Please address comments on *Pharmaceutical Forum* content to

Please address comments on Pharmacopeial Forum content to
USP Executive Secretariat
12601 Twinbrook Parkway
Rockville, MD 20852
execsec@usp.org

ISSN: 1542-1945

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI)*, in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences*.

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the *U.S. Pharmacopeia* and *National Formulary*, the legally recognized compendia of standards for drugs and products of other health care technologies. The *USP* and *NF* include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling. **Pharmacopeial Forum's Public Review and Comment Process**

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum (PF)*, for the development of official standards in the *United States Pharmacopeia* and the *National Formulary (USP-NF)*.

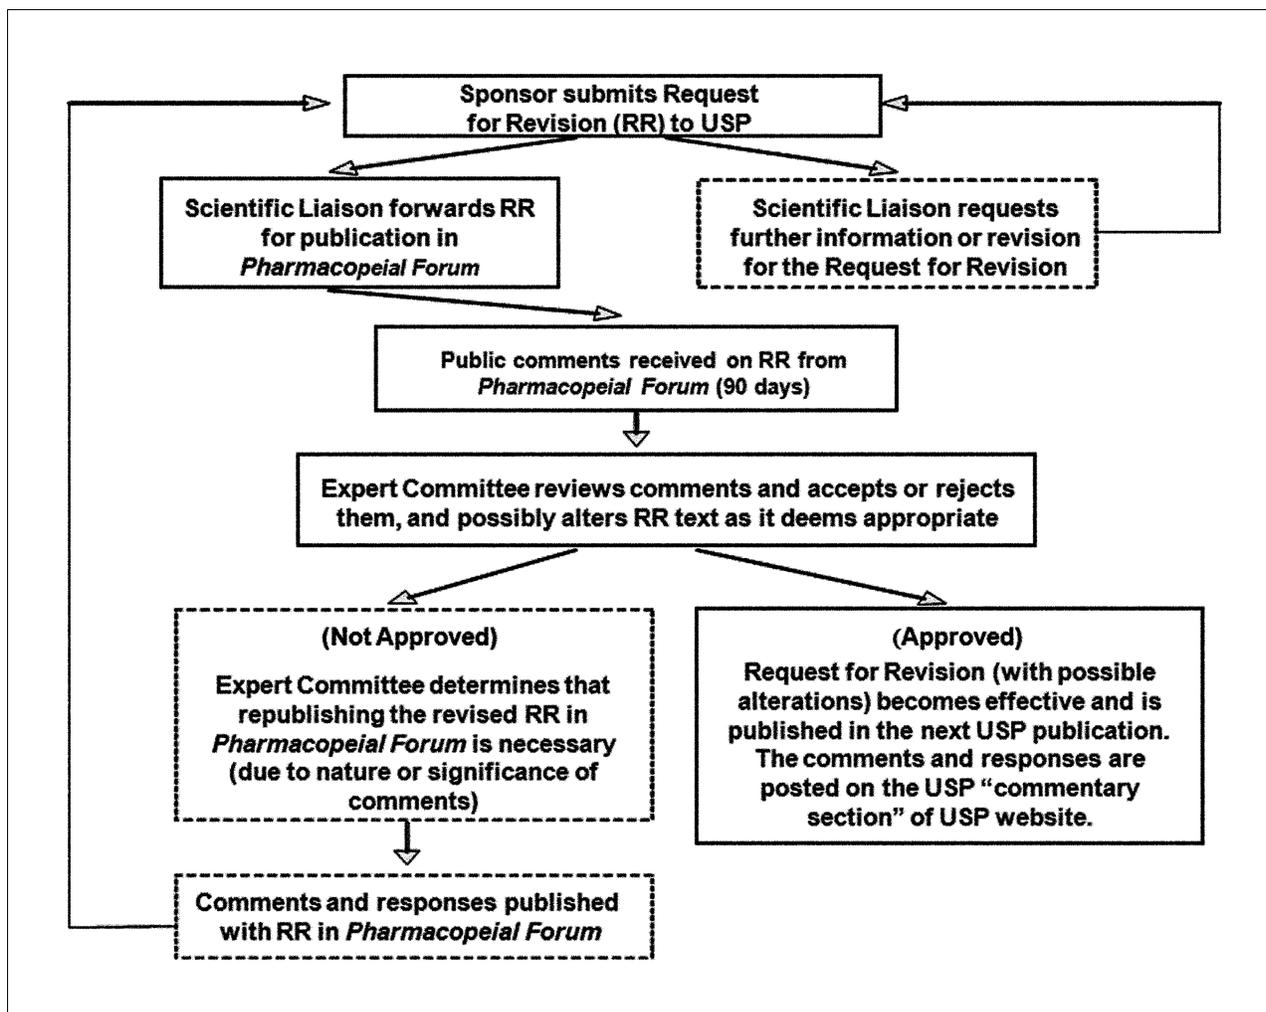

USP publishes *PF* on a bimonthly basis to provide an opportunity to review and comment on new or revised standards.

There are two types of proposed revisions in *PF*:

1. **Proposed Revisions**—New or revised standards targeted for adoption through USP's Standard Revision Process. USP's Revision Process calls for publication of a proposed revision in *PF* for a 90-day notice and comment period. After the comment period and subsequent review of comments and approval by the relevant USP Expert Committee, the official standard is published in the next available *USP-NF* or *Supplement*. If comments received are significant, or if the Expert Committee's consideration of comments results in significant additional changes, the Expert Committee may determine that republishing in *PF* is necessary prior to the revision becoming official. See the *In-Process Revision* section for current proposed revisions.
2. **Proposed Interim Revision Announcements**—New or revised standards that become official through an accelerated process in accordance with USP's Guideline on Accelerated Revisions (available on the USP Web site). *Interim Revision Announcements (IRAs)* allow for a revision to become official prior to the next *USP-NF* or *Supplement*. *IRAs* are first presented for a 90-day public comment period in the *Proposed Interim Revision Announcement* section of the *PF*. Note that final *IRAs*, as well as *Errata*, and *Revision Bulletins*, which also are defined in the Accelerated Revision Guideline, appear only on the USP Web site.

USP welcomes comments and data on proposed revisions. A summary of comments received, along with USP's responses, will be published in the *Revisions and Commentary* section of the USP website (<http://www.usp.org/USPNF/revisions/>).

The chart below shows the public review and comment process and its relationship to standards development.

Questions on the process should be addressed to the USP Executive Secretariat, United States Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE PF

The various sections of *PF* are briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a *Request for Revision* is available in the *Guideline for Submitting Requests for Revision to the USP-NF* on the USP Web site (www.usp.org/USPNF/submitMonograph/subGuide.html). Note that the Expert Committee listing and the Scientific Staff Directory also are located on the USP Web site (see below for links).

Proposed and Adopted Revisions to the USP-NF

Staff Directory

Names and contact information of key USP scientific staff members who work on the development of USP compendial standards

(<http://www.usp.org/USPNF/devProcess/contactScientists.html>)

Proposed Interim Revision Announcements

This section includes proposals for *Interim Revision Announcements (IRAs)* that will be published as official *USP* or *NF* standards. There is a 90-day comment period for these proposals (see <http://www.usp.org/USPNF/pf/pfRedesign.html> for the *PF* comment schedule). Readers should review material in this section and provide comments to the Scientific Liaison using the contact information appearing at the end of each proposed *IRA*. Information on how to comment can be found under the "Participation" section of www.usp.org. It is important to send comments promptly so that the Expert Committee members can consider reader's input as they are deciding whether to advance standards to official status. The approved official text will be published under *IRAs* in the "New Official Text" section of USP's Web site.

Each proposal is preceded by a Briefing that indicates the proposed revisions.

Symbols—New text is enclosed in symbols and set off from the current official text as shown in the following example:

◆new text◆

Where the symbols appear together with no enclosed text, such as

◆◆

, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the date the proposal, if approved, will become official as an *IRA*. For example, ◆(IRA 1-Apr-2011)

BRIEFING

Sesame Oil, *NF 33* page 6858. Based on a request to accommodate certain grades used in injectable dosage forms that are not currently included in the monograph, it is proposed to make the following changes:

1. Revise the specification of *Specific Gravity* by decreasing the lower limit from 0.916 to 0.912.
2. In the *Labeling* section, add a statement to accommodate a special grade that is used in injectable dosage forms. The specific grade must meet the *Other Requirements* that will be added under the section of *Additional Requirements*.
3. Add the subsection for *Other Requirements* that are applied to the special grade of sesame oil, which is used in injectable dosage forms.

The comment period for the above revision ends March 31, 2015. In the absence of significant adverse comments, it is proposed to implement this revision via an *Interim Revision Announcement* to *USP 38–NF33*, with an official date of July 1, 2015.

Interested parties are encouraged to submit comments to Hong Wang, Ph.D., senior scientific liaison to the Excipient Expert Committees (301-816-8351 or hw@usp.org)

As part of the USP monograph modernization effort, the following revisions are proposed:

1. Add a specification for *Alkaline Impurities*.
2. Add a specification for *Peroxide Value*.
3. Add the specification for *Water Determination*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(EXC: H. Wang.)

Correspondence Number—C149850; C152089

Comment deadline: March 31, 2015**Sesame Oil****DEFINITION**

Sesame Oil is the refined fixed oil obtained from the seed of one or more cultivated varieties of *Sesamum indicum* L. (Fam. Pedaliaceae). It may contain suitable antioxidants.

IDENTIFICATION**• A. Identity by Triglyceride Profile**

Analysis: Proceed as directed in the test for *Triglyceride Composition*

Acceptance criteria: The peak responses for the eight major triglycerides—LLL, OLL, PLL, OOL, POL, OOO, SOL, and POO—elute between 0 and about 40 min, in the order specified, and at relative retention times of about 0.55, 0.65, 0.69, 0.77, 0.82, 0.93, 0.97, and 1.0, respectively, as obtained in the chromatogram of the *Sample solution* in the test for *Triglyceride Composition*.

ASSAY**• Triglyceride Composition**

[Note—The fatty acid radicals are designated as linoleic (L), oleic (O), palmitic (P), and stearic (S), and the common abbreviations for triglycerides used are as follows: trilinolein (LLL), 1,2-dilinoleoyl-3-oleoyl-rac-glycerol (OLL), 1,2-dilinoleoyl-3-palmitoyl-rac-glycerol (PLL), 1,2-dioleoyl-3-linoleoyl-rac-glycerol (OOL), 1-palmitoyl-2-oleoyl-3-linoleoyl-rac-glycerol (POL), triolein (OOO), 1-linoleoyl-2-oleoyl-3-stearoyl-rac-glycerol (SOL), and 1,2-dioleoyl-3-palmitoyl-rac-glycerol (POO).]

Mobile phase: Acetonitrile and methylene chloride (60:40)

System suitability solution: 3.0 mg/mL of USP Sesame Oil Related Compound A RS and USP Sesame Oil Related Compound B RS in *Mobile phase*. [Note—USP Sesame Oil Related Compound A RS is OLL, and USP Sesame Oil Related Compound B RS is PLL.]

Sample solution: 20 mg/mL of Sesame Oil in *Mobile phase*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: Refractive index

Columns: Two 4.6-mm × 25-cm in series; packings L1

Column temperature: 30°

Flow rate: 1.0 mL/min

Injection volume: 20 µL

System suitability

Sample: *System suitability solution*

[Note—The relative retention times for OLL and PLL are about 0.93 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.8 between OLL and PLL

Relative standard deviation: NMT 1.5% determined from peak areas; NMT 2.2%

determined from the peak area ratio of OLL to PLL

Analysis

[Note—The relative retention times for the eight major triglyceride peaks are listed in *Table 1*.]

Sample: *Sample solution*

Calculate the percentage of each of these triglycerides in the portion of sample taken:

$$\text{Result} = (A/B) \times 100$$

A = peak area for each individual triglyceride

B = sum of the areas of all the peaks, excluding the solvent peak

Table 1

Triglyceride	Relative Retention Time	Composition (%)
LLL	0.55	7.0–19.0
OLL	0.65	13.0–30.0
PLL	0.69	5.0–9.0
OOL	0.77	14.0–25.0
POL	0.82	8.0–16.0
OOO	0.93	5.0–14.0
SOL	0.97	2.0–8.0
POO	1.0	2.0–8.0

IMPURITIES

Delete the following:

•

• **Heavy Metals, Method II** (231)

: NMT 10 µg/g •(Official 1-Dec-2015)

Add the following:

▲• Alkaline Impurities

Sample: 10 mL of Sesame Oil

Analysis: Mix 10 mL of freshly opened acetone and 0.3 mL of water, and add 0.05 mL of bromophenol blue TS. Add the *Sample*, shake, and allow to stand. Titrate with 0.01 N hydrochloric acid VS to change the color of the upper layer to yellow.

Acceptance criteria: NMT 0.1 mL of 0.01 N hydrochloric acid is required. ▲NF34

SPECIFIC TESTS

Change to read:

• **Specific Gravity** (841) : 0.916

•0.912•(IRA 1-Jul-2015)

-0.921

- **Fats and Fixed Oils, Acid Value (Free Fatty Acids) 〈 401 〉**

Sample: 10 g

Acceptance criteria: NMT 2.0 mL of 0.020 N sodium hydroxide is required for neutralization.

- **Fats and Fixed Oils, Iodine Value 〈 401 〉:** 103–116

- **Fats and Fixed Oils, Saponification Value 〈 401 〉:** 188–195

- **Fats and Fixed Oils, Solidification Temperature of Fatty Acids 〈 401 〉:** 20°–25°

Add the following:

- ▲● **Fats and Fixed Oils, Peroxide Value 〈 401 〉:** NMT 10.0 ▲NF34

- **Fats and Fixed Oils, Unsaponifiable Matter 〈 401 〉:** NMT 1.5%

- **Cottonseed Oil**

Sample: 5 mL

Analysis: Mix the *Sample* in a test tube with 5 mL of a mixture of equal volumes of amyl alcohol and a 10-mg/mL solution of sulfur in carbon disulfide. Warm the mixture carefully until the carbon disulfide is expelled, and immerse the tube to one-third of its depth in a boiling saturated solution of sodium chloride.

Acceptance criteria: No reddish color develops within 15 min.

Add the following:

- ▲● **Water Determination, Method Ic 〈 921 〉:** NMT 0.1% ▲NF34

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight, light-resistant containers, and prevent exposure to excessive heat.

Change to read:

- **Labeling:** Label it to indicate the name and quantity of any added antioxidant.

● Where Sesame Oil is intended for use in the manufacture of injectable dosage forms, it is so labeled. ●(IRA 1-Jul-2015)

Add the following:

- **Other Requirements:** For Sesame Oil intended for use in injectable dosage forms, which is specified in the labeling, the requirements must be met for *Unsaponifiable Matter, Acid Value, Peroxide Value, and Water, Method Ic*, under *Specific Tests* in the chapter *Injections and Implanted Drug Products 〈 1 〉, Vehicles and Added Substances, Nonaqueous Vehicles*. ●(IRA 1-Jul-2015)

- **USP Reference Standards 〈 11 〉**

USP Sesame Oil Related Compound A RS

USP Sesame Oil Related Compound B RS

BRIEFING

Aluminum Sulfate and Calcium Acetate for Topical Solution, *USP 38* page 2142. On the basis of comments received, the calculation for aluminum sulfate tetradecahydrate in the *Assay* is revised to correct the equation. The calculation for calcium acetate monohydrate in the *Assay* is also updated for consistency.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

The comment period for this revision ends on March 31, 2015. In the absence of significant comments, it is proposed to implement this revision through an *Interim Revision Announcement* to *USP 39–NF 34* with an official date of July 1, 2015.

Comment deadline: March 31, 2015

Aluminum Sulfate and Calcium Acetate for Topical Solution

DEFINITION

Aluminum Sulfate and Calcium Acetate for Topical Solution contains NLT 90.0% and NMT 110.0% of the labeled amounts of aluminum sulfate tetradecahydrate $[\text{Al}_2(\text{SO}_4)_3 \cdot 14\text{H}_2\text{O}]$ and calcium acetate monohydrate $(\text{C}_4\text{H}_6\text{CaO}_4 \cdot \text{H}_2\text{O})$.

IDENTIFICATION

- **A.**

Sample: 0.25 g of Aluminum Sulfate and Calcium Acetate for Topical Solution

Analysis: Place the *Sample* in a test tube. Add 10 mL of water and 0.25 g of calcium carbonate. Heat on a steam bath for 10 min, and filter. Add 3–4 drops of ferric chloride TS to the filtrate. [Note—After the addition of the ferric chloride TS, the solution may be heated for 1 min to speed the reaction.]

Acceptance criteria: A reddish-brown color or precipitate indicates acetate.

- **B. Identification Tests—General, Sulfate** 〈 191 〉 *and Calcium* 〈 191 〉

Sample solution: Suspend 2 g of sample in 50 mL of water and filter.

Acceptance criteria: Meets the requirements

ASSAY

Change to read:

- **Aluminum Sulfate Tetradecahydrate**

Sample solution: Transfer 10 g of Aluminum Sulfate and Calcium Acetate for Topical Solution to a 1000-mL volumetric flask. Add 100 mL of 1.2 N hydrochloric acid and 250 mL of water. Heat on a steam bath or hot plate until dissolved. Cool, and dilute with water to volume. Retain a portion of the *Sample solution* for the *Assay for Calcium Acetate Monohydrate*.

Blank: Water

Titrimetric system

Mode: Residual titration

Titrant: 0.02 M zinc sulfate VS

~~**Back-titrant:** 0.01 M edetate disodium VS~~

~~••(IRA 1-Jul-2015)~~

Endpoint detection: Visual

Analysis: Transfer a 5.0-mL aliquot of the *Sample solution* to a 250-mL conical flask. Add, in the order named, 40.0 mL of *Back-titrant*

~~•0.01 M edetate disodium VS•(IRA 1-Jul-2015)~~

and 20 mL of acetic acid-ammonium acetate buffer TS, and mix by swirling. Add 50 mL of alcohol and 2 mL of dithizone TS, and titrate the excess *Back-titrant*

~~•0.01 M edetate disodium VS•(IRA 1-Jul-2015)~~

with *Titrant* until the color changes from green-violet to a clear rose-pink. Perform a blank titration, substituting 5.0 mL of water for the *Sample solution*. Each mL of 0.01 M edetate disodium is equivalent to 2.972 mg of aluminum sulfate tetradecahydrate $[\text{Al}_2(\text{SO}_4)_3 \cdot 14\text{H}_2\text{O}]$.

Calculate the percentage of the labeled amount of aluminum sulfate tetradecahydrate $[\text{Al}_2(\text{SO}_4)_3 \cdot 14\text{H}_2\text{O}]$ taken:

$$\text{Result} = [D \times F \times M \times (V_B - V_U)] / (M_T \times W) \times 100$$

D = dilution factor, 1000/5.0

F = conversion factor (2.972 mg of sample per mL of 0.01 M edetate disodium)

M = actual molarity of the *Titrant*

V_B = blank titration volume (mL)

V_U = sample titration volume (mL)

M_T = theoretical molarity of the *Titrant*, 0.02

W = weight of the sample (mg)

•Calculate the percentage of aluminum sulfate tetradecahydrate $[\text{Al}_2(\text{SO}_4)_3 \cdot 14\text{H}_2\text{O}]$ in the portion of Aluminum Sulfate and Calcium Acetate for Topical Solution taken:

$$\text{Result} = \{ [D \times (V_B - V_S) \times M \times F] / W \} \times 100$$

D

= dilution factor, 1000/5.0

V_B

= blank titration volume (mL)

V_S

= sample titration volume (mL)

M

= molarity of the *Titrant* (mM/mL)

F

= equivalency factor, 297.2 mg/mM

W

= weight of sample used (mg)

•(IRA 1-Jul-2015)

Acceptance criteria: 90.0%–110.0%

•of the labeled amount of aluminum sulfate tetradecahydrate $[\text{Al}_2(\text{SO}_4)_3 \cdot 14\text{H}_2\text{O}]$ •(IRA 1-Jul-2015)

Change to read:

• **Calcium Acetate Monohydrate**

Sample: Transfer a 5.0-mL aliquot of the *Sample solution* retained from the *Assay* for *Aluminum Sulfate Tetradecahydrate* to a 250-mL conical flask.

Titrimetric system

Mode: Direct titration

Titrant: 0.01 M edetate disodium VS

Endpoint detection: Visual

Analysis: Add 1–2 mL of 50% triethanolamine to mask the aluminum, and mix well. With constant stirring, add to the *Sample*, in the order named, 100 mL of water, 15 mL of 1 N sodium hydroxide, and 300 mg of hydroxy naphthol blue, and titrate with *Titrant*. The indicator will change from purple to a clear blue color at the endpoint. ~~Each mL of 0.01 M edetate disodium is equivalent to 1.762 mg of calcium acetate monohydrate (C₄H₆CaO₄·H₂O).~~

~~Calculate the percentage of the labeled amount of calcium acetate monohydrate (C₄H₆CaO₄·H₂O) taken:~~

$$\text{Result} = [(D \times V_T \times F \times M)/(M_r \times W)] \times 100$$

~~D = dilution factor, 1000/5.0~~

~~V_T = sample titration volume (mL)~~

~~F = conversion factor (1.762 mg of sample per mL of 0.01 M edetate disodium)~~

~~M = actual molarity of the *Titrant*~~

~~M_r = theoretical molarity of the *Titrant*, 0.01~~

~~W = weight of the sample (mg)~~

• Calculate the percentage of calcium acetate monohydrate (C₄H₆CaO₄·H₂O) in the portion of Aluminum Sulfate and Calcium Acetate for Topical Solution taken:

$$\text{Result} = [(D \times V \times M \times F)/W] \times 100$$

D

= dilution factor, 1000/5.0

V

= sample titration volume (mL)

M

= molarity of the *Titrant* (mM/mL)

F

= equivalency factor, 176.2 mg/mM

W

= weight of sample used (mg)

*(IRA 1-Jul-2015)

Acceptance criteria: 90.0%–110.0%

*of the labeled amount of calcium acetate monohydrate (C₄H₆CaO₄·H₂O) *(IRA 1-Jul-2015)

SPECIFIC TESTS

- pH (791)

Sample solution: 1 g of Aluminum Sulfate and Calcium Acetate for Topical Solution in 200 mL of water

Acceptance criteria: 4.0–4.8

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in single-unit containers, and protect from excessive heat.

In-Process Revision

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) proposed revisions placed directly under *In-Process Revision*, or (2) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the Scientific Liaison using the contact information appearing at the end of each proposal. Information on how to comment can be found under the "Participation" section of www.usp.org. It is important to send comments promptly, using the comment deadline listed after each title.

Briefings Each Proposal is preceded by a Briefing in the following format:

Briefing
Name of Item , citations of the most recent <i>USP</i> publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Expert Committee acronym (the name of the Scientific Liaison who handled the particular monograph or general chapter, and the <i>USP</i> tracking correspondence number, as shown in the example below:
(Expert Committee Acronym: Liaison Name.)
Correspondence Number—CXXXXX

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed out. All *USP–NF* revisions use the following symbols that indicate the final destination of the official text:

•new text•

if slated for an *IRA*;

▲new text▲

if slated for *USP–NF*;

■new text■

if slated for a *Supplement* to *USP–NF*. The same symbols indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as

• •

, or

■ ■

, or

▲▲

, it means that text has been deleted and no new text was proposed to replace it.

In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA*, *Supplement*, or the *USP* or *NF* as the publication where the revision will appear if approved. For example, ■

2S (*USP 34*) indicates that the proposed revision is slated for the *Second Supplement to USP 34*, and ▲

USP 35 and ▲*NF30* indicates that the revisions are proposed for *USP 35* and *NF 30*, respectively.

Official Title Changes Where the specification "**Monograph title change**" is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

BRIEFING

General Notices and Requirements, USP 38–NF 33 page 1. The *General Notices and Requirements (GN)* section of the *United States Pharmacopeia* and the *National Formulary (USP–NF)* was most recently revised in the *Second Supplement to USP 37–NF 32* (official December 1, 2014). *GN* is regularly revised to refine and clarify its content. This current proposal has been informed by input from stakeholders on the General Notices Project Team, representatives of the U.S. Food and Drug Administration, and members of the Council of Experts Executive Committee, who discussed these revisions in their September 16–17, 2014 meeting. Outlined below are changes that are proposed for this round of *GN* revisions, which are being published for public notice and comment herein (*Pharmacopeial Forum* 41(1) [Jan.–Feb. 2015]) and, following subsequent consideration and balloting by the Council of Experts Executive Committee, are anticipated to be included in *USP 39–NF 34* (publishing November 1, 2015; official May 1, 2016).

Changes are proposed for the following *General Notices and Requirements* sections:

- 1. TITLE AND REVISION
 - Clarification of accelerated revision definitions and location
- 2. OFFICIAL STATUS AND LEGAL RECOGNITION
 - 2.10. *Official Text*
 - Specification of the prevailing publication format
 - Clarification that general chapter citations in the *NF* refer to the general chapters in the *USP*
- 3. CONFORMANCE TO STANDARDS
 - 3.10. *Applicability of Standards*
 - Clarification of the primacy of monographs over general chapters and *General Notices and Requirements*
 - Clarification of early adoption
 - Clarification that tests using multiple dosage units are not statistical

sampling plans with extrapolation to larger populations

3.20. *Indicating Conformance*

- Extension of included provisions to compounded preparations

• 4. MONOGRAPHS AND GENERAL CHAPTERS

4.10. *Monographs*

- Replacement of "interchangeability" with "substitutability"

4.10.10. *Applicability of Test Procedures*

- Simplification of text

• 5. MONOGRAPH COMPONENTS

5.20. *Added Substances* and 5.20.10. *Added Substances, Excipients, and Ingredients in Official Substances*

- Clarification of requirement to use a minimum quantity of added substances

5.50.10. *Units of Potency (Biological)*

- Clarification of the use of USP units and international units

• 6. TESTING PRACTICES AND PROCEDURES

6.50.20.1. *Adjustments to Solutions*

- Removal of the word "special"

• 8. TERMS AND DEFINITIONS

8.230.20. *Water in the Manufacture of Official Substances*

- Revision to requirements for water used in manufacturing

8.230.30. *Water in a Compendial Procedure*

- Clarification of references

8.240. *Weights and Measures*

- Clarification that the degree symbol ($^{\circ}$) is always interpreted as Celsius
- Revision of the unit of acceleration due to gravity in centrifugation as "g"

• 9. PRESCRIBING AND DISPENSING

9.10. *Use of Metric Units*

- Revision restricting the use of abbreviations or international units for prescription purposes

• 10. PRESERVATION, PACKAGING, STORAGE, AND LABELING

10.–10.40.100.1.

- Revision to remove from *General Notices and Requirements* information that is moving to general chapter *Labeling* 〈 7 〉

Additionally, minor editorial changes have been made to update the text to current *USP* style.

(COEEC: M. Sindaco.) Correspondence Number—C145488

Comment deadline: March 31, 2015

GENERAL NOTICES AND REQUIREMENTS

Change to read:

The *General Notices and Requirements* section (the *General Notices*) presents the basic assumptions, definitions, and default conditions for the interpretation and application of the *United States Pharmacopeia (USP)* and the *National Formulary (NF)*.

Requirements stated in these *General Notices* apply to all articles recognized in the *USP* and *NF* (the “compendia”) and to all general chapters unless specifically stated otherwise. ~~Where the requirements of an individual monograph differ from the *General Notices* or a general chapter, the monograph requirements apply and supersede the requirements of the *General Notices* or the general chapter, whether or not the monograph explicitly states the difference.~~

▲▲USP39

Change to read:

1. TITLE AND REVISION

The full title of this publication (consisting of four volumes and including its *Supplements*), is *The Pharmacopeia of the United States of America, Thirty-Ninth Revision* and the *National Formulary, Thirty-Fourth Edition*. These titles may be abbreviated to *USP 39*, to *NF 34*, and to *USP 39–NF 34*. The *United States Pharmacopeia, Thirty-Ninth Revision*, and the *National Formulary, Thirty-Fourth Edition*, supersede all earlier revisions. Where the terms “*USP*,” “*NF*,” or “*USP–NF*” are used without further qualification during the period in which these compendia are official, they refer only to *USP 39*, *NF 34*, and any *Supplement(s)* thereto. The same titles, with no further distinction, apply equally to print or electronic presentation of these contents. Although *USP* and *NF* are published under one cover and share these *General Notices*, they are separate compendia.

This revision is official beginning May 1, 2016, unless otherwise indicated in specific text. *Supplements* to *USP* and *NF* are published periodically.

~~*Interim Revision Announcements* are revisions to *USP* and *NF* that are published on the *USP* website. *Interim Revision Announcements* contain official revisions and their effective dates. Announcements of the availability of new *USP* Reference Standards and announcements of tests or procedures that are held in abeyance pending availability of required *USP* Reference Standards are also available on the “New Official Text” tab of *USP*'s website.~~

▲ Accelerated Revisions, published periodically on the *Official Text* section of *USP*'s website (<http://www.usp.org/usp-nf/official-text>), are designed to make revisions official more quickly than through the routine process for publishing standards in the *USP–NF*. *Interim Revision Announcements* are Accelerated Revisions to *USP* and *NF* that contain official revisions and their effective dates. ▲USP39

~~*Revision Bulletins* are revisions to official text or postponements that require expedited publication. They are published on the *USP* website and generally are official immediately unless otherwise specified in the *Revision Bulletin*.~~

▲*Revision Bulletins* are Accelerated Revisions to official text or postponements that require expedited publication. They generally are official immediately unless otherwise specified in the *Revision Bulletin*. ▲*USP39*

~~*Errata* are corrections to items erroneously published that have not received the approval of the Council of Experts and that do not reflect the official requirements.~~

▲*Errata* are Accelerated Revisions representing corrections to items erroneously published. Announcements of the availability of new USP Reference Standards and announcements of tests or procedures that are held in abeyance pending availability of required USP Reference Standards are also available on the "Official Text" tab of USP's website. ▲*USP39*

Change to read:

2. OFFICIAL STATUS AND LEGAL RECOGNITION

2.10. Official Text

~~*Official text* is text contained in *USP* and *NF*, including monographs, general chapters, and these *General Notices*. Revisions to official text are provided in *Supplements*, *Interim Revision Announcements*, and *Revision Bulletins*. General chapters numbered from 1000 to 1999 are considered interpretive and are intended to provide information on, give definition to, or describe a particular subject. They contain no mandatory requirements applicable to any official article unless specifically referenced in *General Notices*, a monograph, or a general chapter numbered below 1000. General chapters numbered above 2000 apply only to articles that are intended for use as dietary ingredients and dietary supplements.~~

▲*Official text* of the *USP* and *NF*, is published in the *USP-NF Online* (www.uspnf.com) in the edition identified as "CURRENTLY OFFICIAL" and in Accelerated Revisions that supersede the *USP-NF Online* as described below. ▲*USP39*

▲Routine revisions are published in the *USP-NF Online* and become official on the date indicated, usually six months after publication. Accelerated Revisions supersede the *USP-NF Online* and become official on the date indicated. Links to Accelerated Revisions on the USP website can be found in any superseded monograph or general chapter in the *USP-NF Online*.

Print and USB flash drive versions of the *USP* and *NF* also are available. Routine revisions are provided with the same timing as the *USP-NF Online*. Official text published in *Supplements* supersedes that in the previously published print or USB flash drive versions of *USP-NF*. These versions also are superseded by Accelerated Revisions as described above.

In the event of any disparity between the print or USB flash drive versions and the *USP-NF Online*, the *USP-NF Online* will be deemed to apply.

General chapters numbered from 1000 to 1999 are considered interpretive and are intended to provide information on, give definition to, or describe a particular subject. They contain no mandatory requirements applicable to any official article unless specifically referenced in *General Notices and Requirements*, a monograph, or a general chapter numbered below 1000. General chapter citations in *NF* monographs refer to *USP* general chapters. General chapters

numbered above 2000 apply only to articles that are intended for use as dietary ingredients and dietary supplements.

▲USP39

2.20. Official Articles

An *official article* is an article that is recognized in *USP* or *NF*. An article is deemed to be recognized and included in a compendium when a monograph for the article is published in the compendium and an official date is generally or specifically assigned to the monograph.

The title specified in a monograph is the *official title* for such article. Other names considered to be synonyms of the official titles may not be used as substitutes for official titles.

Official articles include both *official substances* and *official products*. An *official substance* is a drug substance, excipient, dietary ingredient, other ingredient, or component of a finished device for which the monograph title includes no indication of the nature of the finished form.

An *official product* is a drug product, dietary supplement, compounded preparation, or finished device for which a monograph is provided.

2.30. Legal Recognition

The *USP* and *NF* are recognized in the laws and regulations of many countries throughout the world. Regulatory authorities may enforce the standards presented in the *USP* and *NF*, but because recognition of the *USP* and *NF* may vary by country, users should understand applicable laws and regulations.

In the United States under the Federal Food, Drug, and Cosmetic Act (FDCA), both *USP* and *NF* are recognized as official compendia. A drug with a name recognized in *USP-NF* must comply with compendial identity standards or be deemed adulterated, misbranded, or both. See, e.g., FDCA § 501(b) and 502(e)(3)(b); also FDA regulations, 21 CFR § 299.5(a&b). To avoid being deemed adulterated, such drugs must also comply with compendial standards for strength, quality, and purity, unless labeled to show all respects in which the drug differs. See, e.g., FDCA § 501(b) and 21 CFR § 299.5(c). In addition, to avoid being deemed misbranded, drugs recognized in *USP-NF* must also be packaged and labeled in compliance with compendial standards. See FDCA § 502(g).

A dietary supplement represented as conforming to specifications in *USP* will be deemed a misbranded food if it fails to so conform. See FDCA § 403(s)(2)(D).

Enforcement of *USP* standards is the responsibility of FDA and other government authorities in the U.S. and elsewhere. *USP* has no role in enforcement.

Change to read:

3. CONFORMANCE TO STANDARDS

3.10. Applicability of Standards

~~Standards for an article recognized in the compendia (*USP-NF*) are expressed in the article's monograph, applicable general chapters, and *General Notices*. Unless specifically exempted elsewhere in a compendium, the identity, strength, quality, and purity of an article are determined by the official tests, procedures, and acceptance criteria, whether incorporated in the monograph itself, in the *General Notices*, or in the applicable general chapters. Early adoption of revised standards is allowed. Where revised standards for an existing article have been published as final approved "official text" (as approved in section 2.10) but are not yet official (six months after publication, unless otherwise specified; see "official date," section 2.20), compliance with the revised standard shall not preclude a finding or indication of conformance with compendial standards, unless *USP* specifies otherwise by prohibiting early adoption in a particular standard.~~

▲Standards for an article recognized in the compendia (*USP–NF*) are expressed in the article's monograph, applicable general chapters, and *General Notices and Requirements*. The identity, strength, quality, and purity of an article are determined by the official tests, procedures, and acceptance criteria, whether incorporated in the monograph, in applicable general chapters, or in the *General Notices and Requirements*. Where the requirements of a monograph differ from the *General Notices and Requirements* or an applicable general chapter, the monograph requirements apply and supersede the requirements of the *General Notices and Requirements* or applicable general chapters, whether or not the monograph explicitly states the difference.

▲*USP39*

Early adoption of revised standards

▲in advance of the official date▲*USP39*

is allowed

▲by USP unless specified otherwise at the time of publication.▲*USP39*

Where revised standards for an existing article have been published as final approved "official text" (as approved in section 2.10) but ~~are not yet official~~

▲have not yet reached the official date▲*USP39*

(six months after publication, unless otherwise specified; see "official date," section 2.20), compliance with the revised standard shall not preclude a finding or indication of conformance with compendial standards, unless USP specifies otherwise by prohibiting early adoption in a particular standard.

~~The standards in the relevant monograph, general chapter(s), and *General Notices* apply at all times in the life of the article from production to expiration. The manufacturer's specifications, and good manufacturing practices generally (including, e.g., Quality by Design initiatives), are developed and followed to ensure that the article will comply with compendial standards until its expiration date, when stored as directed. Thus, any official article is expected to meet the compendial standards if tested, and any official article actually tested as directed in the relevant monograph must meet such standards to demonstrate compliance.~~

▲The standards in the relevant monograph, general chapter(s), and *General Notices and Requirements* apply at all times in the life of the article from production to expiration. It is also noted that the manufacturer's specifications, and manufacturing practices (e.g., Quality by Design, Process Analytical Technology, and Real Time Release Testing initiatives), generally are developed and followed to ensure that the article will comply with compendial standards until its expiration date, when stored as directed. Every compendial article in commerce shall be so constituted that when examined in accordance with these assays and test procedures, it meets all applicable pharmacopeial requirements (*General Notices and Requirements*, monographs, and general chapters). Thus, any official article is expected to meet the compendial standards if tested, and any official article actually tested as directed in the relevant monograph must meet such standards to demonstrate compliance.▲*USP39*

~~At times, compendial standards take on the character of statistical procedures, with multiple units involved and perhaps a sequential procedural design to allow the user to determine that the tested article meets or does not meet the standard. The similarity to statistical procedures may seem to suggest an intent to make inference to some larger group of units, but in all~~

~~cases, statements about whether the compendial standard is met apply only to the units tested.~~

▲Some tests, such as those for Dissolution and Uniformity of Dosage Units, require multiple dosage units in conjunction with a decision scheme. These tests, albeit using a number of dosage units, are in fact one determination. These procedures should not be confused with statistical sampling plans. ▲*USP39*

Repeats, replicates, statistical rejection of outliers, or extrapolations of results to larger populations, as well as the necessity and appropriate frequency of batch testing, are neither specified nor proscribed by the compendia;

▲such decisions are based on the objectives of the testing. ▲*USP39*

Frequency of testing and sampling are left to the preferences or direction of those performing compliance testing, and other users of *USP-NF*, including manufacturers, buyers, or regulatory authorities.

Official products are prepared according to recognized principles of good manufacturing practice and from ingredients that meet *USP* or *NF* standards, where standards for such ingredients exist (for dietary supplements, see section 3.10.20).

Official substances are prepared according to recognized principles of good manufacturing practice and from ingredients complying with specifications designed to ensure that the resultant substances meet the requirements of the compendial monographs.

3.10.10. Applicability of Standards to Drug Products, Drug Substances, and Excipients

The applicable *USP* or *NF* standard applies to any article marketed in the United States that (1) is recognized in the compendium and (2) is intended or labeled for use as a drug or as an ingredient in a drug. Such articles (drug products, drug substances, and excipients) include both human drugs (whether dispensed by prescription, "over the counter," or otherwise), as well as animal drugs. The applicable standard applies to such articles whether or not the added designation "USP" or "NF" is used. The standards apply equally to articles bearing the official titles or names derived by transposition of the definitive words of official titles or transposition in the order of the names of two or more active ingredients in official titles, or where there is use of synonyms with the intent or effect of suggesting a significant degree of identity with the official title or name.

3.10.20. Applicability of Standards to Medical Devices, Dietary Supplements, and Their Components and Ingredients

An article recognized in *USP* or *NF* shall comply with the compendial standards if the article is a medical device, component intended for a medical device, dietary supplement, dietary ingredient, or other ingredient that is intended for incorporation into a dietary supplement, and is labeled as conforming to the *USP* or *NF*.

Generally, dietary supplements are prepared from ingredients that meet *USP*, *NF*, or *Food Chemicals Codex* standards. Where such standards do not exist, substances may be used in dietary supplements if they have been shown to be of acceptable food grade quality using other suitable procedures.

3.20. Indicating Conformance

A drug product, drug substance, or excipient may use the designation "USP" or "NF" in conjunction with its official title or elsewhere on the label only when (1) a monograph is provided in the specified compendium and (2) the article complies with the identity prescribed in the specified compendium.

When a drug product, drug substance,

▲compounded preparation, ▲*USP39*

or excipient differs from the relevant *USP* or *NF* standard of strength, quality, or purity, as determined by the application of the tests, procedures, and acceptance criteria set forth in the relevant compendium, its difference shall be plainly stated on its label.

When a drug product, drug substance,

▲compounded preparation, ▲*USP39*

or excipient fails to comply with the identity prescribed in *USP* or *NF* or contains an added substance that interferes with the prescribed tests and procedures, the article shall be designated by a name that is clearly distinguishing and differentiating from any name recognized in *USP* or *NF*.

A medical device, dietary supplement, or ingredient or component of a medical device or dietary supplement may use the designation "USP" or "NF" in conjunction with its official title or elsewhere on the label only when (1) a monograph is provided in the specified compendium and (2) the article complies with the monograph standards and other applicable standards in the compendium.

The designation "USP" or "NF" on the label may not and does not constitute an endorsement by USP and does not represent assurance by USP that the article is known to comply with the relevant standards. USP may seek legal redress if an article purports to be or is represented as an official article in one of USP's compendia and such claim is determined by USP not to be made in good faith.

The designation "USP-NF" may be used on the label of an article provided that the label also bears a statement such as "Meets *NF* standards as published by USP," indicating the particular compendium to which the article purports to apply.

When the letters "USP," "NF," or "USP-NF" are used on the label of an article to indicate compliance with compendial standards, the letters shall appear in conjunction with the official title of the article. The letters are not to be enclosed in any symbol such as a circle, square, etc., and shall appear in capital letters.

If a dietary supplement does not comply with all applicable compendial requirements but contains one or more dietary ingredients or other ingredients that are recognized in *USP* or *NF*, the individual ingredient(s) may be designated as complying with *USP* or *NF* standards or being of *USP* or *NF* quality provided that the designation is limited to the individual ingredient(s) and does not suggest that the dietary supplement complies with *USP* standards.

Change to read:

4. MONOGRAPHS AND GENERAL CHAPTERS

4.10. Monographs

Monographs set forth the article's name, definition, specification, and other requirements related to packaging, storage, and labeling. The specification consists of tests, procedures, and acceptance criteria that help ensure the identity, strength, quality, and purity of the article. For general requirements relating to specific monograph sections, see section 5, *Monograph Components*.

Because monographs may not provide standards for all relevant characteristics, some official substances may conform to the *USP* or *NF* standard but differ with regard to nonstandardized properties that are relevant to their use in specific preparations. To assure interchangeability

▲substitutability ▲*USP39*

in such instances, users may wish to ascertain functional equivalence or determine such characteristics before use.

4.10.10. Applicability of Test Procedures

~~A single monograph may include several different tests, procedures, and/or acceptance criteria that reflect attributes of different manufacturers' articles. Such alternatives may be presented for different polymorphic forms, impurities, hydrates, and dissolution cases. Monographs indicate the tests, procedures, and/or acceptance criteria to be used and the required labeling.~~

▲A single monograph may include more than one test, procedure, and/or acceptance criterion for the same attribute. Unless otherwise specified in the monograph, all tests are requirements. In some cases, monograph instructions allow the selection of tests that reflect attributes of different manufacturers' articles, such as different polymorphic forms, impurities, hydrates, and dissolution. Monograph instructions indicate the tests, procedures, and/or acceptance criteria to be used and the required labeling. ▲USP39

~~A test in a monograph may contain and require multiple procedures. However, multiple procedures may be included in particular monographs specifically for the purpose of assuring the availability of an appropriate procedure for a particular product. In such cases, a labeling statement to indicate the appropriate application of the procedure(s) will be included in the monograph. A labeling statement is not required if Test 1 is used.~~

▲▲USP39

4.10.11. Dissolution, Disintegration, and Drug Release Tests

▲▲USP39

~~Multiple Dissolution, Disintegration, or Drug Release tests may be present in the monograph.~~

▲▲USP39

The order in which the tests are listed in the monograph is based on the order in which they are approved by the relevant Expert Committee for inclusion in the monograph. Test 1 is not necessarily the test for the innovator or for the reference product. ~~Compliance with any of the tests does not assure bioequivalence or bioavailability.~~

▲Depending on monograph instructions, a labeling statement is not typically required if Test 1 is used. ▲USP39

4.10.20. Acceptance Criteria

The acceptance criteria allow for analytical error, for unavoidable variations in manufacturing and compounding, and for deterioration to an extent considered acceptable under practical conditions. The existence of compendial acceptance criteria does not constitute a basis for a claim that an official substance that more nearly approaches 100 percent purity "exceeds" compendial quality. Similarly, the fact that an article has been prepared to tighter criteria than those specified in the monograph does not constitute a basis for a claim that the article "exceeds" the compendial requirements.

An official product shall be formulated with the intent to provide 100 percent of the quantity of each ingredient declared on the label. Where the minimum amount of a substance present in a

dietary supplement is required by law to be higher than the lower acceptance criterion allowed for in the monograph, the upper acceptance criterion contained in the monograph may be increased by a corresponding amount.

The acceptance criteria specified in individual monographs and in the general chapters for compounded preparations are based on such attributes of quality as might be expected to characterize an article compounded from suitable bulk drug substances and ingredients, using the procedures provided or recognized principles of good compounding practice, as described in these compendia.

4.20. General Chapters

Each general chapter is assigned a number that appears in angle brackets adjacent to the chapter name (e.g., *Chromatography* 〈621〉). General chapters may contain the following:

- Descriptions of tests and procedures for application through individual monographs,
- Descriptions and specifications of conditions and practices for pharmaceutical compounding,
- General information for the interpretation of the compendial requirements,
- Descriptions of general pharmaceutical storage, dispensing, and packaging practices, or
- General guidance to manufacturers of official substances or official products.

When a general chapter is referenced in a monograph, acceptance criteria may be presented after a colon.

Some chapters may serve as introductory overviews of a test or of analytical techniques. They may reference other general chapters that contain techniques, details of the procedures, and, at times, acceptance criteria.

Change to read:

5. MONOGRAPH COMPONENTS

5.10. Molecular Formula

The use of the molecular formula for the active ingredient(s) named in defining the required strength of a compendial article is intended to designate the chemical entity or entities, as given in the complete chemical name of the article, having absolute (100 percent) purity.

5.20. Added Substances

Added substances are presumed to be unsuitable for inclusion in an official article and therefore prohibited, if ~~:(1) they exceed the minimum quantity required for providing their intended effect;~~ ~~(2)~~

▲▲USP39

their presence impairs the bioavailability, therapeutic efficacy, or safety of the official article; or ~~(3)~~

▲▲USP39

they interfere with the assays and tests prescribed for determining compliance with the compendial standards

▲(see 3.20 *Indicating Conformance*).▲USP39

The air in a container of an official article may, where appropriate, be evacuated or be replaced by carbon dioxide, helium, argon, or nitrogen, or by a mixture of these gases. The use of such gas need not be declared in the labeling.

5.20.10. Added Substances, ~~Excipients, and Ingredients~~

▲▲USP39

in Official Substances

Official substances may contain only the specific added substances that are permitted by the individual monograph.

▲Such added substances shall not exceed the quantity required for providing their intended effect. ▲USP39

Where such addition is permitted, the label shall indicate the name(s) and amount(s) of any added substance(s).

5.20.20. Added Substances, ~~Excipients, and Ingredients~~

▲(Excipients and Ingredients) ▲USP39

in Official Products

Suitable substances and excipients such as antimicrobial agents, pharmaceutical bases, carriers, coatings, flavors, preservatives, stabilizers, and vehicles may be added to an official product to enhance its stability, usefulness, or elegance, or to facilitate its preparation, unless otherwise specified in the individual monograph.

Added substances and excipients employed solely to impart color may be incorporated into official products other than those intended for parenteral or ophthalmic use, in accordance with the regulations pertaining to the use of colors issued by the U.S. Food and Drug Administration (FDA), provided such added substances or excipients are otherwise appropriate in all respects. (See also *Added Substances under Injections and Implanted Drug Products (Parenterals)*—

Product Quality Tests { 1 } .)

The proportions of the substances constituting the base in ointment and suppository products and preparations may be varied to maintain a suitable consistency under different climatic conditions, provided that the concentrations of active ingredients are not varied and provided that the bioavailability, therapeutic efficacy, and safety of the preparation are not impaired.

5.20.20.1. In Compounded Preparations

Compounded preparations for which a complete composition is given shall contain only the ingredients named in the formulas unless specifically exempted herein or in the individual monograph. Deviation from the specified processes or methods of compounding, although not from the ingredients or proportions thereof, may occur provided that the finished preparation conforms to the relevant standards and to preparations produced by following the specified process.

Where a monograph for a compounded preparation calls for an ingredient in an amount expressed on the dried basis, the ingredient need not be dried before use if due allowance is made for the water or other volatile substances present in the quantity taken.

Specially denatured alcohol formulas are available for use in accordance with federal statutes and regulations of the Internal Revenue Service. A suitable formula of specially denatured alcohol may be substituted for Alcohol in the manufacture of official preparations intended for internal or topical use, provided that the denaturant is volatile and does not remain in the finished product. A preparation that is intended for topical application to the skin may contain specially denatured alcohol, provided that the denaturant is either a usual ingredient in the preparation or a permissible added substance; in either case the denaturant shall be identified on the label of the topical preparation. Where a process is given in the individual monograph, any preparation compounded using denatured alcohol shall be identical to that prepared by the

monograph process.

5.20.20.2. In Dietary Supplements

Additional ingredients may be added to dietary supplement products provided that the additional ingredients: (1) comply with applicable regulatory requirements; and (2) do not interfere with the assays and tests prescribed for determining compliance with compendial standards.

5.30. Description and Solubility

Only where a quantitative solubility test is given in a monograph and is designated as such is it a test for purity.

A monograph may include information regarding the article's description. Information about an article's "description and solubility" also is provided in the reference table *Description and Relative Solubility of USP and NF Articles*. The reference table merely denotes the properties of articles that comply with monograph standards. The reference table is intended primarily for those who use, prepare, and dispense drugs and/or related articles. Although the information provided in monographs and the information in the reference table may indirectly assist in the preliminary evaluation of an article, it is not intended to serve as a standard or test for purity. The approximate solubility of a compendial substance is indicated by one of the following descriptive terms:

Descriptive Term	Parts of Solvent Required for 1 Part of Solute
Very soluble	Less than 1
Freely soluble	From 1 to 10
Soluble	From 10 to 30
Sparingly soluble	From 30 to 100
Slightly soluble	From 100 to 1,000
Very slightly soluble	From 1,000 to 10,000
Practically insoluble, or Insoluble	Greater than or equal to 10,000

5.40. Identity

A compendial test titled *Identity* or *Identification* is provided as an aid in verifying the identity of articles as they are purported to be, e.g., those taken from labeled containers, and to establish whether it is the article named in *USP-NF*. The *Identity* or *Identification* test for a particular article may consist of one or more procedures. When a compendial test for *Identity* or *Identification* is undertaken, all requirements of all specified procedures in the test must be met to satisfy the requirements of the test. Failure of an article to meet all the requirements of a prescribed *Identity* or *Identification* test (i.e., failure to meet the requirements of all of the specified procedures that are components of that test) indicates that the article is mislabeled and/or adulterated.

5.50. Assay

Assay tests for compounded preparations are not intended for evaluating a compounded preparation before dispensing, but instead are intended to serve as the official test in the event of a question or dispute regarding the preparation's conformance to official standards.

5.50.10. Units of Potency (Biological)

For substances that cannot be completely characterized by chemical and physical means, it

~~may be necessary to express quantities of activity in biological units of potency, each defined by an authoritative, designated reference standard.~~

▲or physical means or that need confirmation of functionality or tertiary structure, it may be necessary to express quantities of biological activity in units of biological potency, each defined by an authoritative, designated reference standard. In cases where international reference materials have been discontinued, international units of potency may be defined in terms of molecular mass, such as in the cases of vitamins A, D, and E. ▲*USP39*

~~Units of biological potency defined by the World Health Organization (WHO) for International Biological Standards and International Biological Reference Preparations are termed International Units (IU). Monographs refer to the units defined by USP Reference Standards as "USP Units." For biological products, units of potency are defined by the corresponding U.S. Standard established by FDA, whether or not International Units or USP Units have been defined (see *Biologics* ~~(1041)~~).~~

▲Where available, World Health Organization (WHO) international biological standards define the International Units (IU). *USP* monographs refer to the units assigned by USP Reference Standards either directly as International Units (IU) or as "USP Units." For some biological products, units of potency are value assigned against a corresponding U.S. Standard established by FDA, whether or not International Units or USP Units have been defined (see *Biologics* ~~(1041)~~). Note that product-related labeling, e.g., on containers, need not use the full phrase "USP [product name] Units" that appears in many *USP* monograph labeling sections. The term "USP units" can be used on product labeling consistent with USP compendial requirements, provided it is clear from the context that the volume is stated in terms of USP [product name] Units. In such circumstances it should be clear that "USP Units" and "USP [product name] Units" share the same meaning. ▲*USP39*

5.60. Impurities and Foreign Substances

Tests for the presence of impurities and foreign substances are provided to limit such substances to amounts that are unobjectionable under conditions in which the article is customarily employed (see also *Impurities in Drug Substances and Drug Products* ~~(1086)~~). Nonmonograph tests and acceptance criteria suitable for detecting and controlling impurities that may result from a change in the processing methods or that may be introduced from external sources should be employed in addition to the tests provided in the individual monograph, where the presence of the impurity is inconsistent with applicable good manufacturing practices or good pharmaceutical practice.

5.60.10. Other Impurities in *USP* and *NF* Articles

If a *USP* or *NF* monograph includes an assay or organic impurity test based on chromatography, other than a test for residual solvents, and that monograph procedure does not detect an impurity present in the substance, the amount and identity of the impurity, where both are known, shall be stated in the labeling (certificate of analysis) of the official substance, under the heading *Other Impurity(ies)*.

The presence of any unlabeled other impurity in an official substance is a variance from the standard if the content is 0.1% or greater. The sum of all *Other Impurities* combined with the

monograph-detected impurities may not exceed 2.0% (see *Ordinary Impurities* 〈 466 〉), unless otherwise stated in the monograph.

The following categories of drug substances are excluded from *Other Impurities* requirements:

- Fermentation products and semi-synthetics derived therefrom,
- Radiopharmaceuticals,
- Biologics,
- Biotechnology-derived products,
- Peptides,
- Herbals, and
- Crude products of animal or plant origin.

Any substance known to be toxic shall not be listed under *Other Impurities*.

5.60.20. Residual Solvents in USP and NF Articles

All *USP* and *NF* articles are subject to relevant control of residual solvents, even when no test is specified in the individual monograph. If solvents are used during production, they must be of suitable quality. In addition, the toxicity and residual level of each solvent shall be taken into consideration, and the solvents limited according to the principles defined and the requirements specified in *Residual Solvents* 〈 467 〉, using the general methods presented therein or other suitable methods.

5.60.30 Elemental Impurities in USP Drug Products and Dietary Supplements

[Note—General chapter 〈 232 〉 was published June 1, 2012, in the *Second Supplement to USP 35–NF 30* and became official on February 1, 2013. General chapter 〈 2232 〉 was published February 1, 2013, in the *First Supplement to USP 36–NF 31* and became official on August 1, 2013. The date of their applicability to articles recognized in *USP–NF*, however, is December 1, 2015, the date on which this *General Notices* provision becomes official.]

Elemental impurities are controlled in official drug products according to the principles defined and requirements specified in *Elemental Impurities—Limits* 〈 232 〉. Also see 〈 232 〉 for information related to drug substances and excipients. Elemental contaminants are controlled in official dietary supplements according to the principles defined and requirements specified in *Elemental Contaminants in Dietary Supplements* 〈 2232 〉.
(Official December 1, 2015)

5.70. Performance Tests

Where content uniformity determinations have been made using the same analytical methodology specified in the *Assay*, with appropriate allowances made for differences in sample preparation, the average of all of the individual content uniformity determinations may be used as the *Assay* value.

5.80. USP Reference Standards

USP Reference Standards are authentic specimens that have been approved as suitable for use as comparison standards in *USP* or *NF* tests and assays. (See *USP Reference Standards* 〈 11 〉.) Where *USP* or *NF* tests or assays call for the use of a *USP Reference Standard*, only those results obtained using the specified *USP Reference Standard* are conclusive. Where a procedure calls for the use of a compendial article rather than for a *USP Reference Standard* as a material standard of reference, a substance meeting all of the compendial monograph requirements for

that article shall be used. If any new *USP* or *NF* standard requires the use of a new *USP* Reference Standard that is not yet available, that portion of the standard containing the requirement shall not be official until the specified *USP* reference material is available. Unless a reference standard label bears a specific potency or content, assume the reference standard is 100.0% pure in the official application. Unless otherwise directed in the procedure in the individual monograph or in a general chapter, *USP* Reference Standards are to be used in accordance with the instructions on the label of the Reference Standard.

Change to read:

6. TESTING PRACTICES AND PROCEDURES

6.10. Safe Laboratory Practices

In performing compendial procedures, safe laboratory practices shall be followed, including precautionary measures, protective equipment, and work practices consistent with the chemicals and procedures used. Before undertaking any procedure described in the compendia, the analyst should be aware of the hazards associated with the chemicals and the techniques and means of protecting against them. These compendia are not designed to describe such hazards or protective measures.

6.20. Automated Procedures

Automated and manual procedures employing the same basic chemistry are considered equivalent.

6.30. Alternative and Harmonized Methods and Procedures

Alternative methods and/or procedures may be used if they provide advantages in terms of accuracy, sensitivity, precision, selectivity, or adaptability to automation or computerized data reduction, or in other special circumstances. Such alternative procedures and methods shall be validated as described in the general chapter *Validation of Compendial Procedures* (1225) and must be shown to give equivalent or better results. Only those results obtained by the methods and procedures given in the compendium are conclusive.

Alternative procedures should be submitted to *USP* for evaluation as a potential replacement or addition to the standard (see section 4.10, *Monographs*).

Certain general chapters contain a statement that the text in question is harmonized with the corresponding text of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia* and that these texts are interchangeable. Therefore, if a substance or preparation is found to comply with a requirement using an interchangeable method or procedure from one of these pharmacopoeias, it should comply with the requirements of the *USP*. When a difference appears, or in the event of dispute, only the result obtained by the method and/or procedure given in the *USP* is conclusive.

6.40. Dried, Anhydrous, Ignited, or Solvent-Free Basis

All calculations in the compendia assume an "as-is" basis unless otherwise specified.

Test procedures may be performed on the undried or unignited substance and the results calculated on the dried, anhydrous, or ignited basis, provided a test for *Loss on Drying*, or *Water Determination*, or *Loss on Ignition*, respectively, is given in the monograph. Where the presence of moisture or other volatile material may interfere with the procedure, previous drying of the substance is specified in the individual monograph and is obligatory.

The term "solvent-free" signifies that the calculation shall be corrected for the presence of known solvents as determined using the methods described in *Residual Solvents* (467) unless

a test for limit of organic solvents is provided in the monograph.

The term "previously dried" without qualification signifies that the substance shall be dried as directed under *Loss on Drying* 〈 731 〉 or *Water Determination* 〈 921 〉 (gravimetric determination).

Where drying in vacuum over a desiccant is directed, a vacuum desiccator, a vacuum drying pistol, or other suitable vacuum drying apparatus shall be used.

6.40.10. Ignite to Constant Weight

"Ignite to constant weight" means that ignition shall be continued at $800 \pm 25^{\circ}$, unless otherwise indicated, until two consecutive weighings, the second of which is taken after an additional period appropriate to the nature and quantity of the residue, do not differ by more than 0.50 mg per g of substance taken.

6.40.20. Dried to Constant Weight

"Dried to constant weight" means that drying shall be continued until two consecutive weighings, the second of which is taken after an additional drying period appropriate to the nature and quantity of the residue, do not differ by more than 0.50 mg per g of substance taken.

6.50. Preparation of Solutions

6.50.10. Filtration

Where a procedure gives direction to "filter" without further qualification, the liquid shall be passed through suitable filter paper or equivalent device until the filtrate is clear. Due to the possibility of filter effects, the initial volumes of a filtrate may be discarded.

6.50.20. Solutions

Unless otherwise specified, all solutions shall be prepared with Purified Water. Solutions for quantitative measures shall be prepared using accurately weighed or accurately measured analytes (see section 8.20, *About*).

An expression such as "(1 in 10)" means that 1 part *by volume* of a liquid shall be diluted with, or 1 part *by weight* of a solid shall be dissolved in, (ERR 1-Aug-2014)

a sufficient quantity of the diluent or solvent to make the volume of the finished solution 10 parts *by volume*. An expression such as "(20:5:2)" means that the respective numbers of parts, by volume, of the designated liquids shall be mixed, unless otherwise indicated.

6.50.20.1. Adjustments to Solutions

When a specified concentration is called for in a procedure, a solution of other normality or molarity may be used, provided that allowance is made for the difference in concentration and that the change does not increase the error of measurement.

Proportionately larger or smaller quantities than the specified weights and volumes of assay or test substances and Reference Standards may be taken, provided the measurement is made with at least equivalent accuracy.

Unless otherwise indicated, analyte concentrations shall be prepared to within ten percent (10%) of the indicated value. In the special

▲▲USP39

case in which a procedure is adapted to the working range of an instrument, solution concentrations may differ from the indicated value by more than ten percent (10%), with

appropriate changes in associated calculations. Any changes shall fall within the validated range of the instrument.

When adjustment of pH is indicated with either an acid or base and the concentration is not indicated, appropriate concentrations of that acid or base may be used.

6.50.20.2. Test Solutions

Information on Test Solutions (TS) is provided in the *Test Solutions* portion of the *Reagents, Indicators, and Solutions* section of the *USP-NF*. Use of an alternative Test Solution or a change in the Test Solution used may require validation.

6.50.20.3. Indicator Solutions

Where a procedure specifies the use of an indicator TS, approximately 0.2 mL, or 3 drops, of the solution shall be added unless otherwise directed.

6.60. Units Necessary to Complete a Test

Unless otherwise specified, a sufficient number of units to ensure a suitable analytical result shall be taken.

6.60.10. Tablets

Where the procedure of a Tablet monograph directs to weigh and finely powder not fewer than a given number of Tablets, a counted number of Tablets shall be weighed and reduced to a powder. The portion of the powdered Tablets taken shall be representative of the whole Tablets and shall, in turn, be weighed accurately.

6.60.20. Capsules

Where the procedure of a Capsule monograph gives direction to remove, as completely as possible, the contents of not fewer than a given number of the Capsules, a counted number of Capsules shall be carefully opened and the contents quantitatively removed, combined, mixed, and weighed accurately. The portion of mixed Capsules contents taken shall be representative of the contents of the Capsules and shall, in turn, be weighed accurately.

6.70. Reagents

The proper conduct of the compendial procedures and the reliability of the results depend, in part, upon the quality of the reagents used in the performance of the procedures. Unless otherwise specified, reagents conforming to the specifications set forth in the current edition of *Reagent Chemicals* published by the American Chemical Society (ACS) shall be used. Where such ACS reagent specifications are not available or where the required purity differs, compendial specifications for reagents of acceptable quality are provided (see the *Reagents, Indicators, and Solutions* section of the *USP-NF*). Reagents not covered by any of these specifications should be of a grade suitable to the proper performance of the method of assay or test involved.

Listing of these reagents, including the indicators and solutions employed as reagents, in no way implies that they have therapeutic utility; furthermore, any reference to *USP* or *NF* in their labeling shall include also the term "reagent" or "reagent grade." *USP* may supply reagents if they otherwise may not be generally commercially available.

6.80. Equipment

Unless otherwise specified, a specification for a definite size or type of container or apparatus in a procedure is given solely as a recommendation. Other dimensions or types may be used if they are suitable for the intended use.

6.80.10. Apparatus for Measurement

Where volumetric flasks or other exact measuring, weighing, or sorting devices are specified, this or other equipment of at least equivalent accuracy shall be employed.

6.80.10.1. Pipet/Pipette

Where a pipet/pipette is specified, a suitable buret may be substituted. Where a "to contain" pipet/pipette is specified, a suitable volumetric flask may be substituted.

6.80.10.2. Light Protection

Where low-actinic or light-resistant containers are specified, either containers specially treated to protect contents from light or clear containers that have been rendered opaque by application of a suitable coating or wrapping may be used.

6.80.20. Instrumental Apparatus

An instrument may be substituted for the specified instrument if the substitute uses the same fundamental principles of operation and is of equivalent or greater sensitivity and accuracy. These characteristics shall be qualified as appropriate. Where a particular brand or source of a material, instrument, or piece of equipment, or the name and address of a manufacturer or distributor, is mentioned (ordinarily in a footnote), this identification is furnished solely for informational purposes as a matter of convenience, without implication of approval, endorsement, or certification.

6.80.20.1. Chromatographic Tubes and Columns

The term "diameter" refers to internal diameter (ID).

6.80.20.2. Tubing

The term "diameter" refers to outside diameter (OD).

6.80.20.3. Steam Bath

Where use of a steam bath is directed, use actively flowing steam or another regulated heat source controlled at an equivalent temperature.

6.80.20.4. Water Bath

A water bath requires vigorously boiling water unless otherwise specified.

6.80.30. Temperature Reading Devices

Temperature reading devices suitable for Pharmacopeial tests conform to specifications that are traceable to an NIST standard or equivalent. Temperature reading devices may be of the liquid-in-glass type or an analog or digital temperature indicator type, such as a resistance temperature device, thermistor, or thermocouple. Standardization of thermometers is performed on an established testing frequency with a temperature standard traceable to NIST. For example, refer to the current issue of ASTM standards E1 for liquid-in-glass thermometers.

7. TEST RESULTS**7.10. Interpretation of Requirements**

Analytical results observed in the laboratory (or calculated from experimental measurements) are compared with stated acceptance criteria to determine whether the article conforms to compendial requirements.

The reportable value, which often is a summary value for several individual determinations, is compared with the acceptance criteria. The reportable value is the end result of a completed measurement procedure, as documented.

Where acceptance criteria are expressed numerically herein through specification of an upper and/or lower limit, permitted values include the specified values themselves, but no values outside the limit(s). Acceptance criteria are considered significant to the last digit shown.

7.10.5. Nominal Concentrations in Equations

Where a "nominal concentration" is specified, calculate the concentration based on the label claim. In assay procedures, water correction is typically stated in the Definition and on the label of the USP Reference Standard. For other procedures, correction for assayed content, potency, or both is made prior to using the concentration in the equation provided in the monograph.

7.10.10. Equivalence Statements in Titrimetric Procedures

The directions for titrimetric procedures conclude with a statement of the weight of the analyte that is equivalent to each mL of the standardized titrant. In such an equivalence statement, the number of significant figures in the concentration of the titrant should be understood to correspond to the number of significant figures in the weight of the analyte. Corrections to calculations based on the blank determination are to be made for all titrimetric assays where appropriate (see *Titrimetry* 〈 541 〉).

7.20. Rounding Rules

The observed or calculated values shall be rounded off to the number of decimal places that is in agreement with the limit expression. Numbers should not be rounded until the final calculations for the reportable value have been completed. Intermediate calculations (e.g., slope for linearity) may be rounded for reporting purposes, but the original (not rounded) value should be used for any additional required calculations. Acceptance criteria are fixed numbers and are not rounded.

When rounding is required, consider only one digit in the decimal place to the right of the last place in the limit expression. If this digit is smaller than 5, it is eliminated and the preceding digit is unchanged. If this digit is equal to or greater than 5, it is eliminated and the preceding digit is increased by 1.

Illustration of Rounding Numerical Values for Comparison with Requirements			
Compendial Requirement	Unrounded Value	Rounded Result	Conforms
Assay limit \geq 98.0%	97.96%	98.0%	Yes
	97.92%	97.9%	No
	97.95%	98.0%	Yes
Assay limit \leq 101.5%	101.55%	101.6%	No
	101.46%	101.5%	Yes
	101.45%	101.5%	Yes
Limit test \leq 0.02%	0.025%	0.03%	No
	0.015%	0.02%	Yes
	0.027%	0.03%	No
Limit test \leq 3 ppm	3.5 ppm	4 ppm	No
	3.4 ppm	3 ppm	Yes
	2.5 ppm	3 ppm	Yes

Change to read:**8. TERMS AND DEFINITIONS****8.10. Abbreviations**

- RS refers to a USP Reference Standard.
- CS refers to a Colorimetric Solution.
- TS refers to a Test Solution.
- VS refers to a Volumetric Solution that is standardized in accordance with directions given in the individual monograph or in the *Reagents, Indicators, and Solutions* section of *USP-NF*.

8.20. About

"About" indicates a quantity within 10%.

If the measurement is stated to be "accurately measured" or "accurately weighed," follow the statements in the general chapters *Volumetric Apparatus* 〈 31 〉 and *Balances* 〈 41 〉, respectively.

8.30. Alcohol Content

Percentages of alcohol, such as those under the heading *Alcohol Content*, refer to percentage by volume of C₂H₅OH at 15.56°. Where a formula, test, or assay calls for alcohol, ethyl alcohol, or ethanol, the *USP* monograph article Alcohol shall be used. Where reference is made to "C₂H₅OH," absolute (100 percent) ethanol is intended. Where a procedure calls for dehydrated alcohol, alcohol absolute, or anhydrous alcohol, the *USP* monograph article Dehydrated Alcohol shall be used.

8.40. Atomic Weights

Atomic weights used in computing molecular weights and the factors in the assays and elsewhere are those established by the IUPAC Commission on Atomic Weights and Isotopic Abundances.

8.50. Blank Determinations

Where it is directed that "any necessary correction" be made by a blank determination, the determination shall be conducted using the same quantities of the same reagents treated in the same manner as the solution or mixture containing the portion of the substance under assay or test, but with the substance itself omitted.

8.60. Concomitantly

"Concomitantly" denotes that the determinations or measurements are to be performed in immediate succession.

8.70. Desiccator

The instruction "in a desiccator" indicates use of a tightly closed container of suitable size and design that maintains an atmosphere of low moisture content by means of a suitable desiccant such as anhydrous calcium chloride, magnesium perchlorate, phosphorus pentoxide, or silica gel. See also section 8.220, *Vacuum Desiccator*.

8.80. Logarithms

Logarithms are to the base 10.

8.90. Microbial Strain

A microbial strain cited and identified by its ATCC catalog number shall be used directly or, if

subcultured, shall be used not more than five passages removed from the original strain.

8.100. Negligible

"Negligible" indicates a quantity not exceeding 0.50 mg.

8.110. NLT/NMT

"NLT" means "not less than." "NMT" means "not more than."

8.120. Odor

"Odorless," "practically odorless," "a faint characteristic odor," and variations thereof indicate evaluation of a suitable quantity of freshly opened material after exposure to the air for 15 minutes. An odor designation is descriptive only and should not be regarded as a standard of purity for a particular lot of an article.

8.130. Percent

"Percent" used without qualification means:

- For mixtures of solids and semisolids, percent weight in weight;
- For solutions or suspensions of solids in liquids, percent weight in volume;
- For solutions of liquids in liquids, percent volume in volume;
- For solutions of gases in liquids, percent weight in volume.

For example, a 1 percent solution is prepared by dissolving 1 g of a solid or semisolid, or 1 mL of a liquid, in sufficient solvent to make 100 mL of the solution.

8.140. Percentage Concentrations

Percentage concentrations are expressed as follows:

- *Percent Weight in Weight (w/w)* is defined as the number of g of a solute in 100 g of solution.
- *Percent Weight in Volume (w/v)* is defined as number of g of a solute in 100 mL of solution.
- *Percent Volume in Volume (v/v)* is defined as the number of mL of a solute in 100 mL of solution.

8.150. Pressure

Pressure is determined by use of a suitable manometer or barometer calibrated in terms of the pressure exerted by a column of mercury of the stated height.

8.160. Reaction Time

Reaction time is 5 minutes unless otherwise specified.

8.170. Specific Gravity

Specific gravity is the weight of a substance in air at 25^o divided by the weight of an equal volume of water at the same temperature.

8.180. Temperatures

Temperatures are expressed in centigrade (Celsius) degrees, and all measurements are made at 25^o unless otherwise indicated. Where moderate heat is specified, any temperature not higher than 45^o (113^o F) is indicated.

8.190. Time

Unless otherwise specified, rounding rules, as described in section 7.20, *Rounding Rules*, apply

to any time specified.

8.200. Transfer

"Transfer" indicates a quantitative manipulation.

8.210. Vacuum

"Vacuum" denotes exposure to a pressure of less than 20 mm of mercury (2.67 kPas), unless otherwise indicated.

8.220. Vacuum Desiccator

"Vacuum desiccator" indicates a desiccator that maintains a low-moisture atmosphere at a reduced pressure of not more than 20 mm of mercury (2.67 kPas) or at the pressure designated in the individual monograph.

8.230. Water

8.230.10. Water as an Ingredient in an Official Product

As an ingredient in an official product, water meets the requirements of the appropriate water monograph in *USP* or *NF*.

8.230.20. Water in the Manufacture of Official Substances

When used in the manufacture of official substances, water ~~may meet the requirements for drinking water as set forth in the regulations of the U.S. Environmental Protection Agency (potable water).~~

▲shall meet the requirements for drinking water as set forth in the U.S. Environmental Protection Agency National Primary Drinking Water Regulations or in the drinking water regulations of the European Union or of Japan, or in the World Health Organization's Guidelines for Drinking Water Quality. Additional specifications may be required in monographs.▲*USP39*

8.230.30. Water in a Compendial Procedure

When water is called for in a compendial procedure, the USP article Purified Water shall be used unless otherwise specified. Definitions for ~~High-Purity Water and Carbon Dioxide-Free Water~~ are provided in ~~Containers—Glass <660>~~. Definitions of other types of water are provided in ~~Water for Pharmaceutical Purposes <1231>~~.

▲other types of water are provided in *Reagents, Indicators, and Solutions* and in *Water for Pharmaceutical Purposes <1231>*.▲*USP39*

8.240. Weights and Measures

In general, weights and measures are expressed in the International System of Units (SI) as established and revised by the *Conférence générale des poids et mesures*. For compendial purposes, the term "weight" is considered to be synonymous with "mass."

Molality is designated by the symbol *m* preceded by a number that represents the number of moles of the designated solute contained in 1 kilogram of the designated solvent.

Molarity is designated by the symbol *M* preceded by a number that represents the number of moles of the designated solute contained in an amount of the designated solvent that is

sufficient to prepare 1 liter of solution.

Normality is designated by the symbol N preceded by a number that represents the number of equivalents of the designated solute contained in an amount of the designated solvent that is sufficient to prepare 1 liter of solution.

▲The symbol for degrees ($^{\circ}$) without a qualifying unit of measure represents degrees Celsius.

▲USP39

Chart of Symbols and Prefixes commonly employed for SI metric units and other units:

	Units	Symbol	Notes
Length			
	meter	m	
	centimeter	cm	
	millimeter	mm	
	micrometer	μm	Previously referred to as a micron
	nanometer	nm	Previously the symbol $\text{m}\mu$ (for millimicron) was used
	Ångström	Å	Equal to 0.1 nm
Mass			
	kilogram	kg	
	gram	g	
	milligram	mg	
	microgram	μg	The symbol μg is used in the <i>USP</i> and <i>NF</i> to represent micrograms, but micrograms may be represented as "mcg" for labeling and prescribing purposes. The term "gamma," symbolized by γ , frequently is used to represent micrograms in biochemical literature.
	nanogram	ng	
	picogram	pg	
	dalton	Da	Also referred to as the unified atomic mass unit and is equal to 1/12 times the mass of the free carbon 12 atom.
	kilodalton	kDa	
Time			
	second	s	
	minute	min	
	hour	h	
Volume			
	liter	L	1 L is equal to 1000 cm^3 (cubic centimeters)
	deciliter	dL	
	milliliter	mL	1 mL is equal to 1 cm^3 , sometimes referred to as cc
	microliter	μL	
Temperature			
	Celsius	$^{\circ}\text{C}$	

Amount of Substance			
	mole	mol	Historically referred to as gram-molecular weight or gram-atomic weight
	millimole	mmol	
	micromole	μmol	
	femtomole	fmol	
	equivalent	Eq	Also referred to as gram-equivalent weight. It is used in the calculation of substance concentration in units of normality. This unit is no longer preferred for use in analytical chemistry or metrology.
	milliequivalent	mEq	
	osmole	Osmol	Osmotic pressure of a solution, related to substance concentration.
	milliosmole	mOsmol	
Pressure			
	pascal	Pa	
	kilopascal	kPa	
	pounds per square inch	psi	
	millimeter of mercury	mmHg	Equal to 133.322 Pa
Electrical units			
	ampere	A	
	volt	V	
	millivolt	mV	
	hertz	Hz	Unit of frequency
	kilohertz	kHz	
	megahertz	MHz	
	electron volt	eV	
	kilo-electron volt	keV	
	mega-electron volt	MeV	
Radiation			
	becquerel	Bq	SI unit of activity for radionuclides
	kilobecquerel	kBq	
	megabecquerel	MBq	
	gigabecquerel	GBq	
	curie	Ci	Non-SI unit of activity for radionuclides
	millicurie	mCi	
	microcurie	μCi	
	nanocurie	nCi	
Other			

	acceleration due to gravity	g_n ▲▲USP39

9. PRESCRIBING AND DISPENSING

9.10 Use of Metric Units

Prescriptions for compendial articles shall be written to state the quantity and/or strength desired in metric units unless otherwise indicated in the individual monograph (see also *Units of Potency [Biological]*, section 5.50.10 above). If an amount is prescribed by any other system of measurement, only an amount that is the metric equivalent of the prescribed amount shall be dispensed.

▲Abbreviations for units or International Units shall not be used for labeling or prescribing purposes. ▲USP39

Apothecary unit designations on labels and labeling shall not be used.

9.20 Changes in Volume

In the dispensing of prescription medications, slight changes in volume owing to variations in room temperatures may be disregarded.

Change to read:

10. PRESERVATION, PACKAGING, STORAGE, AND LABELING

[Note—Storage and packaging-related provisions previously addressed in the *General Notices and Requirements* have been omitted, except for the brief provision ~~proposed to be established~~ below in 10.10; see the new general chapter ~~(659)~~ for packaging components and storage conditions. Labeling-related provisions are also in the process of being moved to a new general chapter ~~(7)~~, and will be similarly omitted in the future.

▲previously established below in 10.10; see the general chapter *Packaging and Storage Requirements* 〈 659 〉 for packaging and storage requirements. Labeling-related provisions also previously addressed in the *General Notices and Requirements* are also now proposed for deletion, except for the brief provision proposed to be established below in 10.20; see the new general chapter *Labeling* 〈 7 〉 for labeling requirements. General chapter 〈 7 〉 is scheduled to become official on the same date these changes to *General Notices* become official.▲*USP39*

]

10.10. Packaging and Storage

All articles in *USP* or *NF* are subject to the packaging and storage requirements specified in general chapter *Packaging and Storage Requirements* 〈 659 〉, unless different requirements are provided in a specific

▲an individual▲*USP39*

monograph.

▲10.20. Labeling

All articles in *USP* or *NF* are subject to the labeling requirements specified in general chapter 〈 7 〉, unless different requirements are provided in an individual monograph.▲*USP39*

~~10.40. Labeling~~

~~The term "labeling" designates all labels and other written, printed, or graphic matter upon an immediate container of an article or upon, or in, any package or wrapper in which it is enclosed, except any outer shipping container. The term "label" designates that part of the labeling upon the immediate container.~~

~~A shipping container containing a single article, unless such container is also essentially the immediate container or the outside of the consumer package, is labeled with a minimum of product identification (except for controlled articles), lot number, expiration date, and conditions for storage and distribution.~~

~~Articles in these compendia are subject to compliance with such labeling requirements as may be promulgated by governmental bodies in addition to the compendial requirements set forth for the articles.~~

~~10.40.10. Amount of Ingredient Per Dosage Unit~~

~~The strength of a drug product is expressed on the container label in terms of micrograms or milligrams or grams or percentage of the therapeutically active moiety or drug substance, whichever form is used in the title, unless otherwise indicated in an individual monograph. Both the active moiety and drug substance names and their equivalent amounts are then provided in the labeling.~~

~~Official articles in capsule, tablet, or other unit dosage form shall be labeled to express the quantity of each active ingredient or recognized nutrient contained in each such unit; except that, in the case of unit dose oral solutions or suspensions, whether supplied as liquid~~

~~preparations or as liquid preparations that are constituted from solids upon addition of a designated volume of a specific diluent, the label shall express the quantity of each active ingredient or recognized nutrient delivered under the conditions prescribed in *Deliverable Volume* (698). Official drug products not in unit dosage form shall be labeled to express the quantity of each active ingredient in each milliliter or in each gram, or to express the percentage of each such ingredient (see 8.140, *Percentage Concentrations*), except that oral liquids or solids intended to be constituted to yield oral liquids may, alternatively, be labeled in terms of each 5-mL portion of the liquid or resulting liquid. Unless otherwise indicated in a monograph or chapter, such declarations of strength or quantity shall be stated only in metric units. See also 5.50.10, *Units of Potency (Biological)*.~~

~~10.40.20. Use of Leading and Terminal Zeros~~

~~To help minimize the possibility of errors in the dispensing and administration of drugs, the quantity of active ingredient when expressed in whole numbers shall be shown without a decimal point that is followed by a terminal zero (e.g., express as 4 mg [not 4.0 mg]). The quantity of active ingredient when expressed as a decimal number smaller than 1 shall be shown with a zero preceding the decimal point (e.g., express as 0.2 mg [not .2 mg]).~~

~~10.40.30. Labeling of Salts of Drugs~~

~~It is an established principle that official articles shall have only one official title. For purposes of saving space on labels, and because chemical symbols for the most common inorganic salts of drugs are well known to practitioners as synonymous with the written forms, the following alternatives are permitted in labeling official articles that are salts: HCl for hydrochloride; HBr for hydrobromide; Na for sodium; and K for potassium. The symbols Na and K are intended for use in abbreviating names of the salts of organic acids, but these symbols are not used where the word Sodium or Potassium appears at the beginning of an official title (e.g., Phenobarbital Na is acceptable, but Na Salicylate is not to be written).~~

~~10.40.40. Labeling Vitamin-Containing Products~~

~~The vitamin content of an official drug product shall be stated on the label in metric units per dosage unit. The amounts of vitamins A, D, and E may be stated also in USP Units. Quantities of vitamin A declared in metric units refer to the equivalent amounts of retinol (vitamin A alcohol). The label of a nutritional supplement shall bear an identifying lot number, control number, or batch number.~~

~~10.40.50. Labeling Botanical-Containing Products~~

~~The label of an herb or other botanical intended for use as a dietary supplement bears the statement, "If you are pregnant or nursing a baby, seek the advice of a health professional before using this product."~~

~~10.40.60. Labeling Parenteral and Topical Preparations~~

~~The label of a preparation intended for parenteral or topical use states the names of all added substances (see 5.20, *Added Substances* and see *Labeling* under *Injections* (1)), and, in the case of parenteral preparations, also their amounts or proportions, except that for substances added for adjustment of pH or to achieve isotonicity, the label may indicate only their presence and the reason for their addition.~~

~~10.40.70. Labeling Electrolytes~~

~~The concentration and dosage of electrolytes for replacement therapy (e.g., sodium chloride or potassium chloride) shall be stated on the label in milliequivalents (mEq). The label of the product shall indicate also the quantity of ingredient(s) in terms of weight or percentage concentration.~~

~~10.40.80. Labeling Alcohol~~

~~The content of alcohol in a liquid preparation shall be stated on the label as a percentage (v/v) of C₂H₅OH.~~

~~10.40.90. Special Capsules and Tablets~~

~~The label of any form of Capsule or Tablet intended for administration other than by swallowing intact bears a prominent indication of the manner in which it shall be used.~~

~~10.40.100. Expiration Date and Beyond-Use Date~~

~~The label of an official drug product or nutritional or dietary supplement product shall bear an expiration date. All articles shall display the expiration date so that it can be read by an ordinary individual under customary conditions of purchase and use. The expiration date shall be prominently displayed in high contrast to the background or sharply embossed, and easily understood (e.g., "EXP 6/08," "Exp. June 08," or "Expires 6/08"). [Note—For additional information and guidance, refer to the Consumer Healthcare Products Association's *Voluntary Codes and Guidelines of the Self-Medication Industry*.]~~

~~The monographs for some preparations state how the expiration date that shall appear on the label shall be determined. In the absence of a specific requirement in the individual monograph for a drug product or nutritional supplement, the label shall bear an expiration date assigned for the particular formulation and package of the article, with the following exception: the label need not show an expiration date in the case of a drug product or nutritional supplement packaged in a container that is intended for sale without prescription and the labeling of which states no dosage limitations, and which is stable for not less than 3 years when stored under the prescribed conditions.~~

~~Where an official article is required to bear an expiration date, such article shall be dispensed solely in, or from, a container labeled with an expiration date, and the date on which the article is dispensed shall be within the labeled expiry period. The expiration date identifies the time during which the article may be expected to meet the requirements of the compendial monograph, provided it is kept under the prescribed storage conditions. The expiration date limits the time during which the article may be dispensed or used. Where an expiration date is stated only in terms of the month and the year, it is a representation that the intended expiration date is the last day of the stated month. The beyond-use date is the date after which an article shall not be used. The dispenser shall place on the label of the prescription container a suitable beyond-use date to limit the patient's use of the article based on any information supplied by the manufacturer and the *General Notices*. The beyond-use date placed on the label shall not be later than the expiration date on the manufacturer's container.~~

~~For articles requiring constitution before use, a suitable beyond-use date for the constituted product shall be identified in the labeling.~~

~~For all other dosage forms, in determining an appropriate period of time during which a~~

prescription drug may be retained by a patient after its dispensing, the dispenser shall take into account, in addition to any other relevant factors, the nature of the drug; the container in which it was packaged by the manufacturer and the expiration date thereon; the characteristics of the patient's container, if the article is repackaged for dispensing; the expected storage conditions to which the article may be exposed; any unusual storage conditions to which the article may be exposed; and the expected length of time of the course of therapy. The dispenser shall, on taking into account the foregoing, place on the label of a multiple-unit container a suitable beyond-use date to limit the patient's use of the article. Unless otherwise specified in the individual monograph, or in the absence of stability data to the contrary, such beyond-use date shall be not later than (a) the expiration date on the manufacturer's container, or (b) 1 year from the date the drug is dispensed, whichever is earlier. For nonsterile solid and liquid dosage forms that are packaged in single-unit and unit-dose containers, the beyond-use date shall be 1 year from the date the drug is packaged into the single-unit or unit-dose container or the expiration date on the manufacturer's container, whichever is earlier, unless stability data or the manufacturer's labeling indicates otherwise.

The dispenser shall maintain the facility where the dosage forms are packaged and stored, at a temperature such that the mean kinetic temperature is not greater than 25°. The plastic material used in packaging the dosage forms shall afford better protection than polyvinyl chloride, which does not provide adequate protection against moisture permeation. Records shall be kept of the temperature of the facility where the dosage forms are stored, and of the plastic materials used in packaging.

10.40.100.1. Compounded Preparations

The label on the container or package of an official compounded preparation shall bear a beyond-use date. The beyond-use date is the date after which a compounded preparation is not to be used. Because compounded preparations are intended for administration immediately or following short-term storage, their beyond-use dates may be assigned based on criteria different from those applied to assigning expiration dates to manufactured drug products.

The monograph for an official compounded preparation typically includes a beyond-use requirement that states the time period following the date of compounding during which the preparation, properly stored, may be used. In the absence of stability information that is applicable to a specific drug and preparation, recommendations for maximum beyond-use dates have been devised for nonsterile compounded drug preparations that are packaged in tight, light-resistant containers and stored at controlled room temperature unless otherwise indicated (see *Stability Criteria and Beyond-Use Dating* in the general test chapter *Pharmaceutical Compounding—Nonsterile Preparations* ~~(795)~~).

▲ 〈 21 〉 THERMOMETERS

~~Temperature reading devices suitable for Pharmacopeial tests conform to specifications that are traceable to a NIST standard. Temperature reading devices may be of the liquid-in-glass type or an analog or digital temperature indicator type, such as a resistance temperature device, thermistor, or thermocouple.~~

~~An analog or digital temperature indicator consists of a temperature probe, which houses a sensor. The probe is attached to a meter capable of translating a signal in ohms or millivolts into a temperature reading. The temperature probe portion of the analog or digital temperature indicator that is submerged in the medium whose temperature is being measured must be made of inert material. Standardization of analog and digital temperature indicator devices is performed on an established testing frequency with a temperature standard traceable to NIST. In the selection of a temperature reading device, careful consideration of the condition under which it is to be used is essential.~~

~~Liquid-in-glass thermometers may be standardized for total immersion, partial immersion, or full immersion. Insofar as practicable, each thermometer should be employed according to the condition of immersion under which it was standardized. Standardization of thermometers is performed on an established testing frequency with a temperature standard traceable to NIST. Refer to the current issue of ASTM standards E1. Standardization of liquid-in-glass thermometers for total immersion involves immersion of the thermometer to the top of the liquid column, with the remainder of the stem and the upper expansion chamber exposed to ambient temperature. Standardization for partial immersion involves immersion of the thermometer to the indicated immersion line etched on the front of the thermometer, with the remainder of the stem exposed to ambient temperature. Standardization for full immersion involves immersion of the entire thermometer, with no portion of the stem exposed to ambient temperature. For use under other conditions of immersion, an emergent stem correction is necessary to obtain correct temperature readings. ▲USP39~~

BRIEFING

〈 321 〉 **Drug Product Assay Tests—Organic Chemical Medicines.** U.S. Pharmacopeia (USP) is engaged in the ongoing challenge of obtaining information needed to create and sustain up-to-date drug product quality monographs for drugs marketed under the Food and Drug Administration (FDA) over-the-counter (OTC) drug monograph system (21 CFR Part 330). This general chapter will facilitate assay testing in drug products by providing chromatographic procedures to address the development of quality standards for this category of drug products. The first procedure, *Procedure 1*, introduced in this chapter,

covers drug products containing 1 or more of 11 different active ingredients associated with oral dosage forms. *Procedure 1* provides a high-performance liquid chromatographic assay procedure using photo-diode array ultraviolet spectroscopic detection for the identification and quantitation of acetaminophen, aspirin, brompheniramine maleate, dextromethorphan hydrobromide, chlorpheniramine maleate, doxylamine succinate, diphenhydramine citrate, diphenhydramine hydrochloride, pseudoephedrine hydrochloride, phenylephrine hydrochloride, and caffeine in drug products. The proposed procedure uses an Acquity UPLC HSS T3 brand of L1 column manufactured by Waters. This analytical procedure and future procedures will be reflective of currently marketed drug product active ingredient combinations, their routes of administration, and/or their dosage forms. The *Assay* and *Identification* procedures in the individual drug product monographs will be modernized by cross-referencing the procedures in this general chapter, unless there are circumstances for which an individual product must have a separate procedure to ensure its identity, quality, purity, or strength. New drug product monographs proposed for this category will also cross-reference the procedures in this general chapter. Further information can be found in the *Stimuli* article *Medicines Marketed under the Food and Drug Administration's Over-the-Counter (FDA OTC) System Regulations: Strategy for Developing Compendial Quality Standards*, also published in this issue of *Pharmacopeial Forum (PF)*. This article describes in detail the rationale for development of this chapter and other related chapters, as well as the associated impact on drug product monographs. USP plans to continue with this initiative to revise or establish standards for OTC drug products.

The following is a list of USP drug product monographs that are being proposed to be modernized in this *PF* by replacing the current official *Assay* test procedure, all of which use outdated techniques and methodologies, with the proposed procedure, *Procedure 1*.

- *Aspirin Capsules*
- *Brompheniramine Maleate Oral Solution*
- *Brompheniramine Maleate Tablets*
- *Chlorpheniramine Maleate Tablets*

Add the following:

▲〈 321 〉 DRUG PRODUCT ASSAY TESTS—ORGANIC CHEMICAL MEDICINES

INTRODUCTION

The general procedures set forth in the following sections of this general chapter are applicable to the quantitation and identification of active ingredients in drug products.

ASSAY

• **Procedure 1**

Procedure 1 provides a high-performance liquid chromatographic assay procedure using ultraviolet spectroscopic detection for acetaminophen, aspirin, brompheniramine maleate, caffeine, chlorpheniramine maleate, dextromethorphan hydrobromide, diphenhydramine

citrate, diphenhydramine hydrochloride, doxylamine succinate, phenylephrine hydrochloride, and pseudoephedrine hydrochloride containing drug products.

Solution preparation: All solution preparations containing drug substances should be protected from light and should be stored only for as long as can be supported by solution stability data acquired during verification under actual conditions of use.

Solution A: 0.15% Trifluoroacetic acid in water

Solution B: 0.02% Trifluoroacetic acid in a mixture of acetonitrile and methanol (75:25)

Mobile phase: See *Table 1*. Return to original conditions and equilibrate the system.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.0	90	10
0.6	90	10
2.3	77	23
5.5	77	23
7.4	57	43
8.0	57	43
12.5	1	99
13.5	1	99

Diluent A: 0.2% Formic acid in a mixture of methanol and water (25:75). Add 2.0 mL of formic acid and dilute to 1000 mL for each liter.

Diluent B: 0.2% Formic acid in a mixture of acetonitrile and water (5:95). Add 2.0 mL of formic acid and dilute to 1000 mL for each liter.

System suitability solution: 0.05 mg/mL each of USP Caffeine RS, USP Doxylamine Succinate RS, USP Pseudoephedrine Hydrochloride RS, USP Dextromethorphan Hydrobromide RS, and USP Diphenhydramine Hydrochloride RS in *Diluent A*

Standard solution: The *Standard solution* may be limited to the USP Reference Standards that correspond to the active ingredients specified in the monograph of the Article under test. Unless otherwise stated in the monograph, *Table 2* provides the concentration and diluent information for each Reference Standard solution. Reference Standards within the same category may be combined into a single solution.

Table 2

Category	Reference Standard	Concentration (mg/mL)	Diluent
1	USP Acetaminophen RS USP Caffeine RS USP Chlorpheniramine Maleate RS USP Brompheniramine Maleate RS USP Dextromethorphan Hydrobromide RS USP Diphenhydramine Citrate RS USP Diphenhydramine Hydrochloride RS USP Pseudoephedrine Hydrochloride RS	0.1	<i>Diluent A</i>
1	USP Doxylamine Succinate RS	0.05	<i>Diluent A</i>
2	USP Phenylephrine Hydrochloride RS	0.1	<i>Diluent B</i>
3	USP Aspirin RS	0.2	<i>Diluent A</i>

Transfer an amount of the USP RS into a suitable flask. Dissolve in the specified diluent, with sonication if necessary. Dilute to final volume with the specified diluent.

Sample solution: (unless otherwise stated in the monograph) Prepare a solution in *Diluent A* containing an amount of drug product necessary to provide a final concentration that is similar to the concentration of the drug in the *Standard solution* prepared as follows. Transfer a suitable portion of drug product to a suitable volumetric flask. Add *Diluent A* equivalent to about two-thirds of the flask volume. Dissolve and make to volume with *Diluent A*. Sonicate solutions for Aspirin analysis for 5 min, otherwise sonicate for 15 min. Pass a portion through a suitable filter of 0.2- μ m pore size.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: Variable wavelength, UV, see *Table 3*. Unless otherwise stated in the monograph, use a photo-diode array detector (190–400 nm) when specified for Identification test.

Column: 2.1-mm \times 15-cm; 1.8- μ m packing L1

Column temperature: 40 $^{\circ}$

Flow rate: 0.4 mL/min

Injection volume: 2 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The approximate retention times are given in *Table 3*.]

Suitability requirements

Relative standard deviation: NMT 1.0%, *Standard solution*

Tailing: NMT 2.0, *Standard solution*

Resolution: Evaluate the *System suitability solution* at 254 nm.

The resolution, *R*, between caffeine and doxylamine is NLT 1.

The resolution, *R*, between doxylamine and pseudoephedrine is NLT 2.0.

The resolution, *R*, between dextromethorphan and diphenhydramine is NLT 1.

Analysis

Samples: Analyze the *Standard solution* and *Sample solution* at the wavelengths given in *Table 3*.

Table 3

Name	Wavelength (nm)	Retention Time (min)
Phenylephrine	225	1.9
Acetaminophen	254	2.7
Caffeine	254	3.9
Doxylamine	264	4.0
Pseudoephedrine	210	4.1
Chlorpheniramine	225	6.1
Brompheniramine	264	7.0
Aspirin	276	7.5
Dextromethorphan	225	10.1
Diphenhydramine	225	10.2

If present, calculate the percentage of the labeled amount of acetaminophen ($C_8H_9NO_2$), aspirin ($C_9H_8O_4$), caffeine ($C_8H_{10}N_4O_2$), chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$), brompheniramine maleate ($C_{16}H_{19}BrN_2 \cdot C_4H_4O_4$), dextromethorphan hydrobromide ($C_{18}H_{25}NO \cdot HBr \cdot H_2O$), diphenhydramine citrate ($C_{17}H_{21}NO \cdot C_6H_8O_7$), diphenhydramine hydrochloride ($C_{17}H_{21}NO \cdot HCl$), doxylamine succinate ($C_{17}H_{22}N_2O \cdot C_4H_6O_4$), phenylephrine hydrochloride ($C_9H_{13}NO_2 \cdot HCl$), or pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) in the portion of drug product taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of the respective active ingredient from the *Sample solution*

r_S peak response of the respective active ingredient from the *Standard solution*

C_S concentration of the respective Reference Standard in the *Standard solution* (mg/mL)

C_U nominal concentration of the respective active ingredient from the *Sample solution* (mg/mL)

Chromatographic adjustments: The mobile phase gradient can be adjusted to achieve specificity for a given product matrix. This allowance supersedes provisions in $\langle 621 \rangle$ for adjusting chromatographic conditions and is intended to provide a measure of flexibility when needed. Suggestions for changing the gradient program are given in *Table 4*.

Table 4

Condition Change
Solution B (%): NMT 30% relative change may be made at the gradient times 0, 2.3, and 7.4 min to effect the %B/min gradient ramp rate.

Adjustments to the chromatographic procedure may lead to a need for verification or validation of the new conditions. See *Validation of Compendial Procedures* $\langle 1225 \rangle$ and *Verification of Compendial Procedures* $\langle 1226 \rangle$ for guidance. The need for adjustments does not change the need to meet the *System suitability requirements*.

BRIEFING

《 327 》 **Drug Product Impurities Tests.** U.S. Pharmacopeial Convention (USP) is engaged in the ongoing challenge of obtaining information needed to create and sustain up-to-date drug product quality monographs for drugs marketed under the Food and Drug Administration's Over-the-Counter (FDA OTC) drug monograph system (21 CFR Part 330). This general chapter will facilitate testing for specified impurities in drug products by providing chromatographic procedures to address the development of quality standards for this category of drug products. The first procedure, *Salicylic Acid in Aspirin-containing Drug Products*, introduced in this chapter, provides a liquid chromatographic assay procedure using ultraviolet spectroscopic detection for the quantitation of salicylic acid, the principal degradation product, in aspirin-containing drug products. The proposed procedure uses an Acquity UPLC HSS T3 brand of L1 column manufactured by Waters and gives retention times for aspirin and salicylic acid at approximately 7.5 and 8.6 min, respectively.

This procedure and any future procedures will be reflective of additional specified impurities that need to be controlled in currently marketed drug products. The *Organic Impurities* procedures found in individual drug product monographs may be modernized by replacing those procedures with the procedures in this general chapter, unless there are circumstances for which an individual product must have a separate procedure to ensure identity, quality, purity, or strength. Further information can be found in the *Stimuli* article *Medicines Marketed under the Food and Drug Administration's Over-the-Counter (FDA OTC) System Regulations: Strategy for Developing Compendial Quality Standards*, also published in this issue of *Pharmacoepial Forum (PF)*. This article describes in detail the rationale for development of this chapter and other related chapters, as well as the associated impact on drug product monographs. USP plans to continue with this initiative to revise or establish standards for OTC drug products.

The following is a USP drug product monograph wherein the proposed procedure will replace the current *Limit of Free Salicylic Acid* test procedure.

- *Aspirin Capsules*

A revision to this monograph is published in this same issue of *PF*.

BRIEFING

{ 856 } **Near-Infrared Spectroscopy.** This new general chapter is being proposed as part of the broader initiative to revise the general chapters related to spectroscopy. This chapter provides calibration and qualification criteria for near-infrared (NIR) spectroscopic instrumentation as well as the acceptable procedure validation criteria. This chapter is complemented by general information chapter *Near-Infrared Spectroscopy—Theory and Practice* { 1119 }; a proposed revision to { 1119 }, including a title and number change, also appears in this issue of *PF*. Sections related to qualification, calibration, and validation that appeared in { 1119 } have been moved to the new chapter { 856 }; therefore, these sections now contain mandatory standards. The NIR technique can be used for both qualitative and quantitative analyses of liquids, powders, and solid materials. A *Stimuli* article published in *PF* 40(1) entitled *An Alignment of Concepts and Content across the Spectroscopy General Chapters in the United States Pharmacopeia–National Formulary (USP-NF)* provides insight into the rationale for the revisions to the chapters related to spectroscopy. This chapter follows the same format as the other spectroscopy chapters described in the *Stimuli* article and previously published in *PF*.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style.

Add the following:**▲〈 856 〉 Near-Infrared Spectroscopy**

1. Introduction
2. Qualification of NIR Spectrometers
 - 2.1 Installation Qualification
 - 2.2 Operational Qualification
 - 2.3 Performance Qualification
3. Procedure
4. Validation and Verification
 - 4.1 Validation
 - 4.2 Verification

1. INTRODUCTION

Near-infrared (NIR) spectroscopy covers the electromagnetic field wavelength range from 780 to 2500 nm, with the frequencies expressed in wavenumbers (from 12,821 to 4,000 cm^{-1}). NIR spectroscopy is a vibrational spectroscopic technique that measures the absorption of radiation in this wavelength range that is resonant with frequencies from molecular dipole changes in the sample; thus, NIR spectroscopy is related to infrared (IR) spectroscopy. The NIR spectroscopic region is dominated by overtone and combination frequencies of the molecular fundamental harmonic frequencies in the mid-IR region. The molar absorptivities in the NIR region tend to be much lower than those in the IR region, and the radiation can penetrate several millimeters into the material, giving rise to a wavelength-dependent scattering signal overlapping the molecular absorbance signals.

Not all materials absorb NIR radiation, and materials such as glass are relatively transparent. These attributes of NIR spectroscopy have been shown to be useful in the area of pharmaceutical analysis for both qualitative and quantitative applications. For further discussion of the theory and applications, see *Near-Infrared Spectroscopy—Theory and Practice* 〈 1119 〉, which may be a helpful, but not mandatory, resource.

The instrument qualification tests and acceptance criteria provided in this chapter may not be appropriate for some instrument configurations. In such cases, alternative instrument qualification and performance checks should be scientifically justified and documented before use. In addition, validation parameters discussed in this chapter may not be appropriate for all applications of NIR spectroscopy. Validation parameters characterized for a specific NIR-spectroscopic application should demonstrate the suitability of the application for its intended use.

2. QUALIFICATION OF NIR SPECTROMETERS

Qualification of NIR spectrometers is divided into three components: 1) *Installation*

Qualification, 2) *Operational Qualification*, and 3) *Performance Qualification*. For further discussion on qualification, see the general chapter *Analytical Instrument Qualification* (1058)

2.1 Installation Qualification

The installation qualification (IQ) requirements elicit evidence that the hardware and software are properly installed in the desired location.

2.2 Operational Qualification

In operational qualification (OQ), an instrument's performance is characterized using standards to verify that the system operates within target specifications. The purpose of OQ is to demonstrate that instrument performance is suitable. Because there are so many different approaches for measuring NIR spectra, OQ using standards with known spectral properties is recommended. The use of external, traceable reference standard materials does not justify omitting the instrument's internal quality control procedures. As is the case with any spectroscopic device, wavelength uncertainty, photometric linearity, and noise characteristics of NIR instruments must be qualified against target specifications for the intended application. The OQ tests described in the sections that follow are typical examples only. Other tests and samples can be used to establish specifications for OQ. Instrument vendors often have samples and test parameters available as part of the IQ/OQ package. The acceptance specifications given in this section are applicable for general use specifically, whereas specifications for particular instruments and applications can vary, depending on the analytical method used and the desired accuracy of the final result.

2.2.1 CHARACTERIZING INSTRUMENT PERFORMANCE

Use the apparatus according to the manufacturer's instructions, and carry out the prescribed verification at regular intervals. For in-line and on-line applications, the use of alternative means of control of instrument performance must be scientifically justified. For example, use the manufacturer's internal standards or use separate channels/probes, with scientific justification, to demonstrate instrument performance. System suitability tests may be required prior to sample scanning, and the instrument attributes with the most variation (typically photometric noise and wavelength accuracy) must be tested. The frequency at which each performance test is conducted must be assessed for risk, depending on the instrument type and its environment. For example, instruments placed in harsh environments, such as environments with changing temperature and humidity, will need frequent performance testing. Wherever possible, in the procedures for determining wavelength accuracy and linearity, analysts must use certified reference materials (CRMs) rather than laboratory-prepared solutions. These CRMs should be obtained from a recognized, accredited source and should include independently verified, traceable value assignments with associated calculated uncertainty. CRMs are to be kept clean and free from dust. Recertification is to be performed periodically to maintain the validity of the certification.

2.2.2 WAVELENGTH ACCURACY

Wavelength uncertainty: NIR spectra from sample and/or reference standard materials can be used to demonstrate an instrument's suitable wavelength-dispersion performance against target

specifications. Typically, wavelength uncertainty is characterized from a single spectrum (collected with the same spectral resolution used to obtain the standard value) using a minimum of three peaks that cover a suitable spectral range of the instrument.

Verification of wavelength scale (except for filter apparatus): Verify the wavelength scale utilized, which is generally in the region between about 780 and about 2,500 nm (about 12,800 cm^{-1} to about 4,000 cm^{-1}) or in the intended spectral range using one or more suitable wavelength standards that have characteristic maxima or minima within the range of methodology wavelengths to be used. The USP Near IR System Suitability RS can be used for wavelength verification. Suitable materials for demonstrating wavelength dispersion performance must be used. With appropriate justification, alternative standards may be used. Additional information on calibration considerations may be found in $\langle 1119 \rangle$.

Typical tolerances for agreement with standard values are ± 1.0 nm from approximately 700 to 2,000 nm and ± 1.5 nm above 2,000 nm to approximately 2,500 nm (± 8 cm^{-1} below 5,000 cm^{-1} and ± 4 cm^{-1} from 5,000 cm^{-1} to approximately 14,000 cm^{-1}). For the reference material used, apply the tolerance for the nearest wavelength (or wavenumber) from the above information for each peak used. For diode-array instruments, the pixel resolution (wavelength between pixels) can be as large as 10 nm. The pixel resolution must be adapted to match the spectral resolution. The peak-finding algorithms are critical to wavelength accuracy. From a practical standpoint, ± 2 nm is appropriate for peak wavelength accuracy when using such instrumentation. Alternatively, refer to the manufacturer's specifications for acceptance.

2.2.3 PHOTOMETRIC LINEARITY AND RESPONSE STABILITY

Photometric linearity is typically characterized in the range from 10% to 90% reflection (or transmission). NIR applications based on measuring an absorbance larger than 1.0 may require standards with reflectivity properties between 2% and 5% reflection (or transmission) for characterizing instrument performance at low reflectance. The purpose is to demonstrate a linear relationship between NIR reflectance and/or transmittance and instrument response across the scanning range of the instrument. Subsequent verifications of the photometric model can use the initial observed absorbance values as the established values.

Measure four photometric standards across the working method absorbance range. Typical tolerances for a linear relationship are 1.00 ± 0.05 for the slope and 0.00 ± 0.05 for the intercept of a plot of the measured photometric response versus the standard photometric response. Alternative tolerances may be used when justified for specific applications. A tolerance of $\pm 2\%$ is acceptable for long-term stability.

2.2.4 PHOTOMETRIC NOISE

NIR instrument software may include built-in procedures to automatically determine system noise and to provide a statistical report of noise or signal-to-noise ratio (S/N) over the instrument's operating range. In addition, it may be desirable to supplement such checks with measurements that do not rely directly on manufacturer-supplied procedures. Typical procedures involve measuring spectra of traceable reference materials with both high and low reflectance. Determine the photometric noise using suitable reflectance standards. Tolerances for these procedures should demonstrate suitable S/N for the intended application. Follow the

manufacturer's methodology and specifications.

High-flux noise: Instrument noise is evaluated at high-light flux by measuring reflectance or transmittance of the reference standard, with the reference material (e.g., 99% reflection standard) acting as both the sample and the background reference.

Low-flux noise: The same procedure may be used with a lower-reflectivity reference material (e.g., 10% reflectance standard) to determine system noise at reduced-light flux. The source, optics, detector, and electronics make significant contributions to the noise under these conditions.

2.3 Performance Qualification

The objective of performance qualification (PQ) is to ensure that the instrument is performing within specified limits with respect to wavelength and photometric precision. In certain cases, when the instrument has been set up for a specific measurement, it might no longer be possible or desirable to measure the wavelength and photometric (signal) qualification reference standards used in the OQ. Provided that the instrument operational qualification has shown that the equipment is fit for use, a single external performance verification standard can be used on a continuing basis (e.g., daily or before use). The performance verification standard must match the format of the samples in the current analysis as closely as possible and must use similar spectral acquisition parameters. Quantitative measurements of an external performance verification standard can be used to check both the wavelength accuracy and the photometric precision. Favorable comparison of a series of performance verification spectra demonstrates proper continued operation of the instrument.

Specific procedures, acceptance criteria, and time intervals for characterizing NIR instrument performance are selected based on the instrument and intended application. Many NIR applications use previously validated models that relate NIR spectral response to a physical or chemical property of interest. Demonstrating stable instrument performance over extended periods of time provides some assurance that reliable measurements can be taken from sample spectra using previously validated chemometric models.

3. PROCEDURE

NIR spectra can be obtained from several sample presentations including solids, powders, slurries, gels, liquids, films, and gases. In addition, measurement can be performed through glass or plastic films that are normally used for containment. Typically, NIR spectroscopy does not require any sample preparation because the detectors have a wide dynamic range, and the collection time can be adjusted by the user. It is important to note that specific parameters such as spectrometer noise, limits of detection (LOD), limits of quantification (LOQ), and acceptable spectral bandwidth for any given application must be included as part of the analytical procedure. Equally important, data pretreatment must be properly implemented such that the intended measurement sensitivity is not subsequently degraded. Specific values for tests such as spectrometer noise and bandwidth will be dependent on the instrument chosen and the purpose required. For this reason, specific instrument tests for these parameters are not indicated here. Additional details can be found in 〈 1119 〉.

4. VALIDATION AND VERIFICATION

The objective of NIR procedure validation, as is the case with validation of any analytical process, is to demonstrate that the measurement is suitable for its intended purpose. NIR spectroscopy is somewhat different from conventional vibrational spectroscopic techniques, because it is not a primary technique. Validation can be achieved by the assessment of variability (precision) and comparison to a reference standard or the result of a validated primary method (accuracy). The procedure for validation is related to the fundamental validation characteristics required for any analytical procedure. Data pretreatment is often a vital step in the chemometric analysis of NIR spectral data. Many suitable data pretreatments exist; the selection should be based on sound scientific judgment and suitability for the intended application.

4.1 Validation

Validation is required when a NIR spectroscopic procedure is intended for use as an alternative to the monograph procedure for testing an official article. The objective of procedure validation is to demonstrate that the measurement is suitable for its intended purpose, including: quantitative determination of the main component in a drug substance or drug product (Category I assays); quantitative determination of impurities or limit tests (Category II); and identification tests (Category IV; see *Table 2* in *Validation of Compendial Procedures* 〈1225〉). Depending on the category of the test, the analytical procedure validation process for a NIR spectroscopic method requires the testing of linearity, range, accuracy, specificity, precision, detection limit, quantitation limit, and robustness. Note that validated NIR spectroscopy procedures may not be transferrable to all configurations of NIR spectrometers because of differences in their inherent performance characteristics.

Chapter 〈1225〉 provides definitions and general guidance on analytical procedures validation without indicating specific validation criteria for each characteristic. The following sections are intended to provide the user with specific validation criteria that represent the minimum expectations for this technology, assuming use of the typical Category 1 USP specifications of 98.0%–102.0% for a drug substance and 90.0%–110.0% for a drug product. The actual validation performance characteristics will depend on the specifications in place and must provide adequate evidence that the measurement capability is sufficient for those specifications. For certain particular applications, tighter criteria may be needed in order to demonstrate suitability for the intended use.

4.1.1 ACCURACY

Accuracy is demonstrated by showing the closeness of agreement between the value that is obtained and either a conventional true value or an accepted reference value from a reference procedure. Accuracy can be determined by direct comparison between validation results and actual or accepted reference values. Suitable agreement with reference values is based on required measurement capability for a specific application. The purpose is to demonstrate a linear relationship between the NIR spectroscopic results and actual values. If a chemometric model is used, accuracy can be determined by agreement between the standard error of prediction (SEP) and the standard error of the reference procedure for validation. The error of the reference procedure may be known: 1) on the basis of historical data, 2) through validation

results specific to the reference procedure, or 3) by calculating the standard error of the laboratory (SEL). Suitable agreement between SEP and SEL is based on required measurement capability for a specific application.

For Category I and II procedures, accuracy can be determined by conducting recovery studies with the appropriate matrix spiked with known concentrations of the analyte. It is also an acceptable practice to compare assay results obtained using the NIR spectroscopy procedure under validation with those obtained from an established alternative analytical method.

Validation criteria: 98.0%–102.0% recovery for a drug substance, 95.0%–105.0% recovery for a drug product assay, and 70.0%–150.0% recovery for an impurity analysis. These criteria must be met throughout the intended range.

4.1.2 PRECISION

The precision of a NIR spectroscopic procedure expresses the closeness of agreement among a series of measurements under prescribed conditions. Precision measurements are typically expressed as the relative standard deviation of a series of results and should be suitable for the intended application. Two levels of precision should be considered for NIR spectroscopic procedures: *Repeatability* and *Intermediate precision*.

Repeatability: Repeatability can be demonstrated by either: 1) statistical evaluation of a number of replicate measurements of the sample without repositioning the sample between the individual spectral acquisitions, or 2) statistical evaluation of multiple NIR procedure results, with each result being from a replicate analysis of a sample after repositioning between spectral acquisitions. The analytical procedure can be assessed by measuring the concentrations of six independently prepared sample preparations at 100% of the assay test concentration. Alternatively, it can be based on measurements of three replicates of three separate sample solutions at different concentrations. The three concentrations should be close enough that the repeatability is constant across the concentration range. If this is done, the repeatability at the three concentrations may be pooled for comparison to the acceptance criteria.

Validation criteria—The relative standard deviation is NMT 1.0% for a drug substance, NMT 2.0% for a drug product, and NMT 20.0% for an impurity analysis.

Intermediate precision: Analysts must test the effects of changes in variables, such as performing the analysis on different days, using different instrumentation, or having the method performed by two or more analysts in the *Repeatability* study. At a minimum, any combination of at least two of these factors totaling six experiments will provide an estimation of intermediate precision.

Validation criteria—The relative standard deviation is NMT 1.0% for a drug substance, NMT 3.0% for a drug product assay, and NMT 25.0% for an impurity analysis.

4.1.3 SPECIFICITY

The extent of specificity testing depends on the intended application. Specificity is typically demonstrated by using the following approaches.

Qualitative: Identification testing is a common application of qualitative NIR spectroscopy. Identification is achieved by comparing a sample spectrum to a reference spectrum or spectra. The specificity of the NIR identification procedure is demonstrated by obtaining positive

identification from samples, coupled with negative results from materials that should not meet the criteria for positive identification. Materials to demonstrate specificity should be selected on the basis of sound scientific judgment.

Quantitative: Quantitative applications of NIR spectroscopy typically first establish a mathematical relationship (chemometric model) between NIR spectral response and a physical or chemical property of interest. Demonstration of specificity against a physical or chemical property of interest is based on interpreting both NIR spectral attributes and chemometric parameters in terms of the intended application. The demonstration of specificity may include the following:

- Spectral regions can be correlated to the property of interest.
- Wavelengths used by regression analysis for the calibration (e.g., for multiple linear regression models) or the loading vector for each factor (e.g., for partial least squares or principal component regression models) can be examined to verify relevant spectroscopic information that is used for the mathematical model.
- Variation in spectra from samples for calibration should be examined and interpreted.
- Variation in material composition and sample matrix may be shown to have no significant effect on quantification of the property of interest within the specified procedure range.

For Category I and II procedures, the specificity is demonstrated by meeting the accuracy requirements.

For Category IV procedures, the identity of the analyte must be confirmed by comparison with appropriate reference substances.

4.1.4 QUANTITATION LIMIT

A measurement of a representative sample matrix spiked at the estimated quantitation limit (QL) concentration must be performed to confirm accuracy. The QL can be estimated by calculating the standard deviation, or the QL can be determined from the error of the intercept from a calibration curve or by determining that the S/N is >10 . Other suitable approaches can be used (see $\langle 1225 \rangle$).

A measurement of a test sample prepared from a representative sample matrix spiked at the required QL concentration must be performed to confirm sufficient sensitivity and adequate precision. The observed S/N at the required QL must be >10 .

Validation criteria: For the estimated QL to be considered valid, the measured concentration must be accurate and precise at a level $\leq 50\%$ of the specification.

4.1.5 LINEARITY

Quantitative procedures generally attempt to demonstrate a linear relationship between NIR spectral response and the property of interest. Although demonstrating a linear response is not required for all NIR applications, the model chosen should properly represent the relationship. Linearity of NIR spectroscopic procedures depends on variables such as matrix effects and data pretreatment. Validation of linearity in NIR procedures may be accomplished by examining NLT five samples that span the range and by plotting the NIR spectral responses versus actual or accepted values for the property of interest. Many applications may require models of higher order, and various statistical procedures are available for evaluation of the goodness of fit.

Applicable statistics and graphical procedures may be used as appropriate.

The correlation coefficient, R , may not be an informative measure of linearity. The square of the (Pearson) correlation coefficient is a measure of the fraction of the data's variation that is adequately modeled. Linearity depends on the standard error of the calibration equation (and hence the reference procedure) and on the range of the calibration data. Thus, although values very near 1.00, such as 0.99 or greater, typically indicate a linear relationship, lower values do not distinguish between nonlinearity and variability.

Validation criteria: The correlation coefficient (R) is NLT 0.995 for Category I assays and NLT 0.99 for Category II quantitative tests.

4.1.6 RANGE

The specified range of a NIR spectroscopic procedure depends on the specific application. The range typically is established by confirming suitable measurement capability (accuracy and precision) at the extreme limits. Controls must be used to ensure that results outside of the validated range are not accepted. In certain circumstances, it may not be possible or desirable to extend the validated range to include sample variability outside of the validated range. Extending the range of a NIR spectroscopic procedure requires demonstration of suitable measurement capability within the limits of the expanded range. Examples of situations in which only a limited sample range may be available are samples from a controlled manufacturing process and in-process samples. A limited procedure range does not preclude the use of a NIR spectroscopic procedure.

Validation criteria: For Category I tests, the validation range for 100.0% centered acceptance criteria is 80.0%–120.0%. For noncentered acceptance criteria, the validation range is 10.0% below the lower limit to 10.0% above the upper limit. For content uniformity, the range is 70.0%–130.0%. For Category II tests, the validation range covers 50.0%–120.0% of the acceptance criteria.

4.1.7 ROBUSTNESS

The reliability of an analytical measurement must be demonstrated by making deliberate changes to experimental parameters. NIR spectroscopic measurement parameters selected to demonstrate robustness will vary depending on the application and the sample's interface with the instrument. Critical measurement parameters associated with robustness often are identified and characterized during method development. Typical measurement parameters include the following:

- Effect of environmental conditions (e.g., temperature, humidity, and vibration)
- Effect of sample temperature
- Sample handling (e.g., fiber-optic probe depth, compression of material, sample depth/thickness)
- Influence of instrument changes (e.g., lamp change, warm-up time)

4.2 Verification

U.S. Current Good Manufacturing Practices regulations [21 CFR 211.194(a)(2)] indicate that users of analytical procedures described in *USP-NF* are not required to validate these procedures if provided in a monograph. Instead, they must simply verify their suitability under actual conditions of use.

The objective of method verification is to demonstrate that the procedure, as prescribed in specific monographs, is being executed with suitable accuracy, sensitivity, and precision.

General chapter *Verification of Compendial Procedures* 〈 1226 〉 notes that, if the verification of the compendial procedure, according to the monograph, is not successful, the procedure may not be suitable for use with the article under test. It may be necessary to develop and validate an alternative procedure as allowed in *General Notices and Requirements*.

Although complete revalidation of a compendial procedure is not required, verification of the compendial NIR spectroscopic procedure includes the determination of certain validation parameters. When the method being verified is for identification purposes, specificity is the only parameter required. For quantitative applications, additional validation parameters, such as accuracy, precision, and QL, must be studied as indicated in *Validation* in 〈 1225 〉, as appropriate.

USP Reference Standards 〈 11 〉

USP Near IR System Suitability RS ▲*USP39*

BRIEFING

〈 1119 〉 **Near-Infrared Spectroscopy**, *USP 37* page 953. A title change is proposed for general chapter *Near-Infrared Spectroscopy* 〈 1119 〉; the proposed new chapter title is *Near-Infrared Spectroscopy* 〈 1856 〉. In addition, it is proposed to move the content on qualification, calibration, and validation to another new general chapter, *Near-Infrared Spectroscopy* 〈 856 〉, and to move the chemometric-analysis terms and definitions to a future general chapter on chemometrics. Chapter 〈 1856 〉 (renamed from 〈 1119 〉) complements chapter 〈 856 〉 by providing information on the theory of near-infrared (NIR) spectroscopy and the acceptable practices for consistent analysis and interpretation of spectroscopic data. The NIR technique can be used for both qualitative and quantitative analysis of liquids, powders, and solid materials. Chapter 〈 1856 〉 also provides practical information on topics including sample preparation, instrumentation, qualitative NIR analysis, and quantitative NIR analysis. A *Stimuli* article published in *PF 40(1)* entitled *An Alignment of Concepts and Content across the Spectroscopy General Chapters in the United States Pharmacopeia–National Formulary (USP–NF)* provides insight into the rationale for the revisions to the chapters related to spectroscopy. This chapter follows the same format as the other new spectroscopy chapters.

INTRODUCTION

Near-infrared (NIR) spectroscopy is a branch of vibrational spectroscopy that shares many of the principles that apply to other spectroscopic measurements. The NIR spectral region comprises two subranges associated with detectors used in the initial development of NIR instrumentation. The short-wavelength (Herschel or silicon region) extends from approximately 780 to 1100 nm ($12,821$ – 9000 cm^{-1}); and longer wavelengths, between 1100 and 2500 nm, compose the traditional (lead sulfide) NIR region. Applications of NIR spectroscopy use spectra displayed in either wavelength or wavenumber units. As is the case with other spectroscopy measurements, interactions between NIR radiation and matter provide information that can be for both qualitative and quantitative assessment of the chemical composition of samples. In addition, qualitative and quantitative characterization of a sample's physical properties can be made because of the sample's influence on NIR spectra. Measurements can be made directly on samples in situ in addition to applications during standard sampling and testing procedures.

Applications of qualitative analysis include identification of raw material, in-process sample, or finished product. These applications often involve comparing an NIR spectrum from a sample to reference spectra and assessing similarities against acceptance criteria developed and validated for a specific application. In contrast, applications of quantitative analysis involve the development of a predictive relationship between NIR spectral attributes and sample properties. These applications typically use numerical models to quantitatively predict chemical and/or physical properties of the sample on the basis of NIR spectral attributes.

Vibrational spectroscopy in the NIR region is dominated by overtones and combinations that are much weaker than the fundamental mid-IR vibrations from which they originate. Because molar absorptivities in the NIR range are low, radiation can penetrate several millimeters into materials, including solids. Many materials, such as glass, are relatively transparent in this region. Fiber-optic technology is readily implemented in the NIR range, which allows monitoring of processes in environments that might otherwise be inaccessible.

The instrument qualification tests and acceptance criteria provided in this chapter may not be appropriate for all instrument configurations. In such cases, alternative instrument qualification and performance checks should be scientifically justified and documented. In addition, validation parameters discussed in this chapter may not be applicable for all applications of NIR spectroscopy. Validation parameters characterized for a specific NIR application should demonstrate suitability of the NIR application for its intended use.

Transmission and Reflection

The most common measurements performed in the NIR spectral range are transmission and reflection spectroscopy. Incident NIR radiation is absorbed or scattered by the sample and is measured as transmittance or reflectance, respectively. Transflection spectrometry is a hybrid of transmission and reflection wherein a reflector is placed behind the sample so that the optical path through the sample and back to the detector is doubled compared to a transmission measurement of a sample of the same thickness. Transflection is used to describe any double-pass transmission technique. The light may be reflected from a diffuse or specular (mirror) reflector placed behind the sample. This configuration can be adapted to share instrument geometry with certain reflection or fiber-optic probe systems in which the source and the detector are on the same side of the sample.

transmittance, T , is a measure of the decrease in radiation intensity as a function of

wavelength when radiation is passed through a sample. The sample is placed in the optical beam between the source and the detector. The results of both transmission and transreflection measurements are usually presented directly in terms of absorbance, i.e., $\log_{10}(1/T)$.

reflectance, R , is a measure of the ratio of the intensity of light reflected from the sample, I , to that reflected from a background or reference reflective surface, I_R . Most reflection measurements in the NIR are made of scattering samples such as powders and slurries. For such materials NIR radiation can penetrate a substantial distance into the sample, where it can be absorbed when the wavelength of the radiation corresponds to a transition between the ground vibrational state of the analyte and either a harmonic of a given vibrational mode (an *overtone*) or the sum of two or more different modes (a *combination band*). Nonabsorbed radiation is scattered back from the sample to the detector. NIR reflection spectra are accessed by calculating and plotting $\log(1/R)$ versus wavelength. This logarithmic form is the pseudo-absorbance of the material and is commonly called absorbance.

