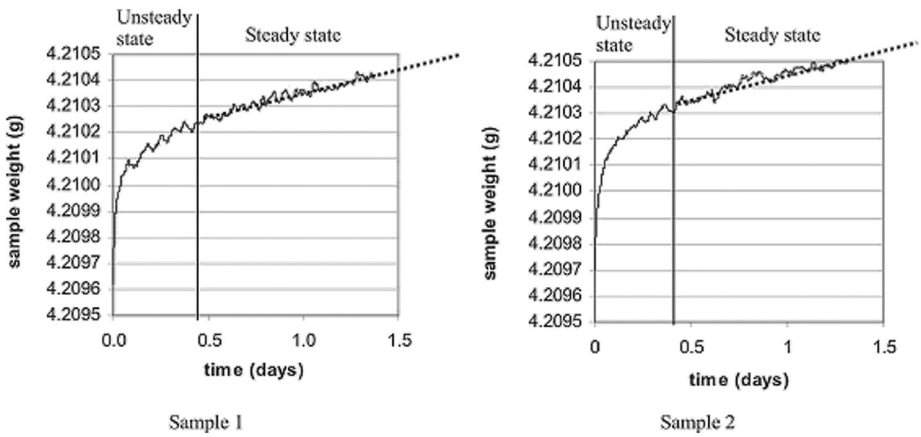

Figure 5. Recorded sample weight change from the VTI system.

Conclusions

A steady-state rate of weight change for 2-mil PCTFE blisters was obtained before 0.5 day at 30 °C/60% RH. If the storage condition is changed, the equilibrium time may be increased or decreased. In addition, if the material thickness and barrier property increase, the equilibrium time will be increased. The equilibrium time should be determined experimentally but probably will not require more than a few days with typical plastic package materials (e.g., HDPE, PP, PET, and PCTFE) at typical stability conditions such as 25 °C/60% RH, 30 °C/65% RH, and 40 °C/75% RH.

NOMENCLATURE

This section includes supplements to the latest edition of the *USP Dictionary of USAN and International Drug Names* that incorporate new United States Adopted Names (USAN) and revisions to existing Dictionary names. Also listed are Proposed and Recommended International Nonproprietary Names (INN) when they have been announced by the World Health Organization.

Possible names suggested for use as USAN and INN are listed for public review and comment along with information on how nonproprietary names are devised. In addition, readers may find articles relevant to current compendial nomenclature issues that also occasionally report on related matters pertaining to USAN and INN.

CHROMATOGRAPHIC REAGENTS USED IN *USP–NF* AND *PHARMACOPEIAL FORUM*

This is an update based on the proposals published in this issue of *PF*.

Chromatographic Columns Used in *USP-NF* and *Pharmacopeial Forum*
Mar.–Apr. 2009

DICLAZURIL (DSD Mgh #24944)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(1)	L1	Hypersil BDS C-18	Chromatographic purity	4.6 mm × 10 cm, 3 μm. Manufacturer: Thermo Scientific

ETHYLENE GLYCOL AND VINYL ALCOHOL GRAFT COPOLYMER (DSD Mgh #3827)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(2)	G1	DB-1	Limit of	Limit of ethylene oxide and dioxane. 0.25 mm × 30 m, 1.0 μm. Manufacturer: J & W Scientific
35(2)	L1	AQUASIL C18	Limit of	Limit of vinyl acetate and Limit of acetic acid/acetate. Analytical column. 4 mm x 25 cm, 5 μm. Manufacturer: Thermo Scientific
35(2)	L1	Nucleosil 120 C18	Limit of	Limit of vinyl acetate. Pre-column. 4.0 mm × 3 cm, 5 μm. Manufacturer: Macherey-Nagel

MISOPROSTOL TABLETS (DSD Mgh #54310)

PF	LGS#	Reagent Brand	Type of Test	Comments
26(1)	L7	ZORBAX C8	Assay, Dissolution, Related compounds	4.6 mm × 15 cm. Manufacturer: Agilent Technologies

OLANZAPINE TABLETS (DSD Mgh #2645)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(2)	L10	ZORBAX SB-CN	Dissolution	4.6 mm × 15 cm. Manufacturer: Agilent Technologies

ORBIFLOXACIN (DSD Mgh #58770)

PF	LGS#	Reagent Brand	Type of Test	Comments
34(2)	L1	Pecosphere-3CR C18	Assay, Identification, and Related compounds	4.6 mm × 3 cm, 3 μm. Manufacturer: PerkinElmer, Inc.

ORBIFLOXACIN TABLETS (DSD Mgh #58780)

PF	LGS#	Reagent Brand	Type of Test	Comments
34(2)	L1	Pecosphere-3CR C18	Assay, Identification, and Chrom. purity	4.6 mm × 3.3 cm, 4 μm. Manufacturer: PerkinElmer, Inc.

OXALIPLATIN INJECTION (DSD Mgh #1903)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(2)	L1	Hypersil BDS C-18	Assay and Limit of	Limit of oxalic acid. 4.6 mm × 25 cm, 5 μm. Manufacturer: Thermo Scientific
35(2)	L1	Hypersil BDS C-18	Limit of	Limit of (*SP*-4-2)-diaqua[(1*R*,2*R*)-cyclohexane-1,2-diamine-*N,N′*]platinum and unspecified impurities. 4.6 mm × 7.5 cm, 3 μm. Manufacturer: Thermo Scientific

PECTIN (DSD Mgh #61250)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(2)	G43	Zebron ZB-624	Methanol, Ethanol, and Isopropanol	0.32 mm × 30 m, 1.8 μm. Manufacturer: Phenomenex
35(2)	S3	Porabond Q	Methanol, Ethanol, and Isopropanol	0.32 mm × 25 m, 5 μm. Alternative column. Manufacturer: Varian

PRAZIQUANTEL TABLETS (DSD Mgh #68458)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(2)	L1	Ultracarb C18	Dissolution	Dissolution test for veterinary products. 4.6 mm × 25 cm, 10 μm. Manufacturer: Phenomenex

TACROLIMUS CAPSULES (DSD Mgh #80283)

PF	LGS#	Reagent Brand	Type of Test	Comments
35(2)	L1	TSK-GEL ODS-80Tm	Assay	4.6 mm × 15 cm, 5 μm. Manufacturer: Tosoh Bioscience
35(2)	L20	Supelcosil LC Diol	Organic impurities	4.6 mm × 25 cm, 5 μm. Manufacturer: Supelco
35(2)	L7	Nucleosil C8	Dissolution	4.6 mm × 15 cm, 5 μm. Manufacturer: Macherey-Nagel

PHARMACOPEIAL FORUM VOL. 35 NO. 3 **MAY–JUNE 2009**

* The *USP–NF* (*USP 33–NF 28*), the *Supplement* (*Supp*), or the *Interim Revision Announcement* (*IRA*) for which the revision proposal is targeted is shown in parentheses next to each proposed item.

THE JOURNAL OF STANDARDS DEVELOPMENT AND OFFICIAL COMPENDIA REVISION

Please address comments on *Pharmacopeial Forum* content to
USP Executive Secretariat
12601 Twinbrook Parkway,
Rockville, MD 20852
execsec@usp.org

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI),* in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences.*

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling.

This publication was paginated using Advent 3B2 Publishing Software.

Printed in USA by United Book Press, Baltimore, Maryland

ISSN: 0363-4655

STANDARDS DEVELOPMENT

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum* (*PF*), for the development of official standards in the *United States Pharmacopeia* and the *National Formulary* (*USP–NF*).

USP publishes *PF* on a bimonthly basis to provide an opportunity to review and comment on the new or revised standards.

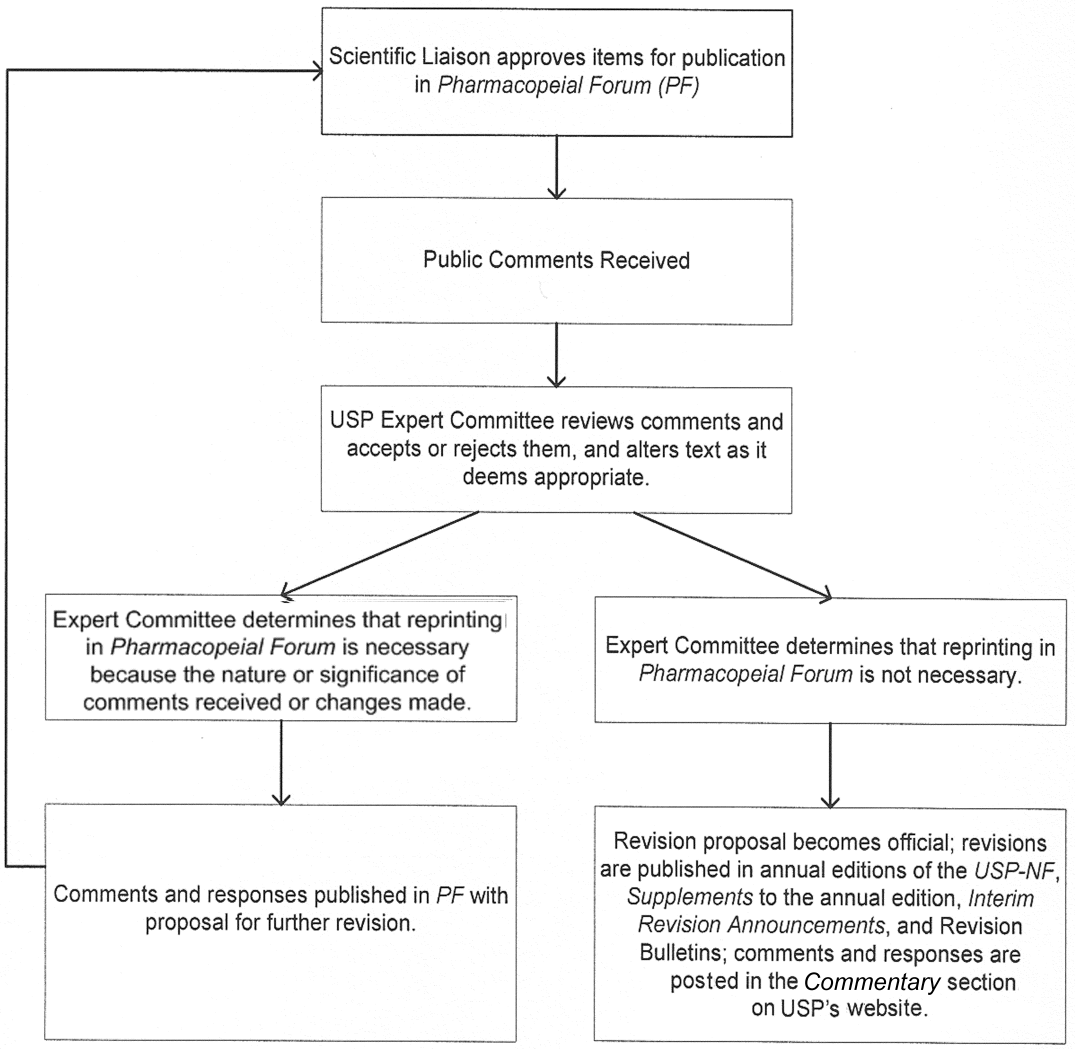
PF includes the following:

1. **Proposed Revisions**—New or revised standards targeted for adoption through USP's typical Revision Process. USP's Revision Process calls for publication of a proposed revision in *PF* for a 90-day notice and comment period. After the comment period and subsequent review of comments and approval by the relevant USP Expert Committee, the official standard is published in the next *USP–NF* or *Supplement*. If comments received are significant, or if the Expert Committee's consideration of comments results in significant additional changes, the Expert Committee may determine that reprinting in *PF* is necessary prior to the revision becoming official. See the *In-Process Revision* section for current proposed revisions.
2. **Accelerated Revisions**—New or revised standards that become official through an accelerated process in accordance with USP's Guideline on Accelerated Revisions (available on the USP website) (e.g., *Interim Revision Announcements*, *Revision Bulletins*, and *Errata*). Accelerated Revisions allow for a revision to become official prior to the next *USP–NF* or *Supplement* and do not always require notice and comment. *Interim Revision Announcements* are first presented for a 60-day public comment period in the *Proposed Interim Revision Announcement* section before becoming official in a later *PF* in the *Interim Revision Announcements* section of the *PF*. Note that *Revision Bulletins* appear only on the USP website.

USP welcomes comments and data on proposed revisions. Comments, along with USP's responses, will be published in the *Commentary* section of the USP website (www.usp.org).

The chart below shows the public review and comment process and its relationship to standards development.

Public Review and Comment Process for *USP-NF* Standards Development



Questions on the process should be addressed to Director, Executive Secretariat, United States Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE *PF*

''How to Use PF'' describes the various parts of *Pharmacopeial Forum*, lists the *Committee Designations*, and includes the *Staff Directory*.

The content of the different sections of *PF* are briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a *Request for Revision* is available in the *Guideline for Submitting Requests for Revision to the USP–NF* on the USP website (www.usp.org/USPNF/submitMonograph/subGuide.html).

Proposed and Adopted Revisions to the *USP–NF*

Section	Content	How Readers Can Respond
In-Process Revision Revisions targeted for adoption	•BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst such as the brand name of the column used in developing the proposed procedure and the USP scientific staff liaison who handled the issue. •New and revised standards that have been approved for publication by the appropriate USP Committee when it is considering whether to advance standards to official status (see *Standards Development*).	Review material and send comments promptly to USP staff liaison (see the *Staff Directory*) identified at the end of the briefing accompanying each item. For general inquiries or in cases where a particular liaison is not identified, use the general USP telephone number 301-881-0666 or fax number 301-816-8373. Comment deadlines are found at the end of the *Policies and Announcements* section.
Harmonization Items the Pharmacopeial Discussion Group (PDG) is working to harmonize internationally	•BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change. The designated stage of harmonization. Two stages are printed in the *Pharmacopeial Forum Harmonization* section: Stage 4 is available for comment, whereas Stage 6 is the final official harmonized standard. Stage 4 and Stage 6 standards are separated into their own respective sections within *Pharmacopeial Forum* in order to clearly differentiate the stages. •New or revised text to Stage 6 documents is marked with symbols that indicate the publication in which the book or *Supplement* becomes official.	For Stage 4 harmonized documents, review material and provide comments to the appropriate staff liaison cited in the *Briefing* preceding each *In-Process Revision.* Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Official Inquiry and Consensus stages of international harmonization should address their comments to the coordinating pharmacopeia, with a copy to USP, for a given article. The addresses for the European and Japanese Pharmacopoeias are as follows: EP Secretariat Ms. Lynn Kelso-Eleuterio Central Secretariat European Pharmacopoeia Department European Directorate for the Health Care Council of Europe 7, Allée Kastner CS 30026 67081 Strasbourg France Tel: +33 (3) 88 41 31 48 Fax: +33 (3) 88 41 27 71 lynn.kelso@edqm.eu JP Secretariat Dr. Shigenori Harada Quality Expert Pharmaceuticals and Medical Devices Agency (PMDA) Shin-kasumigaseki Building 3-3-2, Kasumigaseki, Chiyoda-ku Tokyo, 100-0013 Japan Phone: +81-3-3506-9431 Fax: +81-3-3506-9440 harada-shigenori@pmda.go.jp

Proposed and Adopted Revisions to the *USP–NF* (*Continued*)

Section	Content	How Readers Can Respond
Interim Revision Announcement Adopted standards	Standards that have been adopted and will become officially binding on the specified date. Effective date is specified in the section's introductory page or within parentheses following a particular item. New or revised text is marked by the symbols ‣•.	Review to see if affected by any of the changes. Note effective date when standards become official and ensure compliance.
Pending Proposals	In order for an item to be adopted into the *USP–NF* and become officially binding, it must first be proposed and published in the *PF* to allow the public an opportunity to review and comment upon it. When an item is adopted, it is published in the *USP–NF*, its *Supplements*, or an *IRA*. Those items that have not yet been adopted are still pending.	Review items to track pending proposals.
Canceled Proposals	Canceled proposals are items that were published in *PF* and were pending, but have since been canceled. Note that canceled proposals may be republished to be considered in the future for adoption into the *USP–NF*.	Review items to track canceled proposals.

POLICIES AND ANNOUNCEMENTS

This section provides general information resources for *USP–NF* standards and processes. Information resources include announcements on scientific and policy issues currently under consideration, schedules for USP publications, and schedules for comment periods for proposed standards.

USP ANNOUNCES REVISION TO AMANTADINE HYDROCHLORIDE CAPSULES MONOGRAPH. The Biopharmaceutics Expert Committee (BPC) has approved the addition of *Dissolution Test 2* to the Amantadine Hydrochloride Capsules *Interim Revision Announcement* monograph. This monograph was previously printed as an *In-Process Revision* in *Pharmacopeial Forum* volume 35(1). The approved *Interim Revision Announcement* supersedes the monograph printed in *USP 32–NF 27* until the monograph is printed in the *USP 32–NF 27, Second Supplement*, which will be released June 1, 2009 and will become official December 1, 2009. The chromatographic procedure in this test was validated using the RTX-1 or DB-1 brand of G1 phase. The retention times for naphthalene and amantadine hydrochloride are approximately 6 and 7 minutes, respectively.

Should you have any questions on the Amantadine Hydrochloride Capsules Monograph, please contact Margareth Marques, Ph.D. at 301-816-8106 or mrm@usp.org.

USP ANNOUNCES REVISION TO BUPROPION HYDROCHLORIDE EXTENDED-RELEASE TABLETS MONOGRAPH. The Biopharmaceutics Expert Committee (BPC) has approved the addition of *Dissolution Test 8* to the Bupropion Hydrochloride Extended-Release Tablets *Interim Revision Announcement* monograph. This monograph was previously printed as an *In-Process Revision* in *Pharmacoeial Forum* volume 35(1). The approved *Interim Revision Announcement* supersedes the monograph printed in *USP 32–NF 27, First Supplement* (released February 1, 2009 and official August 1, 2009) until it is printed in the *USP 32–NF 27, Second Supplement*, which will be released June 1, 2009 and will become official December 1, 2009.

Should you have any questions on the Bupropion Hydrochloride Extended-Release Tablets Monograph, please contact Margareth Marques, Ph.D. at 301-816-8106 or mrm@usp.org.

STAGE 4 AND STAGE 6 HARMONIZED STANDARDS ARE NOW FEATURED IN TWO SEPARATE PF SECTIONS. USP publishes monographs and general chapters that are undergoing international harmonization by the Pharmacopeial Discussion Group (PDG) at Stage 4 and Stage 6. The Stage 4 documents are published for public comment. The Stage 6 documents have received PDG approval. These documents are being published to inform readers of their PDG sign-off status.

To make clear the distinction between Stages 4 and 6, USP has revised the Harmonization section of *Pharmacopeial Forum (PF)* by separating the two types of documents.

Stage 4 documents are published in *PF* in draft form and are available for public comment. The Japanese and the European Pharmacopoeias and the USP analyze comments and revise the general chapters and monographs accordingly. The documents are revised based on the comments received and then forwarded to the next stage.

The Stage 6 documents are provided in *PF* as an informational resource, and these documents will be published in the next available official publication. The Stage 6 documents published in *PF* 35(3) will be official in *USP 33–NF 28*.

***PHARMACOPEIAL FORUM* PUBLIC REVIEW AND COMMENT PERIOD DEADLINES.** The USP welcomes and encourages interested parties to submit comments and data regarding potential, proposed, or adopted (official) standards. In accordance with the Rules and Procedures of the 2005–2010 Council of Experts, USP has implemented a 90-day comment period by providing a deadline for each issue of *PF* unless otherwise stated in the individual briefing. The listing of comment period deadlines and the targeted official publications appears below.

Pharmacopeial Forum	Comment Deadline	Targeted Official Publication	Release Date	Official Date
PF 35(2)	June 15, 2009	*USP 33–NF 28 1st Supplement*	February 2010	August 1, 2010
PF 35(3)	August 15, 2009			
PF 35(4)	October 15, 2009	*USP 33–NF 28 2nd Supplement*	June 2010	December 1, 2010
PF 35(5)	December 15, 2009			
PF 35(6)	February 15, 2010	*USP 34–NF 29*	November 2010	May 1, 2011
PF 36(1)	March 31, 2010			

All official revisions are published in the annual edition or *Supplements* to *USP–NF* (twice yearly). Between these publications, official revisions are published in *PF* in the *Interim Revision Announcement* section and incorporated in the upcoming *Supplement* or book. They may also be published as *Revision Bulletins* on www.usp.org in the ''New Official Text'' section. The official publication in which an *IRA* is incorporated will depend upon publication deadlines. See the table below. The electronic version of *USP–NF* is updated as each *Supplement* becomes available and, therefore, contains all official text up to and including the contents of the latest *Supplement.* The table below outlines the publications and their release and official dates, and the book or supplement which supersedes them.

Publication Schedules

Publication	Release Date	Official Date	Superseded by
USP 32–NF 27	November 1, 2008	May 1, 2009	*1st Supplement to USP 32–NF 27*
IRA [*PF* 35(1)]	January 1, 2009	February 1, 2009	*2nd Supplement to USP 32–NF 27*
1st Supplement to USP 32–NF 27	February 1, 2009	August 1, 2009	*2nd Supplement to USP 32–NF 27*
IRA [*PF* 35(2)]	March 1, 2009	April 1, 2009	*2nd Supplement to USP 32–NF 27*
IRA [*PF* 35(3)]	May 1, 2009	June 1, 2009	*USP 33–NF 28*
2nd Supplement to USP 32–NF 27	June 1, 2009	December 1, 2009	*USP 33–NF 28*
IRA [*PF* 35(4)]	July 1, 2009	August 1, 2009	*1st Supplement to USP 33–NF 28*
IRA [*PF* 35(5)]	September 1, 2009	October 1, 2009	*1st Supplement to USP 33–NF 28*
IRA [*PF* 35(6)]	November 1, 2009	December 1, 2009	*2nd Supplement to USP 33–NF 28*
USP 33–NF 28	November 1, 2009	May 1, 2010	*1st Supplement to USP 33–NF 28*

PRIORITY NEW MONOGRAPH ITEMS. USP is seeking monographs for the following drug substances and drug products that are or soon will be off patent and thus are of the highest priority. USP also is seeking monographs for the excipients listed below. Monographs are marked ''Received'' upon receipt of monograph proposal. Received monographs are removed from this list upon publication in *Pharmacopeial Forum* or when posted in the Pending Monographs section of the USP website (http://www.usp.org/standards/pending/). This list has been updated as of February 20, 2009; monographs received since the last update to the list are noted in bold.

Monograph sponsors should consult USP's Guideline for Submitting Requests for Revision to the *USP–NF* at http://www.usp.org/USPNF/submitMonograph/subGuide.html.

For additional information, contact Karen A. Russo, Ph.D., kar@usp.org.

Small Molecules (Drug Substances)—As of February 20, 2009

1. Allopurinol Sodium	2. Aminopropazine Fumarate	3. Aminopterin Sodium
4. Anagrelide Hydrochloride ***(Received)***	5. Arsenic Trioxide	6. Auranfoin
7. Azelaic Acid ***(Received)***	8. Balsalazide Disodium ***(Received)***	9. Bentoquatam
10. Benzphetamine Hydrochloride	11. Bivalirudin ***(Received)***	12. Calcipotriene
13. Calcium Trisodium Pentetate	14. Calfactant	15. Candesartan Cilexetil ***(Received)***
16. Ceftibuten	17. Cetrorelix	18. **Cevimeline Hydrochloride** ***(Received)***
19. Chloroxine	20. Choline Salicylate	21. Cysteamine Bitartrate
22. Dalfopristin	23. Dapirazole Hydrochloride	24. Desirudin
25. Desonide ***(Received)***	26. Dexrazoxane	27. Difenoxin Hydrochloride
28. Entacapone ***(Received)***	29. Epoprostenol Sodium ***(Received)***	30. Erythromycin Phosphate
31. Erythromycin Thiocyanate	32. Esmolol Hydrochloride ***(Received)***	33. Estazolam ***(Received)***
34. Estramustine Phosphate Sodium	35. Ethanolamine Oleate	36. Etomidate ***(Received)***
37. Etoposide Phosphate	38. Exemestane	39. Famciclovir ***(Received)***
40. Felbamate ***(Received)***	41. Fluoromethane F 18	42. Fosfomycin Tromethamine ***(Received)***
43. Gadobenate Dimeglumine	44. Gadopentetic Acid	45. Gallium Nitrate

Small Molecules (Drug Substances)—As of February 20, 2009 *(Continued)*

46. Ganirelix	47. Guanidine Hydrochloride	48. Halobetasol Propionate ***(Received)***
49. Haloperidol Decanoate ***(Received)***	50. Hydrocodone Polistirex	51. Ibandronate Sodium
52. Imipramine Pamoate	53. Imiquimod	54. Isosulfan Blue
55. Latanoprost ***(Received)***	56. Lomustine ***(Received)***	57. Metipranolol Hydrochloride
58. Miglitol	59. Milrinone Lactate	60. Moexipril Hydrochloride
61. Nalbuphine Hydrochloride	62. Nedocromil Sodium	63. Nicardipine Hydrochloride
64. Nilutamide	65. Nisoldipine	66. Olsalazine Sodium ***(Received)***
67. Orlistat ***(Received)***	68. Oxiconazole Nitrate	69. Pemirolast Potassium
70. Pioglitazone Hydrochloride ***(Received)***	71. Piperonyl Butoxide	72. Pirbuterol Acetate ***(Received)***
73. Poractant Alpha	74. Porfimer Sodium	75. Pramiprexole Dihydrochloride ***(Received)***
76. Quetiapine Fumarate ***(Received)***	77. Ranitidine	78. Rivastigmine Tartrate ***(Received)***
79. Ropinirole Hydrochloride ***(Received)***	80. Rose Bengal Disodium	81. Rosiglitazone Maleate
82. Sodium Phenylbutyrate	83. Sodium Phosphates	84. Spectinomycin Sulfate
85. Streptozocin	86. Tenofovir Disoproxil Fumarate ***(Received)***	87. Tiludronate Disodium
88. Tiopronin	89. Trimetrexate Glucuronate	90. Venlafaxine Hydrochloride ***(Received)***
91. Voriconazole ***(Received)***	92. **Zaleplon** ***(Received)***	93. Zinc Tridosium Pentetate
94. Zoledronic Acid		

Small Molecules (Drug Products)—As of February 20, 2009

1. Abacavir Sulfate, Lamivudine, and Zidovudine Tablets	2. Acarbose Tablets	3. Acetaminophen, Butalbital, Caffeine, and Codeine Phosphate Capsules
4. Acetaminophen, Clemastine Fumarate and Pseudoephedrine Hydrochloride Tablets	5. Acetazolamide Extended-Release Capsules	6. Albuterol and Ipratropium Bromide Inhalation Aerosol
7. Albuterol and Ipratropium Bromide Inhalation Solution	8. Albuterol Extended-Release Tablets	9. Albuterol Inhalation Aerosol
10. Albuterol Sulfate Inhalation Solution	11. Albuterol Sulfate Oral Solution	12. Alendronate Sodium Oral Solution
13. Alfuzosin Extended-Release Tablets	14. Allopurinol for Injection	15. Alprazolam Extended-Release Tablets
16. Alprostadil Urethral Suppository	17. Aminopropazine Fumarate and Neomycin Sulfate Tablets	18. Aminopropazine Fumarate Injection
19. Aminopropazine Fumarate Tablets	20. Aminopterin Sodium Tablets	21. Amiodarone Hydrochloride Injection
22. Amlodipine and Benazepril Hydrochloride Capsules ***(Received)***	23. Amphotericin B Injection	24. Anagrelide Hydrochloride Capsules ***(Received)***
25. Arsenic Trioxide Injection	26. Atovaquone and Proguanil Hydrochloride Tablets	27. Atovaquone Tablets
28. Auranofin Capsules	29. Azatadine Maleate and Pseudoephedrine Sulfate Extended-Release Tablets	30. Azelaic Acid Cream
31. Azithromycin for Injection ***(Received)***	32. Azithromycin Tablets ***(Received)***	33. Baclofen Injection
34. Balsalazide Disodium Capsules ***(Received)***	35. Beclomethasone Dipropionate Inhalation Aerosol	36. Beclomethasone Dipropionate Nasal Suspension
37. Benazepril Hydrochloride and Hydrochlorothiazide Tablets	38. Bentoquatam Topical Suspension	39. Benzocaine and Cetylpyridinium Chloride Lozenges
40. Benzocaine and Menthol Lotion	41. Benzphetamine Hydrochloride Tablets	42. **Bivalirudin for Injection** ***(Received)***
43. Brompheniramine Maleate, Dextromethorphan Hydrobromide and Pseudoephedrine Hydrochloride Oral Solution	44. Budesonide Inhalation Aerosol	45. Bupivacaine and Lidocaine Hydrochlorides Injection

Small Molecules (Drug Products)—As of February 20, 2009 *(Continued)*

46. Buprenorphine Hydrochloride Injection	47. Butalbital and Acetaminophen Capsules	48. Butalbital and Acetaminophen Tablets
49. Calcipotriene Cream	50. Calcipotriene Ointment	51. Calcipotriene Topical Solution
52. Calcitriol Capsules	53. Calcitriol Oral Solution	54. Calcium Acetate Capsules
55. Calcium Trisodium Pentetate Injection	56. Calfactant Intratracheal Suspension	57. Carbidopa and Levodopa Tablets for Oral Suspension ***(Received)***
58. Carbidopa, Levidopa, and Entacapone Tablets	59. Carmustine Implant	60. Cefdinir Tablets
61. Cefditoren Pivoxil Tablets	62. Ceftibuten Capsules	63. Ceftibuten For Oral Suspension
64. Ceftiofur Hydrochloride Oral Suspension	65. Cetirizine Hydrochloride Tablets ***(Received)***	66. Cetrorelix Injection
67. Cevimeline Hydrochloride Capsules	68. Chloroxine Cream	69. Chlorpromazine Hydrochloride Extended-Release Capsules
70. Choline and Magnesium Salicylates Oral Solution	71. Choline and Magnesium Salicylates Tablets	72. Choline Salicylate Oral Solution ***(Received)***
73. Ciclopirox Shampoo	74. Ciclopirox Topical Gel	75. Ciclopirox Topical Solution ***(Received)***
76. Cimetidine Oral Solution	77. Ciprofloxacin Extended-Release Tablets	78. Ciprofloxacin Hydrochloride and Hydrocortisone Otic Suspension
79. Ciprofloxacin Otic Solution	80. Cisplatin Injection	81. Citalopram Hydrobromide Oral Solution
82. Citric Acid, Gluconolactone, and Magnesium Carbonate Irrigation	83. Cladribine Injection	84. Clemastine Fumarate Syrup
85. Clobetasol Propionate Gel	86. Clorazepate Dipotassium Capsules	87. Clorazepate Dipotassium Extended-Release Tablets
88. Clotrimazole and Betamethasone Dipropionate Lotion	89. Compound Undecylenic Acid Cream	90. Compound Undecylenic Acid Topical Powder
91. Conjugated Estrogens and Medroxyprogesterone Acetate Tablets	92. Cyclosporine Modified Capsules	93. Cyclosporine Modified Oral Solution
94. Cyclosporine Ointment	95. Cyclosporine Topical Solution	96. Cysteamine Bitartrate Capsules
97. Cytarabine Liposome Injection	98. Dalfopristin and Quinupristin Injection	99. Dantrolene Sodium Oral Suspension
100. Dapiprazole for Ophthalmic Solution	101. Desirudin for Injection	102. Desonide Cream
103. Dexrazoxane for Injection	104. Dextroamphetamine Sulfate Extended-Release Capsules	105. Dextromethorphan Polistirex Extended-Release Oral Suspension
106. Diazepam Injectable Emulsion	107. Diclofenac Sodium Ophthalmic Solution	108. Diethylpropion Hydrochloride Extended-Release Tablets
109. Difenoxin Hydrochloride and Atropine Sulfate Tablets	110. Difloxacin Hydrochloride Tablets	111. Dihydroergotamine Mesylate Metered Spray
112. Diltiazem Hydrochloride Injection	113. Dinoprostone Vaginal Suppositories	114. Diphenhydramine Hydrochloride and Acetaminophen Tablets
115. Divalproex Sodium Delayed-Release Capsules	116. Dorzolamide and Timolol Ophthalmic Solution	117. Dorzolamide Ophthalmic Solution
118. Doxepin Hydrochloride Cream	119. Doxycycline Oral Gel	120. Econazole Nitrate Cream
121. Edrophonium Chloride and Atropine Sulfate Injection	122. Enalapril Maleate and Felodipine Extended-Release Tablets	123. Entacapone Tablets ***(Received)***
124. Ephedrine Sulfate and Guaifenesin Tablets	125. Epirubicin Hydrochloride for Injection	126. Epirubicin Hydrochloride Injection
127. Epoprostenol for Injection	128. Epoprostenol Injection	129. Esmolol Hydrochloride Injection
130. Esomeprazole Magnesium Capsules	131. Estazolam Tablets ***(Received)***	132. Estramustine Phosphate Sodium Capsules
133. Ethanolamine Oleate Injection	134. Etidronate Disodium Injection Concentrate	135. **Etomidate Injection** ***(Received)***
136. Exemestane Tablets	137. Famotidine Orally Disintegrating Tablets	138. Felbamate Oral Suspension
139. Felbamate Tablets	140. Fentanyl Lozenges	141. Famciclovir Tablets
142. Fentanyl Transdermal System ***(Received)***	143. Ferrous Fumarate and Docusate Sodium Extended-Release Capsules	144. Fluconazole Oral Suspension
145. Flunisolide Inhalation Aerosol	146. Flunisolide Nasal Spray	147. Fluocinolone Acetonide Shampoo
148. Fluorescein Sodium Ophthalmic Solution	149. Fluorometholone Ointment	150. Fluticasone Propionate Inhalation Powder ***(Received)***