Factors That Affect NIR Spectra

The following list is not exhaustive, but it includes many of the major factors that affect NIR spectra:

Sample Temperature—Sample temperature influences spectra obtained from aqueous solutions and other hydrogen-bonded liquids, and a difference of a few degrees may result in significant spectral changes. Temperature may also affect spectra obtained from less polar liquids, as well as solids that contain solvents and/or water.

Moisture and Solvent—Moisture and solvent present in the sample material and analytical system may change the spectrum of the sample. Both absorption by moisture and solvent and their influence on hydrogen bonding of the APIs and excipients can change the NIR spectrum.

Sample Thickness—Sample thickness is a known source of spectral variability and must be understood and/or controlled. The sample thickness in transmission mode is typically controlled by using a fixed optical path length for the sample. In diffuse reflection mode, the sample thickness is typically controlled by using samples that are “infinitely thick” relative to the detectable penetration depth of NIR light into a solid material. Here “infinite thickness” implies that the reflection spectrum does not change if the thickness of the sample is increased.

Sample Optical Properties—In solids, both surface and bulk scattering properties of calibration standards and analytical samples must be taken into account. Surface morphology and refractive index properties affect the scattering properties of solid materials. For powder materials, particle size and bulk density influence scattering properties and the NIR spectrum.

Polymorphism—Variation in crystalline structure (polymorphism) from materials with the same chemical composition can influence NIR spectral response. Different polymorphs and amorphous forms of solid material may be distinguished from one another on the basis of their NIR spectral properties. Similarly, different crystalline hydration or solvation states of the same material can display different NIR spectral properties.

Age of Samples—Samples may exhibit changes in their chemical, physical, or optical properties over time. Care must be taken to ensure that both samples and standards used for NIR analysis are suitable for the intended application.

INSTRUMENTATION

Apparatus

All NIR measurements are based on exposing material to incident NIR light radiation and measuring the attenuation of the emerging (transmitted, scattered, or reflected) light. Several spectrophotometers are available; they are based on different operating principles—for example: filters, grating-based dispersive, acousto-optical tunable filter (AOTF), Fourier-transform NIR (FT-NIR), and liquid crystal tunable filter (LCTF). Silicon, lead sulfide, indium gallium arsenide, and deuterated triglycine sulfate are common detector materials. Conventional cuvette sample holders, fiber optic probes, transmission dip cells, and spinning or traversing sample holders are common examples of sample interfaces for introducing the sample to the optical train of a spectrometer.

The selection of specific NIR instrumentation and sampling accessories should be based on the intended application, and particular attention should be paid to the suitability of the sampling interface for the type of sample that will be analyzed.

Near-Infrared Reference Spectra

NIR references, by providing known stable measurements to which other measurements can be compared, are used to minimize instrumental variations that would affect the measurement.

Transmittance—The measurement of transmittance requires a background reference spectrum for determining the absorption by the sample relative to the background. Suitable transmittance reference materials depend on the specific NIR application and include air, an empty cell, a solvent blank, or a reference sample.

Reflectance—The measurement of reflectance requires the measurement of a reference reflection spectrum to determine the attenuation of reflected light relative to the unattenuated incident beam. The reflectance spectrum is calculated as the ratio of the single-beam spectrum of the sample to that of the reference material. Suitable reflectance reference materials depend on the specific NIR application and include ceramic, perfluorinated polymers, gold, and other suitable materials.

Qualification of NIR Instruments

Qualification—Qualification of an NIR instrument can be divided into three elements: Installation Qualification (IQ); Operational Qualification (OQ); and Performance Qualification (PQ). For further discussion, see general information chapter *Analytical Instrument Qualification* (1058):

Installation Qualification—The IQ requirements help ensure that the hardware and software are installed to accommodate safe and effective use of the instrument at the desired location.

Operational Qualification—In operational qualification, an instrument's performance is characterized using standards to verify that the system operates within target specifications. The purpose of operational qualification is to demonstrate that instrument performance is suitable. Because there are so many different approaches for measuring NIR spectra, operational qualification using standards with known spectral properties is recommended. Using external traceable reference standard materials does not justify omitting the instrument's internal quality control procedures. As is the case with any spectroscopic device, wavelength uncertainty, photometric linearity, and noise characteristics of NIR instruments should be

qualified against target specifications for the intended application.

Performance Qualification—Performance qualification demonstrates that the NIR measurement consistently operates within target specifications defined by the user for a specific application; it is often referred to as *system suitability*. Performance qualification for NIR measurements can include comparing a sample or standard spectrum to previously recorded spectra. Comparisons of spectra taken over time from identical and stable samples or reference standard materials can form the basis for evaluating the long-term stability of an NIR measurement system. The objective is to demonstrate that no abnormal wavelength shift or change in detector sensitivity has occurred during ongoing analysis.

Characterizing Instrument Performance—Specific procedures, acceptance criteria, and time intervals for characterizing NIR instrument performance depend on the instrument and intended application. Many NIR applications use previously validated models that relate NIR spectral response to a physical or chemical property of interest. Demonstrating stable instrument performance over extended periods of time provides some assurance that reliable measurements can be taken from sample spectra using previously validated NIR models.

Wavelength Uncertainty—NIR spectra from sample and/or reference standard materials can be used to demonstrate an instrument's suitable wavelength dispersion performance against target specifications. The USP Near IR System Suitability Reference Standard or the National Institute of Standards and Technology (NIST) Standard Reference Material (SRM) 2036 for reflectance measurement and NIST SRM 2035 for transmittance measurement can be used for wavelength verification. Suitable materials for demonstrating wavelength dispersion performance include polystyrene, mixtures of rare earth oxides, and absorption by water vapor for instruments that use an interferometer for wavelength dispersion. With appropriate justification, alternative standards may be used. Wavelength uncertainty typically is characterized from a single spectrum (collected with the same spectral resolution to obtain the standard value) using a minimum of three peaks that cover a suitable spectral range of the instrument. Typical tolerances for agreement with standard values are ± 1.0 nm below 2000 nm and ± 1.5 nm from 2000 nm to 2500 nm. Alternative tolerances may be used when justified for specific applications.

Photometric Linearity and Response Stability—NIR spectra from samples and/or reference standard materials with known relative transmittance or reflectance can be used to demonstrate a suitable relationship between NIR light attenuation (due to absorption) and instrument response. For reflectance measurements, commercially available reflectance standards with known reflectance properties are often used. Spectra obtained from reflection standards are subject to variability as a result of the difference between the experimental conditions under which they were factory calibrated and those under which they are subsequently put to use. Hence, the reflectance values supplied with a set of calibration standards may not be useful in the attempt to establish an "absolute" calibration for a given instrument. Provided that (1) the standards do not change chemically or physically, (2) the same reference background is also used to obtain the standard values, and (3) the instrument measures each standard under identical conditions (including precise sample positioning), the reproducibility of the photometric scale will be established over the range of standards. Subsequent measurements on the identical set of standards give information on long-term stability. Photometric linearity is typically characterized using a minimum of four reference standards in the range from 10% to 90% reflection (or transmission). NIR applications based on

measuring an absorbance larger than 1.0 may require standards with reflectivity properties between 2% and 5% reflection (or transmission) for characterizing instrument performance at low reflectance. The purpose is to demonstrate a linear relationship between NIR reflectance and/or transmittance and instrument response over the scanning range of the instrument. Typical tolerances for a linear relationship are 1.00 ± 0.05 for the slope and 0.00 ± 0.05 for the intercept of a plot of the measured photometric response versus standard photometric response. Alternative tolerances may occur when justified for specific applications.

Spectroscopic Noise—NIR instrument software may include built-in procedures to automatically determine system noise and to provide a statistical report of noise or S/N over the instrument's operating range. In addition, it may be desirable to supplement such checks with measurements that do not rely directly on manufacturer-supplied procedures. Typical procedures involve measuring spectra of traceable reference materials with high and low reflectance. Tolerances for these procedures should demonstrate suitable S/N for the intended application.

high-flux noise—Instrument noise is evaluated at high light flux by measuring reflectance or transmittance of the reference standard, with the reference material (e.g., 99% reflection standard) acting as both the sample and the background reference.

low-flux noise—The same procedure may be used with a lower reflectivity reference material (e.g., 10% reflectance standard) to determine system noise at reduced light flux. The source, optics, detector, and electronics make significant contributions to the noise under these conditions.

METHOD VALIDATION

Introduction

The objective of NIR method validation, as is the case with the validation of any analytical procedure, is to demonstrate that the measurement is suitable for its intended purpose. NIR spectroscopy is somewhat different from conventional analytical techniques because validation of the former generally is achieved by the assessment of chemometric parameters, but these parameters can still be related to the fundamental validation characteristics required for any analytical method.

Data pretreatment is often a vital step in the chemometric analysis of NIR spectral data. Data pretreatment can be defined as the mathematical transformation of NIR spectral data to enhance spectral features and/or remove or reduce unwanted sources of variation prior to using the spectrum. *Calibration* is the process of developing a mathematical relationship between NIR spectral response and properties of samples. Many suitable chemometric algorithms for data pretreatment and calibration exist; the selection should be based on sound scientific judgment and suitability for the intended application.

Validation Parameters

Performance characteristics that demonstrate the suitability of NIR methods are similar to those required for any analytical procedure. A discussion of the applicable general principles is found in *Validation of Compendial Procedures* (1225). These principles should be considered typical for NIR procedures, but exceptions should be dealt with on a case-by-case basis. For qualitative NIR methods, see chapter (1225), *Data Elements Required for Validation*,

Category IV assays. For quantitative NIR methods, see chapter 1225, *Data Elements Required for Validation, Category I and Category II* assays. Specific acceptance criteria for each validation parameter must be consistent with the intended use of the method. The samples for validation should be independent of the calibration set.

Specificity—The extent of specificity testing depends on the intended application. Demonstration of specificity in NIR methods is typically accomplished by using the following approaches:

Qualitative—Identification testing is a common application of qualitative NIR spectroscopy. Identification is achieved by comparing a sample spectrum to a reference spectrum or a library of reference spectra. The specificity of the NIR identification method is demonstrated by obtaining positive identification from samples coupled with negative results from materials that should not meet criteria for positive identification. Materials to demonstrate specificity should be based on sound scientific judgment and can include materials similar in visual appearance, chemical structure, or name.

Quantitative—Quantitative applications of NIR spectroscopy typically involve establishing a mathematical relationship between NIR spectral response and a physical or chemical property of interest. Demonstrating specificity against a physical or chemical property of interest is based on interpreting both NIR spectral attributes and chemometric parameters in terms of the intended application and may include the following:

- Spectral regions in the calibration model can be correlated to a known NIR spectral response associated with the property of interest.
- Wavelengths used by regression analysis for the calibration (e.g., for multiple linear regression [MLR] models) or the loading vector for each factor (e.g., for partial least squares [PLS] or principal component regression [PCR] models) can be examined to verify relevant spectroscopic information that is used for the mathematical model.
- Variation in spectra from samples for calibration can be examined and interpreted as expected spectral observations.
- Variation in material composition and sample matrix may be shown to have no significant effect on quantification of the property of interest within the specified method range.

Linearity—Quantitative NIR methods generally attempt to demonstrate a linear relationship between NIR spectral response and the property of interest. Although demonstrating a linear response is not required for all NIR applications, the model chosen, whether linear or not, should properly represent the relationship.

Validation of linearity in NIR methods may be accomplished by examining a plot of NIR spectral response versus actual or accepted values for the property of interest. Many statistical methods are available for evaluation of the goodness of fit of the linear relationship. Other applicable statistics and graphical methods may be as appropriate.

The correlation coefficient, r , may not be an informative measure of linearity. The square of the (Pearson) correlation coefficient is a measure of the fraction of the data's variation that is adequately modeled by the equation. Linearity depends on the standard error of the calibration equation (and hence the reference method) and on the range of the calibration data. Thus, although values very near 1.00, such as 0.99 or greater, typically indicate a linear relationship, lower values do not distinguish between nonlinearity and variability around the line.

Range—The specified range of an NIR method depends on the specific application. The range

typically is established by confirming that the NIR method provides suitable measurement capability (accuracy and precision) when applied to samples within extreme limits of the NIR measurement. Controls must be used to ensure that results outside the validated range are not accepted. In certain circumstances, it may not be possible or desirable to extend the validated range to include sample variability outside the validated range. Extending the range of an NIR method requires demonstration of suitable measurement capability within the limits of the expanded range. Examples of situations in which only a limited sample range may be available are samples from a controlled manufacturing process and in-process samples. A limited method range does not preclude the use of an NIR method.

Accuracy—Accuracy in NIR methods is demonstrated by showing the closeness of agreement between the value that is accepted as either a conventional true value or an accepted reference value. Accuracy can be determined by direct comparison between NIR validation results and actual or accepted reference values. Suitable agreement between NIR and reference values is based on required measurement capability for a specific application. The purpose is to demonstrate a linear relationship between NIR results and actual values. Accuracy can be determined by agreement between the standard error of prediction (SEP) and the standard error of the reference method for validation. The error of the reference method may be known on the basis of historical data, through validation results specific to the reference method, or by calculating the standard error of the laboratory (SEL). Suitable agreement between SEP and SEL is based on required measurement capability for a specific application.

Precision—The precision of an NIR method expresses the closeness of agreement between a series of measurements under prescribed conditions. Two levels of precision should be considered: repeatability and intermediate precision. The precision of an NIR method typically is expressed as the relative standard deviation of a series of NIR method results and should be suitable for the intended application. Demonstration of precision in NIR methods may be accomplished using the following approaches:

Repeatability—Repeatability can be demonstrated by the following:

- Statistical evaluation of a number of replicate measurements of the sample without repositioning the sample between each individual spectral acquisition, or
- Statistical evaluation of multiple NIR method results, each result from a replicate analysis of a sample subsequent to repositioning between spectral acquisitions

Intermediate Precision—Intermediate precision can be shown by the following:

- Statistical evaluation of a number of replicate NIR measurements of the same or similar samples in the *Repeatability* study by different analysts on different days.

Robustness—NIR measurement parameters selected to demonstrate robustness will vary depending on the application and the sample's interface with the NIR instrument. Critical measurement parameters associated with robustness often are identified and characterized during method development. Typical measurement parameters include the following:

- Effect of environmental conditions (e.g., temperature, humidity, and vibration)
- Effect of sample temperature
- Sample handling (e.g., probe depth, compression of material, sample depth/thickness, sample presentation)
- Influence of instrument changes (e.g., lamp change, warm-up time)

Ongoing Method Evaluation

~~Validated NIR methods should be subject to ongoing performance evaluation, which may include monitoring accuracy, precision, and other suitable method parameters. If performance is unacceptable, corrective action is necessary. It involves conducting an investigation to identify the cause of change in method performance and may indicate that the NIR method is not suitable for continued use. Improving the NIR method to meet measurement suitability criteria may require additional method development and documentation of validation experiments demonstrating that the improved method is suitable for the intended application. The extent of revalidation required depends on the cause of change in method performance and the nature of corrective action required in order to establish suitable method performance. Appropriate change controls should be implemented to document ongoing method improvement activities.~~

~~Revalidation of a qualitative model may be necessary as a result of the following:~~

- ~~• Addition of a new material to the spectral reference library~~
- ~~• Changes in the physical properties of the material~~
- ~~• Changes in the source of material supply~~
- ~~• Identification of previously unknown critical attribute(s) of material(s)~~

~~Revalidation of a quantitative model may be necessary as a result of the following:~~

- ~~• Changes in the composition of the test sample or finished product~~
- ~~• Changes in the manufacturing process~~
- ~~• Changes in the sources or grades of raw materials~~
- ~~• Changes in the reference analytical method~~
- ~~• Major changes in instrument hardware~~

~~**Outliers**—Sample spectra that produce an NIR response that differs from the qualitative or quantitative calibration model may produce an outlier. This does not necessarily indicate an out-of-specification result; but rather an outlier indicates that further testing of the sample may be required and is dependent on the particular NIR method. If subsequent testing of the sample by an appropriate method indicates that the property of interest is within specifications, then the sample meets its specifications. Outlier samples may be incorporated into an updated calibration model subsequent to execution and documentation of suitable validation studies.~~

Method Transfer

~~Controls and measures for demonstrating the suitability of NIR method performance following method transfer are similar to those required for any analytical procedure. Exceptions to general principles for conducting method transfer for NIR methods should be justified on a case-by-case basis. The transfer of an NIR method is often performed by using an NIR calibration model on a second instrument that is similar to the primary instrument used to develop and validate the method. When a calibration model is transferred to another instrument, procedures and criteria must be applied to demonstrate that the calibration model meets suitable measurement criteria on the second instrument. The selection of an appropriate calibration model transfer procedure should be based on sound scientific judgment.~~

GLOSSARY

~~absorbance, A , is represented by the equation:~~

$$~~A = -\log T = \log(1/T)~~$$

~~where T is the transmittance of the sample. Absorbance is also frequently given as:~~

$$A = -\log(1/R)$$

where R is the reflectance of the sample.

background spectrum is used for generating a sample spectrum with minimal contributions from instrument response. It is also referred to as a *reference spectrum* or *background reference*. The ratio of the sample spectrum to the background spectrum produces a transmittance or reflectance spectrum dominated by NIR spectral response associated with the sample. In reflection measurements, a highly reflective diffuse standard reference material is for the measurement of the background spectrum. For transmission measurement, the background spectrum may be measured with no sample present in the spectrometer or using a cell with the solvent blank or a cell filled with appropriate reference material.

calibration model is a mathematical expression to relate the response from an analytical instrument to the properties of samples.

diffuse reflectance is the ratio of the spectrum of radiated light penetrating the sample surface, interacting with the sample, passing back through the sample's surface, and reaching the detector to the background spectrum. This is the component of the overall reflectance that produces the absorption spectrum of the sample.

fiber optic probes consist of two components: optical fibers that may vary in length and in the number of fibers and a terminus, which contains specially designed optics for examination of the sample matrix.

installation qualification is the documented collection of activities necessary to establish that an instrument is delivered as designed and specified, is properly installed in the selected environment, and that this environment is suitable for the instrument's intended purpose.

instrument bandwidth or resolution is a measure of the ability of a spectrometer to separate radiation of similar wavelengths.

multiple linear regression is a calibration algorithm to relate the response from an analytical instrument to the properties of samples. The distinguishing feature of this algorithm is the use of a limited number of independent variables. Linear least squares calculations are performed to establish a relationship between these independent variables and the properties of the samples.

operational qualification is the process by which it is demonstrated and documented that an instrument performs according to specifications and that it can perform the intended task. This process is required following any significant change such as instrument installation, relocation, or major repair.

overall reflectance is the sum of diffuse and specular reflectance.

partial least squares (pls) is a calibration algorithm to relate instrument responses to the properties of samples. The distinguishing feature of this algorithm is that data concerning the properties of the samples for calibration are used in the calculation of the factors to describe instrument responses.

performance qualification is the process of using one or more well characterized and stable reference materials to verify consistent instrument performance. Performance qualification may employ the same or different standards for different performance characteristics.

photometric linearity, also referred to as *photometric verification*, is the process of verifying

the response of the photometric scale of an instrument.

principal component regression (pcr) is a calibration algorithm to relate the response from an analytical instrument to the properties of samples. This algorithm, which expresses a set of independent variables as a linear combination of factors, is a method of relating these factors to the properties of the samples for which the independent variables were obtained.

pseudo-absorbance, A , is represented by the equation:

$$A = -\log R = \log(1/R)$$

where R is the diffuse reflectance of the sample.

reference spectrum—See *Background Spectrum*.

reflectance is described by the equation:

$$R = I/I_R$$

in which I is the intensity of radiation reflected from the surface of the sample and I_R is the intensity of radiation reflected from a background reference material and its incorporated losses due to solvent absorption, refraction, and scattering.

root-mean-square (rms) noise is calculated by the equation:

$$\text{RMS} = \sqrt{\frac{1}{N} \sum_{i=1}^N (A_i - \bar{A})^2}$$

in which A_i is the absorbance for each data point; \bar{A} is the mean absorbance over the spectral segment; and N is the number of points per segment.

spectral reference library is a collection of spectra of known materials for comparison with unknown materials. The term is commonly used in connection with qualitative methods of spectral analysis (e.g., identification of materials).

specular (surface) reflectance is the reflectance of the front surface of the sample.

standard error of calibration (sec) is a measure of the capability of a model to fit reference data. SEC is the standard deviation of the residuals obtained from comparing the known values for each of the calibration samples to the values that are calculated from the calibration. SEC should not be used as an assessment tool for the expected method accuracy (trueness and precision of prediction) of the predicted value of future samples. The method accuracy should generally be verified by calculating the standard error of prediction (SEP), using an independent validation set of samples. An accepted method is to mark a part of the calibration set as the validation set. This set is not fully independent but can be used as an alternative for the determination of the accuracy.

standard error of cross-validation (secv) is the standard deviation calculated using the leave-one-out method. In this method, one calibration sample is omitted from the calibration, and the

difference is found between the value for this sample calculated from its reference value and the value obtained from the calibration calculated from all the other samples in the set. This process is repeated for all samples in the set, and the SECV is the standard deviation of the differences calculated for all the calibration samples. This procedure can also be performed with a group of samples. Instead of leaving the sample out, a group of samples is left out. The SECV is a measure of the model accuracy that one can expect when measuring future samples if not enough samples are available for the SEP to be calculated from a completely independent validation set.

standard error of the laboratory (sel) is a calculation based on repeated readings of one or more samples to estimate the precision and/or accuracy of the reference laboratory method, depending on how the data were collected.

standard error of prediction (sep) is a measure of model accuracy of an analytical method based on applying a given calibration model to the spectral data from a set of samples different from but similar to those used to calculate the calibration model. SEP is the standard deviation of the residuals obtained from comparing the values from the reference laboratory to those from the method under test for the specified samples. SEP provides a measure of the model accuracy expected when one measures future samples.

surface reflectance, also known as *specular reflection*, is that portion of the radiation not interacting with the sample but simply reflecting back from the sample surface layer (sample-air interface).

transflection is a transmittance measurement technique in which the radiation traverses the sample twice. The second time occurs after the radiation is reflected from a surface behind the sample.

transmittance is represented by the equation:

$$T = I/I_0 \text{ or } T = 10^{-A}$$

in which I is the intensity of the radiation transmitted through the sample; I_0 is the intensity of the radiant energy incident on the sample and includes losses due to solvent absorption, refraction, and scattering; and A is the absorbance.

1. THEORY

Near-infrared (NIR) spectroscopy is a technique with broad and varied applications in pharmaceutical analysis. The NIR spectral region lies between the UV-visible and infrared regions, and at one time was considered the forgotten region of the electromagnetic spectrum. It is a branch of vibrational spectroscopy that shares many of the principles that apply to other spectroscopic techniques. The NIR spectral region comprises two sub-ranges (see *Figure 1*) associated with detectors used in instrumentation. The short-wavelength (Herschel or silicon) region extends from approximately 780 to 1,100 nm ($12,821$ – $9,000$ cm^{-1}), and the longer wavelengths, which fall between 1,100 and 2,500 nm ($9,000$ – $4,000$ cm^{-1}), compose the traditional (lead sulfide) NIR spectral region. It is common to express the wavelength (λ) in nanometers (nm) and the frequency (ν) in reciprocal centimeters (wavenumber) as acquired by the instrument. Usually, Fourier-transform (FT) spectrometers report the wavelength in wavenumber (cm^{-1}), whereas a dispersive, monochromator-based instrument will show the wavelength in nm.

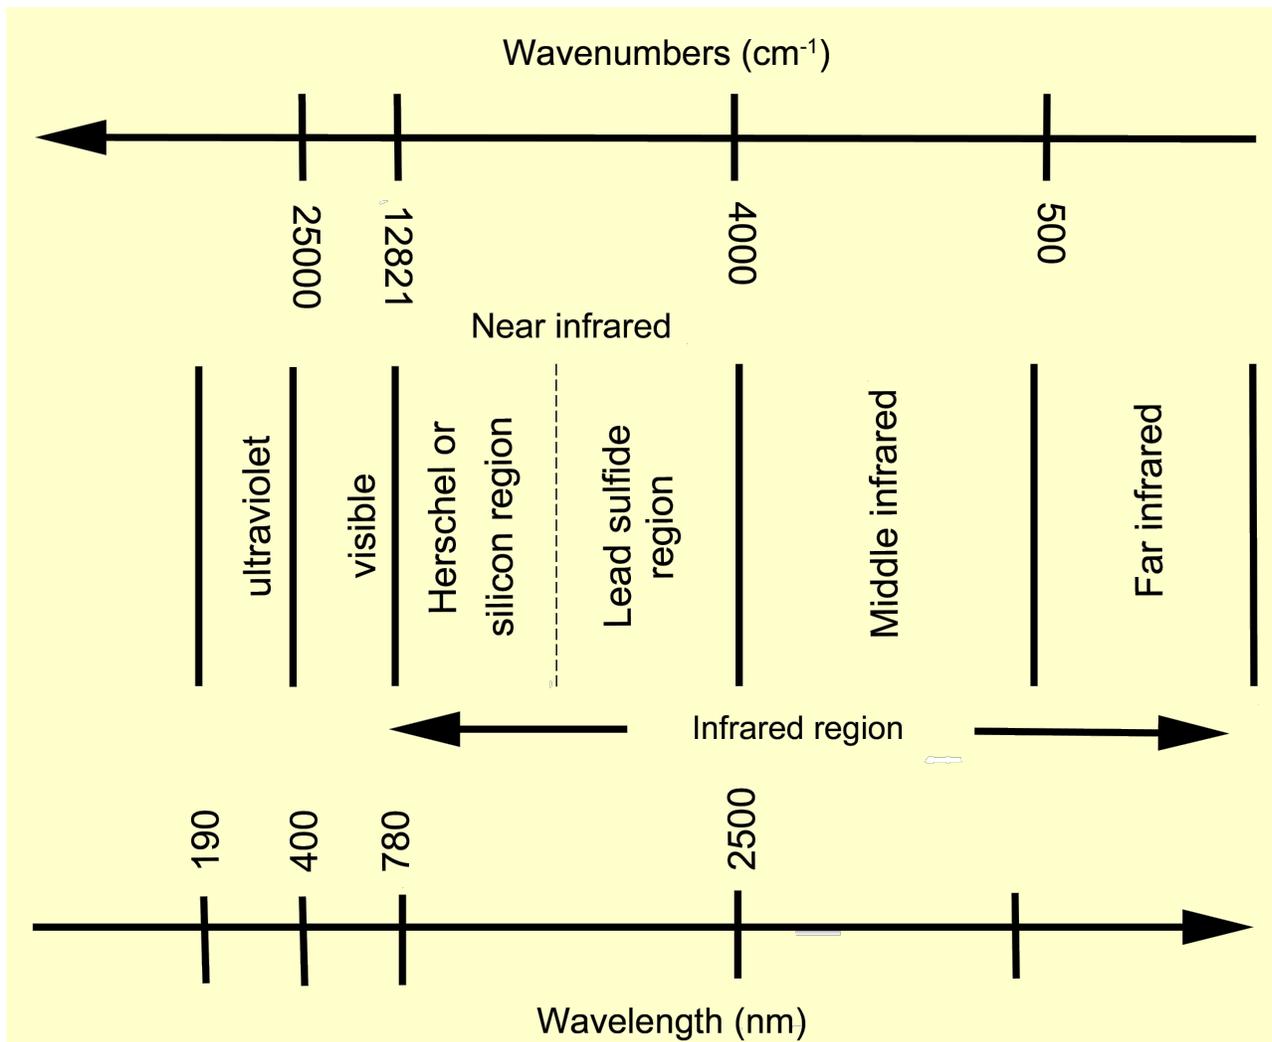

Figure 1. NIR region of the electromagnetic radiation spectrum.

NIR spectra are dominated by C-H, N-H, O-H, and S-H overtone resonances and combinations of fundamental mid-infrared vibrational modes from which they originate. Because molar absorptivities in the NIR range are low, radiation can penetrate several millimeters into materials, including solids. Many materials, such as glass and plastic film, are relatively transparent in this region. Fiber-optic technology is readily implemented in the NIR range, which allows real-time, or near real-time, monitoring of processes in environments that might otherwise be inaccessible. As is the case with other spectroscopy measurements, interactions between NIR radiation and matter provide information that can be useful for both qualitative and quantitative assessment of the chemical composition of samples. In addition, qualitative and quantitative characterization of a sample's physical properties can be made because of the sample's influence on NIR spectra.

Measurements can be made directly on samples *in situ* in addition to applications during standard sampling and testing procedures. Applications of qualitative analysis include identification of raw material, in-process control testing, and finished-product release testing. NIR measurements can be performed off-line, but also at-line, in-line, and on-line for process analytical technology. These applications often involve comparing a NIR spectrum from a sample to a reference spectrum and assessing similarities against acceptance criteria developed

and validated for a specific application. In contrast, applications of quantitative analysis involve the development of a predictive relationship between NIR spectral attributes and sample properties. Because of the highly covariant nature of the NIR signal, these applications typically use chemometrics models to quantitatively predict chemical and/or physical properties of the sample on the basis of its spectral attributes.

2. TRANSMISSION, REFLECTION, AND TRANSFLECTION MODES

The most common measurements performed in the NIR spectral range are transmission and reflection spectroscopy. Incident NIR radiation is absorbed or scattered by the sample and is measured as transmittance or reflectance, respectively.

2.1 Transmission Mode

Transmittance (T) is the intensity ratio of the transmitted radiation (I) to the incident radiation (I_0), which represents the decrease in intensity at given wavelengths when radiation is passed through the sample. The sample is placed in the optical beam between the source and the detector. The arrangement is analogous to that in many conventional spectrophotometers, and the result can be presented directly in terms of transmittance and/or absorbance (A). NIR spectra are usually measured in absorbance (A).

$$T = \frac{I}{I_0} \quad \text{or} \quad T = 10^{-A}$$

I = intensity of transmitted radiation

I_0 = intensity of incident radiation

The measurement of transmittance is dependent on a background transmittance spectrum for its calculation. Examples of background references include air, a polymeric disc, an empty cell, a solvent blank, or in special cases, a reference sample. The method generally applies to liquids (diluted or undiluted), dispersions, solutions, and solids including tablets and capsules. For transmittance measurements of solids, a suitable sample accessory is to be used. Tablets and capsules can be analyzed using suitably engineered holders, thereby ensuring reproducible measurements. Liquid samples are examined in a cell of suitable path length (typically 0.5–4 mm) that is transparent to NIR radiation, or alternatively by immersion of a fiber-optic probe of a suitable configuration.

2.2 Reflectance Modes

2.2.1 REFLECTANCE

Reflectance (R) is the ratio of the intensity of light reflected from the sample, I , to that reflected from a background or reference reflective surface, I_R .

It is composed of both the specular (mirror) and the diffuse components (see *Figure 2*).

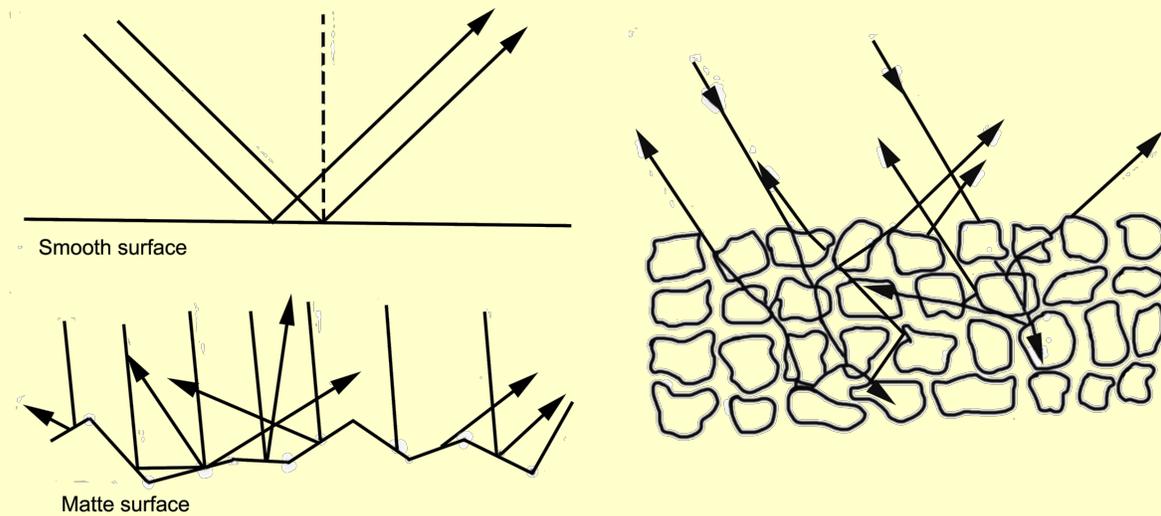

Figure 2.

The determination of reflectance requires the measurement of a reference reflection spectrum to determine the attenuation of reflected light relative to the unattenuated incident beam. The reflectance spectrum is calculated as the ratio of the single-beam spectrum of the sample to that of the reference material.

$$R = \frac{I}{I_R}$$

I = intensity of light diffusively reflected from the sample

I_R = intensity of light reflected from the background or reference reflective surface

Most reflection measurements in the NIR spectral region are made of scattering samples such as powders and slurries. For such materials, NIR radiation can penetrate a substantial distance into the sample, where it can be absorbed when the wavelength of the radiation corresponds to a transition between the ground vibrational state of the analyte and either a harmonic of a given vibrational mode (an overtone) or the sum of two or more different modes (a combination band). Nonabsorbed radiation is scattered back from the sample to the detector. NIR reflectance spectra are accessed by calculating and plotting $\log(1/R)$ versus wavelength. This logarithmic form is the pseudo-absorbance of the material and is commonly called absorbance.

2.2.2 DIFFUSE REFLECTION

The diffuse reflection mode gives a measure of reflectance (R), (penetrating the sample surface, interacting with the sample, and passing back through the sample's surface) which is the ratio of the intensity of light reflected from the sample (I) to that reflected from a background or reference reflective surface (I_r), where by using careful instrumental design, the specular component is often excluded. NIR radiation can penetrate a substantial distance into the sample, where it can be absorbed by vibrational combinations and overtone resonances of the analyte species present in the sample. Nonabsorbed radiation is partially reflected back from the sample to the detector.

$$R = \frac{I}{I_r}$$

I = intensity of light diffusively reflected from the sample

I_r = intensity of light reflected from the background or reference reflective surface

This mode generally applies to solids. The sample is examined in a suitable device. For process monitoring, material can be analyzed through a polished glass (e.g., sapphire) window interface, or using an in-line probe. Care must be taken to ensure that the measuring conditions are as reproducible as possible from one sample to another. The reflected radiation of a background reference is scanned to obtain the baseline, and then the reflectance of one or more analytical samples is measured. Common reflectance references include ceramic tiles, thermoplastic resins, and gold. Other suitable materials may be used. In some process-analysis situations, it may be impossible to remove a probe for reference background data collection; in these cases, consider various options including internal referencing; measurement of a background reference using a second detector; and others. Only spectra measured against a background possessing the same optical properties can be compared directly with one another.

2.3 Transflection Mode

The term transflection (T^*) is used to describe any double-pass transmission technique. Transflection spectrometry is a hybrid of transmission and reflection wherein a reflector is placed behind the sample so that the optical path through the sample and back to the detector is doubled, compared with a transmission measurement of a sample of the same thickness. Nonabsorbed radiation is reflected back from the sample to the detector. The light may be reflected from a diffuse or specular (mirror) reflector placed behind the sample.

$$T^* = \frac{I}{I_{T^*}}$$

I = intensity of translected radiation measured with the sample

I_{T^*} = intensity of translected radiation of the reference material as background

This mode generally applies to liquids and clear plastic materials. This configuration can be adapted to share the same instrument geometry with reflectance and fiber-optic probe systems where the source and the detector are on the same side of the sample. The sample is examined through a cell with a mirror or a suitable diffusive reflector made of either metal or an inert substance (e.g., dried titanium dioxide) not absorbing in the NIR region. Liquids can also be measured using in-line transfectance probes to increase intensity levels for more sensitive applications.

3. FACTORS THAT AFFECT NIR SPECTRA

NIR spectroscopy is advantageous because, as a result of lower molar absorptivities in this region of the electromagnetic spectrum, accurate measurements can often be made quickly without destroying the sample, and with minimal or no sample preparation; this applies whether the samples are solid, semi-solid, liquid, or gas. The NIR spectrum contains information on overtone resonances and fundamental vibrational modes of the sample that can yield both sample and process understanding. Samples may be analyzed directly through packaging or directly in media that is transparent to wavelengths in the NIR spectral region. In addition, by definition NIR spectra are produced using the corresponding NIR radiation, and therefore

standard glass/quartz and fiber optics may be used.

The following discussion is not exhaustive, but it includes many of the major factors that affect NIR spectra.

3.1 Environmental Factors

The environmental temperature and humidity must be considered before carrying out measurements. Ideally, ambient conditions will be controlled to meet the operating specifications of the instrument manufacturer. However, tighter controls may not always be practical to the degree necessary for the application, and as such, another justifiable means of accounting for the influence of the environment (e.g., spectral pre-processing) should be utilized, with frequent verification. This is particularly relevant when considering the effect of temperature when using fiber-optic probes.

3.2 Sampling Factors

Depending on the measurement mode, sample preparation and presentation can vary. The following requirements must be met for all sampling techniques:

- Find the best suitable measurement mode for the intended application (transmission, diffuse reflection, or transflection);
- Find the best suitable accessory (e.g., transmission or immersion probes);
- Optimize path length in transmission and transflection modes;
- Find a suitable spectroscopic background reference sample;
- Show that the background reference sample is reliable over time and that the measurement of the background is reproducible and stable over time;
- When measuring moving materials or samples (for process-related measurements) it is important to obtain a representative spectrum (e.g., by adjusting the measuring time or number of scans, by co-adding individual spectra, or by increasing the beam size);
- Ensure that there is not fouling of the sensor, for example with build-up of material or contamination;
- When measuring through packaging material, consider the variability of content and thickness.

3.2.1 SAMPLE PRESENTATION AREA

The sample presentation area or probe end must be clean and free of residue prior to the measurement. Similarly, the in-line or on-line interface to the sample should not have significant product or contamination build-up, which would interfere with the desired measurement.

3.2.2 SAMPLE TEMPERATURE

Sample temperature influences spectra obtained from aqueous solutions and other hydrogen-bonded liquids, and a difference of a few degrees may result in significant spectral changes. Temperature may also affect spectra obtained from less polar liquids, as well as solids that contain solvents and/or water.

3.2.3 MOISTURE AND SOLVENT

Moisture and solvent that are present in the sample material and analytical system may change the spectrum of the sample. Both absorption by moisture and solvent and their influence on hydrogen bonding of the active pharmaceutical ingredients and excipients can change the NIR spectrum.

3.2.4 SAMPLE THICKNESS

Sample thickness is a known source of spectral variability and must be understood and/or controlled, particularly for tablet and capsule analysis in transmittance mode. The sample thickness in transmission mode is typically controlled by using a fixed optical path length for the sample. In diffuse reflection mode, the sample thickness is typically controlled by using samples that are "infinitely thick" relative to the detectable penetration depth of NIR light into a solid material. Here, the term infinite thickness implies that the reflection spectrum does not change if the thickness of the sample is increased. For the measurement of compressed powders, an infinite thickness is typically reached after 5 mm of sample depth (e.g., in a filled vial).

3.2.5 SAMPLE OPTICAL PROPERTIES

With solids, both surface and bulk scattering properties of calibration standards and analytical samples must be taken into account. Surface morphology and refractive index properties affect the scattering properties of solid materials. For powder materials, particle size and bulk density influence scattering properties and the NIR spectrum. The spectra of physically, chemically, or optically heterogeneous samples may require sample averaging, examination of multiple samples, or spinning the sample to obtain a representative spectrum of the sample. Certain factors, such as differing degree of compaction or particle size in powdered materials and surface finish, can cause significant spectral differences.

3.2.6 SOLID-STATE FORMS

The variations in solid-state forms (polymorphs, hydrates, solvates, and amorphous forms) influence vibrational spectra. Hence, different crystalline forms as well as the amorphous form of a solid may be distinguished from one another on the basis of their NIR spectra. Where multiple crystalline forms are present, care must be taken to ensure that the calibration samples have a distribution of forms relevant to the intended application.

3.2.7 AGE OF SAMPLES

Samples may exhibit changes in their chemical, physical, or optical properties over time. Depending on the storage conditions, solid samples may either absorb or desorb water, and portions of amorphous materials may crystallize. Materials used for NIR calibration are representative of future samples and their matrix variables. Hence, care must be taken to ensure that samples for NIR analysis are representative.

4. PRETREATMENT OF NIR SPECTRAL DATA

NIR spectral data to be used in qualitative or quantitative applications often need pre-processing to attenuate environmental or sampling factors, enhance a certain signal, or for other purposes that may include transformation, normalization, or other mathematical treatment. Pre-processing of samples (rows of data) may include mean or median centering, scaling, and other procedures. NIR responses (columns of data) also can be transformed, centered, or scaled. Because of the highly covariant nature of the NIR signal, it is common to remove linear or polynomial trends or apply filtering or smoothing techniques such as derivatives, wavelets, or a Savitzky-Golay filter. Spectral pretreatment techniques may include the numerical calculation of the first- or second-order derivative of the spectrum. Higher-order derivatives are not recommended because of increased spectral noise.

5. INSTRUMENTATION

5.1 Apparatus

All NIR measurements result from exposing material to incident NIR light radiation and measuring the attenuation of the emerging (transmitted, scattered, or reflected) light.

Spectrophotometers for measurement in the NIR region consist of a suitable light source, such as a highly stable quartz-tungsten lamp, a monochromator or interferometer, and a detector. Common monochromators are acousto-optical tunable filters, gratings, or prisms. Traditionally, many NIR instruments have had a single-beam design, although some process instruments use internal referencing and can therefore be dual beam (for example, in diode-array instruments). Silicon, lead sulfide, and indium gallium arsenide are examples of detector materials. Examples of sampling devices include conventional cuvette sample holders, fiber-optic probes, transmission dip cells, neutral borosilicate vials, and spinning or traversing sample holders. The choice is made on the basis of the intended application, with particular attention paid to the suitability of the sampling system for the type of sample to be analyzed. Suitable data processing and evaluation units (e.g., software and computer) are usually part of the system.

5.2 Specialized Techniques

In addition to conventional NIR spectrometry, there are several more specialized NIR-based techniques.

5.2.1 IMAGING TECHNIQUES

Within a given material, the distribution of the various compounds can be characterized three dimensionally by using imaging. Use of NIR imaging allows for the collection of detailed chemical information. NIR microscopy techniques have the following advantages:

- No preparation of the sample required
- Good spatial resolution
- Clear image quality
- Outstanding chemical differentiation

It is possible to collect a signal from the entire sample (e.g., a tablet), disperse it into a spectrum using a spectrometer, and detect the spectrum using a multi-channel detector such as a charge couple detector or photo-diode array. In this case, instead of obtaining trivial cumulative information about the spot signal intensity, one can obtain a signal spectrum which can be transformed into detailed information about the chemical composition of the given spot on a sample. The three-dimensional array of data sets, two spatial and one spectral, recorded in such an imaging measurement has become known as a hypercube or data cube. These microscopy systems are capable of determining a spatial resolution down to approximately 1–5 μm .

NIR imaging systems are capable of characterizing the structure and distribution of the active components, and excipients within formulations, dosage forms, and delivery devices, to name a few. For example, chemical mapping for homogeneity testing of solid oral dosage forms, creams, and ointments may be useful in select applications.

5.3 Calibration Considerations

NIR instrument calibration involves three components: wavelength accuracy and uncertainty

(x-axis); photometric linearity and response stability (y-axis); and photometric noise. *Table 1* provides an overview of performance verification criteria for a wide range of NIR systems.

5.3.1 WAVELENGTH ACCURACY AND UNCERTAINTY (X-AXIS)

In the case of FT-NIR instruments, primary wavelength-axis calibration is maintained, at least to a first approximation, with an internal helium–neon laser. Suitable materials for demonstrating wavelength-dispersion performance include methylene chloride, talc *R*, spectral calibration lamps, polystyrene, mixtures of rare earth oxides, and absorption by water vapor for instruments that use an interferometer for wavelength dispersion. A certified traceable standard [Standard Reference Material (SRM) 2035a] is available from the National Institute of Standards and Technology (NIST) for transmittance measurements and can be used for wavelength verification. Other suitable standards may also be used. Instrument manufacturers may use polystyrene films (thickness of 0.75–2 mm) as an internal standard for wavelength qualification and control. However, because of the weak asymmetric signals emanating from polystyrene at short wavelengths, this material may not be suitable as a reference standard across the whole NIR range. When choosing an appropriate reference standard, it is important to confirm that the operating parameters (e.g., resolution, band width, and others) are within the limits of the certified material.

The effect of temperature on assignment of wavelength must be taken into account. Typically, standards are measured in environments near 25^o, and the temperature at which certified values were taken will be indicated. The effect of resolution can also have an impact on the measured values. Resolution for NIR spectrometers is typically 8 cm⁻¹, but modern spectrometers are capable of higher resolutions (2 cm⁻¹ or 1 cm⁻¹).

Standard certificates will indicate resolution and possibly even peak assessment algorithms. The choice of reference standard for a performance test should always match the resolution and environmental conditions expected for the execution of the test. Additional standards may be necessary, depending on the range of wavelengths or reference standards meeting these conditions.¹ Refer to *Table 1* for additional information.

5.3.2 PHOTOMETRIC LINEARITY AND RESPONSE STABILITY (Y-AXIS)

Calibration of the photometric axis can be critical for successful quantification. Both FT-NIR and dispersive NIR spectrometers should undergo similar calibration procedures. The tolerance of photometric precision acceptable for a given measurement should be assessed during the method development and validation stages.

NIR spectra from samples and/or reference standard materials with known relative transmittance or reflectance can be used to demonstrate a suitable relationship between NIR light attenuation (resulting from absorption) and instrument response. Verification of photometric linearity and verification of photometric noise are not required for instruments using methods to perform simple identifications that do not use the photometric absorbance as part of the model strategy (e.g., simple correlation with absorbing wavelengths). The USP Near IR System Suitability Reference Standard or the NIST SRM 2036 are recommended, but other certified traceable standards exist in the market and may be used. For reflectance measurements, commercially available reflectance standards with known reflectance properties are often used.

Spectra obtained from reflection standards are subject to variability because the experimental

conditions under which they were factory calibrated differ from those under which they are subsequently put to use. Hence, the reflectance values supplied with a set of calibration standards may not be useful in the attempt to establish an "absolute" calibration for a given instrument. The reproducibility of the photometric scale will be established over the range of standards provided that 1) the standards do not change chemically or physically, 2) the same reference background is also used to obtain the standard values, and 3) the instrument measures each standard under identical conditions (including precise sample positioning). Subsequent measurements on the identical set of standards provide information on long-term stability.

Photometric linearity is demonstrated by using a set of transmission or reflection standards with known values for percentage transmittance or reflectance. For reflectance measurements, carbon-doped polymer standards are available. It is important to ensure that the absorbance of the materials used is relevant to the intended linear working range of the method. Nonlinear calibration models, which are acceptable, may be used, as long as the user can demonstrate adequate justification for this approach.

Spectra obtained from reflectance standards are subject to variability due to the differences between the experimental conditions under which they were factory-calibrated and those under which they are subsequently put to use. Hence, the percentage reflectance values supplied with a set of calibration standards may not be useful in the attempt to establish an "absolute" calibration for a given instrument. As long as the standards do not change chemically or physically, and the same reference background is used as was used to obtain the certified values, subsequent measurements of the same standards under identical conditions (including precise sample positioning) give information on long-term stability of the photometric response.

Table 1. Control of Instrument Performance

Measurement Mode	Reflection	Transflection	Transmission
Verification of wavelength scale (except for filter apparatus)	Typical tolerances for agreement with standard values are ± 1.0 nm from approximately 700–2000 nm and ± 1.5 nm above 2000 nm to approximately 2500 nm (± 8 cm^{-1} below 5000 cm^{-1} and ± 4 cm^{-1} from 5000 cm^{-1} to approximately 14 000 cm^{-1}). For the reference material used, apply the tolerance for the nearest wavelength (or wavenumber) from the above for each peak used. For diode-array instruments, most often the pixel resolution (wavelength between pixels) can be as large as 10 nm. The pixel resolution must be adapted to match the spectral resolution. The peak-finding algorithms are critical to wavelength accuracy. Practically, ± 2 nm is appropriate for peak wavelength accuracy using such instrumentation. Alternatively, refer to manufacturer's specifications for acceptance.		

<p>Bench/mobile instrument</p>	<p>Measure talc <i>R</i> via a suitable medium or by fiber-optic probe. Talc <i>R</i> has suitable for calibration, characteristic peaks at 948, 1391, 2077, and 2312 nm. Alternatively, other suitable standards may also be used that ensure wavelength accuracy in the region of working methodology. For example, measure an internal polystyrene standard if built in, or measure a NIST standard or other traceable material (e.g., USP Near IR System Suitability RS) and assess 3 peaks across the wavelength range for calibration.</p>	<p>A suspension of 1.2 g of dry titanium dioxide <i>R</i> in about 4 mL of methylene chloride <i>R</i> is used directly through the cell or using a probe. Titanium dioxide has no absorption in the NIR range. Spectra are recorded with a maximum nominal instrument bandwidth of 10 nm at 2500 nm (16 cm^{-1} at 4000 cm^{-1}). Methylene chloride has characteristic sharp bands at 1155, 1366, 1417, 1690, 1838, 1894, 2068, and 2245 nm. Choose 3 peaks across the wavelength range for calibration. Other suitable standards may also be used, such as TS5 liquid mixed with titanium dioxide or some other reflective medium.</p>	<p>Methylene chloride <i>R</i> may be used and has characteristic sharp bands at 1155, 1366, 1417, 1690, 1838, 1894, 2068, and 2245 nm. Choose 3 peaks across the wavelength range for calibration. Other suitable standards may also be used, such as TS5 liquid.</p>
<p>Process instrument</p>	<p>If it is not practically possible to measure a traceable standard material at the point of sample measurement, use internal material such as polystyrene, fiberglass, or solvent and/or water vapor. Alternatively, adopt a second external fiber/probe. For FT instruments, the calibration of the wavenumber scale may be performed using a narrow, isolated water-vapor line, for example, the line at 7306.74 cm^{-1}, or 7299.45 cm^{-1}, or 7299.81 cm^{-1} or a narrow line from a certified reference material.</p>		
<p>Verification of wavelength repeatability (except for filter apparatus)</p>	<p>The standard deviation of the wavelength is consistent with the specifications of the instrument manufacturer, or otherwise scientifically justified.</p>		
<p>Bench/mobile instrument</p>	<p>Verify the wavelength repeatability using a suitable external or internal standard.</p>		
<p>Process instrument</p>	<p>Verify the wavelength repeatability using a suitable external or internal standard.</p>		
<p>Verification of photometric linearity and response stability⁽¹⁾</p>	<p>Measure 4 photometric standards across the working method absorbance range.</p>		

Bench/mobile instrument	Analyze 4 reference standards, for example in the range of 10%–90%, including 10%, 20%, 40%, and 80% with respective absorbance values of 1.0, 0.7, 0.4, and 0.1. Evaluate the observed absorbance values against the reference absorbance values, for example perform a linear regression. Acceptable tolerances are 1.00 ± 0.05 for the slope and 0.00 ± 0.05 for the intercept for the first verification of photometric linearity of an instrument. Subsequent verifications of photometric linearity can use the initial observed absorbance values as the reference values.	
Process instrument	If photometric reflectance standards cannot be measured at the point of sample measurement, use the manufacturer's internal photometric standards. Process instruments can use internal photometric standards for photometric linearity. Follow the manufacturer's verified tolerances in such cases.	Analyze 4 reference standards to cover the absorbance values over the working absorbance range of the modelled data. Evaluate the observed absorbance values against the reference absorbance values, for example perform a linear regression. Acceptable tolerances are 1.00 ± 0.05 for the slope and 0.00 ± 0.05 for the intercept for the first verification of photometric linearity of an instrument. Subsequent verifications of photometric linearity can use the initial observed absorbance values as the reference values.
Verification of photometric noise	Determine the photometric noise using a suitable reflectance standard, for example white reflective ceramic tiles or reflective thermoplastic resins (for example, PTFE). Follow the manufacturer's methodology and specifications.	
Bench/mobile instrument	Scan the reflectance low-flux (e.g., 10% reflectance) standard over a suitable wavelength range in accordance with the manufacturer's recommendation and calculate the photometric noise as peak-to-peak noise.	
Process instrument	As above, or if not practically possible, use manufacturer's internal standard for noise testing and specifications.	Scan the transmittance high-flux standard over a suitable wavelength/wavenumber range in accordance with the manufacturer's recommendation and calculate the photometric noise as peak-to-peak noise.

5.3.3 EXTERNAL CALIBRATION

Detailed functional validation employing external reference standards is recommended to demonstrate instrumental suitability of laboratory instruments, even for instruments that

possess an internal calibration approach. The use of external reference standards does not obviate the need for internal quality-control procedures; rather, it provides independent documentation of the fitness of the instrument for the specific analysis or purpose. For instruments installed in a process location or in a reactor where positioning of an external standard routinely is not possible, including those instruments that employ an internal calibration approach, the relative performance of an internal versus an external calibration approach should be evaluated periodically. The purpose of this test is to check for changes or drifts in components (e.g., the process lens or fiber-optic probe) that might not be included in the internal calibration method; this could affect the photometric calibration of the optical system, for example.

5.3.4 MULTI-INSTRUMENT CALIBRATION

There are many approaches for ensuring a transferable calibration across multiple instruments of the same type (same make and model) and different types. This is an area of growing interest because of the globalization of manufacturing and regulatory controls. Today, reference standards have been developed to cover this region, but many deficiencies still exist regarding wavelength uncertainty and photometric response curves. Therefore, verification of compendial procedures, method transfers, and spectrometer platform changes is compromised by the bias involved in differences between instruments. Understanding the risk associated with these variations should be a part of any quality-by-design initiative to use NIR spectroscopic procedures for product control.

The use of appropriate certified reference materials can be helpful in establishing instrumental variance and/or bias. As stated above, the value assignments included on the certification of such materials will contain significant contributions to the overall expanded uncertainty budget from the instrumental factors used in generating these values. For example, the optical geometry, polarization, and other aspects of a reflectance measurement will significantly affect the measured value, and therefore wherever possible these characteristics should be matched to the required measurement configuration. However, by definition, a reference material should have the essential characteristics of appropriate stability and homogeneity to at least allow comparative measurements to be made, albeit they may be biased by known or unknown factors.

6. APPLICATIONS

NIR spectroscopy has a wide variety of applications for chemical, physical, and process analysis.

For chemical analysis, the applications include:

- Identification of active substances, excipients, dosage forms, manufacturing intermediates, chemical absorbance materials, and packaging materials;
- Qualification of ingredients, intermediates, and drug products, including batch-to-batch spectral comparison and supplier change assessment;
- Quantification of active substances and excipients; determination of chemical values such as hydroxyl value; determination of absolute water content; determination of degree of hydroxylation; and control of solvent content.

For physical analysis, the applications include:

- Crystalline form and crystallinity, polymorphism, solvates, and particle size;

- Dissolution behavior, disintegration pattern, and hardness;
- Examination of film properties.

For process analysis, the applications include:

- Monitoring of unit operations such as synthesis, crystallization, blending, drying, granulation, and coating, for the purpose of process control.

Measurements in the NIR spectral region are influenced by many chemical and physical factors. The reproducibility and relevance of the results depend on the control of these factors. Usually, measurements are only valid for a defined system.

6.1 Qualitative Analysis: Identification and Characterization

6.1.1 ESTABLISHMENT OF A SPECTRAL REFERENCE LIBRARY

To establish a spectral reference library, record the spectra of a suitable number of representative samples of the substance; the samples should have known, traceable identities. These representative samples should exhibit the variation that is typical for the substance to be analyzed (e.g., variation in solid-state form and particle size). The set of spectra obtained represents the information that can be used for chemical and/or physical identification of the sample to be analyzed.

The collection of spectra in the library may be represented in different ways, which are defined by the mathematical technique used for identification. These may be:

- All individual spectra representing the substance;
- A mean spectrum of the measured batches for each chemical substance or physical form;
- If necessary, a description of the variability within the substance spectra.

The number of substances to be included in the library depends on the specific application. All spectra in the library will have the same spectral range and number of data points; technique of measurement; and data pretreatment. If subgroups (libraries) are created, the above criteria should be applied independently to each group. Origin spectral data for the preparation of the spectral library must be archived. Caution must be exercised when performing any mathematical transformation, as artifacts can be introduced or essential information can be lost. The suitability of the algorithm chosen should be demonstrated by successful method validation, and in all cases, the rationale for the use of transformation must be documented.

6.1.2 NIR REFERENCE SPECTRA

NIR references provide known, stable measurements to which other measurements can be compared; thus they are used to minimize instrumental and environmental variations that would affect the measurement. Direct comparison of representative spectra of the substance to be examined and a reference substance for qualitative chemical or physical identification purposes may not require use of a reference spectral library, where specificity permits.

6.1.3 DATA EVALUATION

Direct comparison is made between the representative spectrum of the substance to be examined and the individual or mean reference spectra of all substances in the database on the basis of their mathematical correlation or other suitable algorithms. A set of known reference mean spectra and the variability around this mean can be used with an algorithm for classification; alternatively, this can be achieved visually by overlaying spectral data if

specificity is inherent. Different calibration techniques are available, such as principal component analysis, cluster analysis, and soft independent application which has to be validated according to the following.

6.1.3.1 Validation of the model: Chemical or physical identification methods using direct spectral comparison must be validated in accordance with identification method validation procedures. The validation parameters for qualitative methods are robustness and specificity.

6.1.3.2 Relative comparison of spectra: A calibration is not required when comparing a set of spectra for limit analysis purposes, such as determining the maximum or minimum absorbance at which an analyte absorbs. Also, in-process control of a drying operation may use a qualitative approach around a specific absorbing wavelength. Appropriate spectral ranges and pretreatments (if used) must be shown to be fit for purpose.

6.1.3.3 Specificity: The relative discriminatory power and selectivity of a limit test must be demonstrated. The extent of specificity testing is dependent on the application and the risks being controlled. Variations in matrix concentrations within the operating range of the method must not affect the measurement.

6.2 Trend Analysis

6.2.1 RELATIVE COMPARISON OF SPECTRA

A calibration is not necessarily required when comparing a set of spectra for trend analysis purposes, for example, using the moving-block approach to estimate statistical parameters such as mean, median, and standard deviation. For example, blend-uniformity monitoring using NIR spectroscopy has adopted such data analysis approaches. Appropriate spectral ranges and algorithms must be used for trend analyses.

6.2.2 SPECIFICITY

The relative discriminatory power and selectivity for trend analysis must be demonstrated. The extent of specificity testing is dependent on the application and the risks being controlled. Variations in matrix concentrations within the operating range of the method must not affect the trend analysis.

6.3 Quantitative Analysis

6.3.1 SPECTRAL REFERENCE LIBRARY FOR A CALIBRATION MODEL

Calibration is the process of constructing a mathematical model to relate the response from an analytical instrument to the properties of the samples. Any calibration model that can be defined clearly in a mathematical expression and gives suitable results can be used. Record the spectra of a suitable number of representative samples with known or future-established values of the attribute of interest (for example, content of water) throughout the range to be measured. The number of samples for calibration will depend on the complexity of the sample matrix and interferences (e.g., temperature, particle size, and others). It is encouraged to take a risk management approach to identify critical interferences that may need to be assessed. All samples must give quantitative results within a calibration interval as defined by the intended purpose of the method. Multiple linear regression, principal component regression (PCR), and partial least squares regression (PLS) are commonly used. For PLS or PCR calibrations, the regression coefficients and/or the loadings should be plotted, and the regions of large coefficients or loadings should be compared with the spectrum of the analyte. Predicted

residual error sum of squares plots or similar plots are useful for facilitating the optimization of the number of PCR or PLS factors.

6.3.2 PRETREATMENT OF DATA

Wavelength selection, or exclusion of certain wavelength ranges, may enhance the efficiency of calibration models. Wavelength compression (wavelength averaging) techniques may be applied to the data.

6.3.3 MODEL VALIDATION PARAMETERS

Analytical performance characteristics to be considered for demonstrating the validation of NIR methods are similar to those required for any analytical procedure. Specific acceptance criteria for each validation parameter must be consistent with the intended use of the method. Validation parameters for quantitative methods are accuracy, linearity, precision (repeatability and intermediate precision), robustness, and specificity.

6.3.4 ONGOING MODEL EVALUATION

NIR models validated for use are subjected to ongoing performance evaluation and monitoring of validation parameters. If discrepancies are found, corrective action is necessary.

7. PROCEDURE VALIDATION

Validation of NIR methods will follow the same protocols described in the general chapter *Validation of Compendial Procedures* (1225) in terms of accuracy, precision, and other suitable parameters.

Detector linearity must be confirmed over the range of possible signal levels. Method precision must also encompass sample position. The sample presentation is a critical factor for both solids and liquids, and must be either tightly controlled or accounted for in the calibration model. Sample-position sensitivity can often be minimized by appropriate sample preparation or sample holder geometry, but will vary from instrument to instrument on the basis of excitation and optical configuration. In addition, many suitable chemometric algorithms for data pretreatment and calibration are available. Selection of an algorithm should be based on sound scientific judgment and suitability for the intended application.

7.1 Ongoing Method Evaluation

Validated NIR methods should be subject to ongoing performance evaluation, which may include monitoring accuracy, precision, and other suitable method parameters. If performance is unacceptable, corrective action is necessary. This involves conducting an investigation to identify the cause of change in method performance, and may indicate that the NIR method is not suitable for continued use. Improving the NIR method to meet measurement suitability criteria may require additional method development and documentation of validation experiments demonstrating that the improved method is suitable for the intended application. The extent of revalidation that is required depends on the cause of change in method performance and the nature of corrective action needed to establish suitable method performance. Appropriate change controls should be implemented to document ongoing method improvement activities.

Revalidation of a qualitative model may be necessary as a result of the following:

- Major changes in instrument hardware
- Addition of a new material to the spectral reference library
- Changes in the physical properties of the material
- Changes in the source of material supply
- Identification of previously unknown critical attribute(s) of material(s)

Revalidation of a quantitative model may be necessary as a result of the following:

- Changes in the composition of the test sample or finished product
- Changes in the manufacturing process
- Changes in the sources or grades of raw materials
- Changes in the reference analytical method
- Major changes in instrument hardware

7.2 Method Transfer

Controls and measures for demonstrating the suitability of NIR method performance following method transfer are similar to those required for any analytical procedure. Any exceptions to general principles for conducting method transfer for NIR methods should be justified on a case-by-case basis. The transfer of a NIR method is often performed by using a NIR calibration model on a second instrument that is similar to the primary instrument used to develop and validate the method. When a calibration model is transferred to another instrument, procedures and criteria must be applied to demonstrate that the calibration model meets suitable measurement criteria on the second instrument. The selection of an appropriate calibration-model transfer procedure should be based on sound scientific judgment.

8.APPENDIX: GLOSSARY

Absorbance: absorbance (A) is represented by the equation

$$A = -\log T = \log (1/T)$$

where T is the transmittance of the sample. Absorbance is also frequently given as

$$A = \log (1/R)$$

where R is the reflectance of the sample.

Background spectrum: this is used for generating a sample spectrum with minimal contributions from instrument response; it is also referred to as a "reference spectrum" or "background reference." The ratio of the sample spectrum to the background spectrum produces a transmittance or reflectance spectrum dominated by NIR spectral response associated with the sample. In reflection measurements, a highly reflective, diffuse standard reference material is used for the measurement of the background spectrum. For transmission measurement, the background spectrum may be measured with no sample present in the spectrometer or using a cell with the solvent blank or a cell filled with appropriate reference material.

Diffuse reflectance: ratio of the spectrum of radiated light (penetrating the sample surface, interacting with the sample, and passing back through the sample's surface) reaching the

detector to the background spectrum. This is the component of the overall reflectance that produces the absorption spectrum of the sample.

Fiber-optic probes: these consist of two components: optical fibers that may vary in length and number, and a terminus, which contains specially designed optics for examination of the sample matrix.

Installation qualification: the documented collection of activities necessary to establish that an instrument is delivered as designed and specified and is properly installed in the selected environment, which is suitable for the instrument's intended purpose.

Instrument bandwidth or resolution: a measure of the ability of a spectrometer to separate radiation of similar wavelengths.

Operational qualification: the process of demonstrating and documenting that an instrument performs according to specifications and that it can perform the intended task. This process is required following any significant change, such as instrument installation, relocation, or major repair.

Overall reflectance: the sum of diffuse and specular reflectance.

Performance qualification: the process of using one or more well-characterized and stable reference materials to verify consistent instrument performance. Performance qualification may employ the same or different standards for different performance characteristics.

Photometric linearity: also referred to as "photometric verification," it is the process of verifying the response of the photometric scale of an instrument.

Pseudo-absorbance: A , is represented by the equation

$$A = -\log R = \log (1/R)$$

where R is the diffuse reflectance of the sample.

Reference spectrum: see *Background spectrum*.

Reflectance: is described by the equation:

$$R = \frac{I}{I_R}$$

in which I is the intensity of radiation reflected from the surface of the sample and I_R is the intensity of radiation reflected from a background reference material and its incorporated losses due to solvent absorption, refraction, and scattering.

Root-mean-square (RMS): calculated using the equation

$$\text{RMS} = \sqrt{\sum_{i=1}^N \frac{(\hat{A} - A_i)^2}{N}}$$

where \hat{A} is the mean absorbance over the spectral segment, A_i is the absorbance for each data point, and N is the number of points per segment.

Specular (surface) reflectance: the reflectance from the front surface of the sample, where the angle of reflection matches the angle of incidence (mirror effect).

Standard error of calibration (SEC): a measure of the capability of a model to fit reference data. SEC is the standard deviation of the residuals obtained from comparing the known values for each of the calibration samples to the values that are calculated from the calibration. SEC should not be used as an assessment tool for the expected method accuracy (trueness and precision of prediction) of the predicted value of future samples. The method accuracy should generally be verified by calculating the *Standard error of prediction (SEP)* using an independent validation set of samples. An accepted method is to mark a part of the calibration set as the validation set. This set is not fully independent but can be used as an alternative for the determination of the accuracy.

Standard error of the laboratory (SEL): a calculation based on repeated readings of one or more samples to estimate the precision and/or accuracy of the reference laboratory method, depending on how the data were collected.

Standard error of prediction (SEP): a measure of model accuracy of an analytical method based on applying a given calibration model to the spectral data from a set of samples different from but similar to those used to calculate the calibration model. SEP is the standard deviation of the residuals obtained from comparing the values from the reference laboratory to those from the method under test for the specified samples. SEP provides a measure of the model accuracy to be expected when one measures future samples.

Surface reflectance: also known as "specular reflection," it is that portion of the radiation not interacting with the sample but simply reflecting back from the sample surface layer (i.e., the sample-air interface).

Transflection: a transmittance measurement technique in which the radiation traverses the sample twice. The second time occurs after the radiation is reflected from a surface behind the sample.

Transmittance: represented by the equation

$$T = \frac{I}{I_0} \text{ or } T = 10^{-A}$$

where I is the intensity of the radiation transmitted through the sample; I_0 is the intensity of the radiant energy incident on the sample and includes losses due to solvent absorption, refraction, and scattering; and A is the absorbance.

1. SCOPE

1.1 Introduction

This chapter provides guidance on the inspection of injections for visible particles. The terms particle, particulates, and particulate matter are equivalent and do not have different meaning when used in this chapter. Individual visible particles are generally greater than 50 μm in diameter, and the threshold for routine, reliable detection ($\geq 70\%$ probability) is often near 150 μm for single spherical particles in clear solutions contained in clear glass vials [1]. The methods discussed in this chapter are also applicable to the detection of other visible defects. These include, but are not limited to, container integrity defects such as cracks, misplaced stoppers, or incomplete seals, any of which may compromise the sterility of the product. Additional container defects [2], as well as other product characteristics such as fill level, are also detected during visual inspection, and non-conforming units should be rejected using the

methods described in this chapter. Inspection for these other quality attributes often occurs at the same time as the inspection for particles. The primary focus of this chapter is a manual reference inspection method; however, semi-automated and automated methods are also discussed.

1.2 Related Chapters

The general chapter *Injections and Implanted Drug Products (Parenterals)—Product Quality Tests* 〈 1 〉 provides an overview of injectable dosage forms and the quality tests associated with them. Another general chapter, *Visible Particulates in Injections* 〈 790 〉, has been added to the *U.S. Pharmacopeia–National Formulary (USP–NF)* to provide a clear definition of routine inspection procedures for injectable products; the goal is to comply with the expectation that products be essentially free of visible particulate matter. Additionally, information on the detection of subvisible particulates is provided in general chapters *Subvisible Particulate Matter in Therapeutic Protein Injections* 〈 787 〉, *Particulate Matter in Injections* 〈 788 〉, and *Particulate Matter in Ophthalmic Solutions* 〈 789 〉. The general chapter *Methods for the Determination of Particulate Matter in Injections and Ophthalmic Solutions* 〈 1788 〉 provides additional supporting information on measurement methods for subvisible particles.

1.3 Defect Prevention

Although this chapter focuses on detection and removal of product units that show evidence of visible particles, the need for preventing such contamination should not be overlooked. No inspection process, manual or automated, can guarantee complete removal of all visible particulate matter or other visible defects; thus, prevention of such defects is an important consideration. Good process and product design, along with environmental control, are necessary to ensure the reliable production of products with a low particle burden. To ensure the control of defects throughout the process, manufacturers should consider an inspection life-cycle approach [3] in critical areas. This approach begins with developing quality attributes based on incoming component specifications, followed by component-level acceptance testing. It extends to component preparation and product-filling procedures, followed by 100% in-process inspection of filled product, and concluding with final acceptance sampling and testing of the finished product. The approach must extend to purchased, ready-to-use components such as containers or closures, where there is no opportunity for subsequent particle removal after receipt and before filling. Stability and retention sample inspection, customer complaint handling, and in-house investigative procedures support this integrated process. The inspection life-cycle is composed of, and supported by, sub-cycles involving qualification, maintenance, personnel training, defect characterization, and the use of standards within each of the critical areas. The final element of the life-cycle is a feedback loop of trending and data review from each of these process areas, resulting in a mechanism that supports continuous process improvement.

2. INTRODUCTION

2.1 Inspection Process Capability

Visual inspection of injections is necessary to minimize the introduction of unintended particles to patients during the delivery of injectable medications. Such inspection also offers the opportunity to reject containers whose integrity has been compromised, such as those with cracks or incomplete seals, which pose a risk to the sterility of the product. The desire to detect these defects despite their very low frequency and the randomness of their occurrence has resulted in the current expectation that each finished unit will be inspected (100% inspection). Although zero defects is the goal and this should drive continuous process improvement, zero defects is not a feasible specification for visible particles given current packaging components and processing capability.

Understanding human performance is critical to establishing visual inspection criteria. The threshold for human vision is generally accepted to be 50 μm . Individual receptors in the eye have a resolution of 11 μm , but typical resolving power is reported as 85–100 μm [4]. The detection process is probabilistic: the likelihood of detection is a cumulative function of visible attributes such as particle size, shape, color, density, and reflectivity. Analysis of inspection results pooled from several studies [5] [6] shows that the probability of detection for a single 50- μm particle in a clear solution contained in a 10-mL vial utilizing diffuse illumination between 2000 and 3000 lux is only slightly greater than 0%. The detection probability increases to approximately 40% for a 100- μm particle, and typically exceeds 95% for particles that are 200 μm and larger. Thus, in a qualified visual inspection system, the vast majority of extraneous particles that might go undetected and be introduced into the pharmaceutical supply chain will be smaller than 200 μm . Changes to the container (e.g., increasing size and opacity), fill level, and particle characteristics beyond size (e.g., color, shape, and density) will all affect the probability of detection.

2.2 Patient Risk

A complete review of the medical literature is beyond the scope of this chapter, but the effect of extraneous particles on the patient must be considered. A number of reviews on this subject are available [6] [7] [8] [9] [10] [11] [12]. The clinical implications of extraneous particulate matter in injections are determined by many factors, including the size and number of particles, the composition of the material, the potential for microbiological contamination, the route of administration, the intended patient population, and the clinical condition of the patient. For example, an otherwise healthy individual receiving a subcutaneous or intramuscular injection containing sterile, extraneous inert particulates would likely experience no adverse effect or at worst would develop a small granuloma. On the other hand, a critically ill premature infant receiving a particle-laden infusion directly through an umbilical catheter might suffer considerable pathophysiologic sequelae [13] [14].

Garvin and Gunner were among the first to report a concern about the effects of particles in human patients [15] [16]. For obvious ethical reasons, there is a lack of controlled studies on the effect of particles in human patients. Some anecdotal information about human patient safety may be obtained by examining case reports of intravenous drug abusers [17] [18] [19]. In these cases, solid oral dosages are often ground up and injected as a slurry; pulmonary foreign body emboli and granulomas were observed in these patients [20]. Unfortunately, the clinical risks to human patients posed by small numbers of particles are difficult to infer from these observations due to the extreme number of foreign particles and the uncontrolled conditions in which they were administered.

Numerous animal studies have been conducted to determine the fate of intravenous particles with different sizes and composition [21] [22] [23] [24]. Most studies have focused on

subvisible particles with a diameter of less than 50 μm . In these studies, a massive infusion of particles has been accompanied by histologic evidence of injury to pulmonary capillary endothelial cells [25], microscopic thrombi in the pulmonary capillaries [26], pulmonary microscopic granulomata [27], and hepatic inflammatory effects [28]. Although useful for understanding the pathophysiologic response to particulate matter, the large number of particles used in these studies (e.g., 10^9 particles/kg per injection) provides little insight into the risk to humans posed by small numbers of macroscopic particles. Arterial embolization using materials such as polyvinyl alcohol (PVA), collagen-coated acrylic microspheres, and gelatin spheres also provides some insight into the potential human pathophysiologic implications of non-target embolization of extraneous-particle intravenous infusions. In these cases, massive particle loads moving from the arterial injection site into the venous circulation were also reported [29] [30] [31] [32] [33].

In a review of the hazards of particle injection, it has been found that the primary contributor of particulate matter in vial presentations is the rubber closure, a risk that is present with almost every injection. In addition, case reports have documented injury associated with infusion of significant quantities of precipitated admixtures or therapeutic use of particles for embolization [13] [14] [34]. Despite the administration of an estimated 15 billion doses of injectable medicines each year [35], no reports of adverse events associated with the injection of individual visible particles have been found.

Ultimately, the safety considerations related to particulate matter in injections must be assessed for each drug product, intended patient population, and method of administration. No single set of inspection criteria can adequately anticipate all of the potential risks to the patient. The methods outlined in chapter 〈 790 〉 should serve as essential requirements when assessing the adequacy of the visual inspection procedure, but supplemental acceptance criteria should be added when the patient population and intended use of the product warrant these additional measures.

2.3 History of Inspection Standards

The requirement for injections to be "true solutions" appeared in *USP IX* in 1915, and the first appearance of "solution clarity" for parenterals occurred in 1936 in *NF IV*. Since then, there have been numerous modifications to the compendia in this regard. A comprehensive history of compendial inspection standards is available in the *Pharmaceutical Forum* [1].

3. TYPICAL INSPECTION PROCESS FLOW

3.1 100% Inspection

Chapter 〈 790 〉 establishes the expectation that each unit of injectable product will be inspected as part of the routine manufacturing process. This inspection should take place at a point when defects are most easily detected, for example, prior to labeling or insertion into a device or combination product. Each unit may be examined manually with the unaided eye, or by using a conveyor to transport and present the containers to a human inspector (semi-automated inspection), or by means of electronic image analysis (automated inspection). Manual and semi-automated inspection should only be performed by trained, qualified inspectors. Inspection may also be enhanced by means of a device that holds more than a single unit at one time for examination. This inspection may be performed in-line with filling or

packaging or in a separate, off-line inspection department. The intent of this inspection is the detection and removal of any observed defect. When in doubt, units should be removed.

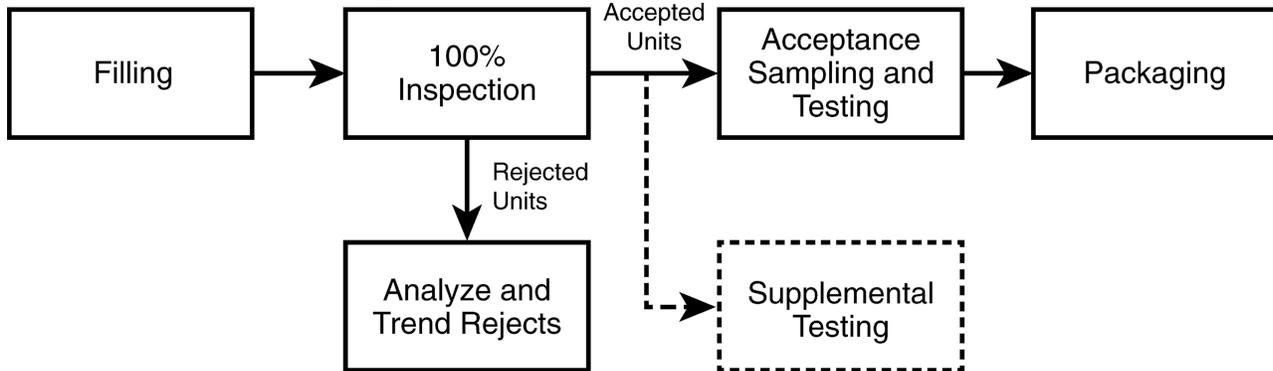

Figure 1. Typical Process Flow Chart.

Note—100% inspection refers to the complete inspection of the container/closure system and its contents. Inspection may be accomplished in a single operation or in multiple steps using a combination of technologies. See additional discussion in *Section 3.3 Remediation and Alternative Practices* and *Section 6 Inspection Methods and Technologies*.

Note—Supplemental testing is required when the nature of the product or container limits visual inspection of the contents (e.g., with a lyophilized cake or powder or with an amber glass or opaque container). See additional discussion in *Section 5.2 Unique Product and Container Considerations*.

During 100% inspection, limits on typical rejection rates should be established to identify atypical lots [36]. These limits may be established for categories of defects (e.g., critical, major, and minor) or for specific types of defects (e.g., particles). A review of historical performance is useful in establishing these limits, and the review may include products similar in appearance and manufacture. Periodic reassessment of these limits is recommended to account for expected process improvements and/or normal fluctuations in process baseline [37]. If a limit is exceeded, it should trigger an investigation. The outcome of the investigation will determine whether additional inspection is necessary.

3.2 Acceptance Sampling and Testing

After 100% inspection, a statistically valid sample is taken from the units accepted by the inspection process. This may be a random sample from across the batch or a representative sample (e.g., at fixed time intervals or a fixed number per tray). Typical sampling plans used for this purpose can be found in the ANSI/ASQ Z1.4 standard [38]. Defects may not be distributed equally over the lot, and therefore a sampling process that represents the whole lot is required. Equivalent plans may also be found in the ISO 2859 [39] or JIS Z9015 [40] standards. For batch release, the sampling plans listed as Normal II are typically used. Tightened sampling plans may be appropriate when an atypical result is observed or reinspection is performed. These plans specify a sample size for a range of batch sizes and require selection of an Acceptable Quality Level (AQL). The AQL is the defect rate at which 95% of the lots examined will be accepted and is a measure of falsely rejecting good batches. Critical defects (those that pose the greatest risk to the patient) should be assigned an AQL with a low value. Often, the accept number (the number of defective units allowed in the sample) for a critical defect is zero. Major and minor defects, which pose less risk to the patient, will have increasing (less stringent) AQL values and accept numbers greater than zero. *Table 1* shows the range of AQL

values typically used for visual inspection processes [41].

Table 1. Typical AQL Values for Visual Inspection Processes

Defect Category	AQL Range (%)
Critical	0.010–0.10
Major	0.10–0.65
Minor	1.0–4.0

[Note—When establishing a sampling plan, select the sample size required for the AQL associated with the critical defect category. Use this sample plan for major and minor defects, adjusting the accept numbers as needed for the larger sample size.]

The Unacceptable Quality Level (UQL) for the sampling plan used should also be known. The UQL is the defect rate at which 90% of the lots examined will be rejected and is a measure of the customer or patient risk. Sampled units should be manually inspected under controlled conditions by trained inspectors. Inspection condition should be aligned with the 100% inspection process.

Acceptance sampling should be performed after any type of 100% inspection process, including manual, semi-automated, and automated inspection processes. It provides a measure of the performance of the overall inspection process and the quality of a specific lot, compared with predefined acceptance criteria. Although automated systems are validated before use and are routinely challenged to ensure acceptable performance, the use of acceptance sampling detects unexpected defects that were not included in the development and training of the automated system by the manual inspection process.

If the acceptance criteria of the sampling plan are not met, an investigation should be conducted. Depending on the nature of the failure, this investigation should include examinations of the manufacturing process, the raw materials, and the packaging materials, as well as the inspection process. If, after investigation, the inspection process is deemed capable of detecting the defect(s) in question, the batch may be reinspected. After reinspection, a new sample of the accepted units is taken and compared against established acceptance criteria. It is a good practice to use a tightened sampling plan and acceptance criteria under these circumstances because of the atypical nature of this process step.

3.3 Remediation and Alternative Practices

3.3.1 REINSPECTION

As discussed in the preceding section, reinspection may be appropriate if the initial 100% inspection is not successful. This includes instances when the established 100% inspection failure rate(s) and/or the accept number(s) associated with the chosen AQL values have been exceeded. Reinspection should only be conducted using a prior-approved procedure that addresses key parameters such as the inspection conditions (e.g., same as primary inspection or modified to enhance detection of a specific defect type), the number of times reinspection may be performed (this should be limited, and repeated reinspection should not be permitted), and the acceptance criteria (e.g., same as primary inspection or tightened).

3.3.2 TWO-STAGE INSPECTION

In cases where an assignable cause—such as formation of air bubbles or a specific container or closure variation—results in a high false-rejection rate (rejection of acceptable units), the use

of a second inspection step may be considered. This is more common with automated inspection systems, where there is less ability to tolerate normal variation in product or container. Under these circumstances, the inspection system is adjusted to ensure acceptance of good units. Those not accepted are considered of uncertain disposition until inspected by another means (e.g., manual inspection following automated inspection). Inspection conditions may be adjusted to provide greater sensitivity in this second inspection step (e.g., additional inspection time) to ensure a high probability that true defective units will be rejected. The second inspection of these units by the same method (e.g., automated inspection after automated inspection) is generally not recommended, because the same limitation in inspection method is present for both inspections. However, it may be suitable when the root cause is air bubbles in the solution; a study has been performed to establish an appropriate holding time to allow the bubbles to dissipate before performing the second inspection. It is recommended that each inspection stream (those accepted by the first stage and those accepted by the second stage) be sampled separately and evaluated against the sampling plan acceptance criteria before they are confirmed as accepted and recombined into a single batch.

4. INSPECTION LIFE-CYCLE

4.1 Common Sources of Added Particulates

Particles may originate from many sources. They are discussed here, as well as in other chapters in the *USP-NF* (e.g., chapter *Measurement of Subvisible Particulate Matter in Therapeutic Protein Injections* (1787)). Those that are foreign to the manufacturing process are considered to be exogenous or "extrinsic" in origin; these include hair, non-process-related fibers, starch, minerals, insect parts, and similar inorganic and organic materials. Extrinsic material is generally a one-time occurrence and should result in the rejection of the affected container in which it is seen; however, elevated levels in the lot may implicate a broader contribution from the same source. These particles may carry an increased risk of microbiological or extractable contamination, because less is known about their path prior to deposition in the product container.

Other particles are considered "intrinsic", or from within. These may come from processing equipment or primary packaging materials that were either added during processing or not removed during container preparation. These primary product-contact materials may include stainless steel, seals, gaskets, packaging glass and rubber, fluid transport tubing, and silicone lubricant. Such particles still pose the risk of a foreign body, but generally come from sterile or sanitized materials and more is known about their interactions when in contact with the product. These process-related intrinsic particles should have controls established based on the use of a life-cycle approach as outlined in *Section 1.3*. Another group of particles considered intrinsic is related to the stability of the product. These product stability-related particles come from container/closure interaction, unintended changes to the drug formulation (degradation), or temperature sensitivity over time. Stability-related intrinsic particles should be identified and addressed as early in the product development process as possible.

A third category of particles is the "inherent" particles, which are known to be or intended to be associated with specific product formulations. The physical form or nature of the inherent particles varies from product to product and includes solutions, suspensions, emulsions, and other drug delivery systems that are designed as particle assemblies (agglomerates, aggregates). For protein-based products in which the aggregates may form longer chains or

protein strands, the protein species may become visibly detectable as haze or individual particles during changes over the shelf-life. Product formulation-related suspensions or particulate formation should be studied in the development phase and in samples placed on stability to determine the normal characteristics and time-based changes that can occur. Use of automated particle counting or image analysis in the subvisible and visible ranges for particle sizes $\geq 2 \mu\text{m}$ may be required to fully characterize inherent formulation-related particles. Inherent particles should have a defined allowable profile over the shelf-life of the product. Where applicable, the inherent particle profile may be covered in product-submission documentation or product-specific monographs.

An evaluation of the potential impact of particles identified from any of these sources may be enhanced by incorporating a clinical risk assessment. This assessment may include factors such as the intended patient population, route of administration, source of the particles, and implications for product sterility. For intrinsic or inherent particulate matter sources, a risk assessment may be useful in developing product-specific control strategies. Given the probabilistic nature of particle detection, it is important to assess the possible implications of particles identified through the product life-cycle to better ensure the product's safe use.

4.2 Prevention of Particulates

The manufacturing process is designed to keep the final container and its contents clean within the control parameters established for process-related intrinsic particulates. Once the container is filled, the stability of the product needs to be maintained throughout its shelf life. Changes that occur as the product ages during its normal shelf life must be characterized. Avoidance of intrinsic particle sources that may affect final product stability depends on careful consideration of the entire product system. If these intrinsically sourced changes occur, and they affect stability, particles ranging from sub-visible to visible may develop. Typically, these particles result from change mechanisms that slowly affect the on-shelf product.

4.2.1 ROBUST DESIGN DURING DEVELOPMENT

To anticipate potential sources of instability that yield intrinsic particles, the product design is evaluated from many perspectives, beginning with a literature review of similar formulae/packages. Points to consider include the reported sensitivities of the active, the formulation type, and the final container/closure system needed for delivery. Knowledge of how glass containers are fabricated, controlled, sterilized, and tested is important as this may affect the tendency to form glass lamellae [42] [43]. Obtaining further information on residual extracts, possible leachates, metals, or solubility-edge conditions is important as these factors may promote formation of solid material in the desired solution. Several additional key factors for successful product design are the product concentration, solution pH, critical micelle concentration, oligomerization content/potential, package effects (large surface area, product volume, head space, light/oxygen transmission), and compatibility of the formulation with the package. Some key formulation design factors include the formula components chosen and their purity; the solubilities of the active ingredient(s) and excipients, and consideration of potential salt forms. Finally, to maximize product stability, consider the final product preparation for delivery, product dilutions, and shelf stability of the commercial product or its therapeutic preparations.

To examine the appropriateness of the product design for maintaining product stability, there are two levels of evaluation. Both levels examine retained containers for visible changes using

methods described in this chapter, but neither level dwells on low percentage defects. For the first level of stability study, bench trials consisting of visual inspection of trial containers in the formulation lab will show general compatibility of the chosen components over time with regard to clarity, color, and particle formation. Careful product assembly in clean containers, with consideration of the container type, headspace, and sealing, will yield a beneficial first-pass trial of stability over several months' time. Detection of extrinsic particles at this stage of development is generally not significant, as the particles do not reflect on the formulation under development.

The second, more refined level of stability study involves conducting visual inspections of the injection in defined, ICH-relevant trials requiring periodic inspection of the same containers over time. Detection of minor or subtle differences in these containers is not the goal at this stage of development. Catastrophic change and the occurrence of intrinsic product-related visible particles should be the focus. Typically, a set of containers is carefully prepared to exclude extrinsic particles and is then inspected to cull out any units with visible defects. Next, a numbered set of containers appropriate for the batch size is placed on trial and visually inspected periodically; a typical sample size is 80 or 100 units. Additional sets of containers stored at selected extremes of ICH temperatures can be followed to aid discovery of solubility-edge phenomena. When unwanted changes are detected—such as particle formation, solution color change, solution haze, and package changes—the process of isolation, characterization, and identification can commence. Identification of the material making up the changes aids in determination of the cause, as well as development of improvements for future use.

4.2.2 COMMON SOURCES OF INTRINSIC PARTICULATES

Process-related intrinsic particles originating from product contact materials tend to be stable and unchanging (e.g., glass, rubber, or metal). In contrast, product instability results from change mechanisms within the final product. It is very important to understand that these changes only have to be slight in certain cases, far below the detection limit of most release or stability assays, to result in visible changes to the product. The threshold levels for the formation of visible change for certain substances may be only 10–100 ppm (0.001%–0.01%). However, if all of this insoluble material were contained in a single visible particle, it would likely cause rejection of the container. Physical instability may be promoted by content below the threshold of acceptable chemical purity.

4.2.3 FORMULATION COMPONENTS

The active ingredient may also contribute to the formation of intrinsic particles. The determination of whether the particulate is inherent or intrinsic to the process is based upon toxicology studies and clinical studies. However, these studies may not be sufficiently long term or sensitive to reveal a particularly insoluble component of the drug at low levels that grow with time. It is also possible for substances to be incorporated into the bulk drug from all points of contact in the synthetic process. These are miscible in the formulation, yet may precipitate from solution over time as a visible haze or particulate matter. For example, significant haze and particles have manifested in aqueous formulations due to extraction of plasticizers from filtration media during bulk drug production [6]. Metal content in the active ingredient has contributed to organometallic salt formation and has also been observed as precipitated inorganic salts, blooming long after product release. The active ingredient and related degradation products may also be relatively insoluble and may grow to form visible particles. Monomers or single molecules may join together through chemical processes to form dimers,

trimers, and oligomers (a limited assemblage of monomers, short of polymerization). Such changes are not unexpected [44]. In high-concentration and/or saturated formulations, and especially for micellar drug associations, the solubility of related forms is significant when the aging formulations contain progressively higher concentrations of these substances. Larger molecules may have a greater effect on solution integrity due to their inherent insolubility, especially if the active drug is in a micellar formulation.

Polymorphs are unique crystalline forms of identical chemical entities. Although uncommon in solutions that have been mixed homogeneously and filtered, small seed crystals of a relatively stable polymorph may form over time, especially at nucleation sites such as container-surface defects. More common than formation of polymorphs is formation of a modified crystal lattice containing an integral liquid, typically water or solvent. The lattice may form slowly, promoted by evaporation, nucleation, and temperature extremes [45] [46].

4.2.4 PACKAGING COMPONENTS

Extractables and leachables are terms commonly used to describe the potential for containers to contribute unwanted agents to the product. Extractables represent all of the materials that could be contributed, and leachables represent the practical contribution upon contact between container and drug formulation [47]. These substances can also contribute to the formation of subvisible and visible particles.

Formulation attack of the container is most dramatic in glass container systems. Glass containers undergo corrosion that is 25 times greater at pH 8 than at pH 4 [48]. A formulation pH above 7, especially with high ionic strength solutions, promotes attack of the inner glass surface, resulting in particle generation.

Silicone oil is added to prefilled glass syringe systems to enhance lubricity for closure insertion and/or syringe movement. Silicone may also come from tubing used for fluid transfer and a variety of polymeric fittings and seals that are used in the processing equipment. All of these components must be compatible with the formulation to minimize leachates. Although silicones are processed to be sterile and are widely used, their use must still be controlled. Silicone can cause container sidewall droplets and a variety of visible semi-solid forms. No more than the minimum quantity should be used during processing. Silicone and other hydrophobic substances have the capacity to coalesce and agglomerate with other particles, reaching a visible size.

4.3 Particulate Removal by Component Washing

4.3.1 GLASS CONTAINERS

Each step of the glass-container washing and rinsing process should be evaluated for particle-reduction capability. The washer validation studies should demonstrate a reduction in naturally occurring particles or should use seeded containers to demonstrate such reduction capability. The use of statistical sampling plans with light obscuration and/or membrane microscopic particle-counting methods can provide a means to demonstrate reduction of both subvisible and visible particles during washing cycle development and validation. During process development, validation, and routine use, container-washing procedures should include periodic visual operational checks. This routine verification ensures that effective draining of all containers is occurring during all washing and rinsing steps. Review the wash-water recirculating filter maintenance procedures to ensure that particle overloading or breakthrough is being prevented.

Glass breakage that occurs during the component washing process should be evaluated for

possible glass particle generation that could affect surrounding containers. Effective written container-clearance procedures following these occurrences should specify the number of containers to be removed from the affected portion of the line. Removing units that could potentially contain glass particles aids in minimizing particle transfer to the downstream process.

4.3.2 RUBBER STOPPERS OR PLUNGERS

Each step of the rubber-component washing and rinsing process should be evaluated for particle-reduction opportunities. Utilize statistical sampling plans to collect meaningful test units. Light obscuration or other automated particle counting and membrane microscopic particle-counting methods may be used to demonstrate reduction of both subvisible and visible particles during washing validation. During process development and validation and in routine use, container-washing procedures should include visual checks to ensure that stoppers are not routinely sticking together. Such sticking surfaces reduce cleaning efficacy and entrap particles. Periodic assessment of component cleanliness and supplier washing capabilities should be included as part of the supplier qualification program when using purchased, ready-to-sterilize, or ready-to-use components.

Evaluate any current siliconization process used—whether in-house or by the supplier—to minimize excess silicone levels while maintaining machinability of the stoppers. Light obscuration or other automated particle-counting method may be used to compare overall particle level reduction (background silicone oil droplets) during process development or validation. The level of residual silicone oil will affect the particulate quality of the final filled product, observed as dispersed droplets and particle-forming matrices.

4.3.3 GLASS DEPYROGENATION

Processes that use racks or trays for transporting and holding samples, as are typically used in batch ovens, should be monitored for metal particle generation. The racks or trays should have a formal maintenance program associated with their routine use. Trays should be inspected for wear and scoring, which can be sources of particulates. Periodic cleaning, polishing, and/or resurfacing may be warranted to effectively control particles. Tunnels used for depyrogenation should also have a routine maintenance program for periodic cleaning, inspection, and replacement of parts that may wear and generate particles. Routine process observation for glass breakage allows for clearance of any potentially affected surrounding containers and minimizes the occurrence of glass particles being carried downstream to filling.

4.3.4 EQUIPMENT PREPARATION

It is important to minimize redeposition of particles on product contact surfaces after cleaning. Cleaned and sanitized equipment should be protected by HEPA-filtered, unidirectional airflow until transferred to, and installed on, the filling line. For cleaned equipment that needs to be wrapped or bagged prior to sterilization, utilize low-shedding, non-cellulose (synthetic) wrapping materials. Cellulose fibers are one of the most common particles found in the injections-manufacturing environment and injectable products.

4.3.5 FILLING LINE

The transfer of open containers should be conducted in Grade A (ISO 5, Class 100), unidirectional air flow to minimize particle contamination. The air in critical zones should be

monitored continuously during operation to confirm compliance.

Routine checks to detect particles and potential particle-generation locations should be explained in the procedures. Effective, written container-clearance procedures to be used after glass breakage should specify the number of containers to remove from the affected portion of the line. Note that improper set-up and adjustment of the filler can lead to "needle strikes," where the filling needles make contact with the container being filled. This can generate either stainless steel or glass particles.

Filling pump design and the pump's compatibility with the filling solution are important considerations. Metal-on-metal piston pumps have a greater potential for generating metal particles, compared with other types of piston pumps. Pump maintenance is essential and includes a requirement to resurface the cylinders and pistons periodically. Peristaltic-action pumps must be monitored for generation of silicone tubing particles, especially with aggressive, near-saturated solutions or suspensions. Friction in the peristaltic roller area can break down the tubing, resulting in the generation of particles.

Stopper bowl surfaces should have a formal maintenance program, and stopper handling or replenishment by operators should be specifically designed to minimize particle transfer to the stoppers.

Proper operator positioning and avoidance of open containers is important in good, aseptic filling practices to avoid microbial contamination. These same principles help reduce particle transfer to the open containers.

Careful selection of cleaning and gowning materials will help reduce contamination from extrinsic particles and fibers. These clean-room materials should be selected for their superior non-shedding and low-particle properties.

4.4 Trending

Data obtained from the inspection process are used for batch release. These data should also be analyzed for adverse trends on a periodic basis, typically at least once per year. High-volume products may generate sufficient data to allow quarterly analysis, whereas a longer period of time may be necessary to accumulate data for products that are produced infrequently. Data from component inspection, production 100% inspection, and the AQL inspections should be evaluated based upon sound statistical principles to determine whether the current action levels are accurately reflecting the current process capability. Alert levels may be introduced and/or adjusted accordingly if the statistical analyses indicate that lower defect levels are being observed consistently.

When establishing new action or alert levels, a preliminary value may be used until sufficient production experience is obtained. Consideration should be given to planned improvements in the manufacturing and inspection processes. If significant improvements are planned, the reduction of the action/alert level should not be instituted until the impact of the improvement is measured over sufficient time to establish the validity of the new value.

5. INTERPRETATION OF INSPECTION RESULTS

5.1 Defect Classification

Defects are commonly grouped into classifications based on patient and compliance risk [2]. The most common system uses three groups: critical, major, and minor. Critical defects are

those that will cause serious adverse reaction or death of the patient if the product is used. This classification includes any nonconformity that compromises the integrity of the container and thereby risks microbiological contamination of the sterile product. Major defects carry the risk of a temporary impairment or medically reversible reaction, or involve a remote probability of a serious adverse reaction. This classification is also assigned to any defect which causes impairment to the use of the product. These may result in a malfunction that makes the product unusable. Minor defects do not impact product performance or compliance; they are often cosmetic in nature, affecting only product appearance or pharmaceutical elegance. Visible particles from multiple sources can be present in drug products before 100% inspection. Particulate matter is defined as "mobile undissolved particles, other than gas bubbles, unintentionally present in the solutions" [49]. For visible particles, particle motion aids in detection. Stationary particles are difficult to detect. Upon 100% inspection, visible extrinsic and intrinsic particles should be reliably removed. The test method allows inherent particles to be accepted if the product appearance specification allows the inherent particle types. The size of particles reliably detected ($\geq 70\%$ probability of detection) is often between 100 and 300 μm . This is dependent on the container characteristics (size, shape, transparency), inspection conditions (lighting and duration), and particle characteristics (size, shape, color, and density).

5.1.1 EXTRINSIC, INTRINSIC, OR INHERENT PARTICLES

Extrinsic particles are foreign to the manufacturing process and should be a rare occurrence. Intrinsic material is generally associated with the primary packaging or processing equipment. These process-related intrinsic particles should be monitored and trended for control purposes. Other intrinsic materials are more often stability indicating and may indeed change due to aging, concentration change, degradation, acceleration of reaction, and component interaction. The intrinsic category should be recognized as different from inherent particle types. A good example would be the inherent slight haze imparted by the light-scattering properties of a protein formulation versus the intrinsic variable haze, droplets, and tearing imparted by excess siliconization. Solution properties such as a slight haze or faint coloration of high-concentration formulae and protein formulations are typical examples of an inherent characteristic of the product fluid, with particle detection being enhanced with backlighting or bottom lighting if the product has significant turbidity. In biologics, floating protein particles are considered inherent when their presence may be measured, characterized, and determined to be part of the clinical profile. Inherent particles may be accepted if the drug product has a control strategy showing that this particulate category is part of the product clinical profile. The manufacturer may allow inherent particles if the product appearance specification also allows their presence or if the product is an emulsion or suspension. For suspension products, a test dissolving the suspension that provides for extrinsic particle detection is also acceptable.

5.2 Unique Product and Container Considerations

5.2.1 LYOPHILIZED PRODUCT

Lyophilized products receive 100% inspection after the freeze-drying step has been completed and each unit has been sealed. However, the solid, lyophilized cake can mask the presence of visible particles because they cannot be seen within the solid matrix. The cake surface is visible during inspection but accounts for only a small fraction of the cake volume. Because of these challenges in evaluating acceptability, a small sample of units is reconstituted and inspected for

visible particles in addition to the 100% inspection of the cakes for visible particles. Care must be taken during reconstitution of these samples to avoid contamination that can lead to false-positive results. Sample preparation should be done in a clean environment with appropriate particle-control measures. Reconstituted samples should be inspected using the same conditions as those for visible particles. The destructive nature of this test limits the size of the sample; however, the resultant fluid allows visible particles to be detected. Typical sampling plans for this type of test can be found in the special sampling plans S-3 and S-4 in ANSI/AQS Z1.4 [38]. Once inspection of these reconstituted samples has been performed, they may be used for other required testing, such as that for subvisible particles, potency, impurities, or other specified tests. If particles are detected in this relatively small sample, additional units may be reconstituted as part of an investigation and to assess the compliance of the entire batch.

5.2.2 POWDER PRODUCT

Sterile powders are difficult to inspect for particles due to powder flow and the occlusion of white or light-colored particles by the drug product itself. Sterile powders should be reconstituted and inspected for visible foreign particles using an approach similar to that for lyophilized products, as discussed above.

5.2.3 AMBER CONTAINERS

Inspecting amber containers is challenging because selected elements have been added to mask UV light penetration into the Type I glass container. Light transmission is blocked below 500 nm, and thus increased light intensity (e.g., 8,000–10,000 lux) may be required to observe visible particles during inspection. Directional lighting from behind the container may also be beneficial. At the extreme, filled solution in practically opaque containers may be audited via sampling and transfer to clear, clean containers.

5.2.4 TRANSLUCENT PLASTIC CONTAINERS

Plastic or translucent containers are chosen for break resistance or other properties that glass cannot offer, such as injection molding into shapes that minimize hold-up volume or for use in a combination product. Rigid plastic containers may have optical properties that require significantly more light (e.g., 8,000–10,000 lux) to illuminate any visible particles against black and white backgrounds. Directional lighting from behind the container may also be beneficial.

5.2.5 LARGE-VOLUME CONTAINERS

Large-volume containers (> 100 mL) may require additional time to complete a thorough inspection. Due to the semi-transparent film characteristics of PVC film used in flexible bags, additional light intensity may also be used to enhance the visibility of extrinsic and intrinsic particles. Directional lighting from behind the container may also be beneficial.

5.2.6 COMBINATION PRODUCTS

When inspecting the unlabeled primary drug container for a combination product, the inspection considerations should be the same as those specified for a conventional drug product in a vial or syringe. This inspection should be performed before assembly into the device. Where there are critical attributes that are only visible after assembly (such as alignment with a fill-level

window), a second inspection after assembly may also be required.

6. INSPECTION METHODS AND TECHNOLOGIES

6.1 Manual Visual Inspection (MVI)

Manual visual inspection (MVI) is the reference inspection method described in all of the major pharmacopeias [49] [50]. It consists of viewing filled and sealed containers under controlled conditions. This process may be aided by the use of a tool to allow consistent examination of more than one container at a time. The quality decision, to either accept or reject the container, is made by a trained person. Inspection is a probabilistic process, and detection rates less than 100% are to be expected, especially for smaller or low-contrast defects.

6.1.1 CRITICAL PROCESS PARAMETERS IN MVI

Light intensity: The results of the manual inspection process are influenced by the intensity of the light in the inspection zone. In general, increasing the intensity of light that illuminates the container being inspected will improve inspection performance; chapter 〈 790 〉 recommends light levels NLT 2000–3750 lux at the point of inspection for routine inspection of glass containers. Increased light levels are recommended for plastic containers or those made from amber glass. Under these circumstances, light levels as high as 10,000 lux may prove beneficial. The final inspection condition will depend on measured performance.

Light should be diffuse and even in the inspection zone, and it is a good practice to clearly identify this zone within the inspection station where the intensity meets the required levels. Fluorescent lamps have often been used as the light source for inspection. When fluorescent lamps are used, high-frequency ballasts are recommended to reduce visible flicker (and associated inspector fatigue). Incandescent lamps have also been used successfully for this purpose, but they generate significant heat during use. Light emitting diodes (LED) offer an energy efficient, stable source of light without the added heat of incandescent lamps. Light intensity in each inspection station should be measured periodically to ensure continued compliance with the specified range. The frequency of monitoring should be based on historical experience with the type of light source in use. A lower light-intensity action limit should be established to trigger corrective action before inspection is performed below the specified value or range.

Background and contrast: Contrast between the defect of interest and the surrounding background is required for detection, and increased contrast improves detection. The use of both black and white backgrounds is described in chapter 〈 790 〉, as well as other global pharmacopeias. The use of both backgrounds provides good contrast for a wide range of particulate and container defects, which can be light or dark in appearance.

Inspection rate: Sufficient time must be provided to allow for thorough inspection of each container; chapter 〈 790 〉 specifies a reference time of 10 seconds per container (5 seconds each against the black and white backgrounds). Larger or more complex containers may require additional time for inspecting all attributes. Increased time may facilitate detection of defects near the threshold of detection, but studies by Wolfe et al. [51] [52] suggest that there are diminishing gains with increasing inspection time. Time spent per container may be controlled through the use of a pacing device such as a light or tone, or these may be used during

training only, much as a musician uses a metronome during practice to learn the tempo of a musical piece for later performance. Recording the time spent inspecting each batch and then calculating a nominal inspection rate is a good way to confirm that the rate of inspection was within established limits.

Container handling and movement: When observing objects, the human eye is very sensitive to movement. Good techniques for manual inspection include a careful swirl or inversion of the liquid product within the container. This rinses any particles from the upper inner surfaces of the container and the closure and puts them into motion. A technique that minimizes the introduction of air bubbles is important, as air bubbles can appear as particles and interfere with detection. A tool that holds multiple containers for consistent presentation can be useful when performing inspection. Holding many containers by hand at once should be avoided, as it is difficult to obtain a complete view of all container surfaces and contents. Container motion is also helpful for identifying small container defects such as cracks or chips.

Magnification: Some inspection processes use a large magnifier to increase image size and thus increase the probability of detecting and rejecting containers with defects near the threshold of detection. Although magnification can be useful for critical examination of a portion of the container, it does not often lead to increased overall detection rates for defects of interest. This may be due in part to the added eye strain that often results from use of magnification, which is not recommended as part of the reference inspection method described in chapter 〈 790 〉 or in other global pharmacopeias [49] [50]. Although not recommended for use during routine inspections, magnification can be helpful for critical examination of a small number of units, as may be needed during an investigation.

6.1.2 INSPECTOR FATIGUE AND ERGONOMIC CONSIDERATIONS

Inspecting for extended periods of time can cause inspector fatigue and a decrease in inspection performance. Based on industry experience [41], it is recommended that inspectors be given a break from performing inspection at least every hour. This break should allow time to rest the eyes and mind, and may be achieved with a short rest (e.g., 5 min) or a longer meal break. This need for regular breaks may also be met through rotation to a non-inspection function, such as material handling or documentation.

Inspection stations should be designed and operated in a manner that minimizes the inspector's risk of repetitive-motion injury. Adjustable chairs and careful positioning of light sources as well as incoming and inspected product can reduce the risk of such injury. These adjustments can also reduce inspector fatigue and discomfort, both of which can be distracting and thus can decrease performance.

6.2 Semi-Automated Visual Inspection

Semi-automated visual inspection combines automated material handling of the containers to be inspected with human vision and judgment to make the accept-or-reject decision. These systems often use a conveyor equipped with rollers to transport the containers in front of the inspector inside an inspection booth or station. For inspection of liquids, the booth can be equipped with a high-speed spin station to set particles in motion. The rollers are also used to slowly rotate the containers in front of the inspector as they traverse the inspection zone. These systems offer a means to control the presentation of the vials and can offer additional lighting options, such as Tyndall lighting, which may enhance the appearance of some defects

such as cracks or small particles. Mirrors may also be used to provide a clear view of the top and bottom of each container. Rejected units may be removed from the rollers by hand, and some systems are equipped with a remote rejection system that can be triggered by the inspector. Care should be taken in the qualification and operation of these systems to ensure full rotation of vials in the inspection zone; this allows examination of all surfaces. In addition, studies should be conducted to ensure the detection of heavy particles, which may not be lifted from the bottom of the container, and to ensure that the rate of inspection produces an acceptable detection rate for defects of interest.

With semi-automated visual inspection, performance is similar to that with MVI. Some increase in throughput may be achieved because the inspector spends all of the available time viewing the containers, rather than splitting the time between inspection and material handling.

6.2.1 CRITICAL PROCESS PARAMETERS FOR SEMI-AUTOMATED INSPECTION

Light intensity must be controlled, as with MVI. The rate of inspection is controlled by the speed of the roller/conveyor. Spin speed for liquid products and rotation rate for all containers should be established during validation/qualification and maintained within the validated range for routine inspection. The background color is controlled by the color of the rollers selected and the color of the background seen through the spaces between the rollers.

6.3 Automated Visual Inspection (AVI)

AVI combines automated material handling of the containers with electronic sensing of product appearance. Containers that do not meet preprogrammed acceptance criteria are automatically rejected by the machine. Early machines performed inspection for particles and fill level, but manual or semi-automated inspection was required for the container and closure system. Newer models have the capability to inspect all attributes of the containers, along with the contents. As with MVI, machines often spin the containers to set particles in motion and make them easier to detect. Multiple cameras are used to image various regions on the container in great detail. Each camera is coupled with unique lighting to highlight specific defects in the region of interest. Light-field and dark-field lighting techniques offer the same benefits as white and black backgrounds as discussed above, offering contrast for a full range of light- and dark-colored defects. A defect found by any camera is tracked through the machine to allow accurate ejection by the reject system. The machine also offers detailed reporting of defects observed in a specific production lot.

AVI offers advantages in the areas of throughput and consistency, compared with MVI [5]. AVI may also offer enhanced sensitivity for some defects, compared with MVI, but may suffer from higher false rejection rates due to the inability to tolerate normal variation in containers or product. This is especially true for molded glass containers.

6.3.1 LIGHT-OBSCURATION METHODS

Some systems use an optical sensor to detect the shadow of particles in solution products. This method requires particles to be in motion, typically using a high-speed spin and rapid braking of the container to achieve this motion. Spin conditions must be optimized to provide sensitivity for heavier particles while minimizing false rejections due to bubbles. Some biological products experience shear-induced agglomeration, so care should be taken with regard to agitation of these products.

Light obscuration methods are optimized for sensitivity to moving particles, and can thus be

made less sensitive to minor container imperfections. This technique can be used with both tubing and molded containers. Results are generally robust in detecting particles that are 100 μm in diameter and larger.

These systems can also detect fill height by detecting the shadow of the solution meniscus. Generally, this process is not sensitive enough to ensure compliance with fill-weight specifications, but it can provide a secondary check of gross fill. Sensitivity is a function of the container shape, with greater sensitivity achieved in small-diameter containers.

6.3.2 IMAGING METHODS

Continuing advances in camera technology now allow the rapid capture of high-resolution images for inspection. When coupled with high-speed processors that have ever-increasing computational capability, a powerful inspection tool can result. Images are divided into inspection windows, and an array of tools such as image subtraction, pixel counting, intensity analysis, and others is used to assess the images against programmed quality attributes. Significant amounts of time are required to train inspectors and test the performance of such systems against a range of known defects, as well as acceptable containers. Imaging systems can detect particles and fill level, as well as other container and closure attributes. Inspection in this manner can provide 100% inspection of all visual attributes. These systems can offer high sensitivity, but may also have high false-rejection rates if container and product attributes are not tightly controlled.

6.3.3 OTHER TECHNOLOGIES

Container integrity [53] can be assessed using non-optical methods such as high-voltage [54] or vacuum decay. Optical spectroscopy [55] can also be used if there is a modified headspace such as vacuum or inert gas. Generally, these container-integrity inspection methods offer greater sensitivity than visual detection, with a significant reduction in false rejection of acceptable product.

X-ray imaging has also been explored as a means to detect particles within freeze-dried cakes, powders, or suspensions [56].

These technologies may be used alone or in combination with other inspection methods to provide a comprehensive assessment of product quality before labeling and packaging.

7. QUALIFICATION AND VALIDATION OF INSPECTION PROCESSES

7.1 Standards

The use of standards for visual inspection has been described by Melchore and Berdovich [57]. Development of inspection standards begins with identification or characterization of the defect types that will be represented in the test set(s). This information typically comes from the manufacturing area, where naturally occurring defective units can be identified from rejected product. The defects are categorized as critical, major, or minor. These defects must be further characterized to allow for 1) selection from naturally occurring particulate and physical or cosmetic production rejects removed from product lots, and/or 2) re-creation of equivalent defect types in a controlled laboratory environment. Characterization information on defects should include, where appropriate, the range of sizes typically observed, the specific location on the container, the volume, and the angle. If feasible, a photograph of the defect should be

included. All information that could support consistent re-creation of the defect standards should be included in the characterization description.

7.2 Preparing Defect Standards

Visual inspection standards may be identified from known production rejects, or may be created manually with characterized particulate material. A single particle per seeded container should be used when determining detection thresholds.

7.3 Particle Types

The primary packaging materials that directly contact the product and the potential environmental contaminants can be divided into specific particle groups such as glass, stainless steel, rubber stopper, plastic, and fibers (synthetic or natural). Naturally occurring particles from rejects should be no smaller than the visible particle (measured in situ) in the container. Measurement can be accomplished with a wide field microscope or loupe with a calibrated reticle. Physically prepared particles can be sieved initially to target a specific size, and then the individual particles are measured using optical microscopy. These materials, or production defects, are preferred for inspector training and qualification as well as machine validation as they better represent actual inspection performance. Spherical standard particles may be utilized as surrogates for naturally occurring particulates; however, these are best used for routine machine calibration rather than validation or inspector qualification, as they do not move or look like actual production defects.

7.4 Rejection Probability Determination

Once a well-defined defect standard is available, it is assigned a detection frequency by conducting a documented, manual human inspection qualification that is accomplished by repeated manual inspection. This repeated inspection is the basis for qualifying the defect standard. This approach has been described by Knapp and Kushner [58] [59]. The Knapp methodology recognizes that the detection of particles is probabilistic, and repeated inspections with strict controls on lighting and inspection pacing/sequencing generate the statistical confidence to assign a reject probability to each standard unit. A manual, visual inspection probability of detection (POD) of ≥ 0.7 or a detection rate (DR) of $\geq 70\%$ is required to assign the container to the reject zone for subsequent calculation of the reject zone efficiency (RZE). Secure probabilistic data for particulate standards can be achieved with 30–50 inspections for each container. This is best achieved with multiple inspectors. Inspection reject probability is calculated for the defect as follows: $POD = (\text{Number of times rejected}) / (\text{Number of times inspected})$.

7.5 Test Sets

These qualified defect standard units are then assembled into test sets which may be used to specifically challenge the particle detection technique of human inspectors, used as part of a defect test set (including container/closure defects) for human qualification, or for comparison during automated equipment qualification and validation. When possible, the test set should be prepared with duplicate product units per particle type and size to ensure that backup units are available in the event that a standard container is broken or the particle is trapped or lost

within the container. When using test sets, it is a good practice to verify the presence of particles before and after use, as particles may become lodged between the container and the closure. When a freely moving particle cannot be verified, the unit should not be used and the data should be excluded from subsequent calculations. When this happens, it may be possible to free the particle with the use of an ultrasonic bath. If this is not possible, the unit should be replaced. The number of defective units in each test set should be limited to approximately 10% to prevent rejection bias [51]. The accept containers will be identified as having a predetermined manual, visual inspection POD < 0.3 or a DR of < 30%. Any particle standards found to fall within the acceptable "grey zone" display, indicating a manual inspection rejection probability $\geq 30\%$ and < 70%, may be included as an "acceptable unit" in a test set, if desired. It is important to prepare a written procedure for the creation and maintenance of standards. This procedure should define the qualification criteria, appropriate storage conditions, periodic examination and requalification, expiration, and sample custody during use. Test sets should be approved by the quality unit. The container in which the specific particle set is stored must be clearly labeled with the test set identification information.

7.6 Types of Test Sets

The particle detection threshold can be determined for a specific inspection method and product/package combination. It is a standard curve of detection probabilities at various particle types and sizes in an approximate range of 100–500 μm (with recommended increments of 100 μm). Fibers are typically observed in sizes > 500 μm . The typical size range of particles used in threshold studies incorporates a variety of particle types and densities that are typically found in the manufacturing environment.

Threshold studies are conducted to determine the sensitivity of manual inspection methods, using a range of particle sizes, in a blinded study that yields the particle-size detection capabilities of a defined group or of an individual inspector. The threshold studies indicate that the method of inspection is valid and appropriate if particle detection is reproducible in detecting particles within the range of 150–250 μm (500–2000 μm for fibers). Threshold studies are also useful as an assessment tool when evaluating or qualifying visual inspection staff on a specific method with fixed testing parameters. Detection threshold studies are typically the first step in evaluating the performance of any new inspection method.

Depending on product and/or presentation, rejects in the test set should represent all defects anticipated for a given container type or product family. For particles, use a bracketed range of types (densities) and sizes from near the visual detection threshold range to the largest routinely observed in the pool of rejects. For an individual manual test set, it is important that all containers and stoppers are of the same type, and the samples are blinded. UV ink (invisible to the inspectors) may be used to mark all containers. Alternatively, bar codes or other coded labels may be used. Manual test sets can be used initially to qualify or periodically to re-qualify human inspectors. These test sets may also be used for direct comparison to semi-automated or automated inspection methods.

If significantly different formulations (e.g., clear solution, suspension, lyophilized) or packages (e.g., clear vials, amber vials, ampoules, syringes) are produced at the same facility, separate test sets should be prepared for each combination.

7.7 Training and Qualification of Human Inspectors

Before training, potential inspectors should be tested for visual acuity [60] and color

perception. Near-vision performance should be the equivalent of 20/20 with no impairment of color vision. Both the Snellen and Jaeger charts are useful for verifying visual acuity; they test far and near vision, respectively. Training should include a phased approach with a specified number of training hours expected for each segment. Initially, train the potential inspectors with defect photographs or a video library and clear written descriptions. Utilize subject matter experts to mentor and provide hands-on training with defect standards for the specified method. Reinforce mental or silent counting and follow the paced sequence to achieve consistent inspection timing. Stress the importance of strict adherence to the inspection process (procedure, sequence, and timing). Address inspector fatigue in the qualification process by testing under worst case conditions (i.e., at the end of a typical inspection shift). Train all inspectors (QC, QA, and Production) with common procedures used for 100% inspections and AQL inspections. All inspection practices should be standardized and consistently executed across all inspection groups. Qualification should be performed for each product type and package that the inspector will encounter. A bracketed or matrix approach can be used to simplify qualification of products with similar physical or visual characteristics such as container type and size, formulation type, product viscosity, color, and others. It is common to initially train and qualify personnel on clear solutions in clear containers (if produced at the facility) and then expand their expertise to inspections of more difficult formulations or presentations.

7.8 Inspector Qualification Requirements

The qualification of all inspection personnel utilizes a manual test set to be inspected under normal operating conditions and inspection critical parameters, including inspection timing and sequence, physical environment, and inspection duration. Three successful inspections of the test set are recommended to demonstrate consistent performance for initial qualification of new inspectors. Suggested acceptance criteria for each defect class are 100% detection of critical defects, $\geq 80\%$ detection of major defects, and $\geq 70\%$ detection of minor defects. A limit is also needed for false rejection, with a recommended target of less than 5% falsely rejected good units.

7.9 Requalification

Inspectors should be requalified at least annually. Requalification includes vision testing and testing with at least one product/test set configuration. A single successful inspection of the test set is sufficient for requalification. Requalification may also be necessary in the event that poor performance is observed during routine inspection or if the inspector has been away from the inspection operation for an extended period of time (e.g., 3 months). If an inspector fails the requalification test, a retraining process should be initiated to identify the root cause and allow the inspector to receive additional instruction. After this process has been completed, the inspector may attempt to meet the acceptance criteria one additional time. If the inspector fails, he or she may attempt to qualify again after a specified time period.

8. CONCLUSIONS AND RECOMMENDATIONS

Visual inspection for particles and other visible defects continues to be an important part of the manufacturing process for injections. Chapter { 790 } provides a useful reference method and

acceptance criteria for visible particulates in injections. Successful execution of visual inspection requires an understanding of the inspection process and careful control of inspection conditions. Inspectors must be trained to ensure consistent, high-quality performance. Alternative inspection methods, either semi-automated or fully automated, may be used in place of manual inspection methods. Where machine methods are used, the equipment must be validated to demonstrate equivalent or better performance when compared to manual inspection. The use of test sets that contain standard defects is an important element in inspector training and qualification, as well as machine validation. Good product development will lead to a stable product with a lower risk of particle formation. Identification of the type or types of particles found during product development and routine manufacturing is an important aid in source identification and reduction. Inspection results should be trended to further aid in continuous process improvement with the ultimate goal of defect prevention.

▲Sodium Pentacyanoammineferrate(II)

[~~Trisodium Aminepentacyanoferrate (3-)~~], $C_5H_3FeN_6Na_3$ ▲*USP39*

—**271.93** [14099-05-9]—Yellow to tan powder. Soluble in water.

Solubility—Dissolve 500 mg in 50 mL of water, and allow to stand for 1 h. The solution is clear and free from foreign matter.

Sensitivity

1,1-Dimethylhydrazine standard solution—Place 500 mL of water in a 1-L volumetric flask, and add from a buret 1.27 mL of anhydrous 1,1-dimethylhydrazine. Dilute with water to volume, and mix. Pipet 10 mL of this solution into a 100-mL volumetric flask, and dilute with water to volume. Each mL of this solution contains the equivalent of 100 µg of 1,1-dimethylhydrazine.

Buffer solution—Transfer 4.8 g of citric acid monohydrate to a 1-L volumetric flask, dissolve in water, add 14.6 g of sodium phosphate, swirl to dissolve, and dilute with water to volume.

Test preparation—Dissolve 100 mg of sodium pentacyanoammineferrate(II) in 100 mL of water.

Procedure—Into each of five 25-mL volumetric flasks pipet 0, 0.25, 0.50, 1.0, and 1.5 mL, respectively, of 1,1-Dimethylhydrazine standard solution; to each add 15 mL of Buffer solution, and swirl to mix. To each flask, add by pipet 2 mL of Test preparation, mix, dilute with Buffer solution to volume, and allow to stand for 1 h. Using a suitable spectrophotometer, 1-cm cells, and the solution containing no 1,1-Dimethylhydrazine

standard solution as the blank, determine the absorbances of the remaining solutions at 500 nm. Plot the observed absorbance as the ordinate versus the concentration of standard as the abscissa on coordinate paper, and draw the curve of best fit. The plot is linear and the absorbance of the 150- μ g solution is NLT 0.65.

▲

Note—A suitable grade is available as catalog number 14099-05-9 from www.bocsci.com.]

BRIEFING

Edetate Disodium, Twentieth-Molar (0.05 M), *USP 38* page 1895. It is proposed to clarify the instructions on how to dry the chelometric standard.

Additionally, minor editorial changes have been made to update the volumetric solution to current *USP* style.

(HDQ: M. Marques.)

Correspondence Number—C151771

Comment deadline: March 31, 2015

Change to read:

Edetate Disodium, Twentieth-Molar (0.05 M)

$C_{10}H_{14}N_2Na_2O_8 \cdot 2H_2O$, **372.24**

18.61 g in 1000 mL

Dissolve 18.6 g of edetate disodium in water to make 1000 mL, and standardize the solution as follows.

Accurately weigh about 200 mg of chelometric standard calcium carbonate, previously dried at 110° for 2 hours and cooled in a desiccator, or dried according to the label instructions,

▲according to the label instructions or, if this information is not available, at 110° for 2 h,

▲USP39

transfer to a 400-mL beaker, add 10 mL of water, and swirl to form a slurry. Cover the beaker

with a watch glass, and introduce 2 mL of diluted hydrochloric acid from a pipet inserted between the lip of the beaker and the edge of the watch glass. Swirl the contents of the beaker to dissolve the calcium carbonate. Wash down the sides of the beaker, the outer surface of the pipet, and the watch glass with water, and dilute with water to about 100 mL. While stirring the solution, preferably with a magnetic stirrer, add about 30 mL of the edetate disodium solution from a 50-mL buret. Add 15 mL of sodium hydroxide TS and 300 mg of hydroxy naphthol blue, and continue the titration with the edetate disodium solution to a blue endpoint.

$$M = \frac{(g \text{ CaCO}_3)(1000)}{100.09 \times \text{mL EDTA}}$$

BRIEFING

Potassium Arsenite, Tenth-Normal (0.1 N), *USP 37* page 1458. It is proposed to clarify the instructions on how to dry the primary standard arsenic trioxide.

Additionally, minor editorial changes have been made to update the volumetric solution to current *USP* style.

(HDQ: M. Marques.)

Correspondence Number—C151772

Comment deadline: March 31, 2015

Change to read:

7.301 g in 1000 mL

Dissolve 4.9455 g of arsenic trioxide primary standard, ~~previously dried at 105° for 1 hour,~~
 ▲dried according to the label instructions or, if this information is not available, dried at 105°
 for 1 h, ▲*USP39*

in 75 mL of 1 N potassium hydroxide. Add 40 g of potassium bicarbonate, dissolved in about 200 mL of water, and dilute with water to 1000.0 mL.

BRIEFING

Potassium Permanganate, Tenth-Normal (0.1 N), *USP 38* page 1899. It is proposed to specify the use of sodium oxalate primary standard in the standardization of this volumetric solution.

Additionally, minor editorial changes have been made to update the volumetric solution to current *USP* style.

(HDQ: M. Marques.)

Correspondence Number—C151773

Comment deadline: March 31, 2015

Change to read:

Potassium Permanganate, Tenth-Normal (0.1 N)

KMnO₄, **158.03**

3.161 g in 1000 mL

Dissolve about 3.3 g of potassium permanganate in 1000 mL of water in a flask, and boil the solution for about 15 min. Insert the stopper in the flask, allow it to stand for at least 2 days, and filter through a fine-porosity, sintered-glass crucible. If necessary, the bottom of the sintered-glass crucible may be lined with a pledget of glass wool. Standardize the solution as follows.

Accurately weigh about 200 mg of

▲primary standard▲*USP39*

sodium oxalate, dried according to the instructions on its label, and dissolve it in 250 mL of water. Add 7 mL of sulfuric acid, heat to about 70°, and then slowly add the permanganate solution from a buret, with constant stirring, until a pale pink color, which persists for 15 s, is produced. The temperature at the conclusion of the titration should be NLT 60°. Calculate the normality. Each 6.700 mg of sodium oxalate is equivalent to 1 mL of 0.1 N potassium permanganate.

Since potassium permanganate is reduced on contact with organic substances such as rubber, the solution must be handled in an apparatus made entirely of glass or other suitably inert material. It should be frequently restandardized. Store in glass-stoppered, amber-colored bottles.

$$N = \frac{\text{g Na}_2\text{C}_2\text{O}_4}{\text{mL KMnO}_4 \text{ solution} \times 0.06700}$$

BRIEFING

Sodium Thiosulfate, Tenth-Normal (0.1 N), *USP 38* page 1900. It is proposed to clarify the instructions on how to dry the primary standard potassium dichromate.

Additionally, minor editorial changes have been made to update the volumetric solution to current *USP* style.

(HDQ: M. Marques.)

Correspondence Number—C151770

Comment deadline: March 31, 2015

Change to read:

Sodium Thiosulfate, Tenth-Normal (0.1 N)

Na₂S₂O₃·5H₂O, **248.19**

24.82 g in 1000 mL

Dissolve about 26 g of sodium thiosulfate and 200 mg of sodium carbonate in 1000 mL of recently boiled and cooled water. Standardize the solution as follows.

Accurately weigh about 210 mg of primary standard potassium dichromate, previously

pulverized and dried at 120° for 4 h, or dried according to the instructions on its label,

▲according to the label instructions or, if this information is not available, dried at 120° for 4 h,

▲USP39

and dissolve in 100 mL of water in a glass-stoppered, 500-mL flask. Swirl to dissolve the solid, remove the stopper, and quickly add 3 g of potassium iodide, 2 g of sodium bicarbonate, and 5 mL of hydrochloric acid. Insert the stopper gently in the flask, swirl to mix, and allow to stand in the dark for exactly 10 min. Rinse the stopper and the inner walls of the flask with water, and titrate the liberated iodine with the sodium thiosulfate solution until the solution is yellowish green in color. Add 3 mL of starch TS, and continue the titration until the blue color is discharged. Perform a blank determination.

Restandardize the solution as frequently as supported by laboratory stability data. In the absence of such data, restandardize the solution weekly.

$$N = \frac{\text{mg K}_2\text{Cr}_2\text{O}_7}{49.04 \times \text{mL Na}_2\text{S}_2\text{O}_3}$$

BRIEFING

Excipients, USP and NF Excipients, Listed by Functional Category, USP 38 page 6493. It is proposed to add Ethylparaben Sodium to the *Antimicrobial Preservative* category to complement the proposed new monograph for *Ethylparaben Sodium*, which also appears in this issue of *PF*.

(EXC: G. Holloway.) Correspondence Number—C151720

In the following reference table, the grouping of excipients by functional category is intended to summarize commonly identified purposes that these excipients serve in drug product formulations. The association of a functional category with a particular dosage form in this table is not absolute and does not limit the use of an excipient to a single type of dosage form or delivery system.

Change to read:

BRIEFING

Cholesterol, NF 33 page 6612 and *PF 39(3)* [May–June 2013]. In the *PF 39(3)* proposal, *Identification* tests *A* and *B* were replaced with IR identification and a test for specific rotation, respectively. *Identification* test *C* was also added. An *Assay* and the *Labeling* section were added as well in the *PF 39(3)* proposal, together with the proposed new USP Cholesterol RS. On the basis of further comments and data received, it is proposed to make the following revisions:

1. Revise the *Definition* by adding an upper limit of 102.0% for the cholesterol content and by including antioxidants. Correspondingly, add a *Labeling* requirement to indicate added antioxidants.
2. In the newly added *Assay* procedure based on a GC method of analysis performed with the Agilent DB-1 brand of G2 column, replace the internal standard, pregnenolone acetate, with a different internal standard, pregnenolone isobutyrate. The typical retention times for pregnenolone isobutyrate and cholesterol are 6.2 and 7.6 min, respectively.
3. Add a test for *Limit of Related Sterols and Other Organic Impurities*, which is based

on the same procedure used for the Assay. The typical retention times for pregnenolone isobutyrate, cholesterol, desmosterol, lathosterol, and 24-dehydrolathosterol are 6.2, 7.6, 8.1, 8.3, and 8.8 min, respectively.

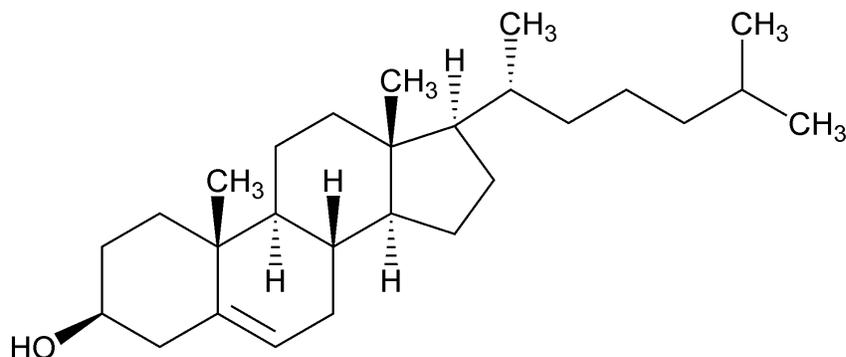

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Standard solution: 1.0 mg/mL of USP Cholesterol RS and 1.0 mg/mL of ~~pregnenolone~~ acetatepregnenolone isobutyrate (internal standard) in heptane

Sample solution: 1.0 mg/mL of Cholesterol and 1.0 mg/mL of ~~pregnenolone~~ acetatepregnenolone isobutyrate (internal standard) in heptane

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm × 30-m capillary column bonded with a 0.25-μm layer of phase G2

Temperatures

Detector: 300°

Injection port: 285°

Column: 275°

Carrier gas: Helium

Flow rate: 2.0 mL/min

Injection volume: 1.0 μL

Injection type: Split ratio, 25:1

Liner: Cup splitter liner (4 mm × 6.3 × 78.5) with deactivated wool

System suitability

Sample: *Standard solution*

[Note—The relative retention times for ~~pregnenolone acetate and cholesterol are 1.0 and 1.6, respectively.~~The relative retention times for pregnenolone isobutyrate and cholesterol are 1.0 and 1.2, respectively.]

System suitability requirements

Resolution: ~~NLT 20 between pregnenolone acetate and cholesterol~~NLT 10 between pregnenolone isobutyrate and cholesterol

Relative standard deviation: NMT 2.0% for the peak response ratio of cholesterol to the internal standard

Analysis

Samples: *Standard solution and Sample solution*

Calculate the percentage of cholesterol in the portion of sample taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U peak response ratio of cholesterol to the internal standard (peak response of cholesterol/peak response of the internal standard) from the *Sample solution*

R_S peak response ratio of cholesterol to the internal standard (peak response of cholesterol/peak response of the internal standard) from the *Standard solution*

C_S concentration of USP Cholesterol RS in the *Standard solution* (mg/mL)

C_U concentration of Cholesterol in the *Sample solution* (mg/mL)

Acceptance criteria: NLT 95.0%–102.0% on the dried basis ▲NF34

IMPURITIES

- **Residue on Ignition** (281): NMT 0.1%

Add the following:

▲• Limit of Related Sterols and Other Organic Impurities

Internal standard solution: 0.02 mg/mL of pregnenolone isobutyrate (internal standard) in heptane

System suitability solution: 0.02 mg/mL of USP Cholesterol RS, 0.04 mg/mL of desmosterol, and 0.02 mg/mL lathosterol in *Internal standard solution*

Sample solution: 2.0 mg/mL of Cholesterol in *Internal standard solution*

Chromatographic system: Proceed as directed in the *Assay*.

System suitability

Sample: *System suitability solution*

[Note—See *Table 1* for the relative retention times.]

Table 1

Name	Relative Retention Time
Pregnenolone isobutyrate (internal standard)	1.00
Cholesterol	1.23
Desmosterol (cholesta-5,24-dien-3 β -ol)	1.31
Lathosterol (5 α -cholest-7-en-3 β -ol)	1.34

System suitability requirements

Resolution: NLT 2.0 between desmosterol and lathosterol

Relative standard deviation: NMT 5.0% for peak response ratio of desmosterol to the internal standard

Analysis

Samples: *System suitability solution* and *Sample solution*

An impurity, 24-dehydrolathosterol (5 α -cholesta-7,24-dien-3 β -ol), may be observed with a relative retention time with reference to pregnenolone isobutyrate (internal standard): 1.42.

Calculate the percentage of desmosterol or lathosterol in the portion of Cholesterol taken:

$$\text{Result} = (R_{U1}/R_{S1}) \times (C_{S1}/C_U) \times 100$$

R_{U1} peak response ratio of desmosterol or lathosterol to the internal standard (peak response of desmosterol or lathosterol/peak response of the internal standard) from the *Sample solution*

R_{S1} peak response ratio of desmosterol or lathosterol to the internal standard (peak response of desmosterol or lathosterol/peak response of the internal standard) from the *System suitability solution*

C_{S1} concentration of desmosterol or lathosterol in the *System suitability solution* (mg/mL)

C_U concentration of Cholesterol in the *Sample solution* (mg/mL)

Calculate the percentage of 24-dehydrolathosterol or any other unspecified organic impurity in the portion of Cholesterol taken:

$$\text{Result} = (R_{U2}/R_{S2}) \times (C_{S2}/C_U) \times 100$$

R_{U2} peak response ratio of 24-dehydrolathosterol or any other unspecified impurity to the internal standard (peak response of 24-dehydrolathosterol or any other unspecified impurity/peak response of the internal standard) from the *Sample solution*

R_{S2} peak response ratio of cholesterol to the internal standard (peak response of cholesterol/peak response of the internal standard) from the *System suitability solution*

C_{S2} concentration of USP Cholesterol RS in the *Standard solution* (mg/mL)

C_U concentration of Cholesterol in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*. Disregard peaks less than 0.05% for any unspecified impurities and any peaks due to solvent.

Table 2

Name	Acceptance Criteria, NMT (%)
Desmosterol	≤ 3
Lathosterol	≤ 2
Total impurities including related sterols	≤ 5

▲NF34

SPECIFIC TESTS

- **Melting Range or Temperature** 〈 741 〉: 147°–150°

- **Optical Rotation, Specific Rotation** 〈 781S 〉

Sample solution: 20 mg/mL, undried, in dioxane

Acceptance criteria: –34° to –38°

- **Acidity**

Sample: 1.0 g

Analysis: Dissolve the *Sample* in 10 mL of ether in a small flask, add 10.0 mL of 0.10 N sodium hydroxide, and shake for about 1 min. Heat gently to expel the ether, then boil for 5 min. Cool, dilute with 10 mL of water, add phenolphthalein TS, and titrate with 0.10 N sulfuric acid until the pink color just disappears, stirring the solution vigorously throughout

the titration. Perform a blank determination (see *Titrimetry* 〈 541 〉, *Residual Titrations*).

Acceptance criteria: The difference between the number of mL of 0.10 N sulfuric acid consumed in the blank and the number of mL consumed in the *Sample* is NMT 0.3 mL.

- **Loss on Drying** 〈 731 〉

Analysis: Dry under vacuum at 60° for 4 h.

Acceptance criteria: NMT 0.3%

- **Solubility in Alcohol**

Sample: 500 mg

Analysis: Dissolve the *Sample* in 50 mL of warm alcohol in a stoppered flask or cylinder, and allow to stand at room temperature for 2 h.

Acceptance criteria: No deposit or turbidity is formed.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed, light-resistant containers.

Add the following:

- ▲● **Labeling:** Label it to indicate whether cholesterol is derived from animal, synthetic, or vegetable sources. For animal-derived sources, indicate the species and tissue used (for example, bovine brain and spinal cord, wool fat, or chicken eggs). Indicate the names and amounts of any added stabilizers. ▲NF34

Add the following:

- ▲● **USP Reference Standards** 〈 11 〉

USP Cholesterol RS

▲NF34

BRIEFING

Ethyl Oleate, *NF 33* page 6656. As part of the USP monograph modernization effort, and on the basis of comments and data received, it is proposed to make the following changes:

1. Update the monograph *Definition* and chemical names.
2. Add an *Identification* section, then under the section add the following tests: *A. Presence of Ester* that is based on the tests for *Saponification Value* and *Acid Value*, and *B. Chromatographic Identity* which is based on GC peak agreement using USP Ethyl Oleate RS in the newly proposed *Assay*.
3. Add a capillary GC *Assay*. The proposed capillary GC procedure in the *Assay* is based on analysis performed with the Agilent CP-Wax 52 CB brand of G16 column. The typical retention times for ethyl palmitate, ethyl stearate, ethyl oleate, and ethyl linoleate are about 6.6, 9.7, 10.1, and 10.9 min, respectively.
4. Add a test for *Total Ash* under *Impurities* section.
5. Delete the test for *Specific Gravity* 〈 841 〉.
6. Delete the test for *Viscosity—Capillary Methods* 〈 911 〉 or *Viscosity—Rotational Methods* 〈 912 〉.
7. As the test for *Acid Value* is moved to the *Identification* section, it is deleted from the *Specific Tests*.
8. As the test for *Saponification Value* is moved to the *Identification* section, it is

deleted from the *Specific Tests*.

9. Delete the test for *Refractive Index* 〈 831 〉.
10. Add a test for *Peroxide Value*.
11. Add a test for *Water Determination*.
12. Add a section for *Labeling* requirements.
13. Add a section of *USP Reference Standards*, and add USP Ethyl Palmitate RS, USP Ethyl Stearate RS, USP Ethyl Oleate RS, and USP Ethyl Linoleate RS to the section.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Injection volume: 1.0 μL

Injection type: Split injection; split ratio is 200:1

Run time: 23–24 min

System suitability

Sample: *System suitability solution*

[Note—See *Table 2* for the relative retention times.]

Table 2

Component	Relative Retention Time
Ethyl palmitate	0.65
Ethyl stearate	0.96
Ethyl oleate	1.00
Ethyl linoleate	1.08

System suitability requirements

Resolution: NLT 2.0 between the ethyl stearate and ethyl oleate peaks

Analysis

Samples: *System suitability solution* and *Sample solution*

Identify each ethyl ester (ethyl palmitate, ethyl stearate, ethyl oleate, or ethyl linoleate) peak in the *Sample solution* based on that in the *System suitability solution*.

Calculate the percentage of each ethyl ester (ethyl palmitate, ethyl stearate, ethyl oleate, or ethyl linoleate) in the portion of Ethyl Oleate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U peak response of each ethyl ester (ethyl palmitate, ethyl stearate, ethyl oleate, or ethyl linoleate) from the *Sample solution*

r_T sum of all the peak responses excluding peak responses due to solvent from the *Sample solution*

Acceptance criteria

Disregard peaks that are less than 0.05% for any unspecified impurities, and any peaks due to solvent.

Ethyl Oleate exhibits the composition profiles shown in *Table 3* below.

Table 3

Component	Percentage (%)
Ethyl palmitate	≤ 16.0
Ethyl stearate	≤ 6.0
Ethyl oleate	≥ 65.0
Ethyl linoleate	≤ 18.0

▲NF34

IMPURITIES

Add the following:

▲● Total Ash

Sample: 2.0 g

Analysis: Heat a silica or platinum crucible to redness for 30 min, allow to cool in a desiccator, and weigh. Transfer the *Sample* to the crucible. Dry at 100°–105° for 1 h and ignite to constant weight in a muffle furnace at 600 ± 25°, allowing the crucible to cool in a desiccator after each ignition. Flames should not be produced at any time during the procedure. If after prolonged ignition the ash still contains black particles, take up with hot water, pass through an ashless filter paper, and ignite the residue and the filter paper.

Combine the filtrate with the ash, carefully evaporate to dryness, and ignite to constant weight.

Acceptance criteria: NMT 0.1% ▲NF34

▲NF34

BRIEFING

Ethylparaben Sodium. Because there is no existing *NF* monograph for this excipient, a new monograph is being proposed. This monograph is based on the corresponding monograph for *Ethylparaben Sodium* in the *European Pharmacopoeia 8.0*. The proposed liquid chromatographic method in the *Assay* is based on analyses performed with the YMC-Pack Pro C18 brand of L1 column. The *p*-hydroxybenzoic acid, methylparaben, and ethylparaben peaks elute at approximately 1.5, 2.2, and 2.9 min, respectively. Interested parties are encouraged to comment on the proposal.

(EXC: G. Holloway.)

Correspondence Number—C140969

Comment deadline: March 31, 2015**Add the following:****▲Ethylparaben Sodium**C₉H₉NaO₃ 188.2

Benzoic acid, 4-hydroxy-, methyl ester, sodium salt;
Ethyl *p*-hydroxybenzoate, sodium salt;
Sodium 4-ethoxycarbonylphenolate [35285-68-8].

DEFINITION

Ethylparaben Sodium contains NLT 95.0% and NMT 102.0% of ethylparaben sodium (C₉H₉NaO₃), calculated on the anhydrous basis.

IDENTIFICATION• **A.****Standard:** 0.5 g of USP Ethylparaben RS**Sample:** 0.5 g of Ethylparaben Sodium

Analysis: Dissolve the *Sample* in 5 mL of water, acidify with hydrochloric acid, and filter the resulting precipitate. Wash the precipitate with water, and dry under vacuum at 80° for 2 h.

Acceptance criteria: The IR absorption spectrum of a mineral oil dispersion of the *Sample*

exhibits maxima only at the same wavelengths as those of a similar preparation of the *Standard*.

- **B.**

Sample solution: Ignite 0.3 g of Ethylparaben Sodium, cool, and dissolve the residue in about 3 mL of 3 N hydrochloric acid.

Acceptance criteria: A platinum wire dipped in the *Sample solution* imparts an intense, persistent yellow color to a nonluminous flame.

ASSAY

- **Procedure**

Mobile phase: Methanol and a 6.8-g/L solution of potassium dihydrogen phosphate (65:35)

System suitability solution: 5.0 µg/mL each of *p*-hydroxybenzoic acid, USP

Methylparaben RS, and USP Ethylparaben RS in *Mobile phase*

Standard solution: Dissolve 50.0 mg of USP Ethylparaben RS in 2.5 mL of methanol, and dilute with *Mobile phase* to 50.0 mL. Dilute 10.0 mL of this solution with *Mobile phase* to 100.0 mL.

Sample solution: Dissolve 50.0 mg of Ethylparaben Sodium in 2.5 mL of methanol, and dilute with *Mobile phase* to 50.0 mL. Dilute 10.0 mL of this solution with *Mobile phase* to 100.0 mL.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 272 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1.3 mL/min

Injection volume: 10 µL

Run time: About 4 times the retention time of the ethylparaben peak

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The retention time of ethylparaben is about 2.9 min; the relative retention times for *p*-hydroxybenzoic acid, methylparaben, and ethylparaben are about 0.5, 0.8, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between methylparaben and ethylparaben peaks, *System suitability solution*

Relative standard deviation: NMT 0.85% for six injections, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of ethylparaben sodium in the portion of Ethylparaben Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times P$$

r_U = peak area of ethylparaben from the *Sample solution*

r_S = peak area of ethylparaben from the *Standard solution*

C_S = concentration of USP Ethylparaben RS in the *Standard solution*

C_U = concentration of Ethylparaben Sodium in the *Sample solution*

$M_{i\bar{r}}$ molecular weight of ethylparaben sodium, 188.2

$M_{i\bar{z}}$ molecular weight of ethylparaben, 166.17

P = labeled purity of USP Ethylparaben RS expressed as a percentage

Acceptance criteria: 95.0%–102.0% on the anhydrous basis

IMPURITIES

• Related Compounds

Mobile phase, System suitability solution, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: Dilute 1.0 mL of the *Sample solution* with *Mobile phase* to 20.0 mL. Dilute 1.0 mL of this solution with *Mobile phase* to 10.0 mL.

System suitability

Sample: *System suitability solution*

[Note— The retention time of ethylparaben is about 2.9 min; the relative retention times for *p*-hydroxybenzoic acid, methylparaben, and ethylparaben are about 0.5, 0.8, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between methylparaben and ethylparaben peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Acceptance criteria

***p*-Hydroxybenzoic acid:** The peak area in the *Sample solution*, multiplied by 1.4 to correct for the calculation of content, is NMT 6 times the area of the principal peak in the *Standard solution*; NMT 3.0%.

Unspecified impurities: The peak area of each impurity in the *Sample solution* is NMT the area of the principal peak in the *Standard solution*; NMT 0.5%.

Total impurities: The total peak area for all unspecified impurities in the *Sample solution* is NMT twice the area of the principal peak in the *Standard solution*; NMT 1.0%.

• Chloride and Sulfate, Chloride 〈 221 〉

Sample: 0.2 g

Control solution: 0.10 mL of 0.020 N hydrochloric acid

Acceptance criteria: 0.035%; the *Sample* shows no more chloride than the *Control solution*

• Chloride and Sulfate, Sulfate 〈 221 〉

Sample: 1.0 g

Control solution: 0.31 mL of 0.020 N sulfuric acid

Acceptance criteria: 0.030%; the *Sample* shows no more sulfate than the *Control solution*

SPECIFIC TESTS

• pH 〈 791 〉

Sample solution: 1 mg/mL

Acceptance criteria: 9.5–10.5

• Water Determination, Method I 〈 921 〉: NMT 5.0%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers.
- **USP Reference Standards** { 11 }
 - USP Ethylparaben RS
 - USP Methylparaben RS

▲NF34

BRIEFING

Sesame Oil, *NF 33* page 6858. Based on a request to accommodate certain grades used in injectable dosage forms that are not currently included in the monograph, it is proposed to make the following changes:

1. Revise the specification of *Specific Gravity* by decreasing the lower limit from 0.916 to 0.912.
2. In the *Labeling* section, add a statement to accommodate a special grade that is used in injectable dosage forms. The specific grade must meet the *Other Requirements* that will be added under the section of *Additional Requirements*.
3. Add the subsection for *Other Requirements* that are applied to the special grade of sesame oil, which is used in injectable dosage forms.

The comment period for the above revision ends March 31, 2015. In the absence of significant adverse comments, it is proposed to implement this revision via an *Interim Revision Announcement* to *USP 38-NF33*, with an official date of July 1, 2015.

Interested parties are encouraged to submit comments to Hong Wang, Ph.D., senior scientific liaison to the Excipient Expert Committees (301-816-8351 or hw@usp.org)

As part of the USP monograph modernization effort, the following revisions are proposed:

1. Add a specification for *Alkaline Impurities*.
2. Add a specification for *Peroxide Value*.
3. Add the specification for *Water Determination*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(EXC: H. Wang.)

Comment deadline: March 31, 2015

Sesame Oil

DEFINITION

Sesame Oil is the refined fixed oil obtained from the seed of one or more cultivated varieties of *Sesamum indicum* L. (Fam. Pedaliaceae). It may contain suitable antioxidants.

IDENTIFICATION

- **A. Identity by Triglyceride Profile**

Analysis: Proceed as directed in the test for *Triglyceride Composition*

Acceptance criteria: The peak responses for the eight major triglycerides—LLL, OLL, PLL,

OOL, POL, OOO, SOL, and POO—elute between 0 and about 40 min, in the order specified, and at relative retention times of about 0.55, 0.65, 0.69, 0.77, 0.82, 0.93, 0.97, and 1.0, respectively, as obtained in the chromatogram of the *Sample solution* in the test for *Triglyceride Composition*.

ASSAY

• Triglyceride Composition

[Note—The fatty acid radicals are designated as linoleic (L), oleic (O), palmitic (P), and stearic (S), and the common abbreviations for triglycerides used are as follows: trilinolein (LLL), 1,2-dilinoleoyl-3-oleoyl-rac-glycerol (OLL), 1,2-dilinoleoyl-3-palmitoyl-rac-glycerol (PLL), 1,2-dioleoyl-3-linoleoyl-rac-glycerol (OOL), 1-palmitoyl-2-oleoyl-3-linoleoyl-rac-glycerol (POL), triolein (OOO), 1-linoleoyl-2-oleoyl-3-stearoyl-rac-glycerol (SOL), and 1,2-dioleoyl-3-palmitoyl-rac-glycerol (POO).]

Mobile phase: Acetonitrile and methylene chloride (60:40)

System suitability solution: 3.0 mg/mL of USP Sesame Oil Related Compound A RS and USP Sesame Oil Related Compound B RS in *Mobile phase*. [Note—USP Sesame Oil Related Compound A RS is OLL, and USP Sesame Oil Related Compound B RS is PLL.]

Sample solution: 20 mg/mL of Sesame Oil in *Mobile phase*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: Refractive index

Columns: Two 4.6-mm × 25-cm in series; packings L1

Column temperature: 30°

Flow rate: 1.0 mL/min

Injection volume: 20 µL

System suitability

Sample: *System suitability solution*

[Note—The relative retention times for OLL and PLL are about 0.93 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.8 between OLL and PLL

Relative standard deviation: NMT 1.5% determined from peak areas; NMT 2.2% determined from the peak area ratio of OLL to PLL

Analysis

[Note—The relative retention times for the eight major triglyceride peaks are listed in *Table 1*.]

Sample: *Sample solution*

Calculate the percentage of each of these triglycerides in the portion of sample taken:

$$\text{Result} = (A/B) \times 100$$

A = peak area for each individual triglyceride

B = sum of the areas of all the peaks, excluding the solvent peak

Table 1

Triglyceride	Relative Retention Time	Composition (%)

LLL	0.55	7.0–19.0
OLL	0.65	13.0–30.0
PLL	0.69	5.0–9.0

BRIEFING

Sodium Starch Glycolate, NF 33 page 6875. The *Identification* by infrared absorption is a non-harmonized attribute; therefore, the note "Disregard any peaks at about 845, 1285, and 1305 cm^{-1} , which are attributed to the presence of citrate" is being added through the regular revision process for *USP-NF*, instead of the revision process for the Pharmacopeial Discussion Group (PDG).

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(EXC: J. Liu.)

Correspondence Number—C149843

Comment deadline: March 31, 2015

Sodium Starch Glycolate

Portions of this monograph that are national *USP-NF* text, and are not part of the harmonized

text, are marked with symbols (◆◆) to specify this fact.

Starch carboxymethyl ether, sodium salt.

DEFINITION

Sodium Starch Glycolate is the sodium salt of a carboxymethyl ether of starch or of a cross-linked carboxymethyl ether of starch. It may contain NMT 7.0% of Sodium Chloride. The pH and assay requirements for Type A and Type B are set forth in the accompanying table.

Type	pH		% Sodium, Combined as Sodium Starch Glycolate	
	Min.	Max.	Min.	Max.
A	5.5	7.5	2.8	4.2
B	3.0	5.0	2.0	3.4

IDENTIFICATION

Change to read:

- ◆◆ **A. Infrared Absorption** (197K)

▲[Note—Disregard any peaks at about 845, 1285, and 1305 cm^{-1} , which are attributed to the presence of citrate.]▲*NF34*

◆

- ◆ **B.** An acidified solution of it is colored blue to violet by the addition of iodine and potassium iodide TS 1.

- ◆ **C.**

Potassium pyroantimonate solution: Dissolve 2 g of potassium pyroantimonate in 85 mL of hot water. Cool quickly, and add 10 mL of a solution of potassium hydroxide (3 in 20). Allow to stand for 24 h, filter, and dilute with water to 100 mL.

Analysis: To a 2-mL portion of the *Sample solution* prepared for the test for *Limit of Iron*, add 2 mL of 15% potassium carbonate, and heat to boiling. No precipitate is formed. Add 4 mL of *Potassium pyroantimonate solution*, and heat to boiling. Allow to cool in ice water and, if necessary, rub the inside of the test tube with a glass rod.

Acceptance criteria: A dense precipitate is formed.

- ◆◆ **D.** Sodium Starch Glycolate imparts an intense yellow color to a nonluminous flame.◆◆

ASSAY

- ◆ **Procedure**

Sample: 1 g

Analysis: Transfer the *Sample* to a conical flask, add 20 mL of 80% alcohol, stir for 10 min, and filter. Repeat the extraction until the chloride has been completely extracted, as shown by a test with silver nitrate. Dry the insoluble portion at 105° to constant weight, and transfer an accurately weighed portion (700 mg) of the dried 80% alcohol-insoluble portion to a suitable flask. Add 80 mL of glacial acetic acid, and heat the mixture under reflux on a boiling water bath for 2 h. Cool to room temperature, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically.

Calculate the percentage of sodium combined in the form of sodium starch glycolate:

$$\text{Result} = 100 \times 22.99 \times V \times (N/W)$$

V = volume of perchloric acid consumed (mL)

N = normality of the perchloric acid

W = weight of the dried alcohol-insoluble residue taken for the Assay (mg)

Acceptance criteria: 2.8%–4.2% for Type A; 2.0%–3.4% for Type B

OTHER COMPONENTS

• Limit of Sodium Chloride

Sample: 500 mg of Sodium Starch Glycolate

Titrimetric system

(See *Titrimetry* 〈 541 〉.)

Mode: Direct titration

Titrant: 0.1 N silver nitrate VS

Endpoint detection: Potentiometric

Electrodes

Indicator: Suitable silver-based

Reference: Double junction electrode containing a 10% potassium nitrate filling solution in the outer jacket, and a standard filling solution in the inner jacket

Analysis: Transfer the *Sample* to a beaker, and suspend in 100 mL of water. Add 1 mL of nitric acid. Titrate with the *Titrant*. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of sodium chloride.

Acceptance criteria: NMT 7.0%

• Limit of Sodium Glycolate

[Note—Conduct this test without exposure to daylight. Use low-actinic glassware.]

Solution A: 0.1 mg/mL of 2,7-dihydroxynaphthalene in sulfuric acid; allow to stand until decolorized, and use within 2 days.

Standard solution: Transfer 310 mg of glycolic acid, previously dried over phosphorus pentoxide in a desiccator at room temperature overnight, to a 500-mL volumetric flask. Dissolve in and dilute with water to volume. Transfer 5.0 mL of this solution to a 100-mL beaker, add 4 mL of 6 N acetic acid, and allow to stand for about 30 min. Add 50 mL of acetone and 1 g of sodium chloride, mix, and pass through fast filter paper moistened with acetone into a 100-mL volumetric flask. Rinse the beaker and the filter paper with acetone. Combine the filtrate and washings, dilute with acetone to volume, and mix. Allow to stand for 24 h without shaking. Use the clear supernatant as the *Standard solution*.

Sample solution: Transfer 200 mg to a 100-mL beaker. Add 4 mL of 6 N acetic acid and 5 mL of water. Stir until dissolution is complete (about 10 min). Add 50 mL of acetone and 1 g of sodium chloride, mix, and pass through fast filter paper moistened with acetone into a 100-mL volumetric flask. Rinse the beaker and filter paper with acetone. Combine the filtrate and washings, dilute with acetone to volume, and mix. Allow to stand for 24 h without shaking. Use the clear supernatant as the *Sample solution*.

Analysis: Treat the *Sample solution* and the *Standard solution* as follows. Heat 2.0 mL of the solution on a water bath for 20 min to remove the acetone. Cool to room temperature. Add 20.0 mL of *Solution A* to the solution under test, mix, and heat on a water bath for 20 min. Cool under running water, and quantitatively transfer to a 25-mL volumetric flask.

Maintain the flask under running water, and dilute with sulfuric acid to volume. Within 10 min, determine the absorbance of the solution at 540 nm with a suitable spectrophotometer, using water as the blank.

Acceptance criteria: The absorbance of the *Sample solution* is NMT that of the *Standard solution* (2.0%).

IMPURITIES

Delete the following:

- ✦

- **Heavy Metals, Method II** 〈 231 〉

: 20 ppm ✦ • (Official 1-Dec-2015)

- **Limit of Iron**

Standard solution: Dissolve 863.4 mg of ferric ammonium sulfate [$\text{FeNH}_4(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$] in water, add 25 mL of 2 N sulfuric acid, dilute with water to 500.0 mL, and mix. Pipet 10 mL of this solution into a 100-mL volumetric flask, dilute with water to volume, and mix. Pipet 5 mL of this solution into a 100-mL volumetric flask, dilute with water to volume, and mix. This solution contains the equivalent of 1.0 $\mu\text{g}/\text{mL}$ of iron.

Sample solution: Place 2.5 g in a silica or platinum crucible, and add 2 mL of 10 N sulfuric acid. Heat on a water bath, then cautiously raise the temperature progressively over an open flame. Ignite, preferably in a muffle furnace, at $600 \pm 25^\circ$. Continue heating until all black particles have disappeared. Cool, add a few drops of 2 N sulfuric acid, and heat and ignite as above. Add a few drops of 2 M ammonium carbonate, evaporate to dryness, and ignite as above. Cool, dissolve the residue in 50 mL of water, and mix.

[Note—Reserve a portion of this solution for *Identification* test C.]

Analysis: Treat the *Sample solution* and the *Standard solution* as follows. Transfer 10 mL of the solution to a suitable beaker, add 2 mL of citric acid solution (1 in 5) and 0.1 mL of thioglycolic acid, and mix. Render the solution alkaline, using litmus paper as an external indicator, by the addition of ammonium hydroxide. Dilute with water to 20 mL, and mix. Allow the solutions to stand for 5 min.

Acceptance criteria: The color of the solution from the *Sample solution* is a shade of pink no deeper than that of the solution from the *Standard solution* (0.002%).

SPECIFIC TESTS

- **Microbial Enumeration Tests** 〈 61 〉 and **Tests for Specified Microorganisms** 〈 62 〉: It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.
- **pH** 〈 791 〉: Disperse 1 g in 30 mL of water. The pH of the resulting suspension is either 5.5–7.5 for Type A or 3.0–5.0 for Type B.
- **Loss on Drying** 〈 731 〉
 - Analysis:** Dry at 130° for 90 min.
 - Acceptance criteria:** NMT 10.0%

ADDITIONAL REQUIREMENTS

- ◆ **Packaging and Storage:** Preserve in well-closed containers, preferably protected from wide variations in temperature and humidity, which may cause caking.◆
- ◆ **Labeling:** Label it to indicate the botanical source of the starch from which it was derived, the cross-linking agent (if used), the pH range, and whether it is Type A or Type B.◆
- **USP Reference Standards** 〈 11 〉
 - USP Sodium Starch Glycolate Type A RS
 - USP Sodium Starch Glycolate Type B RS

BRIEFING

Amoxapine, *USP 38* page 2217. On the basis of comments and supporting data received, it is proposed to modernize the monograph as follows:

1. Revise the limits in the *Definition* and *Assay* from "NLT 98.5% and NMT 101.0%" to "NLT 98.0% and NMT 102.0%," which is typical for liquid chromatographic procedures.
2. Replace the existing liquid chromatographic procedure used in the *Assay* with a more specific liquid chromatographic procedure. USP has received comments indicating that the existing procedure does not separate amoxapine and amoxapine related compound G. The isocratic liquid chromatographic procedure in this proposal is based on analyses performed with the Waters XBridge brand of L1 column. The typical retention time for amoxapine is about 6 min.
3. Replace the nonspecific TLC test in *Organic Impurities* with a specific gradient liquid chromatographic procedure. The isocratic liquid chromatographic procedure proposed in *PF 37(5)* [Sept.–Oct. 2011] was reported to not be specific for amoxapine related compound G. The procedure currently proposed is based on validated analyses performed with the Ascentis Express C18 brand of L1 column with a dwell volume of 0.30 mL. The typical retention time for amoxapine is about 4 min.
4. Update the *USP Reference Standards* section to support the proposed *Assay* and *Organic Impurities* procedures.

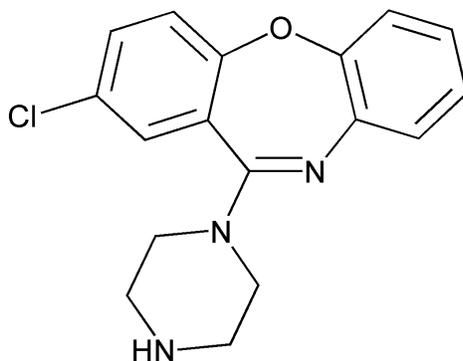

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

BRIEFING

Aripiprazole Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph based on validated methods is being proposed.

1. The liquid chromatographic procedures in the *Assay* and in the *Dissolution* test are based on analyses performed with the YMC ODS-A303 brand of L1 column. The typical retention times for aripiprazole in the *Assay* and the *Dissolution, Analytical Procedure 1* test are about 10 and 5.6 min, respectively. The YMC ODS-AM column may also be suitable.
2. The liquid chromatographic procedure in the test for *Organic Impurities* is based on

analyses performed with the Develosil ODS-HG brand of L1 column. The typical retention time for aripiprazole is about 21.5 min. A YMC ODS-A column may also be suitable.

(SM4: H. Joyce.)

IDENTIFICATION

• **A. Infrared Absorption** 〈 197K 〉

Standard: Add 30 mL of ethyl acetate to 30 mg of USP Aripiprazole RS. Shake for 10 min, centrifuge for NLT 5 min, and pass the supernatant through a suitable membrane filter. To the filtrate, add 15 mL of water, shake for 5 min, and centrifuge for NLT 10 min. Transfer 20 mL of the upper layer to a container and add anhydrous magnesium sulfate, as needed. Shake well, pass through a suitable membrane filter, and evaporate the ethyl acetate on a water bath under reduced pressure. Use the residue. [Note—A centrifuge speed of 2000 rpm may be suitable.]

Sample: Grind a suitable number of Tablets and transfer a suitable portion of the ground Tablets, equivalent to 30 mg of aripiprazole, to an appropriate container. Add 30 mL of ethyl acetate, shake for 10 min, centrifuge for NLT 5 min, and pass the supernatant through a suitable membrane filter. To the filtrate, add 15 mL of water, shake for 5 min, and centrifuge for NLT 10 min. Transfer 20 mL of the upper layer to a container and add a suitable amount of anhydrous magnesium sulfate. Shake well, pass through a suitable membrane filter, and evaporate the ethyl acetate on a water bath under reduced pressure. Use the residue. [Note—A centrifuge speed of 2000 rpm may be suitable.]

Analysis

Samples: *Standard and Sample*

Acceptance criteria: Meet the requirements

- **B.** The retention time of the aripiprazole peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **Procedure**

Solution A: 2.84 g/L of sodium sulfate in water

Mobile phase: Acetonitrile, methanol, *Solution A*, and glacial acetic acid (33:11:56:1)

Internal standard solution: 0.33 mg/mL of USP Propylparaben RS in *Mobile phase*

Standard stock solution: 1 mg/mL of USP Aripiprazole RS in *Mobile phase*

Standard solution: 0.2 mg/mL of USP Aripiprazole RS prepared as follows. Transfer 10.0 mL of *Standard stock solution* and 10.0 mL of *Internal standard solution* to a 50-mL

volumetric flask, and dilute with *Mobile phase* to volume.

Sample solution: Nominally 0.2 mg/mL of aripiprazole from Tablets prepared as follows.

Powder NLT 20 Tablets and transfer a suitable portion of the powder to an appropriate volumetric flask. Add 40% of the final flask volume of *Mobile phase* and 20% of the final flask volume of *Internal standard solution*. Shake for 10 min, and dilute with *Mobile phase* to volume. Centrifuge, if necessary, and pass the supernatant through a suitable filter with a pore size of NMT 0.5 μm , discard the first 1 mL of filtrate, and use the subsequent filtrate.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; 5- μm packing L1

Flow rate: 1 mL/min

Injection volume: 10 μL

Run time: NLT 2 times the retention time of aripiprazole

System suitability

Sample: *Standard solution*

[Note—The relative retention times for aripiprazole and propylparaben are about 1.0 and 1.5, respectively.]

Suitability requirements

Resolution: NLT 8 between aripiprazole and propylparaben

Tailing factor: NMT 1.7 for aripiprazole and for propylparaben

Relative standard deviation: NMT 2.0% for the peak response ratio of aripiprazole to propylparaben

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of aripiprazole ($\text{C}_{23}\text{H}_{27}\text{Cl}_2\text{N}_3\text{O}_2$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_{\bar{U}}$ peak response ratio of aripiprazole to propylparaben from the *Sample solution*

$R_{\bar{S}}$ peak response ratio of aripiprazole to propylparaben from the *Standard solution*

$C_{\bar{S}}$ concentration of USP Aripiprazole RS in the *Standard solution* (mg/mL)

$C_{\bar{U}}$ nominal concentration of aripiprazole in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

• Dissolution { 711 }

Medium: pH 1.2 hydrochloric acid buffer (Transfer 250 mL of 14.9 g/L of potassium chloride in water to a 1-L volumetric flask, add 425 mL of 0.2 N hydrochloride acid solution, and dilute with water to volume. Degas the resulting solution or pass the resulting solution through a filter under vacuum.), degassed; 900 mL

Apparatus 2: 60 rpm

Time: 30 min

Procedure: Determine the percentage of the labeled amount of aripiprazole ($C_{23}H_{27}Cl_2N_3O_2$) dissolved by using either the *Spectrometric procedure* or the *Chromatographic procedure* described below.

Spectrometric procedure

Standard stock solution: 1 mg/mL of USP Aripiprazole RS in alcohol

Standard solution: ($L/900$) mg/mL of USP Aripiprazole RS from *Standard stock solution* in *Medium* where L is the label claim in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter, discarding the first 5 mL of filtrate.

Instrumental conditions

Mode: UV

Analytical wavelengths: 249 and 325 nm

Cell length: 1 cm

Blank: *Medium*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of aripiprazole ($C_{23}H_{27}Cl_2N_3O_2$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

A_U absorbance at 249 nm minus the absorbance at 325 nm of the *Sample solution*

A_S absorbance at 249 nm minus the absorbance at 325 nm of the *Standard solution*

C_S concentration of USP Aripiprazole RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Chromatographic procedure

Solution A: 0.02 M sodium sulfate

Solution B: 13.9 g/L of glacial acetic acid and 23.9 g/L of sodium acetate trihydrate in water

Mobile phase: Acetonitrile, methanol, *Solution A*, and glacial acetic acid (40:10:50:1)

Diluent: *Solution B* and methanol (50:50)

Internal standard solution: 0.35 μ g/mL of USP Propylparaben RS in *Diluent*

Standard stock solution A: 1 mg/mL of USP Aripiprazole RS in *Mobile phase*

Standard stock solution B: 0.002 mg/mL of USP Aripiprazole RS from *Standard stock solution A* in *Medium* passed through a suitable filter with a pore size of NMT 0.5 μ m, discarding the first 6 mL of filtrate

Standard solution: 0.001 mg/mL of USP Aripiprazole RS from *Standard stock solution B* prepared by combining 5 mL of *Standard stock solution B* and 5 mL of *Internal standard solution*

Sample stock solution: Pass a portion of the solution under test through a suitable filter with a pore size of NMT 0.5 μ m, discarding NLT the first 6 mL of filtrate.

Sample solution: Combine 2 mL of *Sample stock solution* with 2 mL of *Internal standard solution*.

Chromatographic system: Proceed as directed in the *Assay* except as follows.

Injection volume: 100 μ L

Run time: NLT 2 times the retention time of aripiprazole

System suitability

Sample: *Standard solution*

[Note—The relative retention times for aripiprazole and propylparaben are about 1.0 and 1.8, respectively.]

Suitability requirements

Resolution: NLT 10 between aripiprazole and propylparaben

Relative standard deviation: NMT 1.5% for the peak response ratios of aripiprazole to propylparaben

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of aripiprazole ($C_{23}H_{27}Cl_2N_3O_2$) dissolved:

$$\text{Result} = (R_U/R_S) \times C_S \times V \times (1/L) \times 100$$

R_U peak response ratio of aripiprazole to propylparaben from the *Sample solution*

R_S peak response ratio of aripiprazole to propylparaben from the *Standard solution*

C_S concentration of USP Aripiprazole RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 75% (Q) of the labeled amount of aripiprazole ($C_{23}H_{27}Cl_2N_3O_2$) is dissolved.

- **Uniformity of Dosage Units** { 905 } : Meet the requirements

IMPURITIES

- **Organic Impurities**

Protect solutions from light.

Buffer: 9.6 g/L of dibasic ammonium citrate, 1.6 g/L of citric acid, and 2.9 g/L of sodium lauryl sulfate in water. Adjust with 0.05 M dibasic ammonia citrate solution or 0.05 M citric acid solution to a pH of 4.7, if needed.

Mobile phase: Acetonitrile and *Buffer* (45:55)

Diluent: Acetonitrile, water, and glacial acetic acid (40:60:1)

System suitability solution: 0.5 mg/mL of USP Aripiprazole RS, and 0.0005 mg/mL each of USP Aripiprazole Related Compound F RS and USP Aripiprazole Related Compound G RS in *Diluent*

Sample solution: Nominally 0.5 mg/mL of aripiprazole from Tablets prepared as follows.

Powder NLT 20 Tablets, transfer a suitable portion of the powder equivalent to NLT 4 mg of aripiprazole to an appropriate container, and add a suitable volume of *Diluent*. Shake for 10 min and centrifuge, if necessary. Pass the supernatant through a suitable filter with a pore size of NMT 0.5 μ m, discard the first 1 mL of filtrate, and use the subsequent filtrate.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 20 µL

Run time: NLT 2 times the retention time of aripiprazole

System suitability

Sample: *System suitability solution*

[Note—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 3 between aripiprazole related compound G and aripiprazole

Signal-to-noise ratio: NLT 10 for aripiprazole related compound F and aripiprazole related compound G

Analysis

Sample: *Sample solution*

Calculate the percentage of each degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U peak response of each degradation product from the *Sample solution*

r_T sum of the peak responses from the *Sample solution*

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Aripiprazole related compound F	0.54	0.20
Aripiprazole related compound G	0.81	0.20
Aripiprazole	1.0	—
Any individual unspecified degradation product	—	0.10
Total degradation products	—	1.0

ADDITIONAL REQUIREMENTS

▲USP39

BRIEFING

Aripiprazole Orally Disintegrating Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph based on validated methods is being proposed.

1. The isocratic liquid chromatographic procedure in the *Assay* is based on analyses performed with the Xterra RP18 brand of L1 column. The typical retention time for aripiprazole is about 8.6 min.
2. The isocratic liquid chromatographic procedure in the *Dissolution* test is based on analyses performed with the YMC-Pack ODS-AM brand of L1 column. The typical retention time for aripiprazole is about 4 min.
3. The gradient liquid chromatographic procedure in the test for *Organic Impurities* is based on analyses performed with the YMC-Pack Pro C18 brand of L1 column with a dwell volume of 1.0 mL. The typical retention time for aripiprazole is about 28.4 min.

Add the following:

▲Aripiprazole Orally Disintegrating Tablets

DEFINITION

Aripiprazole Orally Disintegrating Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of aripiprazole ($C_{23}H_{27}Cl_2N_3O_2$).

IDENTIFICATION

- **A. Infrared Absorption** 〈197A〉
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

● **Procedure**

Solution A: 2.84 g/L of sodium sulfate in water

Buffer: 3.48 g/L of dibasic potassium phosphate adjusted with phosphoric acid to a pH of 8.2

Mobile phase: Acetonitrile and *Buffer* (50:50)

Diluent A: Acetonitrile, methanol, *Solution A*, and glacial acetic acid (33:11:56:1)

Diluent B: Acetonitrile and 0.1 M hydrochloric acid (20:80)

System suitability solution: 0.01 mg/mL each of USP Aripiprazole RS and USP Aripiprazole Related Compound G RS in *Diluent A*. Sonication and shaking may be used to aid in dissolution.

Standard solution: 0.25 mg/mL of USP Aripiprazole RS in *Diluent B*. Sonication may be used to aid in dissolution.

Sample solution: Nominally 0.2–0.3 mg/mL of aripiprazole from NLT 5 Orally Disintegrating Tablets prepared as follows. Transfer NLT 5 Orally Disintegrating Tablets to a suitable volumetric flask and dilute with *Diluent B* to NMT 75% of the final flask volume. Sonicate for 5 min and shake for 15 min. Dilute with *Diluent B* to volume. Pass the resulting solution through a suitable filter and use the filtrate.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 252 nm

Column: 4.6-mm × 10-cm; 3.5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 10 μL

Run time: NLT 1.4 times the retention time of aripiprazole

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times of aripiprazole related compound G and aripiprazole are 0.74 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.0 between aripiprazole related compound G and aripiprazole, *System suitability solution*

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of aripiprazole (C₂₃H₂₇Cl₂N₃O₂) in the portion of Orally Disintegrating Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Aripiprazole RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of aripiprazole in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **Disintegration** { 701 } : NMT 60 s

- **Dissolution** { 711 }

Medium: pH 4.0 sodium acetate trihydrate buffer (3.0 g/L of sodium acetate prepared as follows. Transfer a suitable quantity of sodium acetate to a suitable container containing 90% of the final container volume of water. Adjust with glacial acetic acid to a pH of 4.0. Add water to the final volume.), degassed; 1000 mL

Apparatus 2: 75 rpm

Time: 30 min

Mobile phase: Acetonitrile and 0.025 M hydrochloric acid (40:60)

Standard solution: (L/1000) mg/mL of USP Aripiprazole RS in *Mobile phase* where L is the label claim in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter, discarding the first few mL.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 20 μL

Run time: NLT 1.5 times the retention time of aripiprazole

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of aripiprazole ($C_{23}H_{27}Cl_2N_3O_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Aripiprazole RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 1000 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of aripiprazole ($C_{23}H_{27}Cl_2N_3O_2$) is dissolved.

- **Uniformity of Dosage Units** 〈 905 〉: Meet the requirements

IMPURITIES

- **Organic Impurities**

Solution A: Water and trifluoroacetic acid (100: 0.05)

Solution B: Acetonitrile and trifluoroacetic acid (100: 0.05)

Solution C: 2.84 g/L of sodium sulfate in water

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
20	70	30
40	42	58
50	10	90
55	10	90
56	90	10
60	90	10

[Note—The gradient was established on an HPLC system with a dwell volume of

approximately 1.0 mL.]

Diluent: Acetonitrile, methanol, *Solution C*, and glacial acetic acid (33:11:56:1)

System suitability solution: 250 µg/mL of USP Aripiprazole RS, and 0.5 µg/mL each of USP Aripiprazole Related Compound F RS and USP Aripiprazole Related Compound G RS in *Diluent*. Sonication may be used to aid in dissolution.

Sample solution: Nominally 0.2–0.3 mg/mL of aripiprazole from NLT 5 Orally Disintegrating Tablets prepared as follows. Transfer NLT 5 Orally Disintegrating Tablets to a suitable volumetric flask. Add about 70% of the total volume of *Diluent*. Sonicate for 10 min and shake for 10 min. Dilute with *Diluent* to volume. Pass the resulting solution through a suitable filter and use the filtrate.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 254

Column: 4.6-mm × 15-cm; 3-µm packing L1

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Sample: *System suitability solution*

[Note—See *Table 2* for the relative retention times.]

Suitability requirements

Resolution: NLT 4.0 between aripiprazole related compound G and aripiprazole; NLT 1.5 between aripiprazole and aripiprazole related compound F

Analysis

Sample: *Sample solution*

Calculate the total peak response for individual impurities and aripiprazole in the *Sample solution*:

$$\text{Result} = \sum[r_i \times (1/F)] + r_U$$

r_i = peak response of each degradation product from the *Sample solution*

F = relative response factor (see *Table 2*)

r_U = peak response of aripiprazole from the *Sample solution*

Calculate the percentage of each degradation product in the portion of Orally Disintegrating Tablets taken:

$$\text{Result} = (r_i/r_T) \times (1/F) \times 100$$

r_i = peak response of each degradation product from the *Sample solution*

r_T = sum of the peak responses of individual impurities and aripiprazole from the *Sample solution*

F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*. Disregard peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Aripiprazole related compound G	0.96	0.77	0.3

▲USP39

BRIEFING

Ascorbic Acid Tablets, USP 38 page 2287. It is proposed to make the following changes in the monograph:

1. Revise the *Definition* to add other sources of ascorbic acid.
2. Add a cross-reference to the new general chapter *Vitamin C Assay* { 580 } where the new HPLC procedure for analysis of vitamin C is provided.
3. Add additional performance testing for Tablets recommended to be disintegrated in the mouth before swallowing.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

(DS: N. Davydova.)

Correspondence Number—153939

Comment deadline: March 31, 2015

Ascorbic Acid Tablets

DEFINITION

Change to read:

Ascorbic Acid Tablets contain ~~NLT 90.0% and NMT 110.0%~~ of the labeled amount of ascorbic acid (C₆H₈O₆)

▲ascorbic acid in the form of ascorbic acid (C₆H₈O₆), sodium ascorbate (C₆H₇NaO₆), calcium

ascorbate dihydrate ($C_{12}H_{14}CaO_{12} \cdot 2H_2O$), or their mixture in an amount equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of ascorbic acid ($C_6H_8O_6$). ▲*USP39*

IDENTIFICATION

• A.

Sample solution: Triturate a quantity of finely powdered Tablets with diluted alcohol to make a solution of ascorbic acid with a concentration of 20 mg/mL, and filter.

Analysis: Add alkaline cupric tartrate TS to a portion of the *Sample solution*.

Acceptance criteria: The *Sample solution* reduces alkaline cupric tartrate TS slowly at room temperature but more readily upon heating.

• B.

Sample solution: Use the *Sample solution* from Identification test A.

Analysis: To 2 mL of the *Sample solution* add 4 drops of methylene blue TS, and warm to 40°.

Acceptance criteria: The deep blue color of methylene blue becomes appreciably lighter or is completely discharged within 3 min.

• C.

Sample solution: Use the *Sample solution* from Identification test A.

Analysis: To 1 mL of the *Sample solution* add 15 mL of trichloroacetic acid solution (1 in 20) and 200 mg of activated charcoal, shake the mixture vigorously for 1 min, and pass through a small fluted filter, returning the filtrate if necessary, until clear. To 5 mL of the filtrate add 1 drop of pyrrole, agitate gently until dissolved, and then heat in a bath at 50°.

Acceptance criteria: A blue color develops.

ASSAY

Change to read:

▲[

Note—Where more than one assay procedure is given in the monograph, the requirements may be met by following any one of the specified procedures, the procedure used being stated in the labeling only if *Procedure 1* is not used.] ▲*USP39*

Change to read:

• Procedure

▲**Procedure 1** ▲*USP39*

Sample stock solution: Transfer NLT 20 Tablets to a 1000-mL volumetric flask containing 250 mL of metaphosphoric–acetic acids TS. Insert the stopper in the flask, and shake by mechanical means for 30 min or until the Tablets have disintegrated completely. Dilute with water to volume.

Sample solution: Transfer a portion of the *Sample stock solution* to a centrifuge tube, and centrifuge until a clear supernatant is obtained. Quantitatively dilute the clear supernatant with water, if necessary, to obtain a solution containing 0.5 mg/mL of ascorbic acid.

Blank: A mixture of 5.5 mL of metaphosphoric–acetic acids TS and 15 mL of water

Titrimetric system

(See *Titrimetry* 〈 541 〉.)

Mode: Direct titration

Titrant: Standard dichlorophenol–indophenol VS

Endpoint detection: Visual, a rose-pink color that persists for at least 5 s

Analysis: Transfer a volume of the *Sample solution*, equivalent to 2 mg of ascorbic acid, to a 50-mL conical flask. Add 5 mL of metaphosphoric–acetic acids TS, and titrate with *Titrant*. Correct for the volume of the *Titrant* consumed by the *Blank*.

Calculate the percentage of the labeled amount of ascorbic acid ($C_6H_8O_6$) in the portion of Tablets taken:

$$\text{Result} = \{[(V_S - V_B) \times F]/W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample solution* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

F = concentration of the *Titrant* in terms of the equivalent of ascorbic acid (mg/mL)

W = nominal weight of ascorbic acid taken for *Analysis* (mg)

Acceptance criteria: 90.0%–110.0%

Add the following:

▲● **Procedure 2**

(See *Vitamin C Assay* 〈 580 〉, *Method II—Chromatographic Method.*)

Acceptance criteria: 90.0%–110.0%▲*USP39*

PERFORMANCE TESTS

Change to read:

● **Dissolution** 〈 711 〉

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Sample solution: Withdraw a portion of the solution under test, pass through a suitable filter, and use the pooled sample as the test specimen.

Analysis: Proceed as directed in the *Assay*,

▲*Procedure 1* or *Procedure 2*,▲*USP39*

conducting the procedure without delay and making any necessary modifications.

Calculate the percentage of the labeled amount of ascorbic acid ($C_6H_8O_6$) dissolved:

▲*For Procedure 1* ▲*USP39*

$$\text{Result} = (V_S - V_B) \times F \times [(V_M/a)/L] \times 100$$

V_S = *Titrant* volume consumed by the *Sample solution* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

F = concentration of the *Titrant* in terms of the equivalent of ascorbic acid (mg/mL)

V_M = volume of *Medium*, 900 mL

a = volume of the aliquot taken for *Analysis*

L = label claim of ascorbic acid (mg/Tablet)

▲For Procedure 2

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U

= peak area of ascorbic acid from the *Sample solution*

r_S

= peak area of ascorbic acid from the *Standard solution*

C_S

= concentration of USP Ascorbic Acid RS in the *Standard solution* (mg/mL)

V

= volume of *Medium*, 900 mL

L

= label claim (mg/Tablet)

▲USP39

Tolerances: NLT 75% (Q) of the labeled amount of ascorbic acid ($C_6H_8O_6$) is dissolved.

Add the following:

▲• **Disintegration** 〈 701 〉

[Note—Meet this additional test if the label recommends to disintegrate the Tablets in the mouth before swallowing.]

Medium: Water

Time: NMT 5 min

Acceptance criteria: Meet the requirements ▲USP39

- **Uniformity of Dosage Units** 〈 905 〉: Meet the requirements

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight, light-resistant containers.

Add the following:

- ▲• **Labeling:** The label states the quantity of ascorbic acid in mg/Tablet, and the chemical form of ascorbic acid present in the Tablets. The labeling states with which assay procedure the product complies only if *Procedure 1* is not used. The label also states whether it is to be disintegrated in the mouth. ▲USP39

▲USP39

BRIEFING

Aspirin Capsules, *USP 38* page 2290. The United States Pharmacopeia (USP) is engaged in the ongoing challenge of obtaining information needed to create and sustain up-to-date

drug product quality monographs for drugs marketed under the FDA over-the-counter (OTC) drug monograph system (21 CFR Part 330). The following revisions of the *Assay*, *Identification*, and *Organic Impurities* tests are being proposed:

1. *Identification* test *A*, a non-specific wet chemical test, has been replaced with a high-performance liquid chromatographic procedure from the *Assay* that requires retention time agreement.
2. The *Assay*, which used an outdated column-partition chromatographic procedure, has been replaced with a high-performance liquid chromatographic procedure from the general chapter *Drug Product Assay Tests—Organic Chemical Medicines* 〈 321 〉, *Procedure 1*. This procedure was validated using the Waters Acquity UPLC HSS T3 brand of L1 column. The retention time of aspirin is about 7.5 min.
3. The *Organic Impurities—Limit of Free Salicylic Acid* test used an outdated column-partition chromatographic procedure. It is being proposed to replace this test with a high-performance liquid chromatographic procedure for *Salicylic Acid in Aspirin-Containing Drug Products* from the general chapter *Drug Product Impurities Tests* 〈 327 〉. This procedure requires the same chromatographic conditions as specified in the *Assay* and was validated using the same chromatographic column. The retention time of salicylic acid is about 8.6 min.
4. Additional Reference Standards have been added to the *USP Reference Standards* 〈 11 〉 section to support the revisions of the *Assay* and *Limit of Free Salicylic Acid* test.

The general chapters *Drug Product Assay Test—Organic Chemical Medicines* 〈 321 〉 and *Drug Product Impurities Tests* 〈 327 〉, published in this issue of *PF*, are procedures that were developed and validated for over-the-counter medicines. Further information can be found in the Stimuli article [Medicines Marketed under the Food and Drug Administration Over-the-Counter \(FDA OTC\) Drug Monograph System Regulations: Strategy for Developing Compendial Quality Standards](#) also published in this issue of *PF*. This article describes in detail the rationale for development of general chapters to organize procedures for the assay and specified impurities tests that can then be referenced in the individual product monographs. USP plans to continue with this initiative to revise or establish standards for OTC drug products.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Aspirin Capsules

DEFINITION

Aspirin Capsules contain NLT 93.0% and NMT 107.0% of the labeled amount of aspirin (C₉H₈O₄).

[Note—Capsules that are enteric-coated or the contents of which are enteric-coated meet the requirements for *Aspirin Delayed-Release Capsules*.]

IDENTIFICATION

Delete the following:

▲● A. Procedure

Sample: 100 mg of Capsule contents

Analysis: Combine *Sample* with 10 mL of water, heat for several minutes, cool, and add 1 drop of *ferric chloride TS*.

Acceptance criteria: A violet-red color is produced. ▲*USP39*

Add the following:

▲● **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲*USP39*

● **B. Infrared Absorption** (197K)

Sample: Equivalent to 500 mg of aspirin, from Capsule contents

Analysis: Shake *Sample* with 10 mL of alcohol for several min. Centrifuge the mixture. Pour off the clear supernatant and evaporate it to dryness. Dry the residue in a vacuum at 60° for 1 h.

Acceptance criteria: Meet the requirements

ASSAY

Delete the following:

▲● Procedure

[Note—Use chloroform recently saturated with water.]

Diluent: A solution (1 in 100) of glacial acetic acid in chloroform

Standard stock solution: Transfer 50 mg of USP Aspirin RS to a 50 mL volumetric flask, add 0.5 mL of glacial acetic acid, and add chloroform to volume.

Standard solution: 50 µg/mL of USP Aspirin RS from *Standard stock solution* diluted with *Diluent*

Sample solution: Nominally 50 µg/mL of aspirin from Capsules prepared as follows. Remove, as completely as possible, the contents of NLT 20 Capsules. Mix the combined contents, and transfer a quantity of the powder, equivalent to 50 mg of aspirin, to a 50 mL volumetric flask containing 1 mL of a solution (1 in 50) of hydrochloric acid in methanol, and add chloroform to volume. Transfer 5.0 mL of this solution to the column, wash with 5 mL and then with 25 mL of chloroform, and discard the washings. Elute into a 100 mL volumetric flask with 10 mL of *Diluent*. Dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* (621), *Column Partition Chromatography*.)

Mode: LC

Column: Pack a chromatographic tube with a mixture of 3 g of *Solid Support* and 2 mL of freshly prepared sodium bicarbonate solution (1 in 12).

Analytical wavelength: 280 nm

Cell: 1-cm

Blank: Chloroform

Analysis

Samples: *Standard solution, Sample solution, and Blank*

Calculate the percentage of aspirin ($C_9H_8O_4$) in the portion of Capsules taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_S absorbances of the *Sample solution*

A_U absorbances of the *Standard solution*

C_S concentration of USP Aspirin RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U nominal concentration of aspirin in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 93.0%–107.0%▲*USP39*

Add the following:

▲● **Drug Product Assay Tests—Organic Chemical Medicines, Procedure 1** 〈 321 〉

Acceptance criteria: 93.0%–107.0%▲*USP39*

PERFORMANCE TESTS

● **Dissolution** 〈 711 〉

0.05 M acetate buffer: Mix 2.99 g of sodium acetate trihydrate and 1.66 mL of glacial acetic acid with water to obtain 1000 mL of solution having a pH of 4.50 ± 0.05 .

Medium: 0.05 M acetate buffer; 500 mL

Apparatus 1: 100 rpm

Time: 30 min

Standard solution: USP Aspirin RS having a known concentration in *Medium*. Prepare the *Standard solution* at the time of use. An amount of alcohol not to exceed 1% of the total volume of the *Standard solution* may be used to bring the Reference Standard into solution prior to dilution with *Medium*.

Sample solution: Sample per *Dissolution* 〈 711 〉. Dilute with *Medium*, if necessary, and filter.

Instrumental conditions

Mode: UV

Analytical wavelength: 265 ± 2 nm

Analysis

Samples: *Standard solution and Sample solution*

Determine the labeled amount of aspirin ($C_9H_8O_4$) dissolved at the wavelength of the isosbestic point of aspirin and salicylic acid of the *Sample solution* in comparison with a *Standard solution* having a known concentration.

Tolerances: NLT 80% (Q) of the labeled amount of aspirin ($C_9H_8O_4$) is dissolved.

● **Uniformity of Dosage Units** 〈 905 〉: Meet the requirements

IMPURITIES**Delete the following:****▲Organic Impurities**● **Procedure: Limit of Free Salicylic Acid**

Ferric chloride-urea reagent: Dissolve by swirling, without the aid of heat, 60 g of urea in a mixture of 8 mL of ferric chloride solution (6 of 10) and 42 mL of 0.05 N hydrochloric acid. Adjust the resulting solution, if necessary, with 6 N hydrochloric acid to a pH of 3.2.

Standard solution: 15 µg/mL salicylic acid prepared as follows. Transfer 75.0 mg of salicylic acid, previously dried over silica gel for 3 h, to a 100 mL volumetric flask, and add chloroform to volume. Transfer 10.0 mL of this solution to a second 100 mL volumetric flask, and dilute with chloroform to volume. Transfer 10.0 mL of this last solution to a 50 mL volumetric flask containing 10 mL of methanol, 2 drops of hydrochloric acid, and 10 mL of a solution (1 in 10) of glacial acetic acid in ether, and dilute with chloroform to volume.

Sample solution: Nominally 2 mg of aspirin prepared from Capsules as follows. Weigh a portion of the contents of the Capsules, as determined by the Assay, equivalent to 100 mg of aspirin, mix with 10 mL of chloroform by stirring for 3 min, and then transfer to the chromatographic column with the aid of a few mL of chloroform. Pass 50 mL of chloroform through the column, rinse the tip of the chromatographic tube with chloroform, and discard the eluate. Prepare as a receiver a 50 mL volumetric flask containing 10 mL of methanol and 2 drops of hydrochloric acid, and elute any salicylic acid from the column by passing 10 mL of a solution (1 in 10) of glacial acetic acid in ether that has been recently saturated with water, followed by 30 mL of chloroform. Dilute the eluate with chloroform to volume.

Instrumental conditions

(See *Chromatography* ~~⟨ 621 ⟩~~, *Column Partition Chromatography*.)

Mode: LC

Column: Pack a chromatographic tube with two segments of packing material. The lower segment is a mixture of 1 g of *Solid Support* and 0.5 mL of 5 M phosphoric acid, and the upper segment is a mixture of 3 g of *Solid Support* and 2 mL of freshly prepared *Ferric chloride-urea reagent*.

Analytical wavelength: 306 nm

Cell: 1 cm

Blank: A solvent mixture of the same composition as that used for the *Standard solution*

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Acceptance criteria: The absorbance of the *Sample solution* does not exceed that of the *Standard solution* (NMT 0.75%, calculated on the labeled aspirin content).

▲USP39

Add the following:

▲● **Limit of Free Salicylic Acid:** Proceed as directed for *Salicylic Acid in Aspirin-containing Drug Products* in *Drug Product Impurities Tests* ~~⟨ 327 ⟩~~.

Acceptance criteria: NMT 0.75%▲USP39

BRIEFING

Benzocaine Lozenges, USP 38 page 2389. As part of the USP monograph modernization initiative, it is proposed to make the following changes:

1. Replace *Identification* test A, a wet chemistry test, with a test based on the UV spectrum agreement of the major peak in the chromatogram of the sample and standard in the *Assay*.
2. Add acceptance criteria for both the total labeled amount of benzocaine and free benzocaine in the *Assay* for clarity.
3. Add the test for *Organic Impurities* to the monograph. The proposed HPLC procedure in the test for *Organic Impurities* is based on analyses performed with the Waters Symmetry Shield RP-8 brand of L7 column. The typical retention time for benzocaine is about 6.1 min.
4. Add acceptance criteria for specified and unspecified degradation products. Aminobenzoic acid and ethyl 4-nitrobenzoate are potential degradation products of benzocaine. Acceptance criteria of NMT 0.2% are proposed for aminobenzoic acid and ethyl 4-nitrobenzoate. For unspecified degradation products, acceptance criteria of NMT 0.1% based on ICH guidelines are proposed. Manufacturers are encouraged to submit their approved specifications to USP if they are different from those proposed in this revision.
5. Add a storage condition in the *Packaging and Storage* section based on the product package label.
6. Add two USP Reference Standards to the *USP Reference Standards* section to support the proposed revision for the procedure in the test for *Organic Impurities*.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

BRIEFING

Benzocaine and Menthol Topical Aerosol, USP 38 page 2394. As part of the USP monograph modernization initiative, it is proposed to make the following changes:

1. Replace *Identification test A*, a wet chemistry test, with a test based on the UV spectrum agreement of the major peak in the chromatogram of the sample and standard in the *Assay*.
2. Replace the test procedure for *Benzocaine* in the *Assay* with an HPLC procedure

based on the same HPLC column and mobile phases as the proposed procedure in the test for *Organic Impurities* for consistency and efficiency.

3. Replace the packed GC column test procedure for *Menthol* in the *Assay* with a validated GC procedure which uses a capillary GC column. The proposed GC procedure for menthol is based on analyses performed with the Agilent DB-Wax brand of G16 column. The typical run time is about 13 min.
4. Add the test for *Organic Impurities*. The proposed HPLC procedure in the *Organic Impurities* is based on analyses performed with the Waters Symmetry Shield RP-8 brand of L7 column. The typical retention time for benzocaine is about 15 min.
5. Add acceptance criteria for specified and unspecified degradation products. Aminobenzoic acid and ethyl 4-nitrobenzoate are potential degradation products of benzocaine. Acceptance criteria of NMT 0.2% are proposed for aminobenzoic acid and ethyl 4-nitrobenzoate. For unspecified degradation products, acceptance criteria of NMT 0.1% are proposed. Manufacturers are encouraged to submit their approved specifications to USP if they are different from those proposed in this revision.
6. Replace the *Pressure Test* and *Leakage Test* in *Other Requirements* with the *Pressure Test* and *Leakage Test* in general chapters *Topical Aerosols* 〈 603 〉 and *Leak Rate* 〈 604 〉.
7. Add two USP Reference Standards to the *USP Reference Standards* section to support the proposed revision for the procedure in the test for *Organic Impurities*.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

Benzocaine and Menthol Topical Aerosol

DEFINITION

Benzocaine and Menthol Topical Aerosol is a solution of Benzocaine and Menthol with suitable propellants in a pressurized container. It contains NLT 90.0% and NMT 110.0% of the labeled amounts of benzocaine ($C_9H_{11}NO_2$) and menthol ($C_{10}H_{20}O$).

IDENTIFICATION

Delete the following:

▲● A:

Sample: An amount of Topical Aerosol equivalent to 5 mg of benzocaine

Analysis: Transfer the *Sample* to a beaker. Add 20 mL of 0.5 N hydrochloric acid, and warm gently to disperse the solution. Cool, and filter if necessary, to obtain a clear solution. To 10 mL of the clear solution add 5 drops of a solution of sodium nitrite (1 in 10) and 2 drops of methyl red TS, and neutralize with 1 N sodium hydroxide. Add 2 mL of a solution of 100 mg of 2-naphthol in 5 mL of 1 N sodium hydroxide.

Acceptance criteria: An orange-red precipitate is formed. ▲USP39

Add the following:

- ▲● **A.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay. ▲USP39
- **B.** The retention time of the major peak for benzocaine of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.
- **C.** The retention time of the major peak for menthol of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

Acceptance criteria: 90.0%–110.0%

▲Internal standard solution: 1 mg/mL of decanol in isopropyl alcohol

Standard stock solution: 1 mg/mL of USP Menthol RS in isopropyl alcohol

Standard solution: 0.5 mg/mL each of USP Menthol RS and decanol in isopropyl alcohol from *Internal standard solution* and *Standard stock solution*

Sample solution: Nominally 0.5 mg/mL of menthol prepared as follows. Spray the contents of the Topical Aerosol into a flask. Transfer an amount of Topical Aerosol equivalent to 5 mg of menthol to a 10-mL volumetric flask and add 5.0 mL of *Internal standard solution*. Dilute with isopropyl alcohol to volume.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm × 30-m; fused-silica capillary column bonded with a 1.0-μm film of phase G16

Carrier gas: Hydrogen

Temperatures

Injection port: 250°

Detector: 250°

Column: See *Table 2*.

Table 2

Initial Temperature (°)	Hold Time at 130° (min)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
130	7.5	35	240	1.0

Flow rate: 10 mL/min

Injection volume: 1 μL

Injection type: Split, split ratio 10:1

System suitability

Sample: *Standard solution*

[Note—The relative retention times for menthol and decanol are 1.0 and 1.6, respectively.]

Suitability requirements

Resolution: NLT 2.5 between the menthol and decanol peaks

Relative standard deviation: NMT 1.0% of the ratio of the peak response of menthol to that of decanol

Analysis**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of menthol ($C_{10}H_{20}O$) in the portion of Topical Aerosol taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

 R_U

= peak response ratio of menthol to decanol from the *Sample solution*

R_S = peak response ratio of menthol to decanol from the *Standard solution*

C_S = concentration of USP Menthol RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of menthol in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%▲*USP39*

PERFORMANCE TESTS

- **Minimum Fill** (755): Meets the requirements

IMPURITIES

Add the following:

▲• **Organic Impurities**

Solution A: Dilute 1.0 mL of trifluoroacetic acid with water to 1 L.

Solution B: Acetonitrile

Mobile phase: See *Table 3*.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	90	10
34	50	50
35	90	10
38	90	10

Diluent: *Solution A* and *Solution B* (1:1)

Standard stock solution: 0.1 mg/mL each of USP Benzocaine RS, USP Aminobenzoic Acid RS, and USP Ethyl 4-Nitrobenzoate RS in *Diluent*. Sonicate for about 5 min to dissolve before diluting to final volume.

Standard solution: 0.001 mg/mL each of USP Benzocaine RS, USP Aminobenzoic Acid RS, and USP Ethyl 4-Nitrobenzoate RS in *Diluent* from the *Standard stock solution*

Sample solution: Nominally 0.5 mg/mL of benzocaine in *Diluent* prepared as follows. Spray the contents of the Topical Aerosol into a flask. Heat and stir the sprayed Topical Aerosol at 100° for 30 min in an oil bath to obtain a viscous liquid sample. Cool the sample to room temperature. Transfer an amount of Topical Aerosol equivalent to 50 mg of benzocaine to

a 100-mL volumetric flask. Dissolve the sample in *Diluent* and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5-μm packing L7

Flow rate: 1.5 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0% for each peak corresponding to benzocaine, aminobenzoic acid, and ethyl 4-nitrobenzoate

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of aminobenzoic acid and ethyl 4-nitrobenzoate in the portion of Topical Aerosol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of aminobenzoic acid or ethyl 4-nitrobenzoate from the *Sample solution*

r_S peak response of the corresponding Reference Standard from the *Standard solution*

C_S concentration of USP Aminobenzoic Acid RS or USP Ethyl 4-Nitrobenzoate RS in the *Standard solution* (mg/mL)

C_U nominal concentration of benzocaine in the *Sample solution* (mg/mL)

Calculate the percentage of each unspecified degradation product in the portion of Topical Aerosol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of each unspecified degradation product from the *Sample solution*

r_S peak response of benzocaine from the *Standard solution*

C_S concentration of USP Benzocaine RS in the *Standard solution* (mg/mL)

C_U nominal concentration of benzocaine in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 4*. Disregard peaks less than 0.05%.

Table 4

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Aminobenzoic acid	0.3	0.2
Benzocaine	1.0	—
Ethyl 4-nitrobenzoate	2.1	0.2
Any other unspecified degradation product	—	0.1
Total degradation products	—	2.0

BRIEFING

Brompheniramine Maleate Oral Solution, USP 38 page 2476. The United States Pharmacopeia (USP) is engaged in the ongoing challenge of obtaining information needed to create and sustain up-to-date drug product quality monographs for drugs marketed under the FDA over-the-counter (OTC) drug monograph system (21 CFR Part 330). The following revisions to the *Assay* and *Identification* tests are being proposed:

1. The *Identification—Organic Nitrogenous Bases* 〈 181 〉 procedure, which uses carbon disulfide and requires extensive sample preparation, has been replaced with retention time agreement using the procedure from the *Assay*.

2. An *Identification* test *B* that uses the photo-diode array detection (190–400 nm) has been added, with the *Assay* procedure as a second orthogonal test.
3. The *Assay*, which uses a titration procedure requiring the use of chloroform, an unsafe solvent, has been replaced with a liquid chromatography procedure from the general chapter *Drug Product Assay Tests—Organic Chemical Medicines* 〈 321 〉, *Procedure 1*. This procedure was validated using the Waters Acquity UPLC HSS T3 brand of L1 column. The retention time of brompheniramine is about 7.0 min.
4. The test for *Alcohol Determination* criteria was modified to reflect “if present”.
5. *Deliverable Volume* 〈 698 〉, *Microbial Enumeration Tests* 〈 61 〉, and *Tests for Specified Microorganisms* 〈 62 〉 have been added to strengthen the monograph.
6. The *Packaging and Storage* section is updated to be consistent with the manufacturers’ package inserts.
7. Additional Reference Standards have been added to the *USP Reference Standards* section to support the revision of the *Assay*.

Chapter 〈 321 〉, also published in this issue of *PF*, is a procedure that was developed and validated for OTC medicines. Further information can be found in the *Stimuli* article [Medicines Marketed under the Food and Drug Administration Over-the-Counter \(FDA OTC\) Drug Monograph System Regulations: Strategy for Developing Compendial Quality Standards](#), also published in this issue of *PF*. This article describes in detail the rationale for the development of general chapters to organize procedures for the assay that can then be referenced in the individual product monographs. USP plans to continue with this initiative to revise or establish standards for OTC drug products.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Brompheniramine Maleate Oral Solution

DEFINITION

Brompheniramine Maleate Oral Solution contains NLT 95.0% and NMT 105.0% of the labeled amount of brompheniramine maleate ($C_{16}H_{19}BrN_2 \cdot C_4H_4O_4$).

IDENTIFICATION

Delete the following:

▲• Identification—Organic Nitrogenous Bases ~~〈 181 〉~~

Sample solution: Transfer an equivalent of 50 mg of brompheniramine maleate from a volume of Oral Solution, to a separator. Render distinctly alkaline with 1 N sodium hydroxide, and extract with two 50 mL portions of chloroform, shaking gently to avoid emulsification. Wash the combined chloroform extracts with 10 mL of water, and discard the aqueous phase. Filter the combined chloroform extracts into a conical flask, and evaporate the solvent on a steam bath, with the aid of a current of air. To the residue add 25 mL of dilute hydrochloric acid (1 in 1200), and proceed as directed under

~~Identification—Organic Nitrogenous Bases (181), beginning with "Transfer the liquid to a separator".~~

~~**Acceptance criteria:** The Oral Solution meets the requirements. ▲USP39~~

Add the following:

- ▲● **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲USP39

Add the following:

- ▲● **B.** The UV-vis spectrum (190-400 nm) of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲USP39

BRIEFING

Candesartan Cilexetil Tablets. Because there is no existing *USP* monograph for this dosage form, a new monograph based on validated methods of analysis is proposed. The liquid chromatographic procedure in both the *Assay* and *Dissolution* tests, is based on analysis performed using the Xterra RP8 brand of L7 column. The typical retention time for candesartan cilexetil is about 5.4 min. The liquid chromatographic procedure in the *Organic Impurities* test is based on analyses performed with the Symmetry C18 brand of L1 column. The typical retention time for candesartan cilexetil is about 16.8 min.

(SM2: S. Ramakrishna.)

Correspondence Number—C127211

Comment deadline: March 31, 2015

Add the following:

▲**Candesartan Cilexetil Tablets**

DEFINITION

Candesartan Cilexetil Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of

candesartan cilexetil (C₃₃H₃₄N₆O₆).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV absorption spectra of the major peak of the *Sample solution* exhibit maxima and minima at the same wavelengths as those of the corresponding peak from the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **Procedure**

Mobile phase: Acetonitrile, trifluoroacetic acid, and water (550:1:450)

Diluent: Acetonitrile and water (70:30)

Standard solution: 0.8 mg/mL of USP Candesartan Cilexetil RS in *Diluent*. Sonication may be necessary for complete dissolution. Pass through a suitable filter of 0.45- μ m pore size.

Sample solution: Nominally 0.8 mg/mL of candesartan cilexetil in *Diluent* prepared as follows. Transfer a number of Tablets (see *Table 1*) to a suitable volumetric flask.

Table 1

Tablet Strength (mg)	Number of Tablets (NLT)
4	10
8	10
16	5
32	5

Add *Diluent* to fill about 70% of the total volume, and sonicate for about 25 min with intermittent shaking. Allow to cool and dilute with *Diluent* to volume. Pass through a suitable filter of 0.45- μ m pore size.

Chromatographic system

BRIEFING

Candesartan Cilexetil and Hydrochlorothiazide Tablets. Because there is no existing *USP* monograph for this dosage form, a new monograph based on validated methods of analysis is proposed. The liquid chromatographic procedure used in the *Assay* and *Dissolution* test is based on the Xterra RP8 brand of 5- μm L7 column. The typical retention time for hydrochlorothiazide and candesartan cilexetil are about 4.7 and 10.6 min, respectively, based on the *Assay* conditions and about 3.6 and 10 min, respectively, based on the *Dissolution* test conditions. The liquid chromatographic procedure in the test for *Organic Impurities* is based on analyses performed with the Inertsil C8-3 brand of 5- μm L7 column. The typical retention time for hydrochlorothiazide is 7.5 min, and about 36.7 min for candesartan cilexetil.

(SM2: S. Ramakrishna.)

Correspondence Number—C113423

Comment deadline: March 31, 2015**Add the following:****▲Candesartan Cilexetil and Hydrochlorothiazide Tablets****DEFINITION**

Candesartan Cilexetil and Hydrochlorothiazide Tablets contain NLT 90.0% and NMT 110.0% each of the labeled amount of candesartan cilexetil ($\text{C}_{33}\text{H}_{34}\text{N}_6\text{O}_6$) and hydrochlorothiazide ($\text{C}_7\text{H}_8\text{ClN}_3\text{O}_4\text{S}_2$).

IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV absorption spectra of the major peaks of the *Sample solution* exhibit maxima and minima at the same wavelengths as those of the corresponding peaks of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **Procedure****Solution A:** Acetonitrile, trifluoroacetic acid, and water (10: 0.1: 90)**Solution B:** Acetonitrile, trifluoroacetic acid, and water (90: 0.1: 10)**Mobile phase:** See *Table 1*.**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	90	10
4.0	90	10
6.0	30	70
15.0	30	70

17.0	90	10
20.0	90	10

Diluent: Acetonitrile and water (70:30)

Standard solution: Prepare solutions of USP Candesartan Cilexetil RS and USP Hydrochlorothiazide RS in *Diluent* at concentrations given in *Table 2* as follows. Transfer suitable amounts of USP Candesartan Cilexetil RS and USP Hydrochlorothiazide RS to a suitable volumetric flask. Add *Diluent*, about 50% of the total volume, and sonicate to dissolve. Dilute with *Diluent* to volume and pass through a suitable filter of 0.45- μ m pore size.

Table 2

Tablet Strength Candesartan Cilexetil/Hydrochlorothiazide (mg/mg)	Concentration of Candesartan Cilexetil (mg/mL)	Concentration of Hydrochlorothiazide (mg/mL)
16/12.5	0.32	0.25
32/12.5	0.64	0.25
32/25	0.32	0.25

Sample solution: Nominally equivalent to the concentration mentioned in *Table 2* prepared as follows. Transfer NLT 5 Tablets to a suitable volumetric flask. Add about 60% of the total volume of *Diluent*, and sonicate for about 25 min with intermittent shaking. Cool to room temperature and dilute with *Diluent* to volume. Pass through a suitable filter of 0.45- μ m pore size.

Chromatographic system:

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector

Assay: UV 282 nm

Identification test B: Diode array, UV 282 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L7. [Note—Conditioning of the column with *Solution A* and *Solution B* (80:20) for about 30 min is recommended prior to use.]

Column temperature: 30 $^{\circ}$

Flow rate: 1 mL/min

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0 for both candesartan cilexetil and hydrochlorothiazide peaks

Relative standard deviation: NMT 2.0% for both candesartan cilexetil and hydrochlorothiazide peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount each of candesartan cilexetil ($C_{33}H_{34}N_6O_6$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_{\overline{f}}$ peak response of candesartan cilexetil or hydrochlorothiazide from the *Sample solution*

$r_{\overline{s}}$ peak response of candesartan cilexetil or hydrochlorothiazide from the *Standard solution*

$C_{\overline{s}}$ concentration of USP Candesartan Cilexetil RS or USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)

$C_{\overline{f}}$ nominal concentration of candesartan cilexetil or hydrochlorothiazide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% each of candesartan cilexetil and hydrochlorothiazide

PERFORMANCE TESTS

• Dissolution 〈 711 〉

Medium

For Tablets labeled to contain 16 mg/12.5 mg of candesartan

cilexetil/hydrochlorothiazide: 0.35% Polysorbate 20 in 0.05 M phosphate buffer pH 6.5; 900 mL

For Tablets labeled to contain 32 mg/12.5 mg and 32 mg/25 mg of candesartan

cilexetil/hydrochlorothiazide: 0.70% Polysorbate 20 in 0.05 M phosphate buffer pH 6.5; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Solution A and Solution B: Proceed as directed in the *Assay*.

Mobile phase: See *Table 3*.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	80	20
3.0	80	20
5.0	30	70
10.0	30	70
13.0	80	20
16.0	80	20

Standard stock solution A: 0.72 mg/mL of USP Candesartan Cilexetil RS in acetonitrile prepared as follows. Transfer a quantity of USP Candesartan Cilexetil RS to a suitable volumetric flask. Add acetonitrile, about 50% of volume of the flask, and sonicate. Dilute with acetonitrile to volume.

Standard stock solution B: 0.28 mg/mL of USP Hydrochlorothiazide RS in acetonitrile prepared as follows. Transfer a quantity of USP Hydrochlorothiazide RS to a suitable volumetric flask. Add acetonitrile, about 50% of volume of the flask, and sonicate. Dilute with acetonitrile to volume.

Standard solution: Prepare solutions of concentrations per *Table 4*, from *Standard stock solution A* and *Standard stock solution B* in the appropriate *Medium*. Pass through a suitable filter of 0.45- μ m pore size.

Table 4

Tablet Strength Candesartan Cilexetil/Hydrochlorothiazide (mg/mg)	Concentration of Candesartan Cilexetil (mg/mL)	Concentration of Hydrochlorothiazide (mg/mL)
16/12.5	0.018	0.014
32/12.5 and 32/25	0.036	0.014

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size.

Chromatographic system:

(See *Chromatography* \langle 621 \rangle , *System Suitability*.)

Mode: LC

Detector: UV 264 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L7. [Note—Conditioning of the column with *Solution A* and *Solution B* (80:20) for NLT 20 min is recommended prior to use.]

Flow rate: 1 mL/min

Injection volume: 50 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0 for both candesartan cilexetil and hydrochlorothiazide peaks

Relative standard deviation: NMT 2.0% for both candesartan cilexetil and hydrochlorothiazide peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of candesartan cilexetil ($C_{33}H_{34}N_6O_6$) or hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response of candesartan cilexetil or hydrochlorothiazide from the *Sample solution*

r_S = peak response of candesartan cilexetil or hydrochlorothiazide from the *Standard solution*

C_S = concentration of USP Candesartan Cilexetil RS or USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) each of the labeled amounts of candesartan cilexetil ($C_{33}H_{34}N_6O_6$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) are dissolved.

62	95	5
70	95	5

Diluent A: Acetonitrile and water (70:30)

Diluent B: Acetonitrile and water (50:50)

Peak identification stock solution A: 0.05 mg/mL each of USP Candesartan Cilexetil Related Compound A RS, USP Candesartan Cilexetil Related Compound B RS, USP Candesartan Cilexetil Related Compound D RS, and USP Candesartan Cilexetil Related Compound F RS in acetonitrile

Peak identification stock solution B: 0.1 mg/mL of USP Candesartan Cilexetil RS in acetonitrile

Peak identification stock solution C: 0.5 mg/mL of USP Candesartan Cilexetil Related Compound G RS in methanol

Peak identification solution: 0.0015 mg/mL each of USP Candesartan Cilexetil Related Compound A RS, USP Candesartan Cilexetil Related Compound B RS, USP Candesartan Cilexetil Related Compound D RS, and USP Candesartan Cilexetil Related Compound F RS, 0.001 mg/mL of USP Candesartan Cilexetil RS, and 0.005 mg/mL of USP Candesartan Cilexetil Related Compound G RS from *Peak identification stock solution A*, *Peak identification stock solution B*, and *Peak identification stock solution C* in acetonitrile

System suitability stock solution: 0.05 mg/mL each of USP Benzothiadiazine Related Compound A RS and USP Hydrochlorothiazide RS, and 0.1 mg/mL of USP Chlorothiazide RS in *Diluent B*

System suitability solution: 2.5 µg/mL each of USP Benzothiadiazine Related Compound A RS and USP Hydrochlorothiazide RS, and 5 µg/mL of USP Chlorothiazide RS in *Diluent A* from *System suitability stock solution*

Standard stock solution: 1.6 mg/mL of USP Candesartan Cilexetil RS and 0.6 mg/mL of USP Hydrochlorothiazide RS in *Diluent A* prepared as follows. Transfer a quantity of USP Candesartan Cilexetil RS and USP Hydrochlorothiazide RS to a suitable volumetric flask. Add *Diluent A*, about 60% of the total volume, and sonicate to dissolve. Dilute with *Diluent A* to volume.

Standard solution: 0.008 mg/mL of USP Candesartan Cilexetil RS and 0.003 mg/mL of USP Hydrochlorothiazide RS in *Diluent A* from *Standard stock solution*. Pass through a suitable filter of 0.45-µm pore size.

Sample solution: Nominally 1.5 mg/mL of candesartan cilexetil in acetonitrile prepared as follows. Transfer about 75 mg of candesartan cilexetil, from NLT 20 finely powdered Tablets, to a 50-mL volumetric flask. Add 30 mL of *Diluent A* and sonicate for 20 min with

intermittent shaking in cold water. Allow it to reach room temperature, dilute with *Diluent A* to volume, and pass through a suitable filter of 0.45- μm pore size.

Chromatographic system:

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm \times 25-cm; 5- μm packing L7

Column temperature: 35 $^{\circ}$

Flow rate: 1.5 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solution*. [Note—The relative retention times for benzothiadiazine related compound A and chlorothiazide in *Table 6* are relative to hydrochlorothiazide.]

Suitability requirements

Resolution: NLT 1.5 between benzothiadiazine related compound A and chlorothiazide; NLT 1.5 between chlorothiazide and hydrochlorothiazide, *System suitability solution*

Tailing factor: NMT 2.0 for both candesartan cilexetil and hydrochlorothiazide peaks, *Standard solution*

Relative standard deviation: NMT 10.0% for both candesartan cilexetil and hydrochlorothiazide peaks, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity of candesartan cilexetil and any unspecified impurities in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U peak response of each impurity from the *Sample solution*

r_S peak response of candesartan cilexetil from the *Standard solution*

C_S concentration of USP Candesartan Cilexetil RS in the *Standard solution* (mg/mL)

C_U nominal concentration of candesartan cilexetil in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 6*)

Calculate the percentage of benzothiadiazine related compound A and chlorothiazide in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U peak response of benzothiadiazine related compound A and chlorothiazide from the *Sample solution*

r_S peak response of hydrochlorothiazide from the *Standard solution*

C_S concentration of USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)

C_U nominal concentration of hydrochlorothiazide in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 6*)

Acceptance criteria: See *Table 6*.

BRIEFING

Chlorpheniramine Maleate Tablets, *USP 38* page 2779. The United States Pharmacopeia (USP) is engaged in the ongoing challenge of obtaining information needed to create and sustain up-to-date drug product quality monographs for drugs marketed under the FDA over-the-counter (OTC) drug monograph system (21 CFR Part 330). The following revisions to the *Assay* and *Identification* tests are being proposed:

1. Add an *Identification* test *B* procedure based on the retention time comparison of the chlorpheniramine peak from the proposed *Assay* procedure to complement the spectroscopic identification test.
2. Replace the UV procedure in the *Assay* with the liquid chromatography procedure from the general chapter *Drug Product Assay Tests—Organic Chemical Medicines* (321), *Procedure 1*. This procedure was validated using the Waters Acquity UPLC HSS T3 brand of L1 column. The retention time for chlorpheniramine is about 6.1 min.
3. The *Packaging and Storage* section has been updated to be consistent with the manufacturers' package inserts.
4. Additional Reference Standards have been added to the *USP Reference Standards* section to support the revision of the *Assay*.

Chapter (321), also published in this issue of *PF*, is a procedure that was developed and validated for over-the-counter (OTC) medicines. Further information can be found in the *Stimuli* article [Medicines Marketed under the Food and Drug Administration Over-the-Counter \(FDA OTC\) Drug Monograph System Regulations: Strategy for Developing Compendial Quality Standards](#), also published in this issue of *PF*. This article describes in detail the rationale for development of this chapter and other related chapters, as well as the associated impact on drug product monographs. USP plans to continue with this initiative to revise or establish standards for OTC drug products.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Chlorpheniramine Maleate Tablets

DEFINITION

Change to read:

Chlorpheniramine Maleate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of ~~▲~~chlorpheniramine maleate ~~▲~~[▲]*USP39* ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$).

IDENTIFICATION

Change to read:

•

~~▲~~[▲]*A. ▲*[▲]*USP39*

Standard solution: 1.25 mg/mL of USP Chlorpheniramine Maleate RS in dilute hydrochloric acid (1 in 100)

Sample solution: 1.25 mg/mL of chlorpheniramine maleate from a portion of powdered Tablets in dilute hydrochloric acid (1 in 100)

Analysis: Treat each solution as follows. Render alkaline, to a pH of about 11, with sodium hydroxide solution (1 in 10). Extract with two 50-mL portions of solvent hexane, collect the extracts in a beaker, and evaporate to dryness. Prepare a mineral oil dispersion of the residue so obtained and determine the infrared absorption spectrum of the preparation in the region between 2 and 12 μm .

Acceptance criteria: The spectrum of the *Sample solution* exhibits maxima only at the same wavelengths as those of the *Standard solution*.

Add the following:

~~▲~~[▲] **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ~~▲~~[▲]*USP39*

ASSAY

Delete the following:

~~▲~~[▲] **Procedure**

~~**Standard solution:** 0.2 mg/mL of USP Chlorpheniramine Maleate RS in dilute hydrochloric acid (1 in 100), and treat 20.0 mL of this solution the same as the *Sample solution* in dilute hydrochloric acid (1 in 100) of the portion of Tablets taken.~~

~~**Sample solution:** Using a portion of powdered Tablets equivalent to 4 mg of chlorpheniramine maleate, proceed as directed under *Salts of Organic Nitrogenous Bases* (501), but using dilute hydrochloric acid (1 in 100) instead of the dilute sulfuric acid (1~~

in 350), and dilute sulfuric acid (1 in 70), and using solvent hexane instead of the ether, and diluting 10 mL of the *Sample solution* with dilute hydrochloric acid (1 in 100) to 25.0 mL.

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: 264 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of chlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

C_U = nominal concentration of chlorpheniramine maleate in the *Sample solution* (mg/mL)

BRIEFING

Cromolyn Sodium Ophthalmic Solution, *USP 38* page 2962. The revisions appearing in *PF 40(1)* have been canceled. It is proposed to modernize the monograph with the following changes.

1. Replace the nonspecific *Assay* by UV with a specific high-performance liquid chromatographic procedure developed and validated for this product. The procedure uses the Zorbax SB C8 brand of L7 column manufactured by Agilent Technologies in which cromolyn elutes at about 8.4 min.
2. Replace the TLC procedure in the test for *Organic Impurities* with a more selective and validated HPLC procedure. The procedure uses the same chromatographic parameters as those proposed in the *Assay*, except the *Autosampler temperature* is set at 4°.
3. Replace *Identification* test *A* based on UV analysis with the retention time agreement based on the *Assay*.
4. Add additional storage requirements based on the drug package insert.
5. Add USP impurity Reference Standards to ensure the system suitability evaluation for the HPLC procedures.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Cromolyn Sodium Ophthalmic Solution**DEFINITION**

Cromolyn Sodium Ophthalmic Solution is a sterile, aqueous solution of Cromolyn Sodium. It contains NLT 90.0% and NMT 110.0% of the labeled amount of cromolyn sodium ($C_{23}H_{14}Na_2O_{11}$). It may contain suitable antimicrobial and stabilizing agents.

IDENTIFICATION

Change to read:• **A.**

~~**Sample solution:** A solution (1 in 40,000) in *Buffer* prepared as directed in the *Assay*~~

~~**Acceptance criteria:** The UV absorption spectrum of the *Sample solution* exhibits maxima at the same wavelengths as that of a similar solution of USP Cromolyn Sodium RS, concomitantly measured.~~

▲The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲USP39

ASSAY**Change to read:**• **Procedure**

~~**Buffer:** Dissolve 70 g of anhydrous dibasic sodium phosphate in 900 mL of water. Adjust to a pH of 7.4 by the addition of dilute phosphoric acid (1 in 10). Dilute with water to 1000 mL, and mix. Transfer 10 mL of this solution to a 100 mL volumetric flask, and dilute with water to volume.~~

~~**Standard stock solution:** 250 µg/mL of USP Cromolyn Sodium RS in water.~~

~~**Standard solution:** 25 µg/mL of USP Cromolyn Sodium RS prepared by transferring 10 mL of *Standard stock solution* to a 100 mL volumetric flask, add 1 mL of *Buffer*, and dilute with water to volume.~~

~~**Sample stock solution:** Transfer 4 mL of Ophthalmic Solution to a 100 mL volumetric flask and dilute with water.~~

~~**Sample solution:** Nominally equivalent to 32 µg of cromolyn sodium prepared from a portion of *Sample stock solution* to a 250 mL volumetric flask. Add 2.5 mL of *Buffer*, and dilute with water to volume.~~

~~**Spectrometric conditions**~~

USP Cyanocobalamin RS

BRIEFING

Daunorubicin Hydrochloride for Injection, USP 38 page 3004. As part of the USP monograph modernization efforts, it is proposed to revise the monograph as follows:

1. The current HPLC procedure in the *Assay* is replaced with a stability-indicating UHPLC procedure that employs a mass spectroscopy-compatible *Mobile phase* and a modern analytical column. The procedure was validated using the Acquity UPLC BEH C18 brand of L1 column manufactured by Waters. Daunorubicin elutes at about 7 min.
2. Add a validated *Organic Impurities* method that is used to monitor the impurities/degradants. The procedure uses the same chromatographic parameters as those proposed in the *Assay*.
3. Add the required A designation to the existing *Identification* test. Add *Identification* test B based on the UV spectrum as proposed in the *Assay*.
4. Delete the test for *Water Determination, Method I* because water content is formulation dependent.
5. Add the *Sterility Test* to be consistent with the drug product sterility requirement.
6. Add an additional requirement in the *Packaging and Storage* section based on the drug package insert.
7. Add two USP Reference Standards to the *USP Reference Standards* section to support the proposed test for *Organic Impurities*.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

BRIEFING

Diltiazem Hydrochloride Extended-Release Capsules, *USP 38* page 3128. As part of the monograph modernization effort, it is proposed to make the following changes:

1. Add a new stability indicating UHPLC procedure for the test of *Organic Impurities*. The UHPLC procedure is based on analyses performed with the Waters Acquity UPLC BEH C18 brand of L1 column. The typical retention time for the diltiazem peak in the *Organic Impurities* test is 16 min.
2. Replace the current HPLC Assay with a procedure using the same UHPLC parameters as proposed in the test for *Organic Impurities*.
3. Replace the *Identification* test A by visual detection with UV spectrum as proposed in the Assay.
4. Add an additional storage condition in *Packaging and Storage* based on information from the approved drug product.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM2: D. Min.)

Correspondence Number—C120149

Comment deadline: March 31, 2015

Diltiazem Hydrochloride Extended-Release Capsules

DEFINITION

Diltiazem Hydrochloride Extended-Release Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of diltiazem hydrochloride (C₂₂H₂₆N₂O₄S·HCl).

IDENTIFICATION

Change to read:

- **A.**

~~**Indicator solution:** Transfer 17.4 g of ammonium thiocyanate and 2.8 g of cobalt chloride~~

to a 100-mL volumetric flask, add 50 mL of water, and sonicate for 10 min. Dilute with water to volume.

Analysis: Grind the content of 1 Capsule, and transfer to a 15-mL screw-capped test tube. Add 10 mL of 0.1 N hydrochloric acid, shake, and filter. Add 2 mL of *Indicator solution* to 2 mL of the filtrate, and shake. Add 5 mL of chloroform, and shake.

Acceptance criteria: A blue color develops in the chloroform layer.

▲The UV-Vis spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲USP39

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

Change to read:

- **Procedure**

Buffer: 6.9 g of monobasic potassium phosphate in 1000 mL of water. Adjust with 0.1 N hydrochloric acid to a pH of 3.0, and add 0.50 mL of triethylamine.

Mobile phase: Acetonitrile and *Buffer* (50:50)

Standard stock solution: 1.2 mg/mL of USP Diltiazem Hydrochloride RS and 0.02 mg/mL of USP Desacetyl Diltiazem Hydrochloride RS in methanol

Standard solution: 24 µg/mL of USP Diltiazem Hydrochloride RS from *Standard stock solution*, in *Mobile phase*

Sample stock solution: Nominally 1.2 mg/mL of diltiazem hydrochloride in methanol prepared as follows. Transfer the equivalent to 120 mg of diltiazem hydrochloride from NLT 20 Capsules (mix and grind the contents thoroughly) to a 100-mL volumetric flask. Add approximately 60 mL of methanol, and shake by mechanical means for 30 min. Sonicate the resulting solution for 10 min to complete the extraction. Dilute with methanol to volume.

Sample solution: Nominally 24 µg/mL of diltiazem hydrochloride in *Mobile phase* prepared from *Sample stock solution*

Chromatographic system

(See *Chromatography* ~~621~~, *System Suitability*.)

Mode: LC

Detector: UV 240 nm

Column: 4.6 mm × 15 cm; 5 µm packing L7

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

[Note—The relative retention times for desacetyl diltiazem and diltiazem are 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between desacetyl diltiazem and diltiazem

Relative standard deviation: NMT 2.0% for diltiazem

Analysis

Samples: ~~Standard solution and Sample solution~~

Calculate the percentage of the labeled amount of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the ~~Sample solution~~

r_S peak response from the ~~Standard solution~~

C_S concentration of USP Diltiazem Hydrochloride RS in the ~~Standard solution~~ ($\mu\text{g/mL}$)

C_U nominal concentration of diltiazem hydrochloride in the ~~Sample solution~~ ($\mu\text{g/mL}$)

▲Solution A:

0.79 g/L of ammonium bicarbonate in water. Adjust with diluted ammonium solution to a pH of 8.0.

Solution B: Acetonitrile

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	95	5
2.0	95	5
5.0	60	40
13.0	60	40
16.0	30	70
20.0	30	70
20.1	95	5
25.0	95	5

Diluent: Acetonitrile and water (40:60)

Standard solution: 0.05 mg/mL of USP Diltiazem Hydrochloride RS in *Diluent*

Sample stock solution: Nominally 0.5 mg/mL of diltiazem hydrochloride from the Capsules in *Diluent* prepared as follows. Transfer a portion of finely powdered contents of NLT 20 Capsules to a suitable volumetric flask. Add *Diluent* equivalent to 80% of the flask volume, mechanically shake for 30 min, and sonicate for 60 min. Dilute with the *Diluent* to volume. Centrifuge and use the supernatant.

Sample solution: Nominally 0.05 mg/mL of diltiazem hydrochloride prepared in *Diluent* from *Sample stock solution*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 240 nm. For *Identification* test A, use a diode-array detector in the range of 190–400 nm.

Column: 2.1-mm × 15-cm; 1.7- μm packing L1

Flow rate: 0.3 mL/min

Injection volume: 2.0 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U

= peak response of diltiazem from the *Sample solution*

r_S

= peak response of diltiazem from the *Standard solution*

C_S

= concentration of USP Diltiazem Hydrochloride RS in the *Standard solution* (mg/mL)

C_U

= nominal concentration of diltiazem hydrochloride in the *Sample solution* (mg/mL)

▲USP39

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• Dissolution 〈 711 〉

For products labeled for dosing every 12 h

Test 1: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

Medium: Water; 900 mL

Apparatus 2: 100 rpm

Times: 3, 9, and 12 h

Detector: UV 237 nm

Standard solution: USP Diltiazem Hydrochloride RS in *Medium*

Sample solution: Sample per *Dissolution* 〈 711 〉. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.

Tolerances: See *Table 2*.

Table 2

Time (h)	Amount Dissolved (%)
3	10–25
9	45–85
12	NLT 70

The percentages of the labeled amount of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* 〈 711 〉.

Test 4: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

Medium: Water; 900 mL

Apparatus 2: 100 rpm

Times: 4, 8, 12, and 24 h

Detector: UV 237 nm

Standard solution: USP Diltiazem Hydrochloride RS in *Medium*

Sample solution: Sample per *Dissolution* 〈 711 〉. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.

Tolerances: See *Table 3*.

Table 3

Time (h)	Amount Dissolved (%)
4	10–25
8	35–60
12	55–80
24	NLT 80

The percentages of the labeled amount of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* 〈 711 〉.

Test 5: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.

Medium: 0.05 M phosphate buffer, pH 7.2; 900 mL

Apparatus 2: 50 rpm

Times: 1, 3, and 8 h

Detector: UV 237 nm

Standard solution: USP Diltiazem Hydrochloride RS in *Medium*

Sample solution: Sample per *Dissolution* 〈 711 〉. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.

Tolerances: See *Table 4*.

Table 4

Time (h)	Amount Dissolved (%)
1	NMT 15
3	45–70
8	NLT 80

The percentages of the labeled amount of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* 〈 711 〉.

Test 10: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 10*.

Buffer: Dissolve 7.1 g of anhydrous dibasic sodium phosphate in 1000 mL of water, and adjust with phosphoric acid to a pH of 6.5.

Medium: *Buffer*; 900 mL

Apparatus 1: 100 rpm

Times: 1, 6, 9, and 24 h

Detector: UV 237 nm

Standard solution: USP Diltiazem Hydrochloride RS in *Medium*

Sample solution: Sample per *Dissolution* 〈 711 〉. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.

Tolerances: See *Table 5*.

Table 5

Time (h)	Amount Dissolved (%)
1	NMT 10

- **Uniformity of Dosage Units** 〈905〉: Meet the requirements

IMPURITIES

Add the following:

▲• Organic Impurities

Solution A, Solution B, Mobile phase, Diluent, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 2.5 µg/mL each of USP Desacetyl Diltiazem Hydrochloride RS and USP Diltiazem Hydrochloride RS in *Diluent*

Sample solution: Nominally 0.5 mg/mL of diltiazem hydrochloride from the Capsules in *Diluent* prepared as follows. Transfer a portion of the finely powdered contents of NLT 20 Capsules to a suitable volumetric flask. Add *Diluent* equivalent to 80% of the flask volume, mechanically shake for 30 min, and sonicate for 60 min. Dilute with *Diluent* to volume. Centrifuge and use the supernatant.

System suitability

Sample: *Standard solution*

[Note—For relative retention times see *Table 18*.]

Suitability requirements

Resolution: NLT 2.0 between desacetyl diltiazem and diltiazem

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of desacetyl diltiazem in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of desacetyl diltiazem from the *Sample solution*

r_S peak response of desacetyl diltiazem from the *Standard solution*

C_S concentration of USP Desacetyl Diltiazem Hydrochloride RS in the *Standard solution* (µg/mL)

C_U nominal concentration of diltiazem hydrochloride in the *Sample solution* (µg/mL)

Calculate the percentage of any individual unspecified impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of each unspecified impurity from the *Sample solution*

r_S peak response of diltiazem from the *Standard solution*

C_s concentration of USP Diltiazem Hydrochloride RS in the *Standard solution* ($\mu\text{g/mL}$)

C_T nominal concentration of diltiazem hydrochloride in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: See *Table 18*. Disregard limit: 0.05%.

USP Desacetyl Diltiazem Hydrochloride RS

$C_{20}H_{24}N_2O_3S \cdot HCl$ 408.95

USP Diltiazem Hydrochloride RS

BRIEFING

Diltiazem Hydrochloride Tablets, USP 38 page 3133. As part of the USP monograph modernization effort, it is proposed to make the following changes:

1. Add a new stability-indicating UHPLC procedure in the test for *Organic Impurities*. The UHPLC procedure is based on analyses performed with the Waters Acquity UPLC BEH C18 brand of L1 column. The typical retention time for the diltiazem peak in the test for *Organic Impurities* is 16 min.
2. Replace the current HPLC Assay with a procedure using the same UHPLC parameters as proposed in the test for *Organic Impurities*.
3. Replace the current *Identification test A* using wet chemistry and visual detection with UV spectrum as proposed in the *Assay*.
4. Add an additional storage requirement in the *Packaging and Storage* section.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

Diltiazem Hydrochloride Tablets**DEFINITION**

Diltiazem Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$).

IDENTIFICATION**Delete the following:**

▲● **A. Procedure**

Indicator solution: Transfer 17.4 g of ammonium thiocyanate and 2.8 g of cobalt chloride to a 100 mL volumetric flask, add 50 mL of water, and sonicate for 10 min. Dilute with water to volume.

Analysis: Finely powder 1 Tablet, and transfer to a 15 mL screw capped test tube. Add 10 mL of 0.1 N hydrochloric acid, shake, and filter. Add 2 mL of *Indicator solution* to 2 mL of the filtrate, and shake. Add 5 mL of chloroform, and shake.

Acceptance criteria: A blue color develops in the chloroform layer. ▲*USP39*

Add the following:

- ▲● **A.** The UV-Vis spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲*USP39*
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

Change to read:

● **Procedure**

Solution A: Dissolve 1.16 mg/mL of *d*-10-camphorsulfonic acid in 0.1 M sodium acetate, and adjust with 0.1 N sodium hydroxide to a pH of 6.2.

Mobile phase: Acetonitrile, methanol, and *Solution A* (1:1:2)

System suitability solution: 12 µg/mL of USP Diltiazem Hydrochloride RS and 12 µg/mL of USP Desacetyl Diltiazem Hydrochloride RS, in methanol

Standard solution: 1.2 mg/mL of USP Diltiazem Hydrochloride RS in methanol

Sample solution: Nominally 1.2 mg/mL of diltiazem hydrochloride from Tablets in methanol prepared as follows. Transfer an equivalent to 600 mg of diltiazem hydrochloride from finely powdered Tablets (NLT 20) to a 500 mL volumetric flask. Add 200 mL of methanol, and sonicate for 1 h. Cool, and dilute with methanol to volume. Centrifuge a 25 mL aliquot at 3500 rpm for 15 min, and use the clear supernatant.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 240 nm

Column: 3.9 mm × 30 cm; packing L1

Flow rate: 1.6 mL/min

Injection volume: 10 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

[Note—The relative retention times for desacetyl diltiazem and diltiazem are about 0.65 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3 between desacetyl diltiazem and diltiazem, *System suitability solution*

Column efficiency: NLT 1200 theoretical plates for the diltiazem peak, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

▲**Solution A:** 0.79 g/L of ammonium bicarbonate in water. Adjust with diluted ammonium solution to a pH of 8.0.

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	95	5
2.0	95	5
5.0	60	40
13.0	60	40
16.0	30	70
20.0	30	70
20.1	95	5
25.0	95	5

Diluent: Acetonitrile and water (40:60)

Standard solution: 0.05 mg/mL of USP Diltiazem Hydrochloride RS in *Diluent*

Sample stock solution: Nominally 0.5 mg/mL of diltiazem hydrochloride from Tablets in *Diluent* prepared as follows. Transfer an appropriate portion of finely powdered Tablets (NLT 20) to a suitable volumetric flask. Add *Diluent* equivalent to 80% of the flask volume, and sonicate for 60 min. Dilute with *Diluent* to volume. Centrifuge the solution for 20 min. Use the supernatant.

Sample solution: Nominally 0.05 mg/mL of diltiazem hydrochloride in *Diluent* from *Sample stock solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 240 nm. For *Identification test A*, use a diode-array detector in the range of 190–400 nm.

Column: 2.1-mm × 15-cm; 1.7-μm packing L1

Flow rate: 0.3 mL/min

Injection volume: 2.0 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 1.0%

▲USP39

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of diltiazem from the *Sample solution*

r_S peak response of diltiazem from the *Standard solution*

C_S concentration of USP Diltiazem Hydrochloride RS in the *Standard solution* (mg/mL)

C_U nominal concentration of diltiazem hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **Dissolution** 〈 711 〉

Medium: Water; 900 mL

Apparatus 2: 75 rpm

Time: 30 min and 3 h

Detector: UV 237 nm

Standard solution: USP Diltiazem Hydrochloride RS in *Medium*

Sample solution: Sample per *Dissolution* 〈 711 〉. Dilute with *Medium* to a concentration that is similar to the *Standard solution*.

Tolerances: See *Table 2* for the 30-min time point. Use the criteria in *Dissolution* 〈 711 〉, *Acceptance Table 1* for the 3-h time point. NMT 60% (*Q*) of the labeled amount of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$) is dissolved in 30 min, and NLT 75% (*Q*) is dissolved in 3 h.

Table 2

Stage	Acceptance Criteria
S_1	No unit is more than <i>Q</i> .
S_2	Average value is equal to or less than <i>Q</i> , and no unit is greater than <i>Q</i> + 10%.
S_3	Average value is equal to or less than <i>Q</i> , and NMT 2 units are more than <i>Q</i> + 10%, and no unit is more than <i>Q</i> + 25%.

- **Uniformity of Dosage Units** 〈 905 〉: Meet the requirements

IMPURITIES

Add the following:

- ▲• **Organic Impurities**

Solution A, Solution B, Mobile phase, Diluent, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 2.5 µg/mL each of USP Desacetyl Diltiazem Hydrochloride RS and USP Diltiazem Hydrochloride RS in *Diluent*

Sample solution: Nominally 0.5 mg/mL of diltiazem hydrochloride from Tablets in *Diluent* prepared as follows. Transfer an appropriate portion of the powdered Tablets (NLT 20) to a suitable volumetric flask. Add *Diluent* equivalent to 80% of the flask volume, and sonicate for 60 min. Dilute with *Diluent* to volume. Centrifuge the solution for 20 min. Use the supernatant.

System suitability

Sample: *Standard solution*

[Note—See *Table 3* for the relative retention times.]

Suitability requirements

Resolution: NLT 2.0 between desacetyl diltiazem and diltiazem

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of desacetyl diltiazem in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of desacetyl diltiazem from the *Sample solution*

r_S peak response of desacetyl diltiazem from the *Standard solution*

C_S concentration of USP Desacetyl Diltiazem Hydrochloride RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U nominal concentration of diltiazem hydrochloride in the *Sample solution* ($\mu\text{g/mL}$)

Calculate the percentage of any individual unspecified impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of each unspecified impurity from the *Sample solution*

r_S peak response of diltiazem from the *Standard solution*

C_S concentration of USP Diltiazem Hydrochloride RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U nominal concentration of diltiazem hydrochloride in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: See Table 3. The disregard limit is 0.05%.

BRIEFING

Diphenhydramine Hydrochloride Capsules, *USP 38* page 3150 and *PF 40(2)* [Mar.–Apr. 2014]. The revision proposal for this monograph, which appeared in *PF 40(2)*, is being canceled and replaced with a new proposal based on the comments received. The proposal changes are the following:

1. The current *Assay* procedure is replaced with a validated new HPLC procedure. The liquid chromatographic procedure in the *Assay* is based on analyses performed with the YMC-Pack Pro C8 brand of L7 column. The typical retention time for diphenhydramine is 5 min.
2. The test for *Organic Impurities*, based on the validated HPLC procedure, is added. The liquid chromatographic procedure in the test for *Organic Impurities* is based on analyses performed with the YMC-Pack Pro C8 brand of L7 column. The typical retention time for diphenhydramine is 5 min.
3. USP Diphenhydramine Related Compound A RS is added to the *USP Reference Standards* section to support the proposed revision in the test for *Organic Impurities*.
4. Update the *Packaging and Storage* section to include storage conditions.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Diphenhydramine Hydrochloride Injection

DEFINITION

Diphenhydramine Hydrochloride Injection is a sterile solution of Diphenhydramine Hydrochloride in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of diphenhydramine hydrochloride ($C_{17}H_{21}NO \cdot HCl$).

IDENTIFICATION

• **A.**

Sample solution: Dilute a volume of Injection equivalent to 50 mg of diphenhydramine hydrochloride with 0.03 N sulfuric acid to 25 mL.

Analysis: Proceed as directed in *Identification—Organic Nitrogenous Bases* (181), beginning with "Transfer the liquid to a separator".

Acceptance criteria: Meets the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for diphenhydramine hydrochloride related compound A and diphenhydramine hydrochloride are about 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between diphenhydramine and diphenhydramine related compound A, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of diphenhydramine hydrochloride ($C_{17}H_{21}NO \cdot HCl$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U

= peak response from the *Sample solution*

r_S

= peak response from the *Standard solution*

C_S

= concentration of USP Diphenhydramine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U

= nominal concentration of diphenhydramine hydrochloride in the *Sample solution* (mg/mL)

▲USP39

Acceptance criteria: 90.0%–110.0%

IMPURITIES

Add the following:

▲● Organic Impurities

Buffer, System suitability solution, and Chromatographic system: Proceed as directed in the Assay with a run time that is 10 times the retention time of diphenhydramine.

Mobile phase: Acetonitrile and Buffer (35:65)

Standard solution: 0.002 mg/mL of USP Diphenhydramine Hydrochloride RS in *Mobile phase*

Sample solution: Nominally equivalent to 2 mg/mL of diphenhydramine hydrochloride in water prepared as follows. Transfer a volume of Injection, equivalent to 500 mg of diphenhydramine hydrochloride, to a 250-mL volumetric flask and dilute with water to volume.

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—See Table 2 for the relative retention times. Inject a blank injection between the *System suitability solution* and *Standard solution*.]

Suitability requirements

Resolution: NLT 2.0 between diphenhydramine and diphenhydramine related compound A, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each degradation product in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U peak response of each degradation product from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Diphenhydramine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U nominal concentration of diphenhydramine hydrochloride in the *Sample solution* (mg/mL)

F = relative response factor (see Table 2)

Acceptance criteria: See Table 2. Disregard any peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Diphenhydramine related compound A	0.9	1.1	0.4
Diphenhydramine	1.0	—	—
Benzhydrol ^a	4.3	1.5	0.4
Benzophenone ^b	8.2	0.8	0.2
Individual unspecified impurity	—	—	0.2
Total impurities	—	—	0.8
^a Diphenylmethanol.			

^b Diphenylmethanone.

USP Endotoxin RS

BRIEFING

Dopamine Hydrochloride, *USP 38* page 3200. As part of USP monograph modernization efforts, it is proposed to make the following changes:

1. Replace the titration procedure in the *Assay* with a stability-indicating UHPLC method using the Thermo Hypersil Gold aQ C18 brand of L1 column. The retention time of dopamine in the analysis is 1.3 min.
2. Replace the *Ultraviolet Absorption* test in *Identification test B* using a retention time agreement based upon on the proposed method for the *Assay*.
3. Replace the current TLC procedure for the determination in the test for *Organic Impurities* with the chromatographic method proposed in the *Assay*. The current TLC method in the test for *Organic Impurities* uses an undesirable solvent, chloroform, in the procedure. This proposed chromatographic test monitors specified impurities, namely, dopamine related compound A, dopamine related compound B, and dopamine related compound C (as per the equivalent monograph in the *European Pharmacopoeia*), as well as any other unspecified impurities.
4. Delete the test for *Readily Carbonizable Substances* given the impurities detection capabilities of the proposed test for *Organic Impurities*.
5. Add the following three new Reference Standards, introduced by the proposed procedure in the *Assay* and test for *Organic Impurities*, to the *USP Reference Standards* section to support the proposed changes for the *Assay* and *Impurities* sections: USP Dopamine Related Compound A RS, USP Dopamine Related Compound B RS, and USP Dopamine Related Compound C RS.

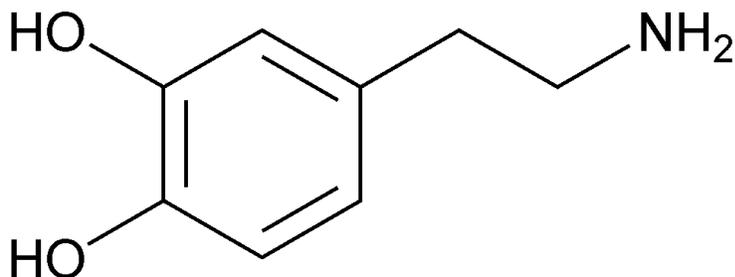

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

BRIEFING

Dopamine Hydrochloride Injection, *USP 38* page 3200. As part of USP monograph modernization efforts, it is proposed to make the following changes:

1. Replace the current HPLC procedure in the *Assay* with the proposed stability-indicating UHPLC method used in *Dopamine Hydrochloride*. The proposed liquid chromatographic procedure is based on analyses using the Thermo Hypersil Gold aQ C18 brand of L1 column.
2. Replace the current TLC method in *Identification* test *A* with the retention time agreement from the proposed *Assay* procedure.
3. Add *Identification* test *B* in which the UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the proposed *Assay*.
4. Add a UHPLC procedure in the test for *Organic Impurities* to be consistent with the proposed *Assay* method.
5. Add a storage requirement in the *Packaging and Storage* section that is consistent with FDA-approved drug products.
6. Add USP Dopamine Related Compound B RS to the *USP Reference Standards* section in support of the proposed changes to the *Assay* and *Impurities*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

BRIEFING

Enalapril Maleate Tablets, *USP 38* page 3292. On the basis of comments received, it is proposed to include the *Standard solution* concentrations in the *Dissolution* test to be consistent with the validation data.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM2: S. Ramakrishna.)

Correspondence Number—C152191

Comment deadline: March 31, 2015

Enalapril Maleate Tablets**DEFINITION**

Enalapril Maleate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of enalapril maleate (C₂₀H₂₈N₂O₅·C₄H₄O₄).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **Procedure**

Buffer: Dissolve 1.38 g of monobasic sodium phosphate in 800 mL of water, adjust with phosphoric acid to a pH of 2.2, and dilute with water to 1000 mL.

Mobile phase: Acetonitrile and *Buffer* (250:750)

Enalapril diketopiperazine solution: Place 20 mg of USP Enalapril Maleate RS in a 100-mL beaker to form a mound on the bottom of the beaker. Place the beaker on a hot plate at one-half the maximum hot plate temperature setting to melt the solid. When melting is observed (after 5–10 min of heating), immediately remove the beaker from the hot plate, and allow it to cool. Avoid overheating beyond the melting initially observed to prevent heat-induced degradation, which would give rise to a brown color.