Small Molecules (Drug Products)—As of February 20, 2009 *(Continued)*

151. Fluticasone Propionate Pressurized Inhaler	152. Foscarnet Sodium Injection	153. Fosfomycin for Oral Solution
154. Gabapentin Oral Solution	155. Gadobenate Dimeglumine Injection	156. Gallium Nitrate Injection
157. Ganciclovir Capsules	158. Ganirelix Acetate Injection	159. Gatifloxacin Injection
160. Gatifloxacin Tablets	161. Gentamicin Sulfate Oral Solution	162. Gentamicin Sulfate Soluble Powder
163. Glipizide Extended-Release Tablets	164. Guaifenesin and Pseudoephedrine Hydrochloride Extended-Release Tablets	165. Guaifenesin and Salts of Dextromethorphan and Pseudoephedrine Oral Solution
166. Guanidine Hydrochloride Tablets	167. Halobetasol Propionate Cream	168. Halobetasol Propionate Ointment
169. Haloperidol Decanoate Injection	170. Haloperidol Lactate Injection	171. Haloperidol Lactate Oral Concentrate
172. Hydralazine Hydrochloride and Hydrochlorothiazide Capsules	173. Hydrochlorothiazide Capsules	174. Hydrochlorothiazide Oral Solution
175. Hydrocodone Bitartrate and Acetaminophen Capsules	176. Hydrocodone Bitartrate and Acetaminophen Oral Solution	177. Hydrocodone Bitartrate and Aspirin Tablets
178. Hydrocodone Bitartrate and Guaifenesin Oral Solution	179. Hydrocodone Bitartrate and Homatropine Methylbromide Syrup	180. Hydrocortisone Acetate Dental Paste
181. Hydrocortisone Acetate Rectal Foam Aerosol	182. Hydrocortisone Butyrate Lotion	183. Hydroflumethiazide and Reserpine Tablets
184. Hydromorphone Hydrochloride Oral Solution ***(Received)***	185. Hydroquinone Lotion	186. Ibandronate Sodium Tablets
187. Ibuprofen Capsules	188. Idarubicin Hydrochloride Injection	189. Imipramine Pamoate Capsules
190. Imiquimod Topical Cream	191. Ipratropium Bromide Inhalation Aerosol	192. Ipratropium Bromide Inhalation Solution
193. Irinotecan Hydrochloride Injection	194. Isosulfan Blue Injection	195. Isradipine Extended-Release Tablets
196. Itraconazole Injection	197. Itraconazole Oral Solution	198. Ketoconazole Cream
199. Ketoconazole Shampoo	200. Ketoprofen Capsules ***(Received)***	201. Ketoprofen Extended-Release Capsules
202. Ketoprofen Tablets	203. Ketotifen Fumarate Ophthalmic Solution	204. Lactic Acid Lotion
205. Lamotrigine Tablets ***(Received)***	206. Latanoprost Ophthalmic Solution	207. Leucovorin Calcium for Injection
208. Levetiracetam Tablets ***(Received)***	209. Levocabastine Ophthalmic Suspension	210. Levofloxacin Solution
211. Lincomycin Hydrochloride and Spectinomycin Sulfate Soluble Powder	212. Liothyronine Injection	213. Lomustine Capsules ***(Received)***
214. Lopinavir and Ritonavir Solution	215. Lopinavir Capsules	216. Lopinavir Solution
217. Melphalan for Injection	218. Mesalamine Suppositories	219. Mesoridazine Besylate Concentrate
220. Metaraminol Bitartrate Injection	221. Methacholine Chloride for Inhalation Solution	222. Methadone Hydrochloride Oral Concentrate
223. Methocarbamol and Aspirin Tablets	224. Methoxsalen Softgels	225. Methyclothiazide and Deserpidine Tablets
226. Methylphenidate Hydochloride Chewable Tablets	227. Metipranolol Ophthalmic Solution	228. Metronidazole Cream
229. Metronidazole Extended-Release Tablets	230. Metronidazole Hydrochloride for Injection	231. Metronidazole Lotion
232. Miconazole Nitrate Topical Aerosol	233. Mifepristone Tablets	234. Miglitol Tablets
235. Milrinone Injection	236. Misoprostol Tablets ***(Received)***	237. Moexipril Hydrochloride and Hydrochlorothiazide Tablets
238. Moexipril Hydrochloride Tablets	239. Molindone Hydrochloride Oral Solution	240. Morphine Sulfate for Injection Concentrate
241. Morphine Sulfate Oral Solution	242. Morphine Sulfate Oral Solution Concentrate	243. Morphine Sulfate Tablets
244. Nalbuphine Hydrochloride Injection	245. Mycophenolate Mofetil Oral Solution	246. Nalmefene Hydrochloride Injection
247. Naphazoline Hydrochloride and Pheniramine Maleate Ophthalmic Solution	248. Naproxen Sodium Extended-Release Tablets	249. Nedocromil Sodium Inhalation Aerosol
250. Neomycin Sulfate Oral Powder	251. Nicardipine Hydrochloride Capsules	252. Nilutamide Tablets
253. Nimodipine Capsules	254. Nisoldipine Extended-Release Tablets	255. Nitroglycerin Solution In Acrylic Adhesive

Small Molecules (Drug Products)—As of February 20, 2009 *(Continued)*

256. Nitroglycerin Transdermal System	257. Nizatidine Tablets	258. Ofloxacin In Dextrose Injection
259. Ofloxacin Injection	260. Olsalazine Sodium Capsules	261. Orphenadrine Citrate Extended Release Tablets ***(Received)***
262. Orphenadrine Citrate, Aspirin, and Caffeine Tablets	263. Oxcarbazepine Suspension	264. Oxiconazole Cream
265. Pamidronate Disodium Injection	266. Pantoprazole Sodium for Injection	267. Pantoprazole Sodium Tablets
268. Paroxetine Hydrochloride Extended-Release Tablets	269. Paroxetine Oral Suspension	270. Pemirolast Potassium Ophthalmic Solution
271. Penicillin G Potassium Tablets for Oral Solution	272. Pentamidine Isethionate for Inhalation	273. Pentamidine Isethionate Injection ***(Received)***
274. Pentazocine Hydrochloride and Acetaminophen Tablets	275. Phendimetrazine Tartrate Extended-Release Capsules	276. Phenobarbital Capsules
277. Phentermine Resin Complex Capsules	278. Phenylephrine Hydrochloride and Chlorpheniramine Maleate Extended-Release Capsules	279. Phenylephrine Hydrochloride, Chlorpheniramine Maleate, and Acetaminophen Extended-Release Tablets
280. Pilocarpine Hydrochloride Ophthalmic Gel	281. Pilocarpine Hydrochloride Ophthalmic Ointment	282. Pioglitazone Hydrochloride Tablets ***(Received)***
283. Piperonyl Butoxide and Pyrethrins Aerosol Foam	284. Pirbuterol Acetate Inhalation Aerosol	285. Poractant Alpha Suspension
286. Porfimer Sodium for Injection	287. Povacrylate Solution	288. Povacrylate–Iodine Topical Solution
289. Povidone–Iodine Gauze	290. Povidone-Iodine Swabsticks	291. Povidone–Iodine Topical Aerosol Foam
292. Povidone–Iodine Vaginal Suppositories	293. Pramipexole Dihydrochloride Tablets	294. Prednisolone Sodium Phosphate Oral Solution
295. Prochlorperazine Maleate Extended-Release Capsules	296. Progesterone Capsules	297. Propafenone Hydrochloride Tablets
298. Pseudoephedrine Hydrochloride and Brompheniramine Maleate Extended-Release Tablets	299. Pseudoephedrine Hydrochloride and Naproxen Sodium Extended-Release Tablets	300. Pseudoephedrine Hydrochloride, Chlorpheniramine Maleate, and Codeine Phosphate Oral Solution
301. Pseudoephedrine Hydrochloride, Guaifenesin, and Codeine Phosphate Oral Solution	302. Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Extended-Release Tablets	303. Pseudoephedrine Sulfate and Dexbrompheniramine Maleate Oral Solution
304. Pseudoephedrine Sulfate, Dexbrompheniramine Maleate, and Acetaminophen Extended-Release Tablets	305. Pyrilamine Maleate Injection	306. Quinapril Hydrochloride and Hydrochlorothiazide Tablets
307. Quinidine Sulfate Injection	308. Ramipril Capsules ***(Received)***	309. Ranitidine Capsules
310. Rauwolfia Serpentina and Endroflumethiazide Tablets	311. Reserpine and Polythiazide Tablets	312. Rimantadine Hydrochloride Oral Solution
313. Risperidone Oral Solution ***(Received)***	314. **Risperidone Orally Disintegrating Tablets** ***(Received)***	315. Rivastigmine Tartrate Capsules ***(Received)***
316. Rivastigmine Tartrate Oral Solution ***(Received)***	317. Rocuronium Bromide Injection	318. Ropinirole Hydrochloride Tablets
319. Rosiglitazone Maleate Tablets	320. Salicylic Acid and Sulfur Cleansing Lotion	321. Salicylic Acid and Sulfur Lotion
322. Salicylic Acid and Sulfur Shampoo	323. Salicylic Acid Cream	324. Salicylic Acid Ointment
325. Salmeterol Inhalation Aerosol	326. Salmeterol Xinafoate Inhalation Powder	327. Scopolamine Transdermal System
328. Selegiline Hydrochloride Capsules	329. Sertraline Hydrochloride Oral Solution	330. Sibutramine Hydrochloride Capsules
331. Sodium Bicarbonate and Sodium Citrate for Oral Solution	332. Sodium Bicarbonate, Sodium Citrate, and Sodium Tartrate for Oral Suspension	333. Sodium Iodide Injection
334. Sodium Phenylbutyrate Oral Powder	335. Sodium Phenylbutyrate Tablets	336. Sodium Phosphates for Oral Suspension
337. Sodium Phosphates Tablets	338. Sodium Salicylate and Sulfur Shampoo	339. Sterile Talc Aerosol
340. Streptozocin for Injection	341. Sucralfate Oral Suspension	342. Sulconazole Nitrate Cream
343. Sulfacetamide Sodium and Fluorometholone Ophthalmic Suspension	344. Sulfacetamide Sodium and Prednisolone Sodium Phosphate Ophthalmic Solution	345. Sulfasalazine Oral Suspension
346. Sulisobenzone Lotion	347. Sumatriptan Injection	348. Sumatriptan Tablets ***(Received)***

Small Molecules (Drug Products)—As of February 20, 2009 *(Continued)*

349. Tacrolimus Injection	350. Tacrolimus Ointment	351. Technetium Tc 99m Teboroxime Injection
352. Tenofovir Disoproxil Fumarate Tablets ***(Received)***	353. Terazosin Capsules ***(Received)***	354. Terazosin Tablets ***(Received)***
355. Terbinafine Hydrochloride Cream	356. Terbinafine Tablets ***(Received)***	357. Terbinafine Topical Solution
358. Terconazole Vaginal Cream	359. Terconazole Vaginal Suppositories	360. Testosterone Transdermal Gel
361. Testosterone Transdermal System	362. Tetracycline Hydrochloride Periodontal Fiber	363. Theophylline Extended-Release Tablets
364. Tioconazole Vaginal Ointment	365. Tiopronin Tablets	366. Tolnaftate Topical Aerosol Solution
367. Topiramate Capsules ***(Received)***	368. Torsemide Injection	369. Torsemide Tablets ***(Received)***
370. Trandolapril and Verapamil Hydrochloride Extended-Release Tablets	371. Trandolapril Tablets	372. Tranexamic Acid Injection
373. Tretinoin Capsules	374. Tretinoin Microsphere Gel	375. Triamcinolone Acetonide Nasal Suspension
376. Trifluridine Ophthalmic Solution	377. Trimetrexate for Injection	378. Trimipramine Maleate Capsules
379. Triprolidine and Pseudoephedrine Hydrochlorides and Codeine Phosphate Syrup	380. Trolamine Salicylate Cream	381. Trolamine Salicylate Gel
382. Trolamine Salicylate Topical Emulsion	383. Undecylenic Acid Topical Foam Aerosol	384. Urea Cream
385. Vecuronium Bromide for Injection	386. Venlafaxine Extended-Release Capsules ***(Received)***	387. Venlafaxine Tablets ***(Received)***
388. Verapamil Hydrochloride Capsules	389. Verapamil Hydrochloride Extended-Release Capsules	390. Voriconazole Injection
391. Voriconazole Oral Suspension	392. Voriconazole Tablets	393. Yttrium Y-90 Chloride Solution
394. Yttrium Y-90 Glass Microspheres	395. Yttrium Y-90 Microspheres Injection	396. Zaleplon Capsules
397. Zidovudine and Lamivudine Tablets ***(Received)***	398. Zinc Acetate Capsules	399. Zinc Tridosium Pentetate Injection
400. Ziprasidone Hydrochloride Capsules	401. Zoledronic Acid for Injection	402. Zonisamide Capsules ***(Received)***

Excipients—As of February 20, 2009

1. Acetone Sodium Bisulfite	2. Acetylated Monoglycerides	3. Aconitic Acid (Achilleic Acid)
4. Acrylic Acid–Octyl Acrylate Copolymer	5. Albumin Colloidal	6. Aliphatic Polyesters
7. Allantoin–Sodium Pyrrolidone Carboxylate	8. Aluminum Ammonium Sulfate	9. Aluminum Lactate
10. Aluminum Oxide	11. Aluminum Potassium Sulfate	12. Aluminum Silicate
13. Aluminum Sodium Sulfate	14. Aluminum Stearate	15. Ammonium Bicarbonate
16. Ammonium Calcium Alginate	17. Ammonium Phosphate	18. Batylalcohol Monostearate

INTERIM REVISION ANNOUNCEMENT

In this section readers will find the following:
- The list of new USP Reference Standards that have become available
- The list of assays or tests that are adopted but held in abeyance pending availability of required USP Reference Standards
- Newly adopted (official) revisions to the *USP–NF* that become effective before the effective date of the next *Supplement* or that were not ready for adoption by the closing date for the upcoming *Supplement*. (The effective date for these revisions is stated on the next page.)

Readers should review this section to determine if they are affected by any of the changes.

Symbols—New text is enclosed in symbols and set off from the current official text as shown in the following example: •new text•

Where the symbols appear together with no enclosed text, such as ••, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the issue of a given *PF* volume.

Errata—Errata are considered to be text, erroneously published in the *USP–NF* or its *Supplements,* that does not accurately reflect the intended official requirements of the Council of Experts. Beginning with *PF* 35(2), Errata will be published both in the *Pharmacopeial Forum* and on the usp.org website. At the end of the *Interim Revision Announcement* section in this publication is a list of errata and corrections to *USP 32–NF 27*. The page number indicates where the item is found in *USP–NF.* Errata are updated as necessary in each *Pharmacopeial Forum* issue and monthly on the usp.org website. This information will also be cumulative in future *Supplements,* and will appear in its corrected form in the next annual edition of *USP–NF.* The list of Errata has been relocated to www.usp.org, where updates will be posted monthly.

INTERIM REVISION ANNOUNCEMENT to *USP 32* and to *NF 27*

By authority of the United States Pharmacopeial Convention, Inc.
Prepared by the Council of Experts and published by the Board of Trustees

John W. Mauger, *Chair*
USP Board of Trustees

Roger L. Williams, M.D., *Executive Vice President, CEO,* and *Chairman, USP Council of Experts*

Darrell R. Abernethy, M.D., Ph.D., *Chief Science Officer*
William F. Koch, Ph.D., FACB, *Chief Metrology Officer*

Released May 1, 2009 **Official June 1, 2009**

All inquiries and comments regarding *USP 32* text and *NF 27* text should be addressed to the Executive Secretariat, *USP–NF*, 12601 Twinbrook Parkway, Rockville, MD 20852 (execsec@usp.org).

New USP Reference Standards

The following USP Reference Standards, which were not available when the associated monograph was made official, have since become available. The respective official date of each *USP 32* or *NF 27* standard, test, or assay requiring the use of the following USP Reference Standards is indicated in parentheses after the name of the Reference Standard.

USP 23-Epi-26-deoxyactein RS (January 1, 2009)
USP Actein RS (January 1, 2009)

Unavailable First-Time Official USP Reference Standards

The official dates of any *USP 32* or *NF 27* standards, tests, or assays requiring the use of the following new USP Reference Standards are postponed until further notice pending availability of the respective Reference Standards. This listing was updated as of February 6, 2009. Please refer to the current USP Catalog for a more up-to-date availability list. The USP Catalog can be accessed on-line at http://www.uspcatalog.com.

USP Acarbose RS
USP Acarbose System Suitability Mixture RS
USP *S*-Adenosyl-L-homocysteine RS
USP Albumin Human RS
USP Alteplase RS
USP Amifostine RS
USP Amifostine Thiol RS
USP Antithrombin III Human RS
USP Aprotinin RS
USP Aprotinin System Suitability RS

USP Sargramostim RS
USP Sincalide RS
USP Valrubicin Related Compound A RS
USP Vasopressin RS

MONOGRAPHS (USP)

Amantadine Hydrochloride Capsules

Add the following:

•**Labeling—**When more than one *Dissolution Test* is given, the labeling states the *Dissolution Test* used only if *Test 1* is not used.•$_3$

Change to read:

Dissolution •$_3$⟨711⟩•—

•TEST 1—*Procedure for a Pooled Sample*.•$_3$
Medium: water; 900 mL.
Apparatus 1: 100 rpm.
Time: 45 minutes.
Internal standard solution—Dissolve an accurately weighed quantity of naphthalene in hexane to obtain a solution having a known concentration of about 0.054 mg per mL.
Standard solution—Dissolve an accurately weighed quantity of USP Amantadine Hydrochloride RS in water to obtain a solution having a known concentration of about 0.1 mg per mL. Pipet 15.0 mL of this solution into a 50-mL screw-capped test tube, add 5.0 mL of 5 N sodium hydroxide and 10.0 mL of *Internal standard solution*, and shake for 60 minutes. Collect the hexane layer.
Test solution—Filter 15.0 mL of the solution under test and place into a 50-mL screw-capped test tube. Pipet 5.0 mL of 5 N sodium hydroxide and 10.0 mL of the *Internal standard solution* into the test tube, and shake for 60 minutes. Collect the hexane layer (*Test solution*).
Chromatographic system—Proceed as directed in the *Assay*.
Procedure—Separately inject equal volumes (about 2.5 µL) of the *Standard solution* and the *Test solution*. Record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $C_{10}H_{17}N \cdot HCl$ dissolved.
Tolerances—Not less than 75% *(Q)* of the labeled amount of $C_{10}H_{17}N \cdot HCl$ is dissolved in 45 minutes.
•TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.
Medium: water; 900 mL.
Apparatus 2: 75 rpm, with sinkers. [NOTE—A suitable sinker is available as catalog number CAPWHT-2S from www.QLA-LLC.com or www.tabletdissolution.com or www.labhut.com.]
Time: 45 minutes.
Standard stock solution—Dissolve an accurately weighed quantity of USP Amantadine Hydrochloride RS in *Medium* to obtain a solution with a final concentration of about 0.12 mg per mL.
Internal standard solution—Dissolve an accurately weighed quantity of naphthalene in hexanes to obtain a solution having a final concentration of about 0.06 mg per mL.
Working standard solution—Transfer 60.0 mL of the *Standard stock solution* to a 200-mL volumetric flask. Add 20 mL of 5 N sodium hydroxide and 40.0 mL of *Internal standard solution*. Shake the flask for approximately 10 minutes, and allow the layers to separate. Use the top layer for injection. The final concentration is about 0.18 mg per mL.
Test solution—Transfer 3.0 mL of the solution under test to a centrifuge tube. Add 1.0 mL of 5 N sodium hydroxide and 2.0 mL of *Internal standard solution*. Shake the tube for approximately 10 minutes, and allow the layers to separate. Use the top layer for injection.
Chromatographic system (see *Chromatography* ⟨621⟩)— The gas chromatograph is equipped with a flame-ionization detector and a 0.32-mm × 30-m column that contains 0.25-µm film of phase G1. The oven temperature is set at 100° for 3 minutes, then increased at a rate of 10° per minute to 200°, and held at 200° for 2 minutes. The injector temperature is maintained at 250°, and the detector at 300°. The carrier gas is helium flowing at a rate of 1.4 mL per minute, and the split flow rate is 20 mL per minute. Chromatograph the *Working standard solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between naphthalene and amantadine hydrochloride is not less than 2; the tailing factor for the amantadine hydrochloride peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.
Procedure—Separately inject equal volumes (about 2 µL) of the *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses for all the peaks. Calculate the percentage of $C_{10}H_{17}N \cdot HCl$ dissolved by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times L}$$

in which A_U is the ratio of the peak areas obtained from the *Test solution*; C_S is the concentration, in mg per mL, of amantadine hydrochloride in the *Standard stock solution*; A_S is the average ratio of the peak areas obtained from the *Working standard solution*; 900 is the volume, in mL, of *Medium*; 100 is the conversion factor to percentage; and *L* is the Capsule label claim in mg.
Tolerances—Not less than 75% (*Q*) of the labeled amount of $C_{10}H_{17}N \cdot HCl$ is dissolved in 45 minutes.•$_3$

Bupropion Hydrochloride Extended-Release Tablets

Change to read:

Dissolution ⟨711⟩—

FOR PRODUCTS LABELED FOR DOSING EVERY 12 HOURS—
TEST 1—
Medium: water; 900 mL.
Apparatus 2: 50 rpm.
Times: 1, 4, and 8 hours.
Procedure—Determine the amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 298 nm, using a 1.0-cm cell, on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Bupropion Hydrochloride RS in the same *Medium.*
Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 25% and 45%
4	between 60% and 85%
8	not less than 80%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.
Medium: 0.1 N hydrochloric acid, pH 1.5 (prepared by transferring about 50 mL of concentrated hydrochloric acid to 6000 mL of water, adding about 18 g of sodium hydroxide, mixing, and adjusting with either diluted sodium hydroxide or hydrochloric acid to a pH of 1.5 ± 0.05); 900 mL, deaerated.
Apparatus 1: 50 rpm.

Times: 1, 2, 4, and 6 hours.

Determine the percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved by employing the following method.

Buffer solution—Dissolve 3.45 g of monobasic sodium phosphate monohydrate in 996 mL of water, add 4.0 mL of triethylamine, and mix. Adjust with phosphoric acid to a pH of 2.80 ± 0.05.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and methanol (65 : 35). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Dissolve an accurately weighed quantity of USP Bupropion Hydrochloride RS in *Medium,* and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration similar to the one expected in the *Test solution.*

Test solution—Use portions of the solution under test, and pass through a 0.45-μm nylon filter.

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 298-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 2000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of bupropion hydrochloride dissolved at each time point.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 25% and 50%
2	between 40% and 65%
4	between 65% and 90%
6	not less than 80%

TEST 3—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3.*

Medium, Apparatus, and *Procedure*—Proceed as directed for *Test 1,* except using the wavelength of about 250 nm.

Times: 1, 2, 4, and 6 hours.

Tolerances: The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 30% and 55%
2	between 50% and 75%
4	between 70% and 90%
6	not less than 80%

TEST 5—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5.*

Medium and *Procedure*—Proceed as directed for *Test 1.*

Apparatus—Proceed as directed for *Test 1,* except to use a 0.5-cm cell.

Times: 1, 3, and 6 hours.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 35% and 55%
3	between 65% and 85%
6	not less than 80%

•TEST 7—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 7.*

Medium, Apparatus 1, and *Times*—Proceed as directed for *Test 2,* including the quantitative chromatographic method, but using as the *Mobile phase* a mixture of *Buffer solution* with methanol (55 : 45).

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 25% and 50%
2	between 45% and 70%
4	not less than 70%
6	not less than 80%

•5

FOR PRODUCTS LABELED FOR DOSING EVERY 24 HOURS—

TEST 4—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

Medium: 0.1 N hydrochloric acid; 900 mL, deaerated.

Apparatus 1: 75 rpm.

Time: 2, 4, 8, and 16 hours.

Procedure—Determine the amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 252 nm, using a 1.0-mm cell, on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Bupropion Hydrochloride RS in the same *Medium.*

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
2	not more than 20%
4	between 20% and 45%
8	between 65% and 90%
16	not less than 80%

TEST 6—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 6*.

Medium and *Apparatus:* Proceed as directed for *Test 4*.

Times: 1, 2, 4, 8, and 12 hours.

Procedure—Determine the amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 298 nm, using a 1.0-cm cell, on filtered portions of the solution under test, suitably diluted with *Medium,* if necessary, in comparison with a Standard solution having a known concentration of USP Bupropion Hydrochloride RS in the same *Medium.*

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1	between 15% and 35%
2	between 25% and 50%
4	between 40% and 65%
8	between 65% and 90%
12	not less than 80%

•TEST 8—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 8*.

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 1: 75 rpm.

Times: 2, 4, 8, and 16 hours.

Standard solution—

FOR TABLETS LABELED TO CONTAIN 150 MG—Prepare a solution containing about 0.1667 mg of USP Buproprion Hydrochloride RS per mL in *Medium*.

FOR TABLETS LABELED TO CONTAIN 300 MG—Prepare a solution containing about 0.3333 mg of USP Bupropion Hydrochloride RS per mL in *Medium*.

Test solution—Pass a portion of the solution under test through a suitable filter having a porosity of 0.45 μm.

Procedure—Determine the percentage of bupropion hydrochloride dissolved by employing UV absorption at the wavelength of maximum absorbance at about 298 nm on portions of the *Test solution* in comparison with the *Standard solution*, using *Medium* as the blank.

Tolerances—The percentages of the labeled amount of $C_{13}H_{18}ClNO \cdot HCl$ dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
2	not more than 10%
4	between 10% and 35%
8	between 45% and 75%
16	not less than 80%

ERRATA

Following is a list of errata and corrections to *USP–NF*. The page number indicates where the item is found and in which official or pending official publication of *USP–NF*. If necessary, this list will be updated with every issue of *PF*. This information will also be available as a cumulative table in future *Supplements* and will appear in its corrected form in a future annual edition of *USP–NF*. Errata are considered to be items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirement. USP staff is available to respond to questions regarding the accuracy of a particular requirement by calling 1-800-822-USPC.

***USP32–NF27* Page**	**Title**	**Section**	**Description**
900	*Description and Solubility*	*Citalopram Hydrobromide*	Line 2: Change ''Freely soluble in water, in alcohol, and in chloroform.'' to: Soluble in alcohol and sparingly soluble in water.
969	*Calcium and Vitamin D with Minerals Tablets*	*Assay for copper*	Line 3 under *Assay preparation*: Replace ''Proceed as directed for *Assay preparation* in the *Assay for calcium* under *Calcium with Vitamin D Tablets*, except to prepare the *Assay preparation* to contain 2 μg of copper per mL and to omit the use of the *Lanthanum chloride solution*.'' with: Heat for 6 to 12 hours in a muffle furnace maintained at about 550°, and cool. Add about 15 mL of hydrochloric acid, and boil gently on a hot plate or a steam bath for about 30 minutes, intermittently rinsing the inner surface of the crucible with 6 N hydrochloric acid. Cool, and quantitatively transfer the contents of the crucible to a 100-mL volumetric flask, rinsing the crucible with portions of 6 N hydrochloric acid. Dilute the contents of the flask with water to volume, mix, and filter, discarding the first 5 mL of the filtrate. Dilute the filtrate quantitatively, and stepwise if necessary, with 0.125 N hydrochloric acid to obtain a solution having a concentration of about 2 μg of copper per mL.
		Assay for manganese	Line 4 under *Assay preparation*: Replace ''Proceed as directed for *Assay preparation* in the *Assay for calcium* under *Calcium with Vitamin D Tablets*, except to prepare the *Assay preparation* to contain 1 μg of manganese per mL and to omit the use of the *Lanthanum chloride solution*.'' with: Heat for 6 to 12 hours in a muffle furnace maintained at about 550°, and cool. PROPOSED INTERIM REVISION ANNOUNCEMENTS

This section includes proposals for *Interim Revision Announcements* (*IRAs*) that will be published as official *USP* or *NF* standards. There is a 60-day comment period for these proposals, beginning on the 15th of the first month of this *Pharmacopeial Forum*. The approved official text will be published in a future *Pharmacopeial Forum* and additionally in the ''New Official Text'' section of USP's web site (www.usp.org). Readers should review material in this section and provide comments to the Scientific Liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Expert Committee members can consider reader's input as they are deciding whether to advance standards to official status.

Each proposal is preceded by a Briefing that indicates the proposed revisions.

MONOGRAPHS (USP)

BRIEFING

Budesonide, *USP 32* page 1714. On the basis of comments received, it is proposed to make the following changes under the test for *Limit of 11-ketobudesonide*:

1. Remove the resolution requirements as part of the system suitability. Comments were received indicating that the resolution cannot be established due to the absence of signal for 14,15-dehydrobudesonide and 21-dehydrobudesonide.
2. Add a requirement that the *Mobile phase* be pre-heated in order to stabilize the retention times. Subject to consideration of comments received, it is proposed to implement this change via the *Fifth Interim Revision Announcement* pertaining to *USP 32–NF 27* in *PF* 35(5) [Sept.–Oct. 2009] with an official date of October 1, 2009. Comments regarding this proposal should be received by July 15, 2009.

(MD-PS: D. Vicchio) RTS—C43834

Change to read:

Limit of 11-ketobudesonide—

Buffer solution—Proceed as directed in the *Assay.*

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution,* acetonitrile, and isopropanol (65 : 26 : 9). Make adjustments if necessary (see *System Suitability* under *Chromatography* ⟨621⟩).

Standard solution—Prepare as directed for *Standard preparation* in the *Assay.*

Test solution—Proceed as directed for the *Assay preparation.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 3.5-µm packing L1. The flow rate is about 1.5 mL per minute.

•Pre-heat the *Mobile phase* to 50° and•$_{5}$ maintain the column at 50°. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the relative retention times are about 0.73 and 0.78, respectively, for the two epimers of 11-ketobudesonide, about 0.68 for 21-dehydrobudesonide, about 0.84 for 14,15-dehydrobudesonide, and 1.0 for the first eluted epimer of budesonide (epimer B). ~~; the resolution, *R,* between the first epimer of 11-ketobudesonide and 21-dehydrobudesonide is not less than 1.0 and between the second epimer of 11-ketobudesonide and 14,15-dehydrobudesonide is not less than 1.2; and~~

••$_{5}$ The column efficiency is not less than 5500 theoretical plates, determined from the budesonide epimer B peak.

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of 11-ketobudesonide in the portion of Budesonide taken by the formula:

$$100(r_i / r_U)$$

in which r_i is the sum of the areas of the two ketobudesonide peaks; and r_U is the sum of the areas of the two budesonide peaks; not more than 0.2% of 11-ketobudesonide is found.

Change to read:

Related compounds—

Buffer solution and *Mobile phase*—Proceed as directed in the *Assay.*

Standard solution—Prepare as directed for the *Standard preparation* in the *Assay.*

Test solution—Proceed as directed for the *Assay preparation.*

Chromatographic system (see *Chromatography* ⟨621⟩)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution,* and record the peak responses as directed for *Procedure:* the column efficiency is not less than 5500 theoretical plates, determined from the budesonide epimer B peak.

Procedure—Inject a volume (about 20 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Budesonide taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak area response for each impurity; and r_s is the sum of the responses of all the peaks: the impurities meet the requirements listed in the *Table* below.

Compound Name	Relative Retention Time	Limit (%)
16α-Hydroxylprednisolone[1]	0.11	0.2
D-Homobudesonide[2]	0.36	0.10
21-Dehydrobudesonide (epimers)[3]	0.61; 0.66	0.07
14,15-Dehydrobudesonide[4]	0.86	■*■$_{2S}$ *(USP32)* 0.10
Total specified impurities	—	0.4
Any other individual impurity	—	■^{5}■$_{2S}$ *(USP32)* 0.10
Total unspecified impurities	—	0.4

■^{5} Total specified impurities includes 11-ketobudesonide obtained in the test for *Limit of 11-ketobudenoside* and the impurities listed above.■$_{2S}$ *(USP32)*

Proposed IRA

BRIEFING

Nefazodone Hydrochloride, *USP 32* page 3043. On the basis of comments received, it is proposed to revise *Identification* test *B* to change the solvent from water to methanol because of the slightly soluble nature of the drug substance in water. Subject to consideration of comments received during the comment period, it is proposed to implement this revision via an *Interim Revision Announcement* pertaining to *USP 32–NF 27* in *PF* 35(5) [Sept.–Oct. 2009], with an official date of October 1, 2009. Comments regarding this proposal should be received by July 15, 2009.