To the cooled residue in the beaker add 50 mL of acetonitrile, and sonicate for a few min to dissolve the residue. The solution typically contains between 0.2 and 0.4 mg/mL of enalapril diketopiperazine.

Enalaprilat stock solution: 0.4 mg/mL of USP Enalaprilat RS in water

Standard solution: 0.2 mg/mL of USP Enalapril Maleate RS and 0.002 mg/mL of USP

Enalaprilat RS in *Buffer* prepared as follows. To a suitable amount of USP Enalapril Maleate RS in a suitable volumetric flask add an appropriate amount of *Enalaprilat stock solution* to the flask, and add 50% of the total volume of *Buffer* to dissolve. Sonicate if necessary, then dilute with *Buffer* to volume.

System suitability solution: Dilute 0.5 mL of *Enalapril diketopiperazine solution* with *Standard solution* to a final volume of 25 mL.

Sample solution: Nominally 0.2 mg/mL of enalapril maleate in *Buffer* prepared as follows.

Transfer NLT 10 Tablets to a volumetric flask of capacity such that when filled to volume it will produce a 0.2-mg/mL solution. Add a volume of *Buffer* that is about one-half the nominal volume of the flask, sonicate for 15 min, and shake by mechanical means for 30 min. Dilute with *Buffer* to volume, shake well, and sonicate for another 15 min. Pass the solution through a suitable filter of 0.45- μ m pore size, and discard the first portion of the filtrate.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L7

Column temperature: 50 $^{\circ}$

Flow rate: 2 mL/min

Injection volume: 50 μ L

System suitability

Samples: *Standard solution* and *System suitability solution*

[Note—The relative retention times for maleic acid, enalaprilat, enalapril, and enalapril diketopiperazine are about 0.3, 0.5, 1.0, and 1.5, respectively, *System suitability solution*. A peak response for a heat-induced degradation product of enalapril diketopiperazine (if present with a relative retention time of about 1.2) is NMT 15% of the response for enalapril diketopiperazine.]

Suitability requirements

Resolution: NLT 2.0 between maleic acid and enalaprilat; NLT 2.0 between enalaprilat and enalapril; NLT 2.0 between enalapril and enalapril diketopiperazine, *System suitability solution*

Column efficiency: NLT 1000 theoretical plates for enalaprilat; NLT 300 theoretical plates for enalapril; NLT 2500 theoretical plates for enalapril diketopiperazine, *System suitability solution*

Tailing factor: NMT 2.0 for enalapril, *System suitability solution*

Relative standard deviation

Enalapril peak: NMT 2.0%, *Standard solution*

Enalaprilat peak: Responses agree within 5%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of enalapril maleate ($C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_{\bar{F}}$ peak response from the *Sample solution*

$r_{\bar{S}}$ peak response from the *Standard solution*

$C_{\bar{S}}$ concentration of USP Enalapril Maleate RS in the *Standard solution* (mg/mL)

$C_{\bar{F}}$ nominal concentration of enalapril maleate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Change to read:

- **Dissolution** 〈 711 〉

Medium: pH 6.8 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*); 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard solution: 0.1 mg/mL of USP Enalapril Maleate RS in *Medium*. Sonicate if necessary.

▲ Dilute in *Medium* per *Table 1*.

Tablet Strength (mg)	Volume of Standard solution (mL)	Volumetric Flask Size (mL)
2.5	5	200
5	10	100
10	10	100
20	10	50
40	10	25

▲ USP39

Sample solution: Pass a portion of solution under test through a suitable filter. Dilute as needed with *Medium* to a concentration that is similar to that of the *Standard solution*.

Analysis: Determine the amount of enalapril maleate ($C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$) dissolved as directed in *Uniformity of Dosage Units* 〈 905 〉.

Tolerances: NLT 80% (*Q*) of the labeled amount of enalapril maleate ($C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$) is dissolved.

- **Uniformity of Dosage Units** 〈 905 〉

Procedure for content uniformity

Buffer and Mobile phase: Prepare as directed in the *Assay*.

Standard solution: 0.1 mg/mL of USP Enalapril Maleate RS in *Buffer*

Sample solution: 0.1 mg/mL of enalapril maleate from 1 Tablet in *Buffer*. Add a volume of *Buffer* that is one-half the nominal volume of the flask, sonicate for 15 min, and shake by mechanical means for 30 min. Dilute with *Buffer* to volume, shake well, and sonicate for an additional 15 min. Pass through a suitable filter of 0.45- μ m pore size, and discard the first portion of the filtrate.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 25-cm; 5-μm packing L7

Column temperature: 50°

Flow rate: 2 mL/min

Injection volume: 50 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 300 theoretical plates

Tailing factor: NMT 2.0

Capacity factor, *k'*: NLT 1.5

Relative standard deviation: NMT 2.0%

[Note—The enalapril peak tailing factor may be minimized by controlling the column temperature between 45° and 50° and by raising the pH of the aqueous component of the *Mobile phase* from 2.2 to 2.6; the capacity factor may be increased by decreasing the amount of acetonitrile in the *Mobile phase*.]

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of enalapril maleate (C₂₀H₂₈N₂O₅·C₄H₄O₄) in the Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Enalapril Maleate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of enalapril maleate in the *Sample solution* (mg/mL)

Acceptance criteria: Meet the requirements

IMPURITIES

• **Organic Impurities**

Buffer, Mobile phase, Enalapril diketopiperazine solution, Standard solution, System suitability solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Diluted standard solution: Dilute 1.0 mL of *Standard solution* with *Buffer* to 100 mL.

Analysis

Samples: *Buffer, Standard solution, Sample solution, and Diluted standard solution*

Measure the responses for all of the peaks in the *Sample solution* greater than 0.1% of the response of the enalapril peak that are not observed in the *Buffer*.

Calculate the percentage of anhydrous enalaprilat (as enalapril maleate) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Enalaprilat RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of enalapril maleate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of enalapril maleate, 492.52

M_{r2} = molecular weight of anhydrous enalaprilat, 348.39

Calculate the percentage of enalapril diketopiperazine (as enalapril maleate) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of enalapril diketopiperazine from the *Sample solution*

r_S = peak response of enalapril from the *Diluted standard solution*

C_S = concentration of USP Enalapril Maleate RS in the *Diluted standard solution* (mg/mL)

C_U = nominal concentration of enalapril maleate in the *Sample solution* (mg/mL)

F = relative response factor of enalapril diketopiperazine, 1.25

M_{r1} = molecular weight of enalapril maleate, 492.52

M_{r2} = molecular weight of enalapril diketopiperazine, 358.44

Calculate the percentage of the sum of all other individual impurities in the portion of Tablets taken:

$$\text{Result} = (r_T/r_S) \times (C_S/C_U) \times 100$$

r_T = sum of the responses of all other individual impurities other than maleic acid, enalapril, enalaprilat, and enalapril diketopiperazine from the *Sample solution*

r_S = peak response of enalapril maleate from the *Diluted standard solution*

C_S = concentration of USP Enalapril Maleate RS in the *Diluted standard solution* (mg/mL)

C_U = nominal concentration of enalapril maleate in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 5.0% for the sum of all impurities including those from enalaprilat and enalapril diketopiperazine

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers.
- **USP Reference Standards** { 11 }

USP Enalaprilat RS

USP Enalapril Maleate RS

BRIEFING

Ephedrine Hydrochloride, *USP 38* page 3312. As part of the USP monograph modernization initiative, the following changes are proposed:

1. Add the chemical structure of ephedrine hydrochloride to the chemical information section.
2. Delete the extraction procedure in *Identification* test A because it is no longer

necessary and add a reference to *Infrared Absorption* 〈197K〉 to strengthen the monograph.

3. Replace the titration method in the *Assay* with the titration procedure from the *European Pharmacopoeia 8.4* that eliminates the use of mercuric acetate, which is a safety hazard.
4. Add a reference to *Chloride and Sulfate* 〈221〉 in the test for *Sulfate*.
5. Replace the *Ordinary Impurities* test with an HPLC method in the test for *Organic Impurities* based on the *Related substances* procedure in the *Ephedrine Hydrochloride* monograph in the *European Pharmacopoeia 8.4*. The procedure uses the Hypersil phenyl brand of L11 column. The typical retention time for ephedrine is about 10 min.
6. Delete the nonspecific *Melting Range or Temperature* test. This test is no longer necessary because a specific HPLC-based test for *Organic Impurities* is added.
7. Delete USP Ephedrine Sulfate RS from the *USP Reference Standards* section because it is no longer needed for *Identification* test A.
8. Add USP Ephedrine Hydrochloride RS and USP Pseudoephedrine Hydrochloride RS to the *USP Reference Standards* section to support the proposed test for *Organic Impurities* and the change in the USP Reference Standard for *Identification* test A.

Additionally, minor editorial changes have been made to update the monograph to the current *USP* style.

BRIEFING

Fluticasone Propionate and Salmeterol Inhalation Aerosol. Because there is no existing *USP* monograph for this dosage form, the following monograph is proposed.

1. The isocratic liquid chromatographic procedure used in the *Assay* and the tests for *Aerodynamic Size Distribution* and *Delivered-Dose Uniformity* is based on validations performed with the Zorbax StableBondSB-C18 column using dual detectors. UV absorbance is used for fluticasone propionate, and fluorescence emission is used for salmeterol. The typical retention times for fluticasone propionate and salmeterol are about 1.4 and 2.2 min, respectively.
2. The equipment used for *Aerodynamic Size Distribution* and the dose collection in *Delivered-Dose Uniformity* are modified from what was provided in general test chapter *Inhalation and Nasal Drug Products: Aerosols, Sprays, and Powders—Performance Quality Tests* { 601 }, but consistent with other new monographs such as *Fluticasone Propionate Inhalation Aerosol*. The details of the modification and the engineering diagrams have been included in the proposal to facilitate evaluation. Interested parties are invited to submit comments.
3. The gradient elution liquid chromatographic procedure used in the test for *Organic Impurities* is based on validations performed with the Inertsil ODS 2 brand of L1 column. The typical retention times for salmeterol and fluticasone propionate are about 15 and 37 min, respectively.

(SM4: R. Ravichandran.)

Correspondence Number—C64167

Comment deadline: March 31, 2015

Add the following:

▲**Fluticasone Propionate and Salmeterol Inhalation Aerosol**

DEFINITION

Fluticasone Propionate and Salmeterol Inhalation Aerosol is a suspension of Fluticasone Propionate and Salmeterol with suitable propellants in a pressurized container. The mean content per actuation contains NLT 88% and NMT 112% of the labeled amount of fluticasone propionate ($C_{25}H_{31}F_3O_5S$). The mean content per actuation contains NLT 88% and NMT 112% of the labeled amount of salmeterol ($C_{25}H_{37}NO_4$) as salmeterol xinafoate.

IDENTIFICATION

- **A. Infrared Absorption** (197A)

Wavenumber range: 4000 cm^{-1} – 600 cm^{-1}

Sample: Discharge an appropriate number of actuations from two containers into an agate mortar. Allow the propellant to evaporate and dry if necessary. Transfer the residue to the sample window.

Acceptance criteria: Meets the requirements. In addition, the ratio of the fluticasone propionate band at 833 cm^{-1} to that of the salmeterol band at 744 cm^{-1} meets the requirements in *Table 1*.

Table 1

Fluticasone Propionate/Salmeterol ($\mu\text{g}/\mu\text{g}$ for each dose)	Ratio (band at 833 cm^{-1} /band at 744 cm^{-1})
45/21	NMT 2.5
115/21	2.5–4.0
230/21	NLT 4.0

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Delivered-Dose Uniformity*.

ASSAY

- **Procedure**

Buffer: 0.01 M sodium dodecyl sulfate containing 0.1% glacial acetic acid

Solution A: Methanol and *Buffer* (20:80)

Mobile phase: Acetonitrile and *Solution A* (50:50)

Diluent: Methanol and water (70:30)

Standard solution: 50 $\mu\text{g}/\text{mL}$ of USP Fluticasone Propionate RS and 15 $\mu\text{g}/\text{mL}$ of USP Salmeterol Xinafoate RS in *Diluent*

Sample solution: Nominally 20–110 $\mu\text{g}/\text{mL}$ of fluticasone propionate and 10 $\mu\text{g}/\text{mL}$ of salmeterol prepared as follows. Shake the canister vigorously, and cool for 10 min in a dry ice–methanol bath. Remove the canister from the bath, and shake vigorously. Using a suitable device, carefully remove and keep the valve, and pour the contents into a suitable container. Allow the propellant to evaporate. Dissolve the canister contents in a minimum amount of methanol and quantitatively transfer to a suitable volumetric flask containing 30% of the flask volume of water. Rinse the canister and valve with methanol into the same volumetric flask. Allow the flask to come to room temperature and dilute with methanol to volume.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detectors

Fluticasone propionate: UV 239 nm

Salmeterol: Fluorescence with excitation at 225 nm and emission at 305 nm. Use emission response for quantification.

Column: 4.6-mm × 5-cm; 3.5-μm packing L1

Column temperature: 40°

Flow rate: 2 mL/min

Injection volume: 5 μL

Run time: NLT 2 times the retention time of salmeterol

System suitability

Sample: *Standard solution*

[Note—The relative retention times for fluticasone propionate and salmeterol are 0.6 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.5 between fluticasone propionate and salmeterol

Tailing factor: NMT 1.5 for fluticasone propionate and salmeterol

Relative standard deviation: NMT 2.0% for fluticasone propionate and salmeterol

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of fluticasone propionate (C₂₅H₃₁F₃O₅S) in the portion of Inhalation Aerosol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of fluticasone propionate from the *Sample solution*

r_S = peak response of fluticasone propionate from the *Standard solution*

C_S = concentration of USP Fluticasone Propionate RS in the *Standard solution* (μg/mL)

C_U = nominal concentration of fluticasone propionate in the *Sample solution* (μg/mL)

Calculate the percentage of the labeled amount of salmeterol (C₂₅H₃₇NO₄) in the portion of Inhalation Aerosol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of salmeterol from the *Sample solution*

r_S = peak response of salmeterol from the *Standard solution*

C_S = concentration of USP Salmeterol Xinafoate RS in the *Standard solution* (μg/mL)

C_U = nominal concentration of salmeterol free base in the *Sample solution* (μg/mL)

M_{r1} = molecular weight of salmeterol free base, 415.57

M_{r2} = molecular weight of salmeterol xinafoate, 603.75

Acceptance criteria: 88%–112% each for fluticasone propionate and salmeterol

PERFORMANCE TESTS

• **Aerodynamic Size Distribution**

(See *Inhalation and Nasal Drug Products: Aerosols, Sprays, and Powders—Performance Quality Tests* { 601 }, *Aerodynamic Size Distribution—Inhalation Aerosols, Sprays, and Powders.*)

Sampling apparatus: Use *Apparatus 1* in { 601 } with a modified *Induction port* (Figure 1) and *Entrance cone* (Figure 2).

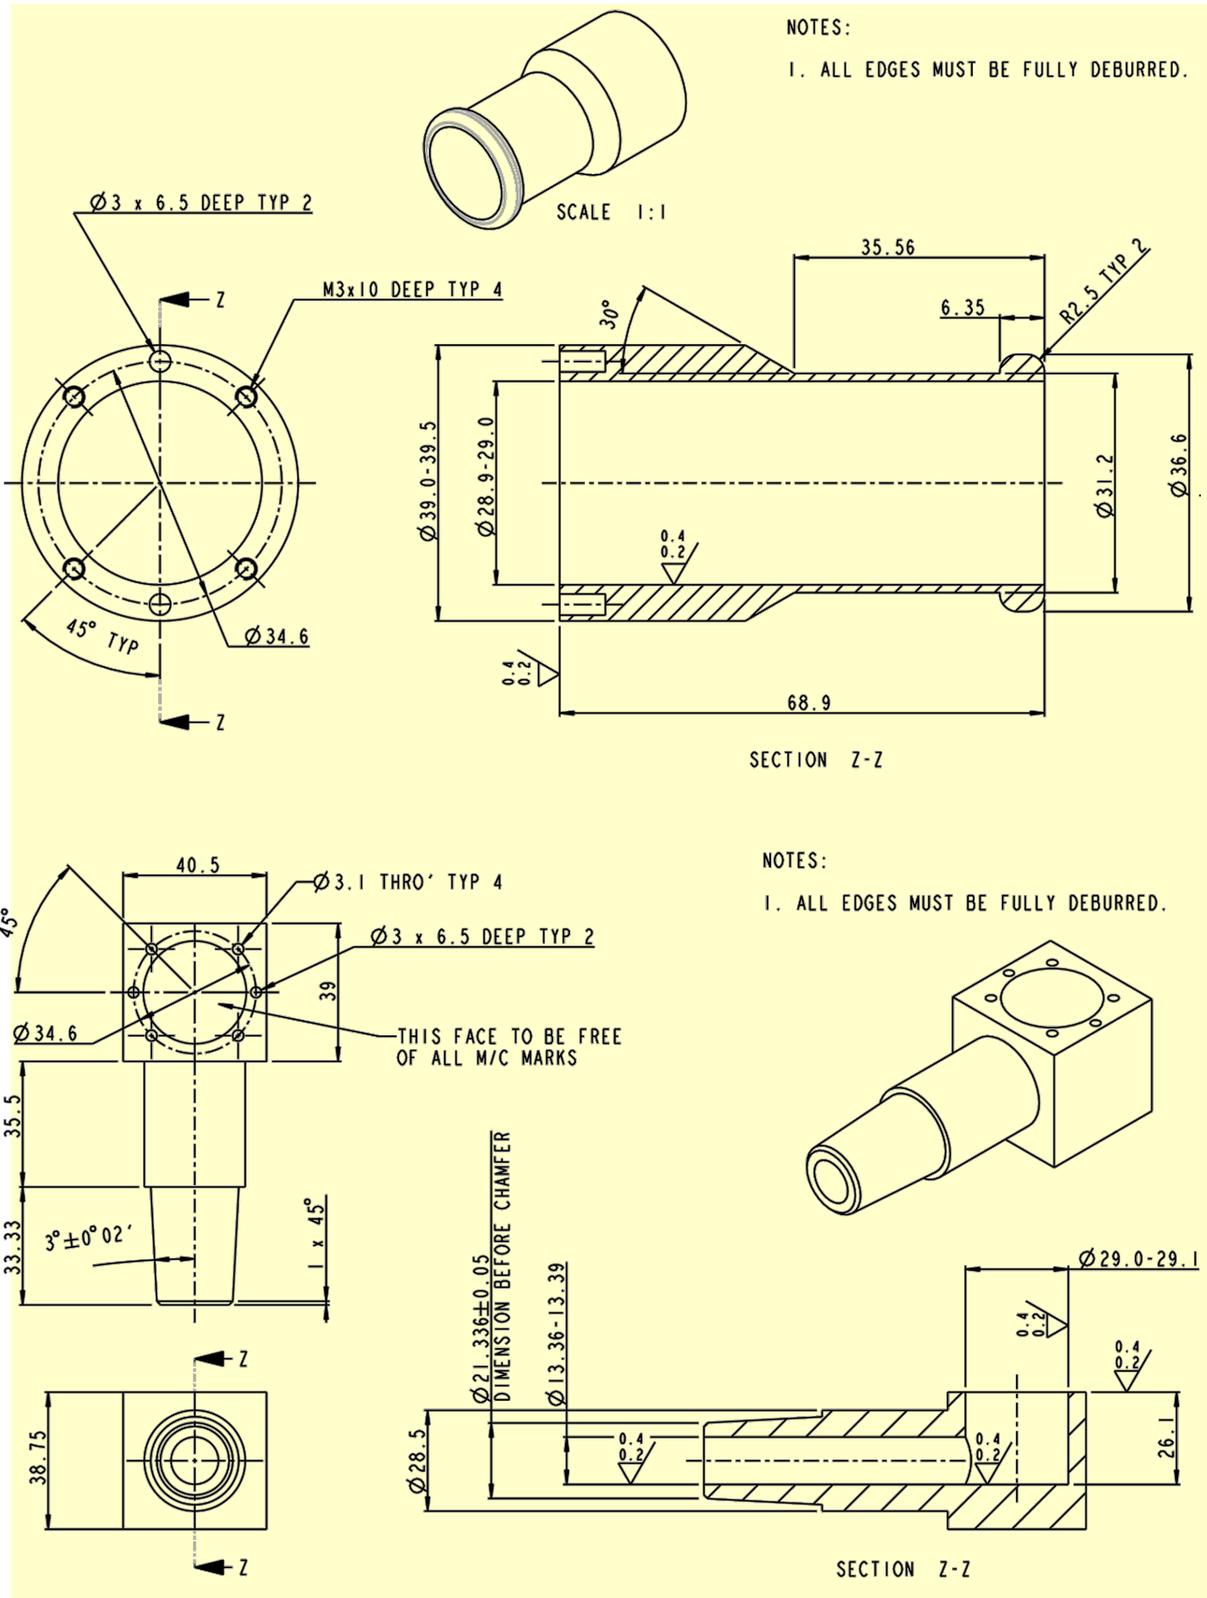

Figure 1. Expanded view of the modified *Induction port*.

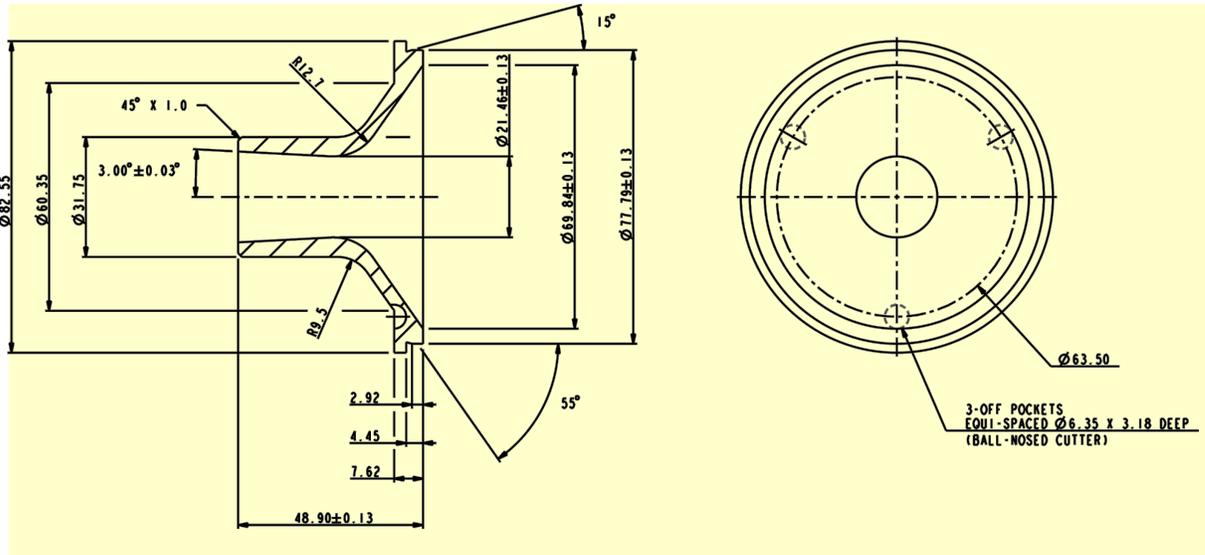

Figure 2. Expanded view of the modified *Entrance cone*.

Buffer, Solution A, and Mobile phase: Proceed as directed in the Assay.

Diluent: Methanol and water (70:30)

Standard solution: 1.25 µg/mL of USP Fluticasone Propionate RS and 0.38 µg/mL of USP Salmeterol Xinafoate RS in *Diluent*

Sample solutions: Prime the valve by discharging a predetermined number of actuations to waste. Discharge the 10 actuations into the cascade impaction *Sampling apparatus* described in *Figure 1* and *Figure 2*. Detach the inhaler, and rinse each piece of the apparatus with methanol into a suitable volumetric flask containing 30% of the flask volume of water. The final concentration of the expected amount of fluticasone propionate should be in the range of 0.05–3.5 µg/mL. Allow the solutions to equilibrate, and dilute with methanol to volume. Repeat these steps on an additional four Inhalation Aerosols for a total of five *Sample solutions*.

Chromatographic system and System suitability: Proceed as directed in the Assay, except for the *Injection volume*.

Injection volume: 50 µL

Analysis

Samples: *Standard solution* and *Sample solutions*

Calculate the quantity, in µg/actuation, of fluticasone propionate (C₂₅H₃₁F₃O₅S) in the *Sample solutions*:

$$\text{Result} = [(r_U/r_S) \times C_S] \times (V/N)$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Fluticasone Propionate RS in the *Standard solution* (µg/mL)

V = total volume of the *Sample solution* (mL)

N = number of actuations discharged into the apparatus

Calculate the quantity, in µg/actuation, of salmeterol (C₂₅H₃₇NO₄) in the *Sample solutions*:

$$\text{Result} = [(r_U/r_S) \times C_S] \times (V/N) \times (M_{r1}/M_{r2})$$

r_U = peak response of salmeterol from the *Sample solution*

r_S = peak response of salmeterol from the *Standard solution*

C_S = concentration of USP Salmeterol Xinafoate RS in the *Standard solution* (µg/mL)

V = total volume of the *Sample solution* (mL)

N = number of actuations discharged into the apparatus

M_{r1} = molecular weight of salmeterol free base, 415.57

M_{r2} = molecular weight of salmeterol xinafoate, 603.75

Acceptance criteria: The mass of fluticasone propionate and salmeterol deposited in each grouping of the *Sampling apparatus* for each individual inhaler is given in *Table 2*.

Table 2

Parameter	Amount of Fluticasone Propionate Deposited (µg/actuation)			Amount of Salmeterol Deposited (µg/actuation)		
Label claim of fluticasone propionate/salmeterol (µg/actuation)	45/21	115/21	230/21	45/21	115/21	230/21
Mass of mouthpiece adapter, and induction port	10–21	24–54	59–109	2–10	3–11	4–12
Sum of Stages 0–2	NMT 8	NMT 25	NMT 59	NMT 5	NMT 6	NMT 7
Sum of Stages 3, 4, and 5	15–27	39–67	77–124	7–13	7–13	7–13
Sum of Stages 6, 7, and filter	NMT 2	NMT 3	NMT 4	NMT 1	NMT 1	NMT 1

The mass of fluticasone propionate and salmeterol deposited in each grouping of the *Sampling apparatus* for the mean of the five inhalers is given in *Table 3*.

Table 3

Parameter	Amount of Fluticasone Propionate Deposited (µg/actuation)			Amount of Salmeterol Deposited (µg/actuation)		
Label claim of fluticasone propionate/salmeterol (µg/actuation)	45/21	115/21	230/21	45/21	115/21	230/21
Mass of mouthpiece adapter, and induction port	11–20	26–52	64–104	3–9	4–10	5–11
Sum of Stages 0, 1, and 2	NMT 7	NMT 22	NMT 52	NMT 4	NMT 5	NMT 6
Sum of Stages 3, 4, and 5	16–26	41–65	81–120	7–12	7–12	7–12
Sum of Stages 6, 7, and filter	NMT 2	NMT 3	NMT 4	NMT 1	NMT 1	NMT 1

● **Delivered-Dose Uniformity**

(See *Inhalation and Nasal Drug Products: Aerosols, Sprays, and Powders—Performance Quality Tests* 〈601〉, *Delivered-Dose Uniformity—Inhalation Aerosols and Inhalation Sprays*.)

Sampling apparatus: Use the apparatus (*Figure 3A*) with modified glass sampling device

(Figure 3B).

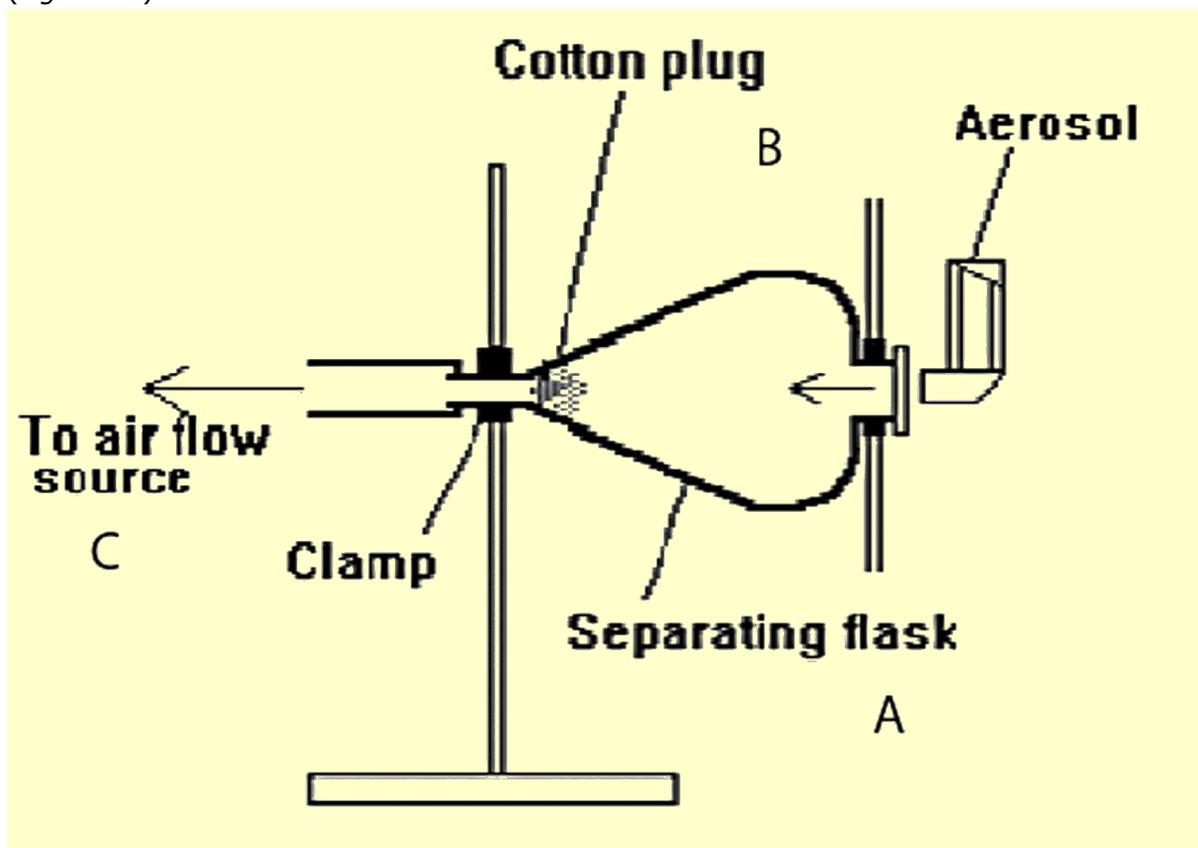

Figure 3A. Sampling apparatus.

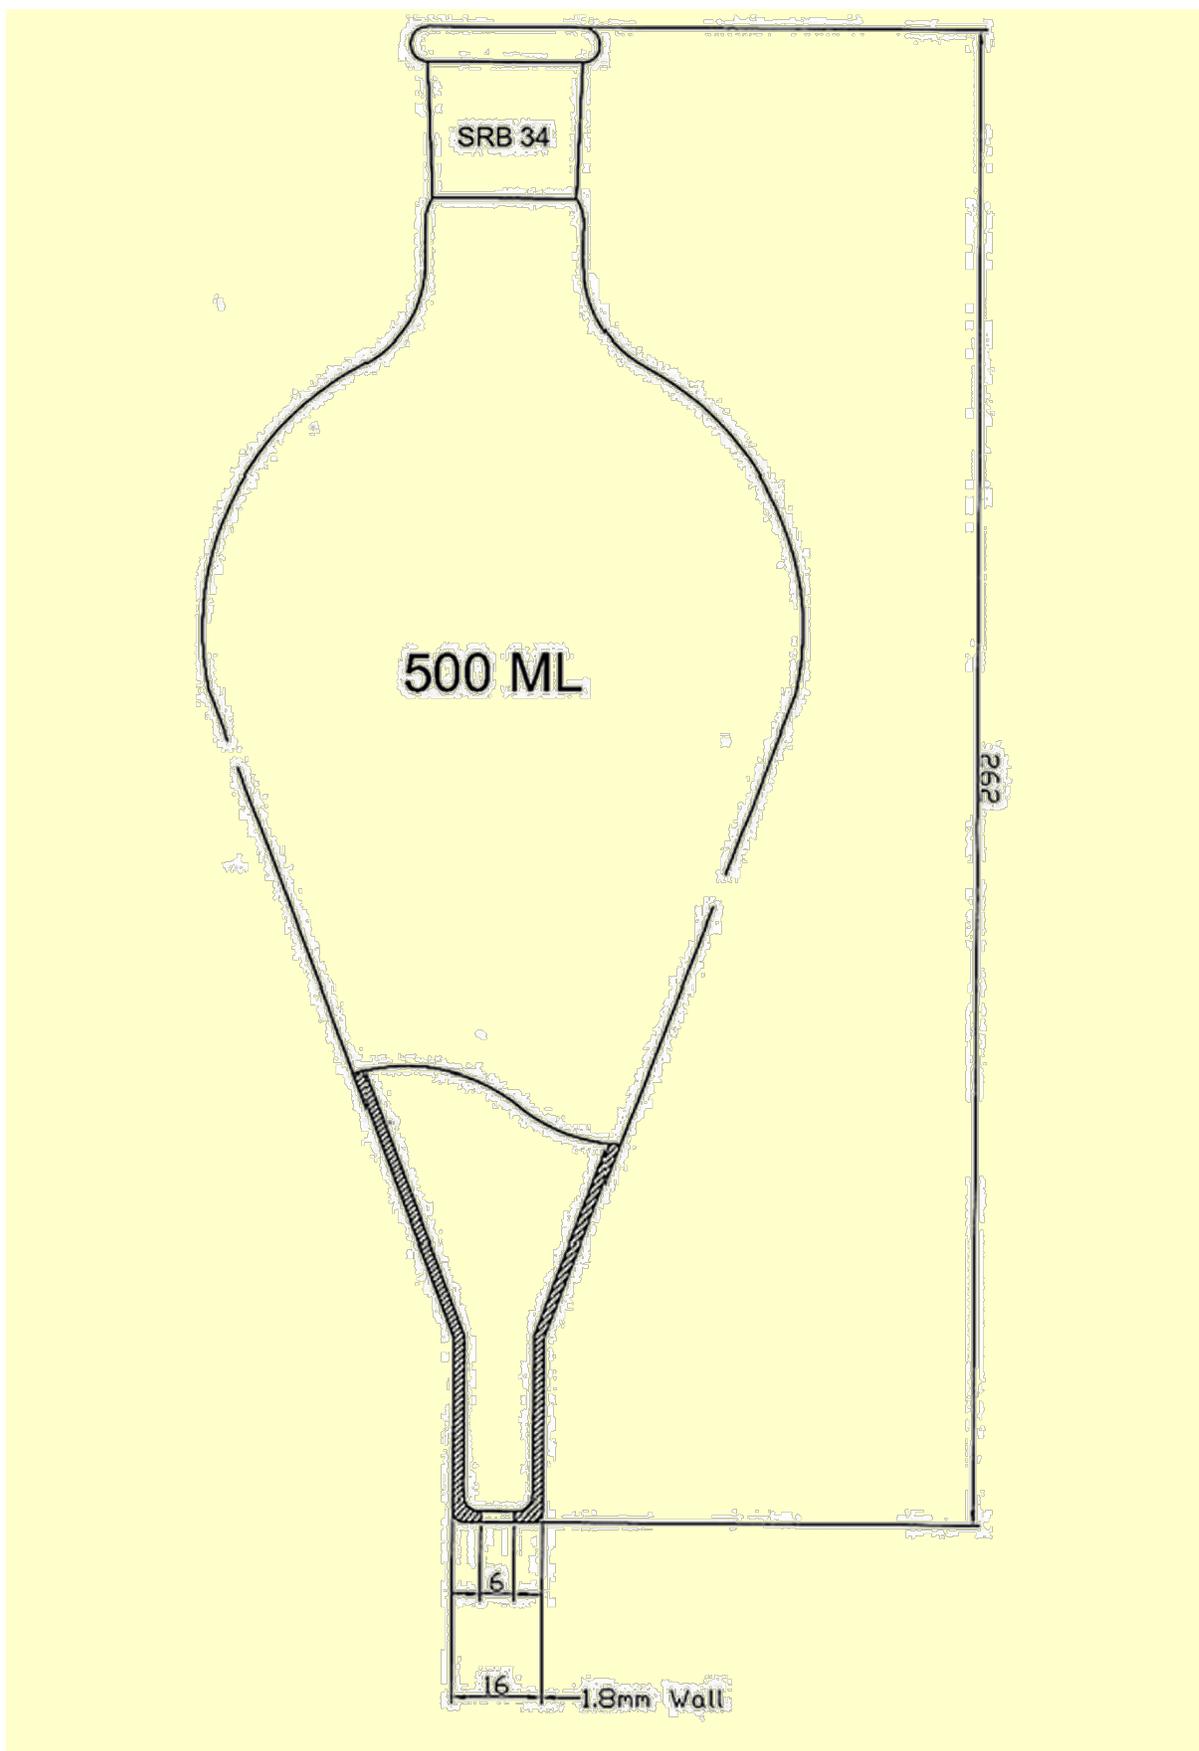

Figure 3B. Expanded view of the modified glass sample collection apparatus.

Buffer, Solution A, Mobile phase, and Diluent: Prepare as directed in the Assay.

Standard solution: 1.25 µg/mL of USP Fluticasone Propionate RS and 0.38 µg/mL of USP Salmeterol Xinafoate RS in *Diluent*

Sample solutions: Prime the valve by discharging a predetermined number of actuations to waste. Discharge the recommended dose at the beginning of use (BOU) into the *Sampling apparatus*, and detach the inhaler. Rinse the apparatus with methanol, and quantitatively transfer the solutions to a 100-mL volumetric flask containing 30 mL of water. Allow the solution to equilibrate, and dilute with methanol to volume. Discharge the requisite number of actuations to waste, shaking the inhaler before each discharge, until the last recommended dose remains. Discharge the remaining recommended dose at end of use (EOU) corresponding to the labeled number of actuations into the *Sampling apparatus*, and detach the inhaler. Rinse the apparatus with methanol, and quantitatively transfer the solution to a 100-mL volumetric flask containing 30 mL of water. Allow the solution to equilibrate, and dilute with methanol to volume. Repeat these steps on an additional nine inhalers for a total of 20 *Sample solutions*.

Chromatographic system and System suitability: Proceed as directed in the Assay, except for the *Injection volume*.

Injection volume: 50 µL

Analysis

Samples: *Standard solution and Sample solutions*

Calculate the percentage of the labeled amount of fluticasone propionate (C₂₅H₃₁F₃O₅S) delivered by the inhaler in each *Sample solution*:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Fluticasone Propionate RS in the *Standard solution* (µg/mL)

C_U nominal concentration of fluticasone propionate in the *Sample solution* (µg/mL)

Calculate the percentage of the labeled amount of salmeterol (C₂₅H₃₇NO₄) delivered by the inhaler in each *Sample solution*:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U peak response of salmeterol from the *Sample solution*

r_S peak response of salmeterol from the *Standard solution*

C_S concentration of USP Salmeterol Xinafoate RS in the *Standard solution* (µg/mL)

C_U nominal concentration of salmeterol free base in the *Sample solution* (µg/mL)

M_{r1} molecular weight of salmeterol free base, 415.57

M_{r2} molecular weight of salmeterol xinafoate, 603.75

Acceptance criteria: See *Table 4* and *Table 5*.

Table 4

Parameter	Acceptance Criteria
-----------	---------------------

Label claim of fluticasone propionate/salmeterol ($\mu\text{g}/\text{actuation}$)	45 /21	115/21	230/21
Mean of 10 BOU contents	80%–120% of label claim	80%–120% of label claim	80%–120% of label claim
Mean of 10 EOU contents	80%–120% of label claim	80%–120% of label claim	80%–120% of label claim
Number of individual contents outside 80%–120% of label claim	NMT 2 of 20	NMT 2 of 20	NMT 2 of 20
Mean of 20 contents/actuations	88%–112% of label claim	88%–112% of label claim	88%–112% of label claim
Each individual content	70%–130% of label claim	75%–125% of label claim	75%–125% of label claim

Test an additional 20 inhalers (BOU and EOU) if up to six of the 20 individual results are outside of 80%–120% of label claim, but none are outside 70%–130% of the label claim for the 45/21 $\mu\text{g}/\text{actuation}$ product strength, or none are outside 75%–125% of the label claim for the 115/21 $\mu\text{g}/\text{actuation}$ and 230/21 $\mu\text{g}/\text{actuation}$.

IMPURITIES

- **Organic Impurities**

[Note—Protect all solutions containing fluticasone propionate or salmeterol from light.]

Buffer: 0.05 M monobasic ammonium phosphate adjusted with 10% (v/v) of phosphoric acid to a pH of 2.9

Solution A: Acetonitrile and *Buffer* (30:70)

Solution B: Acetonitrile and *Buffer* (78:22)

Mobile phase: See *Table 6*.

Table 6

Time (min)	Solution A (%)	Solution B (%)
0	100	0

60	0	100
61	100	0
70	100	0

Diluent 1: Methanol, water, and phosphoric acid (70: 30: 0.05)

Diluent 2: Methanol and water (70:30)

Diluent 3: 0.05% Phosphoric acid in methanol

System suitability solution: 0.075 mg/mL of USP Salmeterol Xinafoate RS, 0.025 mg/mL of USP Fluticasone Propionate RS, and 0.2 µg/mL each of USP Fluticasone Propionate Related Compound D RS and USP Fluticasone Propionate Related Compound J RS in *Diluent 1*

Sensitivity solution: 0.05 µg/mL of USP Salmeterol Xinafoate RS and 0.1 µg/mL of USP Fluticasone Propionate RS in *Diluent 2*

Sample solution: Nominally 50–100 µg/mL of salmeterol prepared as follows. Place a canister into a freezing mixture of dry ice and methanol, and cool for approximately 5 min. Carefully remove the valve from the canister. Pour the contents into a suitable container and allow the propellant to evaporate. Dissolve the residue in *Diluent 3* and dilute with water to the required volume to obtain the nominal concentration.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 228 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 35°

Flow rate: 1 mL/min

Injection volume: 50 µL

System suitability

Samples: *System suitability solution* and *Sensitivity solution*

SPECIFIC TESTS

- **Microbial Enumeration Tests** $\langle 61 \rangle$ and **Tests For Specified Microorganisms** $\langle 62 \rangle$: The total aerobic microbial count does not exceed 10^1 cfu/g of formulation. The total aerobic yeasts and molds count does not exceed 10^1 cfu/g of formulation. It meets the requirements of the tests for absence of *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Escherichia coli*, and *Salmonella* species.

- **Foreign Particulate Matter**

The test described below and the specification is only applicable to a microscopic particle count test methodology. General test chapter *Particulate Matter in Injections* $\langle 788 \rangle$ describes details of the test apparatus to be used for the determination of particulate matter using a microscopic particle count test methodology. Samples should be carefully prepared to avoid environmental contamination, and testing should be performed with suitable controls, including the appropriate use of blank determinations.

Filter: Mixed cellulose and ester; 25-mm diameter and 0.45- μm pore size

Sample solution: Perform testing on two previously unused inhalers. Prime each inhaler by discharging a predetermined number of actuations to waste. Discharge, and dissolve 16 actuations, eight from each of two canisters in 50 mL of methanol.

Analysis

Sample: *Sample solution*

Pass the *Sample solution* through the *Filter*, and allow the *Filter* to dry under conditions that will limit particulate contamination. Using a microscopic particle count test method, enumerate the number of particles present in the *Sample solution*. Calculate the number of particles per actuation:

$$\text{Result} = (N_{<10} + N_{10-100} + N_{>100})/16$$

$N_{<10}$ = total number of particles $<10 \mu\text{m}$ present in the *Sample solution*

N_{10-100} = total number of particles between 10 and 100 μm present in the *Sample solution*

$N_{>100}$ = total number of particles $>100 \mu\text{m}$ present in the *Sample solution*

Acceptance criteria: See *Table 8*.

Table 8

Particle Size Range (μm)	Number of Particles per Actuation
<10	140
10–100	50
>100	5

Total	185
-------	-----

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in nonreactive, light-resistant aerosol containers with metered valves fitted with a dose counter and provided with oral inhalation actuators. Avoid exposure to heat. Store at controlled room temperature.
- **USP Reference Standards** 〈 11 〉

▲USP39

BRIEFING

Fluticasone Propionate and Salmeterol Inhalation Powder. Because there is no existing *USP* monograph for this dosage form, the following monograph is proposed.

1. The isocratic liquid chromatographic procedure used in the *Assay* and the tests for *Aerodynamic Size Distribution* and *Delivered-Dose Uniformity* is based on validations performed with the Zorbax StableBond SB-C18 column using dual detectors. UV absorbance is used for fluticasone propionate, and fluorescence emission is used for salmeterol. The typical retention times for salmeterol and fluticasone propionate are about 1.4 and 2.2 min, respectively.
2. The equipment used for *Aerodynamic Size Distribution* and dose collection in *Delivered-Dose Uniformity* are modified from what is provided in general chapter *Inhalation and Nasal Drug Products: Aerosols, Sprays, and Powders—Performance Quality Tests* 〈 601 〉, but consistent with other official monographs such as *Salmeterol Inhalation Powder* and *Fluticasone Propionate Inhalation Powder*. The details of modification and the engineering diagrams have been included in the proposal to facilitate evaluation. Interested parties are invited to submit comments.
3. The gradient elution liquid chromatographic procedure used in the test for *Organic Impurities* is based on validations performed with the Inertsil ODS 2 brand of L1 column. Typical retention times for salmeterol and fluticasone propionate elute at about 15 and 37 min, respectively.

(SM4: R. Ravichandran.)

Correspondence Number—C64175

Comment deadline: March 31, 2015**Add the following:**▲**Fluticasone Propionate and Salmeterol Inhalation Powder**

DEFINITION

Fluticasone Propionate and Salmeterol Inhalation Powder is a mixture of fluticasone propionate and salmeterol xinafoate for use in dry powder inhalers. The Inhalation Powder contains NLT 90% and NMT 110% of the labeled amount of fluticasone propionate ($C_{25}H_{31}F_3O_5S$) and NLT 90% and NMT 110% of the labeled amount of salmeterol ($C_{25}H_{37}NO_4$) as salmeterol xinafoate.

IDENTIFICATION**• A. Ultraviolet Absorption** 〈 197U〉

Diluent: Methanol and water (70:30)

Standard solution: A mixture of USP Fluticasone Propionate RS and USP Salmeterol Xinafoate RS according to the individual product strengths in the Inhalation Powder under test in *Diluent*

Sample solution: Dissolve a suitable number of unit doses of the Inhalation Powder under test in a suitable volume of *Diluent*.

Acceptance criteria: Meets the requirements

• B. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Delivered-Dose Uniformity*.**ASSAY****• Procedure**

Buffer: 0.01 M sodium dodecyl sulfate containing 0.1% glacial acetic acid

Solution A: Methanol and *Buffer* (20:80)

Mobile phase: Acetonitrile and *Solution A* (50:50)

Diluent: Methanol and water (70:30)

Standard solution: 10 µg/mL of USP Fluticasone Propionate RS and 3 µg/mL of USP Salmeterol Xinafoate RS in *Diluent*

Sample solution: Nominally 5–25 µg/mL of fluticasone propionate and 2.4 µg/mL of salmeterol from NLT 12 unit doses in *Diluent*

Chromatographic system

(See *Chromatography* 〈 621〉, *System Suitability*.)

Mode: LC

Detectors

Fluticasone propionate: UV 239 nm

Salmeterol: Fluorescence with excitation at 225 nm and emission at 305 nm. Use emission response for quantification.

Column: 4.6-mm × 5-cm; 3.5-µm packing L1

Flow rate: 2 mL/min

Column temperature: 40°

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

[Note—The retention times for salmeterol and fluticasone propionate are 0.6 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.5 between salmeterol and fluticasone propionate

Tailing factor: NMT 1.5 for salmeterol and fluticasone propionate

Relative standard deviation: NMT 2.0% for salmeterol and fluticasone propionate

Analysis

Samples: *Standard solution and Sample solution*

Calculate the percentage of the labeled amount of fluticasone propionate ($C_{25}H_{31}F_3O_5S$) in the portion of Inhalation Powder taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of fluticasone propionate from the *Sample solution*

r_S = peak response of fluticasone propionate from the *Standard solution*

C_S = concentration of USP Fluticasone Propionate RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of fluticasone propionate in the *Sample solution* ($\mu\text{g/mL}$)

Calculate the percentage of the labeled amount of salmeterol ($C_{25}H_{37}NO_4$) in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of salmeterol from the *Sample solution*

r_S = peak response of salmeterol from the *Standard solution*

C_S = concentration of USP Salmeterol Xinafoate RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of salmeterol free base in the *Sample solution* ($\mu\text{g/mL}$)

M_{r1} = molecular weight of salmeterol free base, 415.57

M_{r2} = molecular weight of salmeterol xinafoate, 603.75

Acceptance criteria: 90%–110% each for fluticasone propionate and salmeterol

PERFORMANCE TESTS

• Aerodynamic Size Distribution

(See *Inhalation and Nasal Drug Products: Aerosols, Sprays, and Powders—Performance Quality Tests* { 601 }, *Aerodynamic Size Distribution—Inhalation Aerosols, Sprays, and Powders*.)

Sampling apparatus: Modified *Apparatus 3* (Figure 1) in { 601 } with a modified induction port (Figure 2), and preseparator lid (Figure 3) are to be used.

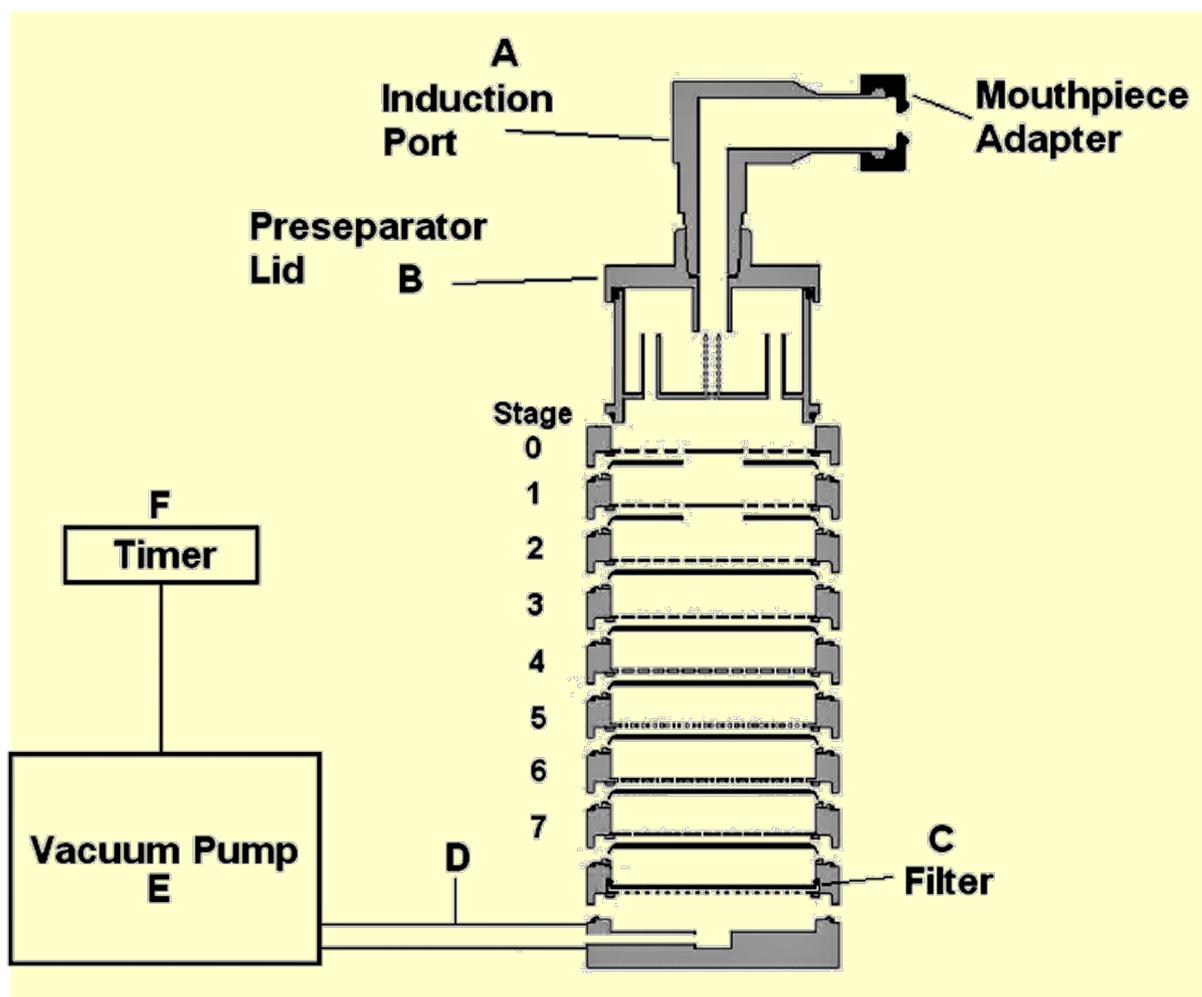

Figure 1. Cascade impaction sampling apparatus (modified *Apparatus 3* in $\langle 601 \rangle$) including *Induction Port* and *Preseparator Lid*.

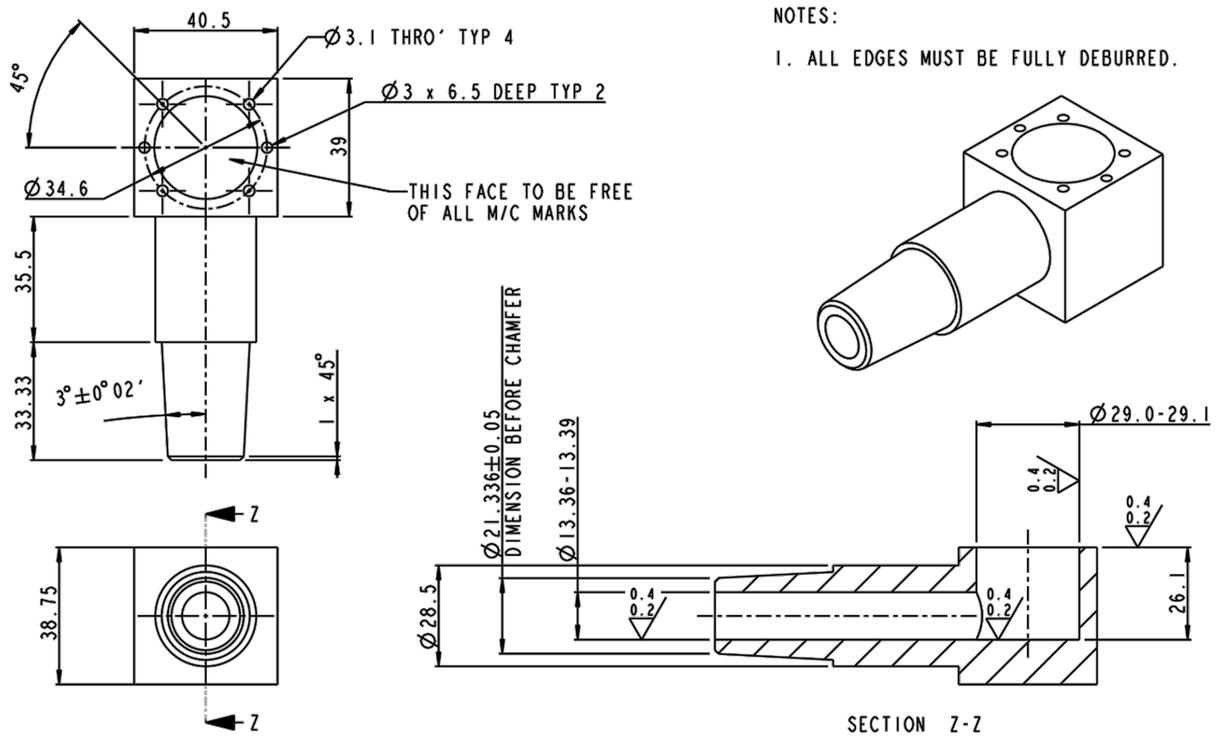

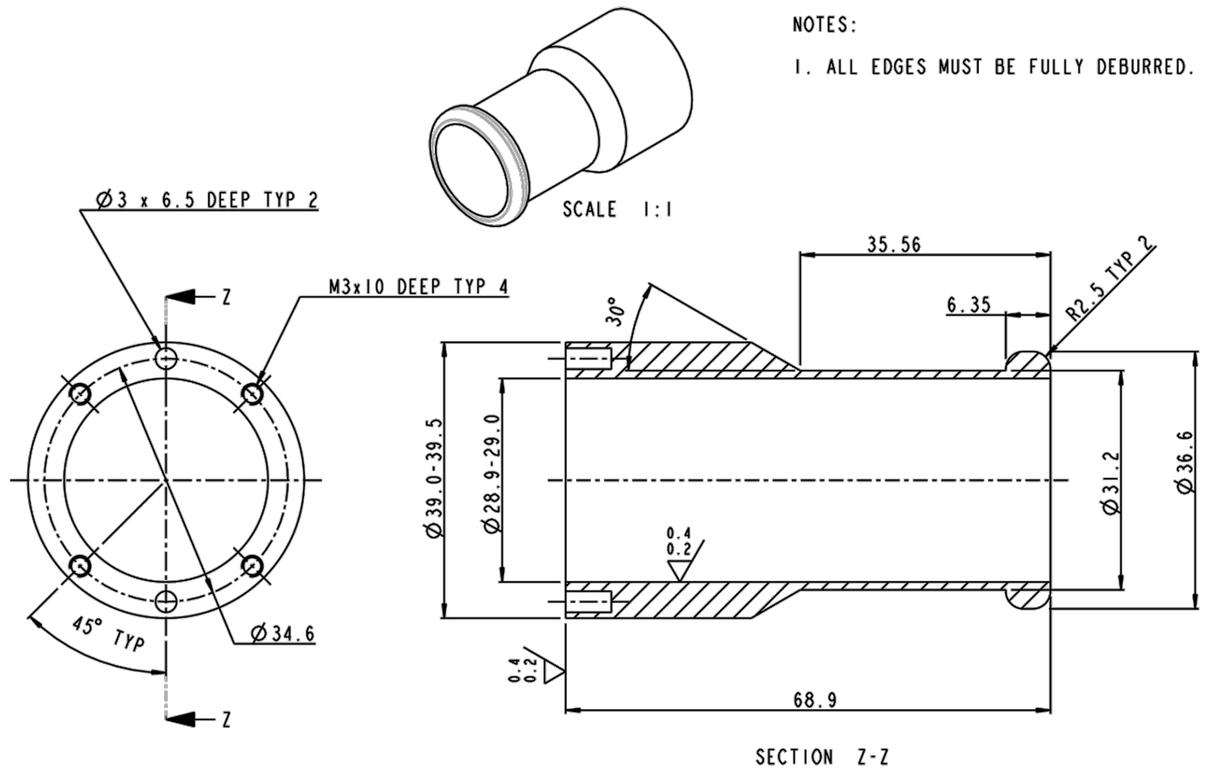

Figure 2. Expanded view of the modified induction port.

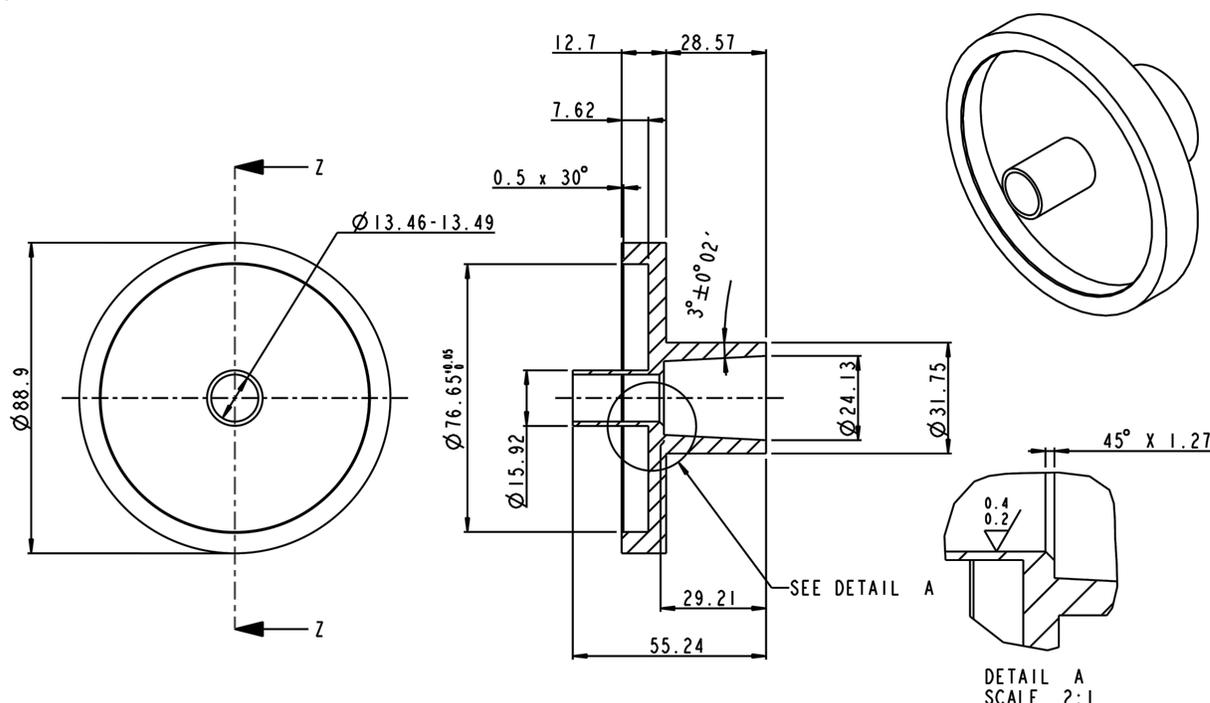

Figure 3. Expanded view of the preseparator lid.

Buffer, Solution A, and Mobile phase: Proceed as directed in the Assay.

Diluent: Methanol and water (70:30)

Standard solution: 2.5 µg/mL of USP Fluticasone Propionate RS and 0.75 µg/mL of USP Salmeterol Xinafoate RS in *Diluent*

Sample solutions: Discharge 10 unit doses given into the cascade impaction sampling apparatus described in *Figure 1*.

Operate the pump for 3 s at an airflow rate of 60 L/min for each dose discharged. Detach the inhaler, and rinse each piece of the apparatus with methanol into a separate suitable volumetric flask containing 30% of the flask volume of water. The final expected amount of fluticasone propionate should be in the concentration range of 0.1–5 µg/mL. Allow the solutions to equilibrate, and dilute with methanol to volume. Repeat these steps for three additional sample preparations, for a total of four *Sample solutions*.

Chromatographic system and System suitability: Proceed as directed in the Assay, except for *Injection volume*.

Injection volume: 50 µL

Analysis

Samples: *Standard solution* and *Sample solutions*

Calculate the quantity, in µg/actuation, of fluticasone propionate (C₂₅H₃₁F₃O₅S) in the *Sample solutions*:

$$\text{Result} = [(r_U/r_S) \times C_S] \times V/N$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Fluticasone Propionate RS in the *Standard solution* (µg/mL)

V = total volume of the *Sample solution* (mL)

N = number of unit doses discharged into the apparatus

Calculate the quantity, in µg/actuation, of salmeterol (C₂₅H₃₇NO₄) in the *Sample solutions*:

$$\text{Result} = [(r_U/r_S) \times C_S] \times V/N \times (M_{r1}/M_{r2})$$

r_U = peak response of salmeterol from the *Sample solution*

r_S = peak response of salmeterol from the *Standard solution*

C_S = concentration of USP Fluticasone Propionate RS in the *Standard solution* (µg/mL)

V = total volume of the *Sample solution* (mL)

N = number of unit doses discharged into the apparatus

M_{r1} = molecular weight of salmeterol free base, 415.57

M_{r2} = molecular weight of salmeterol xinafoate, 603.75

Acceptance criteria

The mass of fluticasone propionate and salmeterol deposited in each grouping of the *Sampling apparatus* for each inhaler is given in *Table 1*.

Table 1

Parameter	Amount of Fluticasone Propionate Deposited (µg)			Amount of Salmeterol Deposited (µg)		
	100/50 µg/actuation	250/50 µg/actuation	500/50 µg/actuation	100/50 µg/actuation	250/50 µg/actuation	500/50 µg/actuation
Label Claim of fluticasone propionate/salmeterol (µg/actuation)	100/50 µg/actuation	250/50 µg/actuation	500/50 µg/actuation	100/50 µg/actuation	250/50 µg/actuation	500/50 µg/actuation
Mass of mouthpiece adapter, induction port, preseparator, and Stage 0	55-80	140-200	290-400	28-42	28-42	28-42
Sum of Stages 1-5	15-30	42-73	96-150	7-13	7-13	7-13
Sum of Stages 3 and 4	6-18	19-45	43-92	3-8	3-8	4-8
Sum of Stages 6, 7, and filter	NMT 1	NMT 2	NMT 2	NMT 0.5	NMT 0.5	NMT 0.5

All the groupings for each sample preparation must meet the criteria in *Table 1*.

If NMT one of the four sample preparations fails to meet the requirements in *Table 1*, but is within 25% of either the lower or upper specification limit being tested, analyze two additional samples. The batch meets the requirements if five of the six sample preparations meet the limits in *Table 1* for the individual sample preparations.

● **Delivered-Dose Uniformity**

(See *Inhalation and Nasal Drug Products: Aerosols, Sprays, and Powders—Performance Quality Tests* (601), *Delivered-Dose Uniformity, Inhalation Powders*.)

Sampling apparatus: Use the apparatus in *Figure 4A* with modified glass sampling device (*Figure 4B*).

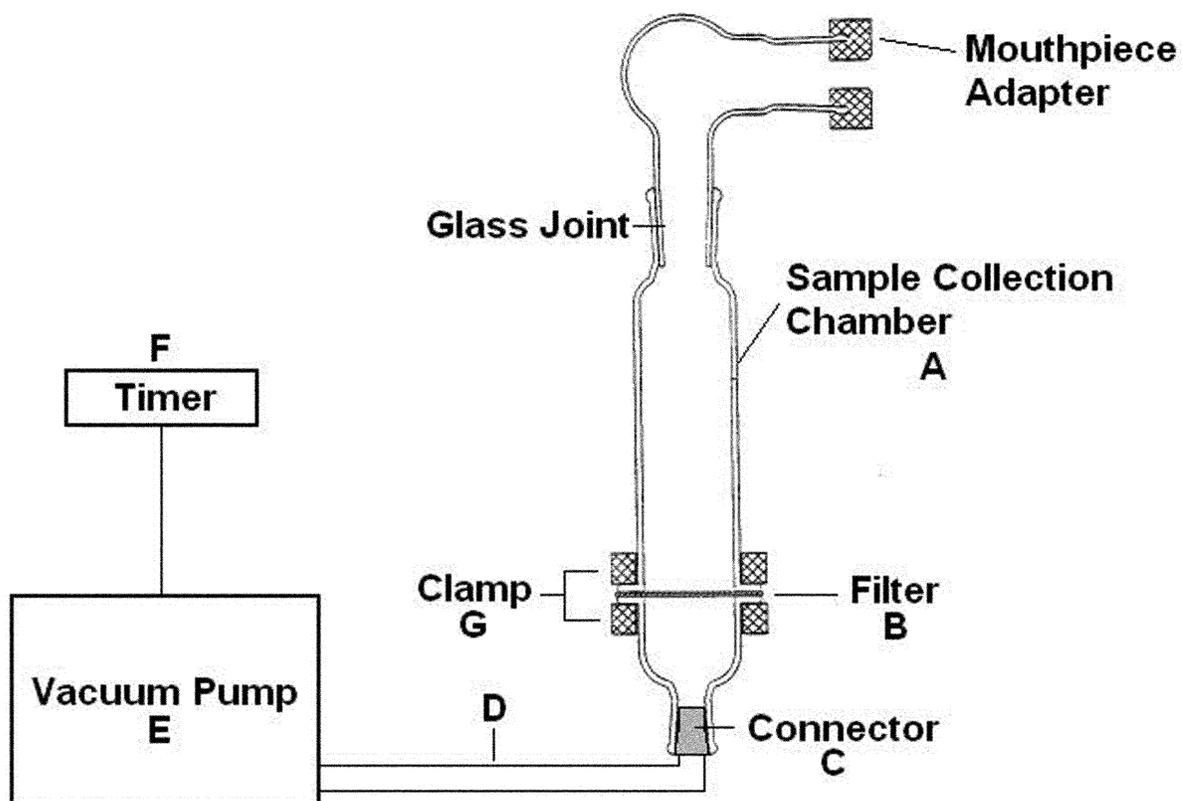

Figure 4A. Sampling apparatus.

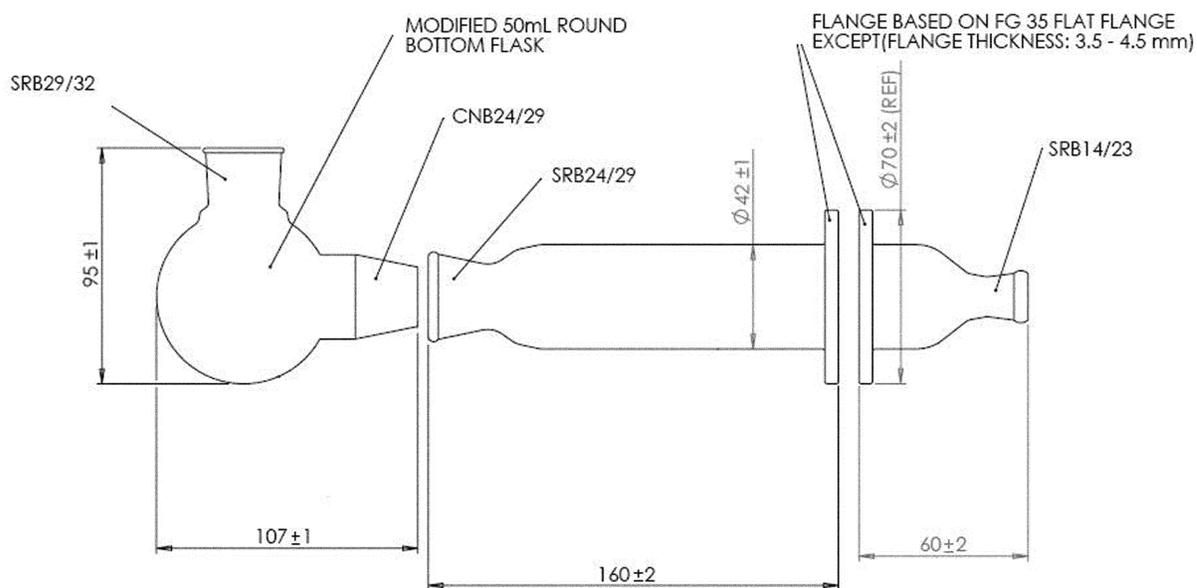

Figure 4B. Expanded view of the modified glass sample collection apparatus.

Buffer, Solution A, Mobile phase, and Diluent: Proceed as directed in the Assay.

Standard solution: 2.5 µg/mL of USP Fluticasone Propionate RS and 0.75 µg/mL of USP Salmeterol Xinafoate RS in *Diluent*

Sample solutions: Discharge a single unit dose into the apparatus shown in *Figure 4A*.

Operate the pump for 2 s at an airflow of 60 L/min to collect the dose. Detach the inhaler. Rinse the mouthpiece adapter and each piece of the sample collection chamber with methanol. Place the filter and washings into a container. Sonicate for 5 min. Quantitatively transfer the contents to a 200-mL volumetric flask containing 60 mL of

water. Allow the solution to equilibrate, and dilute with methanol to volume. Prepare nine additional *Sample solutions* from nine additional unit doses. For multi-dose inhalers, collect one dose from each of 10 inhalers with the 10 doses collected across the minimum number of recommended doses on the label of the inhaler.

Chromatographic system and System suitability: Proceed as directed in the *Assay*, except for the *Injection volume*.

Injection volume: 50 µL

Analysis

Samples: *Standard solution* and *Sample solutions*

Calculate the percentage of the labeled amount of fluticasone propionate ($C_{25}H_{31}F_3O_5S$) delivered by the inhaler in each *Sample solution*:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Fluticasone Propionate RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of fluticasone propionate in the *Sample solution* (µg/mL), based on target emitted dose from *Table 2*

Calculate the percentage of the labeled amount of salmeterol ($C_{25}H_{37}NO_4$) delivered by the inhaler in each *Sample solution*:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of salmeterol from the *Sample solution*

r_S = peak response of salmeterol from the *Standard solution*

C_S = concentration of USP Salmeterol Xinafoate RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of salmeterol free base in the *Sample solution* (µg/mL), based on target emitted dose from *Table 2*

M_{r1} = molecular weight of salmeterol free base, 415.57

M_{r2} = molecular weight of salmeterol xinafoate, 603.75

Table 2. Target Emitted Dose

Label Claim of Fluticasone Propionate/Salmeterol (µg/unit dose)	Fluticasone Propionate Target Emitted Dose (µg/unit dose)	Salmeterol Target Emitted Dose (µg/unit dose)
100/50	93	45
250/50	233	45
500/50	465	45

Acceptance criteria

- 1.The mean content of fluticasone propionate and salmeterol from 10 doses is NLT 85% and NMT 115% of the target emitted dose.
- 2.NMT 1 emitted dose is outside 80%–120% of the target emitted dose.
- 3.No dose is outside 75%–125% of the target emitted dose.

If requirements 1 and 2 described above are not met, test an additional 20 unit doses.

The mean dose of fluticasone propionate from 30 doses is:

• NLT 85% and NMT 115% of the target emitted dose.

• NMT 3 doses are outside 80%–120% of the target emitted dose.

• No dose is outside 75%–125% of the target emitted dose.

IMPURITIES

• Organic Impurities

[Note—Protect all solutions containing fluticasone propionate or salmeterol from light.]

Solution A: 0.05 M monobasic ammonium phosphate adjusted with 10% (v/v) of phosphoric acid to a pH of 2.9

Solution B: Acetonitrile

Mobile phase: See *Table 3*.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	70	30

Diluent: Methanol, water, and phosphoric acid (70: 30: 0.05)

Acidified methanol: 0.05% v/v of phosphoric acid in methanol

System suitability solution: 0.15 mg/mL of USP Salmeterol Xinafoate RS, 0.05 mg/mL of USP Fluticasone Propionate RS, and 0.4 µg/mL each of USP Fluticasone Propionate Related Compound D RS and USP Fluticasone Propionate Related Compound J RS in *Diluent*

Standard solution: 2 µg/mL of USP Salmeterol Related Compound H RS and 4 µg/mL of USP Fluticasone Propionate RS in *Diluent*

Sensitivity solution: 0.05 µg/mL of USP Salmeterol Related Compound H RS and 0.1 µg/mL of USP Fluticasone Propionate RS from *Standard solution* in *Diluent*

Sample solution: Nominally 200–500 µg/mL of fluticasone propionate prepared as follows.

Transfer the contents of NLT 10 unit doses to a 10-mL volumetric flask. Add 6 mL of acidified methanol and sonicate for 10 min. Add 3 mL of water, mix, and allow the solution to equilibrate. Dilute with acidified methanol to volume.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 228 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1 mL/min

Column temperature: 35°

Injection volume: 50 µL

System suitability

Samples: *System suitability solution*, *Standard solution*, and *Sensitivity solution*

[Note—See *Table 4* for relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between fluticasone propionate related compound J and

salmeterol; NLT 1.5 between fluticasone propionate related compound D and fluticasone propionate, *System suitability solution*

Tailing factor: NMT 2.0 for salmeterol related compound H and fluticasone propionate, *Standard solution*

Relative standard deviation: NMT 5.0% for salmeterol related compound H and fluticasone propionate, *Standard solution*

Signal-to-noise ratio: NLT 10 for both fluticasone propionate and salmeterol related compound H, *Sensitivity solution*

Analysis

Samples: *Standard solution, Sensitivity solution, and Sample solution*

Calculate the percentage of each fluticasone propionate related degradation product in the portion of Inhalation Powder taken:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (W_N/W_U) \times (1/L) \times 100$$

$r_{\bar{r}}$ peak response of each fluticasone propionate related degradation product from the *Sample solution*

$r_{\bar{s}}$ peak response of fluticasone propionate from the *Standard solution*

$C_{\bar{S}}$ concentration of USP Fluticasone Propionate RS in the *Standard solution* ($\mu\text{g/mL}$)

V = volume of the *Sample solution* (mL)

$W_{\bar{N}}$ nominal weight of each unit dose (mg)

$W_{\bar{U}}$ weight of the unit doses in the *Sample solution* (mg)

L = label claim of fluticasone propionate ($\mu\text{g/unit dose}$)

Disregard any fluticasone propionate related degradation product peak less than the area of fluticasone propionate in the *Sensitivity solution*.

Calculate the percentage of each salmeterol related degradation product in the portion of Inhalation Powder taken:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (W_N/W_U) \times (1/L) \times 100$$

$r_{\bar{r}}$ response of each salmeterol related degradation product from the *Sample solution*

$r_{\bar{s}}$ response of salmeterol related compound H from the *Standard solution*

$C_{\bar{S}}$ concentration of USP Salmeterol Related compound H RS in the *Standard solution* ($\mu\text{g/mL}$)

V = volume of the *Sample solution* (mL)

$W_{\bar{N}}$ nominal weight of each unit dose (mg)

$W_{\bar{U}}$ weight of the unit doses in in the *Sample solution* (mg)

L = label claim of salmeterol free base ($\mu\text{g/unit dose}$)

Acceptance criteria: See *Table 4*. Disregard any salmeterol related degradation product peak less than the area of salmeterol related compound H in the *Sensitivity solution*. [Note —Any unspecified degradation product eluting before salmeterol is related to salmeterol. Any unspecified degradation product eluting after salmeterol is related to fluticasone propionate.]

SPECIFIC TESTS

- **Microbial Enumeration Tests** $\langle 61 \rangle$ and **Tests For Specified Microorganisms** $\langle 62 \rangle$: The total aerobic microbial count does not exceed 10^1 cfu/g of powder. The total aerobic yeasts and molds count does not exceed 10^1 cfu/g of formulation. It meets the requirements of the tests for absence of *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Escherichia coli*, and *Salmonella* species.
- **Foreign Particulate Matter**

General chapter *Particulate Matter in Injections* $\langle 788 \rangle$ describes details of the test apparatus to be used for the determination of particulate matter using a microscopic particle count test methodology. Samples should be carefully prepared to avoid environmental contamination, and testing should be performed with suitable controls, including the appropriate use of blank determinations.

Diluent: Methanol and water (65:35) passed through a filter of 0.45- μ m pore size

Filter: Mixed cellulose and ester filter; 25-mm diameter and 0.45- μ m pore size

Sample solution: Transfer contents of NLT 8 unit doses to a suitable container. Dissolve in 75 mL of *Diluent*.

Analysis

Sample: *Sample solution*

Pass the *Sample solution* through the filter and allow the filter to dry under conditions that will limit particulate contamination. Using a microscopic particle count test method, enumerate the number of particles present in the *Sample solution*. Calculate the total number of particles per actuation by the formula:

$$\text{Result} = (N_{<10} + N_{10-100} + N_{>100})/8$$

$N_{<10}$ = total number of particles <10 μ m present in the *Sample solution*

N_{10-100} = total number of particles between 10 and 100 μ m present in the *Sample solution*

$N_{>100}$ = total number of particles >100 μ m present in the *Sample solution*

Acceptance criteria: See *Table 5*.

Table 5

Particle Size Range (μ m)	Number of Particles/Dose (NMT)
<10	200
10–100	100
>100	10
Total	300

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in non-reactive, light-resistant Inhalation Powder containers with metered valves fitted with a dose counter and provided with oral inhalation actuators. Avoid exposure to heat. Store at controlled room temperature.
- **USP Reference Standards** $\langle 11 \rangle$

▲USP39

BRIEFING

Hard Gelatin Capsule Shell. It is proposed to add this new monograph for empty Hard Gelatin Capsule Shell. Comments and suggestions should be sent to Margareth Marques, Ph.D., at mrm@usp.org not later than March 31, 2015.

(GCDF: M. Marques.)

Correspondence Number—C153576

Comment deadline: March 31, 2015

Add the following:

▲Hard Gelatin Capsule Shell

DEFINITION

Hard Gelatin Capsule Shell consists of two overlapping pieces (cap and body). One end of each piece is rounded and closed while the other is open. The cap overlaps the body and maintains a tight closure. It is composed of gelatin, water, and additives such as plasticizers, surfactants, dispersing agents, flavoring agents, antimicrobial agents, and sweeteners. It may contain opacifiers, colorants, and/or processing aids. It may be externally coated.

IDENTIFICATION

- **A.**

Sample solution: Dissolve an amount of Hard Gelatin Capsule Shell equivalent to 1 g in 100 mL of carbon dioxide free water at about 55° . Let the solution stand for a period of time to allow any colorant present to settle to the bottom of the vessel.

Analysis: To 2 mL of the supernatant of the *Sample solution* add 0.05 mL of a 125-g/L solution of copper sulfate pentahydrate. Mix, and add 0.5 mL of an 85-g/L solution of

sodium hydroxide.

Acceptance criteria: A violet color is produced.

- **B.**

Picric acid solution: 1% (w/v) solution of picric acid in hot water

Tannic acid solution: 10% (w/v) solution of tannic acid in water. Prepare immediately before use.

Analysis: Boil 1 Hard Gelatin Capsule Shell with 20 mL of water. Allow to cool and centrifuge. To 5 mL of the lukewarm supernatant, add 1 mL of *Picric acid solution*. To another 5 mL of the lukewarm supernatant, add 1 mL of *Tannic acid solution*.

Acceptance criteria: A precipitate is produced in each case.

SPECIFIC TESTS

- **Loss on Drying** 〈 731 〉

Sample: 1–2 g

Analysis: Dry the *Sample* in an oven at $105 \pm 1^\circ$ for 4 h.

Acceptance criteria: 13.0%–16.0%

- **Limit of Chromium**

Analysis: Atomic absorption spectrometry, standard addition method, or any other validated procedure

Acceptance criteria: NMT 10 ppm

- **Disintegration** 〈 701 〉

Analysis: Fill each Hard Gelatin Capsule Shell body to capacity with lactose or other suitable material. Place the cap onto the body and press the cap and body together to lock. Place the Hard Gelatin Capsule Shell in the basket, and add disks.

Medium: Water

Acceptance criteria: NMT 15 min

- **Residual Solvents** 〈 467 〉: Meets the requirements

- **Microbial Enumeration Tests** 〈 61 〉 and **Tests for Specified Microorganisms** 〈 62 〉: The total bacteria count does not exceed 10^3 cfu/g, and the total yeast and molds count does not exceed 10^2 cfu/g. The test for *Escherichia coli* is negative in 1 g.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Store in tightly closed containers at 15° – 30° and a relative humidity of 35%–65%. Avoid light exposure. ▲USP39

BRIEFING

Hydromorphone Hydrochloride, USP 38 page 3799. On the basis of comments received, it is proposed to make the following changes:

1. Revise the *Definition* and *Acceptance criteria* in the *Assay* from 98.0%–101.0% to 98.0%–102.0%, which is typical for a chromatographic assay.
2. Replace *Identification* test B with an HPLC retention time agreement based on the proposed chromatographic procedure in the *Assay*.
3. Replace the titration procedure in the *Assay* with an HPLC procedure validated with the method in *Organic Impurities, Procedure 2*. The proposed liquid chromatography

procedure is based on analysis performed with the Symmetry C8 brand of L7 column. The typical retention time for hydromorphone is about 8.3 min.

4. Delete the test for *Sulfate*; the remaining tests in the revised monograph are sufficient to ensure quality and purity.
5. Revise USP Morphine RS to USP Morphine Sulfate RS in *Organic Impurities, Procedure 2*, and add USP Morphine Sulfate RS to the *USP Reference Standards* section.
6. Add the *Labeling* statement.
7. Add chemical information for USP Hydromorphone Related Compound A RS in the *USP Reference Standards* section.

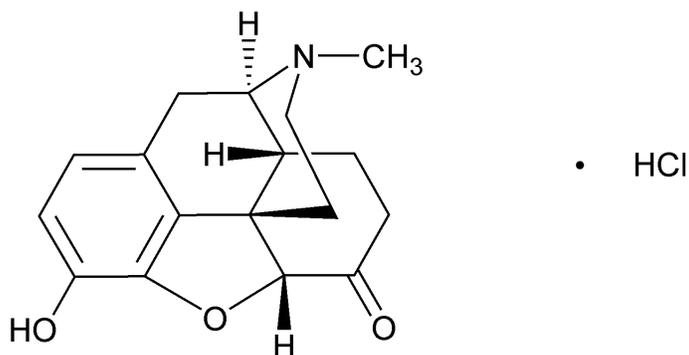

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM2: H. Cai.)

Correspondence Number—C135853

Comment deadline: March 31, 2015

Hydromorphone Hydrochloride

$C_{17}H_{19}NO_3 \cdot HCl$ 321.80

Morphinan-6-one, 4,5-epoxy-3-hydroxy-17-methyl-, hydrochloride, (5 α)-;
4,5 α -Epoxy-3-hydroxy-17-methylmorphinan-6-one hydrochloride [71-68-1].

DEFINITION

Change to read:

~~Hydromorphone Hydrochloride, dried at 105° for 2 h, contains NLT 98.0% and NMT 101.0% of hydromorphone hydrochloride ($C_{17}H_{19}NO_3 \cdot HCl$)~~

▲Hydromorphone Hydrochloride contains NLT 98.0% and NMT 102.0% of hydromorphone hydrochloride ($C_{17}H_{19}NO_3 \cdot HCl$), on the dried basis. ▲*USP39*

IDENTIFICATION

- **A. Infrared Absorption** <197K>

Delete the following:

- ▲• **B. Ultraviolet Absorption** <197U>

Sample solution: ~~100 µg/mL~~

Analytical wavelength: 280 nm

Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 3.0%. ▲*USP39*

Add the following:

▲● **B.** The retention time of the hydromorphone peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲*USP39*

● **C. Identification Tests—General, Chloride** 〈 191 〉

Sample solution: 1 in 20

Acceptance criteria: Meets the requirements

ASSAY

Change to read:

● **Procedure**

Sample: 225 mg, Previously dried

Analysis: Transfer the *Sample* to a 250 mL conical flask. Dissolve in 80 mL of glacial acetic acid, warming, if necessary. Cool, and add 5 mL of acetic anhydride and 10 mL of mercuric acetate TS. Add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue endpoint. Perform a blank determination, and make any necessary correction (see *Titrimetry* 〈 541 〉). Each mL of 0.1 N perchloric acid is equivalent to 32.18 mg of $C_{17}H_{19}NO_3 \cdot HCl$.

Acceptance criteria: 98.0%–101.0%, dried at 105° for 2 h

▲**Diluent:** 1% (v/v) Phosphoric acid in water

Solution A: Mix 3520 mL of water, 18.40 g of monobasic ammonium phosphate, and 4.32 g (on the anhydrous basis) of sodium 1-octanesulfonate. Add 4.0 mL of triethylamine, adjust with phosphoric acid to a pH of 2.90, and add 480 mL of acetonitrile.

Solution B: Acetonitrile and water (160:40)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0

BRIEFING

Hydroxyzine Hydrochloride, *USP 38* page 3812. On the basis of comments received in *PF 39(5)* [Sep.–Oct. 2013] from the FDA and USP monograph modernization efforts, it is proposed to revise the monograph as follows:

1. Replace the liquid chromatographic procedure in the test for *Organic Impurities* with a more specific chromatographic procedure that is capable of identifying 4-chlorobenzophenone and add a corresponding limit for 4-chlorobenzophenone based on ICH guidelines. The liquid chromatographic procedure was validated using the Acquity UPLC HSS C18 SB brand of L1 column. The typical retention time of hydroxyzine is about 14.5 min.
2. Replace the current HPLC procedure in the *Assay* with a chromatographic procedure using the same parameters in the proposed test for *Organic Impurities*.
3. Add USP 4-Chlorobenzophenone RS to the *USP Reference Standards* section to support the proposed test for *Organic Impurities*.

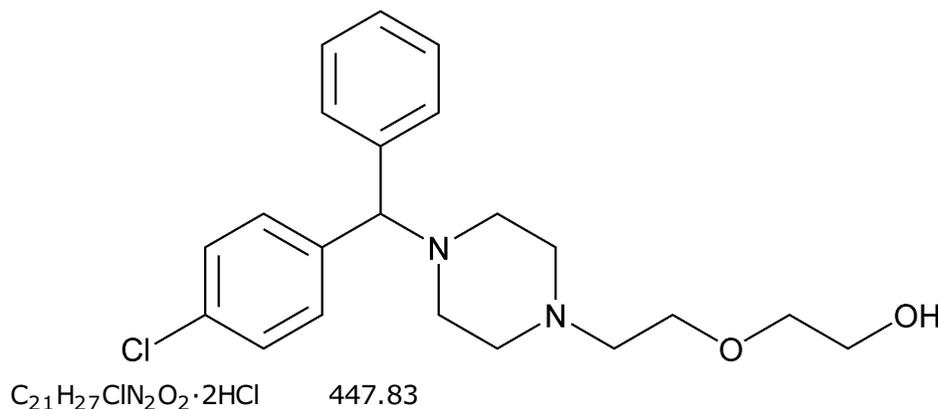

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Comment deadline: March 31, 2015

Hydroxyzine Hydrochloride

Ethanol, 2-[2-[4-[(4-chlorophenyl)phenylmethyl]-1-piperazinyl]ethoxy]-, dihydrochloride, (±)-
;
(±)-2-[2-[4-(*p*-Chloro- α -phenylbenzyl)-1-piperazinyl]ethoxy]ethanol dihydrochloride [2192-20-3].

DEFINITION

Hydroxyzine Hydrochloride contains NLT 98.0% and NMT 102.0% of hydroxyzine hydrochloride ($C_{21}H_{27}ClN_2O_2 \cdot 2HCl$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. Infrared Absorption** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C.**
Sample solution: 2.5 mg/mL of Hydroxyzine Hydrochloride in water
Analysis: To 10 mL of *Sample solution* add 2 drops of nitric acid and 1 mL of silver nitrate TS.
Acceptance criteria: A curdy, white precipitate, insoluble in 2 N nitric acid but soluble in 6 N ammonium hydroxide, separates (presence of chloride).

Hydroxyzine Hydrochloride Injection

DEFINITION

Hydroxyzine Hydrochloride Injection is a sterile solution of Hydroxyzine Hydrochloride in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of hydroxyzine hydrochloride (C₂₁H₂₇ClN₂O₂·2HCl).

IDENTIFICATION

• **A.**

Standard solution: 20 µg/mL of USP Hydroxyzine Hydrochloride RS in 0.1 N hydrochloric acid

Sample solution: Nominally 20 µg/mL of hydroxyzine hydrochloride from Injection in 0.1 N hydrochloric acid

Acceptance criteria: The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as those of the *Standard solution*, concomitantly measured.

Add the following:

- ▲● **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the hydroxyzine peak of the *Standard solution*, as obtained in the *Assay*. ▲*USP38*

BRIEFING

Hydroxyzine Hydrochloride Tablets, *USP 38* page 3815. As part of the USP monograph modernization efforts, it is proposed to revise the monograph as follows:

1. Add a stability-indicating liquid chromatographic procedure as a test for *Organic Impurities* and replace the existing *Assay* with a similar procedure. These procedures were validated using the Acquity UPLC HSS C18 SB brand of L1 column. The typical retention time for hydroxyzine is about 14.5 min.
2. Replace *Identification* test *A* that is based on the TLC procedure with a test based on the retention time agreement using the proposed *Assay*.
3. Add *Identification* test *B* based on the UV spectral agreement for the main peak from the proposed *Assay*.
4. Include a storage requirement to the *Packaging and Storage* section based on the information for an approved drug product.
5. Add two new Reference Standards to the *USP Reference Standards* section to support the proposed test for *Organic Impurities*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Hydroxyzine Hydrochloride Tablets**DEFINITION**

Hydroxyzine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of hydroxyzine hydrochloride ($C_{21}H_{27}ClN_2O_2 \cdot 2HCl$).

IDENTIFICATION

Delete the following:

▲• A.

Standard solution: 2 mg/mL of USP Hydroxyzine Hydrochloride RS in methanol

Sample solution: Nominally 2 mg/mL of hydroxyzine hydrochloride in methanol prepared as follows. Triturate a quantity of finely powdered Tablets, equivalent to about 100 mg of hydroxyzine hydrochloride, with 50 mL of methanol, and filter. Use the filtered solution.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: Thin-layer chromatographic plate, coated with a 0.25-mm layer of chromatographic silica gel, and dried in air for 30 min, followed by drying under vacuum at 140 ° for 30 min.

Application volume: 100 µL

Developing solvent system: Toluene, alcohol, and ammonium hydroxide (150:95:1)

Spray reagent: Potassium iodoplatinate TS

Analysis

Samples: *Standard solution and Sample solution*

Apply the solutions on the chromatographic plate, and allow the spots to dry. Develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots by lightly spraying with *Spray reagent*.

Acceptance criteria: The R_f value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

▲USP39

Add the following:

▲• **A.** The retention time of the main peak of the *Sample solution* corresponds to that of the hydroxyzine peak of the *Standard solution*, as obtained in the Assay. ▲USP39

Add the following:

▲• **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay. ▲USP39

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of hydroxyzine hydrochloride ($C_{21}H_{27}ClN_2O_2 \cdot 2HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Hydroxyzine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U nominal concentration of hydroxyzine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

● **Dissolution** 〈 711 〉

Test 1

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Standard solution: USP Hydroxyzine Hydrochloride RS in *Medium*

Sample solution: Use a filtered portion of the solution under test. Dilute with *Medium*, if necessary.

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum absorbance at about 230 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Determine the percentage of the labeled amount of hydroxyzine hydrochloride ($C_{21}H_{27}ClN_2O_2 \cdot 2HCl$) dissolved from the UV absorbances.

Tolerances: NLT 75% (Q) of the labeled amount of hydroxyzine hydrochloride ($C_{21}H_{27}ClN_2O_2 \cdot 2HCl$) is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: Water; 250 mL

Apparatus 3: 30 dips/min

Time: 45 min

Standard solution: USP Hydroxyzine Hydrochloride RS in *Medium*

Sample solution: Use a filtered portion of the solution under test. Dilute with *Medium*, if necessary.

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum absorbance at about 230 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Determine the percentage of the labeled amount of hydroxyzine hydrochloride ($C_{21}H_{27}ClN_2O_2 \cdot 2HCl$) dissolved from the UV absorbances.

Tolerances: NLT 75% (Q) of the labeled amount of hydroxyzine hydrochloride ($C_{21}H_{27}ClN_2O_2 \cdot 2HCl$) is dissolved.

- **Uniformity of Dosage Units** { 905 } : Meet the requirements

IMPURITIES

Add the following:

▲• **Organic Impurities**

Solution A, Solution B, Mobile phase, and Diluent: Proceed as directed in the *Assay*.

Standard stock solution: 25.0 µg/mL each of USP Hydroxyzine Hydrochloride RS, USP Hydroxyzine Related Compound A RS, and USP 4-Chlorobenzophenone RS in *Diluent*

Standard solution: 1.0 µg/mL each of USP Hydroxyzine Hydrochloride RS, USP Hydroxyzine Related Compound A RS, and USP 4-Chlorobenzophenone RS from the *Standard stock solution* in *Diluent*

Sample solution: Nominally 500 µg/mL of hydroxyzine hydrochloride from Tablets prepared as follows. Transfer a portion of finely powdered Tablets (NLT 10), equivalent to 50 mg of hydroxyzine hydrochloride, to a 100-mL volumetric flask. Add 80 mL of *Diluent*. Sonicate 30 min to dissolve and dilute with *Diluent* to volume. Centrifuge the solution and use the supernatant.

[Note—The use of a centrifuge speed of 3000 rpm for 10 min may be suitable.]

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detectors

Hydroxyzine and hydroxyzine related compound A: UV 230 nm

4-Chlorobenzophenone: UV 254 nm

Column: 2.1-mm × 15-cm; 1.8-µm packing L1

Flow rate: 0.3 mL/min

Injection volume: 2 µL

System suitability

Sample: *Standard solution*

[Note—See *Table 2* for the relative retention times.]

Suitability requirements

Resolution: NLT 5.0 between hydroxyzine related compound A and hydroxyzine

Relative standard deviation: NMT 3.0% each for hydroxyzine related compound A, hydroxyzine, and 4-chlorobenzophenone

Analysis

Samples: *Standard solution* and *Sample solution*

For impurities detected at UV 230 nm

Calculate the percentage of any individual unspecified degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of each unspecified degradation product from the *Sample solution*

r_S peak response of hydroxyzine from the *Standard solution*

C_S concentration of USP Hydroxyzine Hydrochloride RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U nominal concentration of hydroxyzine hydrochloride in the *Sample solution* ($\mu\text{g/mL}$)

For 4-Chlorobenzophenone detected at UV 254 nm

Calculate the percentage of 4-chlorobenzophenone in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of 4-chlorobenzophenone from the *Sample solution*

r_S peak response of 4-chlorobenzophenone from the *Standard solution*

C_S concentration of USP 4-Chlorobenzophenone RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U nominal concentration of hydroxyzine hydrochloride in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: See *Table 2*. Disregard any peak below 0.03%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Declocixine ^a	0.87	—
Hydroxyzine related compound A ^a	0.96	—
Hydroxyzine	1.0	—
4-Chlorobenzophenone	1.4	0.2
Any individual unspecified degradation product	—	0.3
Total degradation products	—	0.5

^a These are process impurities that are controlled in the drug substance. They are not to be reported or included in the total degradation products.

BRIEFING

Ibuprofen Oral Suspension, *USP 38* page 3828. As part of USP monograph modernization efforts, it is proposed to make the following changes:

1. Revise *Identification* test *A* and *Identification* test *B*, based on the UV spectra and retention time agreement as obtained in the *Assay*, to eliminate the use of chloroform due to safety concerns.
2. Replace the *Assay* procedure with a new HPLC procedure to eliminate the use of internal standard. The proposed liquid chromatography is based on analysis using the Spherisorb S5C8 brand of L7 column. The typical retention time for ibuprofen is about 10.5 min.
3. Delete the test for *Limit of Ibuprofen Related Compound C* and add a single HPLC procedure for *Organic Impurities*, in which the *Mobile phase* and *Chromatographic system* are the same as those in the proposed *Procedure* in the *Assay*.
4. Include USP Benzoic Acid RS and USP Ibuprofen Related Compound J RS in the *USP Reference Standards* section and add the chemical information for USP Ibuprofen Related Compound C RS.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Comment deadline: March 31, 2015

Ibuprofen Oral Suspension

DEFINITION

Ibuprofen Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of ibuprofen ($C_{13}H_{18}O_2$).

IDENTIFICATION

Change to read:

• A.

~~**Standard solution:** 20 mg/mL of USP Ibuprofen RS in chloroform~~

~~**Sample solution:** Transfer a volume of Oral Suspension, nominally equivalent to 200 mg of ibuprofen, to a separator containing 10 mL of chloroform, and shake for about 1 min. Allow the layers to separate, and pass the lower chloroform layer through a filter containing about 2 g of anhydrous sodium sulfate. Use the filtrate.~~

~~[Note—Retain a portion of this solution for use in *Identification* test B.]~~

~~**Chromatographic system**~~

~~(See *Chromatography* ~~621~~, *Thin-Layer Chromatography*.)~~

~~**Adsorbent:** 0.25-mm layer of chromatographic silica gel, previously activated by heating at 105° for 30 min~~

~~**Application volume:** 10 µL~~

~~**Developing solvent system:** *n*-hexane, butyl acetate, and glacial acetic acid (17:3:1)~~

~~**Analysis**~~

~~**Samples** *Standard solution* and *Sample solution*~~

~~Allow the spots to dry, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and dry in a current of cool air. Examine the chromatograms under short-wavelength UV light.~~

~~**Acceptance criteria:** The R_f value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.~~

▲The UV absorption spectra of the ibuprofen peak of the *Sample solution* exhibit maxima and minima at the same wavelengths as those of the *Standard solution*, as obtained in the *Assay*. ▲USP39

Delete the following:

▲• ~~**B. Infrared Absorption**~~ ~~197K~~

~~**Standard and Sample:** Evaporate about 20 drops of the *Standard solution* and the *Sample solution* retained from *Identification* test A to dryness in a current of air without heating.~~

~~**Acceptance criteria:** Meets the requirements. ▲USP39~~

Add the following:

▲• **B.** The retention time of the ibuprofen peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲USP39

ASSAY

Change to read:● **Procedure**

Buffer: Dilute 0.7 mL of phosphoric acid with water to obtain 1000 mL of 0.01 M phosphoric acid.

Mobile phase: Acetonitrile and *Buffer* (37:63)

Diluent: Acetonitrile and water (1:1)

Internal standard solution: 3.2 mg/mL of benzophenone in acetonitrile

Standard stock solution: 1.2 mg/mL of USP Ibuprofen RS in *Diluent*

Standard solution: Transfer 20.0 mL of the *Standard stock solution* and 5.0 mL of the *Internal standard solution* to a 50 mL volumetric flask, dilute with acetonitrile to volume, mix, and filter. This solution contains about 0.48 mg of ibuprofen per mL.

Density: Using a tared 50 mL volumetric flask, weigh 50 mL of Oral Suspension that has previously been well shaken to ensure homogeneity, allow to stand until the entrapped air has risen, and invert carefully just prior to transferring it to the volumetric flask. From the observed weight of 50 mL of the Oral Suspension, calculate the density of the Oral Suspension in g/mL.

Sample stock solution: Nominally 1.2 mg/mL of ibuprofen prepared as follows. Transfer a portion of Oral Suspension to a suitable volumetric flask, and dilute with *Diluent* to volume.

[Note—Retain a portion of this solution for use in *Limit of Ibuprofen Related Compound C* below.]

Sample solution: Transfer 20.0 mL of the *Sample stock solution* and 5.0 mL of the *Internal standard solution* to a second 50 mL volumetric flask, dilute with acetonitrile to volume, mix, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6 mm × 15 cm; 5 µm packing L7

Flow rate: 2 mL/min

Injection volume: 5 µL

System suitability

Sample: *Standard solution*

[Note—The relative retention times for benzophenone and ibuprofen are 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between benzophenone and ibuprofen

Relative standard deviation: NMT 2.0%

Tailing factor: NMT 2.0

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ibuprofen ($C_{13}H_{18}O_2$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

~~r_U~~ ratio of the ibuprofen peak area to the benzophenone peak area from the *Sample solution*

~~r_S~~ ratio of the ibuprofen peak area to the benzophenone peak area from the *Standard solution*

~~C_S~~ concentration of USP Ibuprofen RS in the *Standard solution* (mg/mL)

~~C_U~~ nominal concentration of ibuprofen in the *Sample solution* (mg/mL)

▲Mobile phase:

Dissolve 1.52 g of monobasic potassium phosphate in 560 mL of water. Adjust with phosphoric acid to a pH of 2.05 if necessary. Add 440 mL of tetrahydrofuran and mix.

Diluent: Methanol and water (1:1)

Standard solution: 0.4 mg/mL of USP Ibuprofen RS in *Diluent*

Sample solution: Nominally 0.4 mg/mL of ibuprofen in *Diluent* prepared as follows.

Transfer a suitable amount of Oral Suspension to a suitable volumetric flask. Add about 60% final volume of *Diluent*. Sonicate for 45 min. Cool and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detectors

Assay: UV 254 nm

Identification test A: Diode array UV 200–400 nm

Column: 4.6-mm × 15-cm; 5-µm packing L7

Flow rate: 1.0 mL/min

Injection volume: 25 µL

Run time: NLT 1.9 times the retention time of ibuprofen

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 3.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ibuprofen ($C_{13}H_{18}O_2$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U

= peak response of ibuprofen from the *Sample solution*

r_S

Ibuprofen Tablets

DEFINITION

Ibuprofen Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of ibuprofen ($C_{13}H_{18}O_2$).

IDENTIFICATION

Change to read:

- **A.**

~~**Sample:** Grind 1 Tablet to a fine powder in a mortar, add about 5 mL of chloroform, and swirl.~~

~~**Analysis:** Filter the *Sample*, and evaporate the filtrate with the aid of a stream of nitrogen to dryness.~~

~~**Acceptance criteria:** The IR absorption spectrum of a mineral oil dispersion of the residue exhibits maxima only at the same wavelengths as that of a similar preparation of USP Ibuprofen RS.~~

▲The UV absorption spectra of the ibuprofen peak of the *Sample solution* exhibit maxima and minima at the same wavelengths as those of the *Standard solution*, as obtained in the *Assay*. ▲*USP39*

Change to read:

- **B.** The relative retention time of the ibuprofen peak, relative to the internal standard, from the *Sample solution* corresponds to that of the USP Ibuprofen RS, as obtained in the *Assay*.
- ▲ The retention time of the ibuprofen peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲*USP39*

ASSAY

Change to read:

- **Procedure**

Mobile phase: Dissolve 4.0 g of chloroacetic acid in 400 mL of water, and adjust with ammonium hydroxide to a pH of 3.0. Add 600 mL of acetonitrile, filter and degas

Internal standard solution: 0.35 mg/mL of valerophenone in *Mobile phase*

Standard solution: 12 mg/mL of USP Ibuprofen RS in *Internal standard solution*

Ibuprofen related compound C standard stock solution: 0.6 mg/mL of USP Ibuprofen Related Compound C RS in acetonitrile

Ibuprofen related compound C standard solution: Dilute *Ibuprofen related compound C standard stock solution* with *Internal standard solution* to obtain a solution containing 0.012 mg/mL of ibuprofen related compound C

Sample solution: Nominally 12 mg/mL of ibuprofen prepared as follows. Transfer a portion nominally equivalent to 1200 mg of ibuprofen from NLT 20 finely powdered to a suitable container, add 100.0 mL of *Internal standard solution*, and shake for 10 min. [Note—Where the Tablets are coated, place an accurately counted number of Tablets, nominally equivalent to NLT 1200 mg of ibuprofen, in a container, add a volume of *Internal standard solution*, sufficient to obtain a *Sample solution* containing 12 mg/mL of ibuprofen, and about 15 glass beads, and then shake until the Tablets are completely disintegrated.] Centrifuge a portion of the suspension and use the clear supernatant.

compound C standard solution

Analysis

Samples: *Standard solution, Sample solution, and Ibuprofen related compound C standard solution*

Calculate the percentage of the labeled amount of ibuprofen ($C_{13}H_{18}O_2$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U ratio of the ibuprofen peak response to the valerophenone peak response from the *Sample solution*

R_S ratio of the ibuprofen peak response to the valerophenone peak response from the *Standard solution*

C_S concentration of USP Ibuprofen RS in the *Standard solution* (mg/mL)

C_U nominal concentration of ibuprofen in the *Sample solution* (mg/mL)

▲Mobile phase:

Dissolve 4.0 g of chloroacetic acid in 400 mL of water, adjust with ammonium hydroxide to a pH of 3.0 if necessary, add 600 mL of acetonitrile, and mix.

Standard solution: 10.0 mg/mL of USP Ibuprofen RS in *Mobile phase*

Sample solution: Nominally 10.0 mg/mL of ibuprofen prepared as follows. Transfer NLT 10 Tablets to a suitable volumetric flask and add about 50% final volume of *Mobile phase*. Shake on a flat bed shaker for at least 60 min or until the Tablets are disintegrated. Dilute with *Mobile phase* to volume. Centrifuge a portion of the solution at about 3000 rpm for about 10 min or until a clear supernatant is obtained. Use the supernatant for analysis.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

[Note—It is suggested to use the mixture of methanol and water (90:10) for needle wash.]

Mode: LC

Detectors

Assay: UV 254 nm

Identification test A: Diode array UV 200–400 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 2.0 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution and Sample solution*

Calculate the percentage of the labeled amount of ibuprofen ($C_{13}H_{18}O_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U

= peak response of ibuprofen from the *Sample solution*

 r_S

= peak response of ibuprofen from the *Standard solution*

 C_S

= concentration of USP Ibuprofen RS in the *Standard solution* (mg/mL)

 C_U

= nominal concentration of ibuprofen in the *Sample solution* (mg/mL)

▲USP39

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• Dissolution 〈 711 〉

Medium: pH 7.2 phosphate buffer (see *Buffers in Reagents, Indicators, and Solutions*); 900 mL

Apparatus 2: 50 rpm

Time: 60 min

Standard solution: A known concentration of USP Ibuprofen RS in *Medium*

Sample solution: Filter a portion of the solution under test, and suitably dilute with *Medium* if necessary.

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum absorbance at about 221 nm

Analysis: Determine the amount of ibuprofen ($C_{13}H_{18}O_2$) dissolved by comparing the UV absorbance of the *Sample solution* with that of the *Standard solution*. [Note—Where the Tablets are labeled as gelatin-coated, determine the amount of ibuprofen ($C_{13}H_{18}O_2$) dissolved from the UV absorbance at the wavelength of maximum absorbance at about 266 nm, from which is subtracted the absorbance at 280 nm, in comparison with the *Standard solution*, similarly measured.]

Tolerances: NLT 80% (Q) of the labeled amount of ibuprofen ($C_{13}H_{18}O_2$) is dissolved.

• Uniformity of Dosage Units 〈 905 〉: Meet the requirements

BRIEFING

Iodixanol, *USP 38* page 3901 and *PF 39(3)* [May–June 2013]. On the basis of comments received, it is proposed to cancel the proposal that appeared in *PF 39(3)* and republish the monograph proposal with the following changes:

1. Revise *Identification* test *B* with a retention time match based on the test for *Limit of Iodixanol Related Compound E and Iodixanol Impurity H*.
2. Delete *Identification* test *C* because it generates iodine vapors, which are a potential safety hazard because iodine vapors can irritate the nose and eyes.
3. Revise the *Assay* to include a formula for calculation of the content of iodixanol.
4. Revise the *Limit of Free Iodide* test to include a formula for calculation of iodide.
5. Delete the *Limit of Calcium* test because the manufacturing history indicates that no detectable levels of calcium have been observed.
6. Delete the *Free Iodine* test because the manufacturing history indicates that no free iodine has been observed.
7. Revise the *Limit of Free Aromatic Amine* test to be consistent with the procedure in *European Pharmacopoeia 8.4*.
8. Replace the *Limit of Methanol, Isopropyl Alcohol, and Methoxyethanol* test with a modified gas chromatographic procedure for quantifying 2-methoxyethanol. The procedure is based on analyses performed with the JW Scientific (Agilent Technologies) DB-Wax brand of G16 column. The retention time of 2-methoxyethanol is about 8 min.
9. Rename *Organic Impurities, Procedure 1* as *Organic Impurities*. Revise the test to be consistent with the *Related Substances* test in *European Pharmacopoeia 8.4*. The procedure is based on validations performed using the Hypersil-ODS brand of L1 column. Under chromatographic conditions, the first major peak of iodixanol elutes at 28.5 min.
10. Replace *Organic Impurities, Procedure 2* with the *Limit of Iodixanol Related Compound E and Iodixanol Impurity H* test. The new test is consistent with the *Impurities E and H* test in *European Pharmacopoeia 8.4*. This procedure is based on validations performed with the Supelcosil-NH2 brand of L8 column. The Zorbax-NH2 brand of L8 column is also suitable for this analysis. Under chromatographic conditions, iodixanol related compound E and iodixanol impurity H elute at about 12 and 22 min, respectively.
11. Delete the redundant *Microbial Enumeration Tests*, because it needs to be performed in the finished formulation, regardless of whether the drug substance is tested for

microbial limits.

12. Delete the *Optical Rotation* test, which does not add value.
13. Revise the existing storage condition in *Packing and Storage* to room temperature, based on the stability data.

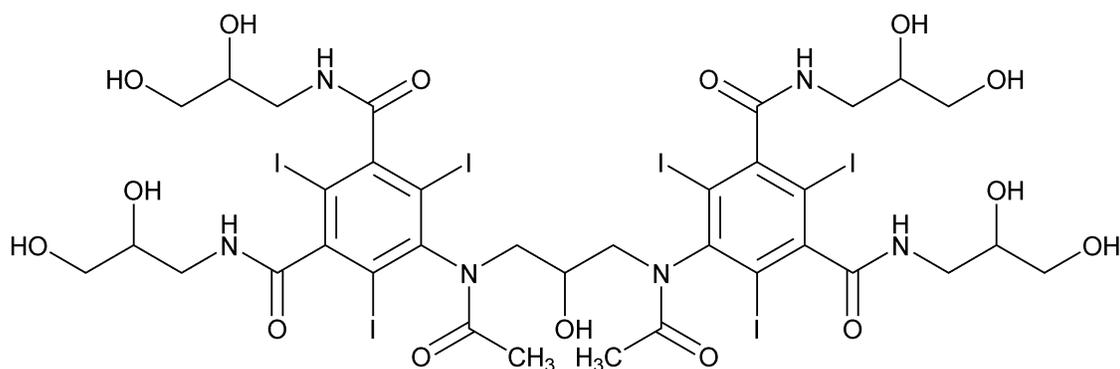

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM4: R. Ravichandran.)

Iodixanol

$C_{35}H_{44}I_6N_6O_{15}$ 1550.18

1,3-Benzenedicarboxamide, 5,5'-[(2-hydroxy-1,3-propanediyl)bis(acetylimino)]bis[*N,N'*-bis(2,3-dihydroxypropyl)-2,4,6-triiodo-];
5,5'-[(2-Hydroxytrimethylene)bis(acetylimino)]bis[*N,N'*-bis(2,3-dihydroxypropyl)-2,4,6-triiodoisophthalamide] [92339-11-2].

DEFINITION

Iodixanol contains NLT 98.6% and NMT 101.0% of iodixanol ($C_{35}H_{44}I_6N_6O_{15}$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. Infrared Absorption** 〈 197K 〉

Change to read:

- **B.** The retention times of the two principal peaks from the *Sample solution* correspond to those from *Standard solution B*, as obtained in *Limit of Iodixanol Related Compound E and Iodixanol impurity H*.

▲The retention times of the three principal peaks of the *Sample solution* correspond to those of the *Identification solution*, as obtained in the test for *Limit of Iodixanol Related Compound E and Iodixanol Impurity H*. ▲*USP39*

[Note—A third isomer may appear as a minor peak.]

ASSAY

Change to read:

● **Procedure**

Analysis: ~~Titrate with 0.1 N silver nitrate VS. Each mL of 0.1 N silver nitrate is equivalent to 25.84 mg of $C_{35}H_{44}I_6N_6O_{15}$.~~

▲**Sample solution:** Transfer 500 mg of Iodixanol to a glass-stoppered, 125-mL conical flask. Add 25 mL of 1.25 N sodium hydroxide and 500 mg of powdered zinc. Connect the flask to a reflux condenser, and reflux for 1 h. Cool the flask to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and pass the mixture through a filter. Rinse the flask and the filter thoroughly with small portions of water, adding the rinsings to the filtrate. Add 5 mL of glacial acetic acid.

Titrimetric system

(See *Titrimetry* 〈 541 〉.)

Mode: Direct titration

Titrant: 0.1 N silver nitrate VS

Endpoint detection: Potentiometric

Analysis

Sample: *Sample solution*

Titrate the *Sample solution* with the *Titrant*.

Calculate the percentage of iodixanol ($C_{35}H_{44}I_6N_6O_{15}$) in the portion of Iodixanol taken:

$$\text{Result} = [(V \times N \times F)/W] \times 100$$

V

= sample titrant volume (mL)

N

= *Titrant* normality (meq/mL)

F

= equivalent weight of iodixanol, 258.4 mg/meq

W

= weight of iodixanol (mg)

▲USP39

Acceptance criteria: 98.6%–101.0% on the anhydrous basis

● **Limit of Ionic Compounds**

[Note—Rinse all glassware with water.]

Standard solution: 4 µg/mL of sodium chloride in water

Sample solution: 2 g of Iodixanol in 100 mL of water

Acceptance criteria: The specific conductance in the *Sample solution* is NMT that of the *Standard solution* (equivalent to NMT 0.02% of ionic compounds, as sodium chloride).

Change to read:

● **Limit of Free Aromatic Amine**

Solution A: 3 mg/mL of *N*-(1-naphthyl)ethylenediamine dihydrochloride in a mixture of propylene glycol and water (70:30)

Blank solution: Add 15 mL of water to a 25-mL volumetric flask.

Standard stock solution: 10 µg/mL of USP Iohexol Related Compound B RS in water

Standard solution: Transfer 10.0 mL of the *Standard stock solution* and 5 mL of water to a 25-mL volumetric flask.

Sample solution: Transfer 200 mg of Iodixanol to a 25-mL volumetric flask, and add 15 mL of water.

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: 495 nm

Cell: 5 cm

Analysis

Samples: *Blank solution*, *Standard solution*, and *Sample solution*

Treat the *Samples* as follows. Place the flask in an ice bath for 5 min. Add 1.5 mL of 6 N hydrochloric acid, and mix by swirling. Add 1.0 mL of sodium nitrite solution (20 mg/mL), and allow to stand in the ice bath for 4 min. Remove the flask from the ice bath, add 1.0 mL of sulfamic acid solution (40 mg/mL), and swirl gently until gas evolution ceases.

▲ [**Caution**—Considerable pressure is produced.]▲*USP39*

Add 1.0 mL of *Solution A*, dilute with water to volume, and allow to stand for 5 min. Transfer the solution obtained from the *Sample solution* and the solution obtained from the *Standard solution* to separate color comparison tubes. The solution obtained from the *Sample solution* is lighter than the solution obtained from the *Standard solution*: NMT 0.05% is found. If the solution obtained from the *Sample solution* is the same color or darker than the solution obtained from the *Standard solution*, determine the absorbances of the solutions. Use the solution obtained from the *Blank solution* to zero the spectrophotometer.

Calculate the percentage of free aromatic amine in the portion of Iodixanol taken:

$$\text{Result} = (C_S/C_U) [(A_U - A_B)/(A_S - A_B)]$$

C_S = concentration of USP Iohexol Related Compound B RS in the *Standard solution* ($\mu\text{g}/\text{mL}$)

C_U = weight of Iodixanol taken to prepare the *Sample solution* (mg)

A_U = absorbance of the final solution from the *Sample solution*

A_B = absorbance of the final solution from the *Blank solution*

A_S = absorbance of the final solution from the *Standard solution*

Acceptance criteria: NMT 0.05%

▲ Measure the absorbance of the *Standard solution* and the *Sample solution* against the *Blank solution*.

Acceptance criteria: The absorbance of the *Sample solution* is NMT that of the *Standard solution* (NMT 0.05% of free aromatic amine).▲*USP39*

Analysis

Samples: *Blank solution, Sample solution A,* and *Sample solution B*

High-low chromatography: Where it is specified to proceed as directed for *High-low chromatography*, for the chromatogram from *Sample solution A*, calculate the percentage of each specified related compound in the portion of Iodixanol taken:

$$\text{Result} = (10X)/(0.1Y + Z)$$

X = peak area for each of the specified related compounds from *Sample solution A*

Y = total area of all the peaks eluted before and after iodixanol from *Sample solution A*; disregarding any peaks due to injection noise or solvent

Z = sum of peak areas of iodixanol and any related compounds which are eluted together with, and between, the principal iodixanol peaks from *Sample solution B*

Iohexol: If iohexol is present, it exhibits two peaks, with retention times of 0.37 and 0.39 relative to the main iodixanol peak from *Sample solution A*. Draw a baseline at the height of the baseline from the *Blank solution*. Calculate the total area of the two peaks and the percentage of iohexol in the portion of Iodixanol taken as directed for *High-low chromatography*.

Iodixanol related compound B¹: If iodixanol related compound B is present, it elutes as a single peak with a retention time of 0.34 relative to the main iodixanol peak, in the chromatogram from *Sample solution A*. Draw a baseline at the height of the baseline from the *Blank solution*. Calculate the area of the peak and the percentage of iodixanol related compound B in the portion of Iodixanol taken, as directed for *High-low chromatography*.

Iodixanol related compound C: If iodixanol related compound C is present, only the

first and larger peak, with a retention time of 1.07 relative to the main iodixanol peak, is seen between the two principal iodixanol peaks from *Sample solution A*; the second iodixanol related compound C peak co-elutes with iodixanol. The area of the first and larger peak corresponds to 80% of the total area of iodixanol related compound C. Draw a vertical line through the minimum before the first and larger peak. Draw a horizontal baseline at the minimum after the first and larger peak.

Calculate the percentage of iodixanol related compound C in the portion of Iodixanol taken:

$$\text{Result} = 12.5X_2 / (0.1Y + Z)$$

X_2 = peak area response of iodixanol related compound C

Y = sum of all the peaks eluted before and after iodixanol from *Sample solution A*, disregarding any peaks due to injection noise or solvent

Z = sum of the peak area response of iodixanol and any related compounds which are eluted together with, and between, the principal iodixanol peaks from *Sample solution B*

Iodixanol related compound F²: If iodixanol related compound F is present, only the first and smaller peak with a retention time of 0.8 relative to the main iodixanol peak, can be seen in the chromatogram from *Sample solution A*; the second peak co-elutes with iodixanol. The area of the first and smaller peak corresponds to 25% of the total area of iodixanol related compound F. Draw the baseline at the height of the baseline from the *Blank solution*.

Calculate the percentage of iodixanol related compound F in the portion of Iodixanol taken:

$$\text{Result} = 40X_1 / (0.1Y + Z)$$

X_1 = the actual observed area of the peak of iodixanol related compound F from *Sample solution A*

Y = sum of all the peaks eluted before and after iodixanol from *Sample solution A*, disregarding any peaks due to injection noise or solvent

Z = sum of the peak areas of iodixanol and any related compounds which are eluted together with, and between, the principal iodixanol peaks from *Sample solution B*

Iodixanol related compound G³: If iodixanol related compound G is present, the second and larger peak, with a retention time of 1.18 relative to the last iodixanol peak, is seen in the chromatogram from *Sample solution A*; the first peak co-elutes with iodixanol. The area of the second peak corresponds to 85% of the total area of iodixanol related compound G. Draw the baseline at the height of the baseline from the *Blank solution*. Calculate the percentage of iodixanol related compound G in the portion of Iodixanol taken:

$$\text{Result} = 10X_2 / \{0.85(0.1Y + Z)\}$$

X_2 = peak area response of iodixanol related compound G

Y = sum of all the peak area responses eluted before and after iodixanol from *Sample solution A*, disregarding any peaks due to injection noise or solvent

Z = the sum of peak areas of iodixanol and any related compounds which are eluted together with, and between, the principal iodixanol peaks from *Sample solution B*

Overalkylated related compounds: These compounds elute after iodixanol related compound G, with a retention time greater than 1.18 relative to the last iodixanol peak. Draw the baseline at the height of the baseline from the *Blank solution*, and determine the peak areas.

Calculate the percentage of overalkylated related compounds as directed for *High-low chromatography*.

Unspecified related compounds: Examine the chromatograms from *Sample solution A* and the area of each peak eluting before or after iodixanol, other than those of iodixanol, specified related compounds, specified impurities, and overalkylated related compounds. Draw the baseline at the height of the baseline from the *Blank solution*. Calculate the percentage of the largest of these peaks as directed for *High-low chromatography*.

Other unspecified related compounds: Determine the area of any unspecified peak eluting between those of iodixanol. Draw the baseline between minima, and calculate the percentage as directed for *High-low chromatography*.

Acceptance criteria : See *Table 3* below.

Table 3

Name	Acceptance Criteria, NMT (%)
Iodixanol related compound B	0.2
Iodixanol related compound C	0.4
Iodixanol related compound F	0.2
Iodixanol related compound G	0.2
Iohexol	0.6
Overalkylated related compounds	1.0
Any individual unspecified related compound	0.2
Total unspecified related compounds	0.5

Total related compounds: From each of the chromatograms from *Sample solution A*, calculate the percentage of all related compounds as the sum of the results for the peaks appearing between the two principal iodixanol peaks, and the area percentage obtained as follows:

$$\text{Result} = [100(Y - X_1 - X_3 + X_1/0.25 + X_2/0.8 + X_3/0.85)]/10(0.1Y + Z)$$

Y = sum of all the peaks eluted before and after iodixanol from *Sample solution A*, disregarding any peaks due to injection noise or solvent

X_1 = actual observed area of the peak of iodixanol related compound F from *Sample solution A*

X_2 = peak area response of iodixanol related compound

X_3 = peak area response from iodixanol related compound C

Z = sum of the peak areas of iodixanol and any related compounds which are eluted together with, and between, the principal iodixanol peaks from *Sample solution B*

Solution A: Acetonitrile

Solution B: Water

Blank solution: Water

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	85	15
25	66	34

Standard stock solution A: 12.5 mg/mL of USP Iodixanol RS in water

Standard stock solution B: 0.025 mg/mL of USP Iodixanol Related Compound D RS

Standard stock solution C: 2.5 mg/mL of USP Iodixanol Related Compound E RS

Standard solution A: 2.5 mg/mL from *Standard stock solution A* diluted with water

Standard solution B: 2.5 mg/mL of iodixanol and 0.0025 mg/mL of related compound D from *Standard stock solution A* and *Standard stock solution B*, respectively, diluted with water

Standard solution C: 0.25 mg/mL of iodixanol and 0.25 mg/mL of related compound E from *Standard stock solution A* and *Standard stock solution C*, respectively, diluted with water

Sample solution: 2.5 mg/mL of anhydrous iodixanol from iodixanol

Chromatographic system

(See *Chromatography* ~~621~~, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6 mm × 25 cm; 5 μm packing L8

Flow rate: 2.5 mL/min

Injection size: 10 μL

System suitability

Samples: *Standard solution A*, three portions of *Standard solution B*, *Standard solution C*, and *Sample solution*

[Note—The chromatogram from *Standard solution A* exhibits three principal unresolved peaks: the relative areas are 62%, 35%, and 3%; and the retention time of the last iodixanol peak is NMT 14 min. The chromatogram from *Standard solution B* exhibits two partially unresolved peaks due to iodixanol related compound D, with relative retention times of 0.33 and 0.39, that elute before the iodixanol peaks: the peak area of iodixanol related compound D is between 0.075% and 0.125% of the total area. Disregard any peak due to the solvent.]

Relative standard deviation: NMT 5%

Determine the sum of the peak areas of the two isomers of iodixanol related compound D for each of the three chromatograms from *Standard solution B*.

The chromatogram from *Standard solution C* exhibits two unresolved peaks due to iodixanol related compound E, with relative retention times of 0.67 and 0.72, that elute before the iodixanol peaks. Adjust the sensitivity of the amplifier so that the peak heights are between 90% and 100% of full scale of the highest peak.

Resolution: NLT 5.0 between the first and largest iodixanol related compound E peak and the first principal iodixanol peak

Analysis

Samples: *Standard solution A*, three portions of *Standard solution B*, *Standard solution C*, and *Sample solution*

For the first chromatogram from *Standard solution B*, adjust the sensitivity of the amplifier to obtain a peak height of 15% of the first and larger peak that corresponds to iodixanol related compound D. Use this sensitivity setting for the subsequent injections.

Compare the retention times of the peaks from *Standard solution C* to those from the *Sample solution*. Iodixanol related compound E exhibits two peaks, the second of which may partly overlap with another peak; use only the area of the first and larger peak, which corresponds to 60% of the total area of iodixanol related compound E. Draw a baseline at the height of the baseline from the *Blank solution*. Calculate the percentage of iodixanol related compound E by dividing the area from the *Sample solution* by 0.6 and using area percent.

Iodixanol related compound H⁴ appears as a single peak, with a shoulder, on the tail of the iodixanol peak.

Calculate the percentage of iodixanol related compound H by using area percent.

Acceptance criteria: NMT 0.3% of iodixanol related compound E and NMT 0.6% of iodixanol related compound H ▲*USP39*

Add the following:**▲● Limit of Iodixanol Related Compound E and Iodixanol Impurity H****Solution A:** Acetonitrile and water (50:50)**Solution B:** Acetonitrile**Mobile phase:** See *Table 4*.**Table 4**

BRIEFING

Iohexol, *USP 38* page 3910 and *PF 39(3)* [May–June 2013]. On the basis of comments received, it is proposed to cancel the *PF 39(3)* proposal. It is proposed to publish the revision addressing the comments:

1. Replace *Identification test B* with a retention time match based on the test for *Organic Impurities*.
2. Delete *Identification test C* using thin-layer chromatography, because the test is similar to the proposed new *Identification test B* and therefore is redundant.
3. Delete *Identification test D* because it generates iodine vapors that can irritate the nose and eyes, and therefore is a potential safety hazard.
4. Revise the *Assay* to include a formula for the calculation of the content of iohexol.
5. Rename the *Ionic Compounds* test as the test for *Limit of Ionic Compounds*. Revise the test by deleting the formula and making the *Acceptance criteria* consistent with *European Pharmacopoeia 8.4*.

6. Delete the test for *Free Iodine* because the manufacturing history indicates that no free iodine has been observed.
7. Rename the test for *Free Iodide* as *Limit of Free Iodide*. Revise the test to include a formula for the calculation of iodide.
8. Revise the *System suitability* criteria in the test for *Organic Impurities* to be consistent with *European Pharmacopoeia 8.4*. Also, include a clarifying note to indicate the presence of endo- and exo-isomers of iohexol. The procedure is based on analyses performed with the Spheri-5 RP-18 (Brownlee) brand of L1 column manufactured by PerkinElmer Corporation. In this procedure the retention times for endo- and exo-isomers are about 18 and 19 min, respectively.
9. Replace the test for *Limit of Methanol, Isopropyl Alcohol, and 2-Methoxyethanol* with a modified gas chromatographic procedure for quantifying 2-methoxyethanol. The procedure is based on analyses performed with the DB-Wax brand of G16 column manufactured by JW Scientific (Agilent Technologies) in which the retention time of 2-methoxyethanol is about 8 min.
10. Rename the test for *Limit of 3-Chloro-1,2-propanediol* as *Limit of 3-Chloropropane-1,2-diol*. Revise the test to be consistent with *European Pharmacopoeia 8.4* except the temperature gradient. The change in the gradient is necessary to avoid carry over. The procedure is based on analyses performed with the JW Scientific (Agilent Technologies) DB 1701 brand of G46 column. The retention time of 3-chloro-1,2-propanediol is about 8 min.
11. Rename the test for *Free Aromatic Amine* as *Limit of Free Aromatic Amine*. Revise the test to be consistent with *European Pharmacopoeia 8.4*.
12. It is proposed to delete the test for *Optical Rotation* to be consistent with *European Pharmacopoeia 8.4*.
13. On the basis of stability data, revise the existing *Packaging and Storage* conditions to specify storage at room temperature.

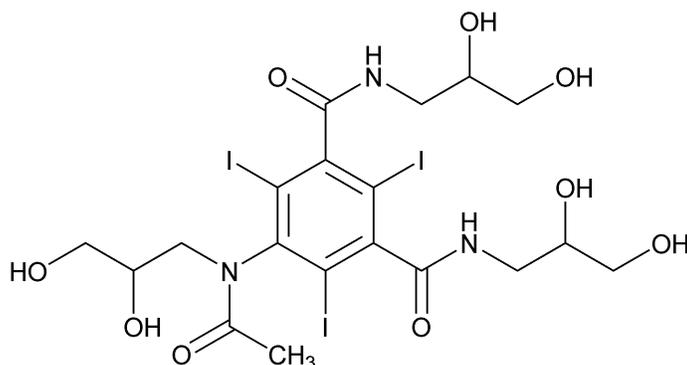

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

System suitability solution: 1.5 mg/mL of USP Iohexol RS and 0.0075 mg/mL of USP Iohexol Related Compound A RS and 0.0069 mg/mL of USP Iohexol Related Compound C RS  USP39

in water

Sample solution: 1.5 mg/mL of Iohexol

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Sample: *System suitability solution*

~~[Note—The retention time for the *O*-alkylated compounds is between 1.1 and 1.4 relative to the *exo*-isomer of iohexol. The peak area of iohexol related compound C is 0.5% ± 0.1% by comparison to the total area of all the peaks in the chromatogram.]~~

 [

Note—Iohexol may give two nonresolved peaks due to *exo*-*endo* isomerism. In addition, a small peak due to iohexol usually appears at the leading edge of the first principal peak. This small peak has a retention time about 1.2 min less than the first principal peak.

The relative retention times for the iohexol related compound A, iohexol *endo*-isomer, iohexol *exo*-isomer, and *O*-alkylated compounds peaks are 0.85, 0.96, 1.0, and 1.1–1.4,

respectively.

]▲*USP39*

Suitability requirements

Resolution: ~~NLT 20.0 between iohexol related compound A and iohexol related compound C~~

▲NLT 5.0 between iohexol related compound A and the exo-isomer (the second and greater peak) of iohexol▲*USP39*

Analysis

Sample: *Sample solution*

Calculate the percentage of *O*-alkylated compounds and any other individual impurity in the portion of Iohexol taken. Exclude peaks with a retention time between 0.84 (relative to the *endo*-isomer of iohexol [first main peak]) and the *endo*-isomer of iohexol

▲Disregard any peak less than or equal to 0.03% of the principal peaks.▲*USP39*

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each impurity

r_T = sum of all of the peak responses

Acceptance criteria

***O*-alkylated compounds:** NMT 0.6%

Any individual impurity: NMT 0.1%

Total impurities excluding *O*-alkylated compounds: NMT 0.3%

Delete the following:

▲● ~~Limit of methanol, isopropyl alcohol, and methoxyethanol~~

~~**Internal standard solution:** 0.05 mg/mL of butyl alcohol~~

~~**Standard stock solution:** Transfer 0.6 g of methanol to a 1000 mL volumetric flask, and add 100 mL of water. Add 0.6 g of isopropyl alcohol, and 100 mL of water. Add 0.6 g of methoxyethanol, and 100 mL of water. Dilute with water to volume.~~

~~**Standard solution A:** Transfer 10.0 mL of *Standard stock solution* to a 100 mL volumetric flask, and dilute with water to volume.~~

~~**Standard solution B:** Transfer 5.0 mL of *Standard stock solution* to a 100 mL volumetric flask, and dilute with water to volume.~~

~~**Standard solution C:** Transfer 10.0 mL of *Standard stock solution* to a 100 mL volumetric flask, and dilute with water to volume.~~

~~**Standard solution D:** Transfer 10.0 mL of *Standard solution C* and 10.0 mL of *Internal standard solution* to a 50 mL volumetric flask, dilute with water to volume, and mix. Transfer 6.0 mL of the solution so obtained to a vial fitted with a septum and crimp cap, and seal. Heat the sealed vial at 95 ° for 15 min.~~

~~**Sample stock solution:** Transfer about 6.25 g of Iohexol to a 25 mL volumetric flask. Add 5.0 mL of *Internal standard solution*, and dilute with water to volume.~~

~~**Sample solution A:** Transfer 5.0 mL of *Sample stock solution* and 1.0 mL of water to a vial fitted with a septum and crimp cap, and seal. Heat the sealed vial at 95 ° for 15 min.~~

~~**Sample solution B:** Transfer 5.0 mL of *Sample stock solution* and 1.0 mL of *Standard*~~

solution A to a vial fitted with a septum and crimp cap, and seal. Heat the sealed vial at 95 ° for 15 min.

Sample solution C: Transfer 5.0 mL of *Sample stock solution* and 1.0 mL of *Standard solution B* to a vial fitted with a septum and crimp cap, and seal. Heat the sealed vial at 95 ° for 15 min.

Sample solution D: Transfer 5.0 mL of *Sample stock solution* and 1.0 mL of *Standard solution C* to a vial fitted with a septum and crimp cap, and seal. Heat the sealed vial at 95 ° for 15 min.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm × 30-m fused-silica column coated with a 3-µm phase G43

Carrier gas: Helium

Temperature

Injector: 140 °

Detector: 250 °

BRIEFING

Ketorolac Tromethamine Tablets, USP 38 page 4012. As part of the USP monograph modernization initiative, it is proposed to make the following changes:

1. Add *Identification* test *B* based on the UV spectra as obtained in the *Assay*. Revise the *Detector* in the *Assay* accordingly.
2. Revise *System suitability stock solution* and *System suitability solution* in the *Assay* for clarity.
3. Delete the *Column efficiency* requirement in the *Assay* because there are already three requirements that will ensure the suitability of the *Chromatographic system*.
4. Delete the *Procedure for content uniformity* in the test for *Uniformity of Dosage Units* to allow flexibility.
5. Revise the system suitability requirements in the test for *Organic Impurities* to

ensure the appropriate suitability of the *Chromatographic system*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM2: H. Cai.)

Comment deadline: March 31, 2015

Ketorolac Tromethamine Tablets

DEFINITION

Ketorolac Tromethamine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of ketorolac tromethamine ($C_{15}H_{13}NO_3 \cdot C_4H_{11}NO_3$).

IDENTIFICATION

Change to read:

-

▲A. ▲*USP39*

The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

Add the following:

- ▲● **B.** The UV absorption spectra of the ketorolac peak of the *Sample solution* and that of the *Standard solution* exhibit maxima and minima at the same wavelengths, as obtained in the *Assay*. ▲*USP39*

ASSAY

Memantine Hydrochloride

• HCl

$C_{12}H_{21}N \cdot HCl$ 215.76

Tricyclo[3.3.1.1^{3,7}]decan-1-amine, 3,5-dimethyl-, hydrochloride;
1-Amino-3,5-dimethyladamantane hydrochloride [41100-52-1].

DEFINITION

Memantine Hydrochloride contains NLT 98.0% and NMT 102.0% of memantine hydrochloride ($C_{12}H_{21}N \cdot HCl$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. Infrared Absorption** 〈 197K 〉
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. Identification Tests—General, Chloride** 〈 191 〉: Meets the requirements

ASSAY• **Procedure**

Internal standard solution: 4.0 mg/mL of adamantane in *n*-hexane

Standard solution: 4.0 mg/mL of USP Memantine Hydrochloride RS in *Internal standard solution* prepared as follows. Transfer 100 mg of USP Memantine Hydrochloride RS to a 50-mL centrifuge tube. Add 15 mL of 1 N sodium hydroxide, and mix. Add 25 mL of *Internal standard solution*, and shake for 15 min. Allow the layers to separate, and filter a portion of the top hexane layer through anhydrous sodium sulfate. Use the clear filtrate.

Sample solution: 4.0 mg/mL of Memantine Hydrochloride in *Internal standard solution* prepared as follows. Transfer 100 mg of Memantine Hydrochloride to a 50-mL centrifuge tube. Add 15 mL of 1 N sodium hydroxide, and mix. Add 25 mL of *Internal standard solution*, and shake for 15 min. Allow the layers to separate, and filter a portion of the top hexane layer through anhydrous sodium sulfate. Use the clear filtrate.

Chromatographic system

BRIEFING

Methionine, *USP 38* page 4312. As part of the USP modernization efforts, it is proposed to replace the TLC procedure with an HPLC procedure in the test for *Related Compounds* to better characterize the organic impurities. The liquid chromatographic procedure is based on analyses performed with the Hichrom Kromasil C18 brand of L1 column. The typical retention times for methionine and *N*-acetyl-d,l-methionine are 2.0 and 6.8 min, respectively.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

BRIEFING

Methocarbamol Injection, USP 38 page 4314. Based on the comments received, it is proposed to revise the monograph as follows:

1. Clarify the preparation of *Solution C* in the test for *Limit of Aldehydes* to be consistent with the use of formaldehyde solution.
2. Revise the *Sample solution* in the test for *Limit of Aldehydes* to reflect the use of composite sample to be consistent with the sponsor's approved procedure.
3. Revise the acceptance criterion for the *Limit of Aldehydes* from NMT 0.01% as formaldehyde to NMT 10 µg/mL of the Injection as formaldehyde.
4. Delete the reference to the general chapter in the test for *Limit of Aldehydes* because it is not necessary.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

Methocarbamol Injection

DEFINITION

Methocarbamol Injection is a sterile solution of Methocarbamol in an aqueous solution of Polyethylene Glycol 300. It contains NLT 95.0% and NMT 105.0% of the labeled amount of methocarbamol (C₁₁H₁₅NO₅).

IDENTIFICATION

- **A. Infrared Absorption** (197K)
Sample: Mix a volume with 40 mL of water equivalent to 500 mg of methocarbamol from Injection in a small separator. Extract with 10 mL of ethyl acetate, and dry the ethyl acetate layer over anhydrous sodium sulfate. Evaporate the ethyl acetate with the use of a water bath maintained at 40° under a stream of nitrogen to dryness.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **Procedure**
Buffer: 6.8 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid or potassium hydroxide to a pH of 4.5.
Mobile phase: Methanol and *Buffer* (30:70)
Standard solution: 1 mg/mL of USP Methocarbamol RS in *Mobile phase*

Sample solution: Nominally 1 mg/mL of methocarbamol from a suitable volume of Injection containing NLT 100 mg of methocarbamol in *Mobile phase*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 274 nm

Column: 4.6-mm × 10.0-cm; 3-µm or 5-µm packing L1

BRIEFING

Metoprolol Fumarate, *USP 38* page 4369. As part of the USP monograph modernization effort, it is proposed to revise the monograph as follows:

1. Replace the current titration-based *Assay* with an HPLC procedure. The procedure was validated using the Agilent Zorbax Stablebond C8 brand of L7 column in which metoprolol elutes at about 8 min.
2. Replace the current TLC procedure for *Organic Impurities* with a stability-indicating

HPLC procedure. The procedure uses similar chromatographic parameters as those proposed in the *Assay* except the use of gradient in the *Mobile phase*.

3. Revise the acceptance criteria in the *Definition* and *Assay* from NLT 99.0% and NMT 100.5% to NLT 98.0% and NMT 102.0%, which is typical for chromatographic procedures.
4. Revise *Identification* test A using TLC with the retention time agreement in the proposed *Assay*.
5. Delete *Melting Range or Temperature* as it is a non-value added test.
6. Add an additional requirement to the *Packaging and Storage* section.
7. Add four new USP impurity Reference Standards to the *USP Reference Standards* section to support the test for *Organic Impurities*.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

BRIEFING

Naphazoline Hydrochloride, *USP 38* page 4492. As part of USP monograph modernization efforts, it is proposed to make the following changes:

1. The *Ordinary Impurities* (466) procedure in the test for *Organic Impurities* is revised based on the *Related substances* procedure in the current *Naphazoline Hydrochloride* monograph in the *European Pharmacopoeia*. The evaluation of the 4- μ m Agilent Superspher 60 RP Select B brand of L7 column, listed as a suitable HPLC column in the *European Pharmacopoeia*, and the 4- μ m Merck Superspher 60-RP-8 brand of L7 column showed the reversed elution order of naphazoline and 1-naphthylacetic acid. The use of the 5- μ m Agilent Zorbax SB-C8 and 3- μ m Ace ACE C8 brands of L7 columns resulted in the elution order to be consistent with *Table 1*,

- with the typical retention time for the naphazoline peak at about 17–20 min.
- The UV procedure in *Identification* test B is replaced with the retention time agreement in the *Assay*.
 - The criteria of the *Capacity factor* and *Column efficiency* in the *System suitability* section of the *Assay* are deleted, because the remaining requirements are adequate to evaluate the system suitability.
 - The *Relative standard deviation* in the *System suitability* section in the *Assay* is revised to be consistent with the repeatability requirements in *Chromatography* (621).
 - USP Naphazoline Related Compound A RS is added to the *USP Reference Standards* section.

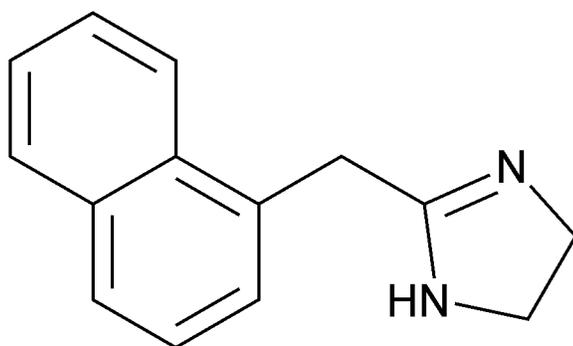

Additionally, minor editorial changes have been made to update the monograph to current USP style.

(SM3: F. Mao.)

BRIEFING

Nitrofurazone, *USP 38* page 4570. As part of USP monograph modernization efforts, the following revisions are proposed:

1. Delete the drying condition in the *Definition* as it is listed in the test for *Loss on Drying* and add the statement “calculated on the dried basis” to be consistent with current FDA approvals.
2. Delete the nonspecific *Identification* test *C* as the other two tests are sufficient.
3. Replace the nonspecific TLC tests for *Ordinary Impurities* and *Limit of 5-Nitro-2-furfuraldazine* with a test for *Organic Impurities* based on the *Related substances* procedure in the *European Pharmacopoeia 8.0* monograph for *Nitrofurazone* with some modifications. The liquid chromatography procedure is performed with the Lichrosphere RP18 brand of L1 column. The typical retention time for the nitrofurazone peak is about 4 min.
4. The *USP Reference Standards* section is revised to include additional Reference Standards used in the test for *Organic Impurities*.

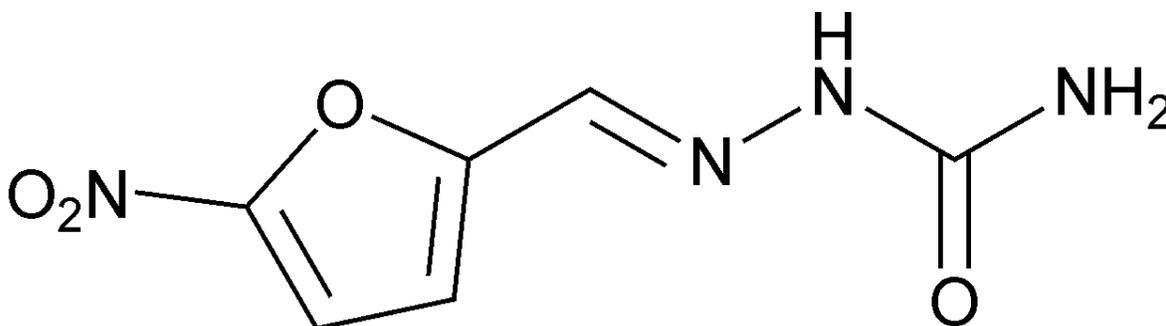

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Orphenadrine Citrate, USP 38 page 4656. Based on the comments received, it is proposed to revise the monograph as follows:

1. Replace *Identification* test B with a retention time agreement based on the *Assay*.
2. Include a third *Identification* test for citrate counter ion to strengthen the monograph.
3. Delete the need to adjust the pH of the *Buffer* in the *Assay* as the robustness study does not support the need for stringent pH control.
4. Introduce a *System suitability solution* to the *Assay* to strengthen the monograph. This introduces the use of three Reference Standards that are already being used in other dosage forms containing orphenadrine citrate.
5. Revise the *Suitability requirements* in the *Assay* to include a *Resolution* requirement. Delete the *Column efficiency* requirement as the proposed resolution is a better indicator of the column performance. Move the *Signal-to-noise ratio* requirement to the test for *Organic Impurities, Procedure 1*, where it is relevant.
6. Rename the test for *Organic Impurities* as *Organic Impurities, Procedure 1*. Revise

the *Suitability requirements* to include *Resolution*. Revise the calculation to include the inverse of the correction factor for consistency with current *USP* style. Include limits for the specified impurities based on International Conference on Harmonization (ICH) guidelines. The currently official monograph only has the requirement for total impurities. Also include relative retention time information for citrate to facilitate the identification of counter ion.

7. Introduce *Organic Impurities, Procedure 2*, to allow the monitoring of the impurities specified in *European Pharmacopoeia 8.2*. The gas chromatographic procedure uses the HP-5 brand of G27 column manufactured by Agilent Technologies. The SPB 5 brand of G27 column manufactured by Supelco is a suitable alternative column. Typical retention time for orphenadrine is about 20.6 min, under the chromatographic conditions. Because the impurities are not the same as in *Organic Impurities, Procedure 1*, a flexible monograph approach has been proposed. This introduces the use of *USP Diphenhydramine Citrate RS* for peak identification purposes.
8. Replace the NMR procedure for *Isomer Content*, which uses carbon tetrachloride, with a gas chromatographic procedure based on *European Pharmacopoeia 8.2*. The proposed limit of NMT 0.3% each for *meta*- and *para*- isomers is more stringent than the currently official limit of NMT 3% for the sum of both *meta*- and *para*- isomers. The gas chromatographic procedure uses the HP-5 brand of G27 column manufactured by Agilent Technologies. The SPB 5 brand of G27 column manufactured by Supelco is a suitable alternative column. Typical retention time for orphenadrine is about 13 min, under the chromatographic conditions. This test requires the use of two new Reference Standards.
9. Delete the tests for *Melting Range or Temperature* and *Clarity and Color of Solution* as the monograph includes other tests that are sufficient to ensure the quality of the drug substance.
10. Include a *Labeling* section to indicate compliance with the appropriate *Organic Impurities* procedure.
11. Revise the *USP Reference Standards* section to include the newly required Reference Standards.

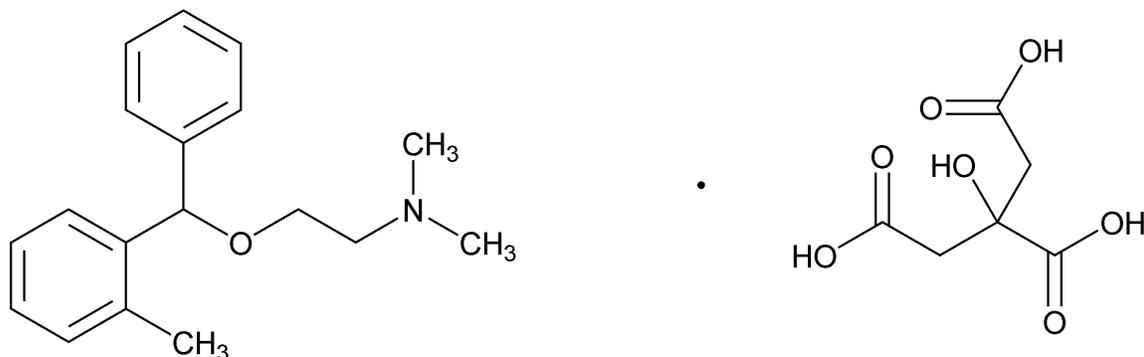

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Orphenadrine Citrate

$C_{18}H_{23}NO \cdot C_6H_8O_7$ 461.50

Ethanamine, *N,N*-dimethyl-2-[(2-methylphenyl)phenylmethoxy]-, (\pm)-, 2-hydroxy-1,2,3-propanetricarboxylate (1:1);
 (\pm)-*N,N*-Dimethyl-2-[(*o*-methyl- α -phenylbenzyl)oxy]ethylamine citrate (1:1) [4682-36-4].

DEFINITION

Orphenadrine Citrate contains NLT 98.0% and NMT 101.5% of orphenadrine citrate ($C_{18}H_{23}NO \cdot C_6H_8O_7$), calculated on the dried basis.

Change to read:

• Isomer Content

Solvent: ~~Carbon tetrachloride~~

NMR reference: ~~Tetramethylsilane~~

Sample solution: ~~Place 1 g of Orphenadrine Citrate and 10 mL of water in a separatory funnel, slowly add about 20 drops of sodium hydroxide solution (1 in 2), with swirling, to obtain a solution having a pH of about 10, and extract with three 15-mL portions of ether. Combine the ether extracts in a beaker, discarding the aqueous phase, and evaporate to about one-half the volume by warming on a steam bath under a stream of nitrogen. Transfer to another separatory funnel, wash with three 20-mL portions of water, and dry the ether solution with about 15 g of anhydrous sodium sulfate in a conical flask for 1 h, with intermittent swirling. Decant the dried ether solution through a pledget of glass wool into a small beaker. Rinse the sodium sulfate with two 10-mL portions of ether, and add the rinsings to the beaker. Evaporate most of the ether by warming under a stream of nitrogen, and remove the last traces of ether by drying at a pressure of NMT 2 mm of mercury at 60°. Transfer 400 mg of the orphenadrine so obtained to a small weighing bottle, add 0.5 mL of carbon tetrachloride and 1 drop of tetramethylsilane, and swirl to dissolve.~~

Analysis: ~~Proceed as directed under Nuclear Magnetic Resonance (761), Relative Method of Quantitation, using the calculation formula given therein, in which A_1 is the sum of the average areas of the combined methine peaks associated with the *meta*- and *para*-methylbenzyl isomers, appearing at about 5.23 ppm, and A_2 is the area of the methine peak associated with the *ortho*-methylbenzyl isomer, appearing at about 5.47 ppm, with reference to the tetramethylsilane singlet at 0 ppm, and both n_1 and n_2 are equal to 1.~~

Acceptance criteria: ~~The limit of combined *meta*- and *para*-methylbenzyl isomers is 3.0%.~~

▲If methyl orphenadrine is a known manufacturing impurity, the test for *Isomer Content* is to be performed.

System suitability solution: 0.3 mg/mL each of USP Orphenadrine Citrate RS, USP Orphenadrine Related Compound E RS, and USP Orphenadrine Related Compound F RS in toluene prepared as follows. Dissolve 6 mg each of the USP Reference Standards in 10 mL of water. Add 0.2 mL of ammonium hydroxide and shake with 3 mL of toluene.

Separate the organic layer. Repeat the extraction of the aqueous layer two more times with 3 mL of toluene. To the combined organic layer add anhydrous sodium sulfate, shake, and filter. Evaporate the filtrate at NMT 50° using a rotary evaporator. Dissolve the residue in 20 mL of toluene.

BRIEFING

Orphenadrine Citrate Injection, USP 38 page 4657. Based on the comments received, it is proposed to revise the monograph as follows:

1. Introduce a *System suitability solution* to the *Assay* to strengthen the monograph. This introduces three Reference Standards that are already being used in other dosage forms containing orphenadrine citrate.
2. Revise the *Suitability requirements* in the *Assay* to include a *Resolution* requirement. Delete the *Column efficiency* requirement because the proposed resolution is a better indicator of the column performance. Move the *Signal-to-noise ratio* requirement to the test for *Organic Impurities*, where it is relevant.
3. Revise the concentration of the *Sensitivity solution* from 0.45 µg/mL to 1 µg/mL, which is 50% of the limit of any individual unspecified degradation product.
4. Revise the concentration of the *Standard solution* from 0.9 mg/mL to 0.002 mg/mL,

which is the limit of any individual unspecified degradation product.

5. Include a second *Resolution* requirement to strengthen the public standard. In addition, widen the *Relative standard deviation* from NMT 2.0% to NMT 5.0% to account for the lower concentration of the *Standard solution*.
6. Revise the calculation in the test for *Organic Impurities* to include the inverse of the correction factor for consistency with current *USP* style.
7. Revise the table of impurities in the test for *Organic Impurities* to include limits for the specified impurities based on International Conference on Harmonization (ICH) guidelines. The currently official monograph only has the requirement for total impurities. Also include relative retention time information for citrate to facilitate the identification of counter ion. Revise the names of the specified degradation products with more appropriate and meaningful names and add appropriate footnotes.
8. Include storage conditions to be consistent with FDA approved label.
9. Update the *USP Reference Standards* section to include the additional Reference Standards.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

▲USP39**BRIEFING**

Orphenadrine Citrate Extended-Release Tablets, *USP 38* page 4658. Based on the comments received, it is proposed to revise the monograph as follows:

1. Include a *Resolution* requirement in the *Assay* to strengthen the monograph. This will not cause any burden to the user as the monograph requires the same resolution requirement as the test for *Organic Impurities*.
2. Delete the need to adjust the pH of the *Buffer* in the *Assay* as the robustness study does not support the need for stringent pH control.
3. Revise the calculation formulae in *Dissolution, Test 1*, to be consistent with current *USP* style.
4. Include calculation formulae in *Dissolution, Test 2*, to be consistent with current *USP* style.
5. Revise the table of impurities by adding appropriate footnotes to provide guidance to the analyst. Also, include relative retention time information for citrate to facilitate the identification of counter ion.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Orphenadrine Citrate Extended-Release Tablets**DEFINITION**

Orphenadrine Citrate Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of orphenadrine citrate (C₁₈H₂₃NO·C₆H₈O₇).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

Change to read:

- **Procedure**

Buffer: 5.75

▲5.8▲*USP39*

g/L of monobasic ammonium phosphate. Adjust with phosphoric acid to a pH of 3.2. ~~±0.1.~~

▲▲*USP39*

Mobile phase: Acetonitrile and *Buffer* (40:60)

▲**System suitability solution:** 0.1 mg/mL of USP Orphenadrine Citrate RS and 0.01 mg/mL each of USP Orphenadrine Related Compound B RS and USP Orphenadrine Related Compound C RS, in *Mobile phase*▲*USP39*

Standard solution: 0.1 mg/mL of USP Orphenadrine Citrate RS

Sample stock solution: Nominally 0.5 mg/mL of orphenadrine citrate prepared as follows.

Transfer a quantity of powder equivalent to NLT 100 mg of orphenadrine citrate, from finely powdered Tablets (NLT 20), to a suitable volumetric flask. Add 50% of the flask volume of *Mobile phase*. Sonicate for 5 min and shake for 15 min. Dilute with *Mobile phase* to volume. Pass through a suitable filter.

Sample solution: 0.1 mg/mL of orphenadrine citrate in *Mobile phase* from *Sample stock solution*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 3.9-mm × 30-cm;

▲10-μm▲*USP39*

L1 packing

Flow rate: 2 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

▲**Resolution:** NLT 1.2 between orphenadrine and orphenadrine related compound C; NLT 2.0 between orphenadrine citrate and orphenadrine related compound B▲*USP39*

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of orphenadrine citrate ($C_{18}H_{23}NO \cdot C_6H_8O_7$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Orphenadrine Citrate RS in the *Standard solution* (mg/mL)

C_T nominal concentration of orphenadrine citrate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Change to read:

• **Dissolution** 〈 711 〉

Test 1

Medium: Water; 900 mL, deaerated

Apparatus 2: 50 rpm

Times: 1, 2, 6, and 12 h

Buffer: 5.75

▲5.8▲USP39

g/L of monobasic ammonium phosphate in water

Mobile phase: Acetonitrile and *Buffer* (40:60). Adjust with phosphoric acid to a pH of 3.2 ± 0.1.

Standard stock solution: 1 mg/mL of USP Orphenadrine Citrate RS in *Mobile phase*.

▲Sonication may be used to promote dissolution.▲USP39

Standard solution 0.1 mg/mL of USP Orphenadrine Citrate RS in *Medium* from a suitable volume of *Standard stock solution* and *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter with 0.45-µm pore size and discard the first few mL of the filtrate.

Chromatographic system

Flow rate: 2 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis:

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of labeled amount of orphenadrine citrate ($C_{18}H_{23}NO \cdot C_6H_8O_7$) dissolved by using the following formulas:

The percentage dissolved after 1 h is determined by the formula:

$$A = (r_U \times C_S \times 900 \times 100) / (r_S \times L)$$

The percentage dissolved after 2 h is determined by:

$$\text{Result} = B + A \times (V_1/900)$$

where

$$B = (r_U \times C_S \times (V - V_1/900) \times 100) / (r_S \times L)$$

The percentage dissolved after 6 h is determined by:

$$\text{Result} = C + [A \times (V_1/900)] + [B \times [V_2/(900 - V_1)]]$$

where

$$C = [r_U \times C_S \times [900 - (V_1 + V_2)] \times 100] / (r_S \times L)$$

The percentage dissolved after 12 h is determined by:

$$\text{Result} = D + [A \times (V_1/900)] + [B \times [V_2/(900 - V_1)]] + [C \times [V_3/(900 - (V_1 + V_2))]]$$

where

$$D = [r_U \times C_S [900 - (V_1 + V_2 + V_3)] \times 100] / (r_S \times L)$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

L = Tablet label claim (mg)

V = volume (mL)

V_1 = volume of sample withdrawn at the first hour (mL)

V_2 = volume of the sample withdrawn at the second hour (mL)

V_3 = volume of the sample withdrawn at the sixth hour (mL)

▲ Calculate the concentration (C_i) of orphenadrine citrate ($C_{18}H_{23}NO \cdot C_6H_8O_7$) dissolved in the portion of the sample withdrawn at each time point (i) (mg/mL):

$$C_i = (r_U/r_S) \times C_S$$

r_U

= peak response from the *Sample solution*

r_S

= peak response from the *Standard solution*

C_S

= concentration of the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of orphenadrine citrate ($C_{18}H_{23}NO \cdot C_6H_8O_7$) dissolved at each time point (i):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_S)] + (C_1 \times V_S)\} \times (1/L) \times 100$$

$$\text{Result}_3 = \{C_3 \times [V - (2 \times V_S)] + [(C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{C_4 \times [V - (3 \times V_S)] + [(C_3 + C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

C_i

= concentration of orphenadrine citrate in the portion of sample withdrawn at time point (i) (mg/mL)

V

= volume of *Medium*, 900 mL

L

= label claim (mg/Tablet)

V_S

= volume of the *Sample solution* withdrawn at each time point (mL)

▲USP39

Tolerances: See Table 1.

Table 1

Time point (i)	Time (h)	Amount Dissolved
1	1	10%–40%
2	2	30%–50%
3	6	50%–80%
4	12	NLT 80%

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Times: 1, 4, and 12 h

Standard solution: 0.02 mg/mL of USP Orphenadrine Citrate RS in *Medium*

Sample solution: Withdraw 10 mL of the solution under test from each vessel at each specified time point. Replace 10 mL of *Medium* in each vessel. Pass a portion of the solution under test through a suitable filter having a porosity of 0.45 μm . Transfer 1.0 mL of the filtrate to a 50-mL volumetric flask, and dilute with *Medium* to volume.

Blank: *Medium*

Instrumental conditions

Mode: UV 210 nm

Path length: 1 cm

▲**Analysis**

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of orphenadrine citrate ($\text{C}_{18}\text{H}_{23}\text{NO}\cdot\text{C}_6\text{H}_8\text{O}_7$) in the sample

withdrawn from the vessel at each time point (i):

$$\text{Result} = (A_U/A_S) \times C_S \times D_S \times (1/L) \times V \times 100$$

A_U

= absorbance of the *Sample solution*

A_S

= absorbance of the *Standard solution*

C_S

= concentration of the *Standard solution* (mg/mL)

D_S

= dilution factor of the *Sample solution*, 50

L

= label claim (mg/Tablet)

V

= volume of *Medium*, 900 mL

Calculate the percentage of the labeled amounts (Q_i) of orphenadrine citrate ($C_{18}H_{23}NO \cdot C_6H_8O_7$) dissolved at each time point (i):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times V) + (C_1 \times V_S)] \times (1/L) \times 100$$

$$\text{Result}_3 = \{(C_3 \times V) + [(C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

C_i

= concentration of orphenadrine citrate in the portion of sample withdrawn at time point (i) (mg/mL)

V

= volume of *Medium*, 900 mL

L

= label claim (mg/Tablet)

V_S

= volume of the *Sample solution* withdrawn at each time point (mL)

▲USP39

Tolerances: See Table 2.

Table 2

BRIEFING

Palonosetron Hydrochloride. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods of analyses, is proposed. The liquid chromatographic procedure in the *Assay* and in the test for *Limit of Unspecified Impurities* is based on analyses performed with the Zorbax SB-C8 brand of L7 column. The typical retention time for palonosetron is about 11 min. The liquid chromatographic procedure in the test for *Limit of Specified Impurities* is based on analyses performed with the Astec Chirobiotic-V brand of L88 column. The typical retention time for palonosetron is about 23–27 min.

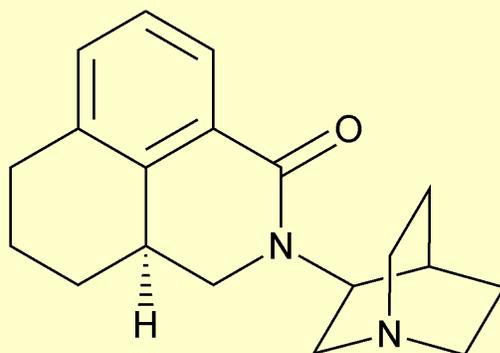

(SM3: A. Wise, E. Gonikberg.)

Correspondence Number—C125958

Comment deadline: March 31, 2015

Add the following:

▲Palonosetron Hydrochloride

C₁₉H₂₄N₂O·HCl 332.87

1*H*-Benzo[*de*]isoquinoline-1-one, 2,3,3*a*,4,5,6-hexahydro-2-[(3*S*)-1-azabicyclo[2.2.2]octan-3-yl],(3*S*)-, hydrochloride;
(3*aS*)-2-[(3*S*)-Quinuclidin-3-yl]-2,3,3*a*,4,5,6-hexahydro-1*H*-benzo[*de*]isoquinolin-1-one hydrochloride [135729-62-3].

DEFINITION

Palonosetron Hydrochloride contains NLT 98.0% and NMT 102.0% of palonosetron hydrochloride (C₁₉H₂₄N₂O·HCl), calculated on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption** { 197K }

Analysis

Samples: *Peak identification solution* and *Sample solution*

Chromatograph the *Peak identification solution* and identify specified impurities based on the relative retention times listed in *Table 2*.

Calculate the percentage of each unspecified impurity in the portion of Palonosetron Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_{\bar{U}}$ peak response of each unspecified impurity from the *Sample solution*

$r_{\bar{T}}$ sum of all peak responses from the *Sample solution*

Acceptance criteria: See *Table 2*. The reporting threshold is 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Palonosetron related compound E ^a	0.91	—
Palonosetron related compound D ^a	0.94	—
Palonosetron	1.0	—
Palonosetron related compound B ^a	1.1	—
Palonosetron related compound A ^a	1.2	—
Any individual unspecified impurity	—	0.1
Total impurities ^b	—	1.0

^a These impurities are controlled in the test for *Limit of Specified Impurities* and are not to be reported here.

^b Total impurities includes impurities controlled in the test for *Limit of Specified Impurities* and in the test for *Limit of Unspecified Impurities*.

SPECIFIC TESTS

- **pH** 〈 791 〉
Sample solution: 10 mg/mL in water
Acceptance criteria: 5.0–6.0
- **Loss on Drying** 〈 731 〉
Analysis: Dry under vacuum at 80° for 3 h.
Acceptance criteria: NMT 1.0%
- **Microbial Enumeration Tests** 〈 61 〉 and **Tests for Specified Microorganisms** 〈 62 〉: The total aerobic microbial count does not exceed 10² cfu/g, and the total combined molds and yeasts count does not exceed 10 cfu/g.
- **Bacterial Endotoxins Test** 〈 85 〉: Where the label states that Palonosetron Hydrochloride is sterile or must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 30 USP Endotoxin Units/mg of palonosetron hydrochloride.
- **Sterility Tests** 〈 71 〉: Meets the requirements where the label states that Palonosetron Hydrochloride is sterile

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers. Store at controlled room temperature, protected from light.
- **Labeling:** Where it is intended for use in preparing injectable dosage forms, the label states

that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

▲**USP39**

BRIEFING

Palonosetron Injection. Because there is no existing *USP* monograph for this dosage form, a new monograph, based on validated methods of analyses, is proposed. The liquid chromatographic procedure in the *Assay* and in the test for *Limit of Unspecified Impurities* is based on analyses performed with the Zorbax SB-C8 brand of L7 column. The typical retention time for palonosetron is about 11 min. The liquid chromatographic procedure in the test for *Limit of Specified Impurities* is based on analyses performed with the Astec Chirobiotic-V brand of L88 column. The typical retention time for palonosetron is about 23–27 min.

(SM3: A. Wise, E. Gonikberg.)

Comment deadline: March 31, 2015

Add the following:

▲Palonosetron Injection

DEFINITION

Palonosetron Injection contains an amount of palonosetron hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of palonosetron ($C_{19}H_{24}N_2O$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV absorption spectra of the major peak of the *Sample solution* and that of the *Standard solution* exhibit maxima and minima at the same wavelengths, as obtained in the *Assay*.

ASSAY

• **Procedure**

Mobile phase: Acetonitrile, water, and trifluoroacetic acid (280: 720: 0.67)

Standard stock solution: 0.07 mg/mL of USP Palonosetron Hydrochloride RS in methanol. Sonicate as needed to dissolve. This solution is stable for 6 weeks if stored in the refrigerator and protected from light.

Standard solution: 0.014 mg/mL of USP Palonosetron Hydrochloride RS from the *Standard stock solution* in *Mobile phase*

Sample solution: Nominally 0.012 mg/mL of palonosetron from Injection in *Mobile phase*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 210 nm. When this procedure is used for *Identification* test *B*, use a diode array detector set at 200–400 nm.

Column: 4.6-mm × 25-cm; 5- μ m packing L7

Flow rate: 1 mL/min

Injection volume: 80 μ L

System suitability

Sample: *Standard solution*

[Note—See *Table 2* for the relative retention times.]

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of palonosetron ($C_{19}H_{24}N_2O$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Palonosetron Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of palonosetron in the *Sample solution* (mg/mL)

$M_{r\bar{r}}$ = molecular weight of palonosetron, 296.41

$M_{r\bar{z}}$ = molecular weight of palonosetron hydrochloride, 332.87

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **Uniformity of Dosage Units** { 905 } : Meets the requirements

IMPURITIES

- **Limit of Specified Impurities**

Buffer: 1.5 g/L of ammonium acetate in water, adjusted with acetic acid to a pH of 6.0

Mobile phase: Tetrahydrofuran and *Buffer* (1:9)

System suitability stock solution: 0.07 mg/mL each of USP Palonosetron Related Compound A RS, USP Palonosetron Related Compound B RS, USP Palonosetron Related Compound C RS, USP Palonosetron Related Compound D RS, USP Palonosetron Related Compound E RS, and USP Palonosetron Enantiomer RS in methanol. Sonicate as needed to dissolve.

System suitability solution: 3.5 µg/mL each of USP Palonosetron Related Compound A RS, USP Palonosetron Related Compound B RS, USP Palonosetron Related Compound C RS, USP Palonosetron Related Compound D RS, USP Palonosetron Related Compound E RS, and USP Palonosetron Enantiomer RS from the *System suitability stock solution* and 50 µg/mL of USP Palonosetron Hydrochloride RS in *Buffer*

Impurity standard stock solution: 0.06 mg/mL of USP Palonosetron Related Compound D RS in methanol. Sonicate as needed to dissolve.

Impurity standard solution: 0.003 mg/mL of USP Palonosetron Related Compound D RS from the *Impurity standard stock solution* in *Buffer*

Sensitivity solution: 0.3 µg/mL of USP Palonosetron Related Compound D RS from the *Impurity standard stock solution* in *Buffer*

Sample solution: Use the Injection. (This solution has a concentration of 0.05 mg/mL of palonosetron.)

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: 238 nm

Column: 4.6-mm × 25-cm; 5-µm packing L88. [Note—A suitable column is Astec Chirobiotic-V from www.sigma-aldrich.com.]

Column temperature: 35°

Flow rate: 1.5 mL/min

Injection volume: 200 µL

Run time: At least 2.5 times the retention time of palonosetron

System suitability

Samples: *System suitability solution*, *Impurity standard solution*, and *Sensitivity solution*

Suitability requirements

Resolution: NLT 1.4 between palonosetron related compound D and palonosetron enantiomer; NLT 1.2 between palonosetron enantiomer and palonosetron related compound E, *System suitability solution*

Tailing factor: NMT 2.5 for palonosetron related compound E, *System suitability solution*

Relative standard deviation: NMT 5.0% for palonosetron related compound D, *Impurity standard solution*

Signal-to-noise ratio: NLT 10 for palonosetron related compound D, *Sensitivity solution*

Analysis

Samples: *Impurity standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of palonosetron related compound D from the *Impurity standard solution*

C_S = concentration of USP Palonosetron Related Compound D RS in the *Impurity standard solution* (mg/mL)

C_U = nominal concentration of palonosetron in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Palonosetron related compound A ^a	0.45	—	—
Palonosetron related compound B ^a	0.54	—	—
Palonosetron	1.0	—	—
Palonosetron related compound C ^b	1.2	—	—
Palonosetron related compound D	1.3	1.0	0.5
Palonosetron enantiomer ^b	1.4	1.0	—
Palonosetron related compound E	1.5	2.5	0.5
^a These degradation products are controlled using the limit for unspecified impurities (see <i>Table 2</i>).			

^b These are included in the table for identification only. These impurities are controlled in the drug substance. They are not to be reported for the drug product and should not be included in the total impurities.

- Limit of Unspecified Impurities**

Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

Peak identification stock solution: 0.07 mg/mL each of USP Palonosetron Related

Compound A RS, USP Palonosetron Related Compound B RS, USP Palonosetron Related Compound D RS, and USP Palonosetron Related Compound E RS in methanol. Sonicate as needed to dissolve.

Peak identification solution: 0.07 µg/mL each of USP Palonosetron Related Compound A RS, USP Palonosetron Related Compound B RS, USP Palonosetron Related Compound D RS, and USP Palonosetron Related Compound E RS, from the *Peak identification stock solution* in *Mobile phase*

Sensitivity solution: 0.04 µg/mL of USP Palonosetron Hydrochloride RS from the *Standard solution* in *Mobile phase*

System suitability

Sample: *Sensitivity solution*

Suitability requirements

Signal-to-noise ratio: NLT 10 for palonosetron

Analysis

Samples: *Peak identification solution* and *Sample solution*

Chromatograph the *Peak identification solution* and identify specified impurities based on the relative retention times listed in *Table 2*.

Calculate the percentage of each unspecified impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U peak response of each unspecified impurity from the *Sample solution*

r_T sum of all peak responses from the *Sample solution*

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Palonosetron related compound E ^a	0.91	—
Palonosetron related compound D ^a	0.94	—
Palonosetron	1.0	—
Palonosetron related compound B ^b	1.1	—
Palonosetron related compound A ^b	1.2	—
Any individual unspecified impurity	—	0.5
Total impurities ^c	—	2.0
^a These impurities are controlled in the test for <i>Limit of Specified Impurities</i> and are not to be reported here.		

^b These degradation products are controlled using the limit for unspecified impurities.

^c Total impurities includes impurities controlled in the test for *Limit of Specified Impurities* and in the test for *Limit of Unspecified Impurities*.

SPECIFIC TESTS

- **pH** 〈 791 〉: 4.5–5.5
- **Particulate Matter in Injections** 〈 788 〉: Meets the requirements
- **Bacterial Endotoxins Test** 〈 85 〉: NMT 30 USP Endotoxin Units/mg of palonosetron hydrochloride
- **Sterility Tests** 〈 71 〉: Meets the requirements
- **Other Requirements**: Meets the requirements in *Injections and Implanted Drug Products* 〈 1 〉

ADDITIONAL REQUIREMENTS

- **Packaging and Storage**: Preserve in tight containers. Store at controlled room temperature, protected from light.
- **USP Reference Standards** 〈 11 〉
 - USP Endotoxin RS
 - USP Palonosetron Enantiomer RS

▲USP39

BRIEFING

Perindopril Erbumine. Because there is no existing *USP* monograph for this drug substance,

a new monograph, based on validated methods of analysis, is being proposed.

1. The liquid chromatographic procedure in the *Assay* is based on analyses performed with the Waters Spherisorb brand of L7 column. The typical retention time for perindopril is about 12.5 min under the conditions specified in the *Assay*.
2. The liquid chromatographic procedure in the test for *Organic Impurities* is based on analyses performed with the Merck LiChroCART Superspher 60 Å RP8 brand of L7 column. The typical retention time for perindopril is about 27.2 min.
3. The liquid chromatographic procedure in the test for *Limit of Perindopril Related Compound A and Imidazole* is based on analyses performed with the Eclipse XDB-C8 brand of L7 column. The typical retention times for imidazole and perindopril related compound A are about 3.3 and 4.4 min, respectively.
4. The liquid chromatographic procedure in the test for *Limit of Perindopril Related Compound I* is based on analyses performed with the Waters Xterra RP 18 brand of L1 column. The typical retention times for perindopril and perindopril related compound I are about 12 and 19 min, respectively.

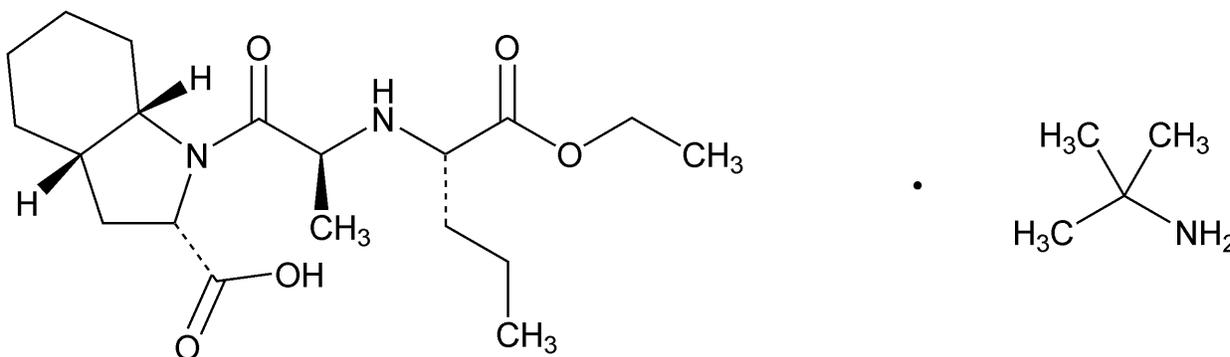

(SM2: S. Ramakrishna.)

Correspondence Number—C120791

Comment deadline: March 31, 2015

Add the following:

▲Perindopril Erbumine

$C_{19}H_{32}N_2O_5 \cdot C_4H_{11}N$ 441.6

1*H*-Indole-2-carboxylic acid, 1-[2-[[1-(ethoxycarbonyl)butyl]amino]-1-oxopropyl]octahydro-, [2*S*-[1[*R**(*R**)],2 α ,3 α β ,7 α β]-, compound with 2-methyl-2-propanamine (1:1); (2*S*,3 α *S*,7 α *S*)-1-[(*S*)-*N*-[(*S*)-1-Carboxybutyl]alanyl]hexahydro-2-indolinecarboxylic acid, 1-ethyl ester, compound with *tert*-butylamine (1:1); (2*S*,3 α *S*,7 α *S*)-1-[(*S*)-2-[(*R*)-1-Ethoxy-1-oxopentan-2-ylamino]propanoyl]octahydro-1*H*-indole-2-carboxylic acid [107133-36-8].

DEFINITION

Perindopril Erbumine contains NLT 99.0% and NMT 101.0% of perindopril erbumine ($C_{19}H_{32}N_2O_5 \cdot C_4H_{11}N$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. Infrared Absorption** 〈 197K 〉
- **B.** The retention time of the major peak of the *Sample solution* corresponds to the major peak of *System suitability solution 1*, as obtained in the test for *Limit of Perindopril Related Compound I*.

ASSAY

• Procedure

Buffer: Dissolve 0.92 g of sodium 1-heptanesulfonate in 1 L of water and add 1 mL of triethylamine. Adjust with a solution of perchloric acid and water (1:1) to a pH of 2.0.

Mobile phase: Acetonitrile and *Buffer* (35:65)

Standard solution: 0.1 mg/mL of USP Perindopril Erbumine RS in *Buffer*. Initially add *Buffer* to about 60% of the flask volume, sonicate to dissolve, and dilute with *Buffer* to volume.

Sample solution: 0.1 mg/mL of Perindopril Erbumine in *Buffer*. Initially add *Buffer* to about 60% of the flask volume, sonicate to dissolve, and dilute with *Buffer* to volume.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 25-cm; 5- μ m packing L7

Column temperature: 60 $^{\circ}$

Flow rate: 1 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 0.5%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of perindopril erbumine ($C_{19}H_{32}N_2O_5 \cdot C_4H_{11}N$) in the portion of Perindopril Erbumine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak area of perindopril from the *Sample solution*

r_S peak area of perindopril from the *Standard solution*

C_S concentration of USP Perindopril Erbumine RS in the *Standard solution* (mg/mL)

C_U concentration of Perindopril Erbumine in the *Sample solution* (mg/mL)

Acceptance criteria: 99.0%–101.0% on the anhydrous basis

IMPURITIES

- **Residue on Ignition** 〈 281 〉: NMT 0.1%

• Organic Impurities

Solution A: Proceed as directed for the *Buffer* as described in the *Assay*.

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	80	20
5	80	20
27	68	32
45	50	50
60	20	80
70	20	80
71	80	20
80	80	20

Diluent: *Solution B* and *Solution A* (20:80)

System suitability stock solution A: 0.03 mg/mL of USP Imidazole RS in *Diluent*

System suitability stock solution B: 0.03 mg/mL each of USP Perindopril Erbumine RS, USP Perindopril Related Compound B RS, USP Perindopril Related Compound C RS, USP Perindopril Related Compound D RS, and USP Perindopril Related Compound F RS in *Diluent*

System suitability solution: Transfer 5 mL each of *System suitability stock solution A* and *System suitability stock solution B* to a 50-mL volumetric flask and dilute with *Diluent* to volume. Pass through a suitable filter of 0.45- μ m pore size, discard the first 3 mL of filtrate, and use the clear filtrate.

Standard stock solution: 0.03 mg/mL of USP Perindopril Erbumine RS in *Diluent* prepared as follows. Dissolve a suitable quantity of USP Perindopril Erbumine RS in 80% of the total volume of *Diluent*, sonicate for about 5 min, and dilute with *Diluent* to volume.

Standard solution: 0.003 mg/mL of USP Perindopril Erbumine RS in *Diluent* from the *Standard stock solution*. Pass through a suitable filter of 0.45- μ m pore size and discard the first 3 mL of filtrate.

Sample solution: 3 mg/mL of Perindopril Erbumine in *Diluent* prepared as follows. Dissolve a suitable quantity of Perindopril Erbumine in 80% of the total volume of *Diluent*, sonicate for 5 min, and dilute with *Diluent* to volume. Pass through a suitable filter of 0.45- μ m pore size and discard the first 3 mL of filtrate.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.0-mm \times 25-cm; 4- μ m packing L7

Column temperature: 60 $^{\circ}$

Flow rate: 1 mL/min

Injection volume: 20 μ L

System suitability

Sample: *System suitability solution*

Suitability requirements

Tailing factor: NMT 1.5 for the perindopril peak

Relative standard deviation: NMT 5.0% for the perindopril peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Perindopril Erbumine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of perindopril erbumine from the *Standard solution*

C_S = concentration of USP Perindopril Erbumine RS in the *Standard solution* (mg/mL)

C_U = concentration of Perindopril Erbumine in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*. Disregard peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Imidazole ^a	0.08	—	—
Perindopril related compound B ^b	0.42	1.20	0.3
Perindopril related compound C ^c	0.74	0.96	0.1
Perindopril related compound D ^d	0.85	0.98	0.1
Perindopril erbumine	1.0	—	—
Perindopril related compound E ^e	1.38	0.85	0.2
Any individual unspecified impurity	—	—	0.10
Total impurities ^f	—	—	1

^a Imidazole is quantitated using the test for *Limit of Perindopril Related Compound A and Imidazole* and is included in the table for identification purposes only.

^b ((2*S*,3*aS*,7*aS*)-1-{(*S*)-2-[(*S*)-1-carboxybutylamino]propanoyl}octahydro-1*H*-indole-2-carboxylic acid).

^c (2*S*)-2-[(3*S*,5*aS*,9*aS*,10*aS*)-3-Methyl-1,4-dioxodecahydropyrazino[1,2-*a*]indol-2(1*H*)-yl]pentanoic acid.

^d (2*S*)-2-[(3*S*,5*aS*,9*aS*,10*aR*)-3-Methyl-1,4-dioxodecahydropyrazino[1,2-*a*]indol-2(1*H*)-yl]pentanoic acid.

^e Ethyl (2*S*)-2-[(3*S*,5*aS*,9*aS*,10*aS*)-3-methyl-1,4-dioxodecahydropyrazino[1,2-*a*]indol-2(1*H*)-yl]pentanoate.

^f Total impurities include all specified and unspecified impurities and imidazole from the test for *Limit of Perindopril Related Compound A and Imidazole*. Perindopril related compound A is not included.

• **Limit of Perindopril Related Compound A and Imidazole**

Solution A: Proceed as directed in *Organic Impurities*.

Solution B: Acetonitrile

Mobile phase: See Table 3.

BRIEFING

Perindopril Erbumine Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph, based on validated methods of analysis, is being proposed.

1. The liquid chromatographic procedure in the *Assay* is based on analyses performed with the Merck Superspher 60 Å RP8 brand of L7 column. The typical retention time for perindopril is about 6.2 min.
2. The liquid chromatographic procedure in the *Dissolution* test is based on analyses performed with the Agilent Zorbax XDB-C8 brand of L7 column. The typical retention time for perindopril is about 4.2 min.
3. The liquid chromatographic procedure in the test for *Organic Impurities* is based on analyses performed with the Merck Superspher 60 Å RP8 brand of L7 column. The typical retention time for perindopril is about 27.2 min.
4. The liquid chromatographic procedure in the test for *Limit of Perindopril Related Compound I* is based on analyses performed with the Waters Xterra RP 18 brand of L1 column. The typical retention times for perindopril and perindopril related compound I are about 12 and 19 min, respectively.

(SM2: S. Ramakrishna.)

Add the following:

▲Perindopril Erbumine Tablets

DEFINITION

Perindopril Erbumine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of perindopril erbumine ($C_{19}H_{32}N_2O_5 \cdot C_4H_{11}N$).

IDENTIFICATION

- **A.** The UV absorption spectra of the major peak of the *Sample solution* exhibit maxima and minima at the same wavelengths as those of the corresponding peak of the *Standard solution*, as obtained in the *Assay*.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

● **Procedure**

Solution A: Dissolve 0.92 g of sodium 1-heptanesulfonate in 1 L of water and add 1 mL of triethylamine. Adjust with a solution of perchloric acid and water (1:1) to a pH of 2.0.

Mobile phase: Acetonitrile and *Solution A* (38:62)

Diluent: Acetonitrile and *Solution A* (40:60)

Standard solution: 0.08 mg/mL of USP Perindopril Erbumine RS in *Diluent* prepared as follows. Dissolve a suitable quantity of USP Perindopril Erbumine RS in 80% of the total volume of *Diluent*, sonicate for 5 min, and dilute with *Diluent* to volume. Pass through a suitable filter of 0.45- μ m pore size and discard the first 3 mL of filtrate.

Sample solution: Nominally equivalent to 0.08 mg/mL of perindopril erbumine in *Diluent*

prepared as follows. Weigh and transfer the number of Tablets into a suitable volumetric flask, as indicated in *Table 1*.

Table 1

Tablet Strength	Number of Tablets (NLT)	Volumetric Flask, (mL)
2	20	500
4	10	500
8	10	1000

Add *Diluent* to about 70% of the flask volume, shake mechanically for about 60 min at 180 rpm, and sonicate for 20 min. Dilute with *Diluent* to volume. Pass through a suitable filter of 0.45- μ m pore size and discard the first 3 mL of filtrate.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4-mm \times 25-cm; 4- μ m packing L7

Temperatures

Column: 60 $^{\circ}$

Sample cooler: 5 $^{\circ}$

Flow rate: 1 mL/min

Injection volume: 20 μ L

Run time: NLT 2.5 times the retention time of perindopril

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of perindopril erbumine ($C_{19}H_{32}N_2O_5 \cdot C_4H_{11}N$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Perindopril Erbumine RS in the *Standard solution* (mg/mL)

C_U nominal concentration of perindopril erbumine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- Dissolution** { 711 }

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Solution A: Proceed as directed in the *Assay*.

Mobile phase: Acetonitrile and *Solution A* (350:650)

Standard stock solution: 0.55 mg/mL of USP Perindopril Erbumine RS in acetonitrile

Standard solution: Prepare solutions of USP Perindopril Erbumine RS in *Medium* from the *Standard stock solution*, with final concentrations from *Table 2*.

Table 2

Tablet Strength (mg)	Concentration (mg/mL)
2	0.0022
4	0.0044
8	0.0088

Sample solution: Pass a portion of the solution under test through a suitable filter and discard the first 1 mL of filtrate.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 15-cm; 5-µm packing L7

Column temperature: 50°

Flow rate: 1.2 mL/min

Injection volume: 100 µL

Run time: NLT 1.6 times the retention time of perindopril

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of perindopril erbumine (C₁₉H₃₂N₂O₅·C₄H₁₁N) dissolved.

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 900 mL

Tolerances: NLT 85% (Q) of the labeled amount of perindopril erbumine (C₁₉H₃₂N₂O₅·C₄H₁₁N) is dissolved.

- **Uniformity of Dosage Units** 〈 905 〉: Meet the requirements

IMPURITIES● **Organic Impurities****Solution A:** Proceed as directed in the *Assay*.**Solution B:** Acetonitrile**Mobile phase:** See *Table 3*.**Table 3**

Time (min)	Solution A (%)	Solution B (%)
0	80	20
5	80	20
27	68	32
45	50	50
60	20	80
70	20	80
71	80	20
80	80	20

Diluent: *Solution B* and *Solution A* (20:80)**System suitability stock solution A:** 0.03 mg/mL of USP Imidazole RS in *Diluent***System suitability stock solution B:** 0.12 mg/mL each of USP Perindopril RelatedCompound C RS and USP Perindopril Related Compound D RS in *Diluent*. Initially add 80% of the total volume of *Diluent*, sonicate for 5 min, and dilute with *Diluent* to volume.**System suitability solution:** Accurately weigh about 1.5 mg each of USP Perindopril Related Compound B RS and USP Perindopril Related Compound F RS into a 50-mL volumetric flask. Add 30 mL of *Diluent* and sonicate for 5 min. Transfer 5.0 mL each of *System suitability stock solution A*, *System suitability stock solution B*, and *Standard stock solution*. Dilute with *Diluent* to volume.**Standard stock solution:** 0.05 mg/mL of USP Perindopril Erbumine RS in *Diluent*. Dissolve a suitable quantity of USP Perindopril Erbumine RS in 80% of the total volume of *Diluent*, sonicate for 5 min, and dilute with *Diluent* to volume.**Standard solution:** 0.005 mg/mL of USP Perindopril Erbumine RS in *Diluent* from the *Standard stock solution*. Pass through a suitable filter of 0.45- μ m pore size and discard the first 3 mL of filtrate.**Sample solution:** Nominally equivalent to 2 mg/mL of perindopril erbumine in *Diluent* prepared as follows. Transfer a quantity equivalent to about 20 mg of perindopril erbumine from powdered Tablets (NLT 20) into a test tube. Pipet 10.0 mL of *Diluent* into the test tube, sonicate for about 10 min, and vortex for about 1 min. Pass through a suitable filter of 0.45- μ m pore size and discard the first 3 mL of filtrate.**Chromatographic system**(See *Chromatography* { 621 }, *System Suitability*.) Proceed as directed in the *Assay*, except for the *Run time*. [Note—The run time is determined by the gradient from *Table 3*.]**System suitability****Sample:** *System suitability solution***Suitability requirements****Tailing factor:** NMT 1.5 for the perindopril peak**Relative standard deviation:** NMT 5.0%**Analysis**

Samples: *Standard solution and Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of perindopril erbumine from the *Standard solution*

C_S = concentration of USP Perindopril Erbumine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of perindopril erbumine in the *Sample solution* (mg/mL)

F = relative response factor for each individual impurity (see *Table 4*)

Acceptance criteria: See *Table 4*. Disregard peaks less than 0.1%.

Table 4

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Imidazole ^a	0.08	—	—
Perindopril related compound B ^b	0.42	1.21	2.0
Perindopril related compound C ^c	0.74	0.97	0.5
Perindopril related compound D ^d	0.85	0.98	0.5
Perindopril erbumine	1.0	—	—
Perindopril related compound F ^e	1.38	0.86	2.0
Any unspecified impurity	—	—	0.2
Total impurities ^f	—	—	1.5

^a Imidazole is given for identification only and is not quantitated using this procedure.

^b (2*S*,3*aS*,7*aS*)-1-[(2*S*)-2-[[*(1S)*]-1-carboxybutyl]amino]propanoyl]octahydro-1*H*-indole-2-carboxylic acid.

^c (2*S*)-2-[(3*S*,5*aS*,9*aS*,10*aS*)-3-methyl-1,4-dioxodecahydropyrazino[1,2-*a*]indol-2(1*H*)-yl]pentanoic acid.

^d (2*S*)-2-[(3*S*,5*aS*,9*aS*,10*aR*)-3-methyl-1,4-dioxodecahydropyrazino[1,2-*a*]indol-2(1*H*)-yl]pentanoic acid.

^e Ethyl (2*S*)-2-[(3*S*,5*aS*,9*aS*,10*aS*)-3-methyl-1,4-dioxodecahydropyrazino[1,2-*a*]indol-2(1*H*)-yl]pentanoate.

^f Total impurities includes perindopril related compound I from the test for *Limit of Perindopril Related Compound I* and excludes perindopril related compound F and perindopril related compound B.

- **Limit of Perindopril Related Compound I**

Solution A: Dissolve 5 g of potassium phosphate monobasic in 1900 mL of water. Adjust

with triethylamine to a pH of 6.5 and add 100 mL of acetonitrile.

Solution B: Acetonitrile

Mobile phase: See Table 5.

Table 5

Time (min)	Solution A (%)	Solution B (%)
0	83	17
22	83	17

Pyrimethamine▲**Compounded**▲*USP39*

Oral Suspension

DEFINITION***Change to read:***

Pyrimethamine

▲**Compounded**▲*USP39*

Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of pyrimethamine (C₁₂H₁₃ClN₄).

Prepare Pyrimethamine

▲**Compounded**▲*USP39*

Oral Suspension 2 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile*

Preparations 〈 795 〉).

Pyrimethamine powder	200 mg
Vehicle: a 1:1 mixture of Methylcellulose 1% Solution, and Syrup, <i>NF</i> , a sufficient quantity to make	100 mL

Calculate the required quantity of each ingredient for the total amount to be prepared. Place *Pyrimethamine powder* in a suitable mortar. Add 2 mL of the *Vehicle*, and triturate to make a smooth paste. Add an additional 10 mL of the *Vehicle* to the paste, and levigate to form a suspension. Add increasing volumes of *Vehicle* to make a liquid that is pourable. Transfer the contents of the mortar to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

ASSAY● **Procedure**

Mobile phase: Acetonitrile and 50 mM anhydrous sodium acetate (40:60). Pass through a PVDF membrane filter of 0.45-µm pore size, and degas.

System suitability solution: 0.20 mg/mL of USP Pyrimethamine RS (previously dried) and 0.10 mg/mL of USP Phenacetin RS (previously dried) in methanol

Standard solution: 0.20 mg/mL of USP Pyrimethamine RS (previously dried) in methanol

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Prepare 0.20 mg/mL of pyrimethamine from Oral Suspension in methanol. Sonicate, and mix on a vortex mixer.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Autosampler temperature: 10°

Flow rate: 1.5 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for phenacetin and pyrimethamine are about 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 6.0 between the pyrimethamine and phenacetin peaks, *System suitability solution*

Column efficiency: NLT 8000 theoretical plates, *System suitability solution*

Tailing factor: NMT 1.5, *System suitability solution*

Relative standard deviation: NMT 2.0% for replicate injections, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of pyrimethamine ($C_{12}H_{13}ClN_4$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of pyrimethamine from the *Sample solution*

r_S = peak response of pyrimethamine from the *Standard solution*

C_S = concentration of pyrimethamine in the *Standard solution* (mg/mL)

C_U = nominal concentration of pyrimethamine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- pH (791): 6.6–7.6

ADDITIONAL REQUIREMENTS

Oral Suspension

DEFINITION

Change to read:

Quinidine Sulfate

▲Compounded▲*USP39*

Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of quinidine sulfate [(C₂₀H₂₄N₂O₂)₂·H₂SO₄·2H₂O]. Prepare Quinidine Sulfate

▲Compounded▲*USP39*

Oral Suspension 10 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* 〈795〉).

Quinidine Sulfate	1 g
Vehicle: a 1:1 mixture of Vehicle for Oral Solution (regular or sugar-free), <i>NF</i> , and Vehicle for Oral Suspension, <i>NF</i> , a sufficient quantity to make	100 mL

If using *Quinidine Sulfate* tablets, place in a suitable mortar, and comminute into a fine powder, or add *Quinidine Sulfate* powder to the mortar. Add 15 mL of the *Vehicle*, and mix to a uniform paste. Add the *Vehicle* in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar to the calibrated bottle. Add sufficient *Vehicle* to volume, and mix well.

ASSAY

● **Procedure**

Solution A: Add 35.0 mL of methanesulfonic acid to 20.0 mL of glacial acetic acid, and dilute with water to 500 mL.

Solution B: Dissolve 10.0 mL of diethylamine in water to obtain 100 mL of solution.

Mobile phase: Acetonitrile, *Solution A*, *Solution B*, and water (10:1:1:40)

Standard solution: 100 µg/mL of USP Quinidine Sulfate RS in *Mobile phase*

Sample solution: Agitate the container of Oral Suspension for 30 min on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at -70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix on a vortex mixer for 30 s. Pipet 1.0 mL of the *Sample solution* into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system

Oral Suspension

DEFINITION

Change to read:

Rifabutin

▲**Compounded**▲*USP39*

Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of rifabutin (C₄₆H₆₂N₄O₁₁).

Prepare Rifabutin

▲**Compounded**▲*USP39*

Oral Suspension 20 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* { 795 }).

Rifabutin capsules ^a equivalent to	3 g
Vehicle: a 1:1 mixture of Ora-Sweet ^b and Ora-Plus ^b , a sufficient quantity to make	150 mL
^a Mycobutin 150-mg capsules, Pfizer Inc., New York, NY. ^b Paddock Laboratories, Minneapolis, MN.	

Calculate the required quantity of each ingredient for the total amount to be prepared. Empty

the required number of capsules in a suitable mortar, and comminute to a fine powder. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a rifabutin liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

ASSAY

• Procedure

Solution A: 100 mM monobasic potassium phosphate buffer, adjusted with 2 N sodium hydroxide to a pH of 6.5

Mobile phase: Acetonitrile and *Solution A* (50:50). Filter and degas.

Standard stock solution: 2.0 mg/mL of USP Rifabutin RS in *Mobile phase*

Standard solution: Transfer 10 mL of *Standard stock solution* to a 100-mL volumetric flask. Immediately rinse the volumetric apparatus with 10 mL of acetonitrile and 10 mL of *Mobile phase*. Dilute with *Mobile phase* to volume to obtain a solution with a nominal concentration of 0.2 mg/mL of rifabutin. Pass through a filter of 0.45- μ m pore size.

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Pipet 1.0 mL of Oral Suspension into a 100-mL volumetric flask. Immediately rinse the pipette with 10 mL of acetonitrile and 10 mL of *Mobile phase*. Dilute with *Mobile phase* to volume to obtain a solution with a nominal concentration of 0.2 mg/mL of rifabutin. Pass through a filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L7

Flow rate: 1.0 mL/min

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

[Note—The retention time for the rifabutin is about 14.0 min.]

Suitability requirements

Column efficiency: NLT 4500 theoretical plates

Tailing factor: NMT 3.0

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of rifabutin ($C_{46}H_{62}N_4O_{11}$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of rifabutin in the *Standard solution* (mg/mL)

C_U nominal concentration of rifabutin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

Oral Suspension

DEFINITION**Change to read:**

Rifampin

▲Compounded▲USP39

Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of rifampin ($C_{43}H_{58}N_4O_{12}$).

Prepare Rifampin

▲Compounded▲USP39

Oral Suspension

▲10 mg/mL▲USP39

as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* 〈 795 〉).

Rifampin	1.20 g
Citric Acid or Sodium Citrate	To adjust pH
Syrup, a sufficient quantity to make	120 mL

Empty the required number of capsules into a suitable mortar, or use *Rifampin* powder. If necessary, gently crush the capsule contents with a pestle to produce a fine powder. Add 2 mL of *Syrup* to the mortar, and triturate until a smooth paste is formed. Add 10 mL of *Syrup*, and triturate to form a suspension. Continue to add *Syrup* until 80 mL has been added. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add *Syrup* in portions to rinse the mortar, and add the rinses to the bottle. If necessary, add *Citric Acid* or *Sodium Citrate* to adjust to a pH of 5.0. Add a suitable flavor if desired. Add sufficient *Syrup* to bring the preparation to final volume. Shake vigorously.

ASSAY● **Procedure**

Solution A: 1.0 M monobasic potassium phosphate containing 6.3 mL/L of phosphoric acid

Solution B: Acetonitrile, 1.0 M dibasic potassium phosphate, 1.0 M monobasic potassium phosphate, 1.0 M citric acid, and water (25: 7.7: 2.3: 1: 64)

Mobile phase: Acetonitrile, *Solution A*, 1.0 M citric acid, 0.5 M sodium perchlorate, and water (36:10:2:2:50). Pass through a suitable filter of 0.7- μ m or finer pore size, and degas.

Diluent: Acetonitrile and water (50:50)

System suitability solution: 0.1 mg/mL of USP Rifampin RS and 0.1 mg/mL of USP Rifampin Quinone RS in acetonitrile. Transfer 1.0 mL of the solution into a 10-mL volumetric flask, and dilute with *Solution B* to volume.

Standard solution: 0.5 mg/mL of USP Rifampin RS in *Diluent*. If necessary, sonicate for 30 s to dissolve. Transfer 5.0 mL of the solution to a 50-mL, low-actinic volumetric flask, and dilute with *Diluent* to volume. Use the solution within 1 h.

Sample solution: Transfer 5.0 mL of Oral Suspension, freshly mixed and free of air bubbles, to a 100-mL, low-actinic volumetric flask, and dissolve in and dilute with *Diluent* to volume. Transfer 5.0 mL of the resulting solution to a 50-mL, low-actinic volumetric flask, and dilute with *Diluent* to volume.

BRIEFING

Simvastatin Tablets, USP 38 page 5300. As part of USP monograph modernization efforts, it is proposed to make following changes:

1. Add *Identification* test *B* to strengthen the monograph.
2. Remove the concentration of acid or base for the adjustment of pH in the *Assay*.

3. Preparation of the *Sample solution* in the *Assay* is modified to accommodate different Tablet strengths.
4. Delete *Capacity factor* and *Column efficiency* from the system suitability requirements in the *Assay* as the remaining requirements adequately measure the system suitability. Use of diode array detector for the *Assay* is included in order to support the proposed addition of *Identification* test *B*.
5. Add a new stability indicating liquid chromatographic procedure for the test for *Organic Impurities*. The liquid chromatographic procedure is based on analysis performed with the Agilent Zorbax Eclipse XDB of L1 packing. The typical retention time for simvastatin is about 31 min.
6. Add USP Tenvastatin Calcium RS and USP Lovastatin RS under the section for *USP Reference Standards* to support the proposed revision for the test for *Organic Impurities*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Simvastatin Tablets

DEFINITION

Simvastatin Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of simvastatin ($C_{25}H_{38}O_5$).

IDENTIFICATION

Change to read:

-

▲A. ▲USP39

The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

Add the following:

- ▲● B. The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲USP39

ASSAY

Change to read:

- **Procedure**

Buffer solution: Dissolve 3.9 g of monobasic sodium phosphate in 900 mL water. Adjust, if necessary, with either 50%

▲▲USP39

sodium hydroxide or 85%

▲▲USP39

phosphoric acid to a pH of 4.5. Dilute with water to 1000 mL and mix.

Mobile phase: Acetonitrile and *Buffer solution* (65:35)

Solution A: Add 3.0 mL of glacial acetic acid to 900 mL of water. Adjust with 5 N sodium hydroxide to a pH of 4.0 and dilute with water to 1 L.

Diluent: Acetonitrile and *Solution A* (8:2)

Standard solution: 0.1 mg/mL of USP Simvastatin RS in *Diluent*

Sample solution: Prepare nominally 0.1 mg/mL of simvastatin from Tablets in *Diluent* as follows. Transfer NLT 10 Tablets to a suitable volumetric flask. Add a small volume of water (NMT 4% of the total volume), and swirl to disintegrate the Tablets. Dilute with *Diluent* to volume, sonicate for 15 min, and cool to room temperature. Centrifuge a portion of the mixture, and use the clear supernatant.

▲Crush NLT 20 Tablets into a fine powder and transfer the powder equivalent to 100 mg of simvastatin to a suitable volumetric flask. Add *Diluent* to fill 70% of the volume of the flask, and sonicate with intermittent swirling for 10 min. Equilibrate to room temperature and dilute with *Diluent* to volume. Centrifuge a portion of the mixture, and pass the clear supernatant through a filter of 0.45 µm pore size. Discard first few mL of filtrate. ▲USP39

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 238 nm.

▲For *Identification* test B, use diode array detector in the range of 190 nm–300 nm. ▲USP39

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 45°

Flow rate: 1.5 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Capacity factor: NLT 3.0

Column efficiency: NLT 4500 theoretical plates

▲▲USP39

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of simvastatin (C₂₅H₃₈O₅) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of simvastatin from the *Sample solution*

r_S = peak area of simvastatin from the *Standard solution*

C_S concentration of USP Simvastatin RS in the *Standard solution* (mg/mL)

C_T nominal concentration of simvastatin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• Dissolution 〈 711 〉

Medium: Prepare a pH 7.0 buffer solution containing 0.5% sodium dodecyl sulfate in 0.01 M sodium phosphate as follows. Dissolve 30 g of sodium dodecyl sulfate and 8.28 g of monobasic sodium phosphate in 6000 mL of water and adjust with 50% (w/v) sodium hydroxide solution to a pH of 7.0; 900 mL.

Apparatus 2: 50 rpm

Time: 30 min

Prewashed manganese dioxide: Transfer 10 g of manganese dioxide to a suitable container, and treat as follows. Add 50 mL of *Medium*, and shake vigorously for 5 min. Centrifuge, decant the supernatant layer, and discard. Repeat twice, first with *Medium* and then with water. Dry the solid at 100° for 1 h before use.

Standard solution: USP Simvastatin RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter. Transfer a portion of the solution to a centrifuge tube containing about 10 mg of *Prewashed manganese dioxide* per mL of transferred solution under test, and mix. Allow the mixture to stand for 30 min with occasional shaking, centrifuge, and use a portion of the clear supernatant.

Instrumental conditions

Mode: UV

Analytical wavelength: 247 nm and 257 nm

Blank: Proceed as directed for the *Sample solution*, except use the *Medium*.

Analysis: Calculate the percentage of the labeled amount of simvastatin ($C_{25}H_{38}O_5$) dissolved from the difference between the UV absorbances at the wavelengths of maximum and minimum absorbances at about 247 and 257 nm, respectively, of the *Sample solution*, in comparison with the *Standard solution*.

Tolerances: NLT 75% (Q) of the labeled amount of simvastatin ($C_{25}H_{38}O_5$) is dissolved.

• Uniformity of Dosage Units 〈 905 〉: Meet the requirements

IMPURITIES

Add the following:

▲• Organic Impurities

Solution A: Prepare a mixture of acetonitrile and dilute phosphoric acid (1 mL in 1 L of water) (45:55).

Solution B: Prepare a mixture of acetonitrile and dilute phosphoric acid (1 mL in 1 L of water) (90:10).

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
------------	----------------	----------------

0	100	0
38	100	0
40	65	35
50	65	35
70	0	100
90	0	100
92	100	0
100	100	0

Solution C: 1.4 g/L of monobasic potassium phosphate in water. Adjust with diluted ammonia solution to a pH of 7.0.

Diluent: Acetonitrile and *Solution C* (60:40)

System suitability stock solution: 0.2 mg/mL each of USP Simvastatin RS and USP Lovastatin RS in *Diluent*. Sonicate if necessary.

System suitability solution: 0.02 mg/mL each of USP Simvastatin RS and USP Lovastatin RS in *Diluent* from *System suitability stock solution*

Standard stock solution: 0.15 mg/mL of USP Simvastatin RS and 1.3 mg/mL of USP Tenivastatin Calcium RS in *Diluent*. Sonicate if necessary.

Standard solution: 7.5 µg/mL of USP Simvastatin RS and 0.026 mg/mL of USP Tenivastatin Calcium RS in *Diluent* from *Standard stock solution*

Sample solution: Prepare nominally 1.5 mg/mL of simvastatin in *Diluent* as follows.

Transfer a suitable amount of powdered Tablets (NLT 20) to a volumetric flask. Add *Diluent* to fill 60% of the volume of the flask, and sonicate with intermittent swirling for 5 min. Dilute with *Diluent* to volume. Pass the solution through a filter of 0.45 µm pore size. Discard the first few mL of filtrate.

Chromatographic system

Change to read:

Sodium Bromide

▲Compounded ▲*USP39*

Injection, Veterinary

DEFINITION

Change to read:

Sodium Bromide

▲Compounded ▲*USP39*

Injection, Veterinary contains an amount of Sodium Bromide equivalent to NLT 21.0 mg and

NMT 25.6 mg of bromide (Br^-) per mL.

Prepare Sodium Bromide

▲Compounded ▲*USP39*

Injection, Veterinary as follows (see *Pharmaceutical Compounding—Sterile Preparations* 〈 797 〉).

Sodium Bromide	3.0 g
Sterile Water for Injection, <i>USP</i> , a sufficient quantity to make	100 mL

Dissolve the *Sodium Bromide* in *Sterile Water for Injection* with mixing. Sterilize by a suitable means such as sterile filtration or autoclaving.

ASSAY

• **Procedure**

TCA solution: 20% (w/v) Trichloroacetic acid in water

Gold chloride solution: 5 mg/mL of gold chloride in water

Standard stock solution: Dissolve USP Sodium Bromide RS in water to obtain a solution with a nominal concentration of 20 mg/mL of bromide.

Standard solutions: Prepare four solutions of known concentrations of about 2.0, 1.0, 0.5, and 0.25 mg/mL of bromide from *Standard stock solution* and water.

Sample solution: Dilute Injection, Veterinary quantitatively with water (1:19).

Blank: Water

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* 〈 851 〉.)

Mode: Vis

Analytical wavelength: 440 nm

System suitability

Samples: *Standard solutions* and *Blank*

Suitability requirements

Correlation coefficient: NLT 0.99, linear regression of the *Standard solutions*

Analysis

Samples: *Sample solution* and *Blank*

To 750- μ L aliquots of each *Sample* add 500 μ L of *TCA solution* and 250 μ L of *Gold chloride solution*. Mix on a vortex mixer, and immediately read the absorbance of each *Sample*.

Calculate the concentration of bromide (Br^-), in mg/mL, in the portion of Injection, Veterinary taken:

$$\text{Result} = C \times D$$

C = concentration of the *Sample solution* (mg/mL) calculated from the standard curve

D = dilution factor of the *Sample solution* (20)

Acceptance criteria: 21.0–25.6 mg/mL of bromide (Br^-)

SPECIFIC TESTS

- **Bacterial Endotoxins Test** 〈 85 〉: NMT 0.03 USP Endotoxin Units/mg of sodium bromide
- **Sterility Tests** 〈 71 〉: Meets the requirements
- **Other Requirements:** It meets the requirements in *Injections and Implanted Drug Products* 〈 1 〉.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Package in single-dose containers, preferably of Type I glass, and store in a refrigerator.

Change to read:

- **Beyond-Use Date:**

▲In the absence of passing a sterility test and endotoxin test, the storage conditions for *Pharmaceutical Compounding—Sterile Preparations* 〈 797 〉, *High-Risk Level CSPs* apply. After successful completion of sterility and endotoxin testing, ▲*USP39*

NMT 180 days after the date on which it was compounded

▲when stored in a refrigerator. ▲*USP39*

- **Labeling:** Label to state the *Beyond-Use Date* and to state the nominal content of sodium bromide in the Injection, Veterinary. Label to state that it is to be kept out of the reach of children. Label to state that it is for infusion only at a rate not to exceed 150 mg of sodium bromide per kg of body weight per hour. Label to state that it is for veterinary use only.

Comment deadline: March 31, 2015

Change to read:

Sodium Hypochlorite

▲▲Compounded▲▲*USP39*

Topical Solution

DEFINITION

Change to read:

Sodium Hypochlorite

▲Compounded▲*USP39*

Topical Solution contains NLT 0.20 g and NMT 0.32 g of sodium hypochlorite (NaClO) in 1000 mL of Topical Solution.

Prepare Sodium Hypochlorite

▲Compounded▲*USP39*

Topical Solution as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* 〈795〉).

Sodium Hypochlorite Solution	5.0 mL
Monobasic Sodium Phosphate, monohydrate	1.02 g
Dibasic Sodium Phosphate, anhydrous	17.61 g
Purified Water, a sufficient quantity to make	1000 mL

Dissolve the *Dibasic Sodium Phosphate, anhydrous* and the *Monobasic Sodium Phosphate, monohydrate* in about 500 mL of *Purified Water*. Add the *Sodium Hypochlorite Solution* and sufficient *Purified Water* to bring the preparation to final volume, and mix.

[Note—The source of the *Sodium Hypochlorite Solution* may be commercial unscented laundry bleach, nominally 5.25% (w/v) provided that the commercial laundry bleach was acquired recently.]

ASSAY

● **Procedure**

Sample: 50.0 mL

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N sodium thiosulfate VS

Endpoint detection: Visual

Analysis: To the *Sample* in a glass-stoppered flask add 0.5 g of potassium iodide and 10 mL of 6 N acetic acid. Titrate the liberated iodine with *Titrant*, adding 2 mL of starch TS as the endpoint is approached. Perform a blank determination and make any necessary correction. Each mL of *Titrant* is equivalent to 3.722 mg of sodium hypochlorite (NaClO).

Acceptance criteria: 0.20–0.32 g in 1000 mL

SPECIFIC TESTS

- pH $\langle 791 \rangle$: 7.8–8.2

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Package in tight, light-resistant, 1-L plastic containers, and store at controlled room temperature.

Change to read:

- **Beyond-Use Date:** NMT 7 days after the date on which it was compounded

▲when stored at controlled room temperature▲*USP39*

- **Labeling:** Label it to indicate that its strength is 0.025%, and to state the *Beyond-Use Date*. [Note—For external use only; it may be applied to wounds and burns.]

BRIEFING

Sodium Phenylbutyrate Compounded Oral Suspension, *USP 38* page 5330. The Compounding Expert Committee and the Nomenclature, Safety, and Labeling Expert Committee propose to revise the title of this and other compounded monographs to identify that it is a compounded preparation, consistent with the *Nomenclature Guidelines* (<http://www.usp.org/usp-nf/development-process/compendial-nomenclature>). Sodium Phenylbutyrate

▲**Compounded**▲*USP39*

Oral Suspension

DEFINITION

Change to read:

Sodium Phenylbutyrate

▲Compounded▲USP39

Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of sodium phenylbutyrate (C₁₀H₁₁O₂Na).

Prepare Sodium Phenylbutyrate

▲Compounded▲USP39

Oral Suspension 200 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile*

Preparations { 795 }).

Sodium Phenylbutyrate powder ^a	20 g
Vehicle: a 1:1 mixture of Ora-Sweet ^b (regular or sugar-free) and Ora-Plus ^b , a sufficient quantity to make	100 mL
<p>^a Ucyclyd Pharma, Inc., Scottsdale, AZ.</p> <p>^b Paddock Laboratories, Minneapolis, MN.</p>	

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the *Sodium Phenylbutyrate powder* in a suitable mortar, and comminute to a fine powder with a pestle. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a sodium phenylbutyrate liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

ASSAY● **Procedure**

Mobile phase: Acetonitrile and 5 mM phosphoric acid (40:60). Filter and degas.

Standard solution: 0.1 mg/mL of sodium phenylbutyrate in *Mobile phase*. [Note—The *Standard solution* should be prepared from the appropriate reference material.]

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Prepare 0.1 mg/mL of sodium phenylbutyrate from Oral Suspension and *Mobile phase*.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 218 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Column temperature: 60°

Flow rate: 1.0 mL/min

Injection volume: 5 μL

System suitability

Sample: *Standard solution*

[Note—The retention time for sodium phenylbutyrate is about 3.0 min.]

Suitability requirements

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of sodium phenylbutyrate ($C_{10}H_{11}O_2Na$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of sodium phenylbutyrate in the *Standard solution* (mg/mL)

C_U nominal concentration of sodium phenylbutyrate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **pH** $\langle 791 \rangle$: 7.0–8.0

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Package in tight, light-resistant containers. Store at controlled room temperature.
- **Beyond-Use Date:** NMT 90 days after the date on which it was compounded when stored at controlled room temperature
- **Labeling:** Label it to indicate that it is to be well shaken before use, and to state the *Beyond-Use Date*.

Tacrolimus

▲Compounded▲*USP39*

Oral Suspension

DEFINITION

Change to read:

Tacrolimus

▲Compounded▲*USP39*

Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$).

Prepare Tacrolimus

▲Compounded▲*USP39*

Oral Suspension 0.5 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* 〈 795 〉).

Tacrolimus capsules ^a equivalent to	50 mg
Vehicle: a 1:1 mixture of Ora-Plus ^b and Syrup, <i>NF</i> , a sufficient quantity to make	100 mL
^a Prograf 5-mg capsules, Astellas Pharma US, Inc., Deerfield, IL. ^b Paddock Laboratories, Minneapolis, MN.	

Calculate the quantity of each ingredient required for the total amount to be prepared. Empty the required number of capsules in a suitable mortar. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a tacrolimus liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well. Tacrolimus powder is not interchangeable with *Tacrolimus capsules* and should not be used.

ASSAY

● **Procedure**

Mobile phase: Acetonitrile and deionized distilled water (65:35). Filter and degas.

Standard stock solution: 0.5 mg/mL of USP Tacrolimus RS in acetonitrile

Standard solution: Pipet 1.0 mL of *Standard stock solution* into a 10-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution having a nominal concentration of 50 µg/mL of tacrolimus. [Note—The *Standard solution* is relatively unstable, and the *Assay* should proceed immediately.]

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Pipet 1.0 mL of Oral Suspension to a 10-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution with a nominal concentration of 50 µg/mL of tacrolimus. [Note—The *Sample solution* is relatively unstable, and the *Assay* should proceed immediately.]

Oral Suspension

DEFINITION

Change to read:

Temozolomide

▲**Compounded**▲*USP39*

Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of temozolomide ($C_6H_6N_6O_2$).

Prepare Temozolomide

▲**Compounded**▲*USP39*

Oral Suspension 10 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* 〈 795 〉).

Temozolomide capsules, ^a equivalent to	1 g
Povidone K-30, <i>USP</i>	500 mg
Anhydrous Citric Acid, <i>USP</i>	25 mg
Purified Water, <i>USP</i>	1.5 mL
Vehicle: a 1:1 mixture of Ora-Plus ^b and Ora-Sweet ^b (regular or sugar-free), a sufficient quantity to make	100 mL

- | |
|--|
| a Temodar 100-mg capsules, Schering Corporation, Whitehouse, NJ. |
| b Paddock Laboratories, Minneapolis, MN. |

Calculate the required quantity of each ingredient for the total amount to be prepared. Empty the required number of capsules in a suitable mortar. Add the *Povidone K-30* powder to the mortar, and triturate to a fine powder. [Note—Povidone is critical for physical stability.] Dissolve the *Anhydrous Citric Acid* in *Purified Water*. Add the mixture of *Anhydrous Citric Acid* and *Purified Water* to the mortar to wet the powder. Mix thoroughly to form a uniform paste. Add the *Vehicle* in small portions, and triturate to make a smooth mixture. Add increasing volumes of the *Vehicle* to make a temozolomide liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well. It is necessary to wear appropriate personal protective equipment and to perform this procedure in a Biologic Safety Cabinet. [Caution—Temozolomide is cytotoxic. Great care should be taken to prevent inhaling particles of temozolomide and exposure to the skin.]

ASSAY

• Procedure

Solution A: 10 mM ammonium phosphate adjusted to a pH of 3.25

Mobile phase: Methanol and *Solution A* (12:88). Filter and degas.

Standard stock solution: 0.5 mg/mL of USP Temozolomide RS in *Mobile phase*. Transfer the mixture to a centrifuge tube, and centrifuge at $1,500 \times g$ for 10 min. Pass the supernatant through a filter of 0.45- μm pore size, into a glass vial.

Standard solution: 0.1 mg/mL of temozolomide prepared from *Standard stock solution* and *Mobile phase*

Sample solution: Shake thoroughly each bottle of Oral Suspension. Immediately transfer 2.5 mL of Oral Suspension to a 25-mL volumetric flask, and dilute with *Mobile phase* to volume. Vortex the sample for 30 s, centrifuge for 10 min at $1,500 \times g$, and pass through a membrane filter of 0.22- μm pore size. Pass at least 0.5 mL of sample through the filter before collecting the sample in a vial. Transfer 1.0 mL of the resultant solution to a 10-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution with a nominal concentration of 0.1 mg/mL of temozolomide.

Change to read:

Tetracycline Hydrochloride

▲▲Compounded▲▲USP39

Oral Suspension

DEFINITION

Change to read:

Tetracycline Hydrochloride

▲▲Compounded▲▲USP39

Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of tetracycline hydrochloride. ~~in 100 mL of Oral Suspension~~

▲▲USP39

Prepare Tetracycline Hydrochloride

▲▲Compounded▲▲USP39

Oral Suspension

▲25 mg/mL▲USP39

as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Tetracycline Hydrochloride	2.50 g
Cetylpyridinium Chloride	10 mg
Xanthan Gum	0.15 g
Dibasic Sodium Phosphate	60 mg
Monobasic Sodium Phosphate	0.65 g
Sodium Hydroxide	0.30 g
Purified Water	35 mL
Suspension Structured Vehicle or Sugar-Free Suspension Structured Vehicle, a sufficient quantity to make	100 mL

Dissolve *Dibasic Sodium Phosphate* and *Monobasic Sodium Phosphate* in 25 mL of *Purified Water*. Separately dissolve a quantity of *Cetylpyridinium Chloride* in *Purified Water* and dilute, if

necessary, with *Purified Water* to obtain 5 mL of a solution containing 10 mg of *Cetylpyridinium Chloride*. Mix this solution with 5 mL of the aqueous phosphate solution and add the resulting solution, in divided portions, with mixing, to the *Tetracycline Hydrochloride* in a glass mortar to completely wet the powder, and make a smooth paste.

Transfer the remaining 20 mL of the aqueous phosphate solution to a beaker. Using moderate heat, stir to form a vortex, and slowly sprinkle the *Xanthan Gum* into the vortex to produce a uniform dispersion. Add this dispersion to the paste in the glass mortar, and mix until smooth; then add 20 mL of the *Suspension Structured Vehicle* or *Sugar-Free Suspension Structured Vehicle* to the mixture.

Dissolve the *Sodium Hydroxide* in 5 mL of *Purified Water*, and while mixing, slowly add this solution to the prepared mixture. Complete the suspension by adding a sufficient quantity of the *Suspension Structured Vehicle* or *Sugar-Free Suspension Structured Vehicle* to make a final volume of 100 mL, and pass this final dispersion through a hand homogenizer prior to transferring it to the dispensing container.

ASSAY

• Procedure

Diluent: Dimethylformamide and ammonium oxalate (27:68)

Mobile phase: Dimethylformamide, 0.1 M ammonium oxalate, and 0.2 M dibasic ammonium phosphate (27:68:5). Adjust, if necessary, with 3 N ammonium hydroxide or 3 N phosphoric acid to a pH of 7.6–7.7.

System suitability solution: 100 µg/mL of tetracycline hydrochloride and 25 µg/mL of USP 4-Epianhydrotetracycline Hydrochloride RS

Standard solution: 0.5 mg/mL of USP Tetracycline Hydrochloride RS in *Diluent*

Sample solution: Equivalent to 125 mg of tetracycline hydrochloride, from Oral Suspension, to a 250-mL volumetric flask, add 200 mL of *Diluent*, and shake. Add *Diluent* to volume and filter.

Change to read:**Theophylline**▲▲**Compounded**▲*USP39*

Oral Suspension

DEFINITION**Change to read:**

Theophylline

▲**Compounded**▲*USP39*

Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of theophylline (C₇H₈N₄O₂).

Prepare Theophylline

▲**Compounded**▲*USP39*

Oral Suspension 5 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile*

Preparations 〈 795 〉).

Theophylline	500 mg
Vehicle: a 1:1 mixture of Vehicle for Oral Solution (regular or sugar-free), <i>NF</i> , and Vehicle for Oral Suspension, <i>NF</i> , a sufficient quantity to make	100 mL

Calculate the required quantity of each ingredient for the total amount to be prepared. Calculate the amount of *Theophylline* on the anhydrous basis. If using tablets, place the required number in a suitable mortar, and comminute to a fine powder, or use *Theophylline* powder. Add about 20 mL of the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated container. Add enough of the liquid *Vehicle* to bring to final volume, and mix well.

ASSAY● **Procedure**

Solution A: Dissolve 2.500 g of sodium citrate and 1.633 g of citric acid (anhydrous) in 850 mL of ASTM Type I water, add 150 mL of methanol, and pass through 0.45-µm membrane filters.

Solution B: Acetonitrile

Mobile phase: See *Table 1*. Make adjustments, if necessary.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.0	100	0.0
20.0	100	0.0
20.01	5.0	95.0
25.0	5.0	95.0
25.01	100	0.0

Diluent: *Solution A*

System suitability solution: 0.10 mg/mL of USP Theophylline RS and 0.20 mg/mL of USP

Caffeine RS in *Solution A*

Standard solution: 0.10 mg/mL of USP Theophylline RS in *Solution A*

Sample solution: 0.10 mg/mL of theophylline prepared from Oral Suspension and *Solution A*

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 μL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 3.0 between the theophylline and caffeine peaks

Column efficiency: NLT 1000 theoretical plates for the theophylline peak

Tailing factor: NMT 1.5 for the theophylline peak

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of theophylline ($C_7H_8N_4O_2$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of theophylline in the *Standard solution* (mg/mL)

C_U = nominal concentration of theophylline in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **pH** 〈 791 〉: 4.0–5.0

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Package in tight, light-resistant containers. Store at controlled room temperature. Do not refrigerate.
- **Beyond-Use Date:** NMT 90 days after the date on which it was compounded when stored at controlled room temperature
- **Labeling:** Label to state that it is to be well shaken before use, protected from light, not to be refrigerated, and to state the *Beyond-Use Date*.

 USP Tramadol Hydrochloride RS

BRIEFING

Tripolidine Hydrochloride, *USP 38* page 5699. As part of the USP monograph modernization efforts, the following revisions are proposed:

1. Revise the acceptance criterion in the *Definition* from "NLT 98.0% and NMT 101.0%" to "NLT 98.0% and NMT 102.0%", which is typical for chromatographic procedures.
2. Replace *Identification* test *B* that uses ultraviolet absorptivities with an HPLC procedure based on the retention time agreement for tripolidine from the proposed *Assay* procedure.
3. Replace the existing *Assay* titration procedure with a validated stability-indicating HPLC procedure. The proposed liquid chromatographic procedure is based on an analysis performed with the Inertsil ODS-3V brand of column containing L1 packing. The typical retention time for tripolidine is about 5.8 min.
4. Add a test for *Organic Impurities* based on the proposed HPLC procedure in the *Assay*.
5. Update the chemical information for USP Tripolidine Hydrochloride Z-Isomer RS in the

USP Reference Standards section.

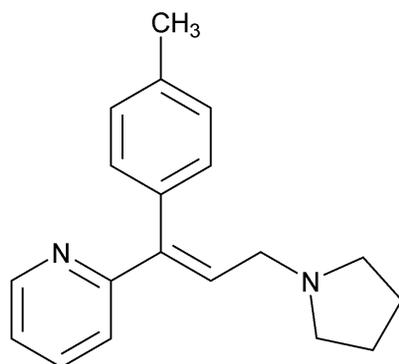

Additionally, minor editorial changes have been made to update the monograph to current USP style.

(SM4: C. Anthony.)

Sample solution: 10 mg/mL of Triprolidine Hydrochloride in chloroform

Developing solvent system: Chloroform and diethylamine (95:5)

Application volume: 5 µL

Analysis: Separately apply the *Sample solution* and each of the eight *Standard solutions*, and develop the chromatograms, protected from light, in the *Developing solvent system*, until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Examine the plate under long and short wavelength UV light. Compare the intensities of any secondary spots observed in the chromatogram of the *Sample solution* with those of the principal spots in the chromatograms of the *Standard solutions*.

Acceptance criteria: The intensity of the Z-isomer triprolidine hydrochloride spot (R_f value 1.2 relative to the R_f value for triprolidine hydrochloride) of the *Sample solution* corresponds to NMT 2.0%, and the sum of the intensities of all secondary spots of the *Sample solution* corresponds to NMT 3.0%.

▲Mobile phase, Diluent, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 10 µg/mL each of USP Triprolidine Hydrochloride RS and USP Triprolidine Hydrochloride Z-Isomer RS in *Diluent*

Sample solution: 0.5 mg/mL of Triprolidine Hydrochloride in *Diluent* prepared as follows. Transfer a suitable amount of Triprolidine Hydrochloride to a suitable volumetric flask and dissolve, by sonication, in about 60% of the flask volume of *Diluent*. Dilute with *Diluent* to volume.

System suitability

Sample: *Standard solution*

[Note—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 5.0 between triprolidine hydrochloride and triprolidine hydrochloride Z-isomer

Relative standard deviation: NMT 1.8% for each peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of triprolidine hydrochloride Z-isomer in the portion of Triprolidine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of triprolidine hydrochloride Z-isomer from the *Sample solution* r_S = peak response of triprolidine hydrochloride Z-isomer from the *Standard solution* C_S = concentration of USP Triprolidine Hydrochloride Z-Isomer RS in the *Standard solution* (mg/mL) C_U = concentration of Triprolidine Hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of any individual unspecified impurity in the portion of Triprolidine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 r_U = peak response of any unspecified impurity from the *Sample solution* r_S = peak response of triprolidine hydrochloride from the *Standard solution* C_S = concentration of USP Triprolidine Hydrochloride RS in the *Standard solution* (mg/mL) C_U = concentration of Triprolidine Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Tripolidine	1.0	—
Tripolidine hydrochloride Z-isomer	1.5	2.0
Any individual unspecified impurity	—	0.10
Total impurities	—	3.0

Oral Solution

DEFINITION

Change to read:

Verapamil Hydrochloride

▲Compounded▲*USP39*

Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of verapamil hydrochloride ($C_{27}H_{38}N_2O_4 \cdot HCl$).

Prepare Verapamil Hydrochloride

▲Compounded▲*USP39*

Oral Solution 50 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* { 795 }).

Verapamil Hydrochloride powder	5 g
Vehicle for Oral Solution (regular or sugar-free), <i>NF</i> , a sufficient quantity to make	100 mL

Add *Verapamil Hydrochloride powder* and about 40 mL of *Vehicle* to a mortar, and mix. Add the *Vehicle* in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add sufficient *Vehicle* to bring the preparation to final volume, and mix well.

ASSAY

● **Procedure**

Solution A: 0.01 N sodium acetate solution containing 33 mL/L of acetic acid

Mobile phase: Acetonitrile, 2-aminoheptane, and *Solution A* (50: 0.5: 50). Filter, and degas.

Standard solution: 500 µg/mL of USP Verapamil Hydrochloride RS in *Mobile phase*

Sample solution: Agitate containers of Oral Solution for 30 min on a rotating mixer,

remove a 5-mL sample, and store in a clear glass vial at -70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix on a vortex mixer for 30 s. Pipet 1.0 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 278 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

USP Verapamil Hydrochloride RS

BRIEFING

Zaleplon, *USP 38* page 5825. Based on the comments received, it is proposed to revise the

monograph as follows:

1. Replace the test for *Organic Impurities* procedure with a different gradient elution liquid chromatographic procedure because the existing procedure is not selective enough to separate an additional process impurity from a different manufacturing process. The proposed new procedure is capable of separating and quantifying six different process impurities from two different manufacturing processes. The liquid chromatographic procedure is based on the validations performed with the YMC Pack C8 brand of L7 column in which zaleplon elutes at about 11 min.
2. Introduce a new Reference Standard to support the proposed new *Organic Impurities* procedure. The proposed new Reference Standard, USP Zaleplon Related Compound C RS, forms a critical pair with USP Zaleplon Related Compound A RS.

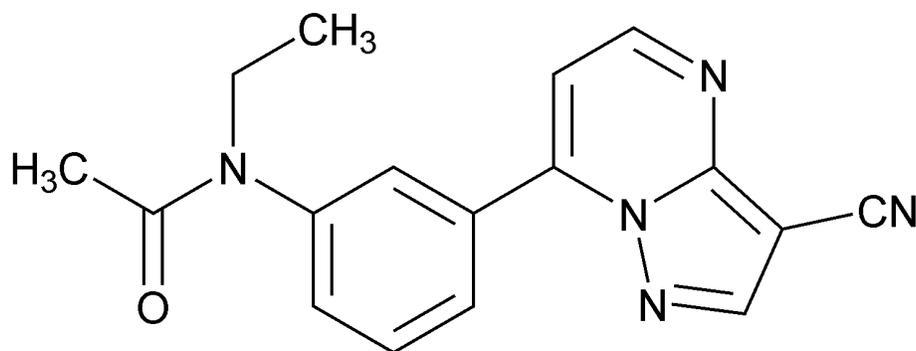

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM4: R. Ravichandran.)

Correspondence Number—C112937

Comment deadline: March 31, 2015

Zaleplon

$C_{17}H_{15}N_5O$ 305.33

Acetamide, *N*-[3-(3-cyanopyrazolo[1,5- α]pyrimidin-7-yl)phenyl]-*N*-ethyl- ;
3'-(3-Cyanopyrazolo[1,5- α]pyrimidin-7-yl)-*N*-ethylacetanilide [151319-34-5].

DEFINITION

Zaleplon contains NLT 98.0% and NMT 102.0% of zaleplon ($C_{17}H_{15}N_5O$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. Infrared Absorption** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **Procedure**

Buffer: 0.3 g/L of ammonium formate in water. Adjust with formic acid to a pH of 4.0.

Mobile phase: Acetonitrile and *Buffer* (7:18)

Diluent: Acetonitrile and water (1:1)

System suitability solution: 0.5 mg/mL of USP Zaleplon RS and 0.5 µg/mL each of USP Zaleplon Related Compound A RS and USP Zaleplon Related Compound B RS in *Diluent*

Standard solution: 50 µg/mL of USP Zaleplon RS in *Diluent*

Sample solution: 50 µg/mL of Zaleplon in *Diluent*

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 245 nm

Column: 4-mm × 10-cm; 3-µm packing L1

Flow rate: 1 mL/min

Injection volume: 10 µL

Run time: Two times the retention time of zaleplon

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for zaleplon and zaleplon related compound B are 1.0 and 1.2, respectively.]

Suitability requirements

Resolution: NLT 2.0 between zaleplon and zaleplon related compound B, *System suitability solution*

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of zaleplon (C₁₇H₁₅N₅O) in the portion of Zaleplon taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of zaleplon from the *Sample solution*

r_S = peak response of zaleplon from the *Standard solution*

C_S = concentration of USP Zaleplon RS in the *Standard solution* (µg/mL)

C_U = concentration of Zaleplon in the *Sample solution* (µg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization consists of several steps (**Stages 1** through **7**, as defined below). Stage 4 drafts are available for comments. Below are descriptions of the developmental Stages as defined by the United States Pharmacopeia, the European Pharmacopoeia, and the Japanese Pharmacopoeia.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a

harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

STIMULI TO THE REVISION PROCESS

Stimuli articles do not necessarily reflect the policies of the USPC or the USP Council of Experts

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of Expert Committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues.

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* section. Readers interested in submitting comments should see *Instructions to Authors*.

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP-NF* revision will be considered for publication in *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously in any language or medium and that they are not simultaneously under consideration by any other publication. All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication they will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention (USPC) and may not be subsequently published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

Style and Usage—*Stimuli* articles generally follow the current *Chicago Manual of Style* except in scientific usage (numbers, abbreviations, etc.). For the latter, authors should use the current *AMA Manual of Style* or the current *ACS Style Guide*. Authors may usefully consult a current edition of *Pharmacopeial Forum*.

References—Consult the current *AMA Manual of Style*, which is generally consistent with the National Library of Medicine's *Recommended Formats for Bibliographic Citation*. A current edition of *Pharmacopeial Forum* will offer examples of reference formats.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Disclosure of Potential Conflicts of Interest—Maintaining independence and impartiality are critical to the integrity and credibility of USP's public health mission. Accordingly, authors are expected to conform to the Conflict of Interest provisions of the USP Code of Ethics (see link below), including as part of their manuscript submission disclosure of all financial and personal relationships that may potentially influence, or be perceived to influence, their article. USP staff are available to provide additional guidance to authors on the range of disclosure that would be appropriate. Although USP *Stimuli* articles are not the type of source likely to be relied on as a basis for governmental actions (e.g., not a vehicle for reports of human clinical research), USP nevertheless supports the overall policies of the International Committee of Medical Journal Editors (ICMJE) regarding Uniform Requirements for Manuscripts Submitted to Biomedical Journals and Ethical Considerations in the Conduct and Reporting of Research (links below).

USP Code of Ethics:

<http://www.usp.org/aboutUSP/governance/policies/codeOfEthics.html>

ICMJE Uniform Requirements:

http://www.icmje.org/urm_main.html

ICMJE Conflicts of Interest:

<http://www.icmje.org/conflicts-of-interest/>

Contact Person—USP will designate a Scientific Liaison in the Documentary Standards Division as the corresponding author. This ensures that USP receives all comments generated by the *Stimuli* article. Authors should contact the Scientific Liaison if they would like to receive copies of comments generated by their *Stimuli* articles.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

《 671 》 *Containers—Performance Testing: Use of Water-Filled Test Containers for Water Vapor Transmission Rate Determinations*

Dwain L. Sparks^a and Seung-yil Yoon, PhD^{a,b}

ABSTRACT

This *Stimuli* article proposes the use of water as an alternative test-sample fill medium for water-vapor transmission rate (WVTR) determinations described in general chapter *Containers—Performance Testing* 《 671 》 for container-closure systems for solid oral drug products. The use of water as the test-sample fill medium eliminates problems with the handling of desiccants and also maintains a constant vapor-pressure difference across the container wall for the duration of the study, thereby reducing bias and variability in the WVTR determinations. Use of water-filled test containers is already provided in the chapter 《 671 》 method for the determination of weight loss for *Multiple-Unit Containers* and *Unit-Dose Containers for Liquids*, but has not been extended to the determination of the WVTR of bottle and blister container-closure systems for solid oral drug products.

INTRODUCTION

Traditionally, the water-vapor transmission rate (WVTR) of container-closure systems for solid oral drug products has been determined by using desiccant-filled test containers stored in environmental chambers to create a difference in relative humidity (RH) or vapor pressure inside versus outside the test containers. Use of desiccants can be problematic, however, because an inadequate amount of desiccant or incompletely dried desiccant may result in variability of the vapor-pressure differences between the inside and outside of the container during the study. This potential variability of the vapor-pressure difference can both bias and increase variability in WVTR determinations.

Eli Lilly and Company has proposed that the water-filled container method be adopted as an industry standard, by inclusion in general chapter 《 671 》, for WVTR determinations of container-closure systems for solid oral drug products. The authors anticipate that readers will incorporate this alternative method into their WVTR testing program.

USE OF DESICCANTS FOR WVTR DETERMINATION

According to the WVTR methods described in chapter *Containers—Performance Testing* 《 671 》, test containers are to be filled with sufficient anhydrous desiccant to maintain an inside RH close to 0% during the study. Desiccant-filled test containers are held in an environmental chamber, and weight determinations are made over time. Under constant environmental conditions, plastic [e.g., polyethylene, polypropylene, polyvinylchloride (PVC), and polychlorotrifluoroethylene (PCTFE)] container walls reach a steady state of water concentration after a preconditioning period. The inside RH remains constant during testing if adequate anhydrous desiccant is present. The weight gain of the desiccant is determined at

this steady-state condition and is translated into a permeation rate for the test container-closure system. In this *Stimuli* article, %RH is used to express the environmental chamber conditions and the headspace inside the test containers.

To obtain reliable WVTR determinations, humidity must remain constant inside and outside the test container throughout the study. Results from desiccant-filled test containers do not account for potential variability introduced if the internal RH of test containers neither starts at 0%, nor remains at 0% during the study. A recent *Stimuli* article describes improvements in desiccant preparation that are designed to maintain the internal RH below 10% throughout the study. However, this internal RH range (0%–10%) translates to variability in the internal RH. In contrast, a test container filled with water will maintain a constant RH (100%) from the beginning to the end of the WVTR study, thereby reducing potential variability.

USE OF WATER AS AN ALTERNATIVE FILL MEDIUM

To address the challenges involved in the use of desiccant-filled test containers, it is proposed to use the water-filled container method as an alternative approach for the determination of WVTR of container-closure systems for solid oral drug products. Desiccant-filled test containers stored in a 40°/75% RH chamber achieve a vapor-pressure difference of 65%–75% if the internal RH created by the desiccant ranges from 0% to 10%. On the other hand, water-filled test containers stored in an environmental chamber at 40°/25% RH achieve and maintain a constant vapor pressure difference of 75%.

Experience with Water-Filled Test Containers

In practice, multiple benefits have been realized by implementing WVTR testing using water as the test medium for blister samples. With water, the variability of the fill amount does not result in variability of internal RH, and no interaction with container walls has been observed. The stability of the internal RH afforded by water facilitates holding the samples or reusing them at a later time, or in multiple studies (e.g., different storage conditions using the same samples). Additional measurements or extensions of studies are possible without concern about depleting the water.

In addition, potential exposure of desiccant to moisture during filling and handling before testing is eliminated with the water-filled container method, and physical damage to foil lidding caused by desiccant is also eliminated. This includes elimination of special handling requirements to protect desiccant-filled blister samples from excessive exposure to moisture before testing. Also, samples filled with aqueous dye can be used for leak testing before or after WVTR testing. Use of dye enhances visual detection of gross leaks during the study.

Sample preparation techniques are important for filling blisters with water. The best practice for delivering water into the cavities on the packaging line was developed using a manual syringe filled with water, allowing delivery of a few drops of water to each cavity without causing sealing problems.

Amount of Water for Test Containers

For blisters, approximately 10–100 mg of water (about 1–10 drops), depending upon expected WVTR, is adequate for all blister types at 40°/25% RH. As an example, consider the preparation of a low-barrier WVTR package, e.g., a PVC water-filled blister as shown in *Table 1*. The expected WVTR is about 1.5 mg water/(day × cavity) at 40° and a 75% RH vapor-pressure

difference. The initial amount of water required to create 100% RH at 40° in this blister (approximately 0.5 cc volume) is 0.025 mg of water, on the basis of absolute humidity. For a typical WVTR study of a low-barrier blister, 2 days are allowed for equilibration, followed by a study period of 15 days for obtaining 3–5 weight determinations. This is a total exposure time, or permeation time, of 17 days. According to *Equation 1*, a minimum of 25.5 mg of water is needed.

$$1.5 \text{ mg water}/(\text{day} \times \text{cavity}) \times 17 \text{ days} + 0.025 \text{ mg} = 25.5 \text{ mg water/cavity} \quad (1)$$

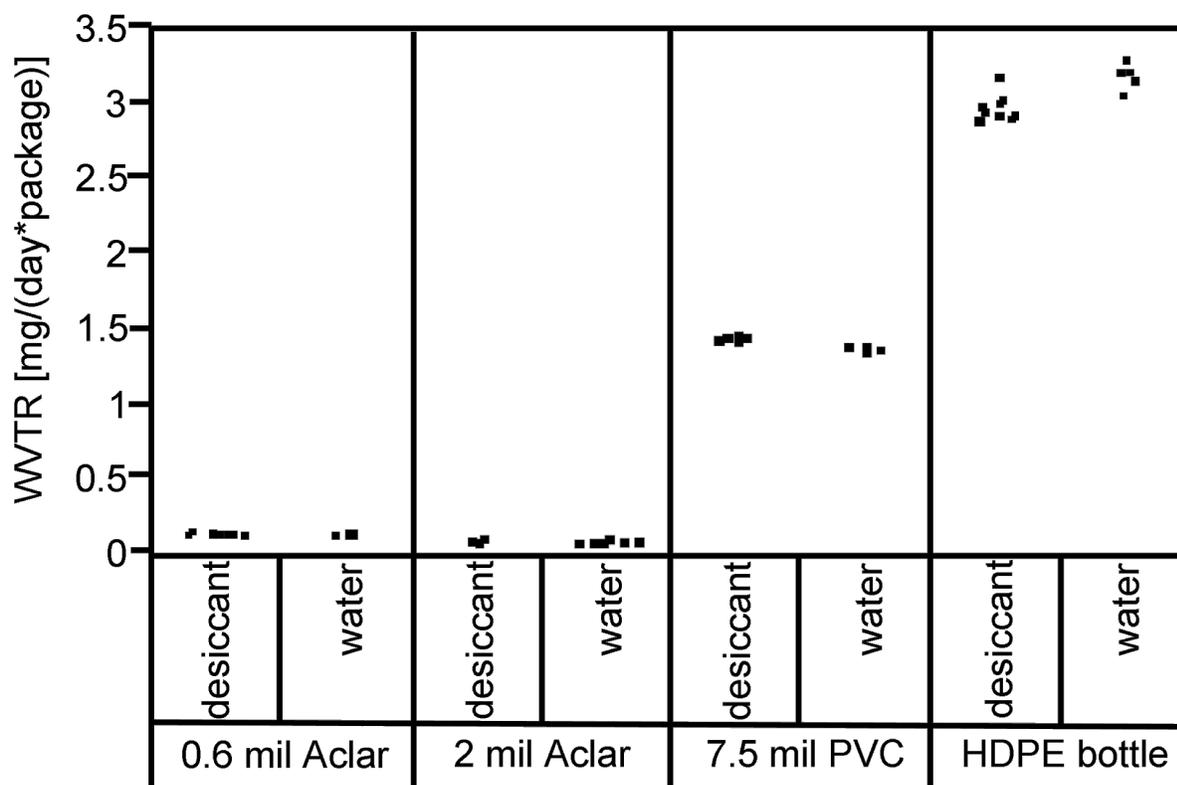

The recommended amount of water for this blister system is about 50 mg. *Equation 1* can be used to determine the minimum amount of water for all blister types, and this amount should then be multiplied by 2–3 to achieve an excess. For bottles, a 10%–25% fill volume of water will create and maintain 100% RH during the entire study.

Comparison of Results for Water-Filled and Desiccant-Filled Test Containers

Observed differences in WVTR results for water-filled test containers versus desiccant-filled test containers are practically insignificant. Several sets of data are provided in *Table 1*. The raw data for each set are shown graphically in *Figure 1*.

Table 1. Summary of WVTR Studies Comparing Desiccant-Filled and Water-Filled Samples

Sample description	Fill medium	Chamber conditions	Number of test containers	Average WVTR
7.5 mil PVC	Molecular sieves	40°/75% RH	10	1.46 mg/(day × cavity)
7.5 mil PVC	Water	40°/25% RH	5	1.39 mg/(day × cavity)
0.6 mil PCTFE	Calcium chloride	40°/75% RH	10	0.161 mg/(day × cavity)
0.6 mil PCTFE	Water	40°/25% RH	6	0.162 mg/(day × cavity)
2 mil PCTFE	Molecular sieves	40°/75% RH	10	0.104 mg/(day × cavity)
2 mil PCTFE	Water	40°/25% RH	10	0.105 mg/(day × cavity)
325 mL HIS ^a HDPE ^b Bottle	Calcium chloride	40°/75% RH	10	2.97 mg/(day × package)
325 mL HIS HDPE Bottle	Water	40°/25% RH	5	3.20 mg/(day × package)
^a HIS, heat induction sealed. ^b HDPE, high-density polyethylene.				

Sample type (desiccant-filled vs. water-filled) within package type

Figure 1. Graphic representation of raw data for *Table 1*.

SUMMARY AND CONCLUSIONS

WVTR can be measured in terms of desiccant weight gain or water weight loss for a container-closure system held in an environment with constant temperature and RH. Test containers filled with water provide a constant vapor-pressure difference across test container walls, offering potential improvements in WVTR testing compared to desiccant-filled containers where the vapor pressure inside may neither start nor remain at 0% RH. Also, use of water-filled containers mitigates many of the challenges inherent in the preparation and handling of desiccant and desiccant-filled containers. Eli Lilly and Company has proposed that the water-filled container method be included in general chapter $\langle 671 \rangle$ and be adopted as an industry standard for WVTR determinations of container-closure systems for solid oral drug products.

ACKNOWLEDGMENTS

The authors would like to acknowledge Lilly colleagues for their contributions to this work: Juan Arandia, Tamara Edelman, Allan Hoepers, Timothy Kramer, Jacob Lewis, David Pena, Michael Skibic, and Randy Thackrey. Also, the authors acknowledge that the contributions by Mocon and the members of the USP $\langle 671 \rangle$ Expert Panel and the PQRI Container/Closure Systems Working Group continue to be an important and valuable resource for the science of permeation testing and for the utilization of WVTR values for drug product registrations.

Collaborative Study of the Variability of Drug Release Results from Nicotine Gums using Two Apparatus Designs

William Brown,^{a,d} Jayachandar Gajendran,^b Walter Hauck,^c and Johannes Krämer^b

ABSTRACT The differing types of orally administered dosage forms require different apparatus designs for testing drug release. Performance tests used to characterize medicated chewing gums have been described in the *European Pharmacopoeia*. Although the apparatus designs have been described, no report of the variability of results from those apparatus designs has been published. This *Stimuli* article provides the results of a multiple-laboratory collaborative study of this variability. The study evaluates the variability of results from both the gums and the apparatus design used. A nicotine polacrilex gum product, which is not available commercially, was evaluated in this study. The results show that controls need to be applied to the procedures and apparatus designs. A comparison of results from the two apparatus designs is given in this *Stimuli* article.