(MD-PP: R. Ravichandran) RTS—C72911

Proposed IRA

IN-PROCESS REVISION

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) items that previously appeared under *Pharmacopeial Previews* and are now formally proposed as revisions, (2) proposed revisions placed directly under *In-Process Revision,* or (3) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the staff liaison (use the *Staff Directory* to find the contact information). Information on how to comment is found in the *Policies and Announcements* section. It is important to send comments promptly so that the Committee members can consider readers' input as they are deciding whether to advance standards to official status.

Briefings Each Proposal is preceded by a Briefing in the following format:

BRIEFING

> **Name of Item**, citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Committee designation (see *How to Use PF*), the name of the scientific staff liaison who handled the particular issue, and the USP tracking correspondence number, as shown in the example below:
>
> (DSN: L. Evans.) RTS—C55678

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed off. New text (if any) follows, and is enclosed in symbols and set off from the current official text by a paragraph break and by larger type (print edition only), as shown in the examples below:

•new text•

if slated for an *Interim Revision Announcement to USP 30–NF 25* (*IRA*);

▲new text▲$_{USP31}$

if slated for *USP 31–NF 26*; and

■new text■

if slated for a *Supplement to USP–NF*. The same symbols *not* set off by an extra paragraph break and enclosing text with no increase in type size indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as •• or ■■ or ▲▲, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA* or *Supplement* or indicates the *USP* or *NF* as the publication where the revision will appear if approved. For example, •$_2$ indicates that the revision is proposed for the *Interim Revision Announcement* that will appear in issue 2 of a given *PF* volume, ■2S ($_{USP\ 30}$) indicates that the proposed revision is slated for the *Second Supplement to USP 30*, and ▲$_{USP31}$ and ▲$_{NF26}$ indicate that the revisions are proposed for *USP 31* and *NF 26*, respectively.

Official Title Changes Where the specification ''***Monograph title change***'' is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

MONOGRAPHS (USP)

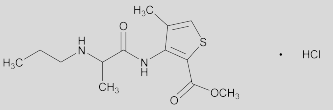
BRIEFING

Articaine Hydrochloride. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on the current *European Pharmacopoeia*, version 6.2, 6th edition, is being proposed. The liquid chromatographic procedure in the test for *Organic Impurities* is based on analyses performed with a Symmetry C18, 4.6-mm × 25-cm, brand of L1 column. The typical retention time for articaine under these conditions is about 9.3 min.

(MD-PS: H. Ramanathan.) RTS—C57726

Add the following:

▪Articaine Hydrochloride



$C_{13}H_{20}N_2O_3S \cdot HCl$ 320.84

2-Thiophenecarboxylic acid, 4-methyl-3-[[1-oxo-2-(propylamino)propyl]amino]-, methyl ester, monohydrochloride;
Methyl 4-methyl-3-[2-(propylamino)propionamido]-2-thiophenecarboxylate, monohydrochloride [23964-57-0].

DEFINITION

Articaine Hydrochloride contains NLT 98.5% and NMT 101.0% of $C_{13}H_{20}N_2O_3 \cdot HCl$, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION ⟨197⟩**
  Standard solution: 12 mg/mL of USP Articaine RS in methylene chloride. Transfer 20 µL of this solution onto a 300-mg disk.
  Sample solution: Dissolve 100 mg of Articaine Hydrochloride in 5 mL of water. Add 3 mL of a saturated solution of sodium bicarbonate, and shake twice with 2 mL of methylene chloride. Combine the methylene chloride layers, dilute with methylene chloride to 5.0 mL, and dry over anhydrous sodium sulphate. Transfer 20 µL of this solution onto a 300-mg disk.
- **B. IDENTIFICATION TESTS—GENERAL,** *Chloride* ⟨191⟩

ASSAY

- **PROCEDURE**
  Sample solution: 250 mg of Articaine Hydrochloride to a 250-mL conical flask. Add 5.0 mL of 0.01 M hydrochloride acid and 50 mL of alcohol. Stir to dissolve.
  Analysis: Titrate with 0.1 M sodium hydroxide VS, determining the endpoint potentiometrically, using a glass electrode. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1 M sodium hydroxide is equivalent to 32.08 mg of $C_{13}H_{20}N_2O_3 \cdot HCl$.

Acceptance criteria: 98.5%–101.0%

IMPURITIES

Inorganic Impurities

- **HEAVY METALS,** *Method I* ⟨231⟩
  Sample solution: 200 mg/mL of Articaine Hydrochloride
  Acceptance criteria: NMT 5 ppm
- **RESIDUE ON IGNITION ⟨281⟩**
  Sample: 1 g
  Acceptance criteria: NMT 0.1%

Organic Impurities

- **PROCEDURE**
  Buffer solution: 2.02 g of sodium 1-heptanesulfonate and 4.08 g of potassium dihydrogen phosphate in 1 L of water. Adjust with phosphoric acid to a pH of 2.0.
  Mobile phase: Acetonitrile and *Buffer solution* (1:3)
  System suitability solution: 1.0 mg/mL of USP Articaine Hydrochloride RS, 2 µg/mL of USP Articane Related Compound A RS, and 1 µg/mL of USP Articaine Related Compound E RS, in *Mobile phase*
  Standard solution: 2 µg/mL of USP Articaine Related Compound A , and 1 µg/mL each of USP Articaine Related Compound E RS and USP Articaine Hydrochloride RS in *Mobile phase.* [NOTE—This solution is also used to determine the reporting threshold limit.]
  Sample solution: 1.0 mg/mL of Articaine Hydrochloride in *Mobile phase*
  Chromatographic system
  (See *Chromatography* ⟨621⟩.)
  Mode: LC
  Detector: UV 276 nm
  Column: 4.6-mm × 25-cm column; packing L1
  Temperature: 45°
  Flow rate: 1 mL/min
  Injection size: 10 µL
  System suitability
  Sample: *System suitability solution*
  Suitability requirements
  Resolution: NLT 1.2 between articaine related compound A and articaine related compound E
  Analysis
  Samples: *Standard solution* and *Sample solution* [NOTE—Run time is 5 times the retention time of articaine.]
  Calculate the percentage of any articaine related compound A in the portion of Articaine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = response of articaine related compound A from the *Sample solution*
r_S = response of articaine related compound A from the *Standard solution*
C_S = concentration of articaine related compound A in the *Standard solution* (mg/mL)
C_U = concentration of Articaine Hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of each individual impurity in the portion of Articaine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = response of each individual impurity from the *Sample solution*
r_S = response of articaine hydrochloride from the *Standard solution*
C_S = concentration of USP Articaine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = concentration of Articaine Hydrochloride in the *Sample solution* (mg/mL)

In-Process Revision

[NOTE— Disregard any peak below 0.05%.]
Acceptance criteria
Individual impurities: See *Impurity Table 1*.
Total impurities: NMT 0.5%

Impurity Table 1

  Sample solution: 0.01 mg/mL of Atenolol in *Mobile phase*
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 226 nm
  Column: 3.9-mm × 30-cm; packing L1
  Flow rate: 0.6 mL/min
  Injection size: 10 µL
  System suitability
  Sample: *Standard solution*
  Suitability requirements
  Column efficiency: NLT 5000 theoretical plates
  Tailing factor: NMT 2.0
  Relative standard deviation: NMT 2.0%
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of $C_{14}H_{22}N_2O_3$ in the portion of Atenolol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Atenolol RS in the *Standard solution* (mg/mL)

In-Process Revision

C_U = concentration of Atenolol in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0%

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION ⟨281⟩:** NMT 0.2%
- **CHLORIDE AND SULFATE,** *Chloride* **⟨221⟩**

Sample solution: 10 mg/mL in 0.15 N nitric acid, made to 100 mL

Acceptance criteria: Shows no more turbidity with 1 mL of silver nitrate TS than 1.4 mL of 0.020 N hydrochloric acid in 100 mL of 0.15 N nitric acid (0.1%)

Organic Impurities

- **PROCEDURE**

Mobile phase: Prepare as directed in the *Assay*.

Sample solution 1: 0.1 mg/mL of Atenolol in *Mobile phase*

Sample solution 2: 0.005 mg/mL Atenolol, made from *Sample solution 1* diluted with *Mobile phase*

Chromatographic system: Proceed as directed in the *Assay*, except use the injection size listed below.

Injection size: 50 µL

Analysis

Samples: *Sample solution 1* and *Sample solution 2*

[NOTE—Chromatograph *Sample solution 1* for a period of time that is 6 times the retention time of the atenolol peak.]

Calculate the percentage of each impurity observed in the chromatogram obtained from the *Sample solution 1*:

$$\text{Result} = 0.5(r_i/r_A)$$

r_i = peak response of any individual impurity in *Sample solution 1*

r_A = peak response of Atenolol in *Sample solution 2*

Acceptance criteria

Individual impurities: NMT 0.25%

Total impurities: NMT 0.5%

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE,** *Class I* **⟨741⟩:** 152°–156.5°
- **LOSS ON DRYING ⟨731⟩:** Dry it at 105° to constant weight: it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.
- **USP REFERENCE STANDARDS ⟨11⟩**

USP Atenolol RS

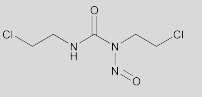
BRIEFING

Carmustine. Because there is no existing *USP* monograph for this drug substance, a new monograph based on the validated methods of analysis is being proposed. The liquid chromatographic procedures used in the test for *Procedure 2: Limit of Carmustine Related Compound A* and in the *Assay* are based on analyses performed with a Waters Spherisorb ODS2, 5-µm brand of L1 column. The typical retention times reported for carmustine related compound A and carmustine are about 2 and 8 min, respectively. The thin-layer chromatographic procedure in the test for *Procedure 3: Limit of 2-Chloroethylamine* is based on the analysis performed with E. Merck analytical glass plate coated with silica gel 60. The typical R_f values for 2-chloroethylamine monohydrochloride and carmustine are about 0.2 and 0.9, respectively. The gas chromatographic procedure in the test for the *Procedure 4: Limit of 2-Chloroethanol* is based on analysis performed with the J & W DB-WAX brand of G14 column. The typical retention time reported for 2-chloroethanol is about 15 min. The gas chromatographic procedure in the test for the *Procedure 5: Limit of Acetaldehyde* is based on analysis performed with the J & W DB-1 brand of G1 column. The typical retention time reported for acetaldehyde is about 15 min.

(MD-OOD: F. Mao.) RTS—C44603

Add the following:

▪Carmustine



$C_5H_9Cl_2N_3O_2$ 214.05

Urea, *N*,*N*′-bis(2-chloroethyl)-*N*-nitroso-;
1,3-Bis(2-chloroethyl)-1-nitrosourea [154-93-8].

DEFINITION

Carmustine contains NLT 98.0% and NMT 102.0% of $C_5H_9Cl_2N_3O_2$, calculated on the anhydrous and solvent-free basis. [**CAUTION—**Use disposable latex surgical gloves, arm covers, and a dusk mask. Perform all work under a fume hood approved for testing cytotoxic agents when possible.]

IDENTIFICATION

- **A. INFRARED ABSORPTION ⟨197F⟩**

Sample: Melt a small portion of the sample in a suitable container in a controlled water bath or oven, and set temperature between 33° and 40°.

Standard: A similar preparation of USP Carmustine RS

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

[NOTE—Prepare solutions in low-actinic glassware and keep them refrigerated until use.]

Mobile phase: Acetonitrile and water (3:7)

Standard solution: 1.5 mg/mL of USP Carmustine RS in acetonitrile

Sample solution: 1.5 mg/mL of Carmustine in acetonitrile

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Refrigerated autosampler temperature: 4°–5°

Column: 4.6-mm × 15-cm column; 5-µm packing L1

Flow rate: 1.5 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Tailing factor: NMT 1.9

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_5H_9Cl_2N_3O_2$ in the portion of Carmustine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Carmustine RS in the *Standard solution* (mg/mL)

In-Process Revision

C_U = nominal concentration of Carmustine in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0%

IMPURITIES

Inorganic Impurities

• **HEAVY METALS,** *Method II* ⟨**231**⟩**:** NMT 20 ppm

Organic Impurities

• **PROCEDURE 1: LIMIT OF ETHER INSOLUBLE SUBSTANCES**

[NOTE—Perform in a well-ventilated fume hood.]

Analysis: Transfer 1.0 g of sample to a suitable container containing 10 mL of anhydrous ether, stir for 5 min, and immediately filter through a tared glass filtering crucible of medium porosity. Wash the container with an additional 10 mL of ether, and filter through the same glass filtering crucible. Dry the crucible at 105° for 1 h. Cool in a desiccator and weigh.

Acceptance criteria: The weight of residue does not exceed 0.1%.

• **PROCEDURE 2: LIMIT OF CARMUSTINE RELATED COMPOUND A**

[NOTE—Prepare solutions in low-actinic glassware and keep them refrigerated until use.]

Mobile phase, Sample solution, and **Chromatographic system:** Proceed as directed under *Assay*.

Carmustine standard solution: Use *Standard solution* under *Assay*.

Standard stock solution: 0.75 mg/mL of USP Carmustine Related Compound A RS in acetonitrile

Standard solution: 0.0075 mg/mL of USP Carmustine Related Compound A RS in acetonitrile, from *Standard stock solution*

System suitability solution: 0.75 g/mL of USP Carmustine Related Compound A RS in acetonitrile, from *Standard solution*

Resolution solution: Transfer 5.0 mL of *Carmustine standard solution* and 10.0 mL of *Standard stock solution* into a 100-mL volumetric flask, and dilute with acetonitrile to volume. Transfer 5.0 mL of this solution into a 50-mL volumetric flask, and dilute with acetonitrile to volume.

System suitability

Samples: *Resolution solution*, *Carmustine standard solution*, and *System suitability solution*

[NOTE—The relative retention times for carmustine related compound A and carmustine are 0.3 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 10 between carmustine related compound A and carmustine, *Resolution solution*

Relative standard deviation: NMT 5%, *System suitability solution*

Tailing factor: NMT 1.9, *Carmustine standard solution*

Analysis

[NOTE—Run *Sample solution* at least 1.5 times of carmustine retention time.]

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of carmustine related compound A in the portion of Carmustine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of carmustine related compound A from the *Sample solution*

r_S = peak response of carmustine related compound A from the *Standard solution*

C_S = concentration of carmustine related compound A in the *Standard solution* (mg/mL)

C_U = nominal concentration of Carmustine in the *Sample solution* (mg/mL)

Calculate the percentage of unspecified impurity in the portion of Carmustine taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of any unspecified impurity from the *Sample solution*

r_T = sum of all peak responses from the *Sample solution*

Acceptance criteria

Carmustine related compound A: NMT 0.5%.

Any unspecified impurity: NMT 0.1%

• **PROCEDURE 3: LIMIT OF 2-CHLOROETHYLAMINE**

[NOTE—Prepare solutions in low-actinic glassware and keep them refrigerated until use.]

Standard solution 1 (0.2%): 1.2 mg/mL of 2-chloroethylamine monohydrochloride in methanol. [NOTE—1.2 mg/mL of 2-chloroethylamine monohydrochloride is equivalent to 0.8 mg/mL of 2-chloroethylamine.]

Standard solution 2 (0.1%): 0.4 mg/mL of USP Carmustine RS in methanol

Sample solution: 0.4 g/mL of Carmustine in methanol

Chromatographic system

(See *Chromatography* ⟨621⟩*, Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic plate (20 cm x 20 cm) coated with silica gel 60

Application volume: 1 µL

Developing solvent system 1: Ethyl acetate

Developing solvent system 2: Ethyl acetate and methanol (7:3)

Spray reagent 1: Diethylamine

Spray reagent 2: 0.1 N silver nitrate solution

Analysis

Samples: *Standard solution 1 (0.2%)*, *Standard solution 2 (0.1%)*, and *Sample solution*

Develop with *Developing solvent system 1* for 27 min, followed by air drying for 5 min. Develop again in *Developing solvent system 2* for 8 min, following by air drying for 10 min. Spray the plate with *Spray reagent 1*, and heat the plate for 20 min in an oven at 100°. Allow the plates to cool to the room temperature, and spray the plate with *Spray reagent 2*. Allow the plate to be exposed to the UV light at 365 nm for 15 min. Examine the plate under UV light.

Acceptance criteria

2-Chloroethylamine: The spot of 2-chloroethylamine in the *Sample solution* is not more intense than the principal spot obtained from *Standard solution 1 (0.2%)*.

Any unspecified impurity: Any spot if present in the chromatogram from the *Sample solution*, except the principle spot of Carmustine and spot of 2-chloroethylamine, is not more intense than the principal spot obtained from *Standard solution 2 (0.1%)*.

• **PROCEDURE 4: LIMIT OF 2-CHLOROETHANOL**

Standard solution: 0.02 mg/L of 2-chloroethanol in acetonitrile

System suitability solution: 0.01 mg/L of 2-chloroethanol in acetonitrile, diluted from *Standard solution*

Sample solution: 10 mg/mL of Carmustine in acetonitrile

[NOTE—Prepare in low-actinic glassware and keep refrigerated until use.]

Chromatographic system

BRIEFING

Carmustine for Injection. Because there is no existing *USP* monograph for this dosage form, a new monograph based on the validated methods of analysis is being proposed. The liquid chromatographic procedures used in the test for *Limit of Carmustine Related Compound A* and the *Assay* are based on analyses performed with a Beckman Ultrasphere C-18, 3-µm brand of L1 column. The typical retention times reported for carmustine related compound A and carmustine are about 3 and 6 min, respectively.

(MDOOD: F. Mao. MSA: R. Tirumalai.) RTS—C44782

Add the following:

■Carmustine for Injection

DEFINITION

Carmustine for Injection is a sterile lyophilized preparation of carmustine. It contains NLT 90.0% and NMT 110.0% of labeled amount of $C_5H_9Cl_2N_3O_2$.
[**CAUTION—**Use disposable latex surgical gloves, arm covers, and a dusk mask. Perform all work under a fume hood approved for testing cytotoxic agents when possible.]

IDENTIFICATION

- **A. INFRARED ABSORPTION** ⟨**197F**⟩

Sample: Melt a small portion of the sample in a suitable container in a controlled water bath or oven, and set the temperature between 33° and 40°.

In-Process Revision

Standard: A similar preparation of USP Carmustin RS

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

[NOTE—Prepare solutions in low-actinic glassware, and keep them refrigerated until use.]

Mobile phase: See the gradient table below.

Time (min)	Water (%)	Acetonitrile (%)
0	90	10
2	90	10
6.5	40	60
8	90	10
10	90	10

Diluent: Acetonitrile and water (1:3)

Standard stock solution: 2.0 mg/mL of USP Carmustine RS in acetonitrile

Standard solution: 0.2 mg/mL of USP Carmustine RS in *Diluent*, from *Standard stock solution*

Impurity standard stock solution: 0.1 mg/mL of USP Carmustine Related Compound A RS in acetonitrile

System suitability solution: 0.2 mg/mL of USP Carmustine RS and 0.002 mg/mL of USP Carmustine Related Compound A RS in *Diluent*, from *Standard stock solution* and *Impurity standard stock solution*

Sample stock solution: 2.0 mg/mL of carmustine in acetonitrile [NOTE—Allow test vials to warm to room temperature in a desiccator for 1 h.]

Sample solution: 0.2 mg/mL of carmustine in *Diluent*, diluted from *Sample stock solution*

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Refrigerated autosampler temperature: 5°

Column: 4.6-mm × 7.5-cm column; 3-µm packing L1

Flow rate: 1.5 mL/min

Injection size: 25 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for carmustine related compound A and carmustine are 0.5 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between carmustine related compound A and carmustine

Relative standard deviation: NMT 2.0% for carmustine related compound A and carmustine peaks

Tailing factor: NMT 1.5 for carmustine related compound A and carmustine peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_5H_9Cl_2N_3O_2$ in the portion of Carmustine for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the *Sample solution*
r_S = peak response of the *Standard solution*
C_S = concentration of carmustine in the *Standard solution* (mg/mL)
C_U = nominal concentration of carmustine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

Change to read:

• **B.** The *Sample solution*, prepared and tested as directed in the test for *Content of Magnesium*, exhibits a significant absorption ~~at the magnesium emission line~~■1S *(USP33)* at 285.2 nm.

ASSAY

• **PROCEDURE**

Solution A: 0.725 g of monobasic sodium phosphate and 4.472 g of anhydrous dibasic sodium phosphate in 300 mL of water, and dilute with water to 1000 mL. Dilute 250 mL of this solution with water to 1000 mL. If necessary, adjust with phosphoric acid to a pH of 7.6.

Solution B: Mix 11 mL of 0.25 M tribasic sodium phosphate with 22 mL of 0.5 M dibasic sodium phosphate, and dilute with water to 100 mL.

Mobile phase: Acetonitrile and *Solution A* (7:13)

Standard solution: 10 mg of USP Omeprazole RS to a 200-mL volumetric flask, and dissolve in about 10 mL of methanol. Add 10 mL of *Solution B*, and dilute with water to volume. [NOTE—This solution contains 0.05 mg/mL of omeprazole.]

Sample solution: 10 mg of Esomeprazole Magnesium to a 200-mL volumetric flask, and dissolve in about 10 mL of methanol. Add 10 mL of *Solution B*, and dilute with water to volume. [NOTE—This solution contains 0.05 mg/mL of esomeprazole magnesium.]

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.0-mm × 12.5-cm or 4.6-mm × 15-cm; 5-µm packing L7. [NOTE—Alternatively, a 3.9-mm × 15-cm column that contains 4-µm packing L1 may be used.]

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 2000 theoretical plates

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{34}H_{36}MgN_6O_6S_2$ in the portion of Esomeprazole Magnesium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times [M_{r1}/(2 \times M_{r2})] \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of omeprazole in the *Standard solution* (mg/mL)
C_U = concentration of Esomeprazole Magnesium in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of esomeprazole magnesium, 713.12
M_{r2} = molecular weight of omeprazole, 345.42

Acceptance criteria: 98.0%–102.0%

OTHER COMPONENTS

Change to read:

• **CONTENT OF MAGNESIUM**

Solution A: 58.7 g of lanthanum oxide into a 1000-mL volumetric flask, wet the substance with some water, and dissolve by cautious addition of 250 mL of hydrochloric acid in 20- to 30-mL portions, cooling between the additions. Add water while stirring, cool to room temperature, and dilute with water to volume. [NOTE—Store the solution in a plastic bottle.]

Standard stock solution: 1000 µg/mL of magnesium, from a commercially prepared atomic absorption standard solution. [NOTE—Store the solution in a plastic bottle.]

Standard solution A: Transfer 10.0 mL of *Standard stock solution* to a 500-mL volumetric flask, add 50 mL of 1 N hydrochloric acid, and dilute with water to volume. Transfer 20.0 mL of this solution to a 200-mL volumetric flask, and dilute with water to volume. [NOTE—This solution contains 2 µg/mL of magnesium.]

Standard solution B: Combine 5.0 mL of *Standard solution A* and 4.0 mL of *Solution A*, and dilute with water to 100.0 mL (0.1 µg/mL).

Standard solution C: Combine 10.0 mL of *Standard solution A* and 4.0 mL of *Solution A*, and dilute with water to 100.0 mL (0.2 µg/mL).

Standard solution D: Combine 15.0 mL of *Standard solution A* and 4.0 mL of *Solution A*, and dilute with water to 100.0 mL (0.3 µg/mL).

Standard solution E: Combine 20.0 mL of *Standard solution A* and 4.0 mL of *Solution A*, and dilute with water to 100.0 mL (0.4 µg/mL).

Standard solution F: Combine 25.0 mL of *Standard solution A* and 4.0 mL of *Solution A*, and dilute with water to 100.0 mL (0.5 µg/mL).

[NOTE—Concentrations of the *Standard solutions* and the *Sample solution* may be modified to fit the linear or working range of the instrument. When using instruments with a linear calibration graph, the number of *Standard solutions* can be reduced.]

Blank solution: Transfer 4.0 mL of *Solution A* to a 100-mL volumetric flask, and dilute with water to volume.

Sample solution: 250 mg of Esomeprazole Magnesium to a 100-mL volumetric flask, add 20 mL of 1 N hydrochloric acid, swirl until dissolved, and dilute with water to volume. Allow to stand for 30 min. Transfer 10.0 mL of this solution to a 200-mL volumetric flask, and dilute with water to volume. Transfer 10.0 mL of the solution so obtained to another 100-mL volumetric flask, add 4.0 mL of *Solution A*, and dilute with water to volume.

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* ⟨851⟩.)

Mode: Atomic absorption spectrophotometer using an air–acetylene flame

Analytical wavelength: 285.2 nm ~~at the magnesium emission line~~■1S *(USP33)*

Analysis

Samples: *Standard solution B*, *Standard solution C*, *Standard solution D*, *Standard solution E*, *Standard solution F*, *Blank solution*, and *Sample solution*

Plot the absorbances of the *Standard solutions* versus concentration, in µg/mL, of magnesium, and draw the straight line between the plotted points. From the graph so obtained, determine the concentration, C_S, in µg/mL, of magnesium in the *Sample solution*.

Calculate the content of magnesium (%) in the portion of Esomeprazole Magnesium taken:

$$\text{Result} = (C_S/C_U) \times (100/(100 - F)) \times 100$$

C_S = content of magnesium in the *Sample solution* as calculated above (µg/mL)
C_U = concentration of Esomeprazole Magnesium in the *Sample solution* (µg/mL)
F = content of water in Esomeprazole Magnesium, as determined in *Specific Tests, Water Determination* (%)

Acceptance criteria: 3.30%–3.55%

IMPURITIES

Organic Impurities

• **PROCEDURE 1**

Solution A: 0.725 g of monobasic sodium phosphate and 4.472 g of anhydrous dibasic sodium phosphate in 300 mL of water, and dilute with water to 1000 mL. Dilute 250 mL

In-Process Revision

of this solution with water to 1000 mL. If necessary, adjust with phosphoric acid to a pH of 7.6.
Mobile phase: Acetonitrile and *Solution A* (27.5:72.5) [NOTE—To improve the resolution, the composition may be changed to 25:75, if necessary.]
System suitability solution: 1 mg of USP Omeprazole RS and 1 mg of USP Omeprazole Related Compound A RS in 25 mL of *Mobile phase*. [NOTE—Omeprazole related compound A is omeprazole sulfone.]
Sample solution: 4 mg of Esomeprazole Magnesium in 25 mL of *Mobile phase*. [NOTE—Prepare this solution fresh.]
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 280 nm
Column: 4.0-mm × 12.5-cm or 4.6-mm × 15-cm; 5-µm packing L7. [NOTE—Alternatively, a 3.9-mm × 15-cm column that contains 4-µm packing L1 may be used.]
Flow rate: 0.8–1 mL/min
Injection size: 50 µL
System suitability
Sample: *System suitability solution*
[NOTE—For relative retention times, see *Impurity Table 1*.]
Suitability requirements
Resolution: NLT 3 between omeprazole related compound A and omeprazole
Analysis
Sample: *Sample solution*
Record the chromatogram for at least 4.5 times the retention time of the omeprazole peak, and measure the peak responses. Identify the impurities based on the relative retention times shown in *Impurity Table 1*.
Calculate the percentage of any individual impurity in the portion of Esomeprazole Magnesium taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response for each impurity
r_T = sum of all peak responses
Acceptance criteria
Individual impurities: See *Impurity Table 1*.
Total impurities: NMT 0.5%

Impurity Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Omeprazole *N*-oxide[a]	0.45	0.1
Omeprazole sulfone[b] (related compound A)	0.8	0.2
Any other individual impurities	—	0.1
Omeprazole	1.0	—

[a]4-Methoxy-2-[[(*RS*)-(5-methoxy-1*H*-benzimidazol-2-yl)sulfinyl]methyl]-3,5-dimethylpyridine 1-oxide.
[b]5-Methoxy-2-[[(4-methoxy-3,5-dimethylpyridin-2-yl)methyl]sulfonyl]-1*H*-benzimidazole.

- **PROCEDURE 2: ENANTIOMERIC PURITY**
Solution A: Mix 70 mL of 1 M monobasic sodium phosphate with 20 mL of 0.5 M dibasic sodium phosphate, and dilute with water to 1000 mL. Dilute 250 mL of this solution with water to 1000 mL.
Diluent: Mix 11 mL of 0.25 M tribasic sodium phosphate with 22 mL of 0.5 M dibasic sodium phosphate, and dilute with water to 1000 mL.
Mobile phase: Acetonitrile and *Solution A* (3:17)
System suitability solution: 2 mg of USP Omeprazole RS in 10 mL of *Diluent*. Dilute 1.0 mL of this solution with *Diluent* to 50 mL.
Sample solution: 40 mg of Esomeprazole Magnesium in 5 mL of methanol, and dilute with *Diluent* to 25 mL. Dilute 1 mL of this solution with *Diluent* to 50 mL.
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 302 nm
Column: 4.0-mm × 10-cm; packing L41
Flow rate: 0.6 mL/min
Injection size: 20 µL
System suitability
Sample: *System suitability solution*
Suitability requirements
Resolution: NLT 3 between the enantiomer peaks
[NOTE—The elution order is the *R*-enantiomer, followed by the esomeprazole peak, which is the *S*-enantiomer.]
Analysis
Sample: *Sample solution*
Calculate the percentage of the *R*-enantiomer in the portion of Esomeprazole Magnesium taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response for the *R*-enantiomer
r_T = sum of the responses of both the esomeprazole and *R*-enantiomer peaks
Acceptance criteria: NMT 0.2% of the *R*-enantiomer is found.

SPECIFIC TESTS

Delete the following:

~~• **OPTICAL ROTATION,** *Specific Rotation* ⟨**7815**⟩~~
~~**Sample solution:** 10 mg/mL, in methanol~~
~~**Acceptance criteria:** −137° to −142°, at 20°~~ ■1S (*USP33*)

BRIEFING

Fluconazole Injection, page 266 of *PF* 34(2) [Mar.–Apr. 2008]. On the basis of comments received and also in line with USP's flexible monograph policy, it is proposed to add an impurity test to the *Organic Impurities* section. Users are to perform either (a) *Procedure 1* and *Procedure 2* or (b) *Procedure 3*. It is also proposed to add a *Labeling* requirement for *Organic Impurity* tests other than *Procedure 1* and *Procedure 2*. The liquid chromatographic procedure in *Organic Impurities: Procedure 3* was validated with a Symmetry brand column that contains 3.5-µm packing L1. The retention time of fluconazole under the specified conditions is 12–14 min. Also, on the basis of comments received, in *Organic Impurities: Procedure 2*, it is proposed to add acceptance criteria for the total impurities as a sum of the results from *Procedure 1* and *Procedure 2*.

(MD-AA: M. Puderbaugh; B. Davani.) RTS—C67034

In-Process Revision

Add the following:

■Fluconazole Injection

DEFINITION
Fluconazole Injection is a sterile solution of Fluconazole in a suitable vehicle. It contains NLT 90.0% and NMT 110.0% of the labeled amount of fluconazole ($C_{13}H_{12}F_2N_6O$).

IDENTIFICATION
- The retention time of the major peak from the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**

Buffer: 0.82 mg/mL of sodium acetate in water. Adjust with 1 N acetic acid solution to a pH of 5.0.
Diluent: Methanol and *Buffer* (20:80)
Solution A: Methanol and *Buffer* (5:95)
Solution B: Acetonitrile and methanol (60:40)
Mobile phase: See the *gradient table* below.

Time (min)	*Solution A* (%)	*Solution B* (%)
0	80	20
9	80	20
15	15	85
18	80	20
25	80	20

System suitability solution: 0.04 mg/mL each of benzyl alcohol and USP Fluconazole RS in *Diluent*
Standard solution: 0.2 mg/mL of USP Fluconazole RS in *Diluent*
Sample solution: Equivalent to 0.2 mg/mL from the Injection in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 261 nm
Column: 4.0-mm × 10-cm; 3-µm packing L1
Flow rate: 1 mL/min
Injection size: 100 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
[NOTE—The relative retention times for benzyl alcohol and fluconazole are about 0.8 and 1.0, respectively, *System suitability solution.*]
Suitability requirements
Resolution: NLT 1.8 between benzyl alcohol and fluconazole, *System suitability solution*
Column efficiency: NLT 4000 theoretical plates for the fluconazole peak, *System suitability solution*
Tailing factor: NMT 1.5 for the fluconazole peak, *System suitability solution*
Relative standard deviation: NMT 2.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{13}H_{12}F_2N_6O$ in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the *Sample solution*
r_S = peak response of the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
C_U = nominal concentration of fluconazole in the *Sample solution* (mg/mL)
Acceptance criteria: 90.0%–110.0%

IMPURITIES

Change to read:

Organic Impurities ■[NOTE—On the basis of the synthetic route, perform either (a) *Procedure 1* and *Procedure 2* or (b) *Procedure 3*. *Procedure 3* is recommended if Impurity G (see *Impurity Table 2*) is a potential related compound.]■1S (*USP33*)
- **PROCEDURE 1: FOR NONPOLAR IMPURITIES**

Buffer and **Diluent:** Prepare as directed in the *Assay*.
Solution A: Methanol and *Buffer* (5:95)
Solution B: Acetonitrile and methanol (60:40)
Mobile phase: See the *gradient table* below.