INTRODUCTION

The scientific rationale for the application of compendial performance testing for medicated chewing gums has been discussed elsewhere (1). Currently, USP does not describe general performance testing procedures for medicated chewing gums. Two apparatus designs for testing medicated gums are described in the *European Pharmacopoeia (Ph. Eur.)* (2). The *Ph. Eur.* nomenclature is followed in this *Stimuli* article.

The feasibility of the use of both apparatus A and apparatus B designs has been demonstrated for the drug release testing of medicated chewing gums by using marketed, multi-source, nicotine chewing gums (3). Gajendran et al. (3) demonstrated acceptable drug release testing methodology that was verified by an alternative in vitro-in vivo correlation approach (3, 4). An understanding of the source and degree of variability associated with the test performance, within and between the laboratories, is a necessary precursor to consideration of inclusion of new compendial performance test procedures (5). Overall, the variability of performance testing results can be affected by: unit-to-unit variability of the samples; variability in the performance of the test apparatus; and variability related to the laboratory procedures, operator, and analytical procedures. The USP Dosage Forms Expert Committee requested this study to test the suitability and performance of the apparatus designs used for performance testing of medicinal gum products and to detect potential sources of variability of results for the available medicated chewing gum performance test apparatus. The results of this study are reported here.

STUDY DESIGN

A multiple-laboratory study was conducted using two commercially available nicotine gum products from the U.S. market for which no compendial performance test is required. A compressed gum formulation was also manufactured expressly for the study. A call for participants identified six laboratories that had at least one of the apparatus designs described

in *Ph. Eur. 2.9.25 Dissolution Test for Medicated Chewing Gums*. Participants were required to furnish data from two runs of six units, conducted by two analysts, as a measure of the intermediate precision of the results. Sample identity was not disclosed to the participants. The participating laboratories are listed in *Table 1*. Laboratories were responsible only for testing and results from the apparatus designs in their laboratory and did not need to test both apparatus A and B designs. Five of the participating laboratories provided data from apparatus B, and one laboratory also provided data from apparatus A.

MATERIALS AND METHODS

PROTOCOL

Samples: 2-mg nicotine chewing gums Commercial 1 (*Product A*), Commercial 2 (*Product B*), and development formulation (*Product C*)

Medium: Simulated saliva, pH 6.2; 12 mM monobasic potassium phosphate, 40 mM sodium chloride, and 1.5 mM calcium chloride, adjusted to pH 6.2 ± 0.05 with sodium hydroxide solution

Test procedure: Six units of the sample were tested (one per cell) in 40 mL of simulated saliva, pH 6.2 (no degassing). The test was conducted at $37^{\circ} \pm 0.5^{\circ}$. Three-mL samples were taken at 5, 10, 20, 30, 45, and 60 min with *Medium* replacement by an equivalent volume of preheated fresh *Medium* for times <60 min. Samples were filtered through an Acrodisc LC-13 mm PVDF membrane filter (or equivalent) of 0.45- μ m pore size with the first 1 mL of filtrate discarded.

For apparatus B, two circular plastic nets (Nylon PA6; 1.4-mm aperture; 0.405-mm wire diameter) were used in each cell as described in *Ph. Eur. 7.5*.

Table 2. Test Parameters for Apparatus A and Apparatus B

	Distance between Horizontal Pistons (mm)	Masticatory Frequency (strokes/min)	Distance from Vertical Piston to Bottom (mm)	Twisting Angle of Jaws ($^{\circ}$)
Apparatus A	0.5	40	3	—
Apparatus B	—	40	1.4	20

hplc method parameters

Standard solutions: 46.5, 29.8, and 2.33 μ g/mL

Sample solution: The *Sample solution* response was mapped to the standard curve calculated from the concentration and responses of the injected *Standard solutions*.

Chromatographic system

Column: Xterra RP 18; 150 × 4.6/3.9 mm, 5 µm or equivalent

Mobile phase: 0.04 M potassium phosphate monobasic, pH 6.5, methanol (98:2 v/v), 30°

Flow rate: 1.2 mL/min

Injection volume: 50 µL

Detection wavelength: 260 nm

statistical methods

Evaluating the results from apparatus A

A complete statistical analysis for apparatus A was not possible due to the limited data available. A limited comparison of results from apparatus A and apparatus B submitted by a single laboratory is provided.

Evaluating the results from apparatus B

Each of the six sampling times was analyzed separately. By doing so, there was no need to model either the amount released or the variances as a function of time. For each sampling time-product combination, the data were analyzed as an analysis of variance (ANOVA) of random effects, with laboratory and analyst nested within laboratory as random effects. Initial analyses were conducted in the untransformed (mg) scale and after log transformation. Log transformation for all three products was used because the distribution of residuals better followed a normal distribution.

For presentation, results from the log scale analyses were back-transformed to the original scale. Thus, the average reported is a geometric mean. The residual variance from the ANOVA is the estimated repeatability variance in the log scale, and the sum of the three components (between-laboratory, between-analyst, and residual) is the estimated reproducibility variance. For reporting, these were converted to the percentages of the coefficient of variance (%CVs) in the original scale using the log-normal formula.

RESULTS AND DISCUSSION

Five laboratories participated in the study, and each laboratory was to conduct the experiment with *Ph. Eur.* apparatus A or B design but could participate only if the laboratory had one of the two apparatus designs. For each apparatus, each laboratory was to conduct six runs by each of two analysts for each of three products (*A*, *B*, and *C*). The inclusion of two analysts was to capture intermediate precision information. All laboratories followed the protocol for apparatus B, except that laboratory 6 ran *Product C* with only one analyst and laboratory 3 did not test *Product C*.

Laboratory 1 provided data for the three products from apparatus A with the exception that only one analyst performed testing for *Product A*.

Evaluation of Results from Apparatus B

The first step was to examine the data sets for unusual values and trends; two data sets were identified. First, many values from lab 3 were >2 mg, the labeled nicotine content of all three products (see *Figures 1* and *2*). Data from this lab were dropped from further analysis. Second, one run from lab 6 for *Product C* was out of line with all of the other data from that lab and the

other labs (see *Figure 3*). In the ANOVA, these six values were the six largest studentized residuals. This run was dropped from further analyses, leaving data available for analyses from 48 runs for each time point for each of *Products A* and *B* and from 41 runs for each time point for *Product C*.

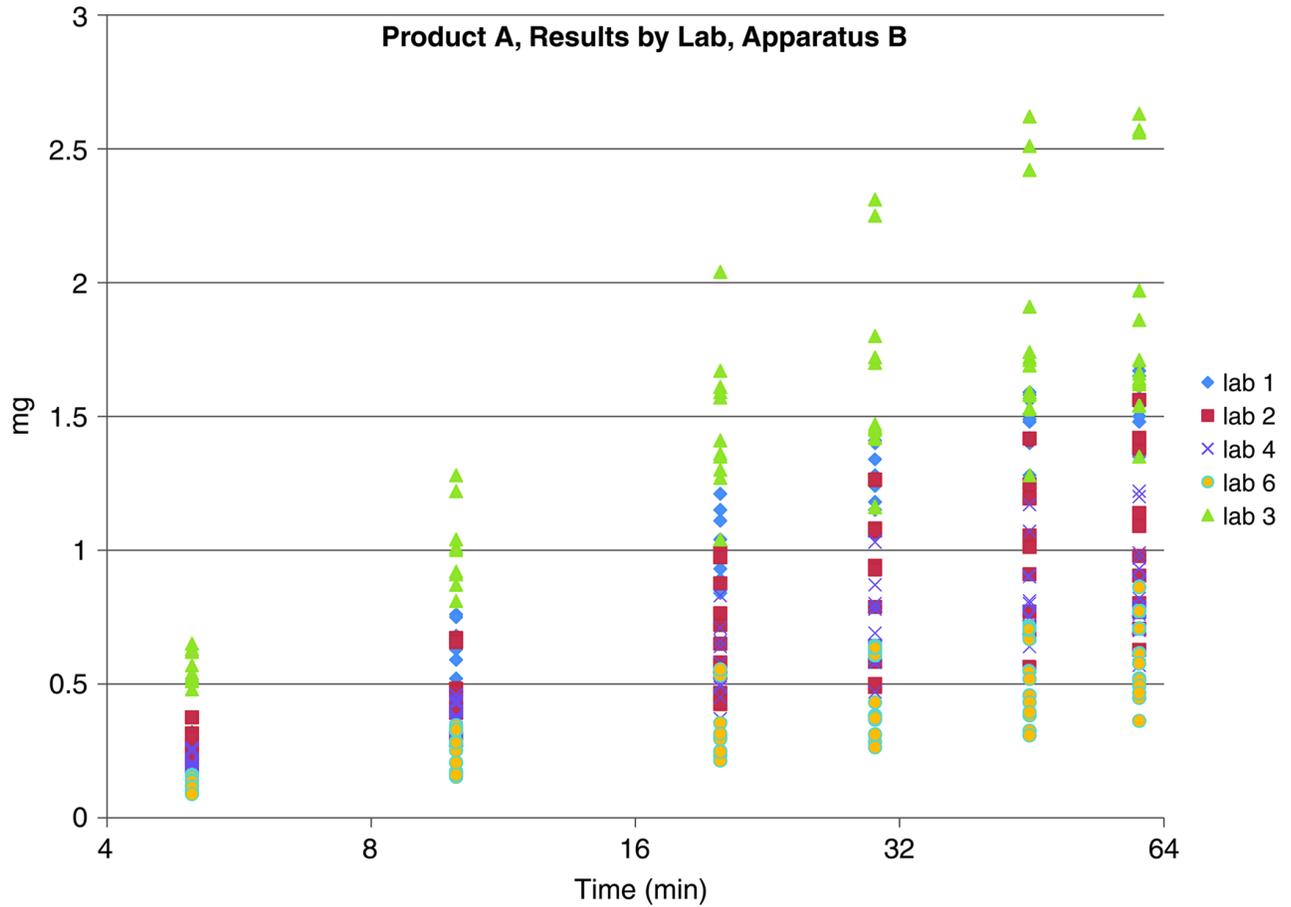

Figure 1. *Product A* data.

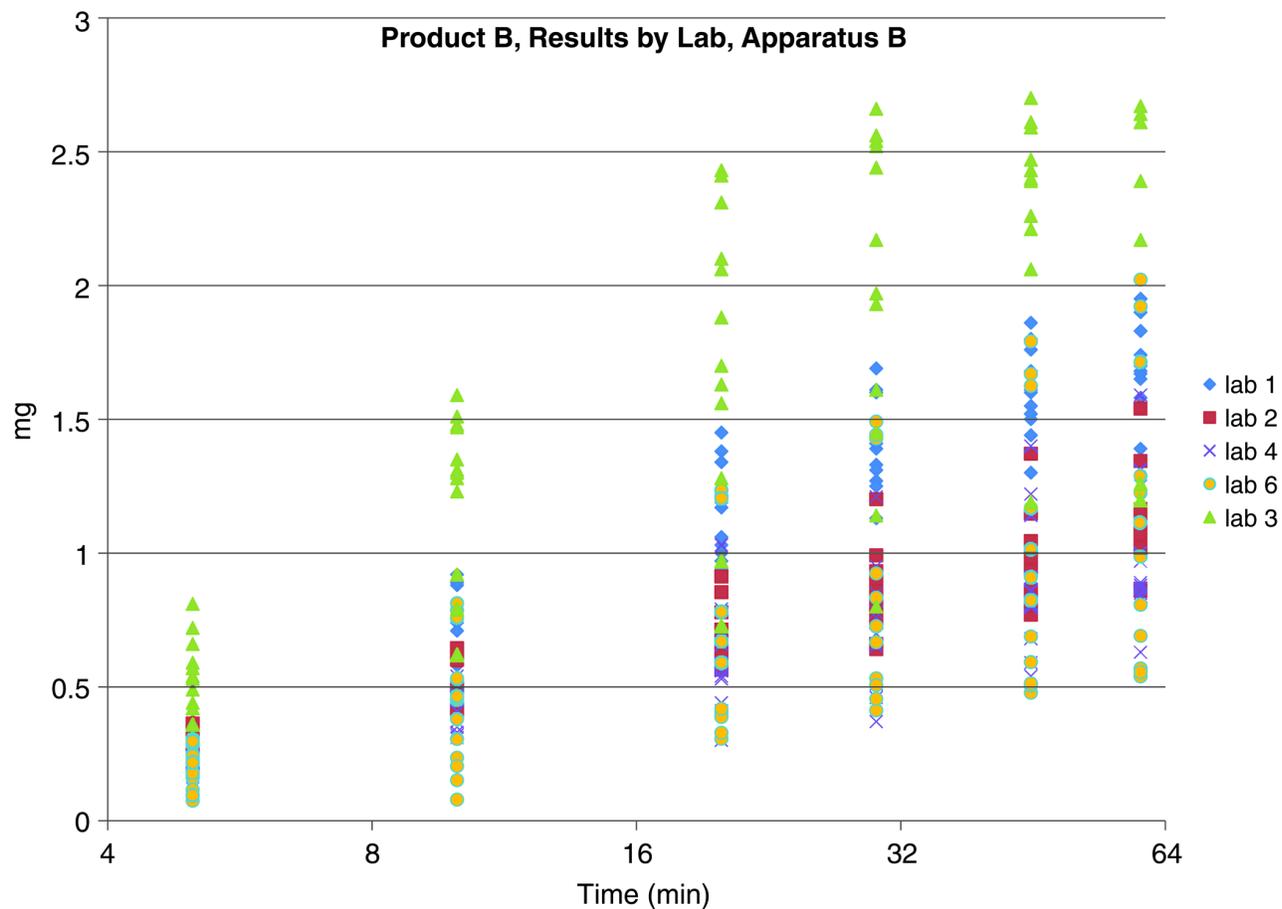

Figure 2. Product B data.

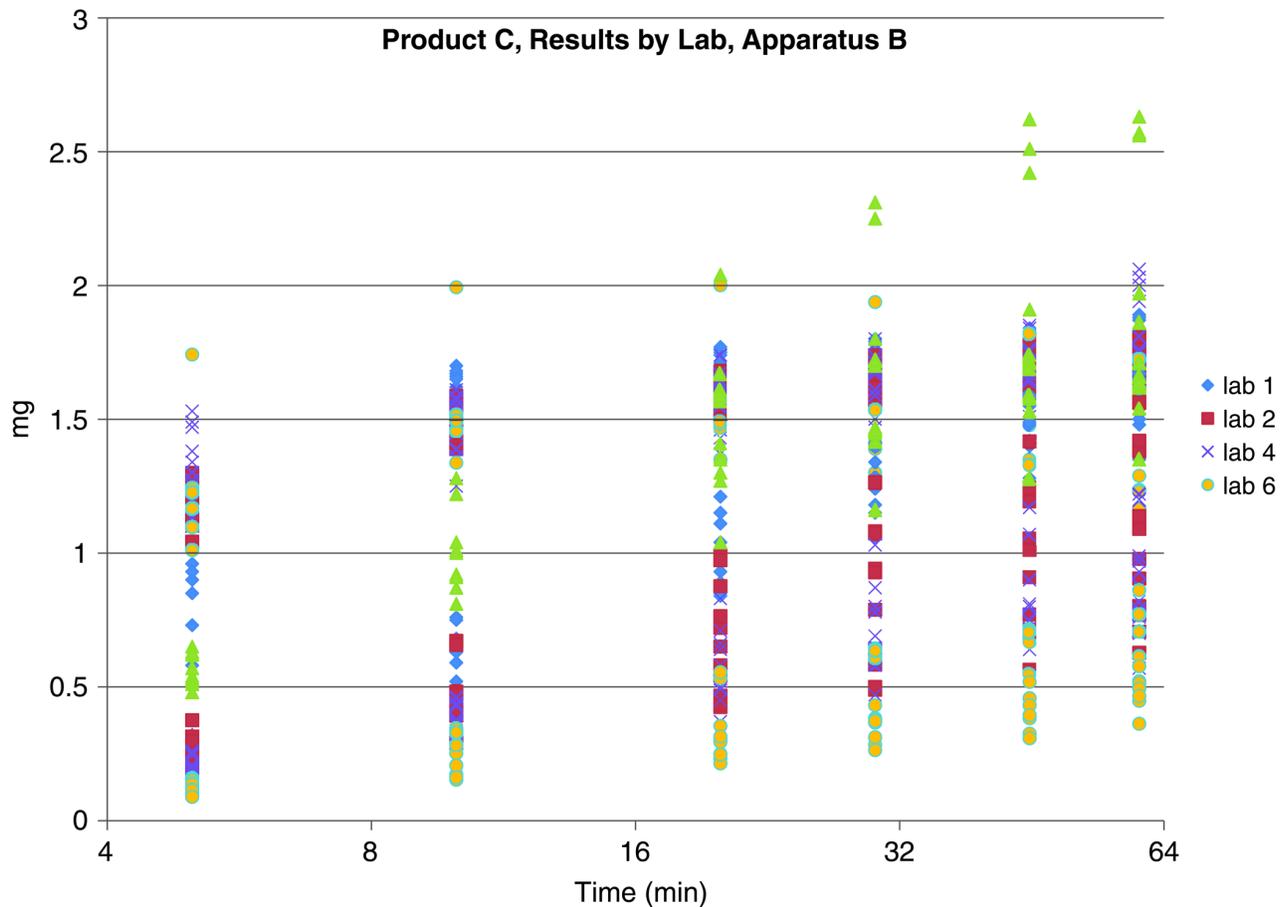

Figure 3. *Product C* data.

Tables 3, 4, and 5 present the geometric mean of amount recovered, repeatability %CVs, and reproducibility %CVs, respectively. Of note is how *Product C* differs from the other two products. *Product C* was developed for this study, whereas *Products A* and *B* are commercial products. The product literature for nicotine polacrilex gums indicates decreasing in vivo release after 30 min of chewing (6). *Product C* had much faster recovery, with the average amount recovered at 5 min equaling or exceeding the averages at 60 min for the other two products. Also, the variability of results for *Product C* is much less, although some of the variability may be due to being farther on the recovery asymptote than the other two products. However, at similar levels of recovery for *Products B* and *C*, *Product C* had considerably lower variability. At 5 min, *Product C* had released 1.20 mg of nicotine, while 1.03 and 1.16 mg of nicotine were released for *Product B* after 45 and 60 min, respectively. The repeatability %CV for *Product C* at 5 min was 12.0%, while for *Product B* the repeatability at 45 and 60 min was 21.5% and 21.2%, respectively. The reproducibility %CV for *Product C* at 5 min was 19.6%, while for *Product B* the reproducibility at 45 and 60 min were 42.4% and 40.6%, respectively. The reproducibility of results has a combined source in the apparatus, method, analyst, laboratory, and the gum sample. The repeatability of results for *Product C* is much less than for *Products A* and *B*. Although this is not a surprising observation for time points after 20 min where the release rate decreases to zero, it is also true for the 10-min timepoint and to a lesser degree at the 5-min timepoint. This serves as an indicator that the contribution from the apparatus design to the reproducibility of the results is not excessive. Other sources, such as the inherent variability of in vitro performance for the marketed products, may have a greater effect.

Table 3. Average Recovered^a for the Three Nicotine Gum Products (mg) Tested with Apparatus B

Product	Time (min)					
	5	10	20	30	45	60
A	41.0%	51.5%	56.7%	56.4%	54.0%	51.5%
B	39.1%	53.8%	47.9%	44.5%	42.4%	40.6%
C	19.6%	7.1%	7.3%	9.6%	13.2%	17.6%

^a Includes repeatability, within-laboratory (between-analyst), and between-laboratory components.

Comparison of Apparatus A and Apparatus B Designs

One participating laboratory provided results from both apparatus designs, enabling a comparison of nicotine release using the two apparatus designs. The releases for both *Products A* and *B* were higher when apparatus A was used than was observed for apparatus B. *Figure 4* compares the average profiles from those products. In this limited study, the variability of results from the two apparatus designs seems to be different, with variance estimates higher for apparatus B than for apparatus A at all test time points and for times after 5 min, at least by a factor of 2 (*Table 6*).

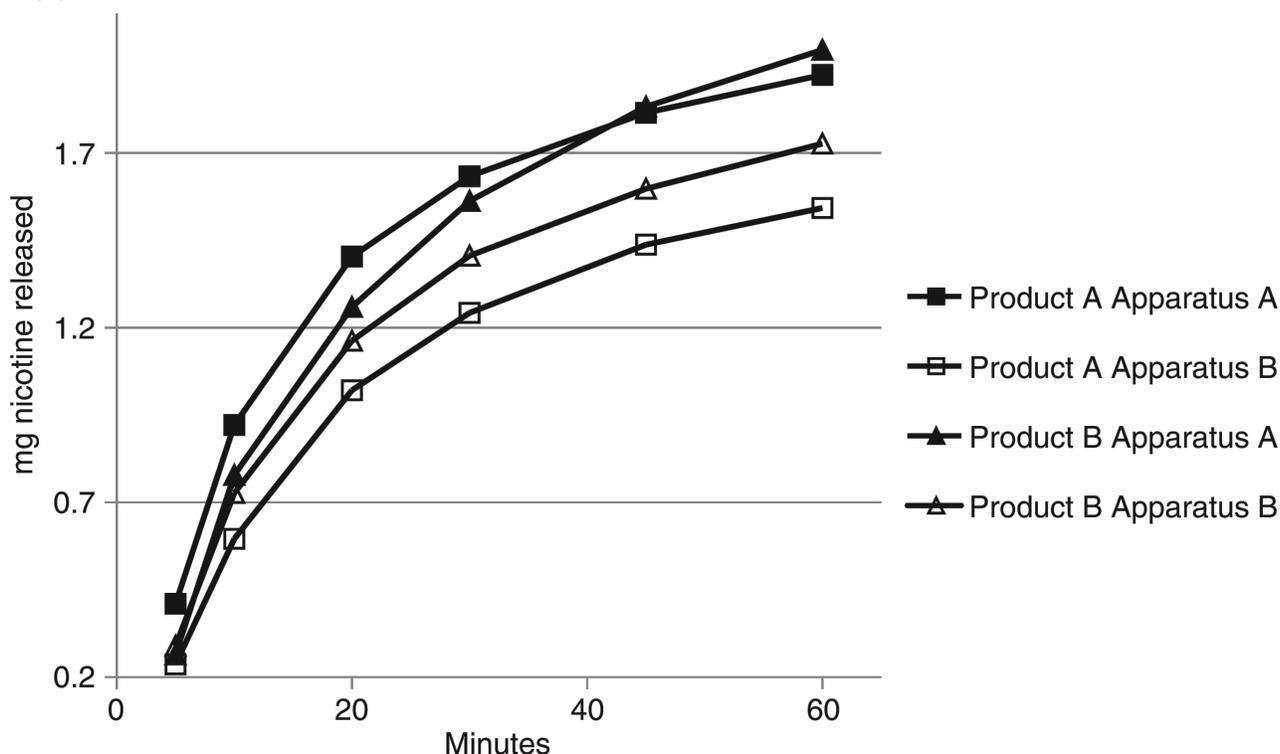

Figure 4. Comparison of nicotine release from *Products A* and *B* with apparatus A and apparatus B.

Table 6. Variance Ratios of Results for *Products A* and *B* Tested with Apparatus A and Apparatus B

Time (min)	Variance Ratios (Apparatus B to Apparatus A)					
	5	10	20	30	45	60
<i>Product A</i> ^a	3.2	2.9	2.8	3.5	4.0	4.8
<i>Product B</i>	1.4	7.8	10.5	11.5	14.7	21.0

^a Only 6 units of *Product A* were tested using apparatus A.

Conditioning the Sample

Several participants reported that thermal conditioning was required to test the samples in apparatus B. Freshly introduced samples resisted the vertical reciprocating action of the plates, but conditioning the samples in the heated medium for 5 min softened the samples, allowing testing to progress.

CONCLUSIONS

Medicated gum performance in vitro represents variability that can be studied and is potentially useful for the control of marketed products. Interlaboratory reproducibility is fairly high, roughly two-fold greater than the repeatability. This is an indication that a performance verification test might be justified and that continuing refinement of operating parameters will be of value. The repeatability of results from the marketed products is an indication that in vitro performance controls may add value in a strategy of control of the marketed product quality. The marketed products (*Products A* and *B*) released their nicotine content incompletely (45%–60%) over the 60-min test time with both test apparatus designs. This may be a reflection of

designed drug release mechanisms. Packaging inserts instruct the consumer to chew the gum until a tingling sensation is observed and, at that point, to place the gum in the buccal pouch until the sensation abates. The continuing renewal of the nicotine release is achieved by renewed chewing but decreases over time. The instructions indicate that the gum should be removed from the mouth after 30 min.

The specially manufactured product (*Product C*) released more rapidly, with a plateau (80%) established after 20 min of the test. The rapid release might offer an opportunity for a performance verification exercise that can be completed in a short period of time that would be convenient for laboratory quality systems. The less variable performance of *Product C*, at a point in the drug release profile where release is comparable to the marketed products, indicates that *Product C* may be a suitable candidate for reference standard use.

The recognition of the need to precondition the gum samples at the temperature of the test represents an improvement in any general procedure. This observation, along with other improvements, will be incorporated in the draft of chapter *Mucosal Drug Products—Product Performance Tests* (1004) that will be proposed in a future issue of *Pharmacopeial Forum*.

The comparison of apparatus A and apparatus B is limited due to the availability of apparatus A. On the basis of this limited experience, three observations are made: 1) apparatus A seems to enable a more rapid release of nicotine from the marketed products sampled than was seen for apparatus B; 2) the results from apparatus A appear to be less variable than results from apparatus B; and 3) with the results from apparatus A as a model, refinement of the procedures associated with apparatus B could improve the variability of results.

In summation, the contribution of the apparatus to the reproducibility of results is less than the variability contributed by the laboratory and the gum sample. Both apparatus A and apparatus B show promise for in vitro release testing of medicated gums.

Medicines Marketed under the Food and Drug Administration Over-the-Counter Drug Monograph System Regulations: Strategy for Developing Compendial Quality Standards

Alan Potts, PhD,^{a,e} Ernest Parente, PhD,^b Tina Engel, PhD,^c and Matthew Van Hook, JD,^d

ABSTRACT This *Stimuli* article explains how the United States Pharmacopeia (USP) proposes to provide better coverage and control of drug product quality through a process that better parallels and supports the Food and Drug Administration Over-the-Counter Drug Monograph System (FDA OTC System). Rationale is provided for using general chapters to organize related tests and procedures in one place for simplified reference from related individual monographs. This *Stimuli* article provides a review of the OTC medicines, USP monograph coverage, and challenges for the development of drug product quality standards. A strategy for developing reference procedures for *Identification*, *Assay*, and *Organic Impurities* will be discussed.

3. General Considerations

- 3.1 Using General Chapters to Achieve Efficiencies in Creating a USP OTC Product Monograph System
- 3.2 Grouping Strategy of Drug Substances

4. Conclusion

1. INTRODUCTION AND BACKGROUND

The United States Pharmacopeial Convention (USP) has begun an initiative to establish and modernize drug product monographs that are applicable to medicines legally marketed under the system established by the FDA under the Federal Food, Drug, and Cosmetic Act (FDCA) for drugs that satisfy all of the requirements in 21 CFR Part 330, their respective therapeutic category monographs, and all other legal requirements (collectively, the FDA OTC Drug Monograph System, which is referred to as the FDA OTC System throughout). Drug products defined in this category are often described as being “generally recognized as safe and effective” (GRASE) and do not require FDA pre-market approval through the pathways of New

Drug Application (NDA)/Abbreviated New Drug Application (ANDA)/Biologics License Application (BLA). This category of drug products includes hundreds of individual drug substances marketed in the form of thousands of drug products. Considering the branding and labeling representations for these products, and not-yet marketed potential combinations, the number of versions marketed legally is considerably greater.

USP already has compendial monographs for many of the "active ingredients" referenced in the FDA OTC System. However, currently USP has not published compendial monographs for most of the OTC drug products currently on the US market and faces the challenge of establishing monograph standards for a broader range of these existing and potential "drug products". Because OTC products are deemed to be safe and effective as a class, the FDA does not require pre-marketing review and approval of quality specifications for OTC products. Each manufacturer establishes the necessary specifications and quality assurance controls for each product in compliance with current Good Manufacturing Practices (cGMPs). When available, USP standards play a critical role in quality assurance. Accordingly, USP is determined to assure that each of its applicable drug substance monographs is kept up-to-date and to provide even better compendial coverage of the legally marketed OTC drug products. Furthermore, USP is prioritizing the development and revision of monographs for as many of the FDA OTC combinations/drug products as is practicable. Certain common OTC drug products are already covered by a USP drug product monograph [e.g., Acetaminophen, Dextromethorphan Hydrobromide (HBr), Doxylamine Succinate, and Pseudoephedrine Hydrochloride (HCl) Oral Solution], but most marketed products currently lack an applicable compendial drug product monograph.

Recently, with the support and urging of FDA and other stakeholders, USP has made compendial standards for FDA OTC System medicines a major focus to ensure improved and ultimately complete coverage of quality standards for this large, consumer-accessible market. USP believes that the optimal way to provide better coverage and control of drug product quality may be through a streamlined monograph development process that parallels the efficiencies of the FDA OTC System by using general chapters to organize related tests and procedures in one place for simplified reference in related individual monographs. This *Stimuli* article outlines current thinking and provides an expanded discussion for the associated monographs and general chapters proposed in this *Pharmacopeial Forum (PF)*.¹

1.1 Scope

The objective of this initiative is to develop a strategy for establishing public quality standards for all OTC GRASE drug products that come to market through the FDA OTC System. *Figure 1* summarizes common pathways for the entry of drug products into commerce. Quality standards for *Prescription Drug Products* (Rx) and OTC products that come to market via the NDA/ANDA/BLA process are established using the specifications emanating from the FDA approval process. The current focus (highlighted in *Figure 1*) is on OTC products without pre-approved specifications, i.e., products covered by the FDA OTC System. To meet this objective, USP is engaged with the on-going challenge of developing and sustaining up-to-date monographs, particularly for complex multi-active ingredient drug products, that provide suitable quality standards while still allowing manufacturers the flexibility for innovation and the continued improvement of drugs in commerce.

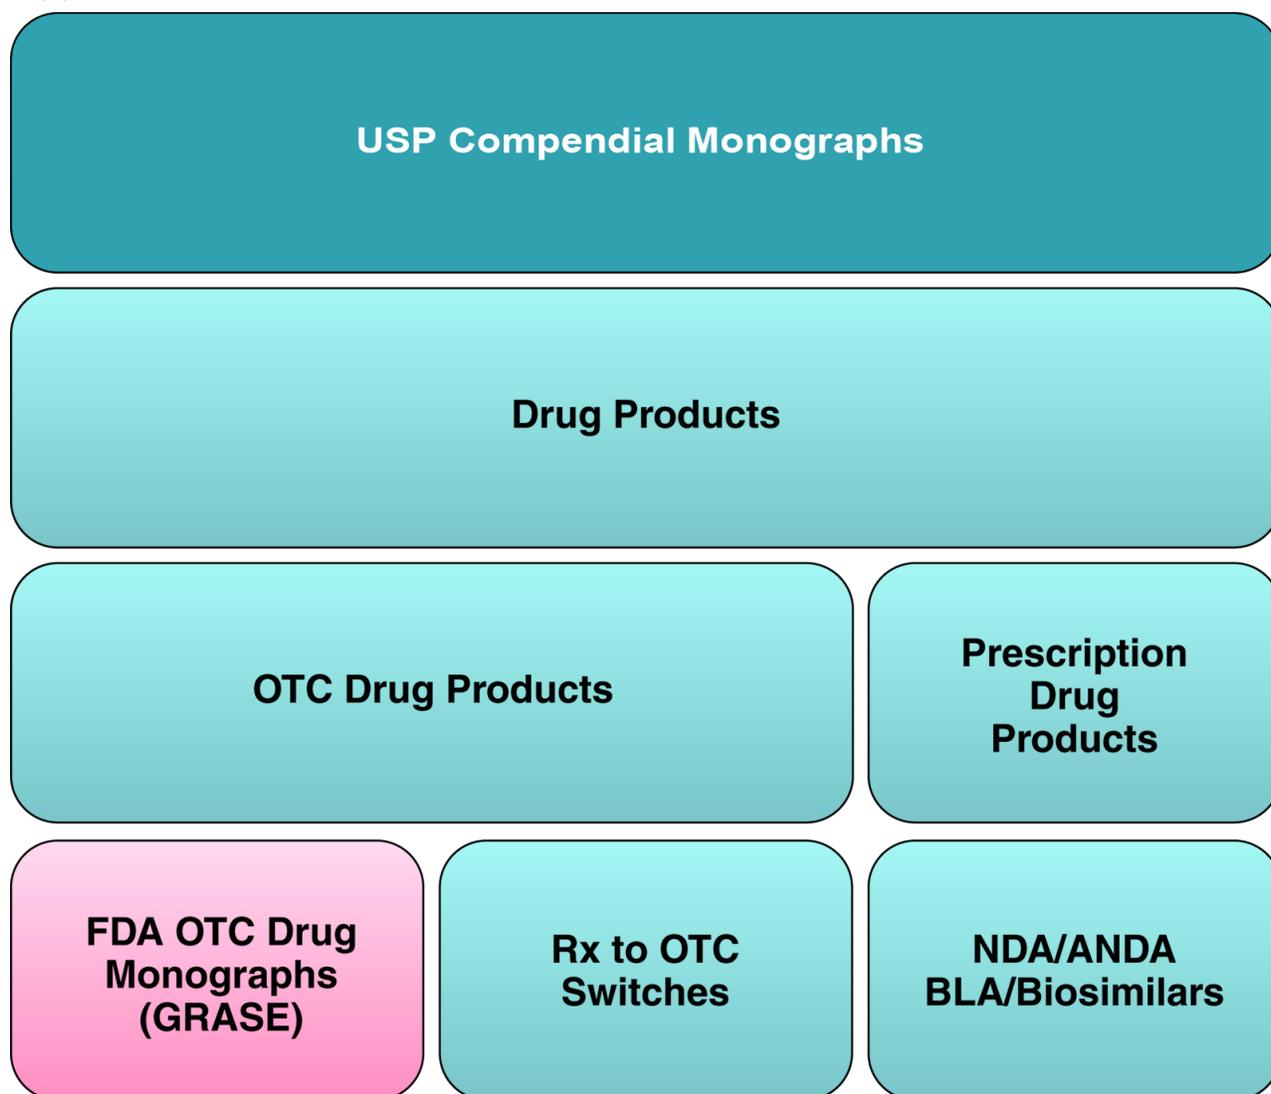

Figure 1. Focus on public quality standards for OTC products that come to market under the FDA OTC System (21 CFR Part 330). Rx = prescription.²

USP drug substance monographs effectively serve as a precondition for coverage in the FDA OTC System under FDA regulations [see e.g., 21 CFR §330.10(a)(2) §VII; §330.14(i)]. At the drug product level (which includes allowed combinations of drug substances), USP currently has about 500 monographs for FDA OTC System drug products. This represents a fraction of OTC products on the market. The OTC product landscape is constantly changing with innovation and because frequent reformulation is permitted within the regulatory flexibility provided by the FDA OTC System. This fast-changing environment makes it virtually impossible for USP to develop and maintain monographs for these products through its traditional approach. The initiative presented in this *Stimuli* article is to define new approaches to develop procedures for identification, assay, and specified impurities. Many drug products exist in the marketplace for which these new procedures may be applicable, and it is the intent of USP to modernize existing or establish new monographs for these products. While the basic tenet of this initiative is to address the drug products that come onto the market through means other than NDA/ANDA regulatory pathways, the outcome could help inform improved approaches to the development of conventional USP quality monographs. Comments are solicited from stakeholders to both improve the content of the current proposal and to gain feedback to

better align future development efforts for this initiative. For further background, see FDA letters submitted to USP^{3,4}, as well as USP comments submitted to FDA.⁵

1.2 Role in Law

USP is determined to better fulfill its compendial role in law and also provide improved support of the FDA OTC System by promptly modernizing existing standards and developing approaches, such as those outlined in this article, to provide more complete coverage of needed drug product monographs. As USP recently noted in a response to the FDA's request for public comments on the FDA OTC System, USP's compendial quality standards in the *United States Pharmacopeia–National Formulary (USP–NF)* support FDA's efforts to provide timely access to safe and effective drugs, and these compendial resources have a role in both law and federal regulations. First, where there is an applicable *USP–NF* compendial standard for either a drug ingredient or drug product, USP plays a role under the adulteration and misbranding provisions of the FDCA (§501 and §502). Second, FDA has also provided a role for applicable *USP–NF* standards in the regulations implementing the FDA OTC System (for example, see e.g., 21 CFR Part 330).

Potentially applicable USP standards include monographs for drug substances, drug products, and other ingredients or excipients. USP standards apply whether the drug is marketed as an OTC (non-prescription) product subject to one of the 21 CFR Part 330 FDA OTC System regulations or a prescription-only product marketed pursuant to a BLA, NDA, or ANDA. Thus, if the USP-designated nonproprietary name (official title) is used, or if the drug complies with monograph Identity,⁶ the official USP title must be used; otherwise, the drug will be deemed misbranded.⁷ If applicable compendial quality standards are not met, the drug will be deemed adulterated.

Note that as USP develops additional compendial drug product monographs applicable to drugs in the FDA OTC System, should there be any different title in an applicable monograph the existing nonproprietary names of those products would need to be revised. Before that is done, the USP Nomenclature Expert Committee would act to designate a name, and the proposed monograph would be posted in *PF* for comment, allowing opportunity for public comment on not only the proposed monograph but the monograph title (i.e., nonproprietary or established name) as well. USP has no role in enforcement; enforcement of USP standards is the responsibility of the FDA and other government authorities in the U.S. and elsewhere.

Beyond USP's general role in law, in terms of FDA OTC System regulations there are specified roles for USP drug substance monographs. The required format for submission of safety and effectiveness data (for classifying OTC drugs as GRASE; see 21 CFR §330.10(a)(2) §VII) specifies that there either be an official applicable *USP–NF* drug substance (active ingredient) quality monograph, or a proposed standard under development at USP for inclusion into *USP–NF*. Time and Extent applications [see 21 CFR §330.14(c)(1)(iii)] may reference the current *USP–NF* to help satisfy the basic information requirements for a "condition" (defined as an active ingredient, or a combination of active ingredients). Finally, as a condition of marketing, any active ingredient included in an OTC monograph "must be recognized in an official *USP–NF* drug monograph that sets forth its [compendial] standards of identity, strength, quality, and purity." [See 21 CFR §330.14(h&i).]

cGMP laws and regulations also play a role in ensuring the quality of OTC drug substances and drug products. In addition to the USP-related authorities in the adulteration provision of the FDCA §501(b), FDA is authorized in §501(a)(2)(B) to deem a drug adulterated if the methods or facilities used for manufacturing, processing, or packaging "do not conform to or are not

operated or administered in conformity with current good manufacturing practice” to assure that the drug meets overall FDCA requirements for safety and also satisfies requisite identity and standards for strength, quality, and purity. In addition, the regulations in 21 CFR Parts 210 and 211 set forth the cGMP requirements for finished pharmaceuticals including OTC drug products. The cGMPs require manufacturers to meet these quality standards, even in the absence of a compendial monograph.

FDA feedback on the *PF 39(1) Stimuli* article supports USP's efforts to establish compendial monographs for those OTC drug products that do not now have *USP* monographs and to modernize those (drug substance and drug product) *USP* monographs that are outdated. An important, generally recognized attribute of compendial standards is that they are public, whereas the manufacturer's standards and practices, including those used to meet FDA-required cGMP, are private and therefore of limited availability and use to anyone other than regulators who have access to such proprietary information.

1.3 Efforts to Date

USP's compendial mission is to engage in a continuous process of assessing and updating standards to ensure that the product specifications reflect changing science. Prioritization for modernization is based on factors such as prevalence of use, evolving measurement techniques and technologies, requests from FDA or other stakeholders, and emergent public health issues. USP has continuously revised standards since its inception, but only in the last decade has USP enlisted a comprehensive prioritization strategy for modernizing the entire set of monographs. For instance, USP posted on its website a list of monographs in need of modernization in May 2010 (*Figure 2*) and has made several periodic updates as more information regarding prioritization has been received from the FDA and other stakeholders.

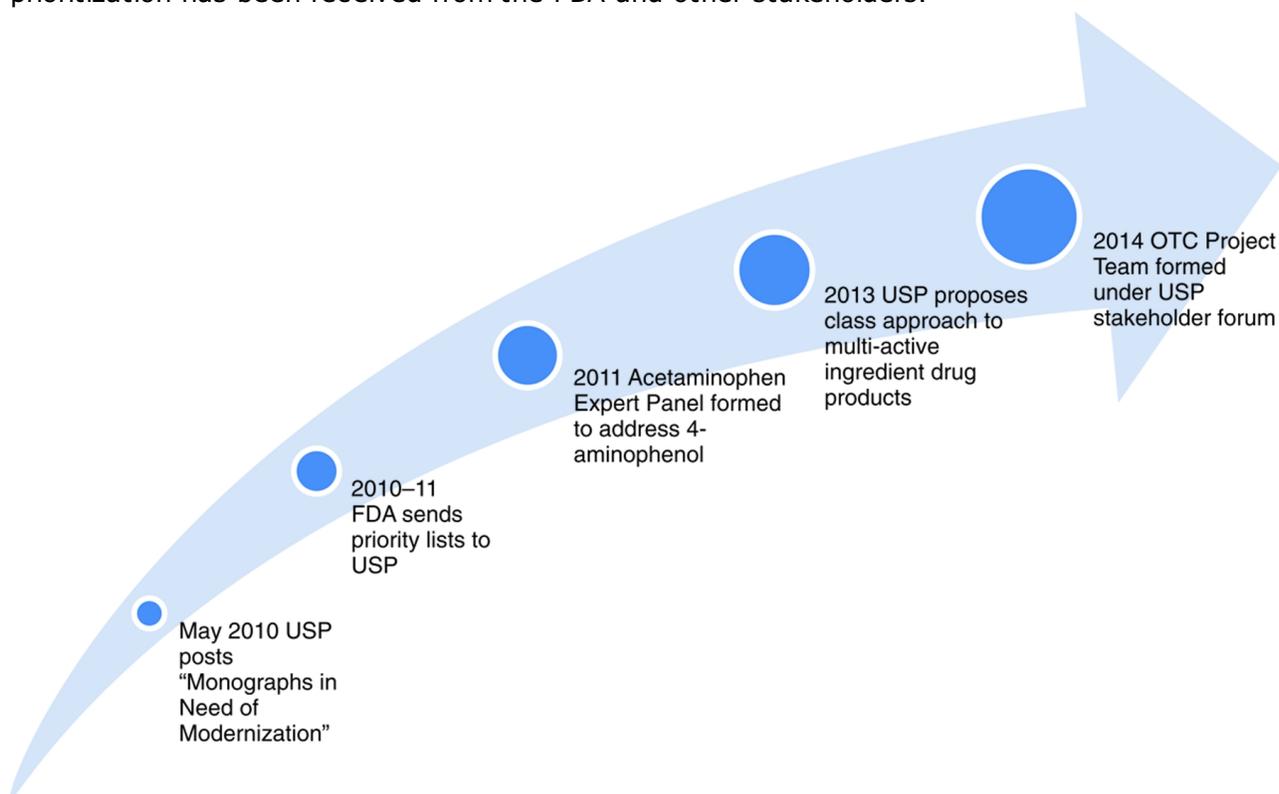

Figure 2. Progress in monograph modernization, 2010–2014.

The FDA sent letters to USP^{3,4} that brought attention to a list of drugs for which monograph modernization should be prioritized. The letters emphasize that USP should conduct a review and prioritize the drug product quality monographs. Several OTC drugs were specifically called out: acetaminophen, chlorpheniramine maleate, pseudoephedrine (HCl and sulfate), phenylephrine HCl, dextromethorphan HBr, and diphenhydramine (HCl and citrate). This provided the impetus for USP to make the fitness of OTC quality compendial monographs a major focus. Current approaches for developing compendial standards for OTC drug products are not efficient for addressing the many unique challenges. To successfully advance USP's role and ensure the preponderance of adequate quality compendial standards for this large and accessible market, a unique approach is needed.

A *Stimuli* article published in *PF 39(1)* entitled *USP's Monographs in Support of FDA's OTC Monograph System: Modernization Opportunities* introduced the concept of a class monograph and detailed the motivation for USP to explore this approach as well as others. The approach presented in that article described a class monograph including quality specifications and performance-based source-independent reference procedures for measuring conformance with the specifications. An example of a class monograph covering the FDA OTC Monograph for Nighttime Sleep-Aid Drug Products⁸, was highlighted. Commenters were generally supportive of USP's initiative to facilitate development of an approach that could provide useful drug product quality standards for use by both industry and regulators. However, the design of the proposed approach relied on the principles of a performance-based method model, which to date, does not have the proven regulatory track record equivalent to a traditional source-verified reference procedure. Feedback received from FDA and other USP stakeholders also highlighted challenges that USP would face if it undertook the development of the class monograph approach. Consideration of these various inputs has led to the current proposed approach. In this *Stimuli* article, we propose publishing individual compendial drug product monographs for products covered under the FDA OTC System, relying on procedures published in general chapters suitable for supporting multiple products which conform to logical combinations of drug substances.

2. PROPOSAL FOR CREATION OF STANDARDS

A systematic focused and simplified approach of developing compendial identification, assay, and specified impurity procedures is proposed. The procedures may be capable of analyzing single active or multi-active ingredient drug products. The proposed approach limits the scope of evaluating organic impurities to only the specified impurities. Development of an approach to address the organic impurity protocol is a priority of USP, but no formal proposals have emerged; more effort on this topic is necessary on the part of USP and stakeholders. The inclusion of drug product performance test requirements is currently being evaluated by USP; no formal proposals have emerged, and more effort on this topic will also be needed. The approaches developed may have applications in either particular monographs or general chapters. The tests and procedures must be capable of meeting specificity and sensitivity requirements for multi-active products, specified and unspecified impurities, and functional excipients. The compendial procedures must also consider the anticipated frequent reformulation and innovation on the part of manufacturers and allow for needed flexibility. Such a compendial standard would provide several advantages:

- A better means of monitoring the quality of products in the marketplace
- A means of establishing more rapid coverage of new GRASE combinations with USP monographs without creating barriers to innovation

- Advancing USP's initiative to modernize the public standards
- Definition of basic but meaningful quality standards for new compendial OTC drug product monographs
- The flexibility for using USP's traditional processes of monograph revision/establishment for drug products that are not suited for inclusion in the general chapter approach

It is understood that the procedures developed and presented based on this approach may not be optimum or suitable for all formulations. However, this approach offers timely delivery of basic core quality standards. USP has different mechanisms to address the challenge of any remaining concerns on a case-by-case basis including the following:

- Regular revisions (revisions based on submission of supporting data) can be submitted by sponsors and utilized to update or replace existing procedures.
- Different specifications (tests, procedures and acceptance criteria) can be considered and added, as a separate procedure, to individual monographs (directly, or indirectly by calling out specifications in a general chapter), or in the form of separate procedures under the flexible monograph policy.
- Alternative approaches as discussed in the *General Notices* (GN) can be used for many purposes, although only USP tests and specified reference materials [USP Reference Standards (RS)] can be used to conclusively demonstrate conformance with USP standards (see *GN 6.30. Alternative and Harmonized Methods and Procedures*, and *GN 5.80 USP Reference Standards*).

2.1 Identification and Assay Test Procedures

For compendial *Identification* and *Assay* tests, specificity becomes a challenge for multi-active ingredient and complex formulations. A clear understanding of the combinations of drug substances, dosage forms, and possible matrices is paramount to achieve a procedure that meets compendial use requirements. Procedure development challenges may also influence the number and types of procedures that will be necessary for some drug products. USP's goal is to minimize the number of procedures needed for a specific product or for a family of closely-related products. The commercial success of high-peak capacity methodologies, such as ultra high performance liquid chromatography (UHPLC) columns, core-shell HPLC columns, and other methodologies, make this approach more attractive today than even a few short years ago. A monograph *Identification* test can make use of the high selectivity of the separation procedure and state-of-the-art detection technologies (e.g., photo-diode array UV detectors). This approach for identification would minimize the number of additional procedures that might otherwise be necessary to comply with compendial requirements.

2.2 Impurity Tests

Test procedures for specified impurities will be developed where needed. In cases where degradation products or toxic impurities and their limits are known, the development of test procedures can be performed in a straightforward manner. A strategy to develop general procedures for each specified impurity in the many drug products will be undertaken. This is in alignment with the work of the Acetaminophen Expert Panel and Small Molecules 2 Expert Committee, which oversaw the development of a general procedure for *4-Aminophenol in Acetaminophen-containing Drug Products* { 227 }, an FDA priority.³ This procedure is official for single-active ingredient products containing acetaminophen, and now is being applied to multi-

active drug products containing acetaminophen in the revision appearing in this *PF*.⁹ Stakeholders may submit information to USP on limits for specified impurities. Comprehensive impurity testing protocols (e.g., unspecified impurities, total impurities) will require additional effort and will be addressed in the future.

2.3 Reference Standards

USP Reference Standards (RSs) are included as comparison standards in most OTC drug monographs; the approach for drug product monograph development discussed in this *Stimuli* article is not expected to generate many new reference standards. However, new reference standards for use in demonstrating procedure system suitability may be introduced for convenience.

3. GENERAL CONSIDERATIONS

3.1 Using General Chapters to Achieve Efficiencies in Creating a USP OTC Product Monograph System

Two approaches were considered by USP for publication of general procedures to simplify and hasten the development of compendial standards for drug products in the FDA OTC System: 1) class monographs, and 2) monographs calling out general chapters. The proposal outlined in the *Stimuli* article in *PF 39(1)* was defined as a 'class' or 'product group' monograph. The concept of a class monograph was assessed to find an efficient means to create drug product monographs for the large and changing array of OTC products as a solution to address the challenge raised both internally at USP and externally [by the FDA and the Consumer Healthcare Products Association (CHPA)]. Upon closer examination, the class monograph approach introduced more complications and provided fewer than expected benefits. Instead, it is anticipated that the required flexibility and efficiencies can be achieved by developing general chapters for identification, assay, and specified impurity procedures for reference by conventional product-specific monographs. This approach makes the referenced general chapter part of a compendial (monograph) requirement, thus avoiding potential confusion arising from applying compendial standards in class monographs (an unconventional and unproven approach) while retaining the expected usefulness of analytical procedures applicable to a range of products. Streamlining the number of analytical procedures needed to ensure the quality of a large class of related drug products would be of benefit to FDA and industry stakeholders. As those general chapters are completed, they will be available for monographs to reference as appropriate. A proposed structure for the general chapters is provided in *Table 1*.

Table 1. Proposed General Chapter Structure

Test	Contents	Chapter Number	Procedure Type
Assay	Organic actives	{ 321 } ^a	Group 1, 2, 3... procedures
	Inorganic actives	{ 323 } ^b	Individual or group 1, 2, 3... procedures
	Other actives (e.g., atypical, natural product, and complex actives)	{ 325 } ^b	Individual 1, 2, 3 procedures

Impurities	Known degradation products with specified limits	{ 327 } ^c	Individual impurity procedures
	Known toxic impurities	{ 327 }	Individual impurity procedures
	Elemental impurities	{ 232 } and { 233 } ^d	—
	Residual solvents	{ 467 } ^d	—
Preservatives	Anti-microbial agents	{ 341 } ^d	—
	Antioxidants	{ 342 } ^b	Group or individual procedures
	Other	{ 343 } ^b	Group or individual procedures

^a *Drug Product Assay Tests—Organic Chemical Medicines* { 321 }, proposed in this *PF*.

^b Future.

^c For acetaminophen-containing drug products, general chapter { 227 } is an example of an individual impurity procedure. New procedures for other specified impurities will be published in *Drug Product Impurity Tests* { 327 }, proposed in this *PF*.

^d No changes are expected to the *Official* chapters.

3.2 Grouping Strategy of Drug Substances

Analytical procedures capable of analyzing groups of FDA OTC System drug products will be developed whenever possible. The term “group” indicates that the procedure may be simultaneously applied for the analysis of multiple drug substances. This approach is expected to allow for a single procedure to be adapted to both single-active and multi-active ingredient drug quality products. Groupings will be largely based on the logical combinations of drug substances and their natural divisions along routes of administration and/or dosage form. Such compendial groupings may or may not happen to conform to FDA's existing regulatory categories in the FDA OTC System. Procedures for “individual” analytes (drug substances, specified impurities, or preservatives) may be more efficient in some cases and Table 1 outlines the proposal of each chapter's contents.

The *Assay* procedures in General Chapter *Drug Product Assay Tests—Organic Chemical Medicines* { 321 } will cover groups of drug substances (FDA OTC active ingredients) to reduce the total number of procedures necessary for multi-active ingredient products. Ideally, each drug product monograph will require a single Assay procedure rather than separate procedures for each individual drug substance. The development strategy is flexible to accommodate groupings based on the logical combinations of drug substances. Although some combinations of active ingredients may not be allowed by the FDA OTC System, the benefits of including them in a group procedure are that fewer procedures would be needed overall.

There are logical boundary conditions to finding the optimal number of procedures. For instance, some active ingredients span different therapeutic categories and are marketed together in combination with multiple other active ingredients through different routes of administration using a variety of dosage forms. A single procedure capable of handling the complexity of all of these factors adds complexity and would perhaps needlessly require additional selectivity. Dividing the number of drug substances along the lines of various routes

of administration or dosage forms may be done to reduce the burden of inactive ingredient interferences. Diphenhydramine is an example of an active ingredient that appears in both oral and topical formulations. If multiple procedures are deemed necessary, the appropriate procedure to be used will be cross-referenced in the monograph. Alternatively, reducing the number of drug substances that are analyzed by a single procedure may be appropriate. Acetaminophen is an example of a drug substance where smaller groupings with other drug substances may provide a benefit.

USP's goal is to establish an optimal number of procedures that will largely reflect the current state of legally marketed products and be derived as a result of specific analytical challenges during procedure development. Furthermore, these procedures may also be useful as a starting point for new drug products introduced to markets containing the same set of drug substances.

4. CONCLUSION

The approaches discussed in this *Stimuli* article provide a general means of updating *USP–NF* consistent with provisions of the FDCA and implementation of regulations. This *Stimuli* article offers a novel approach for developing drug product monographs, particularly those for multi-active ingredient OTC products, and provides a forum for further discussion about ways to modernize the compendial monographs. USP understands that these approaches require careful consideration, and encourages all interested parties and stakeholders to submit comments in response to this article. USP is committed to facilitating further discussion and considering all viewpoints on these matters.

³ FDA letter to USP dated November 16, 2010 (http://www.usp.org/sites/default/files/usp_pdf/EN/USPNF/key-issues/modernizationlistouderkirkseo.pdf).

⁴ FDA letter to USP dated August 22, 2011 (http://www.usp.org/sites/default/files/usp_pdf/EN/USPNF/key-issues/2011-08-22_fda_letter_to_usp--monograph_modernization_requests.pdf).

⁵ USP comments submitted May 9, 2014 to FDA Docket No. FDA-2014-N-0202, Re: "Over-The-Counter Drug Monograph System; Request for Comments," 79 Fed. Reg. 10168 (Feb. 24, 2014).

⁶ Note that monograph identity tests have a limited purpose: the determination of whether a particular monograph applies to the particular drug substance or drug product is the article that is named in *USP–NF*. Compendial identity tests, and related quality specifications, are not intended to be sufficient to establish biological or chemical identity, safety and effectiveness, or other attributes that are required for licensure by FDA or other regulatory authorities. Thus, compendial identity is not equivalent to regulatory identity; where two drugs share a compendial identity, this does not mean they are one and the same drug—only that they are subject to one and the same USP standard for quality. (See *GN 5.40*)

⁷ USP's nonproprietary naming role applies to all drugs with an applicable USP monograph, including drugs in the FDA OTC System. Reflecting USP's role in law, as specified in FDA OTC drug product labeling regulations, if a drug is recognized in *USP* or *NF*, "the official title of the drug or ingredient in such compendium" is the established name unless it has been designated in a notice and comment rulemaking under FDCA §508 [see e.g., 21 CFR §201.66(b)(5)]. No such names have been designated to date by FDA using §508.

Please address comments on *Pharmacopeial Forum* content to
USP Executive Secretariat
12601 Twinbrook Parkway
Rockville, MD 20852
execsec@usp.org

ISSN: 1542-1945

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI)*, in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences*.

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling. **Pharmacopeial Forum's Public Review and Comment Process**

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum (PF)*, for the development of official standards in the *United States Pharmacopeia* and the *National Formulary (USP–NF)*.

USP publishes *PF* on a bimonthly basis to provide an opportunity to review and comment on new or revised standards.

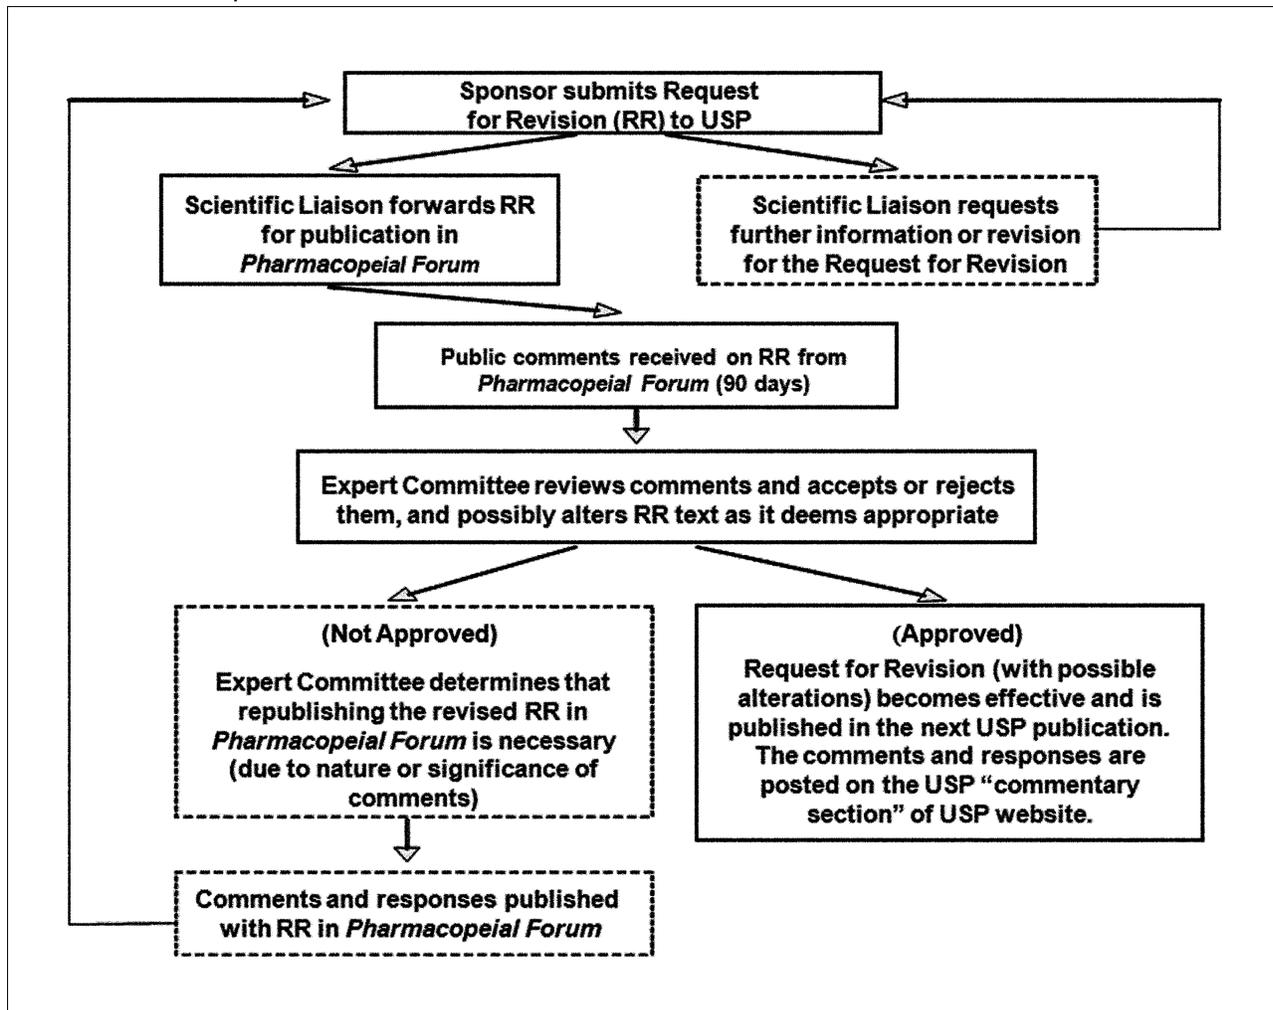

There are two types of proposed revisions in *PF*:

1. **Proposed Revisions**—New or revised standards targeted for adoption through USP's Standard Revision Process. USP's Revision Process calls for publication of a proposed revision in *PF* for a 90-day notice and comment period. After the comment period and subsequent review of comments and approval by the relevant USP Expert Committee, the official standard is published in the next available *USP–NF* or *Supplement*. If comments received are significant, or if the Expert Committee's consideration of comments results in significant additional changes, the Expert Committee may determine that republishing in *PF* is necessary prior to the revision becoming official. See the *In-Process Revision* section for current proposed revisions.

2. **Proposed Interim Revision Announcements**—New or revised standards that become official through an accelerated process in accordance with USP’s Guideline on Accelerated Revisions (available on the USP Web site). *Interim Revision Announcements (IRAs)* allow for a revision to become official prior to the next *USP–NF* or *Supplement*. *IRAs* are first presented for a 90-day public comment period in the *Proposed Interim Revision Announcement* section of the *PF*. Note that final *IRAs*, as well as *Errata*, and *Revision Bulletins*, which also are defined in the Accelerated Revision Guideline, appear only on the USP Web site.

USP welcomes comments and data on proposed revisions. A summary of comments received, along with USP’s responses, will be published in the *Revisions and Commentary* section of the USP website (<http://www.usp.org/USPNF/revisions/>).

The chart below shows the public review and comment process and its relationship to standards development.

Questions on the process should be addressed to the USP Executive Secretariat, United States Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE PF

The various sections of *PF* are briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and

amount of information expected in a *Request for Revision* is available in the *Guideline for Submitting Requests for Revision to the USP-NF* on the USP Web site (www.usp.org/USPNF/submitMonograph/subGuide.html). Note that the Expert Committee listing and the Scientific Staff Directory also are located on the USP Web site (see below for links).

Proposed and Adopted Revisions to the USP-NF

Section	Content	How Readers Can Respond
Proposed Interim Revision Announcements	Proposals for <i>Interim Revision Announcements (IRAs)</i> that will be published as official <i>USP</i> or <i>NF</i> standards BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst, such as the brand name of the column used in developing the proposed procedure and the USP Expert Committee and Scientific Liaisons who handled the monograph or general chapter.	Review material and send comments within 90 days of the <i>PF</i> publication in which the standard was proposed (or per the comment deadline listed in the Briefing section). Direct comments to the USP Scientific Liaison using the contact information provided at the end of each <i>Proposed IRA</i>
In-Process Revision	Proposals for standards that will be published as official in a future <i>USP-NF</i> book or <i>Supplement</i> . BRIEFING: Scientific rationale for proposed changes. May include other information useful to the analyst, such as the brand name of the column used in developing the proposed procedure and the USP Expert Committee and USP Scientific Liaisons who handle the monograph or general chapter.	Review material and send comments within 90 days of the <i>PF</i> publication in which the revision was proposed (or per the comment deadline listed in the Briefing section). Direct comments to the USP Scientific Liaison using the contact information provided at the end of each proposed revision. For general inquiries or in cases where a Scientific Liaison is not identified, use the general USP telephone number 301-881-0666 or fax number 301-998-6839 or stdsmonographs@usp.org .

Section	Content	How Readers Can Respond
Stage 4 Harmonization	Revision proposals from the Pharmacopoeial Discussion Group (PDG), which comprises the European Pharmacopoeia, the Japanese Pharmacopoeia, and USP. The Stage 4 draft and the briefing are published in the forum of each pharmacopoeia for public comment. The draft is published in its entirety. BRIEFING: Scientific rationale for the potential inclusion or change or for the proposed change.	Review material and provide comments to the USP Scientific Liaison using the contact information provided at the end of each Stage 4 Harmonization. Individuals who wish to correspond with the European and Japanese Pharmacopoeias concerning monographs in the Stage 4 period of international harmonization should address their comments to the coordinating pharmacopoeia, with a copy to USP. PhEur Secretariat Ms. Lynn Kelso-Eleuterio Central Secretariat European Pharmacopoeia Department European Directorate for the Health Care Council of Europe 7, Allée Kastner CS 30026 67081 Strasbourg France Tel: +33 (3) 88 41 31 48 Fax: +33 (3) 88 41 27 71 lynn.kelso@edqm.eu JP Secretariat Mr. Issei Takayama Technical Officer Pharmaceuticals and Medical Devices Agency (PMDA) Shin-kasumigaseki Building 3-3-2, Kasumigaseki, Chiyoda-ku Tokyo, 100-0013 Japan Phone: +81-3-3506-9431 Fax: +81-3-3506-9440 takayama-issei@pmda.go.jp
Stimuli to the Revision Process	Articles on standards development topics authored by the USP Council of Experts, USP staff, or other interested parties on which USP desires public input prior to further development.	Review material and provide comments to the recipient indicated (usually footnoted in each <i>Stimuli</i> article).

Other Sections

Expert Committees

A listing of the 2010–2015 Expert Committees that work on the development of USP compendial standards

(<http://www.usp.org/aboutUSP/governance/councilOfExperts/expertCommittees.html>)

Staff Directory

Names and contact information of key USP scientific staff members who work on the development of USP compendial standards

(<http://www.usp.org/USPNF/devProcess/contactScientists.html>)

Proposed Interim Revision Announcements

This section includes proposals for *Interim Revision Announcements (IRAs)* that will be published as official *USP* or *NF* standards. There is a 90-day comment period for these proposals (see <http://www.usp.org/USPNF/pf/pfRedesign.html> for the *PF* comment schedule). Readers should review material in this section and provide comments to the Scientific Liaison using the contact information appearing at the end of each proposed *IRA*. Information on how to comment can be found under the "Participation" section of www.usp.org. It is important to send comments promptly so that the Expert Committee members can consider reader's input as they are deciding whether to advance standards to official status. The approved official text will be published under *IRAs* in the "New Official Text" section of USP's Web site.

Each proposal is preceded by a Briefing that indicates the proposed revisions.

Symbols—New text is enclosed in symbols and set off from the current official text as shown in the following example:

◆new text◆

Where the symbols appear together with no enclosed text, such as

◆◆

, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the date the proposal, if approved, will become official as an *IRA*. For example, ◆(IRA 1-Apr-2011)

In-Process Revision

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) proposed revisions placed directly under *In-Process Revision*, or (2) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the Scientific Liaison using the contact information appearing at the end of each proposal. Information on how to comment can be found under the "Participation" section of www.usp.org. It is important to send comments promptly, using the comment deadline listed after each title.

Briefings Each Proposal is preceded by a Briefing in the following format:

Briefing
Name of Item , citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Expert Committee acronym (the name of the Scientific Liaison who handled the particular monograph or general chapter, and the USP tracking correspondence number, as shown in the example below:
(Expert Committee Acronym: Liaison Name.)
Correspondence Number—CXXXXX

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed out. All *USP-NF* revisions use the following symbols that indicate the final destination of the official text:

◆new text◆

if slated for an *IRA*;

▲new text ▲

if slated for *USP–NF*;

■new text ■

if slated for a *Supplement to USP–NF*. The same symbols indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as

* *

, or

■ ■

, or

▲▲

, it means that text has been deleted and no new text was proposed to replace it.

In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA*, *Supplement*, or the *USP* or *NF* as the publication where the revision will appear if approved. For example, ■

2S (*USP 34*) indicates that the proposed revision is slated for the *Second Supplement to USP 34*, and ▲

USP35 and ▲*NF30* indicates that the revisions are proposed for *USP 35* and *NF 30*, respectively.

Official Title Changes Where the specification "***Monograph title change***" is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

BRIEFING

⟨ 3 ⟩ **Topical and Transdermal Drug Products—Product Quality Tests**, *USP 38* page 71 and *PF 40(2)* [Mar.–Apr. 2014]. On the basis of comments received to the proposed revision published in *PF 40(2)*, the following revisions are being proposed to this chapter:

1. *Description*: Include a visual assessment for the possible presence of cold flow.
2. Replace sachets with packets throughout the text.
3. Replace single-dose and multi-dose with single-unit and multiple-unit, respectively, throughout the text.
4. *Apparent Viscosity*: Include a clearer definition and techniques.
5. *Uniformity in Containers*: Revise *Acceptance Criteria for Products Packaged in Tubes*.
6. *Specific Tests* for transdermal delivery systems: Revise the physical properties to be evaluated and remove specific instructions to assess cold flow, allowing the use of any suitable procedure.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style.

(GCDF: M. Marques.)

Comment deadline: May 31, 2015

〈 3 〉 TOPICAL AND TRANSDERMAL DRUG PRODUCTS—PRODUCT QUALITY TESTS

Change to read:

INTRODUCTION

Topically applied drug products fall into two general categories: those applied to achieve local action and those applied to achieve systemic effects after absorption through the skin into the blood circulation. Local action can occur at or on the surface of the application site (e.g., stratum corneum ~~ocular epithelium~~

■ ■ 1S (USP39)

), in the underlying tissues (e.g., epidermis and/or dermis), and on

■ in ■ 1S (USP39)

subcutaneous tissues (e.g., muscle or joint). Topically applied drug products include but are not restricted to creams, gels, ointments, pastes, suspensions, lotions, foams, sprays, aerosols, solutions, and transdermal delivery systems (TDS, ~~also known as patches~~

■ ■ 1S (USP39)

). The definitions and descriptions of these dosage forms, and brief information on their composition and/or manufacturing process, can be found in *Pharmaceutical Dosage Forms* 〈 1151 〉.

Procedures and acceptable criteria for testing topically applied drug products can be divided into those that assess general product quality attributes and those that assess product performance. The product quality attributes include the following: description, identification, assay (strength), impurities, physicochemical properties, uniformity of dosage units, water content, pH, apparent viscosity, microbial limits, antimicrobial preservative content, antioxidant content, sterility (if applicable), and other tests that may be product specific. Product performance testing assesses drug release and other attributes that affect drug release from the finished dosage form.

~~Although most topically applied drug products are semisolids, liquids, or suspensions, TDS are physical devices that are applied to the skin and vary in their composition and method of fabrication.~~

■ ■ 1S (USP39)

TDS release their active ingredients by different mechanisms. They can be passive or active. This chapter covers only the tests related to passive TDS.

Change to read:

PRODUCT QUALITY TESTS FOR TOPICALLY APPLIED

■ **TOPICAL AND TRANSDERMAL** ■ 1S (USP39)

DRUG PRODUCTS

Universal Tests

Universal tests (see *ICH Guidance Q6A—Specifications: Test Procedures and Acceptance Criteria for New Drug Substances and New Drug Products: Chemical Substances*, available at www.ich.org) are listed as follows and are applicable to all topically applied drug products.

Description: A qualitative description of the drug product should be provided. The acceptance criteria should include the final acceptable appearance of the finished dosage form and packaging. A visual examination should identify changes in color, adhesive migration (i.e., cold flow; see *Cold Flow Test*) for TDS, separations, crystallization, and others that are specific to the drug product. The description should specify the content or the label claim of the article.

■ For TDS, a visual examination should also be done to assess potential use issues with the product. The examination should include an assessment of the difficulty of removing the TDS from the pouch (e.g., due to adhesive migration adhering the system to the pouch), inability to remove the TDS from the pouch without damage to the system, and adhesive residue remaining on the pouch after removal of the TDS. ■ 1S (USP39)

This is not a compendial test but is part of the manufacturer's specification for the drug product.

Identification: Identification tests are discussed in *General Notices and Requirements, 5.40*. Identification tests should establish the identity of the drug or drugs present in the article and should discriminate between compounds of closely related structures that are likely to be present. Identity tests should be specific for the drug substance(s) (e.g., infrared spectroscopy). Near infrared (NIR) or Raman spectrophotometric methods also could be acceptable for the identification of the drug product (for additional information, see *Near-Infrared Spectroscopy* 〈 1119〉 and *Raman Spectroscopy* 〈 1120〉). Identification solely by a single chromatographic retention time is not specific.

Assay: A specific and stability-indicating test should be used to determine the strength (content) of the drug product.

■ This assay requirement can be satisfied for topical products containing antibiotics by a standard microbiological method (see *Antibiotics—Microbial Assays* 〈 81〉). ■ 1S (USP39)

In cases when the use of a nonspecific assay (e.g., *Titrimetry* 〈 541〉) is justified, other supporting analytical procedures should be used to achieve overall specificity.

Impurities: Process impurities, synthetic byproducts, impurities associated with the adhesive (e.g., residual monomers), residual solvents (see *Residual Solvents* 〈 467〉), heavy metals (see *Heavy Metals* 〈 231〉), and other inorganic and organic impurities may be present in the drug substance and excipients used in the manufacture of the drug product and should be assessed and controlled. Impurities arising from the degradation of the drug substance and those arising during the manufacturing process of the drug product also should be assessed and controlled.

Specific Tests

In addition to the *Universal Tests* listed previously, the following specific tests should be considered on a case-by-case basis:

Uniformity of dosage units: This test is applicable for TDS and for

■ topical ■ 1S (USP39)

dosage forms packaged in single-dose

■ **unit** ■ 1S (USP39)

containers,

■ **such as sachets** ■ 1S (USP39)

(see *Uniformity of Dosage Units* 〈 905 〉).

Water content: A test for water content should be included when appropriate (see *Water Determination* 〈 921 〉). This test is generally formulation dependent. Therefore, it is not included in the compendial drug product monograph but is part of the manufacturer's specification for the drug product.

Microbial limits: Microbial examination of nonsterile drug products is performed according to the methods given in general chapters *Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests* 〈 61 〉 and *Microbiological Examination of Nonsterile Products: Tests for Specified Microorganisms* 〈 62 〉, unless the formulation itself is demonstrated to have antimicrobial properties. Acceptance criteria for nonsterile pharmaceutical products based on total aerobic microbial count and total combined yeasts and molds count are given in *Microbiological Examination of Nonsterile Products: Acceptance Criteria for Pharmaceutical Preparations and Substances for Pharmaceutical Use* 〈 1111 〉.

Antimicrobial preservative content: Acceptance criteria for antimicrobial preservative content in ~~multidose~~

■ **multi-unit** ■ 1S (USP39)

products should be established. They should be based on levels of antimicrobial preservative necessary to maintain the product's microbiological quality at all stages throughout its proposed usage and shelf life (see *Antimicrobial Effectiveness Testing* 〈 51 〉).

Antioxidant content: If antioxidants are present in the drug product, tests of their content should be established unless oxidative degradation can be detected by another test method such as impurity testing. Acceptance criteria for antioxidant content should be established. They should be based on the levels of antioxidant necessary to maintain the product's stability at all stages throughout its proposed usage and shelf life.

Sterility: Depending on the use of the dosage form (e.g., ~~ophthalmic preparations,~~

■ 1S (USP39)

products that will be applied to open wounds or burned areas), sterility of the product should be demonstrated as appropriate (see *Sterility Tests* 〈 71 〉).

pH: When applicable, topically applied drug products should be tested for pH. ~~at the time of batch release and at designated stability time points for batch-to-batch monitoring.~~

■ 1S (USP39)

Because some topically applied drug products contain very limited quantities of water or aqueous phase, pH measurements may not always be warranted. This test is generally formulation dependent. Therefore, it is not included in the compendial drug product monograph but is part of the manufacturer's specification for the drug product.

Particle size:

■ When the finished product contains suspended solid drug substance, the product should be examined for particle size. ■ 1S (USP39)

The particle size of the active drug substance(s) in topically applied drug products is usually determined

■ established ■ 1S (USP39)

and controlled at the formulation development stage. However, topically applied drug products should be examined for evidence of particle

■ size ■ 1S (USP39)

alteration (i.e.,

■ drug polymorphic form, ■ 1S (USP39)

appearance of particles, ~~changes in particle form,~~

■ ■ 1S (USP39)

size, shape, ~~habit,~~ or

■ morphology, agglomeration, or ■ 1S (USP39)

aggregation) of the drug substance that may occur during the course of product processing and storage. ~~Such examinations should be conducted at the time of batch release and at designated stability test time points for batch-to-batch monitoring because changes that are visually (macro and microscopically) observable would likely compromise the integrity and/or performance of the drug product.~~

■ ■ 1S (USP39)

These types of tests are generally formulation dependent. Therefore, such tests are not included in compendial monographs but are part of the manufacturer's specification for the drug product.

■ **Crystal formation:** When

■ the drug substance is dissolved in ■ 1S (USP39)

~~the finished product, does not contain a suspended active drug substance but rather contains a dissolved active drug substance~~

■ ■ 1S (USP39)

the product should be

■ microscopically ■ 1S (USP39)

~~examined for evidence of crystal formation of the active drug substance. Such examinations should be done microscopically and conducted at the time of batch release and at designated stability test time points.~~

■ ■ 1S (USP39)

This test is generally formulation dependent. Therefore, it is not included in the compendial drug product monograph but is part of the manufacturer's specification for the drug product. It is recommended that the potential for the drug product to form crystals of drug substance be examined during product development using conditions of stress. ■ 1S (USP39)

Change to read:**SPECIFIC TESTS FOR OPHTHALMIC DRUG PRODUCTS**

~~Ophthalmic dosage forms must meet the requirements of *Sterility Tests* $\langle 71 \rangle$. If the specific ingredients used in the formulation do not lend themselves to routine sterilization techniques, ingredients that meet the sterility requirements described in $\langle 71 \rangle$, along with aseptic manufacture, may be used. Multiple-use ophthalmic preparations must contain a suitable substance or mixture of substances to prevent growth of, or to destroy, microorganisms accidentally introduced during the use of the product (see *Added Substances* in *Ophthalmic Ointments* $\langle 771 \rangle$), unless otherwise directed in the individual monograph or unless the formula itself is bacteriostatic and/or the delivery system promotes bacteriostasis. The finished ophthalmic preparation must be free from large particles and must meet the requirements for *Leakage* and for *Metal Particles* in $\langle 771 \rangle$. The immediate containers for ophthalmic preparations shall be sterile at the time of filling and closing. It is mandatory that the immediate containers for ophthalmic preparations be sealed and tamper-proof so that sterility is ensured at the time of first use.~~

■ See *Ophthalmic Products—Quality Tests* $\langle 771 \rangle$. ■ 1S (USP39)

Change to read:**SPECIFIC TESTS FOR TOPICALLY APPLIED SEMISOLID DRUG PRODUCTS**

■

Minimum Fill

~~This test applies only to multiple-dose containers, such as tubes and jars (see *Minimum Fill* $\langle 755 \rangle$).~~

■ Single-unit and multiple-unit containers must meet minimum fill requirements as established by testing described in *Minimum Fill* $\langle 755 \rangle$. ■ 1S (USP39)

~~For single-dose~~

■ unit ■ 1S (USP39)

~~containers, such as sachets, see chapter~~

■ where the test for ■ 1S (USP39)

Uniformity of Dosage Units $\langle 905 \rangle$

is applied, the test for general chapter $\langle 755 \rangle$ is not required. ■ 1S (USP39)

Apparent Viscosity

Viscosity is a measure of a formulation's resistance to flow and is an assessment of the

~~rheological properties of the dosage form (e.g., semisolid dosage form). Because only Newtonian fluids possess a measurable viscosity that is independent of shear rate, semisolid pharmaceutical dosage forms that are non-Newtonian products exhibit an apparent viscosity.~~

■ of a rheological property of a semisolid dosage form. The term "apparent viscosity" applies to non-Newtonian fluids, which compose the majority of semisolid pharmaceutical dosage forms.

■ 1S (USP39)

~~The apparent viscosity of semisolid drug products should be tested at the time of batch release and initially at designated stability test time points to set specifications for batch-to-batch and shelf-life monitoring.~~

■ 1S (USP39)

Measurement procedures should be developed as outlined in

• *Viscosity—Capillary Methods* 〈 911 〉 • (CN 1-May-2015)

■ *Viscosity—Rotational Methods* 〈 912 〉, and *Viscosity—Rolling Ball Method* 〈 913 〉. ■ 1S (USP39)

For semisolids that show thixotropy and/or irreversible changes in viscosity after shearing, specific attention should be given to sample preparation procedures to minimize variability in the measurement of apparent viscosity caused by variable shear histories (e.g., mixing speed and temperature, filling operation, and sample handling). Furthermore, for some products it may be warranted to have apparent viscosity specifications at more than

■ one stage of the manufacturing process or with more than ■ 1S (USP39)

one set of

■ test ■ 1S (USP39)

conditions (e.g., bulk in-process stage, final packaged product, high and low shear rates, and different temperatures).

~~Apparent viscosity specifications based on data obtained during product development and shelf-life testing should be established for batch release and throughout the proposed shelf life.~~

■ An acceptable range for apparent viscosity should be established based on data obtained during product development and based on statistical assessment of multiple product batches over the product's shelf life. ■ 1S (USP39)

~~The apparent viscosity test is formulation and/or process dependent. Therefore, it is not included in compendial drug product monographs but is part of the manufacturer's specification for the drug product. Furthermore, the specifications for apparent viscosity of semisolid dosage forms at batch release and during stability testing may be different. Although the apparent viscosity of the finished drug product at the time of batch release must conform to the product development specifications, for stability testing, the apparent viscosity specifications for the drug product should be based on statistical assessment of the product over its shelf life.~~

■ 1S (USP39)

■ Apart from single-point viscosity measurements, more advanced rheological techniques (flow, oscillatory, creep, and stress relaxation testing) can be applied to develop a mechanistic understanding of a formulation and its structure. These techniques may be useful for development of the product using the principles of Quality by Design or for comparative

physicochemical characterization of the test and reference formulations in the case of a biowaiver argument in a generic drug application. However, these techniques are not generally suitable for routine quality testing. Common parameters derived from rheological testing of semisolid pharmaceutical dosage forms that may be useful for characterization and comparison are the storage modulus, loss modulus, relaxation modulus, compliance, thixotropic index, and yield stress.

Acceptance criteria are product specific and defined to assure that the apparent viscosity of each batch of semisolid drug product is within the range defined by the product design and is consistent between batches based on the product development specifications and statistical assessment of multiple product batches over the product's shelf life. ■ 1S (USP39)

Uniformity in Containers

Typically applied semisolid drug products may show physical separation during manufacturing processes and during their shelf life. To ensure the integrity of the drug product, it is essential to evaluate the uniformity of the finished product. ~~at the time of batch release and throughout its assigned shelf life.~~

- This test applies only to multiple-dose
- unit ■ 1S (USP39)

containers, such as tubes and jars. ~~For single-dose containers, such as sachets, see chapter *Uniformity of Dosage Units* (905).~~

- 1S (USP39)

This test does not apply to more fluid topical drug products in multiple-unit containers, such as emulsions, lotions, two-phase gels, or topical suspensions, where the labeling directs the user to mix the product (e.g., shake well) before use. ■ 1S (USP39)

PRODUCTS PACKAGED IN TUBES

~~Within-tube content uniformity can be assessed in the following manner.~~

~~Carefully remove or cut off the bottom tube seal and make a vertical cut from the bottom to the top of the tube. Carefully cut the tube around the upper rim, open the two flaps, and lay the flaps open to expose the product.~~

~~Inspect the product visually for the presence of phase separation, change in physical appearance and texture, and other properties described in the product test for *Description*. If there is no observable phase separation or change in physical appearance and texture, and if the product meets the *Description* acceptance criteria, proceed as described in the following sections. If the product exhibits phase separation and/or change in physical appearance or texture, the product fails the tube content uniformity test.~~

~~The procedures described as follows can be modified depending on the sensitivity of the quantitative procedure used to determine the amount of the drug substance(s) present in the formulation.~~

~~**For multiple-dose products that contain 5 g or more**~~

Procedure 1

1. Using a single tube, after visually inspecting the product, remove an appropriate amount of product from the top, middle, and bottom portions of the tube. The sample size should be sufficient for at least one quantitative determination of the active ingredient(s). Determine the amount of the active ingredient(s) in each portion of the product using any appropriate validated quantitative procedure, and evaluate the test results using *Acceptance criteria A*.
2. If the product fails *Acceptance criteria A*, test three additional tubes from the same batch following step 1 described above, and evaluate all 12 test results using *Acceptance criteria B*.

Procedure 2

1. Using two tubes, after visually inspecting the product, remove an appropriate amount of product from the top, middle, and bottom portions of each tube. The sample size should be sufficient for at least one quantitative determination of the active ingredient(s). Determine the amount of the active ingredient(s) in each portion of the tube using any appropriate validated quantitative procedure, and evaluate the test results using *Acceptance criteria A*.
2. If the product fails *Acceptance criteria A*, test two additional tubes from the same batch following step 1 described above, and evaluate all 12 test results using *Acceptance criteria B*.

For multiple-dose products that contain less than 5 g of product

1. Test the top and bottom portions of two tubes using *Procedure 1* or *Procedure 2* as described above. Evaluate the test results using *Acceptance criteria A*.
2. If the product fails *Acceptance criteria A*, test two additional tubes from the same batch following step 1 described above, and evaluate all eight test results using *Acceptance criteria B*.

Tube (container) content uniformity test acceptance criteria: In determining the relative standard deviation (RSD) from multiple tubes, first determine the variance from the three measurements for each tube and average across the tubes. The RSD is calculated using this average variance:

Acceptance criteria A—All results are within the product assay range, and the RSD is NMT 6% or as specified in the product specification or in the compendial monograph. If the RSD is greater than 6%, use *Acceptance Criteria B*.

Acceptance criteria B—All results are within the product assay range, and the RSD of the 12 assay results is NMT 6% or as specified in the product specification or in the compendial monograph.

■ **Visual uniformity:** Carefully remove or cut off the bottom tube seal and make a vertical cut from the bottom to the top of the tube. Carefully cut the tube around the upper rim, open the two flaps, and lay the flaps open to expose the product. Repeat this procedure for a total of three tubes.

■ **1S (USP39)**

Inspect the product visually for the presence of phase separation, change in physical appearance and texture (e.g., color change, crystallization, lumping), and other properties described in the product specification for *Description*. If there is no ~~observable~~

■ significant ■ 1S (USP39)

phase separation or significant

■ ■ 1S (USP39)

change in physical appearance and texture, and if the product meets the *Description* criteria, the product passes the test. If the product exhibits

■ significant ■ 1S (USP39)

phase separation and significant

■ Or ■ 1S (USP39)

change in physical appearance or texture, the product fails the test.

Uniformity of active ingredient(s):

The procedures described as follows can be modified depending on the sensitivity of the quantitative procedure used to determine the amount of the drug substance(s) present in the formulation.

For multiple-dose

■ unit ■ 1S (USP39)

tubes that contain 5 g or more of product

Stage 1

1. Using ~~three tubes~~

■ a single tube, ■ 1S (USP39)

after performing the test for *Visual uniformity*, remove an appropriate amount of the product from the top (i.e., cap end), middle, and bottom (i.e., seal end) portions of the tube. The sample size should be sufficient for at least one quantitative determination of the active ingredient(s)

■ and should not exceed the maximum dose recommended by the product labeling for a single application. ■ 1S (USP39)

2. Determine the amount of the active ingredient(s) in each portion of the product using any appropriate validated quantitative procedure, and evaluate the test results from the single tube using the *Stage 1 Acceptance Criteria*.

3. The *Stage 1 Acceptance Criteria* are met if:

- None of the ~~nine results (i.e., three each from three tubes)~~ are outside of the product assay range by $\pm 5.0\%$ (e.g., if the product assay range is 90.0%–120.0%, the range

~~will be 85.0%–125.0%),~~

■ three results are outside of the product assay range, ■ 1S (USP39)

and

◦ The maximum difference in the amount of active ingredient(s) determined within ~~each tube,~~ for each of the three tubes tested, is NMT ~~10.0%~~. For example, if the three measurements within a tube are ~~87.0%, 95.2%, and 89.7%,~~ the maximum difference would be ~~8.2% (i.e., 95.2% – 87.0% = 8.2%).~~

■ the tube is NMT 10.0%. For example, if the three measurements within the tube are 97.0%, 95.2%, and 99.7%, the maximum difference would be 4.5% (i.e., 99.7%–95.2% = 4.5%).

■ 1S (USP39)

4. Proceed to *Stage 2* testing if ~~NMT one of the nine test results is outside of the product assay range by ±5.0%, and none are outside the product assay range by ±15.0%, and the maximum difference of the amount of active ingredient(s) measured within each tube is NMT 15.0%;~~

■ none of the test results are outside the product assay range by NMT 5.0% (e.g., if the product assay range is 90.0%–120%, the range will be 85.0%–125.0%), and the maximum difference of the amount of active ingredient(s) measured within the tube is NMT 10.0%.

5. Proceed to *Stage 3* testing if NMT one of the three test results is outside of the product assay range by ±5.0%, and none are outside the product assay range by ±15.0%, and the maximum difference of the amount of active ingredient(s) measured within the tube is NMT 15.0%. ■ 1S (USP39)

Stage 2

1. Test an additional ~~seven~~

■ two ■ 1S (USP39)

tubes for *Visual uniformity* and *Uniformity of active ingredient(s)* for a total of three samples from ~~10~~

■ each from 3 ■ 1S (USP39)

tubes.

■ 2. Determine the amount of the active ingredient(s) in each portion of the product using any appropriate validated quantitative procedure, and evaluate the test results from the three tubes using the *Stage 2 Acceptance Criteria*. ■ 1S (USP39)

3. The *Stage 2 Acceptance Criteria* are met if:

- The *Visual uniformity* test is met for all tubes; and
- ~~29 of 30 test results are within the product assay range by ±5.0%, and none are outside of the product assay range by ±15.0%; and~~

- None of the nine results (i.e., three each from three tubes) are outside of the product assay range by NMT 5.0%, and ■ $1S$ (USP39)

- The maximum difference of the amount of active ingredient(s) measured within each tube, for each of the ~~10 tubes tested~~, is NMT ~~15.0%~~

- three tubes tested, is NMT 10.0%.

- Proceed to Stage 3 testing if NMT one of the nine test results is outside of the product assay range by $\pm 5.0\%$, and none are outside the product assay range by $\pm 15.0\%$, and the maximum difference of the amount of active ingredient(s) measured within each tube is NMT 15.0%.

Stage 3

1. Test an additional seven tubes for *Visual uniformity* and *Uniformity of active ingredient(s)* for a total of three samples from 10 tubes.

2. Determine the amount of active ingredient(s) in each portion of the product using any appropriate validated quantitative procedure, and evaluate the test results from the 10 tubes using the *Stage 3 Acceptance Criteria*.

3. The *Stage 3 Acceptance Criteria* are met if:

- The *Visual uniformity* test is met for all tubes; and
- 29 of the 30 test results are within the product assay range by $\pm 5.0\%$, and none are outside of the product assay range by $\pm 15.0\%$; and
- The maximum difference of the amount of active ingredient(s) measured within each tube, for each of the 10 tubes tested, is NMT 15.0%.

■ $1S$ (USP39)

For multiple-dose

■ *unit* ■ $1S$ (USP39)

tubes that contain less than 5 g of product

Stage 1

1. Using

~~three tubes~~

- a single tube, ■ $1S$ (USP39)

after performing the test for *Visual uniformity*, remove an appropriate amount of product from the top (i.e., cap end) and bottom (i.e., seal end) portions of the tube. The sample size should be sufficient for at least one quantitative determination of the active ingredient(s)

- and should not exceed the maximum dose recommended by the product labeling for a single application. ■ $1S$ (USP39)

2. Determine the amount of the active ingredient(s) in each portion of the product using any appropriate validated quantitative procedure, and evaluate the test results from the tube using the *Stage 1 Acceptance Criteria*.

3. The *Stage 1 Acceptance Criteria* are met if:

- ~~None of the six test results (i.e., two each from three tubes) are outside of the product assay range by $\pm 5.0\%$ (e.g., if the product assay range is 90.0%–120.0%, the product assay range $\pm 5\%$ is 85.0%–125.0%), and~~
 - Neither result is outside of the product assay range, and ■ 1S (USP39)

- The difference between the amount of active ingredient(s) determined for the two samples within each tube, for each of the three tubes
 - the tube ■ 1S (USP39)

tested is NMT 10.0%. For example, if the two measurements within a tube were 95.2% and 89.7%, the difference would be 5.5%.

4. Proceed to *Stage 2* testing if ~~NMT one of the six tests results is outside of the product assay range by $\pm 5.0\%$, and none are outside of the product assay range by $\pm 15.0\%$, and the maximum difference of the amount of active ingredient(s) measured within each tube is NMT $\pm 5.0\%$~~

■ neither of the test results are outside the product assay range by $\pm 5.0\%$ (e.g., if the product assay range is 90.0%–120.0%, the range will be 85.0%–125.0%), and the difference between the amounts of active ingredient(s) measured within the tube is NMT 10.0%.

5. Proceed to *Stage 3* testing if NMT one of the test results is outside of the product assay range by $\pm 5.0\%$, and none are outside the product assay range by $\pm 15.0\%$, and the difference between the amounts of active ingredient(s) measured within the tube is NMT 15.0%.

■ 1S (USP39)

Stage 2

1. Test an additional ~~seven~~

■ two ■ 1S (USP39)

tubes for *Visual uniformity* and *Uniformity of active ingredient(s)* for a total of two samples each from ~~10~~

■ 3 ■ 1S (USP39)

tubes.

■ 2. Determine the amount of the active ingredient(s) in each portion of the product using any appropriate validated quantitative procedure, and evaluate the test results from the three tubes using the *Stage 2 Acceptance Criteria*. ■ 1S (USP39)

3. The *Stage 2 Acceptance Criteria* are met if:

- The *Visual uniformity* test is met for all tubes; and
- ~~19 of 20 test results are within the product assay range by $\pm 5.0\%$, and none are outside of the product assay range by $\pm 15.0\%$; and~~
 - None of the six test results (i.e., two each from three tubes) are outside of the product assay range by $\pm 5.0\%$; and ■ 1S (USP39)

- The difference between the amount of active ingredient(s) determined for the two samples within each tube, for each of the ~~10 tubes tested~~, is NMT ~~15.0%~~
■ three tubes tested is NMT 10.0%.
- Proceed to Stage 3 testing if NMT one of the six test results is outside of the product assay range by $\pm 5.0\%$ and none are outside of the product assay range by $\pm 15.0\%$, and the difference between the amounts of active ingredient(s) measured within each tube is NMT 15.0%.

Stage 3

1. Test an additional seven tubes for *Visual uniformity* and *Uniformity of active ingredient(s)* for a total of 20 samples, two samples apiece from each of 10 tubes.
2. Determine the amount of active ingredient(s) in each portion of the product using any appropriate validated quantitative procedure, and evaluate the test results from the 10 tubes using the *Stage 3 Acceptance Criteria*.
3. The *Stage 3 Acceptance Criteria* are met if:
 - The Visual uniformity test is met for all tubes; and
 - 19 of 20 test results are within $\pm 5.0\%$ of the product assay range, and none are outside of the product assay range by $\pm 15.0\%$; and
 - The difference between the amount of active ingredient(s) determined for the two samples within each tube, for each of the 10 tubes tested, is NMT 15.0%.

■ 1S (USP39) ■ 1S (USP39)

PRODUCTS PACKAGED IN CONTAINERS OTHER THAN TUBES

For semisolid products packaged in a container other than a tube when the sampling method presented previously cannot be used, other sampling methods are acceptable, such as the following one described for a jar.

1. Select a suitable syringe of sufficient length to extend to the bottom of the container.
2. Remove and set aside the syringe plunger, and cut off the bottom of the syringe barrel. Sampling should take place from a location to the left/right of the mid-line of the jar surface to preserve an undisturbed region on the other side for any additional investigation (see *Figure 1*).

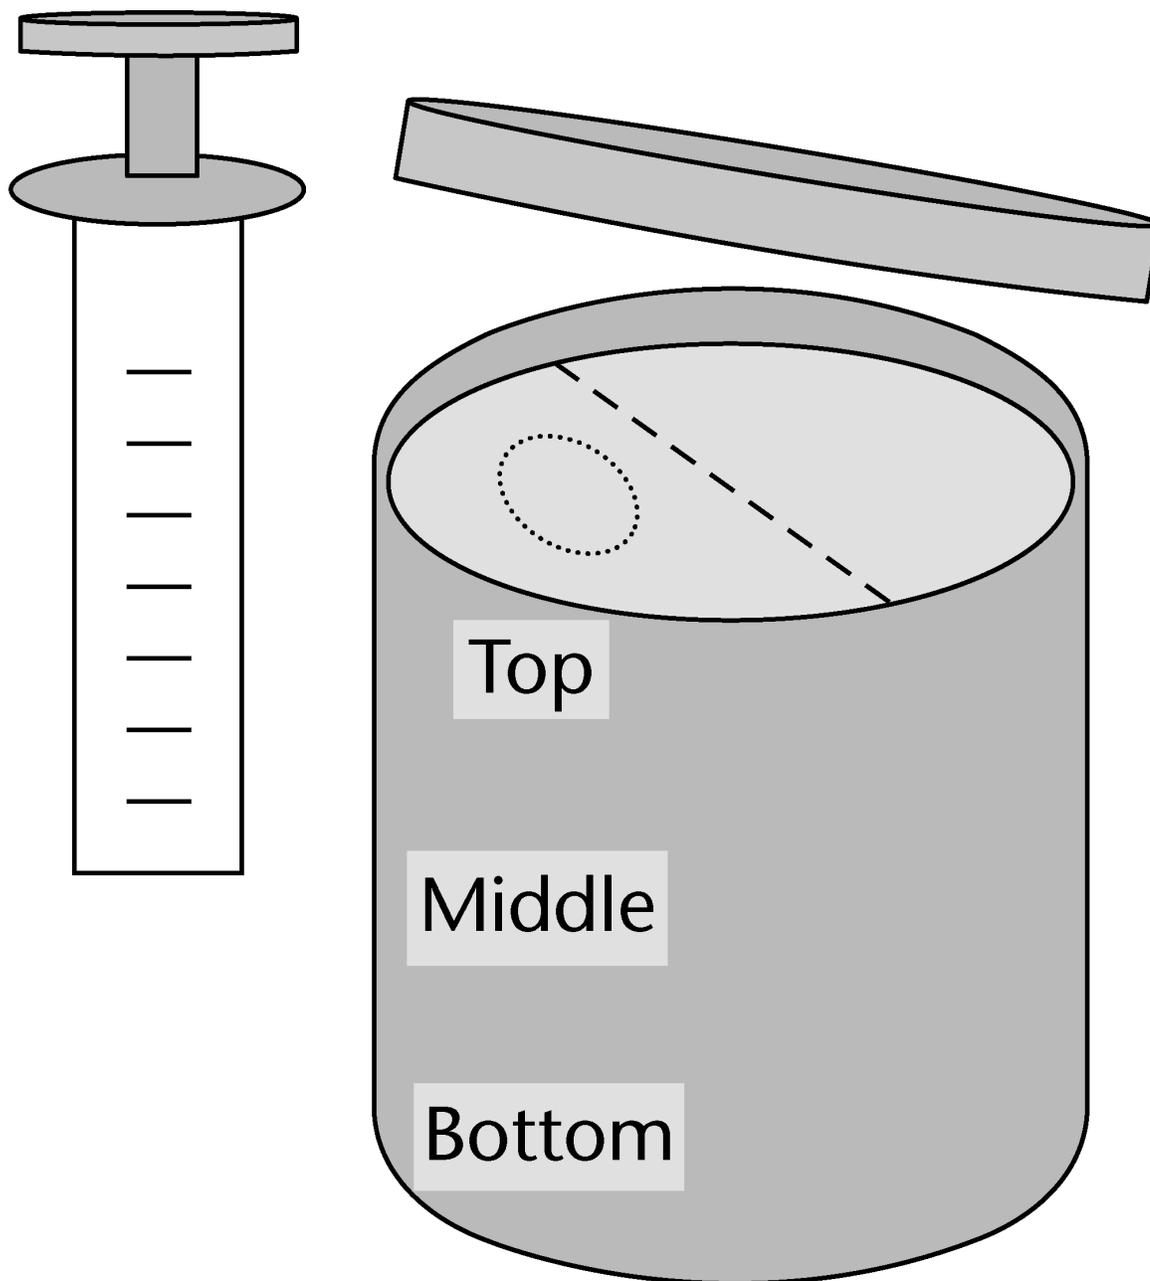

Figure 1. Sampling from a jar container.

3. Slowly push the syringe barrel into the container until it reaches the bottom. Then twist the syringe barrel containing the sample core, and remove the syringe from the container.
4. Insert the syringe plunger into the barrel, and carefully extrude the sample core onto a clean surface in three equal portions to represent the top, middle, and bottom portions of the container.
5. Remove an appropriate sample representative of the middle section of the top, middle, and bottom portions of the container samples, and test according to the instructions outlined in *Products Packaged in Tubes*.

Change to read:

SPECIFIC TESTS FOR TRANSDERMAL DELIVERY SYSTEMS

~~TDS or patches~~

■ TDS ■ 1S (USP39)

are formulated with an adhesive layer to ensure intimate contact with the skin to allow the delivery of the desired dose of drug. Adhesives in TDS must permit easy removal of the release liner before use, adhere properly to human skin upon application, maintain adhesion to the skin during the prescribed period of use, and permit easy removal of the TDS at the end of use without leaving a residue or causing damage to the skin or other undesirable effect(s). Additionally, adhesives must be able to maintain the performance of the TDS throughout the shelf life of the drug product.

~~Three types of TDS adhesion tests are generally used: peel adhesion test (from a standard substrate), release liner peel test, and tack test.~~

■ Testing of the physical properties of the TDS generally include peel adhesion, release liner peel, tack, cold flow, shear, and crystal formation (crystal formation is discussed above in *Product Quality Tests for Topical and Transdermal Drug Products, Specific Tests*). The peel adhesion, release liner peel, and tack tests measure the adhesion properties of the TDS. Each of these tests measures the force required to separate the TDS from another surface. The cold flow and shear measure the cohesive properties of the TDS. These latter tests measure the resistance to flow of the adhesive matrix.

■ 1S (USP39)

Acceptance criteria are product specific and defined to assure that adhesion of each batch of TDS is within the range defined by the product design and is consistent between batches based on the product development specifications ~~or~~

■ and ■ 1S (USP39)

statistical assessment of multiple product batches over the product's shelf life.

■ In addition to physical testing, this section also discusses the *Leak Test* applicable to form-fill-seal (reservoir or pouched)-type TDS.

■ 1S (USP39)

Peel Adhesion Test

This test measures the force required to remove (peel away) a TDS attached to a standard substrate surface (e.g., polished stainless steel). The TDS is applied to the substrate using specified techniques for application and is conditioned at a specified temperature and time. Then the TDS is peeled away from the substrate with an instrument that allows control of peel angle (e.g., 90° or 180°) and peel rate (e.g., 300 mm/min), and the peel force is recorded. This procedure is repeated using a minimum of five independent samples. The product fails the test if the mean peel force is outside the acceptable range determined during product development ~~and/or~~

■ ■ 1S (USP39)

based on statistical assessment of multiple product batches over the product's shelf life.

Release Liner Peel Test

This test measures the force required to separate the release liner from the adhesive layer of

the TDS. The test is performed with a finished product sample. The test sample is conditioned using specific procedures (temperature and time). Then, the release liner is pulled away from the TDS with an instrument that allows for control of peel angle (e.g., 90° or 180°) and peel rate, and the peel force is recorded. This procedure is repeated using a minimum of five independent samples. The product fails the test if the mean peel force is outside the acceptable range determined during product development and/or

■ ■ 1S (USP39)

based on statistical assessment of multiple product batches over the product's shelf life.

Tack Test

Several methods of tack tests have been developed. Examples include the *Probe Tack Method* and the *Rolling Ball Method*. It is up to the TDS manufacturer to decide which one

■ tack test ■ 1S (USP39)

is more

■ most ■ 1S (USP39)

appropriate for each drug product.

PROBE TACK METHOD

This test measures the force required to separate the tip of the test probe from the adhesive layer of the TDS. This test uses an instrument designed to create a bond between the tip of the stainless steel test probe (of defined geometry) and the TDS using a controlled force (light pressure) and specified test conditions (i.e., rate, contact time, contact pressure, and temperature). Then while controlling the rate of probe removal, the test measures the profile of force required to separate the probe tip from the TDS and the maximum force required to break the bond (tack). This procedure is repeated using a minimum of five independent samples. The product fails the test if the mean test result (force profile(s) and/or tack) is outside the acceptable range determined during product development and/or

■ ■ 1S (USP39)

based on statistical assessment of multiple product batches over the product's shelf life.

ROLLING BALL METHOD

This test measures the distance traveled by a defined ball on the adhesive layer of the TDS under defined conditions, as a parameter dependent on the tack properties of the adhesive layer. This test uses a setup designed to roll a ball (with defined material, weight, size, and surface) from a ramp (with defined angle and length) onto the adhesive layer (with defined orientation) under specified test conditions (temperature) (see *ASTM D3121* for more details). The distance traveled by the ball on the adhesive layer is measured using a suitable measuring device. This procedure is repeated using a minimum of five independent samples. The product fails the test if the mean distance traveled is outside the acceptable range determined during product development and/or

■ ■ 1S (USP39)

based on statistical assessment of multiple product batches over the product's shelf life.

Cold Flow Test

Cold flow is the migration of adhesive matrix beyond the edge of the TDS backing
 ■ and through the slit in the release liner, ■ 1S (USP39)

that may occur during the course of product processing and storage. Cold flow is an inherent property of transdermal systems due to the use of pressure-sensitive adhesives that flow when force is applied (i.e., if the adhesive matrix did not flow, the TDS would not stick). The magnitude of the cold flow is generally dependent on the product formulation, storage conditions, and storage time. Cold flow can be
 ■ should be qualitatively and ■ 1S (USP39)

quantitatively measured as an amount (i.e., the region of cold flow can be carefully isolated from the transdermal system and weighed or assayed), an area (i.e., the region of cold flow can be imaged, with suitable magnification, and the area of the cold flow measured using image analysis software), or, most commonly, as a distance (i.e., the distance the adhesive has migrated beyond the edge of the TDS backing, typically NMT a few millimeters, can be measured with suitable magnification; this method is described in further detail below).
 ■ by a suitable method. It is up to the TDS manufacturer to determine the most suitable cold flow test for each drug product. Acceptance criteria are product specific and defined to assure that cold flow of each batch of TDS is within the range defined by the product design and is consistent between batches based on the product development specifications and statistical assessment of multiple batches over the product's shelf life. ■ 1S (USP39)

Assessing cold flow through a combination of qualitative and quantitative methods may be needed. The method(s) chosen to assess cold flow must demonstrate discerning capabilities and be scientifically justified throughout the shelf life of the drug product.

DISTANCE METHOD

Samples to be tested should be carefully handled so as not to disturb the cold flow (if present). If the TDS to be tested is not adhered to the pouching material, carefully remove the TDS without disturbing the cold flow. If the TDS to be tested is adhered to the pouching materials, carefully cut around the perimeter of the pouch so that all edges of the pouch are open. Then carefully peel the front and back of the pouch apart, exposing the TDS, which may be adhered to the inside of the front or back pouch film. A minimum of three TDS should be prepared for testing.

With the aid of magnification (~20–100×) and appropriate lighting, a measurement of the distance the adhesive matrix has migrated beyond the edge of the TDS backing should be taken. A minimum of four measurements should be taken from each TDS. The positions on the TDS where the measurements are to be taken should be evenly spaced and predefined. For example, with the TDS oriented with the printing, measurements could be taken at the 3:00, 6:00, 9:00, and 12:00 positions. Measurements may be taken with the use of a graduated eye piece, through the use of a camera with suitable software, or other appropriate approach.

The product fails if the overall average measured cold flow is outside the acceptable range determined during product development and based on statistical assessment of multiple product batches over the product's shelf life.

~~Note that the test for cold flow provides a direct measure of the cohesive properties of the adhesive matrix, which is a quality attribute that is correlated to shear. Although the shear test has some value during product development as a rudimentary predictor of the potential for cold flow, with the inclusion of cold flow as a product quality test, shear is not recommended as a test to control the quality of the finished product.~~

■ ■ 1S (USP39)

Shear Test

The shear test measures the cohesive strength of a TDS. It can be measured under either static (this method is described in further detail below) or dynamic conditions. Shear testing may not be feasible for all TDS; the presence of multiple layers of adhesive in the system, the presence of a membrane or scrim, or the use of an emulsion adhesive system may result in the inability to achieve cohesive failure. TDS that are constructed with a peripheral adhesive ring or form-fill-seal TDS may not be suitable for this test.

■ It is up to the TDS manufacturer to decide if a shear test is appropriate, and if so, which shear test is most appropriate, for each drug product. Acceptance criteria are product specific and defined to assure that shear of each batch of TDS is within the range defined by the product design and is consistent between batches based on the product development specifications and statistical assessment of multiple product batches over the product's shelf life. ■ 1S (USP39)

Static Shear Test

For the static shear test, the time required to remove a standard area of the TDS from the substrate (i.e., stainless steel test panel) under a standard load (e.g., 250 g) is measured. The TDS is applied to a test panel,

that is at an angle 2° from the vertical

■ ■ 1S (USP39)

and the sample is subjected to a shearing force by means of a given weight suspended from the TDS. The test apparatus holds the test panels at

■ 0° ■ 1S (USP39)

2° from vertical to assure that the TDS will not experience peeling action when the weight is attached. Dwell time, weight used, type of test panel, mode of failure, and sample size should be noted; the time taken for the TDS sample to detach from the test panel is reported. This procedure is repeated using a minimum of five independent samples yielding valid results (see below). The product fails the test if the mean shear force

■ (i.e., arithmetic mean or geometric mean as determined by the manufacturer) ■ 1S (USP39)

is outside the acceptable range determined during product development and based on statistical assessment of multiple product batches over the product's shelf life.

Determination of the validity of static shear test:

Cohesion is the preferred

■ desired ■ 1S (USP39)

failure mode for the static shear test. Cohesive failure is indicated when adhesive is left on the TDS and on the stainless steel test panel. In contrast, an adhesive failure occurs when: 1) the TDS strips cleanly from the stainless steel panel, leaving no visible adhesive on the stainless steel panel; 2) the adhesive transfers to the stainless steel test panel, leaving no adhesive on the TDS; or 3) the TDS delaminates at an interface (e.g., between a membrane and an adhesive layer, or between the two different adhesive layers of a bilayer product). If adhesive failure is indicated, the sample test is invalid. In addition, if the TDS breaks or tears before detaching from the stainless steel test panel or the TDS slides out of the clamp ~~before detaching from the stainless steel test panel,~~

■ ■ 1S (USP39)

or the hanging weight does not hang freely, the sample test is invalid. ■ 1S (USP39)

Leak Test

This test is applicable only for form-fill-seal (reservoir or pouched)-type TDS. Form-fill-seal TDS must be manufactured with zero tolerance for leaks because of their potential for dose dumping if leaking occurs.

In-process control methods to examine TDS for leakers or potential leakers are needed and require considerable development on the part of TDS manufacturers.

IN-PROCESS TESTING

During the manufacturing process, the presence of leakage (or potential for leakage) because of TDS perforation, cuts, and faulty seals resulting from failures such as air bubbles, gel splash, or misalignment of a TDS's backing and release liner layers must be examined. Unless automated process analytical technology is implemented, in-process testing to identify these defects should be performed using the following test procedures.

Visual inspection:

- A specified number of TDS, defined on the basis of batch size, should be examined randomly.
- Each sampled TDS should be thoroughly visually inspected for leakage.
- The product fails if any of the TDS examined are detected with a leak.

Seal integrity: Transdermal system seals should be stress tested to ensure that the application of pressure does not force seals to open, thereby leading to leakage.

- A specified number of TDS, defined on the basis of batch size, should be randomly examined.
- Each sampled TDS should be thoroughly visually inspected for leakage.
- Each sampled TDS is placed on a hard, flat surface and overlaid with a weight so that it is subjected to 13.6 kg. The weight should be left in place for 2 min. Upon removal of the weight, the TDS should be visually inspected for leakage.

- The product fails if the number of TDS detected with a leak is greater than the acceptable limit established by the manufacturer.

Packaged product testing: TDS may leak after they have been individually placed in the primary packaging material as a result of the packaging operation itself or by user opening of the packaging. Therefore, TDS should be tested for leakage after they have been manufactured and packaged in their primary packaging material.

- A specified number of TDS, defined on the basis of batch size, should be randomly tested after they have been placed in their primary packaging material.
- The sampled TDS should be removed from their packaging and thoroughly visually inspected for leakage.
- Each sampled TDS should then be uniformly wiped with a solvent-moistened swab. Both the backing side and the release liner side of the TDS should be wiped. The inside surface of the pouch should also be wiped. The swab(s) is then extracted and assayed for the drug.
- The product fails if the total amount of drug from the TDS, and the corresponding pouch, exceed the acceptable limit established by the manufacturer.

BRIEFING

〈 55 〉 **Biological Indicators—Resistance Performance Tests**, *USP 38* page 103. The General Chapters—Microbiology Expert Committee proposes revisions to this chapter to align its content with the new series of *Sterilization of Compendial Articles* 〈 1229 〉 chapters. References to individual biological indicators monographs are proposed to be deleted and appropriate content moved to the proposed general chapter *Biological Indicators for Sterilization* 〈 1229.5 〉, also found in this issue of *Pharmacopeial Forum*.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style.

Comment deadline: May 31, 2015

〈 55 〉 BIOLOGICAL INDICATORS—RESISTANCE PERFORMANCE TESTS

Change to read:

TOTAL VIABLE SPORE COUNT

~~For paper carrier biological indicators, remove three specimens of the relevant biological indicators from their original individual containers. Disperse the paper into component fibers by placing the test specimens in a sterile 250-mL cup of a suitable blender containing 100 mL of chilled, sterilized *Purified Water* and blending for a time known to be adequate to achieve a homogeneous suspension. It is not unusual for blending times of 15 minutes or more to be required for optimal recovery. Transfer a 10-mL aliquot of the suspension to a sterile, screw-capped 16 × 125-mm tube. For *Biological Indicator for Steam Sterilization, Paper Carrier*, heat the tube containing the suspension in a water bath at 95° to 100° for 15 minutes (heat shock), starting the timing when the temperature reaches 95°. For *Biological Indicator for Dry Heat*~~

Sterilization, Paper Carrier, and for Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier, heat the tube containing the suspension in a water bath at 80° to 85° for 10 minutes, starting the timing when the temperature of the spore suspension reaches 80°. Cool rapidly in an ice water bath at 0° to 4°. Transfer two 1-mL aliquots to suitable tubes, and make appropriate serial dilutions in sterilized *Purified Water*, the dilutions being selected as calculated to yield preferably 30 to 300 colonies, but not less than 6, on each of a pair of plates when treated as described below. Where the biological indicator has a low spore concentration, it may be necessary to modify the dilution series and to use more plates at each dilution. Prepare a separate series of plates for each aliquot. Place 1.0 mL of each selected dilution in each of two 15 × 100-mm Petri dishes. Within 20 minutes, add to each plate 20 mL of *Soybean Casein Digest Agar Medium* that has been melted and cooled to 45° to 50°. Swirl to attain a homogeneous suspension, and allow it to solidify. Incubate the plates in an inverted position at 55° to 60° for *Biological Indicator for Steam Sterilization, Paper Carrier*, and at 30° to 35° for *Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier* and for *Biological Indicator for Dry Heat Sterilization, Paper Carrier* or at the optimal recovery temperature specified by the manufacturer. Examine the plates after 24 and 48 hours, recording for each plate the number of colonies; and use the number of colonies observed after 48 hours to calculate the results. Calculate the average number of spores per specimen from the results, using the appropriate dilution factor. The test is valid if the log number of spores per carrier at 48 hours is equal to or greater than the log number after 24 hours in each case. For *Biological Indicator for Steam Sterilization, Self-Contained*, aseptically remove the three carriers from the container, and proceed as directed for *Biological Indicator for Steam Sterilization, Paper Carrier*.

For *Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Nonpaper Carriers*, aseptically remove the three carriers from their original packaging or container. Place each carrier in a suitable sterile container containing 100 mL of chilled *Purified Water*, and sonicate or shake on a reciprocal shaker for an appropriate time. Fifteen minutes or more may be required for optimal recovery. A previous study should be conducted that ensures that the recovery method results in at least 50% to 300% recovery of the labeled spore viable count. Transfer a 10-mL aliquot of the suspension to a sterile, screw-capped 16 × 125-mm tube. Heat the tubes containing suspensions of *Bacillus atrophaeus*, *Bacillus subtilis*, and *Bacillus coagulans* at 80° to 85° for 10 minutes. Heat the tubes containing a suspension of *Geobacillus stearothermophilus* at 95° to 100° for 15 minutes. Start the timing when the lowest temperature of the stated temperature ranges is reached. Cool rapidly in an ice water bath at 0° to 4°. Transfer two 1-mL aliquots to suitable tubes, and make appropriate serial dilutions in *Purified Water*. The selected dilutions should be those that will preferably yield 30 to 300 colonies but not fewer than 6 on each pair of plates when treated as described below. When the biological indicator has a low spore concentration, it may be necessary to modify the dilution series and to use more plates at each dilution. Prepare a separate series of plates for each aliquot. Place 1.0 mL of each selected dilution in each of two 15 × 100-mm Petri dishes. Within 20 minutes add the aliquot to each plate containing 20 mL of agar that has been melted and cooled to between 45° and 50°. Swirl to attain a homogeneous suspension.

For *G. stearothermophilus*, *B. atrophaeus*, *B. subtilis*, and *B. coagulans*, use *Soybean Casein Digest Agar Medium* and incubate the plates in an inverted position aerobically at the following

respective temperatures for each microorganism: 55° to 60°, 30° to 35°, and 48° to 52°, or at the optimum temperature specified by the biological indicator manufacturer. Examine the plates after 24 and 48 hours. Record the number of colonies observed on each plate. Calculate the average number of spores per carrier from the results, using the appropriate dilution factor. The test is valid if the log number of spores per carrier at 48 hours is equal to or greater than the log number after 24 hours in each case.

For *Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions*, using *G. stearothermophilus*, *B. atrophaeus*, *B. subtilis*, and *B. coagulans* as biological indicators, prepare an appropriate serial dilution of the original spore suspension in chilled *Purified Water* contained in a sterile, screw-capped 16 × 125-mm tube, and proceed with the viable spore count procedures specified under *Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Nonpaper Carriers*.

D-VALUE DETERMINATION

Conduct all the tests described in this section under aseptic conditions, using sterilized equipment for nonthermophilic microorganisms. D-value determination for *G. stearothermophilus* and *B. coagulans* can be performed in a controlled but unclassified environment.

Apparatus

The test equipment for the determination of microbial resistance is described in substantial detail in ISO 18472, *Sterilization of Health Care Products—Biological and Chemical Indicators—Test Equipment*.³ The details of individual Biological Indicator Evaluation Resistometers (BIERs) vary with the specifics of their design and the particular sterilization process in conjunction with which they are used. Provided that the performance of the BIER vessel meets the requirements of the ISO standard for exposure of the biological indicator, design differences are acceptable.

Procedure

Carry out the tests for D value at each of the applicable sets of sterilization conditions for which the packaged biological indicator under test is labeled for use. Take a sufficient number of groups of specimens of biological indicators in their original individual containers, each group consisting of not less than 5 specimens. The number of groups provides a range of observations from not less than one labeled D value below the labeled survival time through not less than one labeled D value above the labeled kill time. Place each group on a separate suitable specimen holder that permits each specimen to be exposed to the prescribed sterilizing condition at a specific location in the sterilizing chamber of the BIER. Check the BIER apparatus for operating parameters using specimen holders without specimens. Select a series of sterilizing times in increments from the shortest time for the specimens to be tested. The differences in sterilizing times over the series are as constant as feasible, and the difference between adjacent times is no greater than 75% of the labeled D value.

Test procedures for the use of BIER vessels for the evaluation of microbial resistance are defined in a series of ISO standards under the 11138 series.^{2,3,4,5} The appropriate standard should be followed for the biological indicator. The test methods and carriers used with the BIER may be adapted to the specifics of the biological indicator. The method and apparatus used for paper carriers may differ from those for other carriers and will be substantially different

from those used for suspensions of biological indicators.

The D value exposure conditions for alternative material carriers are the same as the conditions used to determine the D value for paper carriers. If the manufacturer's label permits usage of the biological indicator carrier with multiple sterilization methods, then data on D value, survival time, and kill time will need to be provided by the manufacturer for each sterilization method. It is possible that biological indicators inoculated onto carriers other than paper will be used for gaseous or vapor sterilization/decontamination methods such as vapor phase hydrogen peroxide and chlorine dioxide.

Standard physical conditions for the evaluation of biological indicators for use with vapor phase hydrogen peroxide or chlorine dioxide have not been defined. In the case of chlorine dioxide, concentration of the gas, relative humidity, and temperature are critical process control conditions that can be accurately measured. The manufacturer of biological indicators marketed for use with chlorine dioxide should state the conditions under which the D value determination was conducted so that the user can at least discern the resistance of a lot of biological indicators as compared to their own anticipated use conditions. The situation with vapor phase hydrogen peroxide is a more complex one. Various equipment manufacturers have proposed different decontamination or sterilization conditions. Thus, there is no standard process for the conduct of vapor phase hydrogen decontamination or surface sterilization. It follows, then, that there are no industry standard biological indicator evaluation methods for vapor hydrogen peroxide, and it has been reported that there may not be a direct correlation between vapor concentration and rate or even effectiveness of biological indicator inactivation. Additionally, it is difficult to accurately assess relative humidity, which is often defined as a critical process parameter, in the presence of vapor hydrogen peroxide. For these reasons it is more reasonable to consider resistance of biological indicators to be a relative or comparative measure from the manufacturer rather than a true D value. It follows that, depending upon equipment and processes employed, it may be impossible for an end user to duplicate the biological indicator resistance tests performed by the manufacturer.

For *Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions*, conduct D value determinations for each of the microorganisms that are provided as a liquid spore crop suspension. The test is conducted using appropriate serial dilutions predicated upon the stated spore titer of the suspension in *Purified Water* in a sterile tube.

Where the suspension is placed on or in a substrate such as an elastomeric closure or formulated product, its resistance may differ from that determined in *Purified Water*. That difference may be significant to the usage of the biological indicators and appropriate measurements made prior to use in sterilization validation activities.

Recovery

After completion of the sterilizing procedure for *Biological Indicator for Dry Heat Sterilization, Paper Carrier*; *Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier*; or *Biological Indicator for Steam Sterilization, Paper Carrier*, whichever is applicable, and within a noted time not more than 4 hours, aseptically remove and add each strip to a suitable medium (see *Media* under *Sterility Tests* (71)) to submerge the biological indicator completely in a suitable tube. For each *Biological Indicator for Steam Sterilization, Self-Contained* specimen, the paper strip is immersed in the self-contained medium according to manufacturers' instructions, within

~~a noted time not more than 4 hours. Incubate each tube at the optimal recovery temperature specified by the manufacturer. Observe each inoculated medium-containing tube at appropriate intervals for a total of 7 days after inoculation. (Where growth is observed at any particular observation time, further incubation of the specimen(s) concerned may be omitted.) Note the number of specimens showing no evidence of growth at any time.~~

~~For *Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Nonpaper Carriers*, recovery of spores from the biological indicator carriers will follow recovery procedures described in the procedures under *Total Viable Spore Count*. D-value determination methods for paper carrier biological indicators may be used to calculate the D value for nonpaper carriers. Incubation conditions for the microorganisms that may be used for nonpaper biological indicators are described in the *Total Viable Spore Count* section.~~

~~For *Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions*, the method of recovery following sterilization exposure conditions are those methods described in the *Total Viable Spore Count* section for liquid suspensions, and when a dry heat D-value determination is made from *B. atrophaeus* suspensions, the same recovery procedures as described under *Biological Indicator for Steam Sterilization, Paper Carrier* are followed.~~

~~Where *C. sporogenes* is used as a biological indicator, methods for preparation, inoculation, and recovery methods and media must be adapted to accommodate the use of this anaerobic sporeformer.~~

Calculation

~~The determination of D values of biological indicators can be performed using the Limited Spearman-Kärber, Survival Curve Method or Stumbo-Murphy-Cochran procedures.^{6,7,8} It is preferable to use the same method as that defined by the biological indicator manufacturer to determine D values. The use of a different method can result in differences that are more an artifact of the method than a variation in the performance of the biological indicator.~~

Survival Time and Kill Time

~~Take two groups, each consisting of 10 specimens of the relevant biological indicator, in their original, individual containers. Place the specimens of a group in suitable specimen holders that permit each specimen to be exposed to the sterilizing conditions at a specific location in the BIER chamber.~~

~~Expose the specimens for the required survival time, enter the chamber, and remove the holder(s) containing the 10 specimens. Repeat the above procedure immediately, or preheat if a substantial interval has elapsed, so as to subject the second holder(s) containing 10 specimens similarly to the first conditions, but for the required kill time.~~

~~The *Survival time and kill time* for all monographed biological indicators is described in the official monograph under the heading for each.~~

INTRODUCTION

A biological indicator (BI) is a well-characterized preparation of a specific microorganism with a known resistance to a specific sterilization process. The correct use of BIs in the development,

validation, and control of sterilization processes requires that their population and resistance be accurately known. The population and resistance can be selected to confirm the adequacy of individual sterilization process conditions for an article. The recommendations of *Sterilization of Compendial Articles* (1229) should be followed for effective BI usage. The methods described below can be used to establish population and resistance, such that the response of the BI to the subject sterilization process is appropriate. Although the BI manufacturers are required to maintain rigorous control of population and resistance using the number of replicates as specified below, the end users are not required to use the same number of replicates for verification of those determinations. Conduct all of the tests described in this chapter under appropriate microbiological laboratory conditions (see *Microbiological Best Laboratory Practices* (1117)).