Time (min)	*Solution A* (%)	*Solution B* (%)
0	77	23
5	77	23
30	40	60
43	77	23
50	77	23

System suitability solution: 2.4 µg/mL and 20 µg/mL, respectively of 1,4-benzoquinone and USP Fluconazole RS in *Diluent*
Standard solution: 2 µg/mL of USP Fluconazole RS in *Diluent*
Diluted standard solution: 0.2 µg/mL of USP Fluconazole RS in *Diluent*, from the *Standard solution*
Sample solution: Equivalent to 1.0 mg/mL from the Injection in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 261 nm
Column: 4.0-mm × 10-cm; 3-µm packing L1
Flow rate: 1 mL/min
Injection size: 100 µL
System suitability
Samples: *System suitability solution, Standard solution,* and *Diluted standard solution*
[NOTE—The relative retention times for 1,4-benzoquinone and fluconazole are about 0.5 and 1.0, respectively, *System suitability solution.*]
Suitability requirements
Resolution: NLT 5.0 between 1,4-benzoquinone and fluconazole, *System suitability solution*
Column efficiency: NLT 2500 theoretical plates for the fluconazole peak, *System suitability solution*
Tailing factor: NMT 1.5 for the fluconazole peak, *System suitability solution*
Relative standard deviation: NMT 5.0%, *Standard solution*
Ratio of average peak area: Between 8.0 and 12.0 for the ratio of the fluconazole peak from the *Standard solution* to that of the *Diluted standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—For the following calculations, do not include peaks eluting before fluconazole and do not include impurities at relative retention times of 2.00–2.12 and 3.14–3.26. The disregarded impurities at the specified relative retention times are process impurities monitored in the drug substance. Furthermore, disregard any peak due to an excipient or any peak less than 0.02%. This test is for determination of the late-eluting peaks, and hence the early-eluting peaks are not quantitated using this procedure.]

Calculate the percentage of the largest unknown nonpolar impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for the largest impurity from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of fluconazole in the *Standard solution* (mg/mL)
C_U = concentration of fluconazole based on the label claim and the extent of dilution in the *Sample solution* (mg/mL)

Calculate the percentage of unknown nonpolar impurities in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for the sum of peak areas of unknown peaks from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
C_U = concentration of fluconazole based on the label claim and the extent of dilution in the *Sample solution* (mg/mL)

Acceptance criteria

Largest unknown nonpolar impurity: NMT 0.1%
Total unknown nonpolar impurities: NMT 0.5%

• **PROCEDURE 2: FOR POLAR IMPURITIES**

Buffer, Diluent, Mobile phase, System suitability solution, and **Chromatographic system:** Prepare as directed in the *Assay*.

Standard solution: 2 µg/mL of USP Fluconazole RS in *Diluent*

Diluted standard solution: 0.2 µg/mL of USP Fluconazole RS in *Diluent*, from the *Standard solution*

Sample solution: Equivalent to 0.2 mg/mL from the Injection in *Diluent*

System suitability

Samples: *System suitability solution, Standard solution*, and *Diluted standard solution*

[NOTE—The relative retention times for benzyl alcohol and fluconazole are about 0.8 and 1.0, respectively, *System suitability solution*.]

Suitability requirements

Resolution: NLT 1.8 between benzyl alcohol and fluconazole, *System suitability solution*

Column efficiency: NLT 4000 theoretical plates for the fluconazole peak, *System suitability solution*

Tailing factor: NMT 1.5 for the fluconazole peak, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Ratio of average peak area: Between 8.0 and 12.0 for the ratio of the fluconazole peak from the *Standard solution* to that of the *Diluted standard solution*

Analysis

Samples: *Sample solution* and *Standard solution*

[NOTE—The relative retention times of known related compounds versus fluconazole are included in *Impurity Table 1*.]

Impurity Table 1

Name	Approximate RRT*
Impurity A (if dextrose is present)[a]	0.22–0.28
Impurity B[b]	0.30–0.36
Impurity C (if dextrose is present)[c]	0.37–0.43
Impurity D[d]	0.47–0.59
Impurity E[e]	0.68–0.74
Impurity F[f]	0.77–0.83

*RRT, relative retention time.
[a]5-Hydroxymethylfurfural.
[b]4-Amino-1-(2-(2,4-difluorophenyl)-2-hydroxy-3-(1*H*-1,2,4-triazol-1-yl)propyl)-4*H*-1,2,4-triazolium bromide.
[c]Dextrose-related compound.
[d]2-(2,4-Difluorophenyl)-1-(1*H*-1,2,4-triazol-1-yl)-3-(4*H*-1,2,4-triazol-4-yl)propan-2-ol.
[e]2-(2,4-Difluorophenyl)-3-(1*H*-1,2,4-triazol-1-yl)propane-1,2-diol.
[f]Cyclohexanone.

[NOTE—Disregard the known related impurities from *Impurity Table 1* in the following calculation because these are process impurities that are monitored in the drug substance.]

Calculate the percentage of the single largest unknown polar impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for the largest impurity from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of fluconazole in the *Standard solution* (mg/mL)
C_U = concentration of fluconazole based on the label claim and the extent of dilution in the *Sample solution* (mg/mL)

Calculate the quantity, as a percentage, of the unknown polar impurities in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for the total of peak areas of all unknown peaks from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of fluconazole in the *Standard solution* (mg/mL)
C_U = concentration of fluconazole based on the label claim and the extent of dilution in the *Sample solution* (mg/mL)

Acceptance criteria

Largest unknown polar impurity: NMT 0.1%
Total unknown polar impurities: NMT 0.5%
■**Total unknown polar and nonpolar impurities:** NMT 1.0% (sum of results from *Procedure 1* and *Procedure 2*)■1S (*USP33*)

[NOTE—Disregard any peak due to an excipient or any peak less than 0.03%.]

■• **PROCEDURE 3**

Buffer: 0.63 mg/mL of ammonium formate in water
Mobile phase: Acetonitrile and *Buffer* (14:86)
Standard solution: 2 mg/mL of USP Fluconazole RS in *Buffer*

[NOTE—Use approximately 14% of the total volume as acetonitrile and sonicate if necessary, to facilitate dissolution.]

Sensitivity solution: 1 µg/mL USP Fluconazole RS in *Mobile phase* from the *Standard solution*
Sample solution: Use the injection.

BRIEFING

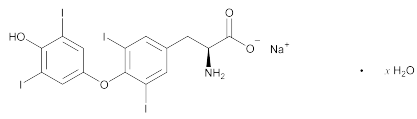
Levothyroxine Sodium, *USP 32* page 2777. On the basis of comments received, it is proposed to add a *Procedure 2* for *Organic Impurities*, using a flexible monograph approach, to capture the potential impurities by a different synthetic route. This test is based on an analytical method validated with the YMC C18 Pro brand of L1 column. The typical retention time for levothyroxine is about 16.5 min. This proposed revision also necessitates the addition of a *Labeling* statement and a revision of the section *USP Reference Standards* ⟨*11*⟩.

In addition, several changes are proposed for *Procedure 1* to make the impurity limits consistent throughout the monograph. The limit of T4-acetic acid is increased from NMT 0.15% to NMT 0.30%, and the limit of total impurities is increased from NMT 1.5% to NMT 2.0%. In addition, it is proposed to calculate the impurity limits on the as-is basis.

Finally, comments were received that for this material, different manufacturers have different storage conditions, which are supported by stability data. It is proposed to indicate that manufacturers can store the material in accordance with their labeling instructions.

(MD-GRE: E. Gonikberg.) RTS—C66966

Levothyroxine Sodium



$C_{15}H_{10}I_4NNaO_4 \cdot xH_2O$ (anhydrous) 798.85
L-Tyrosine, *O*-(4-hydroxy-3,5-diiodophenyl)-3,5-diiodo-, monosodium salt, hydrate;
Monosodium L-thyroxine hydrate [25416-65-3].
Anhydrous [55-03-8].

DEFINITION
Levothyroxine Sodium is the sodium salt of L-3,3′,5,5′-tetraiodothyronine. It contains NLT 97.0% and NMT 103.0% of $C_{15}H_{10}I_4NNaO_4$, calculated on the anhydrous basis.

IDENTIFICATION
- **A. PROCEDURE**
Sample: 50 mg
Analysis: Ignite the *Sample* in a platinum dish over a flame.
Acceptance criteria: It decomposes and liberates iodine vapors. [NOTE—Cool the residue obtained, and reserve it for use in *Identification* test *D*.]
- **B. PROCEDURE**
Acid sodium chloride solution: Alcohol, 1 N sodium hydroxide, hydrochloric acid, and water (25:10:10:30)
Sample: 0.5 mg
Analysis: Add 7.5 mL of *Acid sodium chloride solution* and 1 mL of sodium nitrite solution (1:100) to the *Sample*. Allow to stand in the dark for 20 min, and add 1.25 mL of ammonium hydroxide.
Acceptance criteria: A pink color is produced.
- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution,* as obtained in the *Assay*.
- **D. IDENTIFICATION TESTS—GENERAL,** *Sodium* ⟨**191**⟩**:** The solution meets the requirements of the flame test.
Sample solution: To the residue retained from *Identification* test *A,* add a 1 N potassium hydroxide solution dropwise until the residue is dissolved.

In-Process Revision

ASSAY

- **PROCEDURE**

Mobile phase: Acetonitrile and water (4:6) that contains 0.5 mL of phosphoric acid in each 1000 mL

Solution A: 400 mg of sodium hydroxide in 500 mL of water. Cool, and add 500 mL of methanol.

Levothyroxine stock solution: 0.4 mg/mL of USP Levothyroxine RS in *Solution A*

Liothyronine stock solution: 0.4 mg/mL of liothyronine from USP Liothyronine RS in *Solution A*. Make a 1:100 dilution of this solution using *Mobile phase*.

Standard solution: 10 µg/mL of levothyroxine from *Levothyroxine stock solution* and 0.2 µg/mL of liothyronine from *Liothyronine stock solution*, in *Mobile phase*

Sample solution: Prepare a solution of Levothyroxine Sodium in *Mobile phase* having a known concentration of 10 µg/mL. [NOTE—A small amount of 0.01 M methanolic sodium hydroxide can be used to facilitate the dissolution of the sample.]

Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 225 nm
Column: 4.6-mm × 25-cm; packing L10
Flow rate: 1.5 mL/min
Injection size: 100 µL

System suitability
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 5.0 between liothyronine and levothyroxine
Relative standard deviation: NMT 2.0% of levothyroxine

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{15}H_{10}I_4NNaO_4$ in the portion of Levothyroxine Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of the *Sample solution*
r_S = peak response of the *Standard solution*
C_S = concentration of USP Levothyroxine RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of levothyroxine in the *Sample solution* (µg/mL)
M_{r1} = molecular weight of levothyroxine sodium, 798.85
M_{r2} = molecular weight of levothyroxine, 776.87

Acceptance criteria: 97.0%–103.0%

BRIEFING

Human Acellular Dermal Matrix. Because there is no existing *USP* monograph for this product, a new monograph is being proposed. The proposed procedure for tissue evaluation is based on histological analysis. No evidence of cell nuclei or cytoplasm is apparent in prepared histological sections.

(BB CGT: F. Atouf.) RTS—C60477

Add the following:

■Human Acellular Dermal Matrix

DEFINITION

Human Acellular Dermal Matrix is derived from donated allograft human dermis that is processed to remove cells and freeze-dried to remove moisture while preserving biologic components and structure of the dermal matrix. It is biocompatible and supports remodeling by the recipient's own tissue. The matrix is comprised of native human dermal architecture, consisting of collagen (mainly collagen Type I, with additional collagen Type III and IV components), chondroitin sulfate and hyaluronic acid glycosaminoglycans, and elastin.

The donated human skin is processed in a manner that removes all cellular components including the epidermal layer and dermal cells. Human Acellular Dermal Matrix does not contain intact cells and cell nuclei. Human skin used to produce Human Acellular Dermal Matrix is obtained from sources that have passed applicable donor eligibility requirements for relevant communicable diseases. Human Acellular Dermal Matrix is manufactured using sterile solutions and equipment under aseptic conditions. The final product is inspected and tested to ensure that the product meets the specifications.

SPECIFIC TESTS

- **HISTOLOGICAL EVALUATION**
  Sucrose solution: Dissolve 20 g of sucrose in 100 mL of water.
  Tissue preparation: Submerge a 1.4-cm or greater size piece of Human Acellular Dermal Matrix in normal saline solution to rehydrate the tissue for a minimum of 4–8 hr. Cut three 1.5-cm × 0.5-cm pieces of Human Acellular Dermal Matrix, and place each piece from the same donor lot into a suitable histological tissue cassette for routine histology processing and paraffin embedding. Place the cassettes in 10% neutral buffered formalin[1] at room temperature for a minimum of 12 h. [NOTE—the cassettes may be kept at room temperature for 1 month.] From the same donor lot, cut a minimum of three 1.0-cm × 0.5-cm pieces of Human Acellular Dermal Matrix for immunohistochemical (IHC) staining and place in a vial containing *Sucrose solution* and store at 2°–8° for a minimum of 4 h, but the product can be held in the solution for up to 2 weeks.
  Embedding and sectioning of histological evaluation samples: Place all cassettes to be processed into a suitable histological cassette basket including one cassette containing formalin-fixed normal skin to serve as a process control. The following steps can be performed using a vacuum infiltration tissue processor.[2] At room temperature (37° ± 2°), tissue samples continue to fix in 10% neutral buffered formalin, are dehydrated through graded reagent alcohol (70%, 80%, 95%

[1] 10% Neutral buffered formalin can be purchased from Statlab Medical Products, Inc., Lewisville, TX.
[2] A suitable processor is the Tissue Tek V.I.P. Model #1000 vacuum infiltration tissue processor or the Leica ASP300 tissue processor.

In-Process Revision

and 100%).[3] The tissue samples are cleared in a xylene substitute.[4]

The tissue is infiltrated with paraffin.[5] at 60°. The following embedding procedure can be performed with the use of a histology tissue embedding unit, consisting of a thermal console, dispensing console, and cryo-console. Open the histological cassette. Partially fill embedding molds with molten paraffin (60°). While keeping the paraffin heated, position the three tissue pieces on edge in the paraffin so that cross-sections of the Human Acellular Dermal Matrix can be cut once completely embedded. Rapidly cool the paraffin so that it partially solidifies. Completely fill the embedding mold with additional molten paraffin (60°), and cool until completely solidified.

Remove solidified paraffin blocks from embedding molds for sectioning. Sectioning of paraffin-embedded samples can be performed on a suitable microtome[6]. Clamp the tissue block into the holder of the microtome. Fill a histological water bath with fresh water [NOTE—A quarter teaspoon of USP gelatin may be added to the water bath for section adhesion.], and maintain the water bath at 39°± 2°. Cut sections to a thickness of 3–5 µm to form a ribbon, and gently lay the ribbon on the water bath. Place two consecutive sections on each glass microscope slide.

Embedding and sectioning of immunohistochemical samples: Fill histology embedding molds with a cryo-protectant embedding media. Transfer tissue pieces from *Sucrose solution* to the embedding media in the mold, orient so that cross-sections can be cut, and let sit for 1–30 min. Freeze the molds with liquid nitrogen and store at –80°. Remove frozen blocks from molds for sectioning. Cryo-section each block to 4–7 µm in thickness and place sections on glass microscope slides. Place at least two sections on each slide. Slides can be stored at –70° to –85°.

Hematoxylin and eosin sample staining: [NOTE—Store all solutions at room temperature.]

1% Acid alcohol solution: Alcohol, hydrochloric acid, and water (1309:20:509)

95% Reagent alcohol solution: Alcohol and water (190:10)

80% Reagent alcohol solution: Alcohol and water (160:40)

Saturated lithium carbonate solution: Water, lithium carbonate (200:2), (v:w)

Analysis: The slide with affixed tissue (sections) is deparaffinized in three changes of xylene substitute, rehydrated in graded reagent alcohols (100% and 95%) and rinsed in tap water. The sections are stained with hematoxylin, rinsed, decolorized with *1% Acid alcohol solution*, and neutralized with *Saturated lithium carbonate solution*. The sections are counterstained with 1% alcoholic eosin Y, dehydrated through graded reagent alcohols (95% and 100%) and xylene substitute, and then coverslipped. A positive control is stained with each batch to ensure successful staining.

Acceptance criteria: Adequate staining is defined by a blue nuclear stain and a pink-red cytoplasm. Sections are assessed for tissue matrix integrity and are acceptable if they pass the following criteria: they must not show evidence of intact epidermal or dermal cells, and must not show evidence of widespread collagen damage (broken, condensed, or distorted fibers) or unrecognizable papillary layer, as shown in the USP Human Acellular Dermal Matrix Reference Photomicrographs of products with acceptable appearance.

Immunohistochemical sample staining

0.5 M phosphate-buffered saline, pH 7.4 (PBS): Prepare by combining 8.50 g of sodium chloride, 0.85 g of dibasic sodium phosphate, and 0.54 g of monobasic potassium phosphate in 1 L of water. Adjust the pH to 7.4 with 1.0–3.0 M sodium hydroxide. Store at room temperature.

Diluent PBS: Combine 0.250 g of bovine serum albumin, 25 mL of *PBS*, and 0.02–0.03 g of thimerosal. Store at between 2° and 8° for up to 1 year.

Primary and secondary antibodies: Perform a titer assay to determine optimal dilution for each antibody when a new lot is used. Dilute in *Diluent PBS* as per titer assay.

Human monoclonal anti-type IV collagen[7]: 25–100 µL aliquots of concentrated antibody may be stored at between –70° and –85°.

Human monoclonal anti-MHC class I[8]: 100–200 µL aliquots of concentrated antibody may be stored at between –70° and –85°.

Human monoclonal anti-MHC class II[9]: 100–200 µL aliquots of concentrated antibody may be stored at between –70° and –85°.

Goat anti-mouse IgG (Fab-specific) peroxidase conjugate[10]: 100–200 µL aliquots of concentrated antibody may be stored at between –70° and –85°.

3,3 Diaminobenzidine staining kit or stable diaminobenzidine (DAB)[11]: To make the working stain, consult kit instructions. Store kit at between 2° and 8°. 3,3 Diaminobenzidine is light-sensitive, minimum exposure to light is advisable. Stable DAB is stored at between 0° and –20°.

3% Hydrogen peroxide: Store at room temperature.

Acetone: Store at between –10° and –20°.

Analysis for monoclonal anti-MHC class I and class II: Frozen sections are obtained and slides are fixed in *Acetone*. Endogenous peroxides are blocked with *3% Hydrogen peroxide*. A cocktail of *Human monoclonal anti-MHC class I, Human monoclonal anti-MHC Class II,* and bovine serum albumin are applied to the sections. Sections are rinsed with *PBS* and the secondary antibody, *Goat anti-mouse IgG peroxidase conjugate*, is applied. Following the application of the secondary antibody, the sections are rinsed in *PBS* and the *DAB* is applied. The sections are then counterstained in hematoxylin, decolorized in *1% Acid alcohol solution*, neutralized in *Saturated lithium carbonate solution*, dried, and coverslipped.

Control slides: Normal skin samples are frozen and sectioned for control tissue. The positive control receives the same exact treatment as the test samples. The negative control is the same tissue section as the positive. The difference is that one critical stain step is omitted, such as the application of the primary antibodies. All other stain steps are completed in accordance with the test slides. If acceptable control stains are not achieved the stain is repeated.

Acceptance criteria: Positive staining of sections will appear brown in color, focal, cell-associated, and be clearly distinct from the background, as shown in the USP Human Acellular Dermal Matrix Reference Photomicrographs of products with acceptable appearance for staining with MHC I and II antibodies. Negative stain results appear clear with no brown staining; only a light blue hematoxylin counterstain will be seen.

Analysis for monoclonal anti-type IV collagen: Frozen sections are obtained and slides are fixed in *Acetone*. Endogenous peroxides are blocked with *3% Hydrogen peroxide*. *Human monoclonal anti-type IV collagen* along with bovine serum albumin are applied to the sections. Sections are rinsed with *PBS* and the secondary antibody, *Goat anti-mouse IgG peroxidase conjugate*, is applied. Following the application of the secondary antibody, the sections are rinsed in *PBS* and the *DAB* is applied. The sections are then counterstained in hematoxylin, decolorized in *1% Acid alcohol solution*, neutralized in *Saturated lithium carbonate solution*, dried, and coverslipped.

Control slides: Normal skin samples are frozen and sectioned for control tissue. The positive control receives the same exact treatment as the test samples. The negative control is the same tissue section as the positive. The difference

[3]Graded alcohols: 70%, 80%, and 95% are prepared using 100% Reagent Alcohol such as that purchased from Statlab Medical Products, Inc., Lewisville, TX.
[4]Such as a citrus clearing solvent from Richard-Allan Scientific, Kalamazoo, MI.
[5]Such as Paraplast, Extra, manufactured by McCormick Scientific, St. Louis, MO.
[6]Such as Leica RM 2155 or RM 2255 Rotary Microtome.
[7]Suitable primary antibody is available from Sigma, 3050 Spruce St., St. Louis, MO 63103, cat #C1926.
[8]Suitable primary antibody is available from VMRD Inc., PO Box 502, Pullman, WA 99163, cat #H58A.
[9]Suitable primary antibody is available from VMRD Inc., PO Box 502, Pullman, WA 99163, cat #TH14B.
[10]Suitable secondary antibody is available from Sigma, 3050 Spruce St., St. Louis, MO 63103, cat #A9917.
[11]DAB can be sourced from Invitrogen/Zymed, Serotec, or Dako.

is that one critical stain step is omitted, such as the application of the primary antibodies. All other stain steps are completed in accordance with the test slides. If acceptable control stains are not achieved the stain is repeated.

Acceptance criteria: Positive stain results will reveal a brown stain in the location of basement membrane, as shown in the USP Human Acellular Dermal Matrix Reference Photomicrographs of products with acceptable appearance for staining with collagen type IV antibodies. Negative stain results appear clear with no brown staining; only a light blue hematoxylin counterstain will be seen.

• **BIOCHEMICAL ANALYSIS**

Sample solution: Submerge 20 mg of Human Acellular Dermal Matrix in normal saline solution to rehydrate the tissue for a minimum of 4–8 h. Freeze the sample and mill using a freezer mill.[12] Suspend in 10 mL of 4 M guanidine hydrochloride, 50 mM sodium acetate, 5 mM EDTA, 0.1 mM phenylmethylsulfonyl fluoride (PMSF), 10 mM *N*-ethylmaleimide (NEM), 0.2% Triton X-100, pH 5.8, and extract for 48 h at 4°, with agitation. Centrifuge for 10 min at 4° and 23,500 *g*. Remove the supernatant and digest with 20 µL chondroitinase ABC,[13] 1 milli Unit/µL. Analyze for *Glycosaminoglycan (GAG) content* and *Immunochemical analysis of decorin* (below). For *Collagen content* analysis, wash the pellet three times with 10 mL of deionized water, centrifuging for 10 min at 4° and 23,500 *g* after each wash. Resuspend in a minimal amount of water, freeze at –80°, and lyophilize. Resuspend 20 mg of the lyophilized pellet in 20 mL of 0.5 M acetic acid containing 100 µg of pepsin/mg of tissue, and incubate overnight at 4° with agitation. Remove undigested material by centrifugation at 23,500 *g* for 20 min.

Collagen content

Sample buffer: Prepare as directed for *Sample Buffer 1* in *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* ⟨1056⟩*, Electrophoretic Separation*.

Sample collagen solution: Add 20 µL of the supernatant from the *Sample solution* to 20 µL of *Sample buffer,* mix, and incubate at 60° for 15 min.

Control samples: Prepare suitable positive control samples (human placental collagen types I[14] and III[15]) similar to *Sample collagen solution.*

Gel electrophoresis: Load 40 µL of each of *Sample collagen solution* and the *Control samples* onto a 6% acrylamide gel, perform the electrophoretic separation, and stain with Coomassie brilliant blue as directed under *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* ⟨1056⟩.

Acceptance criteria: The bands obtained from Human Acellular Dermal Matrix are distinct and clearly visible at a mobility similar to the bands obtained from the collagen types I and III control samples. No smears corresponding to degraded collagen types I and III are found on the gel.

Glycosaminoglycan (GAG) content

Sample GAG solution: Use 15 µL of the supernatant prepared as directed under the *Sample solution.*

DMMB reagent: Dissolve 16 mg of 1,9 dimethyl-methylene blue in 5 mL of ethanol. Add 3.24 mL of formic acid and 2.94 mL of 10 M sodium hydroxide. Bring to 1000 mL with water.

50 mM sodium acetate: Dissolve 1.03 g of sodium acetate in 250 mL of water.

Analysis: Add 15 µL of *Sample GAG solution* to each well of a 96-well microtiter plate. To each sample well, add 200 µL of *DMMB reagent* and 35 µL of *50 mM sodium acetate solution*. Read the samples on a spectrophotometric microplate reader at 540 nm, using 595 nm as a reference. Perform the same procedure on a sample of bovine collagen type I[16] negative control and positive controls hyaluronic acid[17] and chondroitin sulfate,[18] using 15 µL each of three mg/mL solutions.

Acceptance criteria: Human Acellular Dermal Matrix will contain glycosaminoglycans (GAG) as represented by positive control standards. GAG concentration can be determined by the preferential binding of DMMB dye to negatively charged ions such as sulfated GAGs.

Immunochemical analysis of decorin

Sample decorin solution: Submerge 100–200 mg of Human Acellular Dermal Matrix in normal saline solution to rehydrate the tissue for a minimum of 4–8 h. Using a freezer mill as outlined above, extract the tissue in a solution of 4 M guanidine hydrochloride, 50 mM sodium acetate (pH 5.8) containing 5 mM EDTA, 0.1 mM PMSF, and 10 mM NEM for 24–48 h with agitation at 4°. Centrifuge the extracted tissue at 23,500 *g* for 10 min, and remove the supernatant.

Nitro blue tetrazolium (NBT): Dissolve 0.5 g in 10 mL of 70% dimethyl sulfoxide (DMSO). Store in the dark at room temperature.

5–Bromo-4-chloro-3-indolyl phosphate (BCIP): Dissolve 0.5 g in 10 mL of 100% DMSO. Store in the dark at room temperature.

Alkaline phosphatase buffer: 100 mM sodium chloride, 5 mM magnesium chloride, and 100 mM Tris(hydroxymethyl)aminomethane hydrochloride, pH 9.5. Filter and store at 4°.

Chromogenic substrate mixture: Mix 66 µL of *NBT* and 33 µL of *BCIP* in 10 mL of *Alkaline phosphatase buffer*.

Blotting buffer 1: 50 mM Tris buffered saline, pH 7.4, with 0.1% Tween 20 (TBST)

Blotting buffer 2: 5% blotting grade milk in TBST

Blotting buffer 3: 0.1% blotting grade milk in TBST

Analysis: Run an aliquot of *Sample decorin solution* on an 8% polyacrylamide gel at 100 V for approximately 60 min along with 100 µg recombinant decorin[19] positive control, bovine type I collagen[20] negative control, and prestained molecular weight marker, and transfer to an polyvinylidene fluoride (PVDF) membrane according to the following procedure. In a shallow tray, soak two sheets of Whatman paper and two pieces of sponge in transfer buffer (200 mM glycine, 25 mM tris, 20% methanol, pH 8.3). Soak the transfer membrane in methanol prior to soaking in the transfer buffer. Equilibrate the gel in transfer buffer for 10 min. Assemble the tank transfer apparatus according to the manufacturer's instructions. Layer the following items within the apparatus in proper order: sponge, paper, gel, PVDF membrane, paper, and sponge. Clamp the apparatus closed. Connect the electrodes, and transfer the gel bands to the membrane at about 100 V at 4° for about 1 h. The use of prestained protein molecular weight marker and staining the gel after electro-blotting allows for visual determination of transfer completion. When transfer is complete, disconnect the transfer apparatus and carefully remove the membrane. Block the membrane for at least 1 h with *Blotting buffer 2*, cover, and shake gently for 30 min. Wash the membrane three times for 5 min each with *Blotting buffer 1*. Add rabbit anti-human decorin primary antibody,[21] diluted to 2 µg/mL in *Blotting buffer 3*, to the membrane, and incubate for 1 h with gentle shaking. Wash the membrane three times for 5 min with *Blotting buffer 1*.

[12]Such as SPEX/CertiPrep Freezer/Mill.

[13]Suitable chondroitinase is available from Seikagaku, Tokyo, Japan, catalog #100330.

[14]Suitable type I collagen is available from Sigma, 3050 Spruce St., St. Louis, MO 63103, catalog #C7774.

[15]Suitable type III collagen is available from Sigma, 3050 Spruce St., St. Louis, MO 63103, catalog #C4407.

[19]Suitable decorin is available from R&D Systems, 614 McKinley Place NE, Minneapolis, MN 55413, catalog #143DE100.

[20]Suitable type I collagen is available from Invitrogen, 1600 Faraday Ave, PO Box 6482 Carlsbad, CA 92008.

[21]Suitable primary antibody is available from BioVision, 980 Linda Vista Ave., Mountain View, CA 94043, catalog #3645100.

In-Process Revision

Add goat anti-rabbit IgG secondary antibody conjugated[22] to alkaline phosphatase, diluted 1:3000 in *Blotting buffer 3*, to the membrane, and incubate for 1 h with gentle shaking. Wash the membrane three times for 5 min with *Blotting buffer 1*. Add 10 mL of *Chromogenic substrate mixture*, and incubate until color has developed. When the bands are clearly visible, stop the development reaction by rinsing the membrane with water.

Acceptance criteria: The decorin band obtained from Human Acellular Dermal Matrix is the only band on the gel and is clearly visible at mobility similar to the band obtained from the control sample recombinant decorin.

- **MICROBIAL ENUMERATION TESTS ⟨61⟩** and **TESTS FOR SPECIFIED MICROORGANISMS ⟨62⟩** The total aerobic microbial count does not exceed 100 cfu/g, and the total combined molds and yeasts count does not exceed 10 cfu/g. Human Acellular Dermal Matrix meets the requirements of the tests for the absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

ADDITIONAL REQUIREMENTS

- **LABELING:** The package label indicates the length, width, and thickness of the Human Acellular Dermal Matrix. The label also contains the lot number, the expiration date, the required storage conditions, cautionary statements pertaining to package handling, and manufacture and/or distributor contact information. "Instructions for Use", which includes a summary of records used to make donor eligibility determination and necessary information for properly using the product for its intended use, is provided with each unit.
- **PACKAGING AND STORAGE:** Human Acellular Dermal Matrix is aseptically packaged and supplied in a freeze-dried configuration in a double pouch configuration. Human Acellular Dermal Matrix is supplied in various sizes and thicknesses. Human Acellular Dermal Matrix is stored at between 1° and 10° and labeled with an expiration date.
- **USP AUTHENTIC VISUAL REFERENCES**

USP Human Acellular Dermal Matrix Reference Photomicrographs. The samples were prepared as directed in the test for *Histological Evaluation*. These photomicrographs show the histological appearance of passing histological evaluation with no evidence of intact epidermal or dermal cells, and no evidence of collagen damage (photomicrographs 2–6) and of failed material with collagen damage and condensed papillary dermis or attached epidermal remnant (photomicrographs 7–10). Passing and failed material are compared to photomicrograph 1 showing the staining of unprocessed normal human skin with intact epidermal or dermal cells. Photomicrographs 11 and 12 are negative and positive controls for the analysis of immunostaining with MHC I and II antibodies. Photomicrographs 13 and 14 are negative and positive controls for the analysis of immunostaining with collagen type IV antibodies. For both types of staining, a passing positive stain will appear brown in color, focal, and cell-associated while a failed negative stain will appear clear with no brown staining.■1S (*USP33*)

BRIEFING

Microsized Human Acellular Dermal Matrix. Because there is no existing *USP* monograph for this product, a new monograph is being proposed. The procedure for tissue evaluation is based on histological analysis. No evidence of cell nuclei or cytoplasm is apparent in prepared histological sections.

(BB CGT: F. Atouf.) RTS—C52657

[22] Suitable secondary antibody is available from Sigma, 3050 Spruce St., St. Louis, MO 63103, cat #A9917.