TOTAL VIABLE SPORE COUNT

Sample Collection/Recovery

PAPER/FIBER INDICATORS

For paper/fiber carrier BIs, remove four test samples from their individual containers. Disperse the indicator into component fibers by placing the test samples in a sterile vessel containing 100 mL of chilled, sterilized *Purified Water* and blending to achieve a homogeneous suspension. For self-contained BIs, aseptically remove four BI carriers from their containers and proceed as directed above.

INDICATORS ON OTHER SUBSTRATES

For all other biological indicators, remove four samples from their individual containers. Place the test samples in a sterile vessel containing 100 mL of chilled, sterilized *Purified Water* and agitate to achieve a homogeneous suspension of the spores in the water.

SPORE SUSPENSIONS

For spore suspensions of BIs, prepare an appropriate serial dilution of the original spore suspension in chilled, sterilized *Purified Water* in a sterile container, and follow the viable spore count procedures as specified below. The requirements of the tests are met if the average number of viable spores per carrier is within 0.5 log of the labeled spore count per carrier.

Viable Cell Elimination

Transfer a 10-mL aliquot of the suspension to a sterile tube. For BIs using spores of *Geobacillus stearothermophilus*, *Bacillus coagulans*, and other thermophilic spore formers, heat the tube containing the suspension in a water bath at 95°–100° for 15 min (heat shock), starting the timing when the temperature reaches 95°. For BIs containing nonthermophilic spore formers, heat the tube containing the suspension in a water bath at 80°–85° for 10 min, starting the timing when the temperature of the spore suspension reaches 80°. Cool suspensions rapidly in an ice-water bath at 0°–4°. Transfer two 1-mL aliquots to suitable tubes, and make appropriate serial dilutions in sterilized *Purified Water*. Calculate the dilutions to yield preferably 30–300 colonies, but NLT 6, on each plate in a pair, when treated as described below. Where the BI has a low spore concentration, it may be necessary to modify the dilution series and to

use more plates at each dilution.

Prepare a separate series of plates for each aliquot. Place 1.0 mL of each selected dilution in each of two 15 × 100-mm Petri dishes. Within 20 min, add to each plate 20 mL of *Soybean-Casein Digest Agar Medium* that has been melted and cooled to approximately 45°. Swirl to attain a homogeneous suspension, and allow it to solidify. Incubate the plates in an inverted position at 55°–60° for thermophilic spore formers and at 30°–35° for nonthermophilic spore formers or at the optimal recovery temperature specified by the manufacturer. Examine the plates after 48 h, recording for each plate the number of colonies. Calculate the average number of spores per test sample from the results, using the appropriate dilution factor. When evaluating vendor-supplied BIs, the viable spore count shall be between 50% and 300% of the manufacturer's stated value.

D-VALUE DETERMINATION

Apparatus

The test equipment used for the determination of microbial resistance ("D-value") is described in substantial detail in ISO 18472, *Sterilization of Health Care Products—Biological and Chemical Indicators—Test Equipment* (1). The details of individual Biological Indicator Evaluation Resistometers (BIERs) vary with the specifics of their design and the particular sterilization process for which they are used. Provided that the performance of the BIER vessel meets the requirements of the ISO standard for exposure of the BI, design differences are acceptable. For single-phase sterilization processes where an acceptable BIER has not been defined, the D-value determination can be accomplished by adapting a BIER design intended for a sterilization process operating in the same phase. There are no current methods available for D-value determination for multiple-phase sterilization processes.

Procedure

Carry out the tests for D-value at sterilization conditions consistent with those intended for use. Use 20 replicate test sample BIs in their original individual containers, subjected to at least five exposure conditions for a total of 100 tests. The number of exposure conditions is chosen to provide a range of observations from NLT one labeled D-value below the expected survival time through NLT one labeled D-value above the expected kill time. Place each group on a separate suitable sample holder that permits each sample to be exposed to the prescribed sterilizing condition at a specific location in the sterilizing chamber of the BIER. Check the BIER apparatus for operating parameters using sample holders without test samples. Select a series of sterilizing times in increments from the shortest time for the samples to be tested. The differences in sterilizing times over the series are as constant as feasible, and the difference between adjacent times is NMT 75% of the expected D-value. Test procedures for the use of BIER vessels for the evaluation of microbial resistance are defined in a series of ISO standards under the 11138 series (2–5). The appropriate standard should be followed for the BI. The test methods and carriers used with the BIER may be adapted to the specifics of the BI. The method and apparatus used for paper carriers may differ from those for other carriers and will be substantially different from those used for suspensions of BIs.

The D-value exposure conditions for alternative material carriers are the same as the conditions used to determine the D-value for paper carriers. If a manufacturer's label permits usage of the

BI carrier with multiple sterilization methods, then data on D-value, survival time, and kill time will need to be provided by the manufacturer for each sterilization method.

For BIs that are spore suspensions, conduct D-value determinations for each of the microorganisms that are provided as a liquid spore crop suspension. The test is conducted using appropriate serial dilutions predicated upon the stated spore filter of the suspension in *Purified Water* in a sterile tube. Where the suspension is placed on or in a substrate such as an elastomeric closure or formulated product, its resistance may differ from that determined in *Purified Water*. That difference may be significant to the usage of the BIs and appropriate measurements made before use in sterilization validation activities.

Recovery

After completion of the sterilizing procedure for BIs and within a noted time (NMT 4 h), aseptically remove and add each BI to a suitable medium (see media in *Sterility Tests* (71)) to submerge the BI completely in a suitable tube. For self-contained BIs, the paper strip is immersed in the self-contained medium according to manufacturers' instructions, within a noted time NMT 4 h. For insoluble items inoculated with a spore suspension, aseptically transfer these items individually to a suitable medium (see media in (71)) to submerge the item completely in the medium (aseptic handling is not required when the suspension used is a thermophilic spore former). When a sealed aqueous filled container has been inoculated, test the units individually, as described within (71).

Incubate each tube at the optimal recovery temperature appropriate for the challenge microorganism. Observe each inoculated medium-containing tube at appropriate intervals for a total of 7 days after inoculation. Where growth is observed at any particular observation time, further incubation of the test sample(s) concerned may be omitted. Note the number of samples showing no evidence of growth at any time.

Where *Clostridium sporogenes* or another anaerobic microorganism is used as a BI, methods for preparation, inoculation, and recovery methods and media must be adapted to accommodate the use of this anaerobic spore former.

Calculation

The determination of D-values of BIs can be performed using the Limited Spearman-Kärber, Survival Curve Method, or Stumbo-Murphy-Cochran procedures (6–8). When the BI has been purchased, use the same method as that defined by the BI manufacturer to subsequently determine D-values. The use of an alternate method can result in differences that are more an artifact of the method than a variation in the performance of the BI.

Survival Time and Kill Time

Take two groups of BIs, each consisting of 10 test samples, in their original, individual containers. Place the samples of each group in suitable sample holders that permit each sample to be exposed to the sterilizing conditions at a specific location in the BIER chamber.

Expose the samples for the required survival time, enter the chamber, and remove the holder(s) containing the 10 test samples. Repeat the above procedure immediately, or preheat if a substantial interval has elapsed, so as to subject the second holder(s) containing 10 test samples similarly to the first conditions, but for the required kill time. Recover BIs as described

above. The *Survival Time and Kill Time* should be provided by the BI manufacturer and verified by the end user.

BRIEFING

《 123 》 **Glucagon Bioidentity Tests**, *USP 38* page 198. This chapter revision proposal contains two options for manufacturers to test the bioidentity of their glucagon material. One option is the currently official *ex vivo* bioidentity test, and a second option is now offered that uses an *in vitro* cell-based procedure. The new test was validated and approved by the FDA for assuring potency of a particular manufacturer's approved product. In the future, USP plans to omit the rat method completely after multiple manufacturers have been able to demonstrate that the cell-based method is appropriate for all their glucagon products. This is part of USP's ongoing effort to phase out animal-based assays in favor of modern *in vitro* testing. Manufacturers are encouraged to contact USP if the new *in vitro* test is not suitable for their glucagon product or if they would like to submit an alternative validated and approved *in vitro* test for this purpose.

In addition, the following changes to the official text are proposed:

- The *Definition* section is now titled *Introduction* and irrelevant text for the purpose of the chapter was removed. This section was also modified to introduce the use of the new *in vitro* method and to clarify that only one suitable bioidentity test is required to meet the monograph requirement in *Glucagon for Injection*, the only USP monograph that cites this chapter. Note that this citation will remain as written in the monograph when the revised general chapter becomes official.

Additionally, minor editorial changes have been made to update the chapter to current USP style.

Comment deadline: May 31, 2015

《 123 》 GLUCAGON BIOIDENTITY TESTS

INTRODUCTION

Change to read:

Glucagon is a polypeptide

■ peptide ■_{1S} (*USP39*)

hormone that increases blood glucose levels via release of liver glycogen stores. ~~and is~~

clinically used to treat hypoglycemia. Human, porcine, and bovine glucagon share an identical 29-amino acid sequence. Commercially available Glucagon was previously purified from bovine and porcine pancreas glands. Today, human glucagon is recombinantly produced (rGlucagon) with various microbial fermentation systems using the human amino acid sequence. The *USP-NF Glucagon for Injection* monograph defines glucagon identification tests. Glucagon bioidentity must be determined using a validated bioassay method approved by a competent authority. The bioassay must demonstrate that the manufacturing process produces Glucagon that has a biologic activity of NLT 0.80 USP Unit/mg of glucagon. This chapter describes a validated glucagon bioidentity test that measures glucose released from freshly prepared rat liver cells (hepatocytes) stimulated with Glucagon in vitro.

■ A robust and precise physicochemical chromatographic procedure is used in the Glucagon Assay to assign potency on a mass basis. Bioidentity is still required in the *USP-NF Glucagon for Injection* monograph, and two procedure options are presented here: an in vivo procedure based on release of glucose from freshly prepared rat liver cells (hepatocytes) stimulated with Glucagon ex vivo, or production of cyclic adenosine monophosphate (cAMP) in vitro in response to Glucagon stimulation of the USP Glucagon Receptor Cell Line RS. To meet the acceptance criteria of the bioidentity test, only one of these bioidentity tests is required. ■ 1S (*USP39*)

PROCEDURE

Change to read:

•

■ A. ■ 1S (*USP39*)

Primary Liver Cell Assay

■ Bioidentity Test ■ 1S (*USP39*)

[Note—All buffers are oxygenated, prepared with either *Sterile Water for Injection* or *Sterile Water for Irrigation*, warmed to 37°, and adjusted to a final pH of 7.4 unless otherwise indicated. At least two independent assays (replicates) must be performed utilizing two rat livers for each lot of Glucagon. *Figure 1* demonstrates the process used to generate one replicate value. A minimum of two replicates are combined according to the *Calculations* section. The concentration range of the *Standard preparations* and *Assay preparations* may be modified to fall within the linear range of the *Assay*, and the calculations can be adjusted accordingly. Alternatively, full curve analysis using validated nonlinear statistical methods can be used, provided that similarity is demonstrated when analysts compare the responses of the *Standard preparations* and *Assay preparations*.]

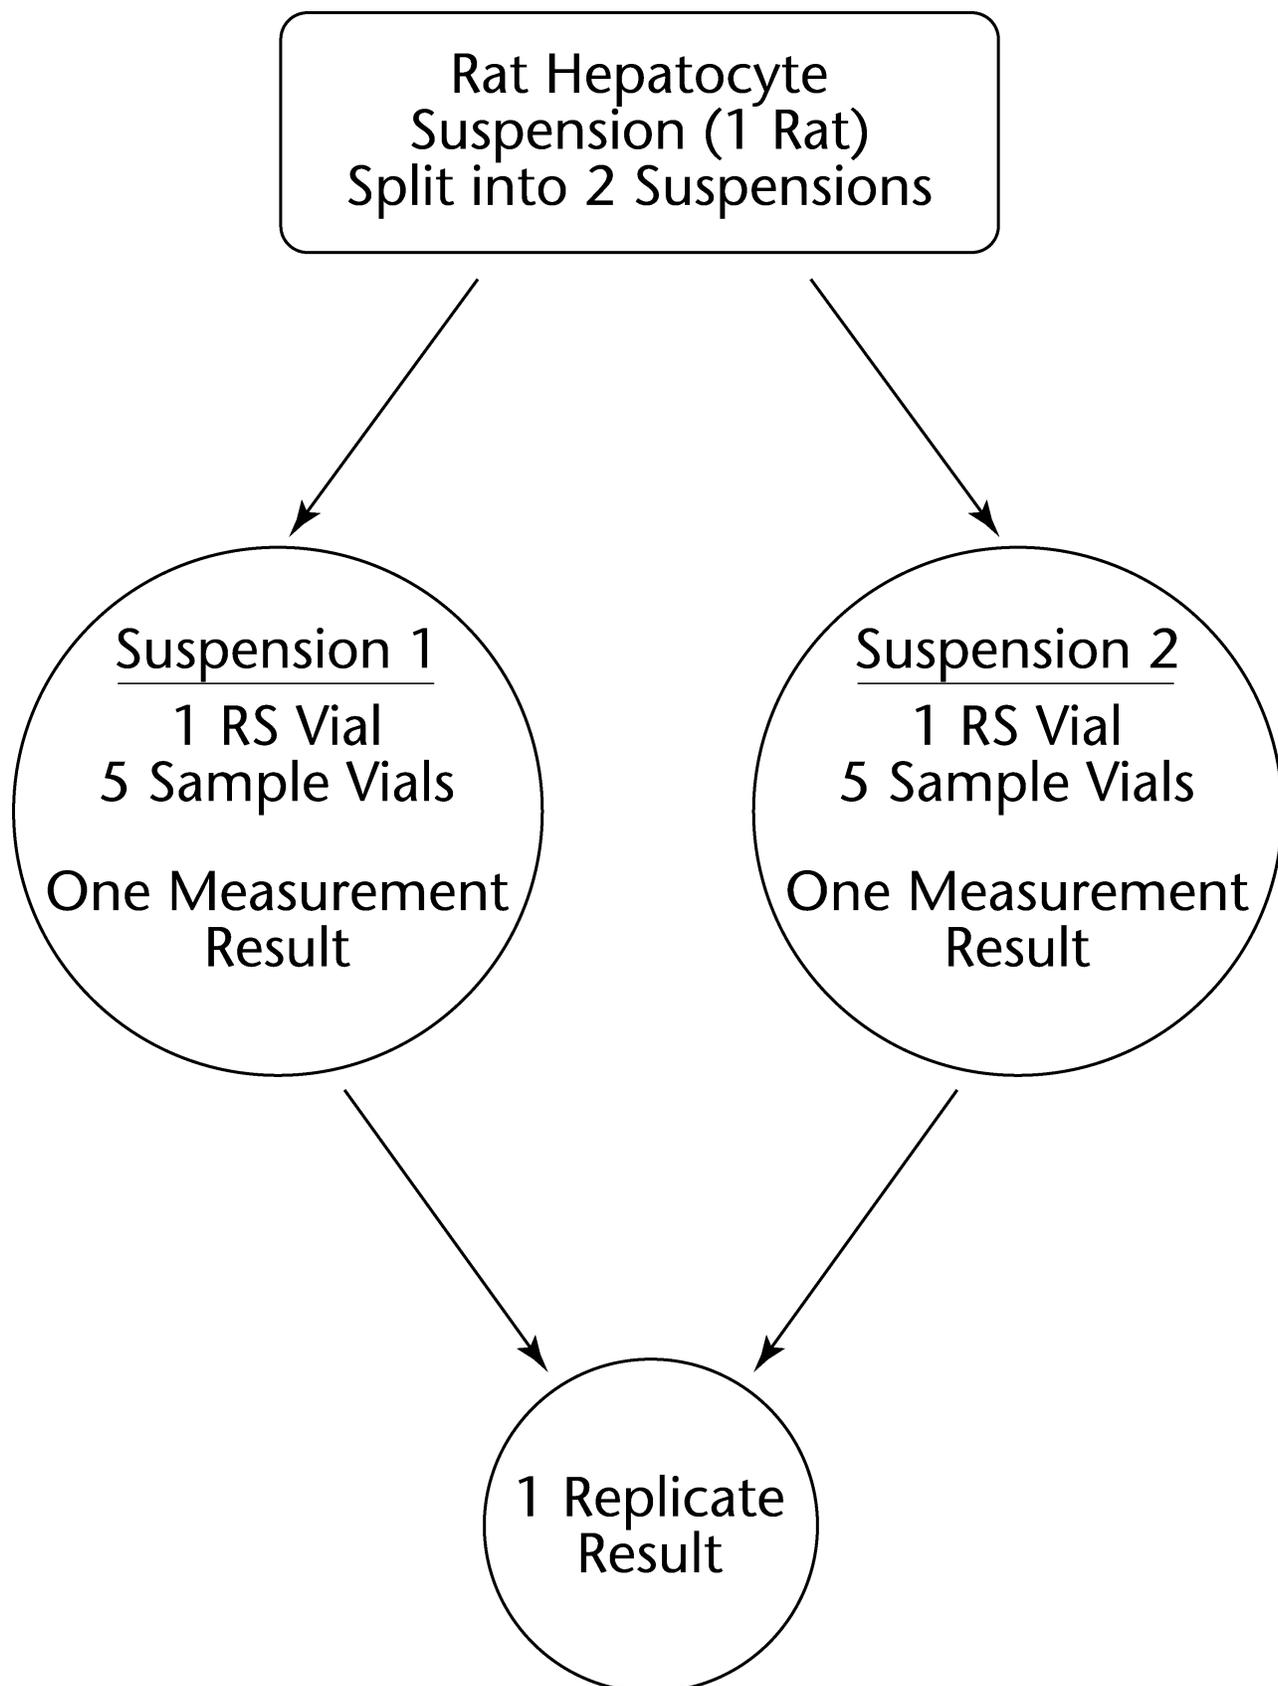

Figure 1. Rat hepatocyte assay method flow diagram (RS = Reference Standard).

Hepatocyte preparation

Calcium-free perfusion buffer with dextrose: Prepare a solution containing 7.92 g/L of

sodium chloride, 0.35 g/L of potassium chloride, 1.80 g/L of dextrose, 0.19 g/L of edetic acid (EDTA), and 2.38 g/L of 4-(2-hydroxyethyl)-1-piperazineethanesulfonic acid (HEPES).

Oxygenate before use.

Collagenase buffer: Prepare a solution containing 3.62 g/L of sodium chloride, 23.83 g/L of HEPES, 0.35 g/L of potassium chloride, 0.52 g/L of calcium chloride, and 1.8 g/L of dextrose. Adjust to a pH of 7.6. Immediately before perfusion, dissolve a quantity of collagenase in this solution to obtain a concentration of 0.02%–0.05%. The exact concentration of collagenase is determined empirically for each new lot of enzyme and is the amount that can consistently dissociate the tissue within 10 min of buffer entry and produce a viable cell concentration of $\text{NLT } 3 \times 10^6$ cells/mL.

Wash buffer: Prepare a solution containing 7.92 g/L of sodium chloride, 0.35 g/L of potassium chloride, 0.19 g/L of EDTA, 2.38 g/L of HEPES, 0.11 g/L of calcium chloride, and 0.06 g/L of magnesium sulfate.

Incubation buffer: Prepare a solution containing 6.19 g/L of sodium chloride, 0.35 g/L of potassium chloride, 0.22 g/L of calcium chloride, 0.12 g/L of magnesium sulfate, 0.16 g/L of monobasic potassium phosphate, 11.915 g/L of HEPES, and 10 g/L of bovine serum albumin (1% BSA). Adjust to a pH of 7.5.

Test animals: Male Sprague-Dawley rats are maintained on a standard rat chow diet, given water ad libitum, and allowed to adjust to their new housing before testing. On the morning of the test, select a healthy rat weighing approximately 300–400 g, and administer 100 Units of Heparin Sodium subcutaneously.

Procedure: [Note—Conduct this procedure in the morning to ensure that the rat has optimal glycogen in its liver and so that the procedure can be completed in 1 day.] Anesthetize the rat with an appropriate anesthetic. Open the abdominal cavity and isolate the portal vein. Insert an angiocatheter and tie into the portal vein at the general location of the lienal branch and then connect to a perfusion pump. Start the perfusion (25 mL/min) in situ with the previously warmed, oxygenated, *Calcium-free perfusion buffer with dextrose*. As the liver enlarges, cut the inferior vena cava to allow pressure equilibrium. [Note—About 300 mL of the perfusate is needed to clear the liver of red blood cells at a flow rate of 25–60 mL/min.] Then circulate *Collagenase buffer* at an appropriate flow rate so that the liver leaks perfusate out of the lobes in approximately 10 min (typically 25–60 mL/min). When the liver significantly increases in size, changes color and consistency, and starts to leak perfusate out of the lobes, change the system to the oxygenated prewarmed *Wash buffer*. About 100 mL of *Wash buffer* is needed to wash the liver of collagenase at a flow rate of 25 mL/min. Surgically remove the liver from the animal, and place in a prewarmed Petri dish containing a small amount of oxygenated *Wash buffer* (37^o). Gently comb the liver with a stainless steel, fine-toothed comb to free the hepatocytes. Filter and wash the hepatocytes with *Wash buffer*, through prewetted cheesecloth (3 layers thick, or through a 150- μm mesh polyethylene net) into a beaker. Transfer the cells to two centrifuge tubes and spin for about 1 min at 600 rpm. Discard the supernatant fractions and resuspend the two pellets in *Incubation buffer*. Combine the two pellets in a suitable container and add sufficient *Incubation buffer* to make 150 mL.

System suitability of cell preparation: The cell yield may vary because of the collagenase activity and the viability of the hepatocytes. To check cell viability and to determine viable cell concentration, dilute a 100- μL aliquot of the cell suspension with 400 μL of *Wash buffer* and 500 μL of isotonic 0.4% trypan blue solution. Load aliquots of the cell suspension into both chambers of a hemocytometer and count all eight quadrants. To meet system suitability

of the cell preparation method, a viable cell concentration of 3×10^6 cells/mL (acceptable range of 2.5×10^6 to 3.4×10^6 cells/mL) must be obtained to proceed with the bioassay. If the viable cell concentration exceeds the upper limit, additional *Incubation buffer* may be added to the cells to adjust the concentration to 3×10^6 cells/mL. In this case, the cells are counted again in a hemocytometer, as described above to verify the concentration. [Note—Viable cells are those cells that exclude the trypan blue.]

Glucose determination

Negative control solution: Prepare a solution containing 0.5% BSA using *Sterile Water for Injection* or *Sterile Water for Irrigation*.

Incubation flasks: Use specially prepared 25-mL conical flasks, the bottoms of which have been heated and pushed inward to form a conically raised center, or similar flasks that allow sufficient mixing when swirling. Place the *Incubation flasks* in an orbital shaker water bath at 35° .

Standard preparations: On the day of the assay, dissolve two vials of USP rGlucagon RS, accurately measured,

■ ■ 1S (USP39)

in 0.01 N hydrochloric acid or other suitable diluent (volume based on the potency of the Reference Standard lot) to obtain two solutions each containing 1 USP rGlucagon Unit/mL. All dilutions thereafter are made using *Negative control solution*. Accurately dilute measured volumes of each solution with *Negative control solution* to obtain an intermediate concentration of 400 $\mu\text{U/mL}$, and then dilute the intermediate to produce five concentrations: 200, 100, 50, 25, and 12.5 $\mu\text{U/mL}$ (*Standard preparations*). Pipette 0.1 mL of each *Standard preparation* into separate *Incubation flasks*. Pipette 0.1 mL of *Negative control solution* into each of two flasks (*Negative control solutions 1* and 2).

Assay preparations: Using accurately weighed quantities of Glucagon samples, proceed as directed for *Standard preparations* or, if testing *Glucagon for Injection*, reconstitute 10 vials by slowly adding the contents of the accompanying prefilled syringes containing an appropriate glucagon diluent. Gently mix each vial until the glucagon is dissolved. Using the same syringes, withdraw the contents of five vials and place the solutions in a 25-mL volumetric flask. Repeat for the second five vials, transferring the contents to a second 25-mL volumetric flask. Dilute each flask with 0.01 N hydrochloric acid to volume. Dilute an accurate amount of each solution with 0.5% BSA to yield a concentration of 400 $\mu\text{U/mL}$, and dilute the intermediate to produce five *Assay preparation* concentrations: 200, 100, 50, 25, and 12.5 $\mu\text{U/mL}$. Then proceed as directed for the *Standard preparations*.

Reference stock solution: Dry USP Dextrose RS, and then transfer 1.0 g, accurately weighed, to a 100-mL volumetric flask. Dissolve in and dilute with saturated benzoic acid solution to volume.

Reference solutions: Transfer suitable quantities of *Reference stock solution* to four flasks, and dilute with saturated benzoic acid solution to obtain *Reference solutions* having concentrations of 100, 500, 1000, and 1500 mg/L.

Potassium ferrocyanide solution: Dissolve 1.25 g of trihydrate potassium ferrocyanide in 125 mL of *Sterile Water for Injection*, or use an appropriate commercial source.

System suitability: Analyze the *Potassium ferrocyanide solution*, the *Reference solutions*, and an additional five replicates of either the 500- or 1000-mg/L *Reference solution* in an appropriate glucose analyzer. [Note—*Potassium ferrocyanide solutions* are only appropriate standards for glucose analyzers that measure glucose oxidase activity. The procedure can

also be performed using alternative platforms.] Prepare a standard curve using the *Reference solutions* as directed for the *Standard preparations*. The square root of the residual error mean square from the regression divided by the average of the response multiplied by 100% (line %RSD) must be NMT 2.0%. In addition, the response of the *Potassium ferrocyanide solution* must be NMT 30 mg/L, and the relative standard deviation must be NMT 2.0% for the replicate analyses of the middle *Reference solution*.

Procedure: Dispense 5 mL of *Hepatocyte Preparation* into the *Incubation flasks* in sequence from high glucagon concentration to low glucagon concentration, alternating the *Standard preparations* with the *Assay preparations*. Swirl the flasks in an orbiting water bath at 125 rpm at 30°–35° for approximately 30 min. Following incubation, remove 1.0-mL aliquots from each *Incubation flask*, transfer to labeled microcentrifuge tubes, and centrifuge at 13,000 rpm for 15 s. Place each supernatant fraction in a labeled sampling tube for a glucose analyzer, and determine the glucose concentration (mg/L) of each *Standard preparation* and *Assay preparation*. Measure the background reading of *Negative control solutions 1* and *2*, and calculate the average of the two responses.

To conform to the linear range of the instrument being used, analysts may find it necessary to adjust by dilution each of the *Standard preparations* and *Assay preparations*. Use a glucose analyzer that has demonstrated appropriate specificity, accuracy, precision, and linear response over the range of concentrations being determined. Determine the increase in glucose concentration for each *Standard preparation* and *Assay preparation* compared to the average value of the *Negative control solution*.

Calculations

Calculate the relative potency of the Glucagon samples using statistical methods for parallel-line assays, comparing the Reference Standard curve (from the *Standard preparations*) to the Glucagon sample curve (from the *Assay preparations*). No dose–response reversals may occur within a run for the 25, 50, or 100 µU/mL *Standard preparations* and *Assay preparations*.

[Note—Either the low- or high-dose level, but not both, may be excluded from the calculation in order to meet linearity requirements.] Because a minimum of two valid assays (rats) are required, the estimated potencies are combined using the procedures in *Design and Analysis of Biological Assays* (111), *Combination of Independent Assays*, and the width, L , of a 95% confidence interval for the estimated logarithm of the relative potency is calculated. If L is NMT 0.1938, the results are valid. If L is >0.1938, additional assays may be performed and combined until a valid L term results, and the relative potency is then calculated from all valid independent runs. Calculate the potency of the Glucagon samples in USP rGlucagon Units/mg by multiplying the relative potency result by the potency of USP rGlucagon RS. ~~It meets the requirement of bioidentity if the potency is NLT 0.80 USP rGlucagon Unit/mg.~~

■ **Acceptance criteria:** NLT 0.80 USP rGlucagon Units/mg ■ 1S (USP39)

Add the following:

■ • B. In Vitro Cell-Based Bioidentity Test

Medium A: Dulbecco's Modified Eagle Medium (DMEM) containing 4.5 mg/mL d-glucose and sodium pyruvate, 4 mM l-alanine-l-glutamine¹ or L-glutamine, 10% (v/v) fetal bovine serum,² and 0.5 mg/mL G418.³

Buffer A: Hank's balanced salt solution⁴ containing 5.3 mM potassium chloride, 0.4 mM potassium phosphate monobasic, 4.2 mM sodium bicarbonate, 137.9 mM sodium chloride, 0.3 mM sodium phosphate dibasic anhydrous, and 5.6 mM dextrose.

Cell culture preparation: Remove USP Glucagon Receptor Cell Line RS from cryostorage and immediately thaw at 37° until the cell suspension has just thawed. Aseptically transfer the cell suspension from the cryotube into a sterile test tube containing 10 mL of 37° *Medium A*. Mix and then pellet the cells by centrifugation for 5 min at 125 × *g*. Remove the supernate and resuspend the cells in fresh, 37° *Medium A*. Measure the quantity of cells contained in an aliquot of the suspension by suitable methods and adjust the cell concentration with *Medium A* such that the cell suspension is 0.5–5 × 10³ cells/cm² of tissue culture flask surface. Inoculate tissue culture flasks⁵ and store in a humidified incubator at 37° containing 5% carbon dioxide. Cells should be passaged 2–3 times/week when they are NMT 90% confluent but never trypsinized 2 d in a row. If cells are not ready for passaging after 3 d of culture, the medium should be replaced with fresh *Medium A*. Cells are passaged by first removing the medium from the cell flasks, followed by adding sufficient *Buffer A* prewarmed to room temperature to cover the surface of the flasks. The flasks are gently rocked to wash the cells. This wash fluid is discarded and then sufficient trypsin⁶ is added to the cell flasks to cover the surface, followed by gentle rocking and placement back in the incubator. After 3–5 min, the trypsinized cells are aseptically collected from the flasks and transferred to a sterile centrifuge tube, then a volume of *Medium A* is added that is about 2× the volume of trypsinized cells, and an aliquot is counted. The cell suspension is further diluted with fresh *Medium A* to a final cell concentration of 0.5–5 × 10³ cells/cm² of tissue culture flask surface. After a minimum of 8 passages post-thaw but NMT 25 passages, the cells can be used in the assay. The day before an assay, follow the cell passaging instructions above but resuspend the cells in fresh, 37° *Medium A* to a final cell concentration of 4–5 × 10⁴ cells/mL. [Note—Three identical, independent 96-well white plates⁷ are needed for measurement of two test samples (“A” and “B”) analyzed on each. All wells must be loaded with cells within 40 min.] Using constant, gentle mixing without foaming, each well is loaded with 0.1 mL of cell suspension and incubated overnight at 37° and 5% carbon dioxide (approximately 24 h ± 4 h) prior to starting the *Procedure*. [Note—All remaining solutions should be prepared on the day of the *Procedure*.]

Medium B: Kreb's salt solution containing 0.3% (v/v) human serum albumen, 25 mM HEPES, 1.7 mM IBMX, 0.2 mg/mL glucose, 650 KIU/mL aprotinin, and 0.0003% (v/v) polysorbate 80, pH 7.4.

Medium C: Kreb's salt solution containing 0.3% (v/v) human serum albumen, and 25 mM HEPES, pH 7.4.

Standard stock solutions: Reconstitute USP rGlucagon RS in *Water for Injection* to a concentration of 4 mg/mL by gently mixing on a rotator for 10 min or until completely clear. Dilute this material 1:1000 with *Medium B* to a concentration of 0.4 µg/mL and then 1:200 with *Medium B* to 20 ng/mL.

Standard solutions: Within an hour of use, dilute the 20 ng/mL *Standard stock solution* with *Medium B* to make a 1:5 concentration series of 4 ng/mL (R8), 0.8 ng/mL (R7), 160 pg/mL (R6), 32 pg/mL (R5), 6.4 pg/mL (R4), and 1.3 pg/mL (R3). A final dilution is made from R3 in *Medium B* to make 65 fg/mL (R2). R1 is a blank solution of *Medium B*. [Note—For these *Standard solutions*, as well as the *Sample solutions* and *cAMP standard solutions* described below, it may be helpful to prepare these dilutions in a dilution microplate that mimics the assay plate layout to easily and quickly transfer the materials

to the wells of the assay plate.]

Sample solutions: Reconstitute two independent preparations of glucagon from the same lot of material in *Water for Injection* to a concentration of 4 mg/mL. Prepare by diluting this material further with *Medium B* to prepare a concentration series similar to that described above for the *Standard solutions*. One preparation series is *Sample solution A8–A2* and the other preparation series is *Sample solution B8–B2*.

cAMP standard solutions: Prepare a 5 mM cAMP⁸ solution in water, and then prepare further solutions by dilution with *Medium B* as shown in *Table 1*.

Table 1: Preparation of cAMP Standard Solutions

Starting cAMP Solution	Fold Dilution with <i>Medium B</i>	Final cAMP Solution	Final cAMP Standard Solution Name
5 mM cAMP	1:10	0.5 mM cAMP	—
0.5 mM cAMP	1:20	25 μM cAMP	C1
25 μM cAMP	1:3.3	7.5 μM cAMP	C2
25 μM cAMP	1:10	2.5 μM cAMP	C3
7.5 μM cAMP	1:10	0.75 μM cAMP	C4
2.5 μM cAMP	1:10	250 nM cAMP	C5
0.75 μM cAMP	1:10	75 nM cAMP	C6
250 nM cAMP	1:10	25 nM cAMP	C7
75 nM cAMP	1:10	7.5 nM cAMP	C8
<i>Medium B</i> only	—	No cAMP	C9

Procedure: Remove the plates seeded with cells the day before, and discard the *Medium A* in each well. Wash the cells with 350 μL/well of *Medium C*, then discard the wash solution. Rapidly add 20 μL/well of diluted 1× anti-cAMP-acceptor beads.⁹ Add 30 μL/well of each *Standard solution*, *Sample solution*, or *cAMP standard solutions* as indicated in the plate layouts shown in *Tables 2* and *3*. [Note—The white plate for the *cAMP standard solutions* does not contain cells.] Cover the plate¹⁰, protecting it from light and evaporation, and incubate for 35–60 min in an incubator at 37^o with gentle shaking. Next, dispense 60 μL of diluted 1× donor beads containing biotin-cAMP probe in a 5 mM HEPES lysis buffer containing 0.1% (w/v) BSA, 0.3% (v/v) polysorbate 20, and a pH of 7.4.¹¹ Mix well, then cover¹² the plate again and wrap it with foil. [Note—The beads are light sensitive so plates should be kept dark or under green light conditions.] Gently rotate the plate on a shaker for at least 30 min at room temperature. Keep the plate in the dark, at room temperature, without shaking for 16–30 h before measuring the top luminescence from the plate wells on a suitable plate reader¹³ and detection mode (excitation wavelength of about 680 nm; emission of 520–620 nm).

LEGEND:

C1–9 = Dilution series of *cAMP standard controls* starting with C1 which contains 25 μM cAMP through C9 which does not contain cAMP.

System suitability criteria: *Sample solutions* A2–A8 and B2–B8 results and *Standard solutions* R1–R8 must be within the linear range of the *cAMP standard solutions* results (defined as C3–C8). NLT 3-fold difference between the signals obtained in the wells of cells treated without glucagon (R1) versus those with the maximal amount of glucagon (R8). The EC₅₀ for the *Standard solution* curves must be between 4.9 and 32.9 pg/mL. NMT 4 technical outliers may be omitted per standard curve. Any plate that fails one or more of these criteria is rejected and must be repeated.

Calculations: A minimum of two independent *Sample solution* preparations must be used for each test sample across three plates (assays). Outliers identified by Grubb's test (see chapter 111); but NMT 4/curve and NMT one data point from a replicate set) are omitted, and then the same number of *Standard solution* and *Sample solution* dose responses, including the 50% response (EC₅₀) of the standard/test sample within this range, are used to calculate the relative potency of the glucagon sample using statistical

methods for parallel-line analysis. For each individual *Sample solution* compared to the *Standard solution*, the statistical tests for linearity, slope, and parallelism must pass at the 95% level. Calculate the relative potency of the Glucagon samples by comparing the Reference Standard curve (from the *Standard solutions*) to the Glucagon sample curve (from the *Sample solutions*). Because a minimum of three valid assays are required, the estimated potencies are combined using the procedures in chapter $\langle 111 \rangle$, *Combination of Independent Assays*, and the confidence interval is calculated using suitable statistical methods. If the confidence limits are between 64% and 156%, the results are valid. If not, up to 2 more assay plates may be performed and combined until a valid confidence interval results, and the relative potency is then calculated from all valid independent runs. Calculate the potency of the Glucagon samples in USP rGlucagon Units/mg by multiplying the relative potency result by the potency of USP rGlucagon RS.

Acceptance criteria: NLT 0.80 USP rGlucagon Units/mg_{1S} (USP39)

BRIEFING

《 191 》 **Identification Tests—General**, *USP 38* page 216. It is proposed to modernize this chapter by providing an option of using instrumental identification methods in lieu of traditional wet-chemistry procedures. A new section, *Instrumental Identification Tests*, was added to the chapter. This section includes a *Procedure* (sample and standard solutions) and *Analysis* for each instrumental technique listed, as well as general guidance for selecting and implementing instrumental options for identification.

The *Introduction* was revised to indicate that unless otherwise specified in the monograph, if *Chemical Identification Tests* is selected for an ion, then all chemical test procedures for the ion shall be met. If *Instrumental Identification Tests* is selected for an ion, then only one instrumental technique is required.

The existing wet-chemistry procedures are now listed in the *Chemical Identification Tests* section. The specific changes are as follows:

- The flame tests under *Sodium*, *Calcium*, *Barium*, *Potassium*, *Lithium*, and *Borate* were removed to address safety concerns. Complementary wet-chemistry identification tests currently listed under *Chemical Identification Tests* for these ions are sufficient to verify the identity.
- Under *Hypophosphite*, the test evolving phosphine was also deleted.
- The section for *Phosphate* was divided into subsections for *Pyrophosphates* and *Orthophosphates* for clarity, to address comments received.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style, including the incorporation of letters (e.g., A, B, C) in the *Chemical Identification Tests* section for clarity and ease of navigation.

The monographs affected by the deletion of the flame tests are being revised in this issue and upcoming issues of *PF*. However, *USP* will coordinate the chapter and the monographs so that they become official at the same time.

For the drug substance and excipient monographs specifically referring to the flame test(s) under chapter 《 191 》, the following revisions are proposed:

- Where available, a replacement wet-chemistry test, adopted from another compendial source, is being proposed.
- For the articles where no replacement wet-chemistry procedures were found, an interim solution to retain the flame test is proposed. A complete description of the test is included in the monograph, and the manufacturers are encouraged to submit a replacement wet-chemistry or an instrumental procedure.

For the drug product monographs specifically referring to the flame test(s) under chapter 《

191 } , the following revisions are proposed:

- For the drug products where the identification test for *Sodium, Calcium, Barium, Potassium, Lithium, and/or Borate* is necessary to verify the identity of one of the active components (such as a monograph family of electrolytes), an interim solution to retain the flame test is proposed. A complete description of the test is included in the monograph, and the manufacturers are encouraged to submit a replacement wet-chemistry or an instrumental procedure.
- For all other drug product monographs, it is proposed to delete the flame tests found in the identification section of the monograph. These tests are often affected by interference from the excipient matrix and typically do not add value to dosage-form monographs.

The following Briefing list includes monographs and/or chapters that both reference the General Chapter under revision and require revision to keep references to the General Chapter accurate. Other monographs and/or chapters may also be listed, even where the reference to the General Chapter remains unchanged, as additional notice to stakeholders where there is believed to be potential for the change in the general chapter itself to affect pass-fail determinations for particular monograph articles. <https://www.usp.org/usp-nf/notices/general-chapter-191-identification-tests>

A companion [Stimuli](#) article is being published in this issue of *PF* to describe the background and rationale for this revision.

⟨ 191 ⟩ IDENTIFICATION TESTS—GENERAL

INTRODUCTION

Change to read:

~~Under this heading are placed tests that are frequently referred to in the Pharmacopeia for the identification of official articles. Before using any acid or base to modify the pH of the sample solution, make sure that the added substance will not interfere with the results of the test. [Note—The tests are not intended to be applicable to mixtures of substances unless so specified.]~~

■ Procedures in this chapter are referenced in monographs for the identification of official articles and their components. Any acids, bases, or other reagents used in these procedures should not interfere with the results. Volumes may be scaled proportionally unless otherwise indicated. All of the tests include approximate amounts, except where specified.

Where “water,” without qualification, is mentioned in the tests or in directions for preparing solutions, *Purified Water, USP* is to be used.

Instrumental techniques described in this chapter may be used in lieu of chemical identification tests. In addition, other suitable, validated instrumental techniques may be used.

Unless otherwise specified in the monograph, if a chemical identification test is selected for an

ion, then all chemical test procedures for the ion shall be met. If an instrumental identification test is selected for an ion, then only one instrumental technique is required.

■ 1S (USP39)

CHEMICAL IDENTIFICATION TESTS

Change to read:

Acetate

■ ● **A.** ■ 1S (USP39)

Dissolve about 30 mg of the substance to be examined in 3 mL of water, or use 3 mL of the prescribed solution. Adjust the pH of the solution with sodium hydroxide to be slightly alkaline. Add 0.25 mL of lanthanum nitrate test solution (TS). If a white precipitate is formed, filter the solution. Add successively 0.1 mL of iodine, and potassium iodide TS 3, and 0.1 mL of ammonia TS 2 to the solution. If no blue color is observed, heat carefully to boiling. In the presence of acetates, a dark color develops or a blue precipitate is formed.

■ ● **B.** ■ 1S (USP39)

With neutral solutions of acetates, ferric chloride TS produces a red color that is destroyed by the addition of mineral acids.

Change to read:

Aluminum

■ ● **A.** ■ 1S (USP39)

By using 6 N ammonium hydroxide, solutions of aluminum salts yield a gelatinous, white precipitate that is insoluble in an excess of 6 N ammonium hydroxide.

■ ● **B.** ■ 1S (USP39)

1 N sodium hydroxide or sodium sulfide TS produces the same precipitate, which dissolves in an excess of either of these reagents.

Change to read:

Ammonium

■ ● **A.** ■ 1S (USP39)

Add 0.2 g of magnesium oxide to the solution under test. Prepare an indicator solution by mixing 1 mL of 0.1 M hydrochloric acid and 0.05 mL of methyl red TS 2. Pass a current of air through the

■ magnesium oxide ■ 1S (USP39)

mixture, and direct the gas that escapes to just beneath the surface of the indicator solution prepared previously. In the presence of ammonium, the color of the indicator solution is changed to yellow. After directing the gas into the indicator solution for a sufficient period of time, add 1 mL of freshly prepared sodium cobaltinitrite TS to the indicator solution. Upon the addition of the sodium cobaltinitrite TS, a yellow precipitate is formed when ammonium is present.

Change to read:

Antimony

■ ● **A.** ■ 1S (USP39)

With hydrogen sulfide, solutions of antimony(III) compounds, strongly acidified with hydrochloric acid, yield an orange precipitate of antimony sulfide that is insoluble in 6 N ammonium hydroxide but is soluble in ammonium sulfide TS.

Change to read:

Barium

- **A.** 1S (USP39)

Solutions of barium salts yield a white precipitate with the addition of 2 N sulfuric acid. This precipitate is insoluble in hydrochloric acid and in nitric acid.

- ~~**B.** Barium salts impart a yellowish-green color to a nonluminous flame that appears blue when viewed through green glass.~~

- 1S (USP39)

Change to read:

Benzoate

- **A.** 1S (USP39)

In neutral solutions, benzoates yield a salmon-colored precipitate with ferric chloride TS.

- **B.** 1S (USP39)

In moderately concentrated solutions, benzoates yield a precipitate of benzoic acid upon acidification when 2 N sulfuric acid is added. This precipitate is readily soluble in ethyl ether.

Bicarbonate

See *Carbonate*.

Change to read:

Bismuth

- **A.** 1S (USP39)

When dissolved in a slight excess of nitric acid or hydrochloric acid, bismuth salts yield a white precipitate upon dilution with water. This precipitate is colored brown by hydrogen sulfide, and the resulting compound dissolves in a warm mixture of equal parts of nitric acid and water.

Bisulfite

See *Sulfite*.

Change to read:

Borate

- **A.** 1S (USP39)

To 1 mL of a borate solution, acidified with hydrochloric acid to litmus, add 3 or 4 drops of iodine TS and 3 or 4 drops of polyvinyl alcohol solution (1:50): an intense blue color is produced.

- ~~**B.** When a borate is treated with sulfuric acid, methanol is added, and the mixture is ignited, it burns with a green-bordered flame.~~

- 1S (USP39)

Change to read:

Bromide

- **A.** ■1S (USP39)

Solutions of bromides, upon the addition of chlorine TS dropwise, liberate bromine, which is dissolved by shaking with chloroform, coloring the chloroform red-to-reddish brown.

- **B.** Silver nitrate TS produces, in solutions of bromides, a yellowish-white precipitate that is insoluble in nitric acid and is slightly soluble when 6 N ammonium hydroxide is added.

- 1S (USP39)

Change to read:

Calcium

- **A.** ■1S (USP39)

Solutions of calcium salts form insoluble oxalates when treated as follows. To a solution of the calcium salt (1:20) add 2 drops of methyl red TS and neutralize with 6 N ammonium hydroxide. Add 3 N hydrochloric acid dropwise, until the solution is acid to the indicator. Upon the addition of ammonium oxalate TS, a white precipitate is formed. This precipitate is insoluble when 6 N acetic acid is added but dissolves in hydrochloric acid.

- ~~**B.** Calcium salts moistened with hydrochloric acid impart a transient yellowish-red color to a nonluminous flame.~~

- 1S (USP39)

Change to read:

Carbonate

- **A.** ■1S (USP39)

Carbonates and bicarbonates effervesce with acids, evolving a colorless gas that, when passed into calcium hydroxide TS, produces a white precipitate immediately.

- **B.** A cold solution (1:20) of a soluble carbonate is colored red by phenolphthalein TS, whereas a similar solution of a bicarbonate remains unchanged or is only slightly colored.

- 1S (USP39)

Change to read:

Chlorate

- **A.** ■1S (USP39)

Solutions of chlorates yield no precipitate with silver nitrate TS. The addition of sulfurous acid to this mixture produces a white precipitate that is insoluble in nitric acid but is soluble in 6 N ammonium hydroxide.

- **B.** ■1S (USP39)

Upon ignition, chlorates yield chlorides, recognizable by appropriate tests.

- **C.** ■1S (USP39)

When sulfuric acid is added to a dry chlorate, decrepitation occurs and a greenish-yellow gas is evolved. [**Caution**—Use only a small amount of chlorate for this test, and exercise extreme caution in performing it.]

Change to read:

Chloride

■● A. 1S (USP39)

With silver nitrate TS, solutions of chlorides yield a white, curdy precipitate that is insoluble in nitric acid but is soluble in a slight excess of 6 N ammonium hydroxide.

■● B. 1S (USP39)

When testing amine (including alkaloidal) hydrochlorides that do not respond to the above test, add 1 drop of diluted nitric acid and 0.5 mL of silver nitrate TS to a solution of the substance being examined containing, unless otherwise directed in the monograph, about 2 mg of chloride ion in 2 mL: a white, curdy precipitate is formed. Centrifuge the mixture without delay, and decant the supernatant layer. Wash the precipitate with three 1-mL portions of nitric acid solution (1:100), and discard the washings. Add ammonia TS dropwise to this precipitate. It dissolves readily.

■● C. 1S (USP39)

When a monograph specifies that an article responds to the test for dry chlorides, mix the solid to be tested with an equal weight of manganese dioxide, moisten with sulfuric acid, and gently heat the mixture: chlorine, which is recognizable by the production of a blue color with moistened starch iodide paper, is evolved.

Change to read:**Citrate****■● A. 1S (USP39)**

To 15 mL of pyridine add a few mg of a citrate salt, dissolved or suspended in 1 mL of water, and shake. To this mixture add 5 mL of acetic anhydride, and shake: a light red color is produced.

Change to read:**Cobalt****■● A. 1S (USP39)**

Solutions of cobalt salts (1:20) in 3 N hydrochloric acid yield a red precipitate when heated on a steam bath with an equal volume of a hot, freshly prepared solution of 1-nitroso-2-naphthol (1:10) in 9 N acetic acid.

■● B. 1S (USP39)

Solutions of cobalt salts, when saturated with potassium chloride and treated with potassium nitrite and acetic acid, yield a yellow precipitate.

Change to read:**Copper****■● A. 1S (USP39)**

Cupric compounds, acidified with hydrochloric acid, deposit a red film of metallic copper upon a bright, untarnished surface of metallic iron.

■● B. 1S (USP39)

An excess of 6 N ammonium hydroxide, when added to a solution of a cupric salt, produces first a bluish precipitate and then a deep blue-colored solution.

■● C. 1S (USP39)

With potassium ferrocyanide TS, solutions of cupric salts yield a reddish-brown precipitate, insoluble in diluted acids.

Change to read:

Hypophosphite

- ~~A. When strongly heated, hypophosphites evolve spontaneously flammable phosphine.~~

■ **1S** (USP39)

- **A.** ■ **1S** (USP39)

Hypophosphites in solution yield a white precipitate with mercuric chloride TS. This precipitate becomes gray when an excess of hypophosphite is present.

- **B.** Solutions of hypophosphites, acidified with sulfuric acid and warmed with cupric sulfate TS, yield a red precipitate. ■ **1S** (USP39)

Change to read:

Iodide

- **A.** ■ **1S** (USP39)

Solutions of iodides, upon the addition of chlorine TS dropwise, liberate iodine, which colors the solution from yellow to red. When the solution is shaken with chloroform, the solution is colored violet. The iodine thus liberated gives a blue color with starch TS.

- **B.** ■ **1S** (USP39)

Silver nitrate TS produces, in solutions of iodides, a yellow, curdy precipitate that is insoluble in nitric acid and insoluble in 6 N ammonium hydroxide.

Change to read:

Iron

- **A.** ■ **1S** (USP39)

Ferrous and ferric compounds in solution yield a black precipitate with ammonium sulfide TS. This precipitate dissolves in cold, 3 N hydrochloric acid and evolves hydrogen sulfide.

Ferric Salts

- **A.** ■ **1S** (USP39)

Acid solutions of ferric salts yield a dark blue precipitate with potassium ferrocyanide TS.

- **B.** ■ **1S** (USP39)

With an excess of 1 N sodium hydroxide, a reddish-brown precipitate is formed.

- **C.** ■ **1S** (USP39)

With ammonium thiocyanate TS, solutions of ferric salts produce a deep red color that is not destroyed by dilute mineral acids.

Ferrous Salts

- **A.** ■ **1S** (USP39)

Solutions of ferrous salts yield a dark blue precipitate with potassium ferricyanide TS. This precipitate is insoluble in 3 N hydrochloric acid but is decomposed by 1 N sodium hydroxide.

- **B.** With 1 N sodium hydroxide, solutions of ferrous salts yield a greenish-white precipitate;

when shaken, the color changes rapidly to green and then to brown. ■1S (USP39)

Change to read:

Lactate

- A. ■1S (USP39)

When solutions of lactates are acidified with sulfuric acid, potassium permanganate TS is added; the mixture is heated, and acetaldehyde evolves. Acetaldehyde can be detected by allowing the vapor to come into contact with a filter paper that has been moistened with a freshly prepared mixture of equal volumes of 20% aqueous morpholine and sodium nitroferricyanide TS: a blue color is produced.

Change to read:

Lead

- A. ■1S (USP39)

With 2 N sulfuric acid, solutions of lead salts yield a white precipitate that is insoluble in 3 N hydrochloric or 2 N nitric acid but is soluble in warm 1 N sodium hydroxide and in ammonium acetate TS.

- B. ■1S (USP39)

With potassium chromate TS, solutions of lead salts, free or nearly free from mineral acids, yield a yellow precipitate that is insoluble in 6 N acetic acid but is soluble in 1 N sodium hydroxide.

Change to read:

Lithium

- A. ■1S (USP39)

With sodium carbonate TS, moderately concentrated solutions of lithium salts, made alkaline with sodium hydroxide, yield a white precipitate on boiling. The precipitate is soluble in ammonium chloride TS.

● ~~B. Lithium salts moistened with hydrochloric acid impart an intense crimson color to a nonluminous flame.~~

- B. Solutions of lithium salts are not precipitated by 2 N sulfuric acid or soluble sulfates (distinction from strontium). ■1S (USP39)

Change to read:

Magnesium

- A. ■1S (USP39)

Solutions of magnesium salts in the presence of ammonium chloride yield NMT a slightly hazy precipitate when neutralized with ammonium carbonate TS, but on the subsequent addition of dibasic sodium phosphate TS, a white, crystalline precipitate, which is insoluble in 6 N ammonium hydroxide, is formed.

Change to read:

Manganese

- A. ■1S (USP39)

With ammonium sulfide TS, solutions of manganous salts yield a salmon-colored precipitate that dissolves in acetic acid.

Change to read:

Mercury

- **A.** 1S (USP39)

When applied to bright copper foil, solutions of mercury salts, free from an excess of nitric acid, yield a deposit that, upon rubbing, becomes bright and silvery in appearance.

- **B.** 1S (USP39)

With hydrogen sulfide, solutions of mercury compounds yield a black precipitate that is insoluble in ammonium sulfide TS and in boiling 2 N nitric acid.

Mercuric Salts

- **A.** 1S (USP39)

Solutions of mercuric salts yield a yellow precipitate with 1 N sodium hydroxide.

- **B.** 1S (USP39)

Solutions of mercuric salts yield, in neutral solutions with potassium iodide TS, a scarlet precipitate that is very soluble in an excess of the reagent.

Mercurous Salts

- **A.** 1S (USP39)

Mercurous compounds are decomposed by 1 N sodium hydroxide, producing a black color.

- **B.** 1S (USP39)

With hydrochloric acid, solutions of mercurous salts yield a white precipitate that is blackened by the addition of 6 N ammonium hydroxide.

- **C.** With potassium iodide TS, a yellow precipitate, which may become green upon standing, is formed.

Change to read:

Nitrate

- **A.** 1S (USP39)

When a solution of a nitrate is mixed with an equal volume of sulfuric acid, the mixture is cooled, and a solution of ferrous sulfate is superimposed; a brown color is produced at the junction of the two liquids.

- **B.** When a nitrate is heated with sulfuric acid and metallic copper, brownish-red fumes evolve.

- **C.** Nitrates do not decolorize acidified potassium permanganate TS (distinction from nitrites). 1S (USP39)

Change to read:

Nitrite

- **A.** 1S (USP39)

When treated with dilute mineral acids or with 6 N acetic acid, nitrites evolve brownish-red fumes. The solution colors starch-iodide paper blue.

Change to read:**Oxalate**

- **A.** ■1S (USP39)

Neutral and alkaline solutions of oxalates yield a white precipitate with calcium chloride TS. This precipitate is insoluble in 6 N acetic acid but is dissolved by hydrochloric acid.

- **B.** Hot acidified solutions of oxalates decolorize potassium permanganate TS. ■1S (USP39)

Change to read:**Permanganate**

- **A.** ■1S (USP39)

Solutions of permanganates acidified with sulfuric acid are decolorized by hydrogen peroxide TS and by sodium bisulfite TS, in the cold, and by oxalic acid TS in a hot solution.

Change to read:**Peroxide**

- **A.** ■1S (USP39)

Solutions of peroxides slightly acidified with sulfuric acid yield a deep blue color upon the addition of potassium dichromate TS. On shaking the mixture with an equal volume of ethyl ether and allowing the liquids to separate, the blue color is found in the ethyl ether layer.

Change to read:

Phosphate [Note—Where the monograph specifies the identification test for *Phosphate*, use the tests for orthophosphates, unless the instructions specify the use of the pyrophosphate tests or indicate that the product is to be ignited before performing the test.]

■Orthophosphates

- **A.** ■1S (USP39)

With silver nitrate TS, neutral solutions of orthophosphates yield a yellow precipitate that is soluble in 2 N nitric acid and in 6 N ammonium hydroxide.

- **B.** ■1S (USP39)

With ammonium molybdate TS, acidified solutions of orthophosphates yield a yellow precipitate that is soluble in 6 N ammonium hydroxide. This precipitate may be slow to form.

■Pyrophosphates

- **C.** ■1S (USP39)

With silver nitrate TS, pyrophosphates obtained by ignition yield a white precipitate that is soluble in 2 N nitric acid and soluble in 6 N ammonium hydroxide.

- **D.** ■1S (USP39)

With ammonium molybdate TS, pyrophosphates obtained by ignition yield a yellow precipitate that is soluble in 6 N ammonium hydroxide.

Change to read:**Potassium**

- ~~**A.** Potassium compounds impart a violet color to a nonluminous flame, but the presence of small quantities of sodium masks the color unless the yellow color produced by sodium is~~

~~screened out by viewing through a blue filter that blocks emission at 589 nm (sodium) but is transparent to emission at 404 nm (potassium). Traditionally, cobalt glass has been used, but other suitable filters are commercially available.~~

■ ■ 1S (USP39)

■ ● A. ■ 1S (USP39)

In neutral, concentrated, or moderately concentrated solutions of potassium salts (depending upon the solubility and the potassium content), sodium bitartrate TS produces a white crystalline precipitate that is soluble in 6 N ammonium hydroxide and in solutions of alkali hydroxides and carbonates. The formation of the precipitate, which is usually slow, is accelerated by stirring or rubbing the inside of the test tube with a glass rod. The addition of a small amount of glacial acetic acid or alcohol also promotes the precipitation.

Change to read:

Salicylate

■ ● A. ■ 1S (USP39)

In moderately dilute solutions of salicylates, ferric chloride TS produces a violet color.

■ ● B. ■ 1S (USP39)

Addition of acids to moderately concentrated solutions of salicylates produces a white, crystalline precipitate of salicylic acid that melts between 158° and 161°.

Change to read:

Silver

■ ● A. ■ 1S (USP39)

With hydrochloric acid, solutions of silver salts yield a white, curdy precipitate that is insoluble in nitric acid but is readily soluble in 6 N ammonium hydroxide.

■ ● B. A solution of a silver salt, to which 6 N ammonium hydroxide and a small quantity of formaldehyde TS are added, deposits, upon warming, a mirror of metallic silver upon the sides of the container. ■ 1S (USP39)

Change to read:

Sodium

■ ● A. ■ 1S (USP39)

Unless otherwise specified in an individual monograph, prepare a solution to contain 0.1 g of the sodium compound in 2 mL of water. Add 2 mL of 15% potassium carbonate, and heat to boiling. No precipitate is formed. Add 4 mL of potassium pyroantimonate TS, and heat to boiling. Allow to cool in ice water and, if necessary, rub the inside of the test tube with a glass rod. A dense precipitate is formed.

~~● B. Sodium compounds impart an intense yellow color to a nonluminous flame.~~

■ ■ 1S (USP39)

Change to read:

Sulfate

■ ● A. ■ 1S (USP39)

With barium chloride TS, solutions of sulfates yield a white precipitate that is insoluble in hydrochloric acid and in nitric acid.

■● **B.** 1S (USP39)

With lead acetate TS, neutral solutions of sulfates yield a white precipitate that is soluble in ammonium acetate TS.

■● **C.** 1S (USP39)

Hydrochloric acid produces no precipitate when added to solutions of sulfates (distinction from thiosulfates).

Change to read:

Sulfite

■● **A.** 1S (USP39)

When treated with 3 N hydrochloric acid, sulfites and bisulfites yield sulfur dioxide, which blackens filter paper moistened with mercurous nitrate TS.

Change to read:

Tartrate

■● **A.** 1S (USP39)

Dissolve a few mg of a tartrate salt in 2 drops of sodium metaperiodate solution (1:20). Add 1 drop of 1 N sulfuric acid and after 5 min add a few drops of sulfurous acid, followed by a few drops of fuchsin-sulfurous acid TS: a reddish-pink color is produced within 15 min.

Change to read:

Thiocyanate

■● **A.** 1S (USP39)

With ferric chloride TS, solutions of thiocyanates yield a red color that is not destroyed by moderately concentrated mineral acids.

Change to read:

Thiosulfate

■● **A.** 1S (USP39)

With hydrochloric acid, solutions of thiosulfates yield a white precipitate that soon turns yellow; with the addition of sulfur dioxide, filter paper moistened with mercurous nitrate TS blackens.

■● **B.** 1S (USP39)

The addition of ferric chloride TS to solutions of thiosulfates produces a dark violet color that disappears quickly.

Change to read:

Zinc

■● **A.** 1S (USP39)

In the presence of sodium acetate, solutions of zinc salts yield a white precipitate with hydrogen sulfide. This precipitate is insoluble in acetic acid but is dissolved by 3 N hydrochloric acid.

- **B.** ■1S (USP39)

Ammonium sulfide TS produces a similar precipitate in neutral and in alkaline solutions.

- **C.** ■1S (USP39)

With potassium ferrocyanide TS, zinc salts in solution yield a white precipitate that is insoluble in 3 N hydrochloric acid.

INSTRUMENTAL IDENTIFICATION TESTS

Add the following:

■ Instrumental techniques described in this section may be used in lieu of procedures described in the *Chemical Identification Tests* section. Instrumental techniques provide flexibility in the choice of identification tests. All instrumental techniques described below shall follow method validation procedures for identification tests (for additional information, see *Category IV* in general chapter *Validation of Compendial Procedures* 〈 1225 〉). *Instrumental Identification Tests* must demonstrate specificity.

The selection of the appropriate sample preparation depends on the material under test, must be appropriate for the technique being used, and is the responsibility of the analyst. The analyst may use any of the following preparation procedures, with the appropriate verification. When using solvents, the solvent must be free of interfering species. ■1S (USP39)

Add the following:

- **Identification Using X-Ray Fluorescence Spectrometry**

X-ray fluorescence spectrometry (XRF) can typically be used for identification of elements with atomic numbers from magnesium through uranium. The actual range of elements for which the instrument is capable is dependent on the instrument design. Guidance regarding the use of XRF may be found in general chapter *X-Ray Fluorescence Spectrometry* 〈 735 〉.

Sample Preparation

Powders/solids: Powders and solids can be used without further manipulation, or material can be made into pellets as described in chapter 〈 735 〉.

Neat liquids: Liquids can be used without further manipulation, provided the liquid is a single phase, is compatible with the sample holder, and has sufficiently low volatility.

Samples in solution: Samples may be dissolved in an appropriate solvent.

Procedure

Blank: For *Powders/solids* and *Neat liquids*, prepare a blank sample holder. For *Samples in solution*, use the solvent as a blank.

Reference Standard and Sample: Prepare each *Reference Standard* and *Sample* by using sufficient material as required for the specific manufacturer's instrumentation.

Analysis: Analyze the *Blank*, *Reference Standard*, and *Sample* according to the manufacturer's suggestions for the specific instrument. If there is any interference, use the *Blank* to make the correction. The spectrum of the *Reference Standard* exhibits radiation characteristic of the element(s) under investigation. The energy bands of the *Sample* exhibit radiation characteristic of the element(s) under investigation and compare

qualitatively with that of the *Reference Standard*. ■1S (USP39)

Add the following:

■● **Identification Using Atomic Spectroscopy Techniques: Atomic Absorption Spectroscopy, Inductively Coupled Plasma–Optical Emission Spectroscopy, Inductively Coupled Plasma–Mass Spectrometry**

Atomic absorption (AA) spectroscopy techniques can be used for the identification of many elements. Guidance regarding the use of AA spectroscopy may be found in general chapter *Atomic Absorption Spectroscopy* 〈 852 〉. Guidance regarding the use of inductively coupled plasma–optical emission spectroscopy (ICP–OES) or inductively coupled plasma–mass spectrometry (ICP–MS) may be found in general chapter *Plasma Spectrochemistry* 〈 730 〉.

Sample Preparation: Samples should be dissolved in an appropriate solvent. If dissolving the sample is not possible, digestion may be necessary.

Procedure

Blank: Prepare an appropriate solution that does not contain the analyte(s) of interest and is compatible with the technique being used.

Standard solution: Standards must contain the analyte of interest. All solutions should be matrix matched where possible.

Sample solution: Prepare the sample in the same solvent as the standard.

Analysis: Analyze the *Blank*, *Standard solution*, and *Sample solution* according to the manufacturer's suggestions for the specific instrument. When a wavelength-based technique is used, wherever possible select at least two wavelengths characteristic of the analyte(s) of interest. When a mass-based technique is used, wherever possible select at least two isotopes characteristic of the analyte(s) of interest. If two isotopes are unavailable, or if an element is monoisotopic, it may be possible to monitor the oxide of the analyte(s) ($m + 16$), if one is formed. If no oxide is formed, or if multiple isotopes cannot be evaluated because of interferences or because of a limited number of isotopes, then a different technique may be required. If interfering elements are present in the sample solution, wavelengths or masses examined must be selected to unequivocally identify the analyte(s) of interest. ■1S (USP39)

Add the following:

■● **Identification Using Ion Chromatography**

Ion chromatography (IC) can be used to identify a number of anions and cations found in drug substances (for additional information, see general chapter *Ion Chromatography* 〈 1065 〉).

Apparatus: Analyte detection will typically utilize suppressed conductivity, although other detection methods are possible, depending on the analyte (see 〈 1065 〉). The ion-exchange column must be capable of separating the analyte from any other ions of the same charge known to be in the sample at a concentration $\geq 5\%$ of the analyte.

Procedure

Blank: Use the sample solvent as a blank.

Standard and Sample solutions: Dissolve or dilute the sample in water. Other solvents can be used if compatible with the IC column.

Analysis: Analyze an equal volume of the *Blank*, *Reference Standard*, and sample (according to the manufacturer's suggestions for the specific instrument and column dimensions). The counterion is identified if a peak in the sample has the same retention time as the peak in the *Reference Standard*, and there is not a peak of $\geq 5\%$ of its size at the same retention time in the *Blank*. ■1S (USP39)

Add the following:

■● **Identification by Other Liquid Chromatography Techniques in Chromatography** (621)

Some of the ions suitable for IC identification can also be identified by other forms of liquid chromatography. *Sample* and *Reference Standard* concentrations, as well as injection volumes, need to be adjusted, depending on the detection technique used. All high-concentration components in the test substance should be analyzed to judge whether there is interference with the analyte of interest. ■1S (USP39)

Add the following:

■● **Identification Using Raman Spectroscopy**

Raman spectroscopy can be used for identification of counterions. Guidance regarding the use of Raman spectroscopy may be found in general chapter *Spectrophotometry and Light-Scattering* (851) .

Apparatus: Prepare the spectrometer for operation according to the instrument instruction manual and the instrument manufacturer's recommendations. Instrument performance and the quality of spectra collected should be verified daily whenever the instrument is in use. Wavelength accuracy should be verified as per applicable instrument operating procedures.

Procedure

Reference Standard and Sample: All reference material and sample spectra should be collected using identical instrumental parameters. These collection parameters may be determined by the analyst based on the nature of the sample and the type of analysis and should be selected based on the quality of spectra needed. Use the appropriate sample container and/or sample holding apparatus, depending on the type of reference material and sample (powder, liquid, paste, film, or other) being analyzed. Transfer the sample or reference material into the appropriate sample container and/or holder, and acquire the spectrum for each.

Analysis: Qualitatively compare the Raman spectra obtained from the reference material and the *Sample*. The *Sample* complies with the identity test if the spectrum exhibits maxima only at the same wavelengths as that of a similar preparation of the corresponding USP Reference Standard. ■1S (USP39)

Add the following:

■● **Identification Using Mid-Infrared Spectroscopy**

Mid-infrared spectroscopy techniques can be used for identification of counterions. Guidance regarding the use of mid-infrared spectroscopy may be found in general chapters *Mid-Infrared Spectroscopy* 〈 854 〉 and *Spectrophotometric Identification Tests* 〈 197 〉. If the monograph contains an identification test by IR (e.g., chapter 〈 197 〉) and a reference to general chapter 〈 191 〉, then mid-infrared cannot be used as an instrumental replacement for the chemical identification tests prescribed in chapter 〈 191 〉.

Procedure

Standard and Sample solutions: Sample preparation may be conducted using any of the procedures described in chapter 〈 854 〉 that are appropriate for the sample of concern. The standard preparation should be conducted in the same way but using the USP Reference Standard of the substance under test.

Analysis: Record the spectra of the test specimen and the corresponding USP Reference Standard over the range from about 4000 to 400 cm^{-1} (2.5–25 μm). The IR absorption spectrum of the preparation of the test specimen, previously dried under conditions specified for the corresponding *Reference Standard*, unless the *Reference Standard* is to be used without drying, exhibits maxima only at the same wavelengths as that of a similar preparation of the corresponding USP Reference Standard. ■1S (USP39)

BRIEFING

〈 341 〉 **Antimicrobial Agents—Content**, *USP 38* page 264 and *PF 39(3)* [May–June 2013]. The previously published proposal in *PF 39(3)* is canceled and replaced with the following proposal based on the comments received.

In an effort to modernize this general test chapter, it is proposed to replace the existing *General Gas Chromatographic Method* section that uses packed-column GC procedures with a combination of agent-specific capillary column GC and HPLC procedures. Furthermore, the *Polarographic Method for Thimerosal* is replaced with an HPLC procedure. The revisions are as follows:

1. Content of *Benzyl Alcohol*: A gas chromatographic procedure based on analyses performed with the J&W Scientific DBWax brand of G16 column with 0.5- μm film thickness, using phenol as the internal standard. The typical retention times reported for benzyl alcohol and phenol are 8 and 10 min, respectively.
2. Content of *Chlorobutanol*: A gas chromatographic procedure based on analyses performed with the J&W Scientific DBWax brand of G16 column with 0.25- μm film thickness. The typical retention times for chlorobutanol and 2,2,2-trichloroethanol are 6.0 and 8.1 min, respectively.
3. Content of *Phenol*: A gas chromatographic procedure based on analyses performed with the J&W Scientific DBWax brand of G16 column with 0.5- μm film thickness, using benzyl alcohol as the internal standard. The typical retention times for benzyl alcohol and phenol are 8 and 10 min, respectively.
4. Content of Parabens, *Methylparaben* and *Polyparaben*: A liquid chromatographic procedure based on analyses performed with the Phenomenex Inertsil 5- μm brand of L1 column, using a Phenomenex C18 Security Guard cartridge with an L1 guard column. The typical retention times for *p*-hydroxybenzoic acid, methylparaben,

ethylparaben, and propylparaben are 1.6, 2.7, 3.8, and 5.7 min, respectively.

5. Content of *Thimerosal*: The polarographic procedure is replaced with a liquid chromatographic procedure based on analyses performed with the ACE Excel C18-AR brand of L1 column. The HPLC procedure is adopted from the recent proposal published in *PF* 40(5) [Sept.–Oct. 2014] for the *Thimerosal* monograph. The typical retention time for thimerosal is about 5 min. Stakeholders are requested to provide their input on the proposed procedure.

Stakeholders who can provide a validated test procedure to replace the polarographic method for the content of *Phenylmercuric Nitrate* are encouraged to submit information to the Expert Committee. Also, USP seeks industry feedback on inclusion of other types of antimicrobial agents in this general chapter. Stakeholders are encouraged to submit comments for Expert Committee consideration.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style.

(GCCA: S. Shivaprasad.)

Comment deadline: May 31, 2015

〈 341 〉 ANTIMICROBIAL AGENTS—CONTENT

Change to read:

An essential component of Injections preserved in multiple-dose containers is the agent or agents present to reduce the hazard of having introduced, in the course of removing some of the contents, accidental microbial contamination of the contents remaining. It is a Pharmacopeial requirement that the presence and amount added of such agent(s) be declared on the label of the container. ~~The methods provided herein for the most commonly used agents~~

■ This general chapter provides methods for the most commonly used antimicrobial agents.

These methods or other suitably validated methods. ■ 1S (*USP39*)

are to be used to demonstrate that the declared agent is present but does not exceed the labeled amount by more than 20%.

The concentration of an antimicrobial preservative added to a multiple-dose or single-dose parenteral, otic, nasal, and ophthalmic preparation may diminish during the shelf life of the product. ~~Because it is recognized that the antimicrobial preservative concentration in a given preparation may decrease during the product's shelf life,~~

■ Therefore, ■ 1S (*USP39*)

the manufacturer shall determine the lowest level at which the preservative is effective, and the product should be so formulated as to assure that this level is exceeded throughout the product's shelf life. At the time of its manufacture, the product should contain the declared amount of antimicrobial preservative (within $\pm 20\%$ to allow for manufacturing and analytical variations). The quantitative label statement of the preservative content is not intended to mean that the labeled quantity is retained during the shelf life of the product; rather, it is a statement of the amount added, within process limits, and which is not exceeded by more than 20%. An example of such a label statement is "____(unit) added as preservative". [Note —"____(unit)" would be a number followed by the unit of measurement, e.g., 0.015 mg/mL or

0.1%.]

The most commonly used agents include benzyl alcohol; chlorobutanol; phenol; the four homologous esters of *p*-hydroxybenzoic acid; and the two mercurials, phenylmercuric nitrate and thimerosal.

~~The methods for the first two named are polarographic, while quantitative gas chromatography is employed in the determination of the other agents.~~

■ The method used for phenylmercuric nitrate is polarographic, whereas quantitative liquid chromatography was used for thimerosal and the four homologous esters of *p*-hydroxybenzoic acid. Gas chromatography is used in the determination of phenol, benzyl alcohol, and chlorobutanol. ■ 1S (USP39)

Delete the following:

■ GENERAL GAS CHROMATOGRAPHIC METHOD

~~The general procedures set forth in the following paragraphs are applicable to the quantitative determination of benzyl alcohol, chlorobutanol, phenol, and the methyl, ethyl, propyl, and butyl esters of *p*-hydroxybenzoic acid, the latter being treated as a group, the individual members of which, if present, are capable of separate determination. Prepare the *Internal Standard Solution* and the *Standard Preparation* for each agent as directed individually below. Unless otherwise directed below, prepare the *Test Preparation* from accurately measured portions of the *Internal Standard Solution* and the sample under test, of such size that the concentration of the agent and the composition of the solvent correspond closely to the concentration and composition of the *Standard Preparation*. Suggested operating parameters of the gas chromatograph apparatus are given in the accompanying table, the carrier gas being helium or nitrogen, and the detector being the flame ionization type.~~

Suggested Operating Parameters of Gas Chromatograph Apparatus

Agent	Column Size		Column Packing Phases and Support	Flow Rate, mL per minute	Column Temperature
	Length	ID			
Benzyl Alcohol	1.8 m	3 mm	5% G16/S1A	50	140 [°]
Chlorobutanol	1.8 m	2 mm	5% G16/S1A	20	110 [°]
Phenol	1.2 m	3 mm	5% G16/S1A	50	145 [°]
Parabens	1.8 m	2 mm	5% G2/S1A	20	150 [°]

● **Benzyl Alcohol**

Internal Standard Solution— Dissolve about 380 mg of phenol in 10 mL of methanol contained in a 200-mL volumetric flask. Add water to volume, and mix.

Standard Preparation— Dissolve about 180 mg of USP Benzyl Alcohol RS, accurately weighed, in 20.0 mL of methanol contained in a 100-mL volumetric flask. Add *Internal Standard Solution* to volume, and mix.

Procedure— Separately inject equal volumes (about 5 µL) of the *Standard Preparation* and the *Test Preparation* into the chromatograph, record the chromatograms with the apparatus adjusted to the parameters set forth in the accompanying table, and measure

the areas under the peaks for benzyl alcohol and phenol. Calculate the content, in mg per mL, of benzyl alcohol (C_7H_8O) in the specimen taken by the formula:

$$100(C/V)(p_1/p_2)(P_2/P_1)$$

in which C is the concentration, in mg per mL, of benzyl alcohol in the *Standard Preparation*; V is the volume, in mL, of the specimen under test used in preparing each 100 mL of the *Test Preparation*; p_1 and p_2 are the peak areas for benzyl alcohol and phenol, respectively, obtained from the *Test Preparation*; and P_1 and P_2 are the peak areas of benzyl alcohol and phenol, respectively, obtained from the *Standard Preparation*.

- **Chlorobutanol**

Internal Standard Solution— Transfer about 140 mg of benzaldehyde to a 100-mL volumetric flask, add 10 mL of methanol, and swirl to dissolve. Dilute with water to volume, and mix.

Standard Preparation— Transfer about 125 mg of USP Chlorobutanol RS, accurately weighed, to a 25-mL volumetric flask. Add 2 mL of methanol, swirl to dissolve, dilute with water to volume, and mix. Transfer 5.0 mL of this solution and 5.0 mL of *Internal Standard Solution* to a 25-mL flask, and mix to obtain a solution having a known concentration of about 2.5 mg of chlorobutanol per mL.

Test Preparation— Quantitatively dilute, if necessary, an accurately measured volume of the specimen under test with methanol to obtain a solution containing not more than about 5.0 mg of chlorobutanol per mL. Combine 3.0 mL of this solution with 3.0 mL of *Internal Standard Solution*, and mix.

Chromatographic System (see *Chromatography* (621))— [Note—See accompanying table for column dimensions, column packing phase and support, flow rate, and column temperature.] The injection port temperature is maintained at 180° , and the detector temperature is maintained at 220° . Chromatograph the *Standard Preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.8 for benzaldehyde and 1.0 for chlorobutanol; the resolution, R , between benzaldehyde and the chlorobutanol is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure— Separately inject equal volumes (about 1 μ L) of the *Standard Preparation* and the *Test Preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of chlorobutanol ($C_4H_7Cl_3O$) in each mL of the specimen under test by the formula:

$$C(L/D)(R_U/R_S)$$

in which C is the concentration, in mg per mL, of chlorobutanol, calculated on the anhydrous basis, in the *Standard Preparation*; L is the labeled quantity, in mg, of chlorobutanol in each mL of the specimen under test; D is the concentration, in mg per mL, of chlorobutanol in the *Test Preparation*, based on the volume of specimen under test taken and the extent of dilution; and R_U and R_S are the ratios of the chlorobutanol peak to the benzaldehyde peak obtained from the *Test Preparation* and the *Standard Preparation*, respectively.

- **Phenol**

Internal Standard Solution— Pipet 1 mL of USP Benzyl Alcohol RS into a 500-mL volumetric flask, add methanol to volume, and mix.

Standard Preparation— Dissolve about 75 mg of USP Phenol RS, accurately weighed, in

7.5 mL of methanol contained in a 100 mL volumetric flask. Add 20.0 mL of *Internal Standard Solution*, then add water to volume, and mix.

Procedure— Separately inject equal volumes (about 3 μ L) of the *Standard Preparation* and the *Test Preparation* into the chromatograph, record the chromatograms with the apparatus adjusted to the parameters set forth in the accompanying table, and measure the areas under the peaks for phenol and benzyl alcohol. Calculate the content, in mg per mL, of phenol (C_6H_6O) in each mL of the specimen taken by the formula:

$$100(C/V)(p_1/p_2)(P_2/P_1)$$

in which C is the concentration, in mg per mL, of phenol in the *Standard Preparation*; V is the volume, in mL, of the specimen under test used in preparing each 100 mL of the *Test Preparation*; p_1 and p_2 are the peak areas for phenol and benzyl alcohol, respectively, obtained from the *Test Preparation*; and P_1 and P_2 are the peak areas of phenol and benzyl alcohol, respectively, obtained from the *Standard Preparation*.

- **Methylparaben and Propylparaben**

Internal Standard Solution— Place about 200 mg of benzophenone in a 250 mL volumetric flask, dilute with ether to volume, and mix.

Standard Preparation— Place 100 mg of USP Methylparaben RS and 10 mg of USP Propylparaben RS, each accurately weighed, in a 200 mL volumetric flask, dilute with *Internal Standard Solution* to volume, and mix. Place 10 mL of this solution in a 25 mL conical flask, and proceed as directed for *Test Preparation*, beginning with "Add 3 mL of pyridine."

Test Preparation— Pipet 10 mL of the specimen under test and 10 mL of the *Internal Standard Solution* into a small separator. Shake vigorously, allow the layers to separate, draw off the aqueous layer into a second separator, and transfer the ether layer into a small flask through a funnel containing anhydrous sodium sulfate. Extract the aqueous layer with two 10 mL portions of ether, also filtering the extracts through the anhydrous sodium sulfate. Evaporate the combined extracts under a current of dry air until the volume is reduced to about 10 mL, then transfer the residue to a 25 mL conical flask. Add 3 mL of pyridine, complete the evaporation of the ether, and boil on a hot plate until the volume is reduced to about 1 mL. Cool, and add 1 mL of a suitable silylation agent, such as bis(trimethylsilyl)trifluoroacetamide, bis(trimethylsilyl)acetamide, or a mixture of hexamethyldisilazane and trimethylchlorosilane [2:1 or 3:1 (v/v)]. Mix, and allow to stand for not less than 15 minutes.

Procedure— Separately inject equal volumes (2 μ L) of the silanized solution from the *Standard Preparation* and the *Test Preparation* into the chromatograph, record the chromatograms with the apparatus adjusted to the parameters set forth in the accompanying table, and measure the areas under the peaks for methylparaben, propylparaben, and benzophenone. Calculate the content, in μ g per mL, of methylparaben ($C_8H_8O_3$) in the sample under test by the formula:

$$10(C_M/V)(p_1/p_3)(P_3/P_1)$$

in which C_M is the concentration, in μ g per mL, of methylparaben in the *Standard Preparation*; V is the volume, in mL, of the specimen taken; p_1 and p_3 are the peak areas for methylparaben and benzophenone, respectively, obtained from the *Test Preparation*; and P_1 and P_3 are the peak areas of methylparaben and benzophenone, respectively, obtained from the *Standard Preparation*. Similarly, calculate the content, in μ g per mL, of propylparaben ($C_{10}H_{12}O_3$) in the specimen under test by the formula:

$$10(C_p/V)(p_2/p_3)(P_3/P_2)$$

in which C_p is the concentration, in μg per mL, of propylparaben in the *Standard Preparation*; V is the volume, in mL, of the specimen taken; p_2 and p_3 are the peak areas for propylparaben and benzophenone, respectively, obtained from the *Test Preparation*; and P_2 and P_3 are the peak areas of propylparaben and benzophenone, respectively, obtained from the *Standard Preparation*.

Ethylparaben and butylparaben may be determined in a similar manner.

■ 1S (USP39)

Add the following:

■ **GENERAL GAS AND LIQUID CHROMATOGRAPHIC METHODS**

The general gas chromatography procedures set forth in the following paragraphs are applicable to the quantitative determination of benzyl alcohol, chlorobutanol, and phenol. Prepare the *Internal standard solution* and the *Standard solution* for each antimicrobial agent as directed below. Unless otherwise directed, prepare the *Sample solution* from accurately measured portions of the sample under test and the *Internal standard solution* such that the concentration of the agent and the composition of the solvent correspond closely to the concentration and composition of the *Standard solution*. Suggested operating parameters of the gas chromatograph are provided in this section.

The general HPLC procedures set forth in the following paragraphs are applicable to the quantitative determination of parabens and *Thimerosal*. Prepare the *Internal standard solution* and the *Standard solution* for each agent as directed below. Unless otherwise directed, prepare the *Sample solution* from accurately measured portions of the sample under test and the *Internal standard solution*, if applicable, such that the concentration of the agent and the composition of the solvent correspond closely to the concentration and composition of the *Standard solution*. Suggested operating parameters of the liquid chromatograph are provided in this section.

● **Benzyl Alcohol**

Diluent: Methanol and water (20:80)

Internal standard solution: 3.8 mg/mL of phenol prepared as follows. Dissolve a suitable amount of phenol in 10% of the flask volume of methanol, and dilute with water to volume.

Standard solution: 1.8 mg/mL of USP Benzyl Alcohol RS and 1.5 mg/mL of phenol prepared as follows. Dissolve 180 mg of USP Benzyl Alcohol RS in 20 mL of methanol contained in a 100-mL volumetric flask. Add 40.0 mL of *Internal standard solution*, and dilute with water to volume.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 30-m \times 0.32-mm fused-silica; bonded with a 0.5- μm film of phase G16

Temperatures

Injection port: 200 $^{\circ}$

Detector: 310 $^{\circ}$

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
150	0	150	5
150	10	230	7

Carrier gas: Helium

Flow rate (constant): 2 mL/min

Injection volume: 1 µL

Split ratio: 10:1

Run time: 20 min

System suitability

Sample: *Standard solution*

[Note—The relative retention times for benzyl alcohol and phenol are about 1.0 and 1.25, respectively.]

Suitability requirements

Resolution: NLT 2.0 between the benzyl alcohol and phenol peaks

Tailing factor: NMT 2.0 for the benzyl alcohol peak

Relative standard deviation: NMT 2.0% for the peak response ratio of benzyl alcohol to phenol

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of benzyl alcohol (C₇H₈O) in the portion of the sample taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_{\bar{U}}$ peak response ratio of benzyl alcohol to phenol from the *Sample solution*

$R_{\bar{S}}$ peak response ratio of benzyl alcohol to phenol from the *Standard solution*

$C_{\bar{S}}$ concentration of USP Benzyl Alcohol RS in the *Standard solution*

$C_{\bar{U}}$ nominal concentration of benzyl alcohol in the *Sample solution*

● Chlorobutanol

Diluent: Methanol and water (50:50)

Internal standard solution: 10 mg/mL of 2,2,2-trichloroethanol in *Diluent*

Standard stock solution: 5 mg/mL of USP Chlorobutanol RS in methanol

Standard solution: 1.25 mg/mL of USP Chlorobutanol RS and 2 mg/mL of 2,2,2-trichloroethanol prepared as follows. Transfer 2.5 mL of *Standard stock solution*, 2.0 mL of *Internal standard solution*, and 0.5 mL of methanol to a 10-mL volumetric flask. Dilute with water to volume.

Sample stock solution: Quantitatively dilute, if necessary, an accurately measured volume corresponding to 2.5 mg/mL of chlorobutanol in water.

Sample solution: Combine 5.0 mL of *Sample stock solution* with 2.0 mL of *Internal standard solution* in a 10-mL volumetric flask, and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 30-m × 0.32-mm fused-silica; bonded with a 0.25-μm film of phase G16

Temperatures

Injection port: 260°

Detector: 280°

Column: 135°

Carrier gas: Helium

Flow rate: 1 mL/min

Injection volume: 0.5 μL

Split ratio: 10:1

Run time: 12 min

System suitability

Sample: *Standard solution*

[Note—The relative retention times for chlorobutanol and 2,2,2-trichloroethanol are about 1.0 and 1.4, respectively.]

Suitability requirements

Resolution: NLT 2.0 between chlorobutanol and 2,2,2-trichloroethanol

Relative standard deviation: NMT 1.0% for the peak response ratio of chlorobutanol to 2,2,2-trichloroethanol

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of chlorobutanol (C₄H₇Cl₃O), on the anhydrous basis, in the portion of the sample taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_{\bar{U}}$ peak response ratio of chlorobutanol to 2,2,2-trichloroethanol from the *Sample solution*

$R_{\bar{S}}$ peak response ratio of chlorobutanol to 2,2,2-trichloroethanol from the *Standard solution*

$C_{\bar{S}}$ concentration of USP Chlorobutanol RS in the *Standard solution*

$C_{\bar{U}}$ nominal concentration of chlorobutanol in the *Sample solution*

● **Phenol**

Internal standard solution: 2 mg/mL of USP Benzyl Alcohol RS in methanol

Standard stock solution: 4 mg/mL of USP Phenol RS in water

Standard solution: 0.4 mg/mL each of USP Phenol RS and USP Benzyl Alcohol RS prepared as follows. Combine 5.0 mL of *Standard stock solution* with 10.0 mL of *Internal standard solution* in a 50-mL volumetric flask, and dilute with water to volume.

Chromatographic system

(See *Chromatography* ⟨ 621 ⟩, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 30-m × 0.32-mm fused-silica; bonded with a 0.5-μm film of phase G16

Temperatures

Injection port: 200°

Detector: 310°

Column: See *Table 2*.

Table 2

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
150	0	150	5
150	10	230	7

Injection volume: 1 µL

Split ratio: 10:1

Run time: 20 min

System suitability

Sample: *Standard solution*

[Note—The relative retention times for benzyl alcohol and phenol are about 0.85 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between benzyl alcohol and phenol

Tailing factor: NMT 2.0 for the phenol peak

Relative standard deviation: NMT 1.0% for the peak response ratio of phenol to benzyl alcohol

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of phenol (C₆H₆O) in the portion of the sample taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_{\bar{U}}$ peak response ratio of phenol to benzyl alcohol from the *Sample solution*

$R_{\bar{S}}$ peak response ratio of phenol to benzyl alcohol from the *Standard solution*

$C_{\bar{S}}$ concentration of USP Phenol RS in the *Standard solution*

$C_{\bar{U}}$ nominal concentration of phenol in the *Sample solution*

● **Methylparaben and Propylparaben**

Buffer: 7 g/L of monobasic potassium phosphate in water

Mobile phase: Methanol and *Buffer* (65:35)

Internal standard solution: 0.013 mg/mL of USP Ethylparaben RS in *Mobile phase*

System suitability solution: 0.01 mg/mL each of USP Butylparaben RS, USP Propylparaben RS, USP Ethylparaben RS, USP Methylparaben RS, and *p*-hydroxybenzoic acid in *Mobile phase*

Standard stock solution: 0.2 mg/mL of USP Methylparaben RS and 0.03 mg/mL of USP Propylparaben RS in *Mobile phase*

Standard solution: Combine 5 mL of *Standard stock solution* with 5 mL of *Internal standard solution*, and extract three times with 10-mL aliquots of diethyl ether. Filter the combined ether layers through anhydrous sodium sulfate. Evaporate the ether extract to dryness, and dissolve the residue in 50 mL of *Mobile phase*.

Sample solution: Combine 5 mL of the specimen under test with 5 mL of *Internal standard*

solution, and extract three times with 10-mL aliquots of diethyl ether. Filter the combined ether layers through anhydrous sodium sulfate. Evaporate the ether extract to dryness, and dissolve the residue in 50 mL of *Mobile phase*.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 272 nm

Columns

Guard: 4.0-mm × 3-mm; packing L1

Analytical: 4.6-mm × 15-cm; 5-μm packing L1

Flow rate: 1.3 mL/min

Injection volume: 10 μL

Run time: 10 min

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for *p*-hydroxybenzoic acid, methylparaben, ethylparaben, and propylparaben are about 0.58, 1.0, 1.4, and 2.1, respectively.]

Suitability requirements

Resolution: NLT 2.0 between *p*-hydroxybenzoic acid and methylparaben, NLT 2.0 between methylparaben and ethylparaben; *System suitability solution*

Tailing factor: NMT 2.0 for the methylparaben and propylparaben peaks, *Standard solution*

Relative standard deviation: NMT 2.0% for the peak response ratio of methylparaben to ethylparaben, NMT 2.0% for the peak response ratio of propylparaben to ethylparaben; *System suitability solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methylparaben (C₈H₈O₃) in the portion of the sample taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_{\bar{U}}$ peak response ratio of methylparaben to ethylparaben from the *Sample solution*

$R_{\bar{S}}$ peak response ratio of methylparaben to ethylparaben from the *Standard solution*

$C_{\bar{S}}$ concentration of USP Methylparaben RS in the *Standard solution*

$C_{\bar{U}}$ nominal concentration of methylparaben in the *Sample solution*

Calculate the percentage of the labeled amount of propylparaben (C₁₀H₁₂O₃) in the portion of the sample taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_{\bar{U}}$ peak response ratio of propylparaben to ethylparaben from the *Sample solution*

$R_{\bar{S}}$ peak response ratio of propylparaben to ethylparaben from the *Standard solution*

$C_{\bar{S}}$ concentration of USP Propylparaben RS in the *Standard solution*

$C_{\bar{U}}$ nominal concentration of propylparaben in the *Sample solution*

Ethylparaben and butylparaben may be determined in a similar manner using appropriate

internal standard solutions. However, because the extraction recovery is matrix dependent, the user should verify the suitability of the procedure for their drug product and for different product formulations.

- **Thimerosal**

Solution A: Trifluoroacetic acid and water (0.5: 1000)

Mobile phase: Methanol and *Solution A* (60:40)

Standard solution: 25 µg/mL of USP Thimerosal RS in water

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 222 nm

Column: 2.1-mm × 10-cm; 2-µm packing L1

Autosampler temperature: 4°

Flow rate: 0.35 mL/min

Injection volume: 2.5 µL

System suitability

Sample: *Standard solution*

Tailing factor: NMT 1.5

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of thimerosal (C₉H₉HgNaO₂S) in the portion of the sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of thimerosal from the *Sample solution*

r_S = peak response of thimerosal from the *Standard solution*

C_S = concentration of USP Thimerosal RS in the *Standard solution*

C_U = nominal concentration of thimerosal in the *Sample solution*

■ 1S (USP39)

Change to read:

POLAROGRAPHIC METHOD

- **Phenylmercuric Nitrate**

Standard stock solution: 0.1 mg/mL of phenylmercuric nitrate in sodium hydroxide solution (1 in 250). Warm, if necessary, to dissolve.

Standard solution: Pipet 10 mL of *Standard stock solution* into a 25-mL volumetric flask, and proceed as directed under *Sample solution* beginning with "add 2 mL of potassium nitrate solution (1 in 100)".

Sample solution: Pipet 10 mL of the specimen under test into a 25-mL volumetric flask, add 2 mL of potassium nitrate solution (1 in 100) and 10 mL of pH 9.2 alkaline borate buffer (see in *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*), and adjust to a pH of 9.2, if necessary, by the addition of 2 N nitric acid. Add 1.5 mL of freshly prepared gelatin solution (1 in 1000), then add the pH 9.2 alkaline borate buffer to volume.

Analysis: Pipet a portion of the *Sample solution* into the polarographic cell, and deaerate

by bubbling nitrogen through the solution for 15 min. Insert the dropping mercury electrode of a suitable polarograph (see *Polarography* 〈 801 〉), and record the polarogram from -0.6 to -1.5 volts versus the saturated calomel electrode. Calculate the quantity, in $\mu\text{g/mL}$, of phenylmercuric nitrate ($\text{C}_6\text{H}_5\text{HgNO}_3$) in the portion of the sample taken:

$$\text{Result} = 2.5C[(i_d)_U/(i_d)_S]$$

C = concentration of phenylmercuric nitrate in the *Standard solution* ($\mu\text{g/mL}$)

$(i_d)_U$ diffusion current of the *Sample solution*, as the difference between the residual current and the limiting current

$(i_d)_S$ diffusion current of the *Standard solution*, as the difference between the residual current and the limiting current

◆ **Thimerosal**

Standard solution: On the day of use, place about 25 mg of USP Thimerosal RS, accurately weighed, in a 250 mL volumetric flask, add water to volume, and mix. Protect from light. Pipet 15 mL of this solution into a 25 mL volumetric flask, add 1.5 mL of gelatin solution (1 in 1000), then add potassium nitrate solution (1 in 100) to volume, and mix.

Sample solution: Pipet 15 mL of the test specimen into a 25 mL volumetric flask, add 1.5 mL of gelatin solution (1 in 1000), add potassium nitrate solution (1 in 100) to volume.

Analysis: Transfer a portion of the *Sample solution* to a polarographic cell, and deaerate by bubbling nitrogen through the solution for 15 minutes. Insert the dropping mercury electrode of a suitable polarograph (see *Polarography* 〈 801 〉), and record the polarogram from -0.2 to -1.4 volts versus the saturated calomel electrode. Determine the diffusion current, $(i_d)_U$, as the difference between the residual current and the limiting current. Similarly and concomitantly determine the diffusion current, $(i_d)_S$, of the *Standard solution*.

Calculate the quantity, in μg , of thimerosal ($\text{C}_6\text{H}_9\text{HgNaO}_2\text{S}$) in each mL of the test specimen taken by the formula:

$$\text{Result} = 1.667C[(i_d)_U/(i_d)_S]$$

in which C is the concentration, in $\mu\text{g per mL}$, of thimerosal in the *Standard solution*; and the other terms are as defined therein.

BRIEFING

〈 381 〉 **Elastomeric Closures for Injections**, *USP 38* page 270 and *PF 40(5)* [Sept.–Oct. 2014]. Due to the impending omission of *Heavy Metals* 〈 231 〉, the USP Packaging, Storage, and Distribution Expert Committee is proposing the following revision while the Expert Committee works to modernize the chapter. The modernized chapter will include specific testing requirements for elastomeric materials of construction and elastomeric materials used in packaging systems. As part of this modernization effort, the elemental impurities tests for elastomeric materials and materials used in final packaging systems will also be updated.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style.

〈 381 〉 ELASTOMERIC CLOSURES FOR INJECTIONS

INTRODUCTION

Elastomeric closures for containers used in the types of preparations defined in the general test chapter *Injections and Implanted Drug Products* 〈 1 〉 are made of materials obtained by vulcanization (cross-linking) polymerization, polyaddition, or polycondensation of macromolecular organic substances (elastomers). Closure formulations contain natural or synthetic elastomers and inorganic and organic additives to aid or control vulcanization, impart physical and chemical properties or color, or stabilize the closure formulation.

This chapter applies to closures used for long-term storage of preparations defined in 〈 1 〉. Such closures are typically used as part of a vial, bottle, or pre-fill syringe package system. This chapter applies to closures formulated with natural or synthetic elastomeric substances. This chapter does not apply to closures made from silicone elastomer; however, it does apply to closures treated with silicone (e.g., *Dimethicone, NF*). When performing the tests in this chapter, it is not required that closures be treated with silicone, although there is no restriction prohibiting the use of siliconized closures.

This chapter also applies to closures coated with other lubricious materials (e.g., materials chemically or mechanically bonded to the closure) that are not intended to, and in fact do not provide, a barrier to the base elastomer. When performing the tests, closures with lubricious nonbarrier coatings are to be tested in their coated state.

The following comments relate solely to closures laminated or coated with materials intended to provide, or in fact function as, a barrier to the base elastomer [e.g., polytetrafluoroethylene (PTFE) or lacquer coatings]. It is not permissible to use a barrier material in an attempt to change a closure that does not meet compendial requirements to one that does conform. Therefore, all *Physicochemical Tests* apply to the base formula of such closures, as well as to the coated or laminated closure. To obtain *Physicochemical Tests* results, the tests are to be

performed on uncoated or nonlaminated closures of the same elastomeric compound, as well as to the laminated or coated closure. The *Functionality Tests* apply to and are to be performed using the laminated or coated elastomeric closure. *Biological Tests* apply to the lamination or coating material, as well as to the base formula. *Biological Tests* may be performed on the laminated or coated closure, or they may be performed on the laminate/coating material and the uncoated or nonlaminated closures of the same elastomeric compound. In the latter case, the results are to be reported separately. The base formula used for physicochemical or biological tests intended to support the compendial compliance of a barrier-coated closure should be similar to the corresponding coated closure in configuration and size.

For all *Elastomeric Closures for Injections* { 381 } tests performed on any closure type, it is important to document the closure being tested, including a full description of the elastomer, and any lubrication, coating, laminations, or treatments applied.

This chapter states test limits for Type I and Type II elastomeric closures. Type I closures are typically used for aqueous preparations. Type II closures are typically intended for nonaqueous preparations and are those which, having properties optimized for special uses, may not meet all requirements listed for Type I closures because of physical configuration, material of construction, or both. If a closure fails to meet one or more of the Type I test requirements but still meets the Type II requirements for the test(s), the closure is assigned a final classification of Type II. All elastomeric closures suitable for use with injectable preparations must comply with either Type I or Type II test limits. However, this specification is not intended to serve as the sole evaluation criteria for the selection of such closures.

It is appropriate to use this chapter when identifying elastomeric closures that might be acceptable for use with injectable preparations on the basis of their biological reactivity, their aqueous extract physicochemical properties, and their functionality.

The following closure evaluation requirements are beyond the scope of this chapter:

- The establishment of closure identification tests and specifications
- The verification of closure–product physicochemical compatibility
- The identification and safety determination of closure leachables found in the packaged product
- The verification of packaged product closure functionality under actual storage and use conditions

The manufacturer of the injectable product (the end user) must obtain from the closure supplier an assurance that the composition of the closure does not vary and that it is the same as that of the closure used during compatibility testing. When the supplier informs the end user of changes in the composition, compatibility testing must be repeated, totally or partly, depending on the nature of the changes. Closures must be properly stored, cleaned for removal of environmental contaminants and endotoxins, and, for aseptic processes, sterilized before use in packaging injectable products.

CHARACTERISTICS

Elastomeric closures are translucent or opaque and have no characteristic color, the latter depending on the additives used. They are homogeneous and practically free from flash and adventitious materials (e.g., fibers, foreign particles, and waste rubber).

IDENTIFICATION

Closures are made of a wide variety of elastomeric materials and optional polymeric coatings. For this reason, it is beyond the scope of this chapter to specify identification tests that encompass all possible closure presentations. However, it is the responsibility of the closure supplier and the injectable product manufacturer (the end user) to verify the closure elastomeric formulation and any coating or laminate materials used according to suitable identification tests. Examples of some of the analytical test methodologies that may be used include specific gravity, percentage of ash analysis, sulfur content determination, Fourier transform infrared spectroscopy/attenuated total reflectance (FTIR-ATR) test, thin-layer chromatography (TLC) of an extract, UV absorption spectrophotometry of an extract, or infrared (IR) absorption spectrophotometry of a pyrolysate.

TEST PROCEDURES

Elastomeric closures shall conform to biological, physicochemical, and functionality requirements both as they are shipped by the closure supplier to the injectable product manufacturer (the end user) and in their final ready-to-use state by the end user.

For those elastomeric closures processed by the supplier before distribution to the end user, the supplier shall demonstrate compendial conformance of closures exposed to such processing and/or sterilization steps. Similarly, if elastomeric closures received by the end user are subsequently processed or sterilized, the end user is responsible for demonstrating the continued conformance of closures to compendial requirements subsequent to such processing and/or sterilization conditions (i.e., in their ready-to-use state). This is especially important if closures shall be exposed to processes or conditions that may significantly affect the biological, physicochemical, or functionality characteristics of the closure (e.g., gamma irradiation). For closures that are normally lubricated with silicone before use, it is permissible to perform physicochemical testing on nonlubricated closures to avoid potential method interference and/or difficulties in interpreting test results. For closures supplied with other lubricious nonbarrier coatings, all tests are to be performed using the coated closure.

For closures coated or laminated with coatings intended to provide a barrier function (e.g., PTFE or lacquer coatings), physicochemical compendial tests apply to the uncoated base elastomer, as well as to the coated closure. In this case, suppliers are responsible for demonstrating physicochemical compendial compliance of the coated closure, as well as of the uncoated closure, processed or treated in a manner simulating conditions typically followed by the supplier for such coated closures before shipment to the end user. The uncoated closure subject to physicochemical tests should be similar to the corresponding coated closure in size and configuration. End users of coated closures are also responsible for demonstrating the continued physicochemical compendial conformance of the coated closure, processed or treated in a manner simulating conditions typically used by the end user before use.

In all cases, it is appropriate to document all conditions of closure processing, pretreatment, sterilization, or lubrication when reporting test results.

Table 1 summarizes the testing requirements of closures, and the responsibilities of the supplier and the end user.

Table 1

Closure Types (as supplied or used)	Test Requirements		
	Physicochemical Tests	Functionality Tests	Biological Tests
Closure with or without silicone coating	• Tests are to be performed.	• Tests are to be performed.	• Tests are to be performed.
	• Silicone use is optional.	• Silicone use is optional.	• Silicone use is optional.
	• Responsibility: supplier and end user	• Responsibility: supplier and end user	• Responsibility: supplier and end user

	• Responsibility: supplier and end user		OR:
	AND: • Tests are to be performed on uncoated closures (base formula).	• Responsibility: supplier and end user	• Tests are to be performed on uncoated closures (base formula) and the laminate/coating material (report results separately).
	• Responsibility: supplier		• Responsibility: supplier and end user

BIOLOGICAL TESTS

Two stages of testing are indicated. The first stage is the performance of an in vitro test procedure as described in general test chapter *Biological Reactivity Tests, In Vitro* (87). Materials that do not meet the requirements of the in vitro test are subjected to the second stage of testing, which is the performance of the in vivo tests, *Systemic Injection Test* and *Intracutaneous Test*, according to the procedures set forth in the general test chapter *Biological Reactivity Tests, In Vivo* (88). Materials that meet the requirements of the in vitro test are not required to undergo in vivo testing. Type I and Type II closures must both conform to the requirements of either the in vitro or the in vivo biological reactivity tests. [Note—Also see the general information chapter *The Biocompatibility of Materials Used in Drug Containers, Medical Devices, and Implants* (1031).]

Change to read:

PHYSICOCHEMICAL TESTS

Preparation of *Solution S*

Place whole, uncut closures corresponding to a surface area of $100 \pm 10 \text{ cm}^2$ into a suitable glass container. Cover the closures with 200 mL of Purified Water or Water for Injection. If it is not possible to achieve the prescribed closure surface area ($100 \pm 10 \text{ cm}^2$) using uncut closures, select the number of closures that will most closely approximate 100 cm^2 , and adjust the volume of water used to the equivalent of 2 mL per each 1 cm^2 of actual closure surface area used. Boil for 5 min, and rinse five times with cold Purified Water or Water for Injection. Place the washed closures into a Type I glass, wide-necked flask (see *Containers—Glass* $\langle 660 \rangle$), add the same quantity of Purified Water or Water for Injection initially added to the closures, and weigh. Cover the mouth of the flask with a Type I glass beaker. Heat in an autoclave so that a temperature of $121 \pm 2^\circ$ is reached within 20–30 min, and maintain this temperature for 30 min. Cool to room temperature over a period of about 30 min. Add Purified Water or Water for Injection to bring it up to the original mass. Shake, and immediately decant and collect the solution. [Note—This solution must be shaken before being used in each of the tests.]

Preparation of Blank

Prepare a blank solution similarly, using 200 mL of Purified Water or Water for Injection omitting the closures.

Appearance of Solution (Turbidity/Opaescence and Color)

DETERMINATION OF TURBIDITY (OPAESCENCE)

Note—The determination of turbidity may be performed by visual comparison (*Procedure A*), or instrumentally using a suitable ratio turbidimeter (*Procedure B*). For a discussion of turbidimetry, see *Spectrophotometry and Light-Scattering* $\langle 851 \rangle$. Instrumental assessment of clarity provides a more discriminatory test that does not depend on the visual acuity of the analyst.

Hydrazine sulfate solution: Dissolve 1.0 g of hydrazine sulfate in water, and dilute with water to 100.0 mL. Allow to stand for 4–6 h.

Hexamethylenetetramine solution: Dissolve 2.5 g of hexamethylenetetramine in 25.0 mL of water in a 100-mL glass-stoppered flask.

Opaescence stock suspension: Add 25.0 mL of *Hydrazine sulfate solution* to the *Hexamethylenetetramine solution* in the flask. Mix, and allow to stand for 24 h. This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.

Opaescence standard suspension: Prepare a suspension by diluting 15.0 mL of the *Opaescence stock suspension* with water to 1000.0 mL. *Opaescence standard suspension* is stable for about 24 h after preparation.

Reference suspensions: Prepare according to *Table 2*. Mix and shake before use. [Note—Stabilized formazin suspensions that can be used to prepare stable, diluted turbidity standards are available commercially and may be used after comparison with the standards prepared as described.]

Table 2

	Reference suspension A	Reference suspension B	Reference suspension C	Reference suspension D
Standard of opalescence	5.0 mL	10.0 mL	30.0 mL	50.0 mL
Water	95.0 mL	90.0 mL	70.0 mL	50.0 mL
Nephelometric turbidity units (NTU)	3 NTU	6 NTU	18 NTU	30 NTU

Procedure A, visual comparison: Use identical test tubes made of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm. Fill one tube to a depth of 40 mm with *Solution S*, one tube to the same depth with water, and four others to the same depth with *Reference suspensions A, B, C, and D*. Compare the solutions in diffuse daylight 5 min after preparation of the *Reference suspensions*, viewing vertically against a black background. The light conditions shall be such that *Reference suspension A* can be readily distinguished from water and that *Reference suspension B* can be readily distinguished from *Reference suspension A*.

Requirement—*Solution S* is not more opalescent than *Reference suspension B* for Type I closures and not more opalescent than *Reference suspension C* for Type II closures. *Solution S* is considered clear if its clarity is the same as that of water when examined as described above, or if its opalescence is not more pronounced than that of *Reference suspension A* (refer to *Table 3*).

Procedure B, instrumental comparison: Measure the turbidity of the *Reference suspensions* in a suitable calibrated turbidimeter (see $\langle 851 \rangle$). The blank should be run, and the results should be corrected for the blank. *Reference suspensions A, B, C, and D* represent 3, 6, 18, and 30 NTU, respectively. Measure the turbidity of *Solution S* using the calibrated turbidimeter.

Requirement—The turbidity of *Solution S* is NMT that for *Reference suspension B* (6 NTU FTU) for Type I closures and is NMT that for *Reference suspension C* (18 NTU FTU) for Type II closures (refer to *Table 3*).

Table 3

Comparison Method		
Opalescence Requirements	Procedure A (visual)	Procedure B (instrumental)
Type I closures	No more opalescent than <i>Reference suspension B</i>	NMT 6 NTU
Type II closures	No more opalescent than <i>Reference suspension C</i>	NMT 18 NTU

DETERMINATION OF COLOR

Color standard: Prepare a solution by diluting 3.0 mL of *Matching Fluid O* (see *Color and Achromicity* $\langle 631 \rangle$) with 97.0 mL of diluted hydrochloric acid.

Procedure: Use identical tubes made of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm. Fill one tube to a depth of 40 mm with *Solution S*, and the second tube with the *Color standard*. Compare the liquids in diffuse daylight, viewing vertically against a white background.

Requirement: *Solution S* is not more intensely colored than the *Color standard*.

Acidity or Alkalinity

Bromothymol blue solution: Dissolve 50 mg of bromothymol blue in a mixture of 4 mL of 0.02 M sodium hydroxide and 20 mL of alcohol. Dilute with water to 100 mL.

Procedure: To 20 mL of *Solution S* add 0.1 mL of *Bromothymol blue solution*. If the solution is yellow, titrate with 0.01 N sodium hydroxide until a blue endpoint is reached. If the solution is blue, titrate with 0.01 N hydrochloric acid until a yellow endpoint is reached. If the solution is green, it is neutral and no titration is required.

Blank correction: Test 20 mL of blank similarly. Correct the results obtained for *Solution S* by subtracting or adding the volume of titrant required for the blank, as appropriate. (See *Titrimetry* 〈 541 〉.)

Requirement: NMT 0.3 mL of 0.01 N sodium hydroxide produces a blue color, or NMT 0.8 mL of 0.01 N hydrochloric acid produces a yellow color, or no titration is required.

Absorbance

Procedure: [Note—Perform this test within 5 h of preparing *Solution S*.] Pass *Solution S* through a filter of 0.45- μ m pore size, discarding the first few mL of filtrate. Measure the absorbance of the filtrate at wavelengths between 220 and 360 nm in a 1-cm cell using the blank in a matched cell in the reference beam. If dilution of the filtrate is required before measurement of the absorbance, correct the test results for the dilution.

Requirement: The absorbances at these wavelengths do not exceed 0.2 for Type I closures or 4.0 for Type II closures.

Reducing Substances

Procedure: [Note—Perform this test within 4 h of preparing *Solution S*.] To 20.0 mL of *Solution S* add 1 mL of diluted sulfuric acid and 20.0 mL of 0.002 M potassium permanganate. Boil for 3 min. Cool, add 1 g of potassium iodide, and titrate immediately with 0.01 M sodium thiosulfate, using 0.25 mL of starch solution TS as the indicator. Perform a titration using 20.0 mL of blank, and note the difference in volume of 0.01 M sodium thiosulfate required.

Requirement: The difference between the titration volumes is NMT 3.0 mL for Type I closures and NMT 7.0 mL for Type II closures.

Heavy Metals

~~*Procedure*—Proceed as directed for *Method I* under *Heavy Metals* 〈 231 〉. Prepare the *Test Preparation* using 10.0 mL of *Solution S*.~~

~~*Requirement*—*Solution S* contains not more than 2 ppm of heavy metals as lead.~~

■ ■ 2S (USP38)

■

Elemental Impurities

Limits for elemental impurities in marketed pharmaceutical drug products can be found in *Elemental Impurities—Limits* 〈 232 〉. These limits are not specific to packaging components; a strategy to limit elemental impurities in a final drug product should consider all potential sources

that include a packaging component. ■ 1S (USP39)

Extractable Zinc

Test solution: Prepare a *Test solution* by diluting 10.0 mL of *Solution S* with 0.1 N hydrochloric acid to 100 mL. Prepare a test blank similarly, using the blank for *Solution S*.

Zinc standard solution: Prepare a solution (10 ppm of zinc) by dissolving zinc sulfate in 0.1 N hydrochloric acid.

Reference solutions: Prepare NLT 3 *Reference solutions* by diluting the *Zinc standard solution* with 0.1 N hydrochloric acid. The concentrations of zinc in these *Reference solutions* are to span the expected limit of the *Test solution*.

Procedure: Use a suitable atomic absorption spectrophotometer (see { 851 }) equipped with a zinc hollow-cathode lamp and an air-acetylene flame. An alternative procedure, such as an appropriately validated inductively coupled plasma analysis (ICP), may be used. Test each of the *Reference solutions* at the zinc emission line of 213.9 nm at least three times. Record the steady readings. Rinse the apparatus with the test blank solution each time to ensure that the reading returns to the initial blank value. Prepare a calibration curve from the mean of the readings obtained for each *Reference solution*. Record the absorbance of the *Test solution*. Determine the ppm of zinc concentration of the *Test solution* using the calibration curve.

Requirement: *Solution S* contains NMT 5 ppm of extractable zinc.

Ammonium

Alkaline potassium tetraiodomercurate solution: Prepare a 100-mL solution containing 11 g of potassium iodide and 15 g of mercuric iodide in water. Immediately before use, mix 1 volume of this solution with an equal volume of a 250-g/L solution of sodium hydroxide.

Test solution: Dilute 5 mL of *Solution S* with water to 14 mL. Make alkaline if necessary by adding 1 N sodium hydroxide, and dilute with water to 15 mL. Add 0.3 mL of *Alkaline potassium tetraiodomercurate solution*, and close the container.

Ammonium standard solution: Prepare a solution of ammonium chloride in water (1 ppm of ammonium). Mix 10 mL of the 1 ppm of ammonium chloride solution with 5 mL of water and 0.3 mL of *Alkaline potassium tetraiodomercurate solution*. Close the container.

Requirement: After 5 min, any yellow color in the *Test solution* is no darker than the *Ammonium standard solution* (NMT 2 ppm of ammonium in *Solution S*).

Volatile Sulfides

Procedure: Place closures, cut if necessary, with a total surface area of $20 \pm 2 \text{ cm}^2$ in a 100-mL flask, and add 50 mL of a 20-g/L citric acid solution. In the same manner and at the same time, prepare a control solution in a separate 100-mL flask by dissolving 0.154 mg of sodium sulfide in 50 mL of a 20-g/L citric acid solution. Place a piece of lead acetate paper over the mouth of each flask, and hold the paper in position by placing over it an inverted weighing bottle. Heat the flasks in an autoclave at $121 \pm 2^\circ$ for 30 min.

Requirement: Any black stain on the paper produced by the test solution is not more intense than that produced by the control substance.

FUNCTIONALITY TESTS

Note—Samples treated as described for preparation of *Solution S* and air dried should be used for *Functionality Tests of Penetrability, Fragmentation, and Self-Sealing Capacity*. *Functionality Tests* are performed on closures intended to be pierced by a hypodermic needle. The *Self-Sealing Capacity* test is required only for closures intended for multiple-dose containers. The needle specified for each test is a lubricated, long-bevel (bevel angle, $12 \pm 2^\circ$) hypodermic needle.¹

Penetrability

Procedure: Fill 10 suitable vials to the nominal volume with water, fit the closures to be examined, and secure with a cap. Using a new hypodermic needle as described above for each closure, pierce the closure with the needle perpendicular to the surface.

Requirement: The force for piercing is NMT 10 N (1 kgf) for each closure, determined with an accuracy of ± 0.25 N (25 gf).

Fragmentation

Closures for liquid preparations: Fill 12 clean vials with water to 4 mL less than the nominal capacity. Fit the closures to be examined, secure with a cap, and allow to stand for 16 h.

Closures for dry preparations: Fit closures to be examined into 12 clean vials, and secure each with a cap.

Procedure: Using a hypodermic needle as described above fitted to a clean syringe, inject into each vial 1 mL of water while removing 1 mL of air. Repeat this procedure four times for each closure, piercing each time at a different site. Use a new needle for each closure, checking that the needle is not blunted during the test. Pass the total volume of liquid in all of the vials through a single filter with a nominal pore size NMT 0.5 μm . Count the rubber fragments on the surface of the filter visible to the naked eye.

Requirement: There are NMT five fragments visible. This limit is based on the assumption that fragments with a diameter >50 μm are visible to the naked eye. In case of doubt or dispute, the particles are examined microscopically to verify their nature and size.

Self-Sealing Capacity

Procedure: Fill 10 suitable vials with water to the nominal volume. Fit the closures that are to be examined, and cap. Using a new hypodermic needle as described above for each closure, pierce each closure 10 times, piercing each time at a different site. Immerse the 10 vials in a solution of 0.1% (1 g/L) methylene blue, and reduce the external pressure by 27 kPa for 10 min. Restore to atmospheric pressure, and leave the vials immersed for 30 min. Rinse the outside of the vials.

Requirement: None of the vials contain any trace of blue solution.

¹ Refer to ISO 7864:1993. Sterile hypodermic needles for single use.

BRIEFING

《 507 》 **Protein Determination Procedures.** The USP Total Protein Measurement Expert Panel and the General Chapters—Biological Analysis Expert Committee propose the following new general test chapter. The chapter contains multiple validated methods for the measurement of total protein, providing users with options depending on their sample matrix and measurement purpose. Because it is impossible to test every potential protein and sample matrix for this general purpose, any selected method must be verified before use as suitable for its intended purpose. The liquid chromatographic procedure in *Amino Acid Analysis* is based on analyses performed with the Biochrom Sodium Prewash 4.6-mm × 10-cm, 20-µm Ultropac 4 packing brand of L58 column and Biochrom Sodium High Performance Protein Hydrolysate 4.6-mm × 20-cm, 8-µm Ultropac 8 packing brand of L58 column. An associated USP BSA for Protein Quantitation Reference Standard is also proposed for assuring system suitability or for approximate protein measurements when a specific protein Reference Standard is unavailable for that purpose. Readers with alternative, validated total protein determination procedures are encouraged to submit their methods to USP for possible inclusion in a future chapter revision.

Comment deadline: May 31, 2015

Add the following:

■ 《 507 》 PROTEIN DETERMINATION PROCEDURES

INTRODUCTION

Several procedures exist to determine the total protein in pharmaceutical drug substances and products. Procedures may differ based on the physical characteristic of the protein, which serves as the basis of the measurement principle (e.g., absorbance of ultraviolet light by aromatic amino acid residues or by dye binding). Understanding the protein structure and sample matrix is important when selecting a total protein quantitation procedure. Users must verify that the chosen validated method below is suitable for their specific purpose (see *Verification of Compendial Procedures* 《 1226 》).

PROCEDURE

Two options for Method I are presented: *Method IA*, using denaturing conditions; and *Method IB*, using native conditions. Depending on the protein sample (e.g., a strong coiled structure with most aromatic amino acids in the interior of the protein), one method may prove superior to the other, and users must verify which is more suitable for their particular protein sample. At a minimum, both methods are dependent on the following conditions being met: 1) the amino acid sequence and molecular weight of the protein must be known; and 2) the protein must contain tyrosines or tryptophans, and no other chromophores (other than cystines) that absorb near 280 nm (including nucleic acids and diluent components) should be present.

- **Method IA. Ultraviolet Light Absorbance Under Denaturing Conditions**

Sample buffer A: Prepare 20 mM sodium phosphate, pH 6.5 by dissolving 0.24 g of sodium

dihydrogen phosphate in about 80 mL of water. Adjust the pH with sodium hydroxide solution (10% w/w), and fill with water to 100 mL. Filter.

Sample buffer B: Prepare 7 M guanidine hydrochloride and 20 mM sodium phosphate, pH 6.5 by dissolving 0.24 g of sodium dihydrogen phosphate and 66.87 guanidine hydrochloride in about 50 mL of water. Adjust with sodium hydroxide solution (10% w/w), and fill with water to 100 mL. Filter.

Reference solution: Prepare 6 M guanidine hydrochloride and 20 mM sodium phosphate, pH 6.5 by mixing 330 μL of *Sample buffer A* and 2000 μL of *Sample buffer B*.

Sample preparation A: Dilute the test sample by adding *Sample buffer A* and *Sample buffer B* to achieve a final concentration of 6 M guanidine hydrochloride and about 0.4 mg/mL of protein, achieving an absorbance of about 0.6. [Note—Gravimetric dilutions can be used and sometimes improve accuracy.] Prepare at least three replicates per test sample.

Analysis

Samples: *Sample buffer A*, *Sample buffer B*, *Reference solution*, and *Sample preparation A*

Determination of the protein concentration in denaturing buffer: Using a suitable spectrophotometer (see *Ultraviolet-Visible Spectroscopy* (857)), measure the absorbance of *Sample preparation A* in 1-cm cuvettes at an optical density of 280 nm against the *Reference solution*, and subtract the absorbance value at 330 nm to obtain $A_{\text{corrected}}$.

Calculate the protein concentration c in the test sample:

$$c = A_{\text{corrected}} \times DF \times MW / (\epsilon_{280 \text{ nm}} \times 1 \text{ cm})$$

$A_{\text{corrected}}$ = absorbance at 280 nm minus the absorbance at 330 nm

DF = dilution factor

MW = calculated molecular weight of the protein

$\epsilon_{280 \text{ nm}}$ = extinction coefficient of the test sample at 280 nm

$$\epsilon_{280 \text{ nm}} = (n_{\text{Trp}} \times 5690 + n_{\text{Tyr}} \times 1280 + n_{\text{Cys}} \times 120) \text{ M}^{-1} \times \text{cm}^{-1}$$

n_{Trp} = number of tryptophans

n_{Tyr} = number of tyrosines

n_{Cys} = number of cystines

System suitability

The test sample UV spectra must show a maximum between 270 and 285 nm and must show a minimum between 243 and 257 nm. The measured absorbance at 280 nm must be NLT 0.4 and NMT 0.6. The relative standard deviation (RSD) of the calculated concentration of all replicates must be NMT 3.0%.

• Method IB. Ultraviolet Light Absorbance Under Native Conditions

Sample buffer A: Prepare 20 mM sodium phosphate, pH 6.5 by dissolving 0.24 g of sodium dihydrogen phosphate in about 80 mL of water. Adjust the pH with sodium hydroxide solution (10% w/w), and fill with water to 100 mL. Filter.

Sample preparation A: Dilute the test sample by adding *Sample buffer A* to achieve a final concentration of about 0.4 mg/mL of protein, achieving an absorbance of about 0.6. [Note—Gravimetric dilutions can be used and sometimes improve accuracy.] Prepare at least

three replicates per test sample.

Analysis

Samples: *Sample buffer A* and *Sample preparation A*

Determination of the protein concentration in native buffer: Using a suitable

spectrophotometer (see chapter (857)), measure the absorbance of *Sample preparation A* in 1-cm cuvettes at 280 nm against *Sample buffer A* and subtract the absorbance value at 330 nm to obtain $A_{corrected}$.