Add the following:

■Microsized Human Acellular Dermal Matrix

DEFINITION

Microsized Human Acellular Dermal Matrix is derived from donated allograft human dermis that is processed to remove cells and freeze-dried to remove moisture while preserving biologic components and structure of the dermal matrix. It is biocompatible and supports remodeling by the recipient's own tissue. The matrix is comprised of native human dermal architecture, consisting of collagen (mainly collagen Type I, with additional collagen Type III and IV components), chondroitin sulfate and hyaluronic acid glycosaminoglycans, and elastin.

The donated human skin is processed in a manner that removes all cellular components, including the epidermal layer and dermal cells. The resulting acellular dermal matrix is then rendered into a particulate form (microsized), with a mean particle size of less than 100 μm, by processing with a freezer mill. Microsized Human Acellular Dermal Matrix does not contain intact cells, cell nuclei, or chemically-induced crosslinks. Human skin used to produce Microsized Human Acellular Dermal Matrix is obtained from sources that have passed applicable donor eligibility requirements for relevant communicable diseases. Microsized Human Acellular Dermal Matrix is manufactured using sterile solutions and equipment under aseptic conditions. The final product is inspected and tested to ensure that the product meets specifications.

SPECIFIC TESTS

- **HISTOLOGICAL EVALUATION**

[NOTE—Histological evaluation of Microsized Human Acellular Dermal Matrix is performed on the Human Acellular Dermal Matrix prior to micronization.]

Sucrose solution: Dissolve 20 g of sucrose in 100 mL of water.

Tissue preparation: Submerge a 1.4-cm or greater size piece of Human Acellular Dermal Matrix in normal saline solution to rehydrate the tissue for a minimum of 4–8 h. Cut three 1.5-cm × 0.5-cm pieces of Human Acellular Dermal Matrix, and place each piece from the same donor lot into a suitable histological tissue cassette for routine histology processing and paraffin embedding. Place the cassettes in 10% neutral buffered formalin[1] at room temperature for a minimum of 12 h. [NOTE—the cassettes may be kept at room temperature for 1 month.] From the same donor lot, cut a minimum of three 1.0-cm × 0.5-cm pieces of Human Acellular Dermal Matrix for immunohistochemical (IHC) staining, and place in a vial containing the *Sucrose solution*. Store at between 2° and 8° for a minimum of 4 h, but the product can be held in the solution for up to 2 weeks.

Embedding and sectioning of histological samples: Place all cassettes to be processed into a suitable histological cassette basket including one cassette containing formalin-fixed normal skin to serve as a process control. The following steps can be performed using a vacuum infiltration tissue processor.[2] At room temperature (37° ± 2°), tissue samples that continue to fix in 10% neutral buffered formalin, are dehydrated through graded reagent alcohol (70%, 80%, 95% and 100%).[3] The tissue samples are cleared in a xylene substitute.[4]

The tissue is infiltrated with paraffin[5] at 60°. The following embedding procedure can be performed with the use of a

[1] 10% Neutral buffered formalin can be purchased through Statlab Medical Products, Inc. Lewisville, TX.

[2] A suitable processor can be the Tissue Tek V.I.P. Model #1000 vacuum infiltration tissue processor or the Leica ASP300 tissue processor.

[3] Graded alcohols: 70%, 80%, and 95% are prepared using 100% reagent alcohol, such as that purchased from Statlab Medical Products, Inc. Lewisville, TX.

[4] Such as a citrus clearing solvent from Richard-Allan Scientific, Kalamazoo, MI.

[5] Such as Paraplast, Extra, manufactured by McCormick Scientific, St. Louis, MO.

histology tissue embedding unit, consisting of a thermal console, dispensing console, and cryo-console. Open the histological cassette. Partially fill embedding molds with molten paraffin (60°). While keeping the paraffin heated, position the three tissue pieces on edge in the paraffin so that cross-sections of the Human Acellular Dermal Matrix can be cut once completely embedded. Rapidly cool the paraffin so that it partially solidifies. Completely fill the embedding mold with additional molten paraffin (60°), and cool until completely solidified.

Remove solidified paraffin blocks from embedding molds for sectioning. Sectioning of paraffin-embedded samples can be performed on a suitable microtome.[6] Clamp the tissue block into the holder of the microtome. Fill a histological water bath with fresh water. [NOTE—A quarter teaspoon of gelatin may be added to the water bath for section adhesion.] Maintain the water bath at 39°± 2°. Cut sections to a thickness of 3–5 µm to form a ribbon, and gently lay the ribbon on the water bath. Place two consecutive sections on each glass microscope slide.

Embedding and sectioning of immunohistochemical samples: Fill histology embedding molds with a cryo-protectant embedding media. Transfer tissue pieces from the *Sucrose solution* to the embedding media in the mold, orient so that cross-sections can be cut, and let sit for 1–30 min. Freeze the molds with liquid nitrogen and store at –80°. Remove the frozen blocks from the molds for sectioning. Cryo-section each block to 4–7 µm in thickness, and place the sections on glass microscope slides. Place at least two sections on each slide. Slides can be stored at between –70° and –85°.

Hematoxylin and eosin sample staining: [NOTE—Store all solutions at room temperature.]

1% Acid alcohol solution: Alcohol, hydrochloric acid, and water (1309:20:509)

95% Reagent alcohol solution: Alcohol and water (190:10)

80% Reagent alcohol solution: Alcohol and water (160:40)

Saturated lithium carbonate solution: Water, lithium carbonate (200:2), (v:w)

Analysis: The slide with affixed tissue (sections) is deparaffinized in three changes of xylene substitute, rehydrated in graded reagent alcohols (100% and 95%), and rinsed in tap water. The sections are stained with hematoxylin, rinsed, decolorized with *1% Acid alcohol solution*, and neutralized with *Saturated lithium carbonate solution*. The sections are counterstained with 1% alcoholic eosin Y, dehydrated through graded reagent alcohols (95% and 100%) and xylene substitute, and then coverslipped. A positive control is stained with each batch to ensure successful staining.

Acceptance criteria: Adequate staining is defined by a blue nuclear stain and a pink-red cytoplasm. Sections are assessed for tissue matrix integrity and are acceptable if they pass the following criteria: they must not show evidence of intact epidermal or dermal cells, and must not show evidence of widespread collagen damage (broken, condensed, or distorted fibers) or unrecognizable papillary layer, as shown in the USP Human Acellular Dermal Matrix Reference Photomicrographs of products with acceptable appearance.

Immunohistochemical sample staining

0.5 M phosphate-buffered saline, pH 7.4 (PBS): Prepare by combining 8.50 g of sodium chloride, 0.85 g of dibasic sodium phosphate, and 0.54 g of monobasic potassium phosphate in 1 L water. Adjust the pH to 7.4 with 1.0–3.0 M sodium hydroxide. Store at room temperature.

Diluent PBS: Combine 0.250 g of bovine serum albumin, 25 mL of *PBS*, and 0.02–0.03 g of thimerosal. Store at between 2° and 8° for up to 1 year.

Primary and secondary antibodies: Perform a titer assay to determine the optimal dilution for each antibody when a new lot is used. Dilute in *Diluent PBS* as per titer assay.

Human monoclonal anti-type IV collagen:[7] 25–100 µL aliquots of concentrated antibody may be stored at between –70° and –85°.

[6]Such as Leica RM 2155 or RM 2255 Rotary Microtome.

[7]A suitable primary antibody is available from Sigma, 3050 Spruce St., St. Louis, MO 63103, catalog #C1926.

Human monoclonal anti-MHC class I:[8] 100–200 µL aliquots of concentrated antibody may be stored at between –70° and –85°.

Human monoclonal anti-MHC class II:[9] 100–200 µL aliquots of concentrated antibody may be stored at between –70° and –85°.

Goat anti-mouse IgG (Fab-specific) peroxidase conjugate:[10] 100–200 µL aliquots of concentrated antibody may be stored at between –70° and –85°

3,3 Diaminobenzidine staining kit or stable diaminobenzidine (DAB):[11] To make the working stain, consult kit instructions. Store the kit at between 2° and 8°. 3,3 Diaminobenzidine is light sensitive, minimum exposure to light is advisable. Stable DAB is stored at between 0° and –20°.

3% Hydrogen peroxide: Store at room temperature.

Acetone: Store at between –10° and –20°.

Analysis for monoclonal anti-MHC class I and class II: Frozen sections are obtained and slides are fixed in *Acetone*. Endogenous peroxides are blocked with *3% Hydrogen peroxide*. A cocktail of *Human monoclonal anti-MHC class I*, *Human monoclonal anti-MHC class II*, and bovine serum albumin are applied to the sections. Sections are rinsed with *PBS*, and the secondary antibody, *Goat anti-mouse IgG peroxidase conjugate*, is applied. Following the application of the secondary antibody, the sections are rinsed in *PBS* and the *DAB* is applied. The sections are then counterstained in hematoxylin, decolorized in *1% Acid alcohol solution*, neutralized in *Saturated lithium carbonate solution*, dried, and coverslipped.

Control slides: Normal skin samples are frozen and sectioned for control tissue. The positive control receives the same exact treatment as the test samples. The negative control is the same tissue section as the positive. The difference is that one critical stain step is omitted, such as the application of the primary antibodies. All other stain steps are completed in accordance with the test slides. If acceptable control stains are not achieved, the stain is repeated.

Acceptance criteria: Positive staining of sections will appear brown in color, focal, cell-associated, and be clearly distinct from the background, as shown in the USP Human Acellular Dermal Matrix Reference Photomicrographs of products with acceptable appearance for staining with MHC I and II antibodies. Negative stain results appear clear with no brown staining; only a light blue hematoxylin counterstain will be seen.

Analysis for monoclonal anti-type IV collagen: Frozen sections are obtained and slides are fixed in *Acetone*. Endogenous peroxides are blocked with *3% Hydrogen peroxide*. *Human monoclonal anti-type IV collagen* along with bovine serum albumin are applied to the sections. Sections are rinsed with *PBS*, and the secondary antibody, *Goat anti-mouse IgG peroxidase conjugate*, is applied. Following the application of the secondary antibody, the sections are rinsed in *PBS* and the *DAB* is applied. The sections are then counterstained in hematoxylin, decolorized in *1% Acid alcohol solution*, neutralized in *Saturated lithium carbonate solution*, dried, and coverslipped.

Control slides: Normal skin samples are frozen and sectioned for control tissue. The positive control receives the same exact treatment as the test samples. The negative control is the same tissue section as the positive. The difference is that one critical stain step is omitted, such as the application of the primary antibodies. All other stain steps are completed in accordance with the test slides. If acceptable control stains are not achieved, the stain is repeated.

Acceptance criteria: Positive stain results will reveal a brown stain in the location of the basement membrane, as shown in

[8]A suitable primary antibody is available from VMRD Inc., PO Box 502, Pullman, WA 99163, catalog #H58A.

[9]A suitable primary antibody is available from VMRD Inc., PO Box 502, Pullman, WA 99163, catalog #TH14B.

[10]A suitable secondary antibody is available from Sigma, 3050 Spruce St., St. Louis, MO 63103 cat #A9917.

In-Process Revision

the USP Human Acellular Dermal Matrix Reference Photomicrographs of products with acceptable appearance for staining with collagen type IV antibodies. Negative stain results appear clear with no brown staining; only a light blue hematoxylin counterstain will be seen.

• **BIOCHEMICAL ANALYSIS**

Sample solution: Submerge 20 mg of Human Acellular Dermal Matrix in normal saline solution to rehydrate the tissue for a minimum of 4–8 h. Freeze the sample and mill using a freezer mill.[12] Suspend in 10 mL of 4 M guanidine hydrochloride, 50 mM sodium acetate, 5 mM EDTA, 0.1 mM phenylmethylsulfonyl fluoride (PMSF), 10 mM *N*-ethylmaleimide (NEM), 0.2% Triton X-100, pH 5.8, and extract for 48 h at 4°, with agitation. Centrifuge for 10 min at 4° and 23,500 *g*. Remove the supernatant and digest with 20 µL chondroitinase ABC,[13] 1 milli Unit/µL. Analyze for *Glycosaminoglycan (GAG) content* and *Immunochemical analysis of decorin* (below). For *Collagen content* analysis, wash the pellet three times with 10 mL of deionized water, centrifuging for 10 min at 4° and 23,500 *g* after each wash. Resuspend in a minimal amount of water, freeze at –80°, and lyophilize. Resuspend 20 mg of the lyophilized pellet in 20 mL of 0.5 M acetic acid containing 100 µg of pepsin/mg of tissue, and incubate overnight at 4° with agitation. Remove undigested material by centrifugation at 23,500 *g* for 20 min.

Collagen content

Sample buffer: Prepare as directed for *Sample Buffer 1* in *Biotechnology-Derived Articles—Polyacrylamide Gel Electrophoresis* ⟨1056⟩, *Electrophoretic Separation*.

Sample collagen solution: Add 20 µL of the supernatant from the *Sample solution* to 20 µL of *Sample buffer,* mix, and incubate at 60° for 15 min.

Control samples: Prepare suitable positive control samples (human placental collagen types I[14] and III[15]) similar to *Sample collagen solution.*

Gel electrophoresis: Load 40 µL of each of *Sample collagen solution* and the *Control samples* onto a 6% acrylamide gel, perform the electrophoretic separation, and stain with Coomassie brilliant blue as directed under *Biotechnology Derived Articles—Polyacrylamide Gel Electrophoresis* ⟨1056⟩.

Acceptance criteria: The bands obtained from Human Acellular Dermal Matrix are distinct and clearly visible at a mobility similar to the bands obtained from the collagen types I and III control samples. No smears corresponding to degraded collagen types I and III are found on the gel.

Glycosaminoglycan (GAG) content

Sample GAG solution: Use 15 µL of the supernatant prepared as directed under the *Sample solution.*

DMMB reagent: Dissolve 16 mg 1,9 dimethyl-methylene blue (DMMB) in 5 mL ethanol. Add 3.24 mL of formic acid and 2.94 mL of 10 M sodium hydroxide. Bring to 1000 mL with water.

50 mM Sodium acetate solution: Dissolve 1.03 g sodium acetate in 250 mL water.

Analysis: Add 15 µL of *Sample GAG solution* to each well of a 96-well microtiter plate. To each sample well, add 200 µL *DMMB reagent* and 35 µL of *50 mM Sodium acetate solution*. Read the samples on a spectrophotometric microplate reader at 540 nm, using 595 nm as a reference. Perform the same procedure on a sample of bovine collagen type I[16] negative control and positive controls hyaluronic acid[17] and chondroitin sulfate,[18] using 15 µL each of three mg/mL solutions.

Acceptance criteria: Microsized Human Acellular Dermal Matrix will contain glycosaminoglycans (GAG) as represented by positive control standards. GAG concentration can be determined by the preferential binding of DMMB dye to negatively charged ions such as sulfated GAGs.

Immunochemical analysis of decorin

Sample decorin solution: Submerge 100–200 mg of Human Acellular Dermal Matrix in normal saline solution to rehydrate the tissue for a minimum of 4–8 h. Using a freezer mill as outlined above, extract the tissue in a solution of 4 M guanidine hydrochloride, 50 mM sodium acetate (pH 5.8) containing 5 mM EDTA, 0.1 mM PMSF, 10 mM NEM for 24–48 h with agitation at 4°. Centrifuge the extracted tissue at 23,500 *g* for 10 min, and remove the supernatant.

Nitro blue tetrazolium (NBT): Dissolve 0.5 g in 10 mL of 70% dimethyl sulfoxide (DMSO). Store in the dark at room temperature.

5-Bromo-4-chloro-3-indolyl phosphate (BCIP): Dissolve 0.5 g in 10 mL of 100% DMSO. Store in the dark at room temperature.

Alkaline phosphatase buffer: 100 mM sodium chloride, 5 mM magnesium chloride, 100 mM Tris(hydroxymethyl)aminomethane hydrochloride, pH 9.5. Filter and store at 4°.

Chromogenic substrate mixture: Mix 66 µL of *NBT* and 33 µL of *BCIP* in 10 mL *Alkaline phosphatase buffer*.

Blotting buffer 1: 50 mM Tris buffered saline, pH 7.4, with 0.1% Tween 20 (TBST)

Blotting buffer 2: 5% blotting grade milk in TBST

Blotting buffer 3: 0.1% blotting grade milk in TBST

Analysis: Run an aliquot of *Sample decorin solution* on an 8% polyacrylamide gel at 100 V for approximately 60 min along with 100 µg recombinant decorin[19] positive control, bovine type I collagen[20] negative control, and prestained molecular weight marker, and transfer to an polyvinylidene fluoride (PVDF) membrane according to the following procedure. In a shallow tray, soak two sheets of Whatman paper and two pieces of sponge in transfer buffer (200 mM glycine, 25 mM tris, 20% methanol, pH 8.3). Soak the transfer membrane in methanol prior to soaking in the transfer buffer. Equilibrate the gel in transfer buffer for 10 min. Assemble the tank transfer apparatus according to manufacturer's instructions. Layer the following items within the apparatus in proper order: sponge, paper, gel, PVDF membrane, paper, and sponge. Clamp the apparatus closed. Connect the electrodes, and transfer the gel bands to the membrane at about 100 V at 4° for about 1 h. The use of prestained protein molecular weight marker, and staining the gel after electro-blotting, allows for visual determination of transfer completion. When transfer is complete, disconnect the transfer apparatus and carefully remove the membrane. Block the membrane for at least 1 h with *Blotting buffer 2*, cover, and shake gently for 30 min. Wash the membrane three times for 5 min each with *Blotting buffer 1*. Add rabbit anti-human decorin primary antibody,[21] diluted to 2 µg/mL in *Blotting buffer 3*, to the membrane, and incubate for 1 h with gentle shaking. Wash the membrane three times for 5 min with *Blotting buffer 1*. Add goat anti-rabbit IgG secondary antibody conjugated[22] to alkaline phosphatase, diluted 1:3000 in *Blotting buffer 3*, to the membrane, and incubate for 1 h with gentle shaking. Wash the membrane three times for 5 min with *Blotting buffer 1*. Add 10 mL of *Chromogenic substrate mixture*, and incubate until color has developed. When the bands are clearly visible, stop the development reaction by rinsing the membrane with water.

Acceptance criteria: The decorin band obtained from Human Acellular Dermal Matrix is the only band on the gel

and is clearly visible at a mobility similar to the band obtained from the control sample recombinant decorin.

- **MICROBIAL ENUMERATION TESTS** ⟨**61**⟩ and **TESTS FOR SPECIFIED MICROORGANISMS** ⟨**62**⟩**:** The total aerobic microbial count does not exceed 100 cfu/g, and the total combined molds and yeasts count does not exceed 10 cfu/g. Microsized Human Acellular Dermal Matrix meets the requirements of the tests for the absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.
- **PARTICLE SIZE ANALYSIS**

(See *Particulate Matter in Injections* ⟨788⟩.)

Sample: 100 mg of Microsized Human Acellular Dermal Matrix material

Analysis: Add the *Sample* to 25 mL of saline in a clean 50-mL conical tube. Rehydrate and disperse the particles by probe sonication at 20 W for 60 s. Place an appropriate aliquot of sample suspension in an appropriate liquid particle counter (LPC) for analysis by laser light obscuration (light extinction).

Acceptance criteria: The mean particle size is NMT 100 µm.

ADDITIONAL REQUIREMENTS

- **LABELING:** The package label indicates the weight of the Microsized Human Acellular Dermal Matrix material enclosed. The label also contains the lot number, the expiration date, the trade name, the required storage conditions, the dosage information, and manufacturer and/or distributor contact information. "Instructions for Use," which includes a summary of records used to make donor eligibility determination and necessary information for properly using the product for its intended use, is provided with each matrix.
- **PACKAGING AND STORAGE:** Microsized Human Acellular Dermal Matrix is aseptically packaged and supplied in a freeze-dried configuration in a single-use delivery syringe. The syringe is packaged in a hermetically sealed pouch. Microsized Human Acellular Dermal Matrix is stored at between 1° and 10° and labeled with an expiration date.
- **USP AUTHENTIC VISUAL REFERENCES** ⟨**11**⟩

USP Human Acellular Dermal Matrix Reference Photomicrographs. The samples were prepared as directed in the test for *Histological Evaluation*. These photomicrographs show the histological appearance of passing histological evaluation with no evidence of intact epidermal or dermal cells, and no evidence of collagen damage (photomicrographs 2–6) and of failed material with collagen damage and condensed papillary dermis or attached epidermal remnant (photomicrographs 7–10). Passing and failed material are compared to photomicrograph 1 showing the staining of unprocessed normal human skin with intact epidermal or dermal cells. Photomicrographs 11 and 12 are negative and positive controls for the analysis of immunostaining with MHC I and II antibodies. Photomicrographs 13 and 14 are negative and positive controls for the analysis of immunostaining with collagen type IV antibodies. For both types of staining, a passing positive stain will appear brown in color, focal, and cell-associated, while a failed negative stain will appear clear with no brown staining.■1S (*USP33*)

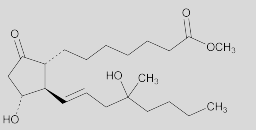
BRIEFING

Misoprostol. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods of analysis, is proposed. The liquid chromatographic procedures in the test for *Organic Impurities, Procedure 1* and in the *Assay* are based on analyses performed with the Zorbax Sil brand of L3 column. The typical retention time for misoprostol is about 15 min. The liquid chromatographic procedure in the test for *Content of Diastereomers* is based on analyses performed with the Spherisorb Silica brand of L3 column. The typical retention times for the two diastereomers are about 23 and 25 min, respectively. An alternative suitable column is Kromasil Si-60, with the typical retention times for the two diastereomers of about 19 and 21 min, respectively.

(MD-GRE: E. Gonikberg.) RTS—C68834

Add the following:

■Misoprostol



$C_{22}H_{38}O_5$ 382.53

Prost-13-en-1-oic acid, 11,16-dihydroxy-16-methyl-9-oxo-, methyl ester, (1*R**,2*R**,3*R**,*E*)-;

(±)-Methyl (1*R*,2*R*,3*R*)-3-hydroxy-2-[(*E*)-(4*RS*)-4-hydroxy-4-methyl-1-octenyl]-5-oxocyclopentaneheptanoate [59122-46-2].

DEFINITION

Misoprostol contains NLT 97.0% and NMT 102.0% of $C_{22}H_{38}O_5$, calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** ⟨**197S**⟩

Sample solution: 30 mg/mL

Medium: Chloroform

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Mobile phase: 2,2,4-Trimethylpentane, dioxane, and acetonitrile (78:21.5:0.5)

Standard solution: 5.0 mg/mL of USP Misoprostol RS in *Mobile phase*

Sample solution: 5.0 mg/mL of Misoprostol in *Mobile phase*

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 25-cm column; 5-µm packing L3

Flow rate: 2 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution* [NOTE—Identify the impurities based on the retention times shown in *Impurity Table 1*.]

Suitability requirements

Resolution: NLT 1.4, between the second diastereomer peak for 12-epimisoprostol and the misoprostol peak

Relative standard deviation: NMT 1.0%, for three replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{22}H_{38}O_5$ in the portion of Misoprostol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the *Sample solution*

r_S = peak response of the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

In-Process Revision

Acceptance criteria: 97.0%–102.0%

IMPURITIES
Organic Impurities
• **PROCEDURE 1**
Mobile phase, Standard solution, Sample solution, Chromatographic system, and **System suitability:** Proceed as directed in the *Assay*.
Analysis
Samples: *Standard solution* and *Sample solution*
Record the chromatogram for at least 3 times the retention time of the misoprostol peak, and measure the peak responses. Identify the impurities based on the retention times shown in *Impurity Table 1*.
Calculate the percentage of each impurity in the portion of Misoprostol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = response for each impurity from the *Sample solution*
r_S = response of the *Standard solution*
C_S = concentration of USP Misoprostol RS in the *Standard solution* (mg/mL).
C_U = concentration of Misoprostol in the *Sample solution* (mg/mL).
F = relative response factor (see *Impurity Table 1*)
Acceptance criteria
Individual impurities: See *Impurity Table 1*
Total impurities: NMT 1.5%

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor (F)	Limit (%)
A-Type misoprostol[a]	0.22	7.8	0.1
B-Type misoprostol[b]	0.33	0.80	0.1
Norprostol[c]	0.51	8.4	0.1
8-Epimisoprostol[d]	0.71	1.05	0.3
12-Epimisoprostol[e]	0.86 and 0.92[f]	1.08	1.0[f]
Misoprostol	1.0	—	—
Any other individual impurity	—	1.0	0.1

[a]Methyl 7-{(1*R**,2*S**)-2-[(*E*)-4-hydroxy-4-methyloct-1-enyl]-5-oxocyclopent-3-enyl}heptanoate.
[b](*E*)-Methyl 7-[2-(4-hydroxy-4-methyloct-1-enyl)-5-oxocyclopent-1-enyl]heptanoate.
[c]Methyl 7-(3-hydroxy-5-oxocyclopent-1-enyl)heptanoate.
[d]Methyl (1*S**,2*R**,3*R**)-3-hydroxy-2-[(*E*)-4-hydroxy-4-methyl-1-octenyl]-5-oxocyclopentaneheptanoate.
[e]Methyl (1*S**,2*R**,3*S**)-3-hydroxy-2-[(*E*)-4-hydroxy-4-methyl-1-octenyl]-5-oxocyclopentaneheptanoate.
[f]12-Epimisoprostol consists of two diastereomers that are separated under these conditions; integrate both peaks together for the impurity calculations.

• **PROCEDURE 2: CONTENT OF DIASTEREOMERS**
Mobile phase: Hexane, ethanol, and isopropyl alcohol (94:4:2)
Sample solution: 1.0 mg/mL of Misoprostol in *Mobile phase*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 205 nm
Column: 4.6-mm × 25-cm column; 5-µm packing L3
Temperature: 40°
Flow rate: 1 mL/min
Injection size: 20 µL
System suitability
Sample: *Sample solution* [NOTE—Identify the components based on their relative retention times which are about 0.92 for the first diastereomer peak and 1.0 for the second diastereomer peak.]
Suitability requirements
Resolution: NLT 2.0, between the two diastereomer peaks
Relative standard deviation: NMT 2.0% from the area of the first diastereomer peak
Analysis
Sample: *Sample solution*
Calculate the fraction of the first diastereomer in the portion of Misoprostol taken:

$$\text{Result} = r_1/(r_1 + r_2)$$

r_1 = response for the first diastereomer
r_2 = response for the second diastereomer
Acceptance criteria
Fraction of the first diastereomer: 0.51–0.56

Sample solution: Equivalent to 0.2 mg/mL of olopatadine in *Mobile phase*, from Olopatadine Hydrochloride Ophthalmic Solution

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 299 nm

Column: 4.6-mm × 15-cm column; 5-µm packing L7

Flow rate: 1 mL/min

Injection size: 30 µL

Run time: At least 1.6 times the retention time of the major peak

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between olopatadine and olopatadine related compound B, *System suitability solution*

Column efficiency: NLT 2000, *Standard solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Ophthalmic Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times (1/F) \times 100$$

r_U = response of each impurity from the *Sample solution*

r_S = response of olopatadine from the *Standard solution*

C_S = concentration of olopatadine hydrochloride in the *Standard solution* (mg/mL)

C_U = nominal concentration of olopatadine in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of olopatadine, 337.41

M_{r2} = molecular weight of olopatadine hydrochloride, 373.87

F = relative response factor for each individual impurity (See *Impurity Table 1*.)

[NOTE—Disregard any peaks corresponding to those of the *Blank solution* and any peaks with relative retention time, measured with respect to olopatadine, greater than 1.5.]

Acceptance criteria

Individual impurities: See *Impurity Table 1*.

Impurity Table 1

Name	Relative Retention Time (RRT)	Relative Response Factor (F)	Limit (%)
Olopatadine *E*-isomer [a]	0.7	1.3	0.5
Olopatadine	1.0	—	—
Olopatadine related compound B	1.2	1.0	2
Olopatadine carbaldehyde [b]	1.3	4.5	0.5
Any Unspecified Impurity	—	1.0	0.5

[a] 11-[(*E*)-3-(Dimethylamino)propylidene]-6,11-dihydrodibenz[*b*,*e*]oxepin-2-acetic acid

[b] (*Z*)-11-[3-(dimethylamino)propylidene]-6,11-dihydrodibenzo[*b*,*e*]oxepine-2-carbaldehyde

• **PROCEDURE 2: LIMIT OF LATE ELUTING IMPURITIES**

Buffer: Proceed as directed in the *Assay*.

Mobile phase: Acetonitrile and *Buffer* (1:1)

Blank solution: *Mobile phase*

System suitability solution: 0.02 mg/mL of olopatadine hydrochloride and 0.01 mg/mL of olopatadine related compound C in *Mobile phase*

Standard solution: 0.01 mg/mL of USP Olopatadine Related Compound C RS in *Mobile phase*

Sample solution: Use *Sample solution* from the test for *Limit of Early Eluting Impurities*.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 299 nm

Column: 4.6-mm × 15-cm column; 5-µm packing L7

Flow rate: 1 mL/min

Injection size: 30 µL

Run time: At least 3 times the retention time of the olopatadine related compound C peak

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for olopatadine and olopatadine related compound C are 0.3 and 1.0, respectively.]

In-Process Revision

Suitability requirements
Resolution: NLT 7.0 between olopatadine and olopatadine related compound C, *System suitability solution*
Column efficiency: NLT 2000, *Standard solution*
Tailing factor: NMT 2.0, *Standard solution*
Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each impurity in the portion of Ophthalmic Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = response of each impurity from the *Sample solution*
r_S = response of olopatadine related compound C from the *Standard solution*
C_S = concentration of USP Olopatadine Related Compound C RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of olopatadine in the *Sample solution* (mg/mL)

[NOTE—Disregard any peaks corresponding to those of the *Blank solution* and any peaks with relative retention time, measured with respect to olopatadine related compound C, less than 0.7.]

Acceptance criteria
Individual impurities: NMT 1% of olopatadine related compound C is found; and NMT 0.5% of any other individual impurity is found.
Total impurities: NMT 3% [NOTE—Total impurities are the sum of olopatadine related compound B, olopatadine related compound C, Olopatadine *E*-isomer, Olopatadine carbaldehyde, and all other impurities found in the tests for *Limit of Early Eluting Impurities* and *Limit of Late Eluting Impurities*.]

SPECIFIC TESTS
- **STERILITY TESTS ⟨71⟩:** Meets the requirements
- **pH ⟨791⟩:** Between 5.0 and 8.0
- **OSMOLALITY AND OSMOLARITY ⟨785⟩:** Between 260 and 320 mOsmol/kg

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store between 4° and 25°.
- **USP REFERENCE STANDARDS ⟨11⟩**
  USP Olopatadine Hydrochloride RS
  USP Olopatadine Related Compound B RS
  USP Olopatadine Related Compound C RS■1S *(USP33)*

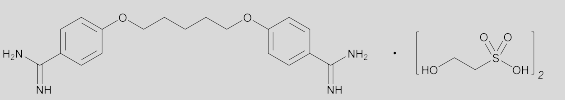
BRIEFING

Pentamidine Isethionate. Because there is no existing *USP* monograph for this drug substance, a new monograph, adopted from the official *European Pharmacopoeia* 6.0 monograph, is being proposed. The liquid chromatographic procedure in the test for *Organic Impurities* is based on analyses performed with a Symmetry C-18 brand of L1 column. The typical retention time of pentamidine is about 3 min.

(MD-AA: L. Santos, B. Davani.) RTS—C49314

Add the following:

■Pentamidine Isethionate



$C_{19}H_{24}N_4O_2 \cdot (C_2H_6O_4S)_2$ 592.70
Ethanesulfonic acid, 2-hydroxy-, compd. with 4,4′-[1,5-pentanediylbis(oxy)]bis [benzenecarboximidamide];
4,4′-(Pentane-1,5-diylbis(oxy))dibenzimidamide bis(2-hydroxyethanesulfonate) [140-64-7].

DEFINITION
Pentamidine Isethionate contains NLT 98.5% and NMT 101.5% of $C_{19}H_{24}N_4O_2 \cdot (C_2H_6O_4S)_2$, calculated on the dried basis.

IDENTIFICATION
- **A. INFRARED ABSORPTION ⟨197K⟩**
- **B. OXYGEN-FLASK COMBUSTION ⟨471⟩**
  Barium chloride solution: 60 mg/mL of barium chloride in water.
  Analysis: Burn 150 mg, using 10 mL of 3% hydrogen peroxide as the absorbing liquid. When the process is complete, acidify with 1 mL of diluted hydrochloric acid, and add 1 mL of *Barium chloride solution*. A white precipitate forms.
- **C.** The retention time of the pentamidine isethionate peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Organic Impurities*.

ASSAY
- **PROCEDURE**
  Sample solution: 5 mg/mL in dimethylformamide. Add 0.25 mL of thymol blue TS.
  Analysis: Titrate under a stream of nitrogen with 0.1M tetrabutylammonium hydroxide VS, determining the endpoint until the color changes to intense blue. Perform a blank determination, and make any necessary correction (see *Titrimetry* ⟨541⟩). Each mL of 0.1M tetrabutylammonium hydroxide is equivalent to 29.63 mg of $C_{19}H_{24}N_4O_2 \cdot (C_2H_6O_4S)_2$.
  Acceptance criteria: 98.5%–101.5%

IMPURITIES
Inorganic Impurities
- **HEAVY METALS,** *Method I* **⟨231⟩:** NMT 20 ppm
- **RESIDUE ON IGNITION ⟨281⟩**
  Acceptance criteria: NMT 0.1% on a 1 g sample

Organic Impurities
- **PROCEDURE**
  Buffer: 30 mg/mL of ammonium acetate in water, adjusted with triethylamine to a pH of 7.5
  Mobile phase: Methanol and *Buffer* (65:35)
  System suitability solution: Prepare 40.0 mL of a 2.5 mg/mL solution of USP Pentamidine Isethionate RS in water. Adjust with 0.2 M sodium hydroxide to a pH of 10.5, and boil under reflux for 20 min. Cool, and dilute with water to 50.0 mL. Transfer quantitatively 1 mL of this solution to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.
  Standard solution: 2 µg/mL of USP Pentamidine Isethionate RS in *Mobile phase*
  Sample solution: 1.0 mg/mL of Pentamidine Isethionate in *Mobile phase*. [NOTE—It must be demonstrated that the final product does not contain a detectable amount of alkyl 2-hydroxyethanesulphonates, a potential in-process impurity.]

In-Process Revision

Mode: LC
Detector: UV 265 nm
Column: 4.6-mm × 25-cm column; 5-µm packing L1
Flow rate: 1 mL/min
Injection size: 10 µL
Run time: 3.5 times the retention time of pentamidine
System suitability
Sample: *System suitability solution*
Suitability requirements
Resolution: NLT 2 between the two major peaks. [NOTE—The chromatogram obtained shows two major peaks.]
Analysis
Samples: *Standard solution* and *Sample solution*
Acceptance criteria
Individual impurities: NMT 0.4% [NOTE—Exclude any other peak producing a response of less than 0.02%.]
Total impurities: NMT 0.7%

SPECIFIC TESTS
- **pH ⟨791⟩:** 4.5–6.5, in a carbon dioxide-free aqueous solution containing 50 mg/mL of pentamidine isethionate
- **Loss on Drying ⟨731⟩:** Dry at 105°: it loses NMT 4.0% of its weight.

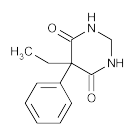
ADDITIONAL REQUIREMENTS
- **Packaging and Storage:** Preserve in tight containers, protected from light. Store at controlled room temperature.
- **USP Reference Standards ⟨11⟩**
USP Pentamidine Isethionate RS■1S *(USP33)*

BRIEFING

Primidone. *USP* 32 page 3382. It is proposed to make the following changes to the monograph:
1. Replace the UV assay with a validated HPLC procedure. The HPLC method was validated for tablets using a Waters Atlantis C18 brand of L1 column. The typical retention time for Primidone is about 4 min.
2. Replace the TLC ordinary impurities method with the HPLC method described in the current *European Pharmacopoeia*. The current *USP* method is nonselective and uses chlorine gas which can pose a safety hazard. The proposed method uses a Merck KGaA Chromolith RP-18E brand of L1 column from which primidone typically elutes at about 2 min.
3. Replace *Identification* tests *B* and *C* with an HPLC retention time comparison of the major peaks in the chromatograms of the *Standard solution* and *Sample solution* in the *Assay*.
4. Delete the test for *Melting Range or Temperature*. Because a selective HPLC impurity test is being added, the test for *Melting Range or Temperature* contributes no additional value in establishing the quality of the drug substance.

(MD-PP: D. Vicchio, R. Ravichandran.) RTS—C57472

Primidone



$C_{12}H_{14}N_2O_2$ 218.25
4,6(1*H*,5*H*)-Pyrimidinedione, 5-ethyldihydro-5-phenyl-;
5-Ethyldihydro-5-phenyl-4,6(1*H*,5*H*)-pyrimidinedione [125-33-7].

DEFINITION
Primidone contains NLT 98.0% and NMT 102.0% of $C_{12}H_{14}N_2O_2$, calculated on the dried basis.

IDENTIFICATION
- **A. Infrared Absorption ⟨197K⟩:** If a difference appears, dissolve portions of both the sample and the Reference Standard in alcohol, evaporate the solutions to dryness, and repeat the tests.

BRIEFING

Propoxyphene Hydrochloride Capsules, *USP 32* page 3418. On the basis of comments received, it is proposed to delete *Identification* test *B* because the optical rotation is not needed in the monograph as the test is already performed in the drug substance monograph. In addition, the *Identification* section already has two orthogonal tests.

(MD-CCA: C. Anthony.) RTS—C42520

Propoxyphene Hydrochloride Capsules

DEFINITION
Propoxyphene Hydrochloride Capsules contain NLT 92.5% and NMT 107.5% of the labeled amount of $C_{22}H_{29}NO_2 \cdot HCl$.

IDENTIFICATION
[NOTE—Use the following solutions in the tests below.]
Standard solution: Transfer 125 mg of USP Propoxyphene Hydrochloride RS to a 125-mL separator containing 8 mL of acetone, 32 mL of water, and 20 mL of 100 mg/mL of sodium carbonate solution, and swirl the mixture for 3 min. Add

In-Process Revision

25.0 mL of chloroform, insert the stopper, and shake the mixture by mechanical means for 1 h. Filter the chloroform extract through a layer of anhydrous sodium sulfate into a suitable beaker.

Sample solution: Transfer a quantity of Capsule contents, remaining from the preparation of the *Sample solution* in the *Assay*, equivalent to 320 mg of propoxyphene hydrochloride to a 100-mL volumetric flask. Add 20 mL of acetone, and sonicate for 1 min. Dilute the solution with water to 100 mL. Allow to stand until the excipients have settled, usually 15–20 min. Transfer 40.0 mL of this solution to a 125-mL separator containing 20 mL of 100 mg/mL of sodium carbonate solution, and swirl the mixture for 3 min. Add 25.0 mL of chloroform, insert the stopper, and shake the mixture by mechanical means for 1 h. Filter the chloroform extract through a layer of anhydrous sodium sulfate into a suitable beaker. Use the *Standard solution* and *Sample solution* for the following tests.

- **A.** The IR absorption spectrum of the *Sample solution*, concentrated if necessary by evaporating a portion on a steam bath with the aid of a current of air to one-fifth of its volume, exhibits maxima only at the same wavelengths as that of the *Standard solution*.

Delete the following:

~~- **B. OPTICAL ROTATION** ⟨781⟩~~

~~**Analysis:** Transfer 20.0 mL of each *Sample solution* and *Standard solution* to separate beakers, and evaporate on a steam bath with the aid of a current of air to 5 mL. Remove the beakers from the steam bath, and continue evaporation with the aid of a current of air until the chloroform is completely evaporated. Add 5.0 mL of 0.1 N hydrochloric acid to each, and dissolve the residue.~~

~~Using the solution of the *Sample solution*, determine the specific rotation, in which C, the concentration of propoxyphene hydrochloride/100 mL of solution, is calculated as follows:~~

~~$$\text{Result} = A \times (W_U/W_T) \times 0.0064$$~~

~~A = quantity of propoxyphene hydrochloride/Capsule, as obtained in the *Assay* (mg)~~
~~W_U = weight of the portion of Capsule contents taken (mg)~~
~~W_T = average weight of the contents of each Capsule (mg)~~

~~Using the solution of the *Standard solution*, determine the specific rotation, C, being calculated by multiplying the weight, in mg, of USP Propoxyphene Hydrochloride RS taken by 0.016.~~

~~**Acceptance criteria:** The specific rotation of the *Sample solution* is NLT 95.0% of that of the *Standard solution*.~~ 1S (*USP33*)

Change to read:

- **C. B.** 1S (*USP33*) The chromatogram of the *Sample solution* obtained as directed in the *Assay* exhibits a major peak for propoxyphene hydrochloride, the retention time of which corresponds to that exhibited for the *Standard solution* in the *Assay*.

ASSAY

- **PROCEDURE**

Solution A: 6.8 g of monobasic potassium phosphate in 900 mL of water. Add 2.0 mL of triethylamine and adjust by the addition of phosphoric acid to a pH of 3.0 ± 0.1. Dilute with water to 1000 mL (phosphate buffer).

Diluent: Acetonitrile and water (2:3)
Mobile phase: Acetonitrile and *Solution A* (2:3)
Standard solution: 6.5 µg/mL of USP Propoxyphene Hydrochloride RS in *Diluent*. [NOTE—Sonicate as needed to aid dissolution.]
Sample stock solution: Remove, as completely as possible, the contents of NLT 20 Capsules. Weigh the contents, and determine the average weight/Capsule. Transfer the mixed combined contents of Capsules nominally equivalent to 65 mg of propoxyphene hydrochloride to 50 mL of *Diluent*, sonicate for 5 min, and shake by mechanical means for 15 min. Dilute with *Diluent* to 200 mL, and filter, discarding the first 20 mL of the filtrate.
Sample solution: Nominally equivalent to 6.5 µg/mL from the *Sample stock solution* diluted with *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 220 nm
Column: 4.6-mm × 3.3-cm; 3-µm packing L1 that is base-deactivated. [NOTE—Precondition the column for at least 30 min with *Mobile phase*.]
Flow rate: 1 mL/min
Injection size: 10 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2 for propoxyphene hydrochloride peak
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{22}H_{29}NO_2 \cdot HCl$ in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Propoxyphene Hydrochloride RS in the *Standard solution* (µg/mL)
C_U = nominal concentration of propoxyphene hydrochloride in the *Sample solution* (µg/mL)

Acceptance criteria: 92.5%–107.5%

PERFORMANCE TESTS

- **DISSOLUTION** ⟨711⟩

Solution A: 2.99 g of sodium acetate trihydrate in 200 mL of water. Add 1.66 mL of glacial acetic acid, and dilute with water to 1000 mL (pH 4.5 acetate buffer).
Medium: *Solution A*; 500 mL
Apparatus 1: 100 rpm
Time: 60 min
Standard solution: USP Propoxyphene Hydrochloride RS in *Diluent*
Sample solution: Sample per *Dissolution* ⟨711⟩. Dilute with *Diluent* to a concentration that is similar to the *Standard solution*.
Analysis: Proceed as directed in the *Assay*, using a filtered portion of the *Sample solution* and a *Standard solution*.
Tolerances: NLT 85% (Q) of the labeled amount of $C_{22}H_{29}NO_2 \cdot HCl$ is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩**:** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** ⟨11⟩

In-Process Revision

BRIEFING

Ribavirin Capsules. Because there is no existing *USP* monograph for this dosage form, a new monograph is being proposed. The liquid chromatographic procedure in the tests for *Organic Impurities* and in the *Assay* is based on analysis performed with the Waters IC-PAK brand of column containing 7-µm packing L17. The typical retention time for the ribavirin peak is about 5.1 min. The chromatographic procedure in the test for *Dissolution* was validated using an Aminex HPX-87H column with packing L17. With this column, the retention time of ribavirin is about 6.6 min.

(MD-AA: L. Santos, B. Davani. BPC: M. Marques.) RTS—C64170

Add the following:

▪Ribavirin Capsules

DEFINITION

Ribavirin Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of ribavirin ($C_8H_{12}N_4O_5$).

IDENTIFICATION

• The retention time of the ribavirin peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Mobile phase: Water. Adjust with sulfuric acid to a pH of 2.5 ± 0.1.

Diluent: *Mobile phase*

Standard solution: 0.025 mg/mL of USP Ribavirin RS in *Diluent*

Sample stock solution: Transfer an equivalent to 50 mg of ribavirin, from NLT 20 finely powdered Capsules, to a 100-mL volumetric flask. Add about 50 mL of *Diluent*, and sonicate with occasional shaking for about 20 min. Cool to room temperature, dilute with *Diluent* to volume, and mix.

Sample solution: 0.025 mg/mL of ribavirin in *Diluent*. Pass the solution through a suitable filter (PTFE, PVDF, or equivalent) having a porosity of 0.45 µm.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 207 nm

Column: 7.8-mm × 15-cm column; packing L17

Temperature: 65°

Flow rate: 1 mL/min

Injection size: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: 0.7–1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_8H_{12}N_4O_5$ in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Ribavirin RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ribavirin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** ⟨**711**⟩

Medium: Water; 900 mL

Apparatus 1: 100 rpm

Time: 30 min

Standard solution: 0.0225 mg/mL of USP Ribavirin RS in *Medium*

Sample solution: Pass the solution through a suitable filter (PTFE, PVDF, or equivalent) having a porosity of 0.45 µm. Transfer 5.0 mL of the filtrate to a 50.0-mL volumetric flask, and dilute with *Medium* to volume.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 207 nm

Column: 7.8-mm × 30-cm, 9-µm packing L17

Temperature: 65°

Flow rate: 1.5 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_8H_{12}N_4O_5$ dissolved in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times D \times 100$$

r_U = peak area from the *Sample solution*
r_S = peak area from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
L = label claim (mg/Tablet)
V = volume of *Medium* (mL)
D = dilution factor of the solution under test

Tolerances: NLT 80% (Q) of the labeled amount of ribavirin is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨**905**⟩**:** Meet the requirements

IMPURITIES

Organic Impurities

• **PROCEDURE**

Mobile phase, Diluent, Standard solution, and **Chromatographic system:** Proceed as directed for the *Assay*.

Sample solution: Count NLT 20 Capsules, and remove their content as completely as possible. Calculate the average net content. Transfer an equivalent to 50 mg of ribavirin from NLT 20 finely powdered Capsules to a 100-mL volumetric flask. Add about 50 mL of *Diluent*, and sonicate with occasional shaking for about 20 min. Cool to room temperature, dilute with *Diluent* to volume, and mix. Pass the solution through a suitable filter (PTFE, PVDF, or equivalent) having a porosity of 0.45 µm.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of ribose triazolole carboxylic acid and any other unknown impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = response of ribose triazolole carboxylic acid or any other unknown impurity from the *Sample solution*
r_S = response of ribavirin from the *Standard solution*
C_S = concentration of USP Ribavirin RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ribavirin in the *Sample solution* (mg/mL)
F = relative response factor (See *Impurity Table 1*.)

In-Process Revision

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor (F)	Limit (%)
Ribose triazolole carboxylic acid	0.7	0.7	0.25
Ribavirin	1.0	—	—
Any individual unknown impurity	—	1.0	0.10

Acceptance criteria
Total impurities: NMT 1.0%

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store between 15° and 30°.
- **USP REFERENCE STANDARDS** ⟨**11**⟩
USP Ribavirin RS■1S *(USP33)*

BRIEFING

Sulfadiazine Tablets, *USP 32* page 3618. It is proposed to make some modifications in the quantitation step in the *Dissolution* test to simplify it.

(BPC: M. Marques.) RTS—C73273

Sulfadiazine Tablets

DEFINITION
Sulfadiazine Tablets contain NLT 95.0% and NMT 105.0% of the labeled quantity of $C_{10}H_{10}N_4O_2S$.

IDENTIFICATION
- **A. INFRARED ABSORPTION** ⟨**197K**⟩
- **B. MELTING RANGE OR TEMPERATURE,** *Class Ia* ⟨**741**⟩
Sample solution: Equivalent to 100 mg/mL of sulfadiazine from finely powdered Tablets in chloroform
Analysis: Transfer the *Sample solution* to a small filter. Wash with 5 mL of chloroform, and discard the filtrate. Triturate the residue with 10 mL of 6 N ammonium hydroxide for 5 min, add 10 mL of water, and filter. Warm the filtrate until most of the ammonia is expelled, cool, and add 6 N acetic acid until the reaction is distinctly acid: a precipitate of sulfadiazine is formed. Collect the precipitate on a filter, wash it with cold water, and dry at 105° for 1 h.
Acceptance criteria: The sulfadiazine so obtained melts at 250°–254°.

ASSAY
- **PROCEDURE**
Mobile phase: Acetonitrile, glacial acetic acid, and water (12:1:87)
Standard solution: 1 mg/mL of USP Sulfadiazine RS in 0.025 N sodium hydroxide
Sample solution: 1 mg/mL of sulfadiazine from powdered Tablets in 0.025 N sodium hydroxide. [NOTE—Weigh NLT 20 Tablets, shake the solution for 30 min, and centrifuge, if necessary.]
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)

Organic Impurities

- **PROCEDURE 1**
  [NOTE—For impurities eluting before tamsulosin.]
  Buffer: Dissolve 8.7 mL of perchloric acid (70%) and 3.0 g of sodium hydroxide in 1900 mL of water. Adjust with 1 N sodium hydroxide to a pH of 2.0, and add sufficient water to make 2000 mL.
  Mobile phase: Acetonitrile and *Buffer* (3:7)
  System suitability solution: 25 µg /mL of Tamsulosin Hydrochloride and 50 µg/mL of propylparaben in *Mobile phase*
  Standard solution: 10 µg/mL of Tamsulosin Hydrochloride from *Sample solution*, in *Mobile phase*
  Sample solution: 5.0 mg/mL of Tamsulosin Hydrochloride in *Mobile phase*
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 225 nm
  Column: 4.6-mm x 15-cm; 5-µm packing L1
  Temperature: 40°
  Flow rate: 1.3 mL/min
  Injection size: 10 µL
  [NOTE—Record the chromatogram for NLT 1.5 times the retention time of tamsulosin.]
  System suitability
  Samples: *System suitability solution* and *Standard solution*
  Suitability requirements
  Resolution: NLT 12 between tamsulosin and propylparaben, *System suitability solution*. [NOTE—Tamsulosin elutes first.]
  Relative standard deviation: NMT 4% for 6 replicates, *Standard solution*
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of any individual impurity eluting before the tamsulosin peak in the portion of Tamsulosin Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

  r_U = peak response of each impurity eluting before tamsulosin from the *Sample solution*
  r_S = peak response of tamsulosin from the *Standard solution*
  C_S = concentration of the *Standard solution* (mg/mL)
  C_U = concentration of the *Sample solution* (mg/mL)
  Acceptance criteria
  Individual impurities: NMT 0.10% for any individual impurity. [NOTE—If present, the des-ethoxy impurity and the methoxy impurity eluting at the relative retention time of about 0.8 are not separated by this method and should be integrated together to determine conformance. (The des-ethoxy impurity is 2-methoxy-5-[(2*R*)-2-[(2-phenoxyethyl)amino]propyl]benzenesulfonamide, and the methoxy impurity is 2-methoxy-5-[(2*R*)-2-[[2-(2-methoxyphenoxy)ethyl]amino]propyl]benzenesulfonamide.) NMT ~~0.20%~~■0.15%■1S *(USP33)* of the sum of the des-ethoxy and methoxy impurities is found.]
  [NOTE—The reporting level for impurities is 0.05%.]
- **PROCEDURE 2**
  [NOTE—For impurities eluting after tamsulosin.]
  Buffer: Proceed as directed for *Procedure 1*.
  Mobile phase: Acetonitrile and *Buffer* (1:1)
  Standard solution: Proceed as directed for *Procedure 1*.
  [NOTE—Use *Mobile phase* from *Procedure 1* to prepare the solution.]
  Sample solution: Proceed as directed for *Procedure 1*.
  [NOTE—Use *Mobile phase* from *Procedure 1* to prepare the solution.]
  Chromatographic system
  (See *Chromatography* ⟨621⟩, *System Suitability*.)
  Mode: LC
  Detector: UV 225 nm
  Column: 4.6-mm x 15-cm; 5-µm packing L1
  Temperature: 40°
  Flow rate: 1.0 mL/min
  Injection size: 10 µL
  [NOTE—Record the chromatogram for NLT 5 times the retention time of tamsulosin.]
  System suitability
  Sample: *Standard solution*
  Suitability requirements
  Resolution: Use a column that meets the resolution requirements of *Procedure 1*.
  Relative standard deviation: 6 replicates, NMT 4%
  Analysis
  Samples: *Standard solution* and *Sample solution*
  Calculate the percentage of any individual impurity eluting after the tamsulosin peak in the portion of Tamsulosin Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

  r_U = peak response of each impurity eluting after tamsulosin from the *Sample solution*
  r_S = peak response of tamsulosin from the *Standard solution*
  C_S = concentration of the *Standard solution* (mg/mL)
  C_U = concentration of the *Sample solution* (mg/mL)

In-Process Revision

Acceptance criteria
Individual impurities: NMT 0.10% for any individual impurity. [NOTE—The reporting level for impurities is 0.05%.]
Total impurities: NMT 0.2%, including all impurities in *Procedure 1* and *Procedure 2*

SPECIFIC TESTS
- **ENANTIOMERIC PURITY**

Mobile phase: Hexane, dehydrated alcohol, methanol, and diethylamine (650:200:150:1)
System suitability solution: 40 µg/mL of USP Racemic Tamsulosin Hydrochloride RS in methanol
Sample solution: 2.0 mg/mL of Tamsulosin Hydrochloride in methanol
Standard solution: 2 µg/mL of Tamsulosin Hydrochloride, from *Sample solution*, in methanol
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 225 nm
Column: 4.6-mm × 25-cm; packing L51
Temperature: 40°
Flow rate: 0.5 mL/min
Injection size: 10 µL
System suitability
Sample: *System suitability solution*
[NOTE—The relative retention times for the optical isomer and tamsulosin are 0.8 and 1.0, respectively.]
Suitability requirements
Resolution: NLT 2 between optical isomer and tamsulosin
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the optical isomer in the portion of Tamsulosin Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of optical isomer from the *Sample solution*
r_S = peak response of tamsulosin from the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
C_U = concentration of the *Sample solution* (mg/mL)
Acceptance criteria
Individual impurities: NMT 0.3%

SPECIFIC TESTS
- **OPTICAL ROTATION,** *Specific Rotation* ⟨**781S**⟩**:** –17.5° to –20.5° at 20°

Sample solution: 7.5 mg/mL in water. [NOTE—Sample should be previously dried at 105° for 2 h; heat at 60°–70° to dissolve, and cool before using.]
- **LOSS ON DRYING** ⟨**731**⟩**:** Dry a sample at 105° for 2 h: it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS** ⟨**11**⟩
USP Racemic Tamsulosin Hydrochloride RS
USP Tamsulosin Hydrochloride RS▲*USP32*

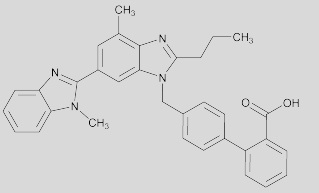
BRIEFING

Telmisartan. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed based on validated methods of analysis. The liquid chromatographic procedure in the test for *Organic Impurities* is based on analyses performed using a Kromasil brand column of 5-µm packing L1. The typical retention time for the telmisartan peak is about 11 min, as per the specified conditions in the test for *Organic Impurities*.

(MD-CV: S. Ramakrishna.) RTS—C52047

Add the following:

▪Telmisartan



$C_{33}H_{30}N_4O_2$ 514.62
[1,1′-Biphenyl]-2-carboxylic acid, 4′-[(1,4′-dimethyl-2′-propyl[2,6′-bi-1*H*-benzimidazol]-1′-yl)methyl;
4′-[[4-Methyl-6-(1-methyl-2-benzimidazolyl)-2-propyl-1-benzimidazolyl]methyl]-2-biphenylcarboxylic acid
[144701-48-4].

DEFINITION
Telmisartan contains NLT 98.0% and NMT 101.0% of $C_{33}H_{30}N_4O_2$, calculated on dried basis.

IDENTIFICATION
- **A. INFRARED ABSORPTION** ⟨**197K**⟩**:** If the spectra obtained shows differences, proceed with the samples prepared as follows. Separately dissolve a quantity of USP Telmisartan RS and the Telmisartan sample in alcohol. [NOTE—Heating the solution may be necessary for complete dissolution.] Cool the solution in an ice bath, filter the crystals, and dry at 105°.
- **B.** The retention time of the major peak in the chromatogram of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay.*

ASSAY
- **PROCEDURE**

Titrimetry ⟨**541**⟩
Sample solution: 190 mg of Telmisartan in 5 mL of anhydrous formic acid. Dilute with 75 mL of acetic anhydride.
Analysis: Titrate with 0.1 M perchloric acid versus a blank determination under the same conditions. Each mL of 0.1 M perchloric acid is equivalent to 25.73 mg of $C_{33}H_{30}N_4O_2$.
Acceptance criteria: 98%–101.0%

IMPURITIES
Inorganic Impurities
- **RESIDUE ON IGNITION** ⟨**231**⟩**:** NMT 0.1%. A 1 g sample is used.
- **HEAVY METALS** ⟨**231**⟩**:** NMT 10 ppm

Organic Impurities
- **PROCEDURE**

[NOTE—Prepare sample solutions freshly and protect from light.]
Solution A: 2.0 g of monobasic potassium phosphate and 3.8 g of sodium pentanesulphonate monohydrate in 1 L water. Adjust the pH to 3.0 using 1 M phosphoric acid.

In-Process Revision

Solution B: Acetonitrile, methanol (4:1)
Mobile phase: See the gradient table below.

Time (min)	Mobile Phase A (%)	Mobile Phase B (%)
0	70	30
2	70	30
27	20	80
32	20	80
32.1	70	30
37	70	30

System suitability solution: Dissolve USP Telmisartan RS and USP Telmisartan Related Compound B RS in methanol (0.2 mL/mg of USP Telmisartan RS) and 100 µL of 1 M sodium hydroxide solution. Sonicate to dissolve. Final concentration is 2.5 mg/mL of the USP Telmisartan RS and 2.5 µg/mL of USP Telmisartan Related Compound B RS in methanol.
Standard solution: Dissolve USP Telmisartan RS in methanol (0.2 mL/mg of USP Telmisartan RS) and 100 µL of 1 M sodium hydroxide solution. Sonicate to dissolve. The final concentration is 0.025 mg/mL.
Sample solution: Dissolve Telmisartan in methanol (0.2 mL/mg of Telmisartan) and 100 µL of 1 M sodium hydroxide solution. Sonicate to dissolve. The final concentration is 2.5 mg/mL.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 230 nm
Column: 4.0-mm × 12.5-cm column; 5-µm packing L1
Flow rate: 1 mL/min
Injection size: 10 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
Suitability requirements
Resolution: NLT 3.0 between telmisartan and telmisartan related compound B, *System suitability solution*
Tailing factor: Between 0.9–1.5 for telmisartan related compound B, *System suitability solution*
Relative standard deviation: NMT 5.0% for the telmisartan peak, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of any individual impurity in the portion of Telmisartan taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = response of each impurity from the *Sample solution*
r_S = response of Telmisartan from the *Standard solution*
C_S = concentration of USP Telmisartan RS in the *Standard solution*
C_U = concentration of Telmisartan in the *Sample solution*

Acceptance criteria
Individual impurities: See *Table 1*.
Total impurities: See *Table 1*. [NOTE—Calculate the total impurities from the sum of all impurity peaks greater than or equal to 0.05%.]

Table 1

Name	Approximate Relative Retention Time	Limit (%)
Telmisartan related compound A[1]	0.3	NMT 0.1

[5]*tert*-Butyl 4′-[(1,7′-dimethyl-2′-propyl-1*H*,3′*H*-2,5′-bibenzo[d]imidazol-3′-yl)methyl]biphenyl-2-carboxylate.

SPECIFIC TESTS
- **LOSS ON DRYING** ⟨**731**⟩**:** Dry 1.0 g of sample at 105° to constant weight. It loses NMT 1.5%.

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** ⟨**11**⟩
  USP Telmisartan RS
  USP Telmisartan Related Compound B RS■1S *(USP33)*

BRIEFING

Telmisartan Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed based on the validated methods. The proposed liquid chromatographic procedures in the *Assay* and the test for *Procedure* under *Organic Impurities* are performed using a Nucleosil 100, 5-µm column of packing L1. The typical retention time for telmisartan is about 1.4 min under the specified conditions for the *Assay*.

(MDCV: S. Ramakrishna; . BPC: M. Marques .) RTS—C57642

Add the following:

■Telmisartan Tablets

DEFINITION
Telmisartan Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of telmisartan ($C_{33}H_{30}N_4O_2$).

In-Process Revision

IDENTIFICATION

- **A. ULTRAVIOLET ABSORPTION ⟨197U⟩:** The spectrum of the solution under test corresponds to that of the *Standard solution*, as obtained in *Performance Tests* for *Dissolution*.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution,* as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Diluent: 0.005 N methanolic solution of sodium hydroxide

Buffer: 2.0 g/L ammonium dihydrogen phosphate. Adjust with 1 M phosphoric acid to a pH of 3.0.

Mobile phase: Methanol and *Buffer* (7:3)

Standard solution: 0.11 mg/mL of USP Telmisartan RS and 0.013 mg/mL of USP Telmisartan Related Compound A RS in *Diluent*. Pass the solution through a 0.45-µm membrane filter.

Sample solution: Transfer not fewer than 20 Tablets into a suitable volumetric flask, and add about 80% of the volume of *Diluent*. Swirl to disperse, and sonicate for about 10 min. Allow to cool to room temperature, dilute with *Diluent* to volume, and mix. Pass the resulting solution through a 0.45-µm membrane filter. Further dilute quantitatively in *Mobile phase* to obtain a solution having a concentration of 0.11 mg/mL.

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

Mode: LC

Detector: UV 298 nm

Column: 4.0-mm × 4-cm column; 5-µm, packing L1

Temperature: 40°

Flow rate: 0.7 mL/min

Injection size: 5 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 3 between telmisartan and telmisartan related compound A

Tailing factor: NMT 2.0 for the telmisartan peak

Capacity factor: NLT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{33}H_{30}N_4O_2$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = response of telmisartan peak from the *Sample solution*

r_S = response of telmisartan peak from the *Standard solution*

C_S = concentration of USP Telmisartan RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of telmisartan in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION ⟨711⟩**

Medium: pH 7.5 phosphate buffer (prepared by dissolving 13.61 g of potassium dihydrogen phosphate in about 800 mL of water, adjusting with 2 M sodium hydroxide to a pH of 7.5, and diluting with water to 1000 mL); 900 mL

Apparatus 2: 75 rpm

Time: 30 min

Standard solution: Transfer about 44 mg of USP Telmisartan RS to a 100-mL volumetric flask. Add 1 mL of 0.1 M sodium hydroxide, and dilute with methanol to volume. Dilute this solution quantitatively with *Medium* to obtain a solution with a final concentration of about 0.011 mg/mL.

Sample solution: Dilute the solution under test 1:2 with *Medium*, and pass the final solution through a suitable 0.45-µm filter.

Detection: UV 296 nm

Blank: *Medium*

Determine the percentage of $C_{33}H_{30}N_4O_2$ dissolved:

$$\text{Result} = (A_U \times C_S \times V \times F)/(A_S \times D_U \times L)$$

A_U = absorbance of the *Sample solution*

C_S = concentration of the *Standard solution* (mg/mL)

V = volume of *Medium* (mL), 900

F = percentage conversion factor, 100

D_U = dilution factor of the *Sample solution*

L = Tablet label claim (mg)

Tolerances: Not less than 75% (Q) of the labeled amount of $C_{33}H_{30}N_4O_2$ is dissolved.

- **UNIFORMITY OF DOSAGE UNITS ⟨905⟩:** Meet the requirements

IMPURITIES

Organic Impurities

- **PROCEDURE**

Diluent, Buffer, Mobile phase, Sample solution, and **Chromatographic system:** Proceed as directed under *Assay*.

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_s) \times 100$$

r_U = response of each individual impurity from the *Sample solution*

r_s = response of telmisartan from the *Sample solution*

Acceptance criteria

Individual impurities: NMT 0.2% of any individual impurity

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and stored at controlled room temperature.
- **USP REFERENCE STANDARDS ⟨11⟩**

USP Telmisartan RS

USP Telmisartan Related Compound A RS■1S *(USP33)*

BRIEFING

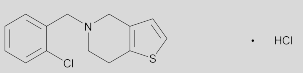
Ticlopidine Hydrochloride. Because there is no existing *USP* monograph for this drug substance, a new monograph based on the validated methods is being proposed. The liquid chromatographic procedure for *Organic Impurities*, *Procedure 2* and *Assay* is based on analyses performed using a Lichrosorb RP8 10-µm column of packing L7. The typical retention time for the ticlopidine peak is about 8 min. The liquid chromatographic procedure in the test for *Limit of Formaldehyde* is based on analyses performed using a Spherisorb ODS II, 5-µm column of packing L1.

(MD-CV: S. Ramakrishna.) RTS—C49319

In-Process Revision

Add the following:

▪Ticlopidine Hydrochloride



$C_{14}H_{14}ClNS \cdot HCl$ 300.25

Thieno[3,2-*c*]pyridine, 5-[(2-chlorophenyl)methyl]-4,5,6,7-tetrahydro-, hydrochloride;
5-(*o*-Chlorobenzyl)-4,5,6,7-tetrahydrothieno-[3,2-*c*]pyridine hydrochloride [53885-35-1].

DEFINITION

Ticlopidine Hydrochloride contains NLT 98.0% and NMT 102.0% of $C_{14}H_{14}ClNS \cdot HCl$, calculated on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption** ⟨**197M**⟩
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay.*
- **C. Identification Tests—General,** *Chloride* ⟨**191**⟩**:** Meets the requirements

ASSAY

- **Procedure**

Buffer: 1.1 g of monobasic sodium phosphate and 0.28 g of dibasic sodium phosphate in 1000 mL of water. The pH of solution is between 6.1 and 6.6. If necessary, adjust to the required pH using phosphoric acid or sodium hydroxide.
Mobile phase: Acetonitrile, methanol, and *Buffer* (6:7:7)
System suitability solution: 0.2 mg/mL of USP Ticlopidine Hydrochloride RS and 0.2 mg/mL of USP Sulconazole Nitrate RS in *Mobile phase.* [NOTE—Sonication may be necessary for complete dissolution.]
Standard solution: 0.4 mg/mL of USP Ticlopidine Hydrochloride RS in *Mobile phase*
Sample solution: 0.4 mg/mL of Ticlopidine Hydrochloride in *Mobile phase*
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 215 nm
Column: 4.6-mm × 25-cm column; 10-µm packing L7
Flow rate: 2 mL/min
Column temperature: 40°
Run time: 1.5 × the retention time of the ticlopidine peak
Injection size: 10 µL
System suitability
Samples: *System suitability solution* and *Standard solution*
Suitability requirements
Resolution: NLT 2.6 between ticlopidine hydrochloride and sulconazole nitrate, *System suitability solution*
Relative standard deviation: NMT 1.0%, *Standard solution*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{14}H_{14}ClNS \cdot HCl$ in the portion of Ticlopidine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of ticlopidine from the *Sample solution*
r_S = peak response of ticlopidine from the *Standard solution*
C_S = concentration of ticlopidine in the *Standard solution*
C_U = concentration of ticlopidine in the *Sample solution*

IMPURITIES

Inorganic Impurities

- **Residue on Ignition** ⟨**231**⟩**:** NMT 0.1% on a 1-g sample
- **Heavy Metals,** *Method 1* ⟨**231**⟩**:** NMT 0.002%

Organic Impurities

- **Procedure 1**

Adsorbent: 0.25-mm thickness of silica
Developing solvent: Butanol, water, and glacial acetic acid (4:5:1). Shake well in a separatory funnel, allow it to settle, and discard the lower aqueous layer and use the upper organic layer.
Diluent: Methylene chloride and methanol (1:2)
Iodine–methanol reagent: Iodine TS and methanol (1:1)
Standard solution A: 15 mg/mL of USP Ticlopidine Hydrochloride RS in *Diluent*
Standard solution B: 2.5 mg/mL of each of USP Ticlopidine Related Compound A RS and USP Ticlopidine Related Compound B RS in *Diluent*
Sample solution: 15 mg/mL of Ticlopidine Hydrochloride in *Diluent*
Combined standard solution: 1.5 mL of *Standard solution B* and 250 µL of *Sample solution* in a 25-mL volumetric flask in *Diluent*
Application size: 2, 5, and 10 µL of *Combined standard solution* and 20 µL of *Sample solution*
Analysis
Samples: *Sample solution* and *Combined standard solution*
Develop the plate to a distance of at least 15 cm from the origin, and remove the plate and air dry for at least 1 h. Analyze visually under UV light. Estimate the amounts of ticlopidine related compound A and ticlopidine related compound B. Spray the plate with the *Iodine–methanol reagent*, and estimate any other impurities by comparing to ticlopidine hydrochloride spots in the *Combined standard solution.*
Acceptance criteria
Individual impurities: See *Impurity Table 1*.

Impurity Table 1

Related Compound	Approximate Relative Retention Factor	Acceptance Criteria, NMT (%)
Ticlopidine hydrochloride	1.00	—
Ticlopidine hydrochloride related compound A[a]	1.26	0.5
Ticlopidine hydrochloride related compound B[b]	1.41	0.5

[a] 4-Methyl-6-(1-methyl-1*H*-benzimidazol-2-yl)-2-propyl-1*H*-benzimidazole.
[b] 4′-[[7-Methyl-5-(1-methyl-1*H*-benzimidazol-2-yl)-2-propyl-1*H*-benzimidazol-1-yl]methyl]biphenyl-2-carboxylic acid.

- **Procedure 2**

Buffer, Mobile phase, System suitability solution, Standard solution, Sample solution, and **Chromatographic system:** Proceed as directed in the *Assay.*
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of *N*-methyl ticlopidine in the portion of Ticlopidine Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = response of *N*-methyl ticlopidine in the *Sample solution*
r_T = sum of responses of all the peaks in the *Sample solution*

Calculate the percentage of any individual impurity in the portion of the Ticlopidine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times 100$$

r_U = response of any impurity in the *Sample solution*
r_S = response of ticlopidine in the *Standard solution*

In-Process Revision

Acceptance criteria
Individual impurities: See *Impurity Table 2.*
Total impurities: NMT 1.0%

Impurity Table 2

Component	Relative Retention Time (min)	Acceptance Criteria, NMT (%)
Ticlopidine hydrochloride	1	—
N-Methyl ticlopidine[a]	1.18	0.5
Any other individual impurity	—	0.10
Total impurities[b]	—	1.0

[a]*N*-(2-Chlorobenzyl)-2-(thiophen-2-yl)ethanamine.
[b]Total of *N*-methyl ticlopidine and sum of % individual impurities from *Procedure 1.*

SPECIFIC TESTS
- **Loss on Drying ⟨731⟩:** NMT 1.0%. 1.0-g sample size at 80° for 5 h.
- **Limit of Formaldehyde**

Mobile phase: Acetonitrile, water, and hydrochloric acid (3:2:0.004)
2,4 Dintirophenyl hydrazine solution: 1.65 mg/mL of 2,4-dinitrophenylhydrazine in acetonitrile
Standard stock solution: Transfer a known amount of formaldehyde solution, equivalent to 37 mg of formaldehyde, into a 100-mL volumetric flask. Dilute with methanol to volume.
Standard solution: Dilute *Standard stock solution* with methanol to prepare a 1.85 µg/mL solution.
Sample solution: 50 mg/mL of Ticlopidine Hydrochloride in methanol (sonication may be necessary for complete dissolution)
Derivatized Standard and Sample solutions: Transfer 2.0 mL of *2,4-Dinitrophenyl hydrazine solution* to five different 10-mL volumetric flasks; 50 µL of 2 N hydrochloric acid and 150, 250, and 500 µL of *Standard solution* to the first three flasks; 500 µL of *Sample solution* to the fourth; and 500 µL of methanol to the fifth flask. Mix each solution well and allow the solutions to react for at least 30 min at ambient temperature. Dilute each flask with *Mobile phase* to volume and mix well. The solutions should be analyzed within 4 h.
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability.*)
Mode: LC
Detector: UV 365 nm
Column: 4.6-mm × 15-cm column; 5-µm packing L1
Flow rate: 1 mL/min
Injection size: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 10.0% for the peak obtained from derivatized *Standard solution* prepared from 500 µL
Analysis
Samples: *Standard solution* and *Sample solution*
[NOTE—The approximate retention time for 2,4 dinitrophenylhydrazine is about 3.5 min and for the formaldehyde and 2,4 dinitrophenylhydrazine derivative is about 3.8 min.]
Calculate the formaldehyde concentration in ppm in the derivatized *Sample solution* (prepared in flask 4 as stated under *Derivatized formaldehyde solutions*) as the concentration in the Ticlopidine Hydrochloride taken:

$$\text{Result} = (C \times D)/W$$

C = concentration of formaldehyde from the calibration curve generated from the peak areas of the derivatized methanol and the three *Standard solutions* (µg/mL)
D = dilution factor, 200
W = sample weight (g)
Acceptance criteria
Formaldehyde: NMT 20 ppm

ADDITIONAL REQUIREMENTS
- **Packaging and Storage:** Preserve in tight containers, and store at a temperature below 30°.
- **USP Reference Standards ⟨11⟩**
USP Sulconazole Nitrate RS
USP Ticlopidine Hydrochloride RS
USP Ticlopidine Hydrochloride Related Compound A RS
USP Ticlopidine Hydrochloride Related Compound B RS■1S *(USP33)*

BRIEFING

Ticlopidine Hydrochloride Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedure in the test for the *Assay* is validated using a Waters µBondapak column of packing L1. The typical retention time for ticlopidine hydrochloride is about 12 min under the conditions specified.

(MD-CV: S. Ramakrishna. BPC: M. Marques.) RTS—C40389

Add the following:

■Ticlopidine Hydrochloride Tablets

DEFINITION
Ticlopidine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of ticlopidine hydrochloride $C_{14}H_{14}ClNS \cdot HCl$.

IDENTIFICATION
- **A. Ultraviolet Absorption ⟨197U⟩:** Place a portion of powdered Tablets, equivalent to 100 mg of ticlopidine hydrochloride, in a suitable flask. Add 1 mL of water, and allow to stand for 15 min with occasional shaking. Add about 60 mL of *Mobile phase*, sonicate for 15 min, and shake by mechanical means for an additional 15 min. Dilute with *Mobile phase* to volume, and mix. Dilute a portion of this solution with *Mobile phase* to prepare 0.1 mg/mL of Ticlopidine hydrochloride: the UV absorption spectra of the solution exhibit maxima at the same wavelength (232 nm) as that of a similar solution prepared from USP Ticlopidine Hydrochloride RS, concomitantly measured.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

In-Process Revision

ASSAY
- **PROCEDURE**

Buffer: 3.55 g of dibasic sodium phosphate in 1000 mL of water
Mobile phase: Acetonitrile and *Buffer* (3:2). Adjust with phosphoric acid to a pH of 7.0 ± 0.1.
Standard solution: 0.1 mg/mL of USP Ticlopidine Hydrochloride RS in *Mobile phase*
Sample solution: Weigh and finely powder not fewer than 20 Tablets. Transfer a portion of the powder, equivalent to about 250 mg of ticlopidine hydrochloride to a 250-mL volumetric flask, add 150 mL of *Mobile phase*, sonicate for about 5 min, and shake mechanically for 10 additional min. Dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a suitable 0.45-µm filter, and use the filtrate after discarding the first few mL. Transfer 5 mL of the filtrate into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 228 nm
Column: 3.9-mm × 3-cm column; 5-µm packing L1
Temperature: 40°
Flow rate: 1.5 mL/min
Injection size: 15 µL
Run time: Twice the retention time of the ticlopidine peak
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{14}H_{14}ClNS \cdot HCl$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of ticlopidine from the *Sample solution*
r_S = peak response of ticlopidine from the *Standard solution*
C_S = concentration of USP Ticlopidine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of ticlopidine hydrochloride in the *Sample solution* (mg/mL)
Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
- **DISSOLUTION**

Medium: Water; 900 mL, deaerated
Apparatus 2: 50 rpm
Time: 45 min
Standard solution: 0.278 mg/mL of USP Ticlopidine Hydrochloride RS in *Medium*
Sample solution: Pass a portion of the solution under test through a suitable filter.
Detection: UV 232 nm
Path length: 0.1 cm
Blank: *Medium*
Calculate the percentage of ticlopidine hydrochloride dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

A_U = absorbance of the *Sample solution*
A_S = absorbance of the *Standard solution*
C_S = concentration of the *Standard solution* (mg/mL)
L = Tablet label claim (mg)
V = 900 mL
Tolerances: NLT 75% (Q) of the labeled amount of ticlopidine hydrochloride is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩**:** Meet the requirements

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in well-closed containers and stored at controlled room temperature.
- **USP REFERENCE STANDARDS** ⟨11⟩
USP Ticlopidine RS■1S (*USP33*)

BRIEFING

Tizanidine Tablets, *USP 32* page 3754. It is proposed to revise the *Tolerances* in *Dissolution Test 1* to express the results as percentage of tizanidine base dissolved rather than percentage of tizanidine hydrochloride dissolved.

(BPC: M. Marques.) RTS—C73274

Tizanidine Tablets

DEFINITION
Tizanidine Tablets contain Tizanidine Hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of tizanidine ($C_9H_8ClN_5S$).

IDENTIFICATION
- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY
- **PROCEDURE**

Solution A: Water and phosphoric acid (44:6)
Buffer: 3.5 mg/mL of sodium 1-pentanesulfonate. Adjust with *Solution A* or 1 N sodium hydroxide to a pH of 3.0 ± 0.05.
Mobile phase: Acetonitrile and *Buffer* (20:80)
Tizanidine related compound A solution: 0.1 mg/mL of USP Tizanidine Related Compound A RS in methanol
Tizanidine related compound B solution: 0.1 mg/mL of USP Tizanidine Related Compound B RS in methanol
Tizanidine related compound C solution: 0.1 mg/mL of USP Tizanidine Related Compound C RS in methanol
System suitability solution: Transfer 23 mg of USP Tizanidine Hydrochloride RS to a 100-mL volumetric flask, and add 20 mL of *Mobile phase* and 10 mL each of *Tizanidine related compound A solution, Tizanidine related compound B solution,* and *Tizanidine related compound C solution*. Sonicate to dissolve the USP Tizanidine Hydrochloride RS, and dilute with *Mobile phase* to volume.
Standard solution: 0.046 mg/mL of USP Tizanidine Hydrochloride RS in *Mobile phase*
Sample solution: Transfer a weighed portion of finely powdered Tablets (NLT 20), equivalent to 20 mg of tizanidine, to a 500-mL volumetric flask. Add 250 mL of *Buffer*, sonicate for 15 min with occasional shaking, and shake by mechanical means for 15 min. Add 100 mL of acetonitrile, and mix. Allow to cool, and dilute with *Buffer* to volume. Centrifuge a portion of this solution at 2000 rpm or higher for 10 min. Pass a portion of this solution through a filter having a 45-µm or finer porosity, and use the filtrate.
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)

In-Process Revision

Mode: LC
Detector: UV 230 nm
Column: 4.6-mm × 25-cm; packing L1
Column temperature: 50°
Flow rate: 1 mL/min
Injection size: 10 µL

System suitability
Samples: *Standard solution* and *System suitability solution*
[NOTE—The relative retention times are listed in *Impurity Table 1*.]
Suitability requirements
Resolution: NLT 4.0 between tizanidine and tizanidine related compound C; NLT 4.0 between tizanidine and tizanidine related compound B, *System suitability solution*
Column efficiency: NLT 5000 theoretical plates, *Standard solution*
Tailing factor: NMT 2.0, *Standard solution*
Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_9H_8ClN_5S$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Tizanidine Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of tizanidine in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of tizanidine, 253.71
M_{r2} = molecular weight of tizanidine hydrochloride, 290.17

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Change to read:

• **DISSOLUTION** ⟨**711**⟩
Test 1
Medium: 0.1 N hydrochloric acid; 500 mL
Apparatus 1: 100 rpm

  USP Tizanidine Related Compound C RS

BRIEFING

Tranylcypromine Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed. The liquid chromatographic procedure for the *Assay* was validated with a Phenomenex Synergi Polar RP brand of L11 column, in which tranylcypromine elutes at about 7 min. The *Dissolution* test was validated using an Xterra RP18 brand of L1 column, in which tranylcypromine elutes at about 4.6 min. The liquid chromatographic procedure for *Organic Impurities* was validated with an Atlantis brand of L1 column, in which tranylcypromine elutes at about 7 min.

(MD-PP: D. Vicchio, R. Ravichandran. BPC: M. Marques.) RTS—C62529

Add the following:

▪Tranylcypromine Tablets

DEFINITION

Tranylcypromine Tablets contain an amount of tranylcypromine sulfate equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of tranylcypromine ($C_9H_{11}N$).

IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution,* as obtained in the *Assay.*

ASSAY

- **PROCEDURE**

Solution A: Transfer 3.4 g of monobasic ammonium phosphate into a 1-L volumetric flask containing about 900 mL of water. Adjust the pH of the solution to 2.2 ± 0.1 with phosphoric acid. Dilute with water to volume, and mix well.

Mobile phase: Methanol and *Solution A* (3:7)

0.05 N sulfuric acid: Cautiously add 1.3 mL of sulfuric acid into 100 mL of water, cool to room temperature, and dilute to 1000 mL.

Diluent: Methanol, water, and *0.05 N sulfuric acid* (1:3:1)

Standard stock solution: Dissolve USP Tranylcypromine Sulfate RS in a 50:50 mixture of methanol and *0.05 N sulfuric acid* (about 60% of the final volume), using a sonicator, and dilute with *Diluent* to obtain a 0.4 mg/mL solution of USP Tranylcypromine Sulfate RS.

Standard solution: 0.04 mg/mL of USP Tranylcypromine Sulfate RS in *Diluent*, from the *Standard stock solution*

Sample stock solution: Transfer the number of Tablets equivalent to about 100 mg, based on the label claim, of tranylcypromine, to a 200-mL volumetric flask, add 60 mL of *0.05 N sulfuric acid*, and sonicate for 10 min with intermittent shaking. Add 60 mL of methanol, and sonicate for 10 min with intermittent shaking. Shake by mechanical means for 30 min, dilute with *Diluent* to volume, and mix to obtain a solution containing the equivalent of 0.5 mg/mL of tranylcypromine. Centrifuge a portion of the solution, and pass the supernatant through a 0.45-µm filter, discarding the first 2 mL.

Sample solution: 0.03 mg/mL of tranylcypromine in *Diluent*, from the *Sample stock solution* filtrate

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm column; 4-µm packing L11

Temperature: 30°

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_9H_{11}N$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M \times M_{r1}/M_{r2}) \times 100$$

In-Process Revision

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Tranylcypromine Sulfate RS in the *Standard solution* (mg/mL)
C_U = concentration of tranylcypromine in the *Sample solution* (mg/mL)
M = number of moles of tranylcypromine per mole of tranylcypromine sulfate, 2
M_{r1} = molecular weight of tranylcypromine, 133.19

In-Process Revision

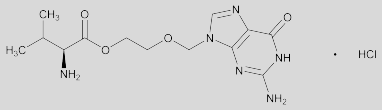
BRIEFING

Valacyclovir Hydrochloride. Because there is no existing monograph for this drug substance, a new monograph based on the validated methods is being proposed. The related compounds are detected using two different chromatographic techniques. The thin layer chromatography procedure in the test for *Organic Impurities*, *Procedure 1* uses a Merck silica gel 60F TLC plate (10 × 20 cm). The liquid chromatographic procedure in the test for *Organic Impurities*, *Procedure 2* employs a Luna Phenyl hexyl brand of column containing 5-µm packing L11. The liquid chromatographic procedure in the tests for *Organic Impurities*, *Procedure 3* and *Assay* employs a Daicel Crownpack CR (+) brand of column containing 5-µm packing L66. The typical retention time for valacyclovir is about 21 min.

(MD-AA: S. Ramakrishna, B. Davani.) RTS—C44129

Add the following:

▪Valacyclovir Hydrochloride



$C_{13}H_{20}N_6O_4 \cdot HCl$ 360.80

L-Valine, 2-[(2-amino-1,6-dihydro-6-oxo-9*H*-purin-9-yl)methoxy] ethyl ester, monohydrochloride;

L-Valine, ester with 9-[(2-hydroxyethoxy)methyl]guanine, monohydrochloride [124832-27-5].

DEFINITION

Valacyclovir Hydrochloride contains NLT 95.0% and NMT 102.0% of $C_{13}H_{20}N_6O_4$.HCl, calculated on the anhydrous and solvent-free basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION ⟨197K⟩**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay.*

ASSAY

- **PROCEDURE**

Mobile phase: Methanol, water, and perchloric acid (1:19:0.1)

Standard solution: 0.5 mg/mL of USP Valacyclovir Hydrochloride RS in 0.05 M hydrochloric acid. [NOTE—USP Valacyclovir Hydrochloride RS contains a detectable quantity of D valacyclovir.]

Sample solution: 0.5 mg/mL of Valacyclovir Hydrochloride in 0.05 M hydrochloric acid

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4-mm × 15-cm column; 5-µm, packing L66

Flow rate: 0.75 mL/min

Column temperature: 10°

Injection size: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between valacyclovir hydrochloride and D valacyclovir

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of Valacyclovir Hydrochloride in the portion taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of valacyclovir from the *Sample solution*

r_S = peak response of valacyclovir from the *Standard solution*

C_S = concentration of Valacyclovir Hydrochloride in the *Standard solution* (mg/mL)

C_U = concentration of Valacyclovir Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–102.0%

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION ⟨231⟩:** NMT 0.1% on a 2-g sample

Organic Impurities

- **PROCEDURE 1 (FOR RELATED COMPOUNDS E, F, AND G)**

Developing solvent: Methylene chloride, methanol, tetrahydrofuran, and ammonia solution (54:34:12:3)

Standard stock solution: Transfer 5 mg of each of USP Valacyclovir Related Compound D RS, USP Valacyclovir Related Compound E RS, and USP Valacyclovir Related Compound G RS, and 8.4 mg of USP Valacyclovir Related Compound F RS into a 10-mL volumetric flask. Add 2 mL of water with swirling, followed by 6 mL of alcohol, and sonicate for 20 min. Allow to cool, and dilute with alcohol to volume.

Standard solutions: Transfer 1.0 mL and 0.5 mL of *Standard stock solution* into two separate 10-mL volumetric flasks. Dilute the solution in both flasks with alcohol to volume.

Sample solution: Transfer 250 mg of Valacyclovir Hydrochloride into a 5-mL volumetric flask. Add 2 mL of water and sonicate for 20 min to dissolve. Add alcohol to about 95% volume of the flask, cool, and dilute with the same to volume. Pass through a suitable 0.45-µm filter.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Mode: TLC

Detector: UV, long and short wavelength

Plate: TLC plate coated with 0.25-mm layer of chromatographic silica gel mixture. Prewash the plate with methanol.

Developing distance: NLT 7 cm from origin

Application size: 4 µL

Analysis

Samples: *Standard solutions* and *Sample solution*

Develop the plate to the specified distance. Remove the plate from the solvent chamber and allow to dry. Examine the plate under short-wavelength UV light and visually estimate the valacyclovir related compound E and G in the sample using the appropriate standard spots. The chromatograms obtained with the *Standard solutions* each show three clearly separated spots due to valacyclovir related compounds D, E, and G. Spray the plate with 0.01% fluorescamine in ethylene dichloride, and examine the sprayed plate under long-wavelength UV to estimate the level of valacyclovir related compound F in the sample using the appropriate standard spot. The R_F values and limits for each impurity are provided in *Impurity Table 1.*

Acceptance criteria: See *Impurity Table 1*.

Impurity Table 1

Component	R_F Value	Relative R_F Value	Acceptance Criteria, NMT (%)
Valacyclovir hydrochloride	0.36	1	—
Valacyclovir related compound D[a]	0.41	1.1	—
Valacyclovir related compound E[b]	0.48	1.3	0.2
Valacyclovir related compound F[c]	0.66	1.8	0.1
Valacyclovir related compound G[d]	0.70	1.9	0.05

[a]This impurity is quantitated using *Procedure 2.*
[b]2-[(2-Amino-6-oxo-1,6-dihydro-9*H*-purin-9-yl)methoxy]ethyl *N*-[(benzyloxy)carbonyl]-L-valinate.
[c]2-Hydroxyethyl-L-valinate.
[d] *N*,*N*-dimethylpyridin-4-amine.

- **PROCEDURE 2**

Solution A: 0.3% w/w trifluoroacetic acid solution in water
Solution B: 0.3% w/w trifluoroacetic acid solution in methanol
Diluent: Alcohol and water (1:4)
Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	90	10
5	90	10
35	60	40
35.01	90	10
45	90	10

System suitability solution: 0.4 mg/mL of USP Valacyclovir Hydrochloride RS, 0.0008 mg/mL of USP Valacyclovir Hydrochloride Related Compound C RS, and 0.0016 mg/mL of USP Acyclovir Related Compound A RS in *Diluent*
Sensitivity solution: Dilute 3.0 mL of the *System suitability solution* into a 100-mL volumetric flask, and dilute with *Diluent* to volume. Transfer 1.0 mL of this solution into a 100-mL volumetric flask, and make up to volume with *Diluent*.
Sample solution: 0.4 mg/mL of Valacyclovir Hydrochloride in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: LC
Detector: UV 254 nm
Column: 4.6-mm × 25-cm column; 5-µm, packing L11
Flow rate: 0.8 mL/min
Column temperature: 15°
Injection size: 10 µL
System suitability
Samples: *System suitability solution* and *Sensitivity solution*
Resolution: NLT 1.5 between valacyclovir and the valacyclovir related compound C, and NLT 1.5 between valacyclovir related compound C and acyclovir related compound A, *System suitability solution*
Tailing factor: NMT 1.5% for the valacyclovir hydrochloride peak, *System suitability solution*
Signal-to-noise ratio: NLT 10, *Sensitivity solution*
Analysis
Sample: *Sample solution*
Calculate the percentage of each individual impurity in the portion of Valacyclovir Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = response of any impurity in the *Sample solution*
r_T = sum of response of all the peaks in the *Sample solution*

Acceptance criteria
Individual impurities: See *Impurity Table 2*.
Total unspecified impurities: NMT 0.2%

Impurity Table 2

Component	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

[a]This impurity is quantitated by the *Procedure 3* method.
[b]2-Amino-1,9-dihydro-6*H*-purin-6-one (guanine).
[c]2-Amino-9-[(2-hydroxyethoxy)methyl]-1,9-dihydro-6*H*purin-6-one (Acyclovir).
[d]2-[(2-Amino-6-oxo-1,6-dihydro-9*H*-purin-9-yl)methoxy]ethyl L-alaninate.
[e]2-[(2-Amino-6-oxo-1,6-dihydro-9*H*-purin-9-yl)methoxy]ethyl *N*-methyl-L-valinate.
[f]2-[(2-Amino-6-oxo-1,6-dihydro-9*H*-purin-9-yl)methoxy]ethyl acetate.
[g]2-[(2-Amino-6-oxo-1,6-dihydro-9*H*-purin-9-yl)methoxy]ethyl *N*-ethyl-L-valinate.
[h]2-[[[(2-Amino-6-oxo-1,6-dihydro-9*H*-purin-9-yl)methyoxy]ethyl isoleucinate.
[i]2-[(2-Amino-6-oxo-1,6-dihydro-9*H*-purin-9-yl)methoxy]ethyl *N*-formyl-L-valinate.
[j]2-[[6-Oxo-2-[[[(6-oxo-6,9-dihydro-1*H*-purin-2-yl)amino]methyl]amino]-1,6-dihydro-9*H*-purin-9-yl]methoxy]ethyl L-valinate.
[k]2,2′-[Methylenebis[imino(6-oxo-1,6-dihydro-9*H*-purine-9,2-diyl)methyleneoxy]]diethyl di(L-valinate.

- **PROCEDURE 3**

Mobile phase, Chromatographic system, Standard solution, and Sample solution: Proceed as directed in the *Assay*.
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of each individual impurity in the portion of Valacyclovir Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (100/F)$$

r_U = peak response of guanine plus acyclovir or acyclovir acetate or D valacyclovir in the *Sample solution*
r_S = peak response of valacyclovir in the *Standard solution*
C_S = concentration of USP Valacyclovir Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = concentration of Valacyclovir Hydrochloride in the *Sample solution* (mg/mL)
F = relative response factor as given in *Impurity Table 3*

In-Process Revision

Acceptance criteria
Individual impurities: See *Impurity Table 3*.

Impurity Table 3

Component	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Guanine and acyclovir[a, b]	0.18	1.51	2.0
Acyclovir related compound A[c]	0.42	1.12	0.2
D valacyclovir[d]	0.55	1.0	3.0
Valacyclovir	1.0	—	—

[a]2-Amino-1,9-dihydro-6*H*-purin-6-one (guanine).
[b]2-Amino-9-[(2-hydroxyethoxy)methyl]-1,9-dihydro-6*H*purin-6-one (Acyclovir).
[c]2-[(2-Amino-6-oxo-1,6-dihydro-9*H*-purin-9-yl)methoxy]ethyl acetate.
[d]D-Valine, 2-[(2-amino-1,6-dihydro-6-oxo-9*H*-purin-9-yl)methoxy] ethyl ester, monohydrochloride.

Total impurities: [NOTE—Sum of all impurities from *Procedures 1*, *2*, and *3*.] NMT 5.0%

SPECIFIC TESTS
- **WATER DETERMINATION,** *Method I* ⟨**921**⟩**:** For anhydrous form: NMT 2.0% (200 mg of sample); if labeled as the hydrated form: between 5.0 and 9.0%
- **HEAVY METALS,** *Method II* ⟨**231**⟩**:** NMT 10 ppm
- **CONTENT OF CHLORIDE, TITRIMETRY** ⟨**541**⟩
  Sample solution: 350 mg of Valacyclovir Hydrochloride in 100 mL water and add 4 drops of nitric acid
  Analysis: Titrate with 0.1 M silver nitrate VS a blank determination under the same conditions. Each mL of 0.1 M silver nitrate is equivalent to 3.55 mg of chloride.
  Acceptance criteria: 9.4–9.9% on the anhydrous basis
- **LIMIT OF PALLADIUM** ⟨**730**⟩ **(***if present***)**
  Diluent: Dimethyl sulfoxide and hydrochloric acid (98:2)
  Blank solution: Use *Diluent.*
  Standard solutions: Dilute with *Diluent* any commercially available standard stock solution of 1 mg/mL of palladium [NOTE—The suggested sources for palladium stock solutions are NIST's SRM 3138 or Perkin elmer's PE PURE.] to prepare the following two solutions: 1 µg/mL of palladium and 10 µg/mL of palladium.
  Sample solution: 10 mg/mL of Valacyclovir Hydrochloride in *Diluent*
  Wavelength: 340.458 nm
  Suitable spectrophotometer system: Use a suitable standard Inductively Coupled Plasma-Optical Emission spectrophotometric system and construct a calibration curve.
  System suitability
  Samples: *Blank solution* and *Standard solutions*
  Suitability requirements
  Relative standard deviation: NMT 2.0%, *Standard solutions*
  Correlation coefficient: NLT 0.999, *Blank* and *Standard solutions*
  Analysis
  Samples: *Blank solution* and *Sample solution*
  Calculate the concentration of palladium using the calibration curve corrected for the emission response of the *Blank solution* and sample weight. Calculate the amount of palladium in the Valacyclovir Hydrochloride taken to prepare the *Sample solution*.
  Acceptance criteria: NMT 10 ppm

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight containers, and store at a temperature below 30°.
- **LABELING:** Where it is the hydrated form, the label so indicates.

BRIEFING

Valproic Acid Capsules, *USP 32* page 3839. It is proposed to delete the *Disintegration* test. When a revision was made to replace the *Disintegration* test with a *Dissolution* test, the *Disintegration* test was not deleted.

(BPC: M. Marques.) RTS—C73275

Valproic Acid Capsules

DEFINITION
Valproic Acid Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of valproic acid ($C_8H_{16}O_2$).

IDENTIFICATION
- **A.** The retention time ratios of the valproic acid peak to the internal standard peak from the *Standard solution* and the *Sample solution*, as directed in the *Assay*, do not differ by more than 2.0%.
- **B. PROCEDURE**
  Sample: Equivalent to 250 mg of valproic acid
  Analysis: Place the *Sample* in a separator, add 20 mL of 1 N sodium hydroxide, shake, and allow the layers to separate. Transfer the aqueous layer to a second separator, add 4 mL of hydrochloric acid, mix, and extract with 40 mL of *n*-heptane. Filter the *n*-heptane layer through glass wool into a beaker, and evaporate the solvent completely on a steam bath with the aid of a current of air. Transfer 2 drops of the residue to a test tube containing 0.5 mL each of potassium iodide solution (1 in 50) and potassium iodate solution (1 in 25), and mix.
  Acceptance criteria: A yellow color is produced.

ASSAY
- **PROCEDURE**
  Internal standard solution: 5 mg/mL of biphenyl in *n*-heptane
  Standard stock solution: 2.5 mg/mL of USP Valproic Acid RS in *n*-heptane
  Standard solution: Combine 10.0 mL of *Standard stock solution* and 4.0 mL of *Internal standard solution* in a container equipped with a closure.
  Sample stock solution: Transfer NLT 20 Capsules to a blender jar or other container. Add 150 mL of methylene chloride, and cool in a solid carbon dioxide–acetone mixture until the contents have solidified. If necessary, transfer the mixture of Capsules and methylene chloride to a blender jar, and blend with a high-speed blender until all the solids are reduced to fine particles. Transfer the mixture to a 500-mL volumetric flask, add *n*-heptane to volume, mix, and allow solids to settle. Dilute the solution to obtain a final concentration of 2.5 mg/mL in *n*-heptane, made up to 100 mL.
  Sample solution: Combine 10.0 mL of *Sample stock solution* and 4.0 mL of *Internal standard solution* in a container equipped with a closure.

In-Process Revision

Chromatographic system
(See *Chromatography* ⟨621⟩, *System Suitability*.)
Mode: GC
Detector: Flame ionization
Column: 2-mm × 1.8-m glass column packed with 10% phase G34 on 80- to 100-mesh support S1A
Temperature
Column: 150°
Injector port: 250°
Detector: 250°
Carrier gas: Dry helium
Flow rate: 40 mL/min
Injection size: 2 µL
System suitability
[NOTE—The relative retention times for valproic acid and biphenyl acid are 0.5 and 1.0, respectively.]
Sample: *Standard solution*
Suitability requirements
Resolution: NLT 3.0 between valproic acid and biphenyl
Relative standard deviation: NMT 2%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_8H_{16}O_2$ in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of valproic acid to internal standard obtained from the *Sample solution*
R_S = peak response ratio of valproic acid to internal standard obtained from the *Standard solution*
C_S = concentration of USP Valproic Acid RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of valproic acid in the *Sample solution* (mg/mL)
Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Delete the following:

■• **DISINTEGRATION** ⟨~~701~~⟩**:** ~~Determine as directed for *Soft Gelatin Capsules*.~~
~~**Time:** 15 min~~■1S (*USP33*)

• **DISSOLUTION** ⟨711⟩
Medium: 5 mg/mL of sodium lauryl sulfate in simulated intestinal fluid TS (prepared without the enzyme and with monobasic sodium phosphate instead of monobasic potassium phosphate), adjusted with 5 M sodium hydroxide to a pH of 7.5; 900 mL
Apparatus 2: 50 rpm
Time: 60 min
Internal standard solution: Proceed as directed in the *Assay*.
Standard solution: Prepare a solution of USP Valproic Acid RS having a concentration similar to that of the *Sample solution*. Transfer 10.0 mL to a suitable container, add 3.0 g of sodium chloride, and mix on a vortex mixer for 5 min. Add 1 mL of 6 N hydrochloric acid and 5.0 mL of *Internal standard solution*, and shake for 2 min. Allow the phases to separate, remove the *n*-heptane layer, and filter. Discard the aqueous layer.
Sample solution: Transfer 10.0 mL of the solution under test to a suitable container, add 3.0 g of sodium chloride, and mix on a vortex mixer for 5 min. Add 1 mL of 6 N hydrochloric acid and 5.0 mL of *Internal standard solution*, and shake for 2 min. Allow the phases to separate, remove the *n*-heptane layer, and filter. Discard the aqueous layer.
Chromatographic system: Proceed as directed in the *Assay*.
System suitability: Proceed as directed in the *Assay*.
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of $C_8H_{16}O_2$ dissolved:

$$\text{Result} = (R_U/R_S) \times C_S \times (V/L) \times 100$$

R_U = peak response ratio of valproic acid to internal standard obtained from the *Sample solution*
R_S = peak response ratio of valproic acid to internal standard obtained from the *Standard solution*
C_S = concentration of USP Valproic Acid RS in the *Standard solution* (mg/mL)
V = volume of *Medium* in mL
L = label claim of Capsules (mg)
Acceptance criteria: NLT 85% (Q) of $C_8H_{16}O_2$ is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩**:** Meet the requirements, chloroform being used as the solvent in the procedure for Soft Capsules

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, at controlled room temperature.
• **USP REFERENCE STANDARDS** ⟨11⟩
USP Valproic Acid RS

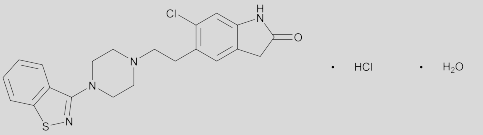
BRIEFING

Ziprasidone Hydrochloride. Because there is no existing *USP* monograph for this drug substance, a new monograph is being proposed based on validated methods of analysis. The liquid chromatographic procedures in the tests for *Procedure 2: Limit of Early Eluting Impurities*, *Procedure 3: Limit of Late Eluting Impurities*, and in the *Assay* are based on analyses performed with a Mac Mod Analytical Zorbax RX-C8, 5-µm brand of L7 column. The typical retention time for ziprasidone in the *Assay* is about 7.5 min. The gas chromatographic procedure in the test for *Procedure 1: Limit of Tetrahydrofuran* is based on analysis performed with the J & W DB-624 brand of G43 column. The typical retention time for tetrahydrofuran is about 12 min.

(MD-PP: R. Ravichandran, F. Mao.) RTS—C44606

Add the following:

■Ziprasidone Hydrochloride



$C_{21}H_{21}ClN_4OS \cdot HCl \cdot H_2O$ 467.41
2*H*-Indol-2-one, 5-[2-[4-(1,2-benzisothiazol-3-yl)-1-piperazinyl]ethyl]-6-chloro-1,3-dihydro-, monohydrochloride, monohydrate;
5-[2-[4-(1,2-Benzisothiazol-3-yl)-1-piperazinyl]ethyl]-6-chloro-2-indolinone monohydrochloride, monohydrate [138982-67-9].

DEFINITION

Ziprasidone Hydrochloride contains NLT 98.0% and NMT 102.0% of $C_{21}H_{21}ClN_4OS \cdot HCl$, calculated on the anhydrous and solvent-free basis.

In-Process Revision

IDENTIFICATION

- **A. INFRARED ABSORPTION ⟨197K⟩**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay.*
- **C. IDENTIFICATION TESTS—GENERAL,** *Chloride* ⟨**191**⟩**:** Meets the requirements

ASSAY

- **PROCEDURE**

Buffer: 6.8 g/L of monobasic potassium phosphate in water. Adjust with 85% phosphoric acid to a pH of 3.0.
Mobile phase: Methanol and *Buffer* (2:3)
Diluent: Methanol and water (3:2)
Standard solution: 0.23 mg/mL of USP Ziprasidone Hydrochloride RS in *Diluent*
Sample solution: 0.23 mg/mL of Ziprasidone Hydrochloride in *Diluent*
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: LC
Detector: UV 229 nm
Refrigerated autosampler temperature: 5°
Column: 4.6-mm × 15-cm column; 5-µm packing L7
Column temperature: 40°
Flow rate: 1.5 mL/min
Injection size: 20 µL
System suitability
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%
Analysis
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{21}H_{21}ClN_4OS \cdot HCl$ in the portion of Ziprasidone Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
r_S = peak response from the *Standard solution*
C_S = concentration of USP Ziprasidone Hydrochloride RS in the *Standard solution* (mg/mL)
C_U = nominal concentration of Ziprasidone Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0%

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION ⟨281⟩:** NMT 0.1%
- **HEAVY METALS,** *Method II* ⟨**231**⟩**:** NMT 20 ppm

Organic Impurities

- **PROCEDURE 1: LIMIT OF TETRAHYDROFURAN**

Standard solution: 0.05 mg/mL in dimethyl sulfoxide. Transfer 4 mL of this solution to a 20-mL headspace vial, and seal.
Sample solution: Transfer 40 mg of Ziprasidone Hydrochloride and 4.0 mL of dimethyl sulfoxide to a 20-mL headspace vial, seal, and mix.
Chromatographic system
(See *Chromatography* ⟨621⟩*, System Suitability*.)
Mode: GC with headspace injector
Detector: Flame ionization
Column: 30-m × 0.32-mm fused silica column coated with a 1.8-µm film of phase G43
Column temperature: See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	0	40	5
40	2	90	0
90	30	225	2

Injection port temperature: 180°
Injector split ratio: 30:1
Detector temperature: 260°
Carrier gas: Helium
Flow rate: 1.6 mL/min
Injection size: 2 mL
System suitability
Sample: *Standard solution*
Suitability requirements
Relative standard deviation: NMT 5%
Analysis: [NOTE—The headspace vials are maintained at 105° for 60 min prior to headspace injection.]
Samples: *Standard solution* and *Sample solution*
Calculate the percentage of tetrahydrofuran in the portion of Ziprasidone Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of tetrahydrofuran from the *Sample solution*
r_S = peak response of tetrahydrofuran from the *Standard solution*
C_S = concentration of tetrahydrofuran in the *Standard solution* (mg/mL)
C_U = nominal concentration of Ziprasidone Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria
Tetrahydrofuran: NMT 0.4%

- **PROCEDURE 2: LIMIT OF EARLY ELUTING IMPURITIES**

Mobile phase and **Chromatographic system:** Proceed as directed in the *Assay*.
Diluent A: Methanol, water, and hydrochloric acid (20:5:0.01)
Diluent B: Methanol and water (3:2)
Standard solution A: 0.5 µg/mL of USP Ziprasidone Related Compound A RS and 0.8 µg/mL of USP Ziprasidone Related Compound B RS in *Diluent A*
Standard solution B: 0.4 µg/mL of USP Ziprasidone Related Compound B RS in *Diluent A*
System suitability solution: 0.24 mg/mL of USP Ziprasidone Hydrochloride RS in *Standard solution A*
Sample solution A: 0.4 mg/mL of Ziprasidone Hydrochloride in *Diluent A*
Sample solution B: 0.2 mg/mL of Ziprasidone Hydrochloride in *Diluent B*
System suitability
Sample: *System suitability solution*
Suitability requirements
Resolution: NLT 1.5 between the ziprasidone related compound B and ziprasidone peaks
Relative standard deviation: NMT 10% for the ziprasidone related compound B peak
Analysis: [NOTE—Run the *Sample solution* NLT 7 times the ziprasidone retention time in *Sample solution A*.]
Samples: *Standard solution A* and *Sample solution A*
Calculate the percentages of ziprasidone related compounds A and B relative to the content of ziprasidone free base in the portion of Ziprasidone Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of the ziprasidone related compound from the *Sample solution A*
r_S = peak response of the ziprasidone related compound from the *Standard solution A*

In-Process Revision

C_S = concentration of the ziprasidone related compound in the *Standard solution* (mg/mL)
C_U = nominal concentration of Ziprasidone Hydrochloride in *Sample solution A* (mg/mL)
M_{r1} = molecular weight of ziprasidone free base $C_{21}H_{21}ClN_4OS$, 412.94
M_{r2} = molecular weight of Ziprasidone Hydrochloride $C_{21}H_{21}ClN_4OS \cdot HCl \cdot H_2O$, 467.41

Samples: *Standard solution B* and *Sample solution B*

Calculate the percentage of ziprasidone open ring relative to the content of ziprasidone free base in the portion of Ziprasidone Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of ziprasidone open ring from *Sample solution A*
r_S = peak response of ziprasidone related compound B from *Standard solution B*
C_S = concentration of ziprasidone related compound B in the *Standard solution* (mg/mL)
C_U = nominal concentration of Ziprasidone Hydrochloride in *Sample solution B* (mg/mL)
M_{r1} = molecular weight of ziprasidone free base $C_{21}H_{21}ClN_4OS$, 412.94
M_{r2} = molecular weight of Ziprasidone Hydrochloride $C_{21}H_{21}ClN_4OS \cdot HCl \cdot H_2O$, 467.41

Samples: *Diluent A*, *Diluent B*, *Standard solution B*, and *Sample solution A*

Calculate the percentage of unspecified impurity relative to the content of ziprasidone free base in the portion of Ziprasidone Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each unspecified impurity from *Sample solution A*
r_S = peak response of ziprasidone related compound B from *Standard solution B*
C_S = concentration of ziprasidone related compound B in the *Standard solution* (mg/mL)
C_U = nominal concentration of Ziprasidone Hydrochloride in the *Sample solution A* (mg/mL)
M_{r1} = molecular weight of ziprasidone free base $C_{21}H_{21}ClN_4OS$, 412.94
M_{r2} = molecular weight of Ziprasidone Hydrochloride $C_{21}H_{21}ClN_4OS \cdot HCl \cdot H_2O$, 467.41

[NOTE—Disregard the peaks in the injections of *Diluent A* and *Diluent B*.]

Acceptance criteria

Individual impurities: See *Impurity Table 1*.

Impurity Table 1

Name	Relative Retention Time (RRT)	Limit (%)

Suitability requirements
Resolution: NLT 6.0 between the ziprasidone and ziprasidone related compound C peaks
Relative standard deviation: NMT 10% for the ziprasidone related compound C peak
Analysis [NOTE—Run the *Sample solution* NLT 12 times the ziprasidone retention time in the *Sample solution*.]
Samples: *Standard solution* and *Sample solution*

Calculate the percentages of ziprasidone related compounds C and D relative to the content of ziprasidone free base in the portion of Ziprasidone Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of the ziprasidone related compound from the *Sample solution*
r_S = peak response of the ziprasidone related compound from the *Standard solution*
C_S = concentration of the ziprasidone related compound in the *Standard solution* (mg/mL)
C_U = nominal concentration of Ziprasidone Hydrochloride in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of Ziprasidone Hydrochloride free base $C_{21}H_{21}ClN_4OS$, 412.94
M_{r2} = molecular weight of Ziprasidone Hydrochloride $C_{21}H_{21}ClN_4OS \cdot HCl \cdot H_2O$, 467.41

Samples: *Standard solution, Sample solution,* and *Diluent*

Calculate the percentage of unspecified impurity relative to the content of ziprasidone free base in the portion of Ziprasidone Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each unspecified impurity from the *Sample solution*
r_S = peak response of ziprasidone related compound D from the *Standard solution*
C_S = concentration of ziprasidone related compound D in the *Standard solution* (mg/mL)
C_U = nominal concentration of Ziprasidone Hydrochloride in the *Sample solution* (mg/mL)
M_{r1} = molecular weight of Ziprasidone Hydrochloride free base $C_{21}H_{21}ClN_4OS$, 412.94
M_{r2} = molecular weight of Ziprasidone Hydrochloride $C_{21}H_{21}ClN_4OS \cdot HCl \cdot H_2O$, 467.41

[NOTE—Disregard the peaks in the injection of *Diluent*.]

Acceptance criteria

Individual impurities: See *Impurity Table 2*.
Total impurities: NMT 0.5%. [NOTE—The total impurities are the sum of related compounds A, B, C, D, ziprasidone open ring and all unspecified impurities found in *Procedure 2: Limit of Early Eluting Impurities* and *Procedure 3: Limit of Late Eluting Impurities*.]

In-Process Revision

Impurity Table 2

Name	Relative Retention Time (RRT)	Limit (%)
Ziprasidone	1.0	—
Ziprasidone related compound C	2.0	0.2
Ziprasidone related compound D	3.0	0.2
Any individual unspecified impurity	—	0.1

BRIEFING

Zolpidem Tartrate Extended-Release Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph, based on validated methods of analysis, is being proposed. The liquid chromatographic procedures in the test for *Organic Impurities* and in the *Assay* are based on analysis performed with an Inertsil ODS-2 5-µm C18, 4.6-mm × 15-cm brand of L1 column. The typical retention time for zolpidem is about 10 min.

(MD-PP: R. Ravichandran. BPC: M. Marques.) RTS—C47819

Add the following:

■Zolpidem Tartrate Extended-Release Tablets

DEFINITION
Zolpidem Tartrate Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of zolpidem tartrate ($C_{42}H_{48}N_6O_8$).

IDENTIFICATION
- **A. ULTRAVIOLET ABSORPTION** ⟨**197U**⟩
  Sample: 25 µg/mL of zolpidem tartrate in 0.01 M HCl from a suitable quantity of powder obtained by grinding one Tablet
- **B.** The retention time of the major peak in the chromatogram of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay.*

ASSAY
- **PROCEDURE**
  Solution A: 3.3 mL of phosphoric acid in 1 L of water. Adjust the pH to 5.5 with triethylamine.
  Mobile phase: Acetonitrile, methanol, *Solution A* (4:5:11)
  Standard stock solution: 0.5 mg/mL of USP Zolpidem Tartrate RS in a mixture of alcohol and 0.01 M hydrochloric acid (4:1)
  Standard solution: 0.1 mg/mL of USP Zolpidem Tartrate RS in *Mobile phase* from *Standard stock solution*
  Sample stock solution: Finely powder NLT 8 Tablets. Transfer the powder quantitatively to a suitable volumetric flask to obtain 0.5 mg/mL of zolpidem tartrate. Add 70% of the flask volume of a mixture of alcohol and 0.01 M hydrochloric acid (5:2), and stir on a magnetic stirrer for 1 h. Dilute with alcohol to volume. Allow solid particles to settle, and pass the supernatant through a suitable filter (Whatman 40 or equivalent).
  Sample solution: 0.1 mg/mL of zolpidem tartrate from filtered *Sample stock solution* and *Mobile phase*
  Chromatographic system
  (See *Chromatography* ⟨621⟩*, System Suitability*.)
  Mode: LC
  Detector: UV 240 nm
  Column: 4.6-mm × 15-cm; 5-µm packing L1
  Column temperature: 40°
  Flow rate: 1 mL/min
  Injection size: 15 µL
  System suitability
  Sample: *Standard solution*
  Suitability requirements
  Tailing factor: NMT 3.0 for zolpidem
  Relative standard deviation: NMT 2.0 for zolpidem
  Analysis
  Sample: *Sample solution* and *Standard solution*
  Calculate the percentage label claim of $C_{42}H_{48}N_6O_8$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

  r_U = peak response from the *Sample solution*
  r_S = peak response from the *Standard solution*
  C_S = concentration of USP Zolpidem Tartrate RS in the *Standard solution* (mg/mL)
  C_U = nominal concentration of the *Sample solution* (mg/mL)
  Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS
- **DISSOLUTION** ⟨**711**⟩
  Medium: 0.01 N hydrochloric acid; 500 mL
  Apparatus 1: 100 rpm
  Times: 30, 90, and 240 min
  Standard solution: Solution of USP Zolpidem Tartrate RS in *Medium* containing L/500 mg/mL, where L is the Tablet label claim in mg
  Sample solution: Pass a portion of the solution under test through a suitable filter.
  Detector: UV 295 nm
  Blank: *Medium*
  Calculate the quantity dissolved as a percentage of the labeled amount of $C_{42}H_{48}N_6O_8$ in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

  A_U = absorbance from the *Sample solution*
  A_S = absorbance from the *Standard solution*
  C_S = concentration of the *Standard solution* (mg/mL)
  V = 500 mL
  L = label claim/Tablet (mg)
  Tolerances: The percentage of the labeled amount of $C_{42}H_{48}N_6O_8$ dissolved in the times specified conform to *Acceptance Table 1*.

Acceptance Table 1

Time (min)	Amount Dissolved (%)
30	50–70
90	70–85
240	NLT 90

• **UNIFORMITY OF DOSAGE UNITS ⟨905⟩:** Meet the requirements

IMPURITIES

Organic Impurities

• **PROCEDURE**

Solution A, Mobile phase and **Standard stock solution:** Proceed as directed under *Assay*.

System suitability solution: Dissolve a suitable amount of USP Zolpidem Related Compound A RS in *Standard stock solution* to obtain a solution containing 1 µg/mL of zolpidem related compound A. Dilute 1 mL of the resulting solution to 5 mL with *Mobile phase*.

Chromatographic system

(See *Chromatography* ⟨621⟩, *System Suitability*.)

Prepare as directed in the *Assay*.

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 1.5 between zolpidem related compound A and zolpidem, *System suitability solution*

Tailing factor: NMT 3.0 for the zolpidem peak

Relative standard deviation: NMT 2.0% for the zolpidem peak

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times (1/F) \times 100$$

r_U = peak response for each impurity from the *Sample solution*

r_T = sum of the peak responses for all the peaks from the *Sample solution*

F = relative response factor of the corresponding impurity obtained from the *Impurity Table*

Acceptance criteria

Individual impurities: See *Impurity Table 1*.

Total impurities: NMT 0.5%

DIETARY SUPPLEMENTS—MONOGRAPHS

BRIEFING

Vitamin A Oral Liquid Preparation. Because there is no existing *USP* monograph for this article, the following new monograph is being proposed. The development of this monograph has been requested by the United Nations International Children's Emergency Fund (UNICEF), the United States Agency for International Development (USAID), Micronutrient Initiative, and the World Health Organization (WHO) in support of one of their children's health initiatives. Vitamin A Oral Liquid Preparation packaged in soft gelatin capsules is not intended for ingestion as is, but rather acts as a single-unit container and delivery device for the Oral Liquid. Strength is described in terms of Vitamin A/dosage unit. The *Assay* is conducted using the same chromatographic procedure in the USP General Chapter *Vitamin A Assay* ⟨571⟩, which clearly separates the different *cis* isomers of vitamin A and the different ester forms. Typical retention times obtained using a Zorbax-NH2 brand column of L8 packing are 7.5 min for 13-*cis* retinyl palmitate, 14.5 min for all-*trans* retinyl palmitate, 14.5 min for 13-*cis* retinyl acetate, 17.2 min for 9-*cis* retinyl acetate, and 20.0 min for all-*trans* retinyl acetate. The average of the contents expelled from the Oral Liquid Preparations packaged in capsules is used in the calculation to reflect the deliverable dose.

(DSN: C. Phinney.) RTS—C70858

Add the following:

■Vitamin A Oral Liquid Preparation

DEFINITION

Vitamin A Oral Liquid Preparation is an emulsion, suspension, or solution that contains retinyl acetate or retinyl palmitate in an amount equivalent to NLT 95.0% and NMT 120.0% of the labeled amount of vitamin A in each dosage unit.

IDENTIFICATION

[NOTE—Use low-actinic glassware.]

• **A. PROCEDURE**

Analysis: Prepare a solution in methylene chloride containing approximately 6 µg of all-*trans* retinol in 1 mL. Add 10 mL of antimony trichloride TS.

Acceptance criteria: A transient blue color appears at once.

• **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST ⟨201⟩**

Standard solution: Dissolve the contents of 1 ampule of USP Vitamin A RS in methylene chloride to obtain 25.0 mL.

Sample solution: Dissolve a quantity of Oral Liquid Preparation equivalent to about 4.5 mg of all-*trans* retinol in methylene chloride to obtain 10 mL of solution.

Application volume: 10 µL as an 8-mm band

Developing solvent system: A mixture of cyclohexane and ether (4:1)

Spray reagent: 0.2 g/mL phosphomolybdic acid in alcohol. Filter and use only the clear filtrate.

Analysis: Apply at the starting point of the chromatogram and 10 µL of the *Sample solution*, as an 8-mm band, and

In-Process Revision

proceed as directed for *Chromatography* ⟨621⟩*, Thin-Layer Chromatography*. Allow the solvent front to move a distance of 10 cm, remove the plate, and air-dry. Spray with phosphomolybdic acid TS.

Acceptance criteria: The blue-green spot formed is indicative of the presence of retinol. The approximate R_F values of the predominant spots, corresponding to the different forms of retinol, are 0.1 for the alcohol form, 0.45 for the acetate, and 0.7 for the palmitate.

ASSAY

• **VITAMIN A**

[NOTE—Use low-actinic glassware.]

Standard solution: Dissolve a quantity of USP Vitamin A RS in *n*-hexane, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 15 µg of retinyl acetate/mL.

Sample solution

For oral liquid preparations in oil vehicles packaged in single-unit containers: Empty the contents of NLT 30 single-unit containers following the directions for use as stated in the labeling. Record the mass of the content delivered from each single-unit container, and calculate the average. Mix the contents to obtain a homogeneous sample. Transfer an amount of the composite to a suitable volumetric flask; dissolve it with hexane, and dilute with hexane quantitatively and stepwise, if necessary, to obtain a solution containing the equivalent of about 13 µg all-*trans* retinol/mL, based on the labeled content.

For oral liquid preparations in oil vehicles packaged in multiple-unit containers: Dissolve an accurately measured volume of Oral Liquid Preparation in a suitable volume of hexane and dilute with hexane, quantitatively and stepwise, if necessary, to obtain a solution containing the equivalent to about 13 µg all-*trans* retinol/mL, based on the labeled content.

For oral liquid preparations in aqueous vehicles: Transfer a mass, or an accurately measured volume of Oral Liquid Preparation, into a separatory funnel, and extract quantitatively with hexane or other suitable solvent. Dilute with hexane, quantitatively and stepwise, if necessary, to obtain a solution containing the equivalent of about 13 µg all-*trans* retinol/mL, based on the labeled content.

System suitability solution: Dissolve a quantity of retinyl palmitate and USP Vitamin A RS in *n*-hexane to obtain a solution containing about 7.5 µg/mL of each.

Chromatographic system

(See *Chromatography* ⟨621⟩*, System Suitability*.)

Mode: LC

Detector: UV 325 nm

Column: 4.6-mm × 15-cm; packing L8

Flow rate: 1 mL/min

Injection size: 40 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 10 between retinyl acetate and retinyl palmitate

Relative standard deviation NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of all-*trans* retinol in each individual container:

$$\text{Result} = (V/D) \times (C/W) \times (r_U/r_S) \times U \times (100/L)$$

V = volume of the *Sample solution* (mL)
D = dilution factor (dilution volume/aliquot volume)
C = concentration of all-*trans* retinol in the *Standard solution* (mg/mL)
W = mass or volume of the Oral Liquid Preparation composite taken (mg or mL)
r_U = peak response from the corresponding all-*trans* retinyl ester in the *Sample solution*
r_S = peak response from the all-*trans* retinyl acetate in the *Standard solution*
U = for multiple-unit containers: labeled volume of each dosage unit (mL); or for single-unit containers: average mass (mg) of the contents delivered from each individual container following the directions for use as stated in the labeling
L = labeled content of all-*trans* retinol in each dosage unit (mg)

Acceptance criteria: 95.0%–120.0% of the labeled amount of all-*trans* retinol in each dosage unit

PERFORMANCE TESTS

• **DELIVERABLE VOLUME** ⟨698⟩

For oral liquid preparations packaged in muiltiple-unit containers: Meets the requirements

• **UNIFORMITY OF DOSAGE UNITS** ⟨905⟩

For oral liquid preparations packaged in single-unit containers: Empty the single-unit containers following the directions for use as stated in the labeling. The contents so expelled from the single-unit containers meet the requirements. [NOTE—Capsules intended for use as single-unit containers are not rinsed after expulsion of the contents.]

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. It may be packaged in single-unit containers. [NOTE—Capsules may be suitable as single-unit containers provided they are packaged in critical secondary containers as described in *Good Packaging Practices* ⟨1177⟩.]

• **LABELING:** The label states that the product is Vitamin A Oral Liquid Preparation. Label the Oral Liquid Preparation to indicate the ester form in which the vitamin is present, and to indicate the content of vitamin A in terms of the equivalent amount of all-*trans* retinol in mg/dosage unit. The content of vitamin A may be stated also in USP Units/dosage unit, on the basis that 1 USP Vitamin A Unit equals the biological activity of 0.3 µg of all-*trans* retinol. Capsules used as single-unit containers may be exempted from the requirements of individual labeling, provided they are packaged in an appropriately labeled secondary container, including directions for use and delivery of the Oral Liquid Preparation. Label the Oral Liquid Preparations packaged in multiple-unit containers to indicate the volume of each dosage unit.

• **USP REFERENCE STANDARDS** ⟨11⟩

USP Vitamin A RS■1S *(USP33)*

BRIEFING

Zinc Gluconate Tablets. Because there is no existing *USP* monograph for this article, a new monograph is being proposed. The development of this monograph has been requested by the United Nations International Children's Emergency Fund (UNICEF), the United States Agency for International Development (USAID), and the World Health Organization (WHO), in support of one of their Children's Health Initiatives. A disintegration test with a short test time is proposed for Tablets to be dissolved or dispersed in a small volume, typically a teaspoon of diluent before oral administration to infants, similar to the existing *USP* monograph for Zinc Sulfate Tablets. For other types of Tablets, dissolution requirements are proposed. Because Zinc Gluconate Tablets are also used as a dietary supplement in the United States, this monograph is proposed as part of the Dietary Supplements section of the *USP*.

(DSN: C. Phinney.) RTS—C70857

Add the following:

■Zinc Gluconate Tablets

DEFINITION
Zinc Gluconate Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of Zn, in the form of zinc gluconate ($C_{12}H_{22}O_{14}Zn$).

IDENTIFICATION
- **A: THIN-LAYER CHROMATOGRAPHY**
  Sample solution: Transfer a weighed quantity of powdered Tablets to a suitable flask, and add the necessary volume of water to obtain a solution containing about 10 mg/mL of zinc gluconate. Shake and sonicate, heating in a water bath at 60°, if necessary, and filter.
  Standard solution: USP Potassium Gluconate RS in water; 10 mg/mL
  Chromatographic system
  (See *Chromatography* ⟨621⟩*, Thin-Layer Chromatography)*
  Mode: TLC
  Adsorbent: 0.25-mm layer of chromatographic silica gel
  Application volume: 5 µL
  Developing solvent system: Alcohol, water, ammonium hydroxide, and ethyl acetate (50:30:10:10)
  Spray reagent: Dissolve 2.5 g of ammonium molybdate in about 50 mL of 2 N sulfuric acid in a 100-mL volumetric flask, add 1.0 g of ceric sulfate, swirl to dissolve, dilute with 2 N sulfuric acid to volume, and mix.
  Analysis
  Samples: *Standard solution* and *Sample solution*
  When the solvent front has moved about three-fourths the length of the plate, remove the plate from the chamber, and dry at 110° for 20 min. Allow to cool, spray with *Spray reagent*, and heat the plate at 110° for about 10 min.
  Acceptance criteria: The principal spot obtained from the *Sample solution* corresponds in color, size, and R_F value to that obtained from the *Standard solution*.
- **B: PROCEDURE**
  Sodium hydroxide solution: 42 mg/mL of sodium hydroxide
  Ammonium chloride solution: 107 mg/mL of ammonium chloride
  Glycerin solution: A mixture of glycerin and water (85:15)
  Sodium sulfide solution: Dissolve 12 g of sodium sulfide with heating in a 45-mL mixture of *Glycerin solution* and water (29:10), allow to cool, and dilute with the same mixture of solvents to 100 mL. The solution should be colorless.
  Sample solution: Shake and sonicate the amount of powdered Tablets with the necessary volume of water to obtain a solution containing 100 mg/mL of zinc gluconate. Heat in a water bath at 60°, if necessary, and filter.
  Analysis: To 5 mL of the *Sample solution* add 0.2 mL of *Sodium hydroxide solution*. Add an additional 2 mL of *Sodium hydroxide solution*. Add 10 mL of *Ammonium chloride solution*. Add 0.1 mL of *Sodium sulfide solution*.
  Acceptance criteria: A white precipitate is formed after the first addition of the *Sodium hydroxide solution*. The precipitate dissolves after the second addition of the *Sodium hydroxide solution*. The solution remains clear after addition of the *Ammonium chloride solution*, and a white precipitate forms after addition of the *Sodium sulfide solution*.

STRENGTH
- **PROCEDURE**
  Sample solution: Weigh and finely powder NLT 20 Tablets. Weigh a portion of the powder, equivalent to about 80 mg of zinc, transfer to a suitable crucible, and ignite, gently at first, until free from carbon. Cool the crucible, add 25 mL of water and 5 mL of hydrochloric acid, and stir. Heat on a steam bath for 5 min, and filter, rinsing the filter with several portions of water. Dilute the combined filtrate and washes with water to about 100 mL.
  Analysis: Add ammonia–ammonium chloride buffer TS until the solution is neutral to litmus. Add 5 mL of ammonia–ammonium chloride buffer TS and 0.1 mL of eriochrome black TS, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Each mL of 0.05 M edetate disodium is equivalent to 3.27 mg of Zn or 22.78 mg of zinc gluconate ($C_{12}H_{22}O_{14}Zn$).
  Acceptance criteria: 93.0%–107.0%

PERFORMANCE TESTS
- **DISINTEGRATION** ⟨**701**⟩ (For Tablets intended to be mixed with water prior to intake as oral liquids)
  Time: NMT 60 s
- **DISINGETRATION AND DISSOLUTION OF DIETARY SUPPLEMENTS** ⟨**2040**⟩ (For Tablets not to be mixed with water prior to ingestion)
  Medium: Hydrochloric acid 0.01 N; 900 mL
  Apparatus 2: 50 rpm
  Time: 45 min
  Analysis: Determine the amount of $C_{12}H_{22}O_{14}Zn$ dissolved, employing atomic absorption spectrophotometry at the resonance emission line for zinc, at 213.8 nm, on filtered portions of the solution under test, suitably diluted with water, in comparison with a *Standard solution* having a known concentration of zinc in the same *Medium.*
  Tolerances: NLT 75% of the labeled amount of $C_{12}H_{22}O_{14}Zn$ is dissolved.
- **UNIFORMITY OF DOSAGE UNITS** ⟨**905**⟩**:** Meet the requirements

ADDITIONAL REQUIREMENTS
- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light.
- **LABELING:** Label the Tablets in terms of elemental zinc, and also in terms of zinc gluconate ($C_{12}H_{22}O_{14}Zn$). The labeling indicates whether the Tablets are intended to be mixed with water before intake.
- **USP REFERENCE STANDARDS** ⟨**11**⟩
  USP Potassium Gluconate RS■1S *(USP33)*