Calculate the protein concentration c of the test sample:

$$c = A_{corrected} \times DF \times MW / (\epsilon_{280\text{ nm-native2}} \times 1\text{ cm})$$

$A_{corrected}$ = absorbance at 280 nm minus the absorbance at 330 nm

DF = dilution factor

MW = calculated molecular weight of the protein

$\epsilon_{280\text{ nm-native2}}$ = extinction coefficient of the test sample at 280 nm

where the extinction coefficient $\epsilon_{280\text{ nm-native2}}$ is calculated as:

$$\epsilon_{280\text{ nm-native2}} = (n_{Trp} \times 5500 + n_{Tyr} \times 1490 + n_{Cys} \times 125) \text{ M}^{-1} \times \text{cm}^{-1}$$

n_{Trp} = number of tryptophans

n_{Tyr} = number of tyrosines

n_{Cys} = number of cystines

System suitability

The test sample UV spectra must show a maximum between 270 and 285 nm and must show a minimum between 243 and 257 nm. The measured absorbance at 280 nm must be NLT 0.4 and NMT 0.6. The RSD of the calculated concentration of all replicates must be NMT 3.0%.

• Method II. Bicinchoninic Acid Method

BCA reagent solution:¹ Prepare a solution of 10 g/L of bicinchoninic acid (BCA), 20 g/L of sodium carbonate monohydrate, 1.6 g/L of sodium tartrate, 4 g/L of sodium hydroxide, and 9.5 g/L of sodium bicarbonate in water to a pH of 11.25.

Copper sulfate reagent solution: Prepare a solution of 40 g/L of cupric sulfate pentahydrate in water.

BCA working reagent solution: Mix 50 volumes of *BCA reagent solution* with 1 volume of *Copper sulfate reagent solution*. Mix until the green solution is clear.

Sample dilution buffer: Water or another suitable, non-interfering buffer

Standard solutions: Ideally, use the USP Reference Standard for the protein under test. If either the protein of interest is unknown, is a mixture, or is a specific USP Reference Standard that is unavailable, use USP BSA for Protein Quantitation RS. Dilute portions of this solution with the *Sample dilution buffer* to obtain NLT five evenly spaced *Standard solutions* in triplicate. The selected *Standard solution* concentrations should result in a linear curve, typically in the range of 25–1000 µg/mL of protein.

Suitability standard solution: Prepare an independent dilution of the same protein used to make the *Standard solutions* above using *Sample dilution buffer* to obtain a *Suitability standard solution* having a concentration near the midpoint of the standard curve. Prepare the *Suitability standard solution* in triplicate.

Sample solution: Prepare a *Sample solution* with an expected concentration within the standard curve by diluting with the *Sample dilution buffer*. Prepare triplicate samples.

Analysis

Samples: *Sample dilution buffer*, *Standard solutions*, *Suitability standard solution*, and *Sample solution*

Accurately transfer 100 μL of *Sample dilution buffer*, *Standard solutions*, *Suitability standard solution*, and *Sample solution* to individual test tubes. [Note—96-well, plate-based, and automated methods can also be used with suitable volume adjustments to the procedure below.] Add 2.0 mL of *BCA working reagent solution* to each tube, and mix well.

Cover and incubate the solutions at $37 \pm 2^\circ$ for 30 ± 1 min, then allow the samples to cool to room temperature for NLT 5 min and NMT 60 min. Determine the absorbances of the solutions at 562 nm with a suitable spectrophotometer (see chapter [857](#)). Autozero the instrument with the *Sample dilution buffer* sample.

Measure the absorbance of all *Sample dilution buffer*, *Standard solutions*, *Suitability standard solution*, and *Sample solution* samples within 10 min.

Calculations: Plot the absorbances of the *Standard solutions* versus the protein concentrations of the *Standard solutions*, and prepare a standard curve using the linear regression method. Use this standard curve and the absorbance of the *Sample solution* to determine the concentration of protein in each *Suitability standard solution* and *Sample solution*.

System suitability

Samples: *Standard solutions* and *Suitability standard solution*

Suitability requirements

Linearity: The coefficient of determination (r^2) for a linear fit of all *Standard solutions* is NLT 0.99.

Relative standard deviation: NMT 5% for triplicate results of the *Suitability standard solution*

Accuracy: The calculated concentration of the *Suitability standard solution* must be within 90%–110% of the theoretical concentration.

Acceptance criteria

Relative standard deviation: NMT 5% for triplicate *Sample solution* results

● Method III. Bradford Method

Sample dilution buffer: Water or another suitable, non-interfering buffer

Standard solutions: Use the USP Reference Standard for the protein under test or USP BSA for Protein Quantitation RS if either the protein of interest is unknown, a mixture, or a specific USP Reference Standard is unavailable. Dilute portions of this solution with the *Sample dilution buffer* to obtain NLT five evenly spaced *Standard solutions* in triplicate. Two standard curve ranges are provided for use: either 0.1–1.0 mg/mL of protein (see *Analysis procedure A*, below) or 5–25 $\mu\text{g/mL}$ of protein (see *Analysis procedure B*, below).

Suitability standard solution: Dilute the USP Reference Standard for the protein under test or USP BSA for Protein Quantitation RS with *Sample dilution buffer* to obtain a *Suitability standard solution* having a concentration near the midpoint of the standard curve. Prepare the *Suitability standard solution* in triplicate.

Sample solution: Prepare a *Sample solution* with an expected concentration within one of the two concentration ranges in options *A* or *B* below by diluting with the *Sample dilution buffer*. Prepare triplicate samples.

Coomassie reagent solution: Dissolve 100 mg of brilliant blue G² in 50 mL of alcohol. Add 100 mL of phosphoric acid, dilute with water to 1 L, and mix. Pass the solution through filter paper (Whatman No. 1 or equivalent), and store the filtered reagent in an amber bottle at room temperature. [Note—Slow precipitation of the dye will occur during storage of the reagent. Filter the reagent before use.]

Analysis: Select one of the two concentration ranges listed below that is suitable for the expected concentrations of the *Sample solutions*.

A. Protein concentration range: 0.1–1.0 mg/mL

Samples: *Sample dilution buffer*, *Standard solutions*, and *Sample solution*

Add 1 mL of the *Coomassie reagent solution* to 20 μ L of each *Sample dilution buffer*, *Standard solutions*, and *Sample solution* samples. Mix by inversion, avoiding foaming.

Incubate 10–30 min. By using a suitable spectrophotometer (see chapter { 857 }) [Note—Do not use quartz (silica) cuvettes.], use the *Sample dilution buffer* to set the instrument to zero at 595 nm. Autozero the instrument with the *Sample dilution buffer* sample.

Measure the absorbance of all *Sample dilution buffer*, *Standard solutions*, *Suitability standard solution*, and *Sample solution* samples within 60 min.

B. Protein concentration range: 5–25 μ g/mL

Samples: *Sample dilution buffer*, *Standard solutions*, and *Sample solution*

Add 0.5 mL of the *Coomassie reagent solution* to 0.5 mL each of *Sample dilution buffer*, *Standard solutions*, and *Sample solution* samples. Mix by inversion, avoiding foaming.

Incubate 10–30 min. By using a suitable spectrophotometer (see chapter { 857 }) [Note—Do not use quartz (silica) cuvettes.], use the *Sample dilution buffer* to set the instrument to zero at 595 nm. Autozero the instrument with the *Sample dilution buffer* sample. Measure the absorbance of all *Sample dilution buffer*, *Standard solutions*, *Suitability standard solution*, and *Sample solution* samples within 60 min.

Calculations: [Note—The relationship of absorbance to protein concentration is nonlinear; however, if the standard curve concentration range is sufficiently small, it will approach linearity.] Plot the absorbances of the *Standard solutions* versus the protein concentrations, and determine the standard curve best fitting the plotted points. From this standard curve and the absorbance of the *Sample solution*, determine the concentration of protein in the *Sample solution*.

System suitability

Samples: *Standard solutions* and *Suitability standard solutions*

Suitability requirements

Linearity: r^2 for a fit of all *Standard solutions* is NLT 0.99.

Relative standard deviation: NMT 15% for triplicate results of the *Suitability standard solution*

Recovery: The calculated concentration of the *Suitability standard solution* must be within 90%–110% of the theoretical concentration.

Acceptance criteria: %CV of triplicates of each *Sample solution* is NMT 15%.

● Method IV. Lowry Method

SDS solution: If required, prepare a solution of 50 g/L of sodium dodecyl sulfate (SDS).

Lowry reagent A: Prepare a solution of 10 g/L of sodium hydroxide in water, and prepare a solution of 50 g/L of sodium carbonate anhydrous in water. Mix equal volumes (2 volumes and 2 volumes) of each solution, and dilute with water or *SDS solution*, if required, to 5

volumes. [Note—SDS may be added to *Lowry reagent A* when the test protein contains detergents or lipids or is poorly soluble after treatment for interfering substances.]

Lowry reagent B: Prepare a fresh solution of 29.8 g/L of disodium tartrate dihydrate in water. Prepare a solution of 12.5 g/L of cupric sulfate pentahydrate in water. Mix equal volumes (2 volumes and 2 volumes) of each solution, and dilute with water to 5 volumes.

Lowry reagent C: Mix 50 volumes of *Lowry reagent A* with 1 volume of *Lowry reagent B*. [Note—Prepare fresh and protect from light.]

Sample dilution buffer: Purified water or other non-interfering buffer

Standard solutions: Use the USP Reference Standard for the protein under test or USP BSA for Protein Quantitation RS if the protein of interest is unknown, a mixture, or a specific USP Reference Standard is unavailable. Dilute portions of this solution with the *Sample dilution buffer* to obtain NLT five evenly spaced *Standard solutions*. The standard concentrations should be selected to result in a linear curve, typically in the range of 10–200 µg/mL of protein.

Suitability standard solution: Dilute the USP Reference Standard for the protein under test or USP BSA for Protein Quantitation RS with *Sample dilution buffer* to obtain a *Suitability standard solution* having a concentration near the midpoint of the standard curve. Prepare and analyze the *Suitability standard solution* in triplicate.

Sample solutions: Prepare a sample solution with an expected concentration within the standard curve by diluting with the *Sample dilution buffer*. Prepare and analyze samples in triplicate.

Diluted Folin–Ciocalteu's phenol reagent: Dilute Folin–Ciocalteu's phenol reagent 1:1 with water. Alternative dilutions may be used provided that the pH of the samples (i.e., *Standard solutions* and *Sample solutions* after addition of *Lowry reagent C* and the *Diluted Folin–Ciocalteu's phenol reagent*) is 10.0–10.6.

Analysis

Samples: *Sample dilution buffer*, *Standard solutions*, *Suitability standard solution*, and *Sample solutions*

Accurately transfer 1.0 mL of *Sample dilution buffer*, *Standard solutions*, *Suitability standard solution*, and *Sample solutions* to individual test tubes. To each test tube add 5.0 mL of *Lowry reagent C*. Allow to stand at room temperature for 10 min. Add 0.5 mL of *Diluted Folin–Ciocalteu's phenol reagent* to each test tube, mix immediately, and incubate at room temperature for 30 min. Determine the absorbance of each solution at 750 nm with a suitable spectrophotometer (see chapter { 857 }). Autozero the instrument with the *Sample dilution buffer*.

Calculations: Plot the absorbances of the *Standard solutions* versus the protein concentrations of the *Standard solutions*, and prepare a standard curve using the linear regression method. Use this standard curve and the absorbances of the *Sample solutions* to determine the concentration of protein in each of the *Sample solutions* and *Suitability standard solution*.

System suitability

Sample: *Suitability standard solution*

Suitability requirements

Linearity: r^2 for a linear fit of all standards is NLT 0.995.

Relative standard deviation: NMT 5% for triplicate results of the *Suitability standard solution*

Recovery: The calculated concentration of the *Suitability standard solution* must be

within 90%–110% of the theoretical concentration.

Acceptance criteria

Relative standard deviation: NMT 5% for triplicate sample results

• Method V. Amino Acid Analysis

Separation and determination of hydrolyzed amino acids by ion-exchange chromatography, followed by postcolumn ninhydrin derivatization, is described. [Note—For additional information, see *Biotechnology-Derived Articles—Amino Acid Analysis* 〈 1052 〉, which may be a helpful but not mandatory resource.]

Hydrolysis solution: 6 N hydrochloric acid

Sample hydrolysate preparations: Prepare a protein sample such that the content of amino acids is within the established linear working range of the procedure. [Note—Glassware used for hydrolysis must be clean.] Place suitable volumes of the sample and *Hydrolysis solution* in a hydrolysis tube. [Note—Common volumes range from 100 to 500 μL for the sample and from 1 to 2 mL for the *Hydrolysis solution* such that complete protein digestion is demonstrated within the hydrolysis incubation time.] Cool the mixture until solidification, and evacuate until the pressure is <0.2 bar. Flame seal the hydrolysis tube in vacuum by melting the neck of the tube. Hydrolyze at 110^o for 22 h. Allow the tube to cool, and remove the solvent by centrifugal vacuum concentrator.

Chromatography

Solution A: Sodium citrate buffer (0.2 N in sodium), containing 2.0% trisodium citrate dihydrate, 0.1% phenol, 0.2% thiodiglycol, and 2.0% propan-2-ol. Adjust with concentrated hydrochloric acid to a pH of 3.2.

Solution B: Sodium citrate buffer (0.2 N in sodium), containing 2.0% trisodium citrate dihydrate and 0.1% phenol. Adjust with concentrated hydrochloric acid to a pH of 4.25.

Solution C: Sodium citrate buffer (1.2 N in sodium), containing 2.0% trisodium citrate dihydrate, 0.1% phenol, and 5.8% sodium chloride. Adjust with concentrated hydrochloric acid to a pH of 6.45.

Solution D: 0.4 M sodium hydroxide containing 0.1% ethylenediaminetetraacetic acid.

Mobile phase: See *Table 1*. Equilibrate the system before each run.

Table 1

Time (min)	Solution (100%)	Column Temperature	Flow, Mobile Phase (mL/h)	Flow, Postcolumn Reagent (mL/h)
0	A	49 ^o	35	25
8.5	A	49 ^o	35	25
8.51	B	51 ^o	35	25
23.0	B	51 ^o	35	25
23.01	C	51 ^o	35	25
24.0	C	51 ^o	35	25
24.01	C	95 ^o	35	25
41.5	C	95 ^o	35	25
41.51	D	95 ^o	35	25

Time (min)	Solution (100%)	Column Temperature	Flow, Mobile Phase (mL/h)	Flow, Postcolumn Reagent (mL/h)
------------	-----------------	--------------------	---------------------------	---------------------------------

45.5	D	95°	35	25
45.51	A	49°	35	25
49.0	A	49°	35	25
49.01	50% Isopropanol	49°	0	0
51.0	50% Isopropanol	49°	0	0
51.01	A	49°	44	0
62.0	A	49°	44	0
62.01	A	49°	35	25
64.0	A	49°	35	25

Loading buffer: Sodium citrate buffer (0.2 N in sodium), containing 2.0% trisodium citrate dihydrate, 0.1% phenol, and 2.0% thiodiglycol. Adjust with concentrated hydrochloric acid to a pH of 2.2.

Postcolumn reagent

Solution 1: Solution containing 7.6% acetic acid, 47.7% ethylene glycol, 28.7% water, and 16.0% potassium acetate

Solution 2: Solution containing 9% methanol, 8% ninhydrin, 46.4% diethylene glycolmethyl ether, 36% ethylene glycol, and 0.6% hydrindantin. Prepare *Postcolumn reagent* by mixing 1.75 L of *Solution 1* and 0.25 L of *Solution 2*. Use nitrogen sparging during preparation and mixing. Keep the solution under nitrogen pressure.

Standard solution: Prepare a solution having known equimolar amounts of L-alanine, L-arginine, L-aspartic acid, L-glutamic acid, glycine, L-histidine, L-isoleucine, L-leucine, L-lysine, L-methionine, L-phenylalanine, L-proline, L-serine, L-threonine, L-tyrosine, and L-valine with half the equimolar amount of L-cystine. [Note—Suitable concentrations are 250 and 125 nmol/mL, respectively.]

Sample solution: Reconstitute the *Sample hydrolysate preparations* in a suitable volume of *Loading buffer*.

Blank: *Hydrolysis solution* that has been taken through analytical steps including hydrolysis

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: 440 and 570 nm

Columns

Prewash: 4.6-mm × 10-cm; 20-µm sodium form, packing L58

Analytical: 4.6-mm × 20-cm; 8-µm sodium form, packing L58

Injection volume: 40 µL, at 1 min with baseline reset

Postcolumn reaction: As the amino acids are eluted from the column, *Postcolumn reagent* is added at a rate of 25 mL/h. After mixing, the column effluent and the *Postcolumn reagent* are passed through a reaction coil of approximately 10-m × 0.3-mm

PTFE tubing at a temperature of approximately 135^o, where a purple color is developed.

Reaction coil temperature: 135^o

System suitability

Sample: *Standard solution*

Suitability requirements: All 17 amino acid peaks must be visible in the *Standard solution*.

Resolution: NLT 1.2 between the pairs of: l-threonine and l-serine; l-cystine and l-valine; and l-isoleucine and l-leucine

Tailing factor: 0.8–1.5 for the peak of l-aspartic acid

Relative standard deviation: NMT 2.0% determined from the l-aspartic acid peak

Analysis

Samples: *Blank, Standard solution, and Sample solution*

Record and measure the responses for each amino acid peak in the *Standard solution* and *Sample solution*. Use the responses obtained from the *Standard solution* to calculate the content of each amino acid in the sample. Analyze the *Blank* to confirm purity of the reagent and diluent.

Calculations: For unknown protein samples, calculate the mass, in μg , of each recovered amino acid by the formula $(m \times Mw)/1000$, in which m is the recovered quantity in nmol of the amino acid under test, and Mw is the molecular weight for that amino acid corrected for the weight of the water molecule that was eliminated during peptide bond formation (see *Table 2*). The sum of the masses of the recovered amino acids will give an estimate of the total mass of the protein or peptide analyzed after appropriate correction for partially and completely destroyed amino acids.

Protein samples with known weight and amino acid composition: Use well-recovered amino acids to quantify the protein. Divide the quantity, in nmol, of each of the well-recovered amino acids by the expected number of residues for that amino acid to obtain the protein content based on each well-recovered amino acid. Average the protein content results calculated. Discard protein content values that deviate >5% from the mean. Recalculate the mean protein content from the remaining values to obtain the protein content of the sample.

Table 2

Amino Acid	Abbreviation	Protein/Peptide Residue (Mw)
Alanine	Ala	71.08
Arginine	Arg	156.19
Aspartic acid	Asp	115.09
Cysteine	Cys	103.14
Glutamic acid	Glu	129.12
Glycine	Gly	57.05
Histidine	His	137.14
Isoleucine	Ile	113.16
Leucine	Leu	113.16
Lysine	Lys	128.17
Methionine	Met	131.20
Phenylalanine	Phe	147.18

Amino Acid	Abbreviation	Protein/Peptide Residue (Mw)
Proline	Pro	97.12
Serine	Ser	87.08
Threonine	Thr	101.11
Tyrosine	Tyr	163.18
Valine	Val	99.13

- **USP Reference Standards** 〈 11 〉

¹ Suitable BCA reagents are available from Thermo Scientific catalog #23225 or equivalent.

² Suitable brilliant blue G dye is available from Sigma-Aldrich, catalog #B0770.

BRIEFING

〈 800 〉 **Hazardous Drugs—Handling in Healthcare Settings**, PF 40(3) [May–Jun. 2013].

Based on the public comments received for the proposed 〈 800 〉 in PF 40(3), the USP Compounding Expert Committee has developed a revised chapter. This chapter has been created to identify the requirements for receipt, storage, compounding, dispensing, and administration of hazardous drugs (HDs) to protect the patient, healthcare personnel, and environment. Facility requirements that differ from *Pharmaceutical Compounding—Sterile Preparations* 〈 797 〉 and this chapter will be harmonized through an upcoming revision of 〈 797 〉, which will include the following:

- Elimination of the current allowance in 〈 797 〉 for facilities that prepare a low volume of HDs that permits placement of a Biological Safety Cabinet (BSC) or Caseptic containment isolator (ACI) in a non-negative pressure room. All HD compounding must be done in a separate area designated for HD compounding.
- Addition of an allowance in 〈 800 〉 for a Containment Segregated Compounding Area (C-SCA), a separate, negative pressure room with at least 12 air changes per hour (ACPH) for use when compounding HDs. Low- and medium-risk HD compounded sterile preparation (CSP) may be prepared in a BSC or compounding aseptic containment isolator (CACI) located in a C-SCA, provided the beyond-use date of the CSP does not exceed 12 hours.

Major changes from the proposal of 〈 800 〉 in PF 40(3) include:

- Clarified wording in many sections.
- Removed statement concerning no acceptable level of HDs.
- Revised section on list of HDs, to allow entities to perform an assessment of risk for non-antineoplastic drugs and final dosage forms to determine alternative containment strategies and/or work practices.
- Clarified that HDs may be unpacked in either a neutral/normal or negative pressure area.
- Allowance for either external venting or redundant high-efficiency particulate air

(HEPA) filtration of containment primary engineering controls (C-PECs) used for nonsterile compounding.

The proposed chapter is posted online at www.usp.org/usp-nf/notices/general-chapter-hazardous-drugs-handling-healthcare-settings with line numbers. Please provide the line numbers corresponding to your comments when submitting comments to CompoundingSL@usp.org.

Comment deadline: May 31, 2015

Add the following:

■ 〈 800 〉 HAZARDOUS DRUGS—HANDLING IN HEALTHCARE SETTINGS

1. INTRODUCTION AND SCOPE

This chapter describes practice and quality standards for handling hazardous drugs (HDs) to promote patient safety, worker safety, and environmental protection. Handling HDs includes, but is not limited to, the receipt, storage, compounding, dispensing, administration, and disposal of sterile and nonsterile products and preparations.

This chapter applies to all healthcare personnel who handle HD preparations and all entities which store, prepare, transport, or administer HDs (e.g., pharmacies, hospitals and other healthcare institutions, patient treatment clinics, physicians' practice facilities, or veterinarians' offices). Personnel who may potentially be exposed to HDs include, but are not limited to: pharmacists, pharmacy technicians, nurses, physicians, physician assistants, home healthcare workers, veterinarians, and veterinary technicians.

Entities that handle HDs must incorporate the standards in this chapter into their occupational safety plan. The entity's health and safety management system must, at a minimum, include:

- Engineering controls
- Competent personnel
- Safe work practices
- Proper use of appropriate Personal Protective Equipment (PPE)
- Policies for HD waste segregation and disposal

The chapter is organized into the following main sections:

1. Introduction and Scope
2. List of Hazardous Drugs
3. Types of Exposure
4. Responsibilities of Personnel Handling Hazardous Drugs
5. Facilities
6. Environmental Quality and Control
7. Personal Protective Equipment
8. Hazard Communication Program
9. Personnel Training
10. Receiving

11. Labeling, Packaging, and Transport
12. Dispensing Final Dosage Forms
13. Compounding
14. Administering
15. Deactivation/Decontamination, Cleaning, and Disinfection
16. Spill Control
17. Disposal
18. Documentation and Standard Operating Procedures
19. Medical Surveillance

Appendix A: Acronyms and Definitions

Appendix B: Examples of Design for Hazardous Drugs Compounding Areas

Appendix C: Types of Biological Safety Cabinets

Appendix D: Bibliography

2. LIST OF HAZARDOUS DRUGS

The National Institute for Occupational Safety and Health (NIOSH) maintains a list of antineoplastic and other HDs used in healthcare. An entity must maintain a list of HDs, which may include items on the current NIOSH list in addition to other agents not on the NIOSH list. The entity's list must be reviewed at least annually and whenever a new agent or dosage form is used.

The NIOSH list of antineoplastic and other HDs provides the criteria used to identify HDs. These criteria must be used to identify HDs that enter the market after the most recent version of the NIOSH list, or that enter the entity as an investigational drug. If the information available on this drug is deemed insufficient to make an informed decision, consider the drug hazardous until more information is available.

Box 1: Containment Requirements

- Any antineoplastic HD requiring manipulation and HD Active Pharmaceutical Ingredients (API) on the NIOSH list must follow the requirements in this chapter.
 - Final antineoplastic dosage forms that do not require any further manipulation other than counting final dosage forms may be dispensed without any further requirements for containment unless required by the manufacturer.
- For dosage forms of other HDs on the NIOSH list, the entity may perform an assessment of risk to determine alternative containment strategies and/work practices.

Some dosage forms of drugs defined as hazardous may not pose a significant risk of direct occupational exposure because of their dosage formulation (e.g., tablets or capsules—solid, intact medications that are administered to patients without modifying the formulation). However, dust from tablets and capsules may present a risk of exposure by skin contact and/or inhalation. An assessment of risk may be performed for these dosage forms to determine alternative containment strategies and/or work practices.

The assessment of risk must, at a minimum, consider the following:

- Type of HD (e.g., antineoplastic, non-antineoplastic, reproductive risk)
- Risk of exposure

- Packaging
- Manipulation

If an assessment of risk approach is taken, the entity must document what alternative containment strategies and/or work practices are being employed for specific dosage forms to minimize occupational exposure. If used, the assessment of risk must be reviewed at least annually and the review documented.

3. TYPES OF EXPOSURE

Routes of unintentional entry of HDs into the body include dermal and mucosal absorption, inhalation, injection, and ingestion (e.g., contaminated foodstuffs, spills, or mouth contact with contaminated hands). Both clinical and nonclinical personnel may be exposed to HDs when they handle HDs or touch contaminated surfaces. *Table 1* lists examples of potential routes of exposure based on activity.

Table 1. Examples of Potential Routes of Exposure Based on Activity

Activity	Potential Route of Exposure
Dispensing	<ul style="list-style-type: none"> • Counting tablets and capsules from bulk containers
Compounding	<ul style="list-style-type: none"> • Crushing tablets or opening capsules • Pouring oral or topical liquids from one container to another • Weighing or mixing components • Constituting or reconstituting powdered or lyophilized HDs • Withdrawing or diluting injectable HDs from parenteral containers • Expelling air or HDs from syringes • Contacting HD residue present on PPE or other garments • Deactivating, decontaminating, cleaning, and disinfecting areas contaminated with or suspected to be contaminated with HDs • Maintenance activities for potentially contaminated equipment and devices
Administration	<ul style="list-style-type: none"> • Generating aerosols during administration of HDs by various routes (e.g. injection, irrigation, oral, inhalation, or topical application) • Performing certain specialized procedures (e.g., intraoperative intraperitoneal injection or bladder instillation) • Priming an IV administration set
Patient-care activities	<ul style="list-style-type: none"> • Handling body fluids (e.g., urine, feces, sweat, or vomit) or body-fluid-contaminated clothing, dressings, linens, and other materials
Spills	<ul style="list-style-type: none"> • Spill generation, management, and disposal
Receipt	<ul style="list-style-type: none"> • Contacting with HD residues present on drug container, individual dosage units, outer containers, work surfaces, or floors
Transport	<ul style="list-style-type: none"> • Moving HDs within a healthcare setting

4. RESPONSIBILITIES OF PERSONNEL HANDLING HAZARDOUS DRUGS

Each entity must have a designated person who is qualified and trained to be responsible for developing and implementing appropriate procedures; overseeing entity compliance with this chapter and other applicable laws, regulations, and standards; ensuring competency of personnel; and ensuring environmental control of the storage and compounding areas. The designated individual must thoroughly understand the rationale for risk-prevention policies, risks to themselves and others, risks of non-compliance that may compromise safety, and the responsibility to report potentially hazardous situations to the management team. The designated individual must also be responsible for the continuous monitoring of the facility and maintaining reports of testing/sampling performed in facilities.

All personnel who handle HDs are responsible for understanding the fundamental practices and precautions and for continually evaluating these procedures and the quality of final HDs to prevent harm to patients, minimize exposure to personnel, and minimize contamination of the work and care environment.

5. FACILITIES

HDs must be handled under conditions that promote patient safety, worker safety, environmental protection, and infection prevention. Access to areas where HDs are handled must be restricted to authorized personnel to protect persons not involved in HD handling. HD handling areas must be located away from break rooms and refreshment areas for personnel, patients, or visitors to reduce risk of exposure. Signs designating the hazard must be prominently displayed before the entrance to the HD handling areas.

Designated areas must be available for:

- Receipt and unpacking of antineoplastic HDs or API
- Storage of HDs
- Nonsterile HD compounding (if performed by the entity)
- Sterile HD compounding (if performed by the entity)

5.1 Receipt

Antineoplastic HDs and APIs must be unpacked (i.e., removal from external shipping containers) in an area that is neutral/normal or negative pressure relative to the surrounding areas. HDs must not be unpacked from their shipping containers in sterile compounding areas or in positive pressure areas.

5.2 Storage

HDs must be stored in a manner that prevents spillage or breakage if the container falls. Do not store HDs on the floor. In areas prone to specific types of natural disasters (e.g., earthquakes) the manner of storage must meet applicable safety precautions, such as secure shelves with raised front lips.

Non-antineoplastic, reproductive risk only, and final dosage forms of antineoplastic HDs may be stored with other inventory. Antineoplastic HDs requiring manipulation other than counting final dosage forms and any HD API must be stored separately from non-HDs in a manner that prevents contamination and personnel exposure. These HDs must be stored in a negative-pressure room with at least 12 air changes per hour (ACPH).

Sterile and nonsterile HDs may be stored together. Depending upon facility design, HDs may be stored within a negative pressure buffer room with at least 12 ACPH. However, only HDs used for sterile compounding may be stored in the negative pressure buffer room.

Refrigerated antineoplastic HDs must be stored in a dedicated refrigerator in a negative pressure area with at least 12 ACPH [e.g., storage room, buffer room, or containment segregated compounding area (C-SCA)]. If a refrigerator is placed in a negative pressure buffer room, an exhaust located adjacent to the refrigerator's compressor and behind the refrigerator should be considered.

5.3 Compounding

Engineering controls are required to protect the preparation from cross-contamination and microbial contamination (if preparation is intended to be sterile) during all phases of the compounding process. Engineering controls for containment are divided into three categories representing primary, secondary, and supplementary levels of control. A containment primary engineering control (C-PEC) is a ventilated device designed to minimize worker and environmental HD exposure while directly handling HDs. Containment secondary engineering controls (C-SEC) is the room in which the C-PEC is placed. Supplemental engineering controls [e.g., closed-system drug-transfer device (CSTD)] are adjunct controls to offer additional levels of protection. *Appendix B* provides examples for designs of HD compounding areas. Sterile and nonsterile HDs must be compounded within a C-PEC located in a C-SEC. The C-SEC used for sterile and nonsterile compounding must:

- Be externally vented through high-efficiency particulate air (HEPA) filtration
- Be physically separated (i.e., a different room from other preparation areas)
- Have a negative pressure between 0.01 and 0.03 inches of water column

The C-PEC must operate continuously if used for sterile compounding or if the C-PEC supplies the negative pressure. If there is any loss of power to the unit, or if repair or moving occurs, all activities occurring in the C-PEC must be suspended immediately. If necessary, protect the unit by covering it appropriately per the manufacturer's recommendations. Once the C-PEC can be powered on, decontaminate, clean, and disinfect (if used for sterile compounding) all interior surfaces and wait the manufacturer-specified recovery time before resuming compounding. A sink must be available for hand washing as well as emergency access to water for removal of hazardous substances from eyes and skin. An eyewash station and/or other emergency or safety precautions that meet applicable laws and regulations must be readily available. However, care must be taken to locate them in areas where their presence will not interfere with required ISO classifications.

For entities that compound both nonsterile and sterile HDs, the respective C-PECs must be placed in segregated rooms separate from each other, unless those C-PECs used for nonsterile compounding are sufficiently effective that the room can continuously maintain ISO 7 classification throughout the nonsterile compounding activity. If the C-PECs used for sterile and nonsterile compounding are placed in the same room, they must be placed at least 1 meter apart and particle-generating activity must not be performed when sterile compounding is in process.

5.3.1 NONSTERILE COMPOUNDING

In addition to this chapter, nonsterile compounding must follow standards in *Pharmaceutical*

Compounding—Nonsterile Preparations 〈 795 〉. A C-PEC is not required if manipulations are limited to handling of final dosage forms (e.g., tablets and capsules) that do not produce particles, aerosols, or gasses.

The C-PECs used for manipulation of nonsterile HDs must be either externally vented (preferred) or redundant-HEPA filtered in series. Nonsterile HD compounding must be performed in a C-PEC that provides personnel and environmental protection, such as a Class I Biological Safety Cabinet (BSC) or Containment Ventilated Enclosure (CVE). A Class II BSC or a compounding aseptic containment isolator (CACI) may be also be used. For occasional nonsterile HD compounding, a C-PEC used for sterile compounding (e.g., Class II BSC or CACI) may be used but must be decontaminated, cleaned, and disinfected before resuming sterile compounding in that C-PEC. The C-PEC used for nonsterile compounding does not need to have unidirectional airflow because the critical environment does not need to be ISO classified.

The C-PEC must be placed in a C-SEC that has at least 12 ACPH. *Table 2* summarizes the engineering controls required for nonsterile HD compounding.

Due to the difficulty of cleaning HD contamination from surfaces, the architectural finish requirements (e.g., smooth, seamless, or impervious surfaces) described in *Pharmaceutical Compounding—Sterile Preparations* 〈 797 〉 also apply to nonsterile compounding areas.

Table 2. Engineering Controls for Nonsterile HD Compounding

C-PEC	C-SEC Requirements
<ul style="list-style-type: none"> • Externally vented (preferred) or redundant-HEPA filtered in series • Examples: CVE, Class I or II BSC, CACI 	<ul style="list-style-type: none"> • 12 ACPH • Externally vented • Negative pressure between 0.01 and 0.03 inches of water column

5.3.2 STERILE COMPOUNDING

In addition to this chapter, applicable sterile compounding standards in 〈 797 〉 must be followed.

All C-PECs used for manipulation of sterile HDs must be externally vented. Sterile HD compounding must be performed in a C-PEC that provides a Class 5 or better air quality, such as a Class II or III BSC or CACI. Class II BSC types A2, B1, or B2 are all acceptable. For most known HDs, type A2 cabinets offer a simple and reliable integration with the ventilation and pressurization requirements of the secondary engineering control. Class II type B2 BSCs are typically reserved for use with volatile components. *Appendix C* describes the different types of BSCs.

A laminar airflow workbench (LAFW) or compounding aseptic isolator (CAI) must not be used for the compounding of an antineoplastic HD. A BSC or CACI used for the preparation of HDs must not be used for the preparation of a non-HD unless the non-HD preparation is placed into a protective outer wrapper during removal from the C-PEC and is labeled to require PPE handling precautions.

The C-PEC must be located in a C-SEC, which may either be an ISO Class 7 buffer room (preferred) or an unclassified containment segregated compounding area (C-SCA). If the C-PEC is placed in a C-SCA, the beyond-use date (BUD) of all compounded sterile preparation (CSP) prepared must be limited as defined in 〈 797 〉 for CSPs prepared in a segregated compounding area. *Table 3* summarizes the engineering controls required for sterile HD compounding.

Table 3. Engineering Controls for Sterile HD Compounding

Configuration	C-PEC	C-SEC	Maximum BUD
ISO Class 7 Buffer Room	<ul style="list-style-type: none"> Externally Vented Examples: Class II BSC or CACI 	<ul style="list-style-type: none"> 30 ACPH Externally vented Negative pressure between 0.01 and 0.03 inches of water column 	As described in { 797 }
C-SCA	<ul style="list-style-type: none"> Externally Vented Examples: Class II BSC or CACI 	<ul style="list-style-type: none"> 12 ACPH Externally vented Negative pressure between 0.01 and 0.03 inches of water column 	As described in { 797 } for segregated compounding area

ISO class 7 buffer room: The C-PEC may be placed in an ISO Class 7 buffer room that has a negative pressure between 0.01 and 0.03 inches of water column and has a minimum of 30 ACPH of HEPA-filtered supply air.

Because the room through which entry into the HD buffer room (e.g., ante-area or non-HD buffer room) plays an important role in terms of total contamination control, the following is required:

- Minimum of 30 ACPH of HEPA-filtered supply air
- Maintain a positive pressure of 0.02 inches of water column relative to all adjacent unclassified spaces
- Maintain an air quality of ISO Class 7 or better

This provides for inward air migration of equal cleanliness classified air into the negative pressure buffer room to contain any airborne HD. A hand-washing sink must be placed at least 1 meter from the entrance of the buffer room to avoid contamination migration into the negative pressure HD buffer room.

Although not a recommended facility design, if the negative-pressure HD buffer room is entered through the positive-pressure non-HD buffer room, the following is required:

- A line of demarcation must be defined within the negative-pressure buffer area for garbing and degarbing
- A method to transport HDs, CSPs, and waste into and out of the negative pressure buffer room to minimize the spread of HD contamination. This may be accomplished by use of a pass-through between the negative-pressure buffer area and adjacent space. The pass-through must be included in the facility's certification to ensure that particles are not compromising the air quality of the negative-pressure buffer room. Do not use a refrigerator pass-through. Other methods of containment (such as sealed containers) may be used if the entity can demonstrate HD containment and appropriate environmental control.

HD CSPs prepared in an ISO Class 7 buffer room may use the BUDs described in { 797 }, based on the categories of CSP, sterility testing, and storage temperature.

Containment segregated compounding area (C-SCA): The C-PEC may be placed in an unclassified C-SCA that has a negative pressure between 0.01 and 0.03 inches of water column

relative to all adjacent spaces and has a minimum of 12 ACPH of HEPA-filtered supply air. A hand-washing sink must be placed at least 1 meter from C-PEC.

Only low- and medium-risk HD CSPs may be prepared in a C-SCA. HD CSPs prepared in the C-SCA must not exceed the BUDs described in § 797 for CSPs prepared in a segregated compounding area.

5.4 Containment Supplemental Engineering Controls

Containment supplemental engineering controls, such as CSTDs, provide adjunct controls to offer additional levels of protection during compounding or administration. Some CSTDs have been shown to limit the potential of generating aerosols during compounding. However, there is no certainty that all CSTDs will perform adequately. Since there is no published universal performance standard for evaluation of CSTD containment, users should carefully evaluate the performance claims associated with available CSTDs based on independent studies and demonstrated containment reduction.

A CSTD must not be used as a substitute for a C-PEC when compounding. CSTDs should be used when compounding HDs when the dosage form allows. CSTDs must be used when administering HDs when the dosage form allows.

6. ENVIRONMENTAL QUALITY AND CONTROL

Environmental wipe sampling should be performed routinely (e.g., initially as a benchmark and at least every 6 months, or more often as needed, to verify containment). Surface wipe sampling should include:

- Interior of the C-PEC and equipment contained in it
- Staging or work areas near the C-PEC
- Areas adjacent to C-PECs (e.g., floors directly under staging and dispensing area)
- Patient administration areas

There are currently no studies demonstrating the effectiveness of a specific number or size of wipe samples in determining levels of HD contamination. Wipe sampling kits should be verified before use to ensure the method and reagent used have been tested to recover a specific percentage of known marker drugs from various surface types found in the sampled area. There are currently no certifying agencies for vendors of wipe sample kits.

There is currently no standard for acceptable limits for HD surface contamination. Common marker HDs that can be assayed include cyclophosphamide, ifosfamide, methotrexate, fluorouracil, and platinum-containing drugs. An example of contamination would be cyclophosphamide levels $>1.00 \text{ ng/cm}^2$, which were shown in some studies to result in uptake of the drug in exposed workers. If any measurable contamination is found, the compounding supervisor must identify, document, and contain the cause of contamination. Such action may include reevaluating work practices, re-training personnel, performing thorough deactivation/decontamination and cleaning, and improving engineering controls. Repeat the wipe sampling to validate that the deactivation/decontamination and cleaning steps have been effective.

7. PERSONAL PROTECTIVE EQUIPMENT

Personal Protective Equipment (PPE) provides worker protection to reduce exposure to HD aerosols and residues. When performing a task in situations where C-PECs are not generally available, such as treating a patient or cleaning a spill, additional PPE may be required. The NIOSH list of antineoplastic and other HDs provides some general guidance on PPE for possible scenarios that may be encountered in healthcare settings.

Gloves, gowns, head, hair, and shoe covers are required for compounding sterile and nonsterile HDs. Gloves are required for administering antineoplastic HDs. Gowns are required when administering injectable antineoplastic HDs. For all other activities, the entity's SOP must describe the appropriate PPE to be worn based on its occupational safety plan and assessment of risk (if used). The entity must develop SOPs for PPE based on the risk of exposure (see *Types of Exposure*) and activities performed.

Appropriate PPE must be worn when handling HDs including during:

- Receipt
- Storage
- Transport
- Compounding (sterile and nonsterile)
- Administration
- Deactivation/Decontamination, Cleaning, and Disinfecting
- Spill Control

7.1 Gloves

When required, chemotherapy gloves must be tested to American Society for Testing and Materials (ASTM) standard D6978 (or its successor). Chemotherapy gloves must be powder-free because powder can contaminate the work area and can adsorb and retain HDs. Gloves must be inspected for physical defects before use. Do not use gloves with pin holes or weak spots.

Chemotherapy gloves must be changed every 30 min or when torn, punctured, or contaminated.

7.2 Gowns

When required, disposable gowns must be tested and shown to resist permeability by HDs. Gowns must be selected based on the HDs handled. Disposable gowns made of polyethylene-coated polypropylene or other laminate materials offer better protection than those made of uncoated materials. Gowns must close in the back (i.e., no open front), be long sleeved, and have closed cuffs that are elastic or knit. Gowns must not have seams or closures that could allow drugs to pass through.

Cloth laboratory coats, surgical scrubs, isolation gowns, or other absorbent materials are not appropriate outerwear when handling HDs because they permit the permeation of HDs and can hold spilled drugs against the skin, thereby increasing exposure. Clothing may also retain HD residue from contact, and may transfer to other healthcare workers or various surfaces.

Washing of non-disposable clothing contaminated with HD residue may transfer drug residue to other clothing.

Gowns must be changed per the manufacturer's information for permeation of the gown. If no permeation information is available for the gowns used, change them every 2–3 h or immediately after a spill or splash. Gowns worn in HD handling areas must not be worn to other

areas in order avoid spreading HD contamination and exposing other healthcare workers.

7.3 Head, Hair, Shoe, and Sleeve Covers

Head and hair covers (including beard and moustache, if applicable) and shoe covers provide protection from contact with HD residue on surfaces and floors. When compounding sterile HDs, a second pair of shoe covers must be donned before entering the buffer room and removed when exiting the buffer room. Shoe covers worn in HD handling areas must not be worn to other areas to avoid spreading HD contamination and exposing other healthcare workers. Disposable sleeve covers constructed of coated materials may be used to protect areas of the arm that may come in contact with HDs. If used, sleeve covers must be carefully removed and properly disposed of after the task is completed.

7.4 Eye and Face Protection

Many HDs are irritating to the eyes and mucous membranes. Appropriate eye and face protection must be worn when there is a risk for spills or splashes of HDs or HD waste materials when working outside of a C-PEC (e.g., administration in the surgical suite, working at or above eye level, or cleaning a spill). A full-facepiece respirator provides eye and face protection. Goggles must be used when eye protection is needed. Eye glasses alone or safety glasses with side shields do not protect the eyes adequately from splashes. Face shields in combination with goggles provide a full range of protection against splashes to the face and eyes. Face shields alone do not provide full eye and face protection.

7.5 Respiratory Protection

For most activities requiring respiratory protection, a fit-tested NIOSH-certified N95 or more protective respirator is sufficient to protect against airborne particles. However, N95 respirators offer no protection against gases and vapors and little protection against direct liquid splashes (see the Centers for Disease Control and Prevention's (CDC's) Respirator Trusted-Source Information).

Surgical masks do not provide respiratory protection from drug exposure and must not be used when respiratory protection is required. A surgical N95 respirator provides the respiratory protection of an N95 respirator, and like a surgical mask, provides a barrier to splashes, droplets, and sprays around the nose and mouth.

Personnel who are unpacking HDs that are not contained in plastic should wear an elastomeric half-mask with a multi-gas cartridge and P100-filter. If the type of drug can be better defined, then a more targeted cartridge should be used.

Fit test the respirator and train workers to use respiratory protection. Follow all requirements in the Occupational Safety and Health Administration (OSHA) respiratory protection standard (29 CFR 1910.134). An appropriate full-facepiece, chemical cartridge-type respirator must be worn when attending to HD spills larger than what can be contained with a spill kit, or when there is a known or suspected airborne exposure to powders or vapors.

7.6 Disposal of Used Personal Protective Equipment

Consider all PPE worn when handling HDs to be contaminated with, at minimum, trace quantities of HDs. PPE must be placed in an appropriate waste container and further disposed of per local,

state, and federal regulations. PPE used during compounding should be disposed of in the proper waste container before leaving the C-SEC. Chemotherapy gloves worn during compounding must be carefully removed and discarded immediately in an approved HD waste container inside the C-PEC or contained in a sealable bag for discarding outside the C-PEC. Potentially contaminated clothing must not be taken home under any circumstances.

8. HAZARD COMMUNICATION PROGRAM

Entities are required to establish policies and procedures that ensure worker safety during all aspects of HD handling. The entity must develop SOPs to ensure effective training regarding proper labeling, transport, and storage of the HDs and use of Safety Data Sheets (SDS), based on the Globally Harmonized System of Classification and Labeling of Chemicals (GHS).

Elements of the plan must include:

- A written plan that describes how the standard will be implemented.
- All containers of hazardous chemicals must be labeled, tagged, or marked with the identity of the material and appropriate hazard warnings.
- Entities must have an SDS for each hazardous chemical they use.
- Entities must ensure that the SDSs for each hazardous chemical used are readily accessible to personnel during each work shift and when they are in their work areas.
- Personnel who may be exposed to hazardous chemicals when working must be provided information and training before the initial assignment to work with a hazardous chemical, and also whenever the hazard changes.

9. PERSONNEL TRAINING

All personnel who handle HDs must be fully trained based on their job functions (e.g., in the receipt, storage, handling, compounding, dispensing, and disposal of HDs). Training must occur before the employee independently handles HDs. The effectiveness of training for HD handling competencies must be demonstrated by each employee. Personnel competency must be reassessed at least every 12 months and when a new HD or new equipment is used or a new or significant change in process or SOP occurs. All training and competency assessment must be documented.

The training must include at least the following:

- Overview of entity's list of HDs and their risks
- Review of the entity's SOPs related to handling of HDs
- Proper use of PPE
- Proper use of equipment and devices (e.g., engineering controls)
- Spill management
- Response to known or suspected HD exposure

10. RECEIVING

The entity must establish SOPs for receiving HDs. HDs should be received from the supplier sealed in impervious plastic to segregate them from other drugs and to improve safety in the receiving and internal transfer process. HDs must be delivered to the HD storage area

immediately upon arrival.

PPE, including ASTM-tested, powder-free chemotherapy gloves, must be worn when unpacking HDs (see *Personnel Protective Equipment*). A spill kit must be accessible in the receiving area. The entity must enforce policies that include a tiered approach, starting with visual examination of the shipping container for signs of damage or breakage (e.g., visible stains from leakage, sounds of broken glass containers, and others). *Table 4* summarizes the steps for receiving and handling of damaged shipping containers.

Table 4. Summary of Requirements for Receiving and Handling Damaged HD Shipping Containers

<p>If the shipping container appear damaged</p>	<ul style="list-style-type: none"> • Seal container without opening and contact the supplier for instructions • If the unopened package is to be returned to the supplier, enclose the package in an impervious container and label the outer container "Hazardous" • If the supplier declines return, dispose of properly
<p>If a damaged shipping container must be opened</p>	<ul style="list-style-type: none"> • Seal the container in plastic or an impervious container • Transport it to a C-PEC and place on a plastic-backed preparation mat • Open the package and remove usable items. • Wipe the outside of the usable items with a disposable wipe. • Enclose the damaged item(s) in an impervious container and label the outer container "Hazardous" • If the supplier declines return, dispose of properly • Decontaminate/deactivate and clean the C-PEC (see <i>Deactivation/Decontamination, Cleaning, and Disinfection</i>) and discard the mat and cleaning disposables as hazardous waste

When opening damaged shipping containers, they should preferably be transported to a C-PEC designated for nonsterile compounding. If a C-PEC designated for sterile compounding is the only one available, it must be thoroughly disinfected after the decontamination/deactivation and cleaning step before returning to any sterile compounding activity.

Damaged packages or shipping cartons must be considered spills that must be reported to the designated person and managed according to the entity's SOPs. Clean up must comply with established SOPs.

11. LABELING, PACKAGING, AND TRANSPORT

The entity must establish SOPs for the labeling, handling, packaging, and transport of HDs. The SOPs must address prevention of accidental exposures or spills, personnel training on response to exposure, and use of a spill kit. Examples of special exposure-reducing strategies include small-bore connectors (such as Luer Lock) and syringes, syringe caps, CSTDs, the capping of container ports, sealed impervious plastic bags, impact-resistant and/or water-tight containers, and cautionary labeling.

11.1 Labeling

HDs identified by the entity as requiring special HD handling precautions must be clearly labeled

at all times during their transport.

11.2 Packaging

Compounding personnel must select and use packing containers and materials that will maintain physical integrity, stability, and sterility (if needed) of the HDs during transport. Packaging materials must protect the HD from damage, leakage, contamination, and degradation, while protecting healthcare workers who transport HDs. The entity must have written SOPs to describe appropriate shipping containers and insulating materials, based on information from product specifications, vendors, mode of transport, and experience of the compounding personnel.

11.3 Transport

HDs that need to be transported must be labeled, stored, and handled in accordance with applicable federal, state, and local regulations. HDs must be transported in containers that minimize the risk of breakage or leakage. Pneumatic tubes must not be used to transport any liquid or antineoplastic HDs because of the potential for breakage and contamination. When shipping HDs to locations outside the entity, the entity must consult the Transport Information on the SDS. The entity must ensure that labels and accessory labeling for the HDs include storage instructions, disposal instructions, and HD category information in a format that is consistent with the courier's policies.

12. DISPENSING FINAL DOSAGE FORMS

HDs that do not require any further manipulation other than counting final dosage forms may be dispensed without any further requirements for containment unless required by the manufacturer or if visual indicators of HD exposure hazards (e.g., HD dust or leakage) are present.

Counting of HDs should be done carefully. Clean equipment should be dedicated for use with these drugs. Tablet and capsule forms of HDs must not be placed in automated counting or packaging machines, which subject them to stress and may introduce powdered contaminants into the work area.

13. COMPOUNDING

Entities and personnel involved in compounding HDs must be compliant with the appropriate USP standards for compounding including $\langle 795 \rangle$ and $\langle 797 \rangle$. Compounding must be done in proper engineering controls as described in *Compounding*. When compounding nonsterile and sterile HD preparations in a C-PEC, a plastic-backed preparation mat must be placed on the work surface of the C-PEC. The mat should be changed immediately if a spill occurs and regularly during use, and should be discarded at the end of the daily compounding activity. Disposable or clean equipment for compounding (such as mortars and pestles, spatulas, and others) must be dedicated for use with HDs. Compounding personnel must ensure that the labeling processes for compounded preparations do not introduce contamination into non-HD handling areas.

When compounding nonsterile HD preparations, use commercially available products as starting

ingredients whenever possible. Liquid formulations are preferred over crushing tablets or opening capsules. APIs should only be used when there are no other options. When compounding sterile HD preparations, APIs should be avoided if a suitable manufactured product is available and appropriate for use (e.g., use an injectable product rather than API). Bulk containers of liquid and API HD must be handled carefully to avoid spills. If used, APIs should be handled in a C-PEC to protect against occupational exposure, especially during particle generating activities (such as crushing tablets, opening capsules, and weighing powder).

14. ADMINISTERING

HDs must be administered safely using protective medical devices and techniques. Examples of protective medical devices include needleless and closed systems. Examples of protective techniques include spiking or priming of IV tubing in a C-PEC and crushing tablets in plastic sleeves.

Appropriate PPE must be worn when administering HDs. After use, PPE must be removed and disposed of in an approved HD waste container at the site of drug administration. Equipment (such as tubing and needles) and packaging materials must be disposed of properly, such as in HD waste containers after administration.

CSTDs must be used for administration when the dosage form allows. Techniques and ancillary devices that minimize the risk posed by open systems must be used when administering HDs through certain routes. Administration into certain organs or body cavities (e.g., the bladder, eye, peritoneal cavity, or chest cavity) often requires equipment for which locking connections may not be readily available or possible.

Healthcare personnel should avoid manipulating HDs such as crushing tablets or opening capsules if possible. Liquid formulations are preferred if solid oral dosage forms are not appropriate for the patient. If HD dosage forms do require manipulation such as crushing tablet(s) or opening capsule(s) for a single dose, personnel must don appropriate PPE and use a plastic sleeve to contain any dust or particles generated.

The Oncology Nursing Society (ONS) Safe Handling of Hazardous Drugs publication contains additional information on handling HDs for administration.

15. DEACTIVATION/DECONTAMINATION, CLEANING, AND DISINFECTION

All areas where HDs are handled (e.g., such as during receiving, compounding, transport, administering, and disposal) and all reusable equipment and devices (e.g., C-PEC, carts, and trays) must be routinely deactivated/decontaminated and cleaned. Additionally, sterile compounding areas and devices must be subsequently disinfected.

All healthcare personnel who perform deactivation/decontamination, cleaning, and disinfection activities in HD handling areas must be trained in appropriate procedures to protect themselves and the environment from contamination. All personnel performing these activities must wear appropriate PPE resistant to the cleaning agents used, including two pairs of ASTM-tested chemotherapy gloves and impermeable disposable gowns. Consult manufacturer or supplier information for compatibility with cleaning agents used. Additionally, eye protection and face shields must be used if splashing is possible. Respiratory protection must be used if warranted by the activity.

The entity must establish written procedures for decontamination, deactivation, cleaning, and disinfection (for sterile compounding areas). Cleaning of nonsterile and sterile compounding areas must also comply with $\langle 795 \rangle$ and $\langle 797 \rangle$. Written procedures for cleaning must include procedures, agents used, dilutions used, frequency, and documentation requirements. *Table 5* summarizes the purpose and example agents for each step.

The deactivating, decontaminating, cleaning, and disinfecting agents selected must be appropriate for the type of HD contaminant(s), location, and surface materials. The products used must not contaminate the surfaces with substances that are toxic, volatile, corrosive, or otherwise harmful to the surface material. Perform cleaning in areas that are sufficiently ventilated to prevent accumulation of hazardous airborne drug concentrations and decontamination agents.

Table 5. Summary of Cleaning Steps

Cleaning Step	Purpose	Agents
Deactivation	Render compound inert or inactive	As listed in the HD labeling or if no specific information available, sodium hypochlorite or other Environmental Protection Agency (EPA)-registered oxidizer
Decontamination	Remove inactivated residue	Sterile alcohol, sterile water, peroxide, or sodium hypochlorite
Cleaning	Remove organic and inorganic material	Germicidal detergent and sterile water
Disinfection	Destroy microorganisms	Sterile alcohol or other EPA-registered disinfectant appropriate for use

15.1 Deactivation/Decontamination

Deactivation renders a compound inert or inactive. Decontamination occurs by physically removing HD residue from non-disposable surfaces and transferring it to absorbent, disposable materials (e.g., wipes, pads, or towels) appropriate to the area being cleaned. All disposable materials must be discarded as contaminated HD waste.

Chemical deactivation of HD residue is preferred, but no single process has been found to deactivate all currently available HDs. Studies have examined oxidizing agents such as potassium permanganate, hydrogen peroxide, and sodium hypochlorite; vaporized hydrogen peroxide and detergents; and high- and low-pH solutions, all with varying results. Some potential deactivators have produced byproducts that are as hazardous as the original drug. Other deactivators have respiratory effects or result in caustic damage to surfaces. Note that sodium hypochlorite is corrosive to stainless steel surfaces if left untreated; therefore, sodium hypochlorite must be neutralized with sodium thiosulfate or followed by use of a germicidal detergent.

A multi-component deactivation system is theoretically more efficient than a single-agent system because of the diverse nature of HDs. One commercially available product provides a system for decontamination and deactivation using sodium hypochlorite, surfactant, and thiosulfate neutralizer. This combination product, followed by rinsing, has been shown to be effective for cleaning HD-contaminated surfaces. Other products use combinations of

deactivating agents and/or cleaning agents, followed by rinsing and disinfecting. Because of the growing number of assays available for HDs, additional surface wipe sampling is now possible and should be done to document the effectiveness of any agent used for decontamination of HD residue from work surfaces (see *Environmental Quality and Control*).

15.2 Cleaning and Disinfection

Cleaning is a process that results in the removal of contaminants (e.g., soil, microbial contamination, HD residue) from objects and surfaces using water, detergents, surfactants, solvents, and/or other chemicals. Disinfection is a process of destroying microorganisms. Disinfection must be done for areas intended to be sterile including the sterile compounding areas.

15.3 Cleaning the Compounding Area

The *Cleaning and Disinfecting the Compounding Area* section in *797* applies to both sterile and nonsterile HD compounding areas. Cleaning agents used on compounding equipment should not introduce microbial contamination.

All C-PEC used for either nonsterile or sterile compounding must be decontaminated between compounding of different HDs, any time a spill occurs, before and after certification, any time voluntary interruption occurs, and if the ventilation tool is moved. No cleaning step may be performed when compounding activities are occurring.

The amount of HD contamination introduced into the C-PEC may be reduced by surface decontamination (i.e., wiping down) of HD containers. Although no wipe-down procedures have been studied, the use of disposable material moistened with alcohol, sterile water, peroxide, or sodium hypochlorite solutions may be effective. To avoid spreading HD residue, spray the wiper, not the HD container. The solution used for wiping HD packaging must not alter the product label.

C-PECs may have areas under the work tray where contamination can build up. These areas must be cleaned at least monthly to reduce the contamination level in the C-PEC. Accessing this area may be difficult. Clean as much as possible of the C-PEC surfaces before accessing the area under the work tray. When cleaning the area under the work tray of a C-PEC, the containment airflows are compromised by opening the cabinets. To provide protection to the worker performing this task, respiratory protection may be required. An NIOSH-approved respirator worn by a worker who has been fit tested and cleared to use a respirator would be appropriate.

16. SPILL CONTROL

All personnel who may be required to clean up a spill of HDs must receive proper training in spill management and the use of PPE and NIOSH-certified respirators (see *Personal Protective Equipment*). Spills must be contained and cleaned immediately only by qualified personnel with appropriate PPE. Qualified personnel must be available at all times in entities handling HDs. Signs must be available for restricting access to the spill area. Spill kits containing all of the materials needed to clean HD spills must be readily available in all areas where HDs are routinely handled. If HDs are being prepared or administered in a non-routine healthcare area, a spill kit and respirator must be available. All spill materials must be disposed of as hazardous waste.

The circumstances and management of spills must be documented. Personnel who are potentially exposed during the spill or spill clean up or who have direct skin or eye contact with HDs require immediate evaluation. Non-employees exposed to an HD spill should report to the designated emergency service for initial evaluation and also complete an incident report or exposure form.

SOPs must be developed to prevent spills and to direct the clean up of HD spills. SOPs must address the size and scope of the spill and specify who is responsible for spill management and the type of PPE required. The management of the spill (e.g., decontamination, deactivation, and cleaning) may be dependent on the size and type of spill. The SOP must address the location of spill kits and clean up materials as well as the capacity of the spill kit. Written procedures should address use of appropriate full-facepiece, chemical cartridge-type respirators if the capacity of the spill kit is exceeded or if there is known or suspected airborne exposure to vapors or gases.

17. DISPOSAL

Disposal of all HD waste (including unused and unusable HDs) must comply with all applicable federal, state, and local regulations. All personnel who perform routine custodial waste removal and cleaning activities in HD handling areas must be trained in appropriate procedures to protect themselves and the environment to prevent HD contamination.

18. DOCUMENTATION AND STANDARD OPERATING PROCEDURES

Activities that must be documented include, but are not limited to, the acquisition, preparation, and dispensing of an HD; personnel training; and the use and maintenance of equipment and supplies. These records must be available for review. Personnel who transport, compound, or administer HDs must document their training according to OSHA standards (see OSHA Standard 1910.120 Hazardous Waste Operations and Emergency Response) and other applicable laws and regulations.

The entity must maintain SOPs for the safe handling of HDs for all situations in which these HDs are used throughout a facility. The SOPs must be reviewed at least annually by the designated responsible individual, and the review must be documented. Revisions in forms or records must be made as needed and communicated to all personnel handling HDs.

The SOPs for handling of HDs should include:

- Hazard communication program
- Occupational safety program
- Labeling of HDs
- Procurement of HDs
- Use of proper engineering controls (e.g., C-PECs, C-SECs)
- Use of PPE based on activity (e.g., receipt, transport, compounding, administration, spill, and disposal)
- Decontamination/deactivation, cleaning, and disinfection
- Transport
- Environmental monitoring
- Spill control
- Medical surveillance

19. MEDICAL SURVEILLANCE

Medical surveillance is part of a comprehensive exposure control program complementing engineering controls, safe work processes, and use of PPE. Entities should ensure that healthcare workers who handle HDs as a regular part of their job assignment are enrolled in a medical surveillance program. The general purpose of surveillance is to minimize adverse health effects in personnel potentially exposed to HDs. Medical surveillance programs involve assessment and documentation of symptom complaints, physical findings, and laboratory values (such as a blood count) to determine whether there is a deviation from the expected norms. Medical surveillance can also be viewed as a secondary prevention tool that may provide a means of early detection if a health problem develops. Tracking personnel through medical surveillance allows the comparison of health variables over time in individual workers, which may facilitate early detection of a change in a laboratory value or health condition. Medical surveillance programs also look for trends in populations of workers. Examining grouped data compared with data from unexposed workers may reveal a small alteration or increase in the frequency of a health effect that would be obscured if individual workers' results alone were considered.

Medical surveillance evaluates the protection afforded by engineering controls, other administrative controls, safe work processes, PPE, and worker education about the hazards of the materials they work with in the course of their duties. The data-gathering elements of a medical surveillance program are used to establish a baseline of workers' health and then to monitor their future health for any changes that may result from exposure to HDs.

Elements of a medical surveillance program should be consistent with the entity's Human Resource policies and should include:

- Development of an organized approach to identify workers who are potentially exposed to HDs on the basis of their job duties
- Use of an 'entity-based' or contracted employee health service to perform the medical surveillance while protecting the confidentiality of the employees' personal medical information
- Initial baseline assessment (pre-placement) of a worker's health status and medical history. Data elements collected include a medical (including reproductive) history and work history to assess exposure to HDs, physical examination, and laboratory testing. Methods used to assess exposure history include a review of:
 - Records of HDs handled, with quantities and dosage forms
 - Number of HD preparations/administrations per week
 - Estimates of hours spent handling HDs per week and/or per month
 - Performance of a physical assessment and laboratory studies linked to target organs of commonly used HDs, such as a baseline complete blood count. Note that biological monitoring to determine blood or urine levels of specific HDs is not currently recommended in surveillance protocols, but may have a role in the follow-up of acute spills with a specific agent.
- Medical records of surveillance should be maintained according to OSHA regulation concerning access to employee exposure and medical records
- Monitoring workers' health prospectively through periodic surveillance using the elements of data gathering described above (updated health and exposure history, physical assessment, and laboratory measures, if appropriate)

- Monitoring of the data to identify prevention failure leading to health effects; this monitoring may occur in collaboration with the employee health service
- Development of a follow-up plan for workers who have shown health changes suggesting toxicity or who have experienced an acute exposure. This follow-up should include evaluation of current engineering and administrative controls and equipment to ensure that all systems are appropriately and accurately implemented (see *Follow-Up Plan* below).
- Completion of an exit examination when a worker's employment at the entity ends, to document the information on the employee's medical, reproductive, and exposure histories. Examination and laboratory evaluation should be guided by the individual's history of exposures and follow the outline of the periodic evaluation.

19.1 Follow-Up Plan

The occurrence of exposure-related health changes should prompt immediate re-evaluation of primary preventive measures (e.g., administrative and engineering controls, PPE, and others). In this manner, medical surveillance acts as a check on the effectiveness of controls already in use.

The entity should take the following actions:

- Perform a post-exposure examination tailored to the type of exposure (e.g., spills or needle sticks from syringes containing HDs). An assessment of the extent of exposure should be conducted and included in a confidential database and in an incident report. The physical examination should focus on the involved area as well as other organ systems commonly affected (i.e., the skin and mucous membranes for direct contact or inhalation; the pulmonary system for aerosolized HDs). Treatment and laboratory studies will follow as indicated and be guided by emergency protocols.
- Compare performance of controls with recommended standards; conduct environmental sampling when analytical methods are available.
- Verify and document that all controls are in proper operating condition.
- Verify and document that the worker complied with existing policies. Review policies for the use of PPE and employee compliance with PPE use and policies. Review availability of appropriate PPE (see *Personal Protective Equipment*).
- Develop and document a plan of action that will prevent additional exposure of workers.
- Ensure confidential, two-way communication between the worker and the employee health unit(s) regarding notification, discussions about a change in health condition, or detection of an adverse health effect.
- Provide and document a follow-up medical survey to demonstrate that the plan implemented is effective.
- Ensure that any exposed worker receives confidential notification of any adverse health effect. Offer alternative duty or temporary reassignment.
- Provide ongoing medical surveillance of all workers at risk for exposure to HDs to determine whether the plan implemented is effective.

APPENDIX A: ACRONYMS AND DEFINITIONS

Acronyms

ACPH	Air changes per hour
------	----------------------

API	Active pharmaceutical ingredient
ASTM	American Society for Testing and Materials
BSC	Biological safety cabinet
BUD	Beyond-use date
CACI	Compounding aseptic containment isolator
CAI	Compounding aseptic isolator
CDC	Centers for Disease Control and Prevention
C-PEC	Containment primary engineering control
C-SCA	Containment segregated compounding area
C-SEC	Containment secondary engineering control
CSP	Compounded sterile preparation
CSTD	Closed-system drug-transfer device
CVE	Containment ventilated enclosure
EPA	Environmental Protection Agency
GHS	Globally Harmonized System of Classification and Labeling of Chemicals
HD	Hazardous drug
HEPA	High-efficiency particulate air
IV	Intravenous
LAFW	Laminar airflow workbench
NIOSH	National Institute for Occupational Safety and Health
ONS	Oncology Nursing Society
OSHA	Occupational Safety and Health Administration
PPE	Personal protective equipment
SDS	Safety Data Sheet
SOP	Standard operating procedure
ULPA	Ultra-low particulate air

Definitions

Active pharmaceutical ingredient (API): Any substance or mixture of substances intended to be used in the compounding of a drug preparation, thereby becoming the active ingredient in that preparation and furnishing pharmacological activity or other direct effect in the diagnosis, cure, mitigation, treatment, or prevention of disease in humans and animals or affecting the structure and function of the body.

Alternative duty: Performance of other tasks that do not include the direct handling of HDs.

Assessment of risk: Evaluation of risk to determine alternative containment strategies and/or work practices.

Beyond-use date (BUD): The date or time after which a compounded preparation must not be used, stored, or transported (see $\langle 795 \rangle$ and $\langle 797 \rangle$).

Biological safety cabinet (BSC): A ventilated cabinet often used for preparation of hazardous drugs. These cabinets are divided into three general classes (Class I, Class II, and Class III). Class II BSCs are further divided into types (Type A1, Type A2, Type B1, and Type B2). See *Appendix C* for details.

Buffer room: Part of the HD compounding area under negative pressure where the C-PEC is physically located. Activities that occur in this area are limited to the preparation and staging

of components and supplies used when compounding HDs.

Chemotherapy glove: A medical glove that meets the ASTM Standard Practice for Assessment of Resistance of Medical Gloves to Permeation by Chemotherapy Drugs (D6978) or its successor.

Cleaning: The removal of soil (e.g., organic and inorganic material) from objects and surfaces, normally accomplished by manually or mechanically using water with detergents or enzymatic products.

Closed-system drug-transfer device (CSTD): A drug transfer device that mechanically prohibits the transfer of environmental contaminants into the system and the escape of HD or vapor concentrations outside the system.

Compounded preparation: A nonsterile or sterile drug or nutrient preparation that is compounded in a licensed pharmacy or other healthcare-related facility in response to or anticipation of a prescription or a medication order from a licensed prescriber.

Compounding aseptic containment isolator (CACI): A specific type of CAI that is designed for the compounding of sterile HDs. The CACI is designed to provide worker protection from exposure to undesirable levels of airborne drugs throughout the compounding and material transfer processes and to provide an aseptic environment with unidirectional airflow for compounding sterile preparations.

Compounding aseptic isolator (CAI): An isolator specifically designed for compounding sterile, non-hazardous pharmaceutical ingredients or preparations. The CAI is designed to maintain an aseptic compounding environment within the isolator throughout the compounding and material transfer processes.

Compounding personnel: Individuals who participate in the compounding process.

Compounding supervisor: Individual(s) responsible for developing and implementing appropriate procedures; overseeing facility compliance with this chapter and other applicable laws, regulations, and standards; ensuring the competency of personnel; and maintaining environmental control of the compounding areas.

Containment primary engineering control (C-PEC): A ventilated device designed and operated to minimize worker and environmental exposures to HDs by controlling emissions of airborne contaminants through the following:

- The full or partial enclosure of a potential contaminant source
- The use of airflow capture velocities to trap and remove airborne contaminants near their point of generation
- The use of air pressure relationships that define the direction of airflow into the cabinet
- The use of HEPA filtration on all potentially contaminated exhaust streams

Examples of C-PECs include Class I, II, or III BSCs, CACIs, and CVE (e.g., powder hood). C-PECs used for nonsterile compounding do not need to have ISO Class 5 air quality, whereas C-PECs used for sterile compounding must have ISO Class 5 air quality (see *Table 2* and *3*).

Containment secondary engineering control (C-SEC): The C-SEC is the room in which the C-PEC is placed. It incorporates specific design and operational parameters required to contain the potential hazard within the compounding room.

Containment segregated compounding area (C-SCA): A type of C-SEC with nominal requirements for airflow and room pressurization as they pertain to HD compounding.

Containment ventilated enclosure (CVE): A full or partial enclosure that uses ventilation principles to capture, contain, and remove airborne contaminants through HEPA filtration and prevent their release into the work environment.

Deactivation: Treatment of an HD contaminant on surfaces with a chemical, heat, ultraviolet

light, or another agent to transform the HD into a less hazardous agent.

Decontamination: Inactivation, neutralization, or removal of HD contaminants on surfaces, usually by chemical means.

Disinfectant: A chemical agent that destroys or inhibits the growth of microorganisms.

Engineering control: Primary, secondary, and supplemental devices designed to eliminate or reduce worker exposure to a chemical, biological, radiological, ergonomic, or physical hazard, and in the case of CSPs, to protect the compounded preparation from environmental contamination.

Entity: Pharmacy, hospital, physician's office, clinic, veterinary office, or other location where HDs are received, stored, prepared, dispensed, administered, and distributed.

EPA-registered disinfectant: Antimicrobial products registered with the Environmental Protection Agency (EPA) for healthcare use against pathogens specified in the product labeling.

Externally vented: Exhausted to the outside

Globally Harmonized System of Classification and Labeling of Chemicals (GHS): A system for standardizing and harmonizing the classification and labeling of chemicals.

Goggles: Tight-fitting eye protection that completely covers the eyes, eye sockets, and facial area that immediately surrounds the eyes. Goggles provide protection from impact, dust, and splashes. Some goggles fit over corrective lenses.

Hazardous drug (HD): Any drug identified as hazardous or potentially hazardous on the basis of at least one of the following six criteria:

- Carcinogenicity
- Teratogenicity or developmental toxicity
- Reproductive toxicity in humans
- Organ toxicity at low doses in humans or animals
- Genotoxicity
- New drugs that mimic existing HDs in structure or toxicity

High-efficiency particulate air (HEPA) filtration: An extended-medium, dry-type filter in a rigid frame, having a minimum particle collection efficiency of 99.97% for particles with a mass median diameter of 0.3 μm when tested at a rated airflow in accordance with MIL STD 282 using IEST Recommended Standard RP-CC001.5.

Negative-pressure room: A room that is maintained at a lower pressure than the adjacent spaces; therefore the net flow of air is into the room.

Pass-through: An enclosure with interlocking doors that is positioned between two spaces for the purpose of reducing particulate transfer while moving materials from one space to another. A pass-through serving negative-pressure rooms needs to be equipped with sealed doors.

Personal protective equipment (PPE): Items such as gloves, gowns, respirators, goggles, faceshields, and others that protect individual workers from hazardous physical or chemical exposures.

Positive-pressure room: A room that is maintained at a higher pressure than the adjacent spaces; therefore, the net flow of air is out of the room.

Safety data sheet (SDS): An informational document that provides written or printed material concerning a hazardous chemical. The SDS is prepared in accordance with the HCS [previously known as a Material Safety Data Sheet (MSDS)].

Spill kit: A container of supplies, warning signage, and related materials used to contain the spill of an HD.

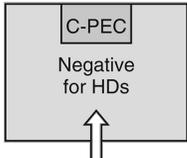

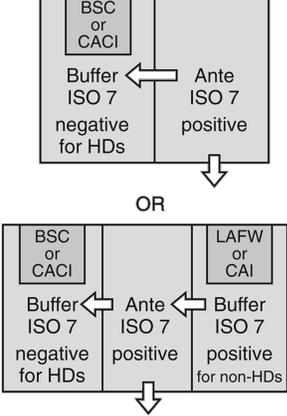

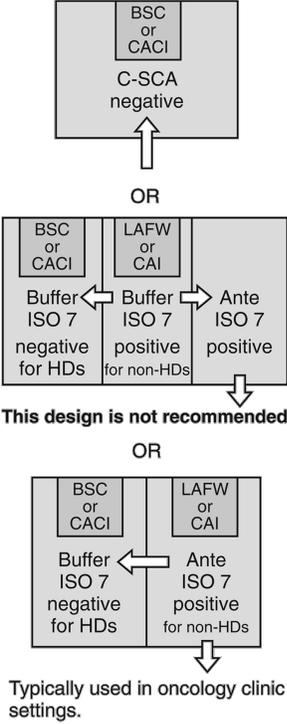

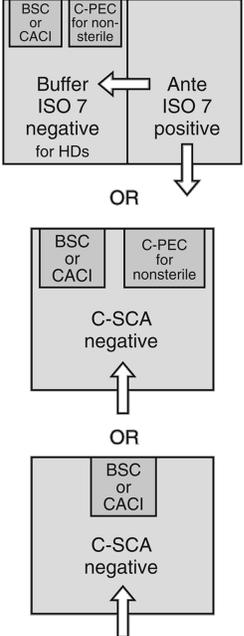

Standard operating procedure (SOP): Written procedures describing operations, testing, sampling, interpretation of results, and corrective actions that relate to the operations that are taking place.

Supplemental engineering control: An adjunct control (e.g., CSTD) used concurrently with primary and secondary engineering controls. Supplemental engineering controls offer additional levels of protection and may facilitate enhanced occupational protection, especially when handling HDs outside of primary and secondary engineering controls (e.g., during administering).

Trace chemotherapy waste: Components such as vials, ampules, IV bags, and others that once held antineoplastic agents.

Trace contaminated waste: Items used in the handling, compounding, dispensing, administration, or disposal of antineoplastic agents that are not overtly contaminated (e.g., gowns, gloves, goggles, wipes).

APPENDIX B: EXAMPLES OF DESIGNS FOR HAZARDOUS DRUGS COMPOUNDING AREAS^a

Use	Optimal Primary and Secondary Control	Minimum ACPH	Limitations Primary and Secondary Control	Minimum ACPH	Notes for limitations
Nonsterile HD compounding		12			
Sterile HD compounding		30		12 30 30	<p>Maximum BUD as described in <797> for segregated compounding area.</p> <p>If this design is in place, measures must be taken to avoid contamination of the positive-pressure buffer room.</p> <p>Maximum BUD as described in <797>.</p>
Both sterile HD and nonsterile HD compounding	A separate room for sterile and nonsterile compounding is recommended			30 12 12	<p>For rooms used for both sterile and nonsterile compounding, particle-generating activity must not be performed when sterile compounding is in process. C-PECs must be at least 1 meter apart.</p> <p>Maximum BUD as described in <797> for segregated compounding area.</p> <p>Maximum BUD as described in <797> for segregated compounding area.</p>

^a The arrows indicate direction of airflow.

APPENDIX C: TYPES OF BIOLOGICAL SAFETY CABINETS

Class I: A BSC that protects personnel and the environment but does not protect the product/preparation. A minimum velocity of 75 linear feet/min of unfiltered room air is drawn through the front opening and across the work surface, providing personnel protection. The air is then passed through a HEPA/ULPA (ultra-low particulate air) filter, either into the room or to the outside in the exhaust plenum, providing environmental protection.

Class II: Class II (Types A1, A2, B1, and B2) BSCs are partial barrier systems that rely on the movement of air to provide personnel, environmental, and product/preparation protection. Personnel and product/preparation protection are provided by the combination of inward and downward airflow captured by the front grille of the cabinet. Side-to-side cross-contamination of products/preparations is minimized by the internal downward flow of HEPA/ULPA filtered air moving toward the work surface and then drawn into the front and rear intake grilles. Environmental protection is provided when the cabinet exhaust air is passed through a HEPA/ULPA filter.

Type A1 (formerly, Type A): These Class II BSCs maintain a minimum inflow velocity of 75 feet/min; have HEPA-filtered, down-flow air that is a portion of the mixed down-flow and inflow air from a common plenum; may exhaust HEPA-filtered air back into the laboratory or to the environment through an exhaust canopy; and may have positive-pressure contaminated ducts and plenums that are not surrounded by negative-pressure plenums. Type A1 BSCs are not suitable for use with volatile toxic chemicals and volatile radionucleotides.

Type A2 (formerly, Type B3): These Class II BSCs maintain a minimum inflow velocity of 100 feet/min; have HEPA-filtered, down-flow air that is a portion of the mixed down-flow and inflow air from a common exhaust plenum; may exhaust HEPA-filtered air back into the laboratory or to the environment through an exhaust canopy; and have all contaminated ducts and plenums under negative pressure or surrounded by negative-pressure ducts and plenums. If these cabinets are used for minute quantities of volatile toxic chemicals and trace amounts of radionucleotides, they must be exhausted through properly functioning exhaust canopies.

Type B1: These Class II BSCs maintain a minimum inflow velocity of 100 feet/min; have HEPA-filtered, down-flow air composed largely of uncontaminated, recirculated inflow air; exhaust most of the contaminated down-flow air through a dedicated duct exhausted to the atmosphere after passing it through a HEPA filter; and have all contaminated ducts and plenums under negative pressure or surrounded by negative-pressure ducts and plenums. If these cabinets are used for work involving minute quantities of volatile toxic chemicals and trace amounts of radionucleotides, the work must be done in the directly exhausted portion of the cabinet.

Type B2 (total exhaust): These Class II BSCs maintain a minimum inflow velocity of 100 feet/min; have HEPA-filtered, down-flow air drawn from the laboratory or the outside; exhaust all inflow and down-flow air to the atmosphere after filtration through a HEPA filter without recirculation inside the cabinet or return to the laboratory; and have all contaminated ducts and plenums under negative pressure or surrounded by directly exhausted negative-pressure ducts and plenums. These cabinets may be used with volatile toxic chemicals and radionucleotides.

Class III: The Class III BSC is designed for work with highly infectious microbiological agents and other hazardous operations. It provides maximum protection for the environment and the

worker. It is a gas-tight enclosure with a viewing window that is secured with locks and/or requires the use of tools to open. Both supply and exhaust air are HEPA/ULPA filtered. Exhaust air must pass through two HEPA/ULPA filters in series before discharge to the outdoors.

BRIEFING

〈 1050.1 〉 **Design, Evaluation, and Characterization of Viral Clearance Procedures.**

This proposed new general information chapter expands upon general information chapter *Viral Safety Evaluation of Biotechnology Products Derived from Cell Lines of Human or Animal Origin*

〈 1050 〉. In 1999, 〈 1050 〉 was adopted, essentially unchanged, from the International Conference on Harmonization Q5A *Viral Safety Evaluation of Biotechnology Products Derived from Cell Lines of Human or Animal Origin* (ICH Q5A). Since then, knowledge and technologies regarding viral clearance have improved. A revision of 〈 1050 〉 was therefore proposed in PF 36(3) [May-June 2010], but comments on the proposed revision, especially with regard to deviations from and additions to the original ICH language, prompted the USP General Chapters—Biological Analysis Expert Committee to decide that chapter 〈 1050 〉 should be left intact and the core content of the potential revision should be proposed as a separate companion chapter. This new chapter, *Design, Evaluation, and Characterization of Viral Clearance Procedures* 〈 1050.1 〉 provides current best practices for, and examples of, virus selection, critical process challenges, sampling, assay qualification, and additional aspects of viral clearance studies. Viral clearance studies are necessary for demonstrating product safety before human exposure, and thus should follow the principles of ICH Q5A. Although ICH Q5A suggests general approaches for evaluation of viral clearance in manufacturing processes, it lacks sufficient content on experimental methodology, and therefore this new chapter is

proposed to address this need. In addition, although the scope of this new chapter differs somewhat from that proposed in *PF 36(3)*, where possible this new chapter also addresses the public comments received for that revision proposal.

Add the following:

■ 〈 1050.1 〉 DESIGN, EVALUATION, AND CHARACTERIZATION OF VIRAL CLEARANCE PROCEDURES

INTRODUCTION

Chapter 〈 1050.1 〉 is a companion document to general information chapter *Viral Safety Evaluation of Biotechnology Products Derived from Cell Lines of Human or Animal Origin* 〈 1050 〉, which was adapted, essentially unchanged, from the International Conference on Harmonization Q5A. Chapter 〈 1050.1 〉 provides users with practical guidance regarding the design, evaluation, and characterization of viral clearance procedures. The chapter scope is the same as that described in chapter 〈 1050 〉 and covers biotechnology products for human use that are derived from cell lines of human or animal origin. Viral clearance studies performed according to the principles outlined in this chapter will provide meaningful data about the ability of the overall production and purification processes to remove or inactivate a broad spectrum of viral types that may affect the safety of biotechnology-derived products. [Note—The *Appendix* contains definitions of terms used in this chapter that are not already defined in chapter 〈 1050 〉.]

The regulations for licensing biotechnology products stipulate that cell banks, biologically derived raw materials, and bulk harvest must be controlled and tested for viral safety; however, many of the viral detection approaches that can be used have inherent limitations. In addition, certain detection methods may be so specific for a particular virus that they may fail to detect viral variants (e.g., noncytopathic strains, or non-laboratory-adapted wild-type strains, or mutated variants). Some newly emerging viruses may be missed. Finally, detection methods typically are limited by their sensitivities, and infectious viruses at a low titer may go undetected. Viral contamination of manufacturing processes can come from many sources, including cell substrates and raw materials of biological origin (such as cell culture supplements and other production raw materials), and contamination during production. In addition to the required viral safety testing of these materials, manufacturers must evaluate the effectiveness of downstream purification process steps, which together must remove or inactivate any viruses potentially present (see 〈 1050 〉).

As suggested in the U.S. Food and Drug Administration "Points to Consider" documents (*Points to Consider in the Manufacture and Testing of Monoclonal Antibody Products for Human Use* and *Draft Points to Consider in the Characterization of Cell Lines Used to Produce Biologicals*), as well as chapter 〈 1050 〉, a multi-step approach is typically used to ensure viral safety. Clearance studies can generally be considered generic or modular. As described in the FDA's

Points to Consider in the Manufacture and Testing of Monoclonal Antibody Products for Human Use, a generic clearance study is one in which virus removal and inactivation is demonstrated for several steps in the purification process of a model monoclonal antibody (mAb) in which the data may be extrapolated to other mAbs following the same purification and virus removal/inactivation scheme as the model mAb. A modular clearance study demonstrates virus removal or inactivation of individual steps during the purification process (column chromatography, filtration, pasteurization, solvent/detergent, low pH, and others) so that each module in the purification scheme may be studied independently of the other modules. If necessary, an alternative model mAb can be used to demonstrate viral clearance in different modules. Identical clearance modules can be extrapolated to the product mAb. This chapter complements these documents by providing users strategies to perform and assess viral clearance.

GOALS AND PRINCIPLES OF VIRAL CLEARANCE STUDIES

A viral clearance study should evaluate the ability of the overall purification process to remove or inactivate a broad spectrum of virus types, including viruses that are known to contaminate or have the potential to contaminate the raw materials, and those that can be introduced during manufacturing. Viral clearance studies typically involve substudies performed on specific and suitable individual steps of the manufacturing and purification process. The studies should be performed in a manner that generates quantitative data, allowing for identification of effective clearance steps and estimation of viral reduction factors (VRFs, also known as log reduction factors, LRF). The VRFs of an individual clearance step represent the ratio of the viral load in the pretreatment material (used to challenge the clearance step) to the viral load in the post-treatment material. The VRFs derived from specific process steps are used to evaluate the overall capacity of the entire production process to remove or inactivate process-specific or nonspecific viruses.

One of the key goals of a manufacturing purification process is to achieve maximal viral clearance without compromising product quality. Critical attributes of strategic viral clearance steps in the manufacturing process must be characterized and validated. In the context of viral clearance, robustness has two main components: 1) the ability of process steps to remove or inactivate viruses under worst-case conditions or over a wide operational range for parameters (e.g., temperature, protein concentration, pressure, flow rate, conductivity, and pH), and 2) the ability of process steps to consistently remove or inactivate nonspecific viruses that possess a broad spectrum of physical and chemical characteristics (e.g., pH, heat, solvent/detergent treatment, or filtration). A validated process that provides robust viral clearance should establish the VRF achievable for a panel of "relevant" or "model" viruses (see next section for definitions). The validated process also should demonstrate robustness of dedicated inactivation or removal steps for which critical operational parameters that could affect viral clearance are well established. Therefore, a demonstration of viral clearance robustness provides confidence that the manufacturing process can remove or inactivate potential viral contaminants.

Viral clearance study protocols begin with an overall action plan and design of experiments.

Chapter **1050** (see *Section V* and *Table 4*) describes five major action plans (*Cases A–E*) and can serve as a guide. Cell substrates categorized in *Cases C, D, and E* represent special cases, and manufacturers who use these substrates should discuss study design with the applicable regulatory authorities. Unique issues for each production process must be considered

on a case-by-case basis. These issues may relate to the starting materials, production process, product, and intended use of the product. The overall action plan dictates the choice of viruses used in the viral clearance study, i.e., the study must include relevant, specific, and nonspecific model viruses. Further, the viral clearance study protocol may include the following elements: descriptions of the study facility and staff responsible for executing the study, the scaled-down purification models, justification of the appropriateness of the scaled-down model, and the study design. The study report may include these elements, as well as a stepwise analysis of calculated VRFs and the overall viral clearance capacity of the purification process. Viral clearance studies should be conducted in a well-documented, controlled manner that complies with current regulatory requirements.

CONSIDERATIONS FOR PERFORMANCE OF VIRAL CLEARANCE STUDIES

Selection of Viruses

The choice and number of viruses that may be used in a viral clearance study are dictated by the nature and origin of the production cell line, as well as the nature and origin of the animal-derived materials used in production and purification. In general, at least two viruses, one enveloped and one nonenveloped (preferably a parvovirus), are used in the early clinical phases of product development, but three or more viruses may be used to generate data for registration-enabling studies. At least two orthogonal virus removal/inactivation steps (steps with different mechanisms of clearance) should be evaluated. The reproducibility of an effective step should be assessed by performing at least two independent experiments, or reproducibility should be supported by relevant in-house data. Model viruses for process evaluation and process characterization studies should be similar to the virus that may contaminate the product; however, other viruses with a wide range of physical and chemical characteristics should also be examined. The latter is important for showing that the purification process is capable of inactivating or removing a wide variety of viruses, including newly emerging viruses (e.g., vesivirus 2117, circoviruses, or newly discovered animal and human parvoviruses) or unexpected contaminants (e.g., BVDV, MVM, epizootic hemorrhagic disease virus, and Cache valley virus). The manufacturer should justify the choice of viruses in accordance with the aims of the process evaluation and process characterization studies and the guidance provided in this document, as well as relevant regulatory guidelines.

Viruses used in clearance studies fall into three categories: relevant viruses, specific model viruses, and nonspecific model viruses. "Relevant viruses" are viruses used in process evaluation studies which are either the identified virus, or of the same species as viruses of the virus that is known, or likely to contaminate the cell substrate or any other reagents or materials used in the production process. When a relevant virus is not available or when it is not well adapted for this purpose (e.g., it cannot be grown in vitro to a sufficiently high titer or cannot be detected using cell-based viral titration endpoints required for assessing inactivation), a "specific model virus" can be used as a substitute. An appropriate specific model virus may be a virus that is closely related to the known or suspected virus (same genus or family), having similar physical and chemical properties to those of the observed or suspected virus. For example, cell lines derived from rodents usually contain endogenous retroviral particles or retroviral-like particles that can be infectious or noninfectious. The capacity of the manufacturing process to remove and/or inactivate rodent retroviruses present in products obtained from such cells should be determined. In the case of rodent-derived cells,

one can use a murine leukemia virus as a model virus. Manufacturers using human-derived B-lymphocyte cells immortalized by infection with Epstein-Barr virus should demonstrate the ability of the manufacturing process to clear a herpesvirus. In this instance, pseudorabies virus or another herpesvirus can be used as a specific model virus.

Finally, when the goal is to characterize the capacity of the manufacturing process to remove and/or inactivate viruses in general (i.e., to characterize the robustness of the clearance process), viral clearance studies can be performed with a panel of “nonspecific model viruses” that have a wide range of physical and chemical characteristics. Data obtained from studies with relevant or specific model viruses also can contribute to this assessment. It is not necessary to test all types of viruses; preference should be given to viruses with diverse physical and chemical properties that would be representative of a wide range of viral families. The results obtained for such viruses provide useful information about the ability of the production process to remove or inactivate viruses in general. *Table 1* gives examples of model viruses that represent a range of physicochemical properties for use in viral clearance studies, including those examples already described in *〈 1050 〉* (see *Table A-1*). Additional points to consider during viral selection are: 1) ability to grow the virus of interest to a sufficiently high titer; 2) ability to create stocks with minimal aggregates; 3) availability of a qualified/validated assay system for detection of the selected virus; 4) the selected viruses are not likely to pose a health hazard to personnel performing the study or the environment; and 5) potential to address new and emerging viruses.

Table 1. Examples of Viruses Used in Viral Clearance Studies for Biotechnology Products Derived from Cell Cultures

Virus	Family	Genus	Natural Host	Genome	Enveloped	Size (nm)	Shape	Resistance ^a
Adenovirus 5	Adeno	Mastadeno-virus	Human	DNA	No	70–90	Spherical	High
BVDV	Flavi	Pestivirus	Bovine	RNA	Yes	50–70	Pleomorphic/spherical	Low
Cache valley virus	Bunya	Bunyavirus	Bovine, ovine	RNA	Yes	80–120	Spherical	Low
Encephalomyocarditis virus (EMC)	Picorna	Cardiovirus	Mouse	RNA	No	25–30	Icosahedral	Medium
Feline calicivirus	Calici	Vesivirus	Feline	RNA	No	35–40	Icosahedral	High
Herpes simplex 1	Herpes	Alpha-herpesvirus	Human	DNA	Yes	120–200	Spherical	Medium
MuLV	Retro	Type C oncovirus	Mouse	RNA	Yes	80–110	Spherical	Low
Parainfluenza virus	Paramyxo	Paramyxovirus	Various	RNA	Yes	100–200	Pleomorphic/spherical	Low
Parvoviruses (MVM, PPV, CPV, BPV)	Parvo	Parvovirus	Murine, porcine, canine, bovine	DNA	No	18–26	Icosahedral	High
Poliovirus sabin type 1	Picorna	Enterovirus	Human	RNA	No	25–30	Icosahedral	Medium
Porcine circovirus (PCV)	Circo	Circovirus	Porcine	DNA	No	15–20	Icosahedral	High
Pseudorabies virus	Herpes	—	Swine	DNA	Yes	120–200	Spherical	Medium
Reovirus 3	Reo	Orthoreovirus	Various	RNA	No	60–80	Spherical	Medium
Simian virus 5	Paramyxo	Rubulavirus	Simian	RNA	Yes	150–300	Pleomorphic/spherical	Low
Sindbis virus	Toga	Alphavirus	Human	RNA	Yes	60–70	Spherical	Low
SV40	Papova	Polyomavirus	Monkey	DNA	No	40–50	Icosahedral	Very high
Vesicular stomatitis virus	Rhabdo	Vesiculovirus	Equine, bovine	RNA	Yes	70 × 150	Bullet	Low
West Nile virus	Flavi	Flavivirus	Avian	RNA	Yes	40–70	Pleomorphic/spherical	Medium

^a Resistance to physicochemical treatments based on studies of purification processes. Resistance is relative to the specific treatment, and it is used in the context of understanding the biology of the virus and the nature of the manufacturing process. Actual results will vary according to the treatment. These viruses are examples only, their use is not mandatory, and the table is not exhaustive.

Process Clearance Capability

The viral clearance capability of a process is typically expressed as the logarithmic value of the virus reduction factor evaluated by the entire process. Although there are no specific requirements for the clearance capability that a process must achieve, the nature and origin of the cell type, raw materials used in production, as well as other factors may influence the need for greater or lower levels of viral clearance. For example, the target retroviral clearance

capability for a CHO and NS0 cell manufacturing process could be 4–6 logs of total-process retroviral clearance above the level found in the maximum therapeutic dose, based on the retroviral-like particle titer in the production bioreactor material. Clearance capability for other types of viruses might include >4 logs of clearance for additional enveloped viruses and >4 logs of clearance for nonenveloped viruses. Specific clearance targets must be established and justified on a case-by-case basis. In general, for a single virus clearance step to be considered effective, 4 logs or more of clearance must be demonstrated with 95% confidence ($\alpha = 0.05$). In contrast, a clearance step demonstrating 1–3 logs of clearance with 95% confidence ($\alpha = 0.05$) is considered a supportive step. A step can be supportive for some viruses and effective for others. To avoid overestimating reduction capacity, the analyst should perform viral clearance studies under expected worst-case conditions for the parameters defined as critical for that step (e.g., pH, temperature, and flow rate). Sufficient numbers of downstream purification process steps should be identified and evaluated so that the required overall clearance target can be reached.

Downstream Processing Steps for Viral Clearance

Downstream processing steps should employ different (orthogonal) mechanisms of viral clearance because consideration of multiple steps of the same or similar clearance mechanisms may lead to overestimation of the overall viral reduction capability. In general, a purification process should include at least one robust viral inactivation step and one robust viral removal step. For every purification step assessed, the mechanism of viral clearance should be described as inactivation, removal, or a combination of both; if both, the primary clearance mechanism should be identified. For inactivation steps, clearance studies should be planned in such a way that they can determine the kinetics of viral inactivation. Ideally, a manufacturing process includes steps that are dedicated to viral clearance; that is, they are present in the production or purification process specifically for the removal or inactivation of viruses. Examples of dedicated steps include solvent and detergent treatment, low-pH inactivation, and virus-removal filtration.

Qualification and Scale-Down of Purification Steps

Viral clearance studies using infectious virus spikes are not conducted at production scale in the manufacturing suite because this could contaminate the suite with viruses. Such studies should be performed in a segregated facility equipped for virological work and staffed with personnel who have virology expertise and familiarity with the operation of a scaled-down purification process. Each scaled-down step of the purification process must be qualified, i.e., found to be comparable to the full-scale production process by all relevant, measurable criteria. Comparability should be demonstrated using representative raw materials in intermediates from production, and equipment with process parameters through appropriate scale-down principles. The outputs should be measured with the appropriate analytical methods and statistical analyses.

In many instances, the monitored parameters are the same as those analyzed during performance of the actual manufacturing steps. For chromatography, the following parameters should be representative of the respective clinical or commercial-scale manufacturing: column bed height, residence time, linear flow rate, chromatographic matrix, buffer composition (including pH, conductivity, and operating temperature), and product pool concentrations and composition. Scaled-down and manufacturing-scale chromatography systems should produce

similar elution profiles and step yields. Similar considerations apply for other types of procedures. Any unavoidable differences between scaled-down and manufacturing-scale procedures should be investigated to determine their potential influence on the viral clearance results.

Selection of Sampling Points

Sampling points for assessing viral inactivation should include the starting materials (virus-spiked process solutions and appropriate controls) as well as samples taken at several time points during the inactivation process. This approach allows the analyst to monitor the kinetics of viral inactivation. Sampling points for virus-removal steps, such as chromatography and filtration, should include the feed-stream process solution that will be applied to the step, as well as the resulting process pool that is then processed in the subsequent steps. Chromatographic fractions (e.g., flow-through, washes, pre-peak, peak, post-peak, strip) of the mainstream, as well as pre- and post-mainstream samples, typically are evaluated in studies that support registration-enabling studies. Analyzing such side fractions might also be helpful in cases where the mechanism of partitioning is not understood. Sampling points are discussed further in the section *Performance of Viral Spiking Studies*.

Selection of Assays for Viral Quantitation

Various types of viral quantitation assays can be used. Examples include infectivity assays such as tissue-culture infectious-dose assays and plaque quantitation assays. In addition, quantitative polymerase chain reaction (qPCR) assays detect and quantify the nucleic acids of both infectious and noninfectious viruses. These assays are described in *Virology Test Methods* { 1237 }, *Nucleic Acid-Based Techniques—Extraction, Detection, and Sequencing* { 1126 }, and *Nucleic Acid Based Techniques—Amplification* { 1127 }. When using nucleic acid-based techniques (NAT), it is important to assure that the virus spike and the spiked samples to be analyzed do not contain significant amounts of free viral nucleic acids. The amount of free nucleic acids can be reduced by nuclease pretreatment of samples. It is important to characterize the impact of nuclease pretreatment on the virus spike since it could have a negative impact on the virus spike. Quantitative/quantal infectivity assays should have adequate sensitivity and reproducibility, and should be performed with a sufficient number of replicates to ensure adequate statistical validity of the results. All assays should include appropriate system suitability controls. Virus titration assays used in support of viral clearance studies must be shown to be suitable for this purpose by means of qualification or validation.

Sample Matrix Effects on Viral Quantitation Assays

When a virus is cleared by inactivation or removal (e.g., filtration or column chromatography) methods, the analysts must perform preliminary cytotoxicity and viral interference analyses to determine if their viral quantitation assays are sensitive to matrix components present in their samples. These studies should be performed before the spiking studies to confirm that the results of the viral clearance spiking studies are actually due to viral clearance and not to other intrinsic or extrinsic factors yielding a false-negative result. For example, some process intermediates may be cytotoxic to the detector (indicator) cells or may interfere with virus detection by a particular assay system. The process solutions used in these studies should be representative of those from a full-scale good manufacturing practice (GMP) manufacturing run.

The dilution of the process sample solution that does not cause cytotoxicity or interference is determined and the process solution is diluted accordingly before storage or testing samples from that manufacturing step in the virus-spiking studies.

In a cytotoxicity evaluation, the cells used in the viral quantitation assay are exposed to a series of dilutions of the sample matrix solution for that process step. Then the cells are assessed for viability and changes in morphology that could interfere with evaluation of the indicator cells for viral cytopathic effects or plaques and hence could have an impact on assay performance. The dilution of the process sample solution that does not cause cytotoxicity is determined, and the process solution is diluted accordingly before storage or testing samples from that manufacturing step in the virus-spiking studies.

The study involves the following steps:

1. Perform serial dilutions (e.g., 10-fold, 5-fold, or 2-fold) of the virus inactivation or filtration load using appropriate cell culture media as the diluent.
2. Inoculate the different dilutions of virus inactivation or filtration load alone onto the indicator cells that will be used for each virus titration.
3. Include appropriate buffer or media and cell controls.
4. Identify the dilution of the virus inactivation load that does not exhibit measurable detector cell toxicity attributable to the load matrix.

Process solutions also can interfere with virus detection by the in vitro cell-based viral infectivity assay system, either by inactivating the virus itself or by altering the indicator cells in a way that delays or prevents occurrence of a productive viral infection. To assess a process solution for viral interference, analysts prepare dilutions of the process solution and spike them with a known quantity of virus. Each dilution is subsequently titrated in the quantitative/quantal viral infectivity assay. If the difference between the known titer and the titer determined for the spiked solution in the assay (the viral interference titer) differ by more than the predetermined assay variability (typically ± 0.5 log), then viral interference is suspected.

To assess the inactivation step load for viral interference, analysts should follow these steps:

1. Perform serial dilutions (e.g., 10-fold, 5-fold, or 2-fold) of the virus stock using appropriate cell culture media as the diluent. This will serve as the positive control for the virus titer.
2. Perform serial dilutions (e.g., 10-fold, 5-fold, or 2-fold) of the virus stock using the virus inactivation load as the diluent. [Note—Information from the cytotoxicity study will determine the design of this step and the next one.]
3. Inoculate the dilution series onto the indicator cells.
4. Include assay suitability controls (positive and negative) in the test.
5. Identify the dilution of the virus inactivation load that does not result in significant changes in virus stock titer compared to the positive control virus titer.

If qPCR assays are used to quantitate the virus, each process solution should be tested for interference and recovery with the nucleic acid extraction method used, as well as for interference with the qPCR reaction itself. Each process solution must be diluted to a level that does not cause interference. Although diluting a process solution to achieve acceptable assay performance is a commonly used strategy, this reduces the maximum demonstrable VRF for the

clearance step under evaluation.

Effects of Storing and Freezing Viral Clearance Samples

If process solutions are used within their established hold times, stability studies should be performed to better understand the effect on the clearance step of holding or storing the solutions, or on the virus (e.g., aggregation). For example, bacterial growth or precipitation of proteins in the solutions may occur, particularly after prolonged storage.

If the samples from the spiking study are stored frozen before virus quantitation, analysts should perform stability studies using the viral infectivity result as an endpoint. Ideally, this should be done before the viral spiking study by spiking dilutions of each process solution with a known amount of virus and then freezing each sample. After specified times in frozen storage, the samples are removed, and the titer of each sample dilution is determined. If the difference between the known titer and the titer determined from the spiked frozen solution is greater than the assay variability (typically ± 0.5 log), this indicates that viral infectivity has been compromised by frozen storage.

Qualification of Virus Stocks and Effects on Processing Steps

The virus stocks used in viral clearance studies are critical reagents. Each virus stock should have a traceable, certified source with full documentation of the controlled production procedures. Virus stocks should meet predetermined criteria for identity, purity (e.g., sterility, mycoplasma, and adventitious virus testing), infectious titer, stability at freezing temperatures, and minimal viral aggregates. Analysts should minimize the number of passages from the master or working viral bank in order to reduce the chance of mutation. Purity of virus preparations should be taken into account in cases when virus preparation impurities may influence the performance of a certain unit operation (e.g., virus filtration).

During qualification, analysts should obtain an initial virus titer for each virus stock. Ideally, analysts should independently assay viral stocks for titer on separate days using different passage numbers of the indicator culture cells that were used in the viral quantification assay. The resulting titers should agree within the predetermined variability of the assay (typically the expectation is ± 0.5 log), and if so, the analyst can average the titers to determine the certified titer of the stock.

Analysts should perform a mock spiking study before the true spiking study. This mock spiking study evaluates the effects of the spiking virus matrix on the process step that is under evaluation. Mock spiking studies are important for all steps that will be tested for viral clearance, but they are particularly important for those steps that will be evaluated for the clearance of virus from a stock that contains impurities or additives (e.g., stabilizing protein). Mock spiking studies are conducted by adding the viral suspension matrix (including all components except the virus) to the process solution at a virus-spike to feed-stream-solution (load) ratio of NMT 10% (v/v) and then executing the processing step. The mock-spiked step is monitored for expected performance, and if results are different than expected, then reducing the virus:load spiking ratio may be helpful. This adjusted virus-spike to feed-stream-solution (load) ratio would be used in performing the actual clearance study for the processing step under study.

Performance of Viral Spiking Studies

Viral clearance studies are usually conducted either at a site where both the spiking and viral quantitation assays are performed (e.g., a biosafety testing laboratory) or at two different sites: one where the spiking studies are done and a second where the samples are quantitated. Sponsors and analysts must gain knowledge and control factors that can influence each manipulation that is not part of the manufacturing process, for example, freezing and thawing (see *Effects of Storing and Freezing Viral Clearance Samples*) as well as shipping conditions. Before initiating a clearance study, analysts should prepare a well-documented study design that clearly defines the following: the steps that will be tested, the sampling plan for each step, sample identification, sample handling and storage, sample shipment if required, critical operating parameters, process scale, rationale for worst-case conditions (if they have been established), and the appropriate controls for each step. At a minimum, the samples tested should include those used to determine: 1) the spiking virus titer, 2) the spiking virus titer after freeze-thaw (if applicable), 3) the virus titer in the production solution before processing, and 4) the virus titer after processing. The analyst may need to collect and assay additional samples, depending on the step under test and the phase of product development. In a typical biomanufacturing process, viral clearance can be accomplished by virus inactivation (e.g., pH treatment, heat treatment, or solvent and detergent treatment) or by virus removal (e.g., filtration or column chromatography). *Figures 1A* and *1B* show examples of experimental designs for virus inactivation, *Figure 2* shows virus removal by filtration, and *Figure 3* shows virus removal by column chromatography. These examples are intended for general reference and do not represent every specific condition. In developing their study designs, sponsors should consider their own process conditions in order to plan their own specific steps. The overall concept of viral clearance procedures can be expressed as follows:

Viral Clearance = Viral Inactivation + Viral Removal, where
Viral Removal = Removal by Filtration + Removal by Column Chromatography

VIRAL CLEARANCE BY VIRUS INACTIVATION

General considerations: Analysts should recognize that virus inactivation is not always a simple, first-order reaction. Typically, virus inactivation is complex and involves a fast initial phase followed by a slower phase. Thus, analysts should plan the inactivation process in such a way that samples are taken at different times in order to construct an inactivation time curve. Samples collected for inactivation studies should include the planned process time, and at a minimum, time zero; a time point or a suitable number of greater than zero but less than the minimum inactivating-agent exposure time; a time point equal to the minimum inactivating-agent exposure time; and in addition a time point beyond the minimum exposure time might be helpful in cases where there is a slow inactivation curve. Additional time points may be particularly important when there is no prior experience with virus inactivation kinetics. When viral clearance by inactivation occurs, two scenarios generally are possible: 1) the inactivating agent is not present in the load material and inactivation is initiated by addition of the inactivating agent after virus spiking (*Figure 1A*); and 2) the load material already contains the inactivating agent before the virus spike, and inactivation is initiated by addition of the virus spike (*Figure 1B*). An example of the latter is a Protein A column eluate at low pH. Whenever possible, analysts should determine the initial virus load from the virus-spiked load material before they add an inactivating agent. However, this is not possible when the inactivating agent is already present in the load material at the start of the experiment. In these situations, the initial virus load can be calculated using the certified titer value of the spiking virus preparation and the virus:load spiking ratio. When viral inactivation occurs too

rapidly to allow for plotting an inactivation time curve under normal process conditions, analysts should include appropriate controls to show that activity is indeed lost due to the inactivating agent present.

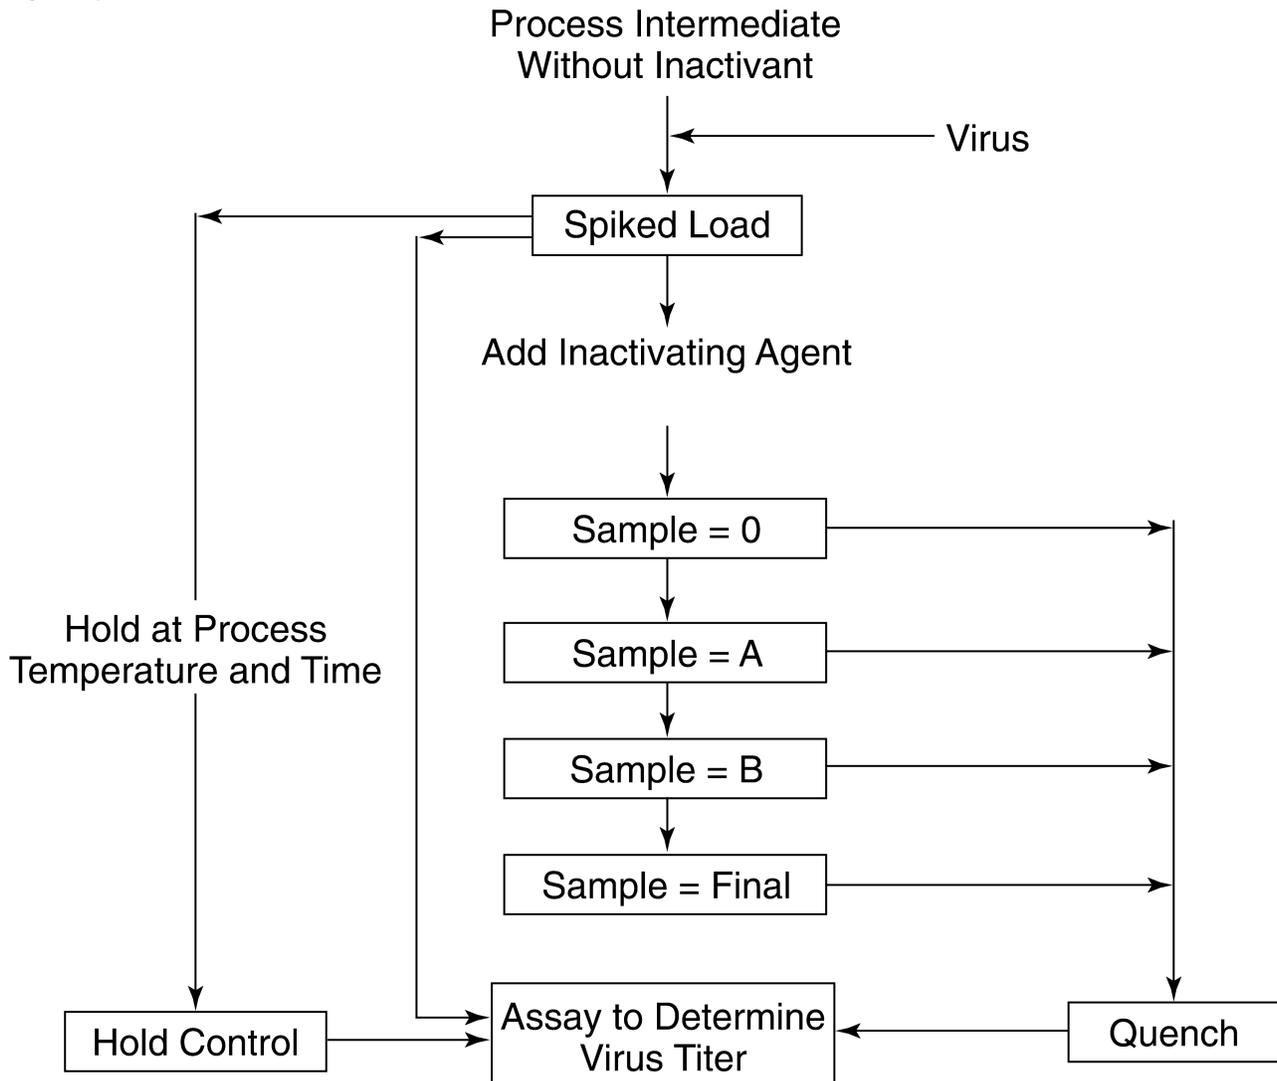

Figure 1A. Virus inactivation when load material does not contain an inactivating agent; the inactivating agent is added after viral spiking. Sampling points are indicated by "T"s in the text boxes in this figure and all subsequent figures.

Study design: The general approach to the study design for assessing viral clearance by inactivation is outlined in *Figures 1A* and *1B*. In *Figure 1A*, the virus spike is added to the load material (process intermediate) before initiation of inactivation. The virus and load material are mixed well, and the spiked load and hold control samples are pulled. The spiked load should be tested immediately to determine virus titer. The actual titer of the spiked load (obtained experimentally) should be compared to the theoretical titer of the spiked load (obtained from the certified titer of the lot of virus used and the spiking ratio) to verify performance of virus detection assay and that the appropriate amount of virus was added to the load material. The hold control should be treated the same as the spiked load (i.e., prior to neutralization of the hold control, the sample should be pH adjusted in the same manner as the spiked load and then neutralized and spiked with virus). In addition, the hold control should remain at process temperature until the final sample in the experiment is pulled. The viral titer of the hold control

then is assessed and compared to the actual titer of the spiked load to determine if any virus was inactivated in the presence of the load material over time and at the temperature of the inactivation study. This may be considered when determining the final VRF.

Inactivation should be initiated in a way that mimics the manufacturing process (e.g., with constant mixing) so that the inactivating agent (e.g., detergent, or acid utilized to lower pH) is mixed homogeneously into the solution as soon as possible. This minimizes the presence of localized high concentrations of the inactivating agent. If heat is used for inactivation, the heat should be applied in a way that mimics manufacturing (e.g., the ramp to target temperature should be identical) and controls should be kept unheated. However, the exact reproduction of addition (mixing) of inactivating agents or reproduction of a heating ramp can be very difficult at down-scale. In such cases it is advised to spike the virus directly into the inactivation agent-containing (or heated) material and to follow inactivation kinetics as described in *Figure 1B*. For control of the added virus, virus is spiked into process material without the inactivating agent or into unheated material.

Worst-case process conditions (e.g., pH, time, and temperature) should be applied if they have been established. Time points (samples) are pulled and the reaction is immediately quenched (e.g., by neutralization, dilution, or immediate cooling of the sample) so that further viral inactivation cannot occur. This allows the analyst to determine the kinetics of virus inactivation and then construct a virus inactivation versus time curve. Large-volume sampling can be applied to maximize clearance values.

In *Figure 1B*, the load material contains the inactivating agent and thus the addition of the virus spike starts the inactivation. In this scenario, it may not be possible to neutralize the process intermediate solution before the virus-spiking study because large fluctuations in pH may cause the protein product to fall out of solution. Also, the spiked load and hold control samples cannot be pulled from the virus-spiked load material, thus the control samples are pulled from a media or buffer control that does not contain the inactivating agent.

Media/Buffer Control

Process Intermediate
(Contains Inactivating Agent)

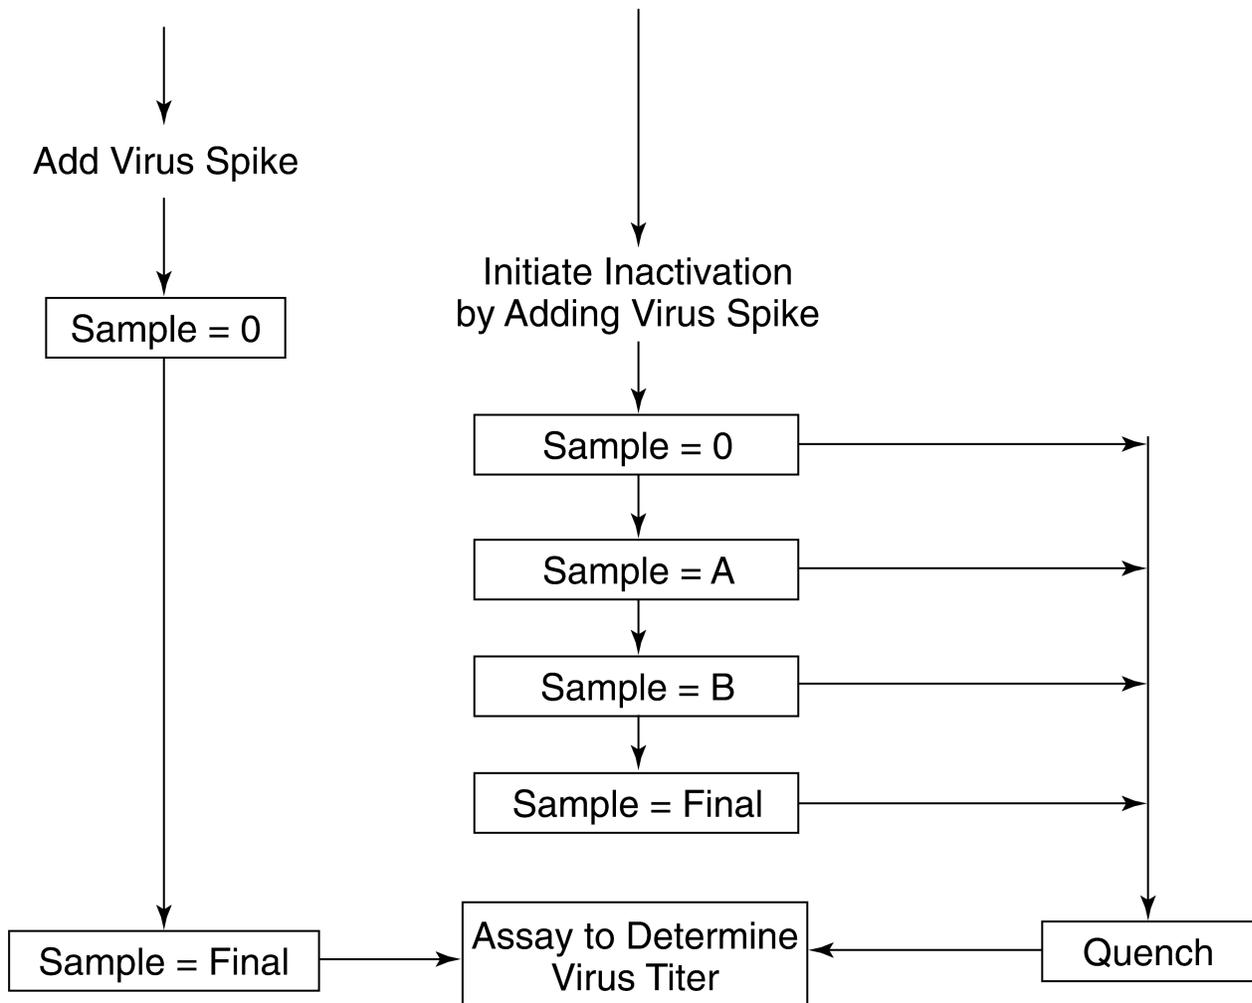

Figure 1B. Virus inactivation when the load material contains the inactivating agent before the virus spike; the addition of virus spike starts inactivation.

VIRAL CLEARANCE BY FILTRATION

Analysts must perform preliminary cytotoxicity and viral interference analyses when preparing to perform viral clearance by filtration (see *Sample Matrix Effects on Viral Quantitation Assays*). The viral filter load and pool dilution that will be used in the clearance study is that dilution shown not to cause cytotoxicity or interference.

Study design: The general approach to the study design for assessing viral clearance by filtration is outlined in *Figure 2*. Once the process intermediate is spiked with virus, the spiked load sample should be assayed immediately for virus titer. Virus spiking can be associated with aggregation effects. The aggregation status of a contaminating virus in the respective product intermediate is difficult to predict and therefore, as a worst-case approach, a mono-disperse virus preparation is advised for spiking. Filtration of virus before spiking (e.g. 0.45 µm or 0.22 µm) reduces larger virus aggregates from frozen virus stocks. A pure high-titer virus preparation can be helpful to reduce virus spike-induced effects influencing performance of virus filtration. The hold control sample should be maintained at processing conditions (temperature and time) and then assayed to evaluate the impact of these conditions, as well as the process

intermediate components, on virus titer. Worst-case process conditions should be applied, if they have been established. The virus titers obtained from the spiked load and hold control should be within the experimental variability of the virus titration assay, and if so, the analyst can average these values to obtain the initial virus load for use in calculating log reduction value. If there is a negative impact on virus titer because of the processing conditions (temperature, time, and process intermediate composition), then an investigation should begin to understand the process. If warranted, the final VRF may need to be adjusted to account for the impact of hold conditions on viral preparations. However, this approach might underestimate the removal capacity from virus filtration. Alternatively, use of another detection method (e.g., NAT) or another, more stable, model virus can be discussed.

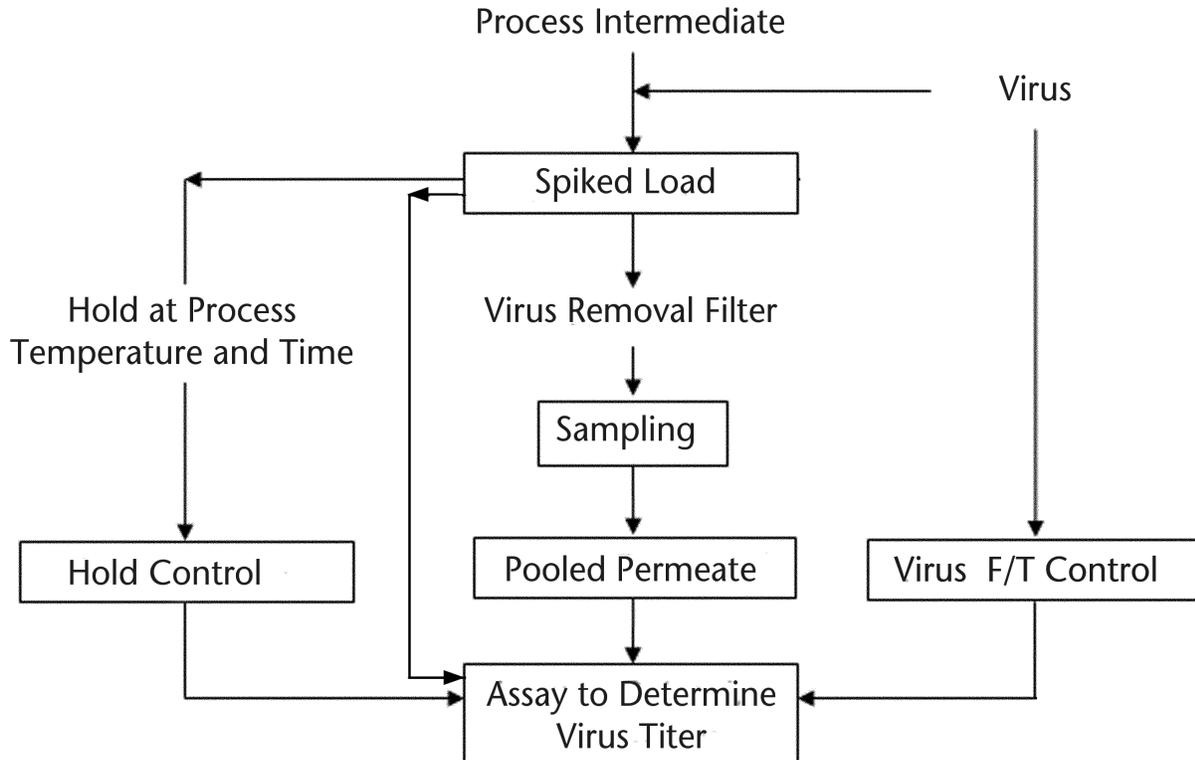

Figure 2. Clearance of virus by filtration methods.

Appropriate pre- and post-filtration controls should be used to assess removal of the virus spike by the prefiltration step. Samples are evaluated using virus titration assays. Test samples may require neutralization to appropriate pH levels for cell-culture-based titration assays. If a 0.22- μm or 0.45- μm prefilter is used during production in line with the virus-reduction filter, spiking could be performed on the intermediate before prefiltration. However, a sample should be taken from the stage after prefiltration in order to determine the VRF. Alternatively, the virus spike can be added to the intermediate after this prefiltration (using a similarly filtered virus spike) in order to determine virus reduction caused by the virus filter. To gain additional understanding of the virus clearance process, analysts can take samples at various time points throughout the run. In the event that samples are stored frozen prior to virus quantitation, a virus freeze/thaw (F/T) control is suggested to determine if there is any impact of the F/T cycle on virus titer (see also *Effects of Storing and Freezing Viral Clearance Samples*).

VIRAL CLEARANCE BY COLUMN CHROMATOGRAPHY

General considerations: For registration-enabling studies, analysts should investigate the distribution of the virus load among different chromatography fractions. Generally, analysts add virus to the starting intermediate (feed stream or load) for each step tested and determine the virus titer of the spiked load material and product pool spiked load material before and after the step. Fractions, in addition to the main product pool, may require testing at the later stages of product development (phase 3 trials and beyond). As is usual for viral clearance, these studies should be performed in duplicate. With column chromatography, the ability of the columns as well as other devices to clear virus may increase or decrease after repeated use. Evidence of constant viral clearance after multiple uses may provide support for repeated use of such columns. Typically, this evidence is obtained when analysts compare clearance on new resin versus resin that has been cycled to or slightly beyond the targeted column lifetime, i.e., the number of times the column will be used in commercial manufacturing. For registration-enabling studies, data should also be provided to show that any virus potentially retained by the resin (carry-over) will be adequately inactivated or removed by cleaning procedures before reuse of the column.

For each manufacturing step assessed for viral clearance, the probable mechanism of reduction in viral infectivity should be known and described as virus inactivation or virus removal, or both. In some situations, it may be necessary to distinguish between removal and inactivation. For example, a column chromatography step that physically separates virus from product also may use a buffer capable of inactivating virus. In such situations, it may be possible to combine the use of viral infectivity assays with NAT assays to measure the individual contributions of the inactivation and removal mechanisms. Dissection of each step to determine the relative contribution of each mechanism of clearance allows for a thorough understanding of how viral clearance is achieved. This understanding may help to identify critical variables in each clearance step that should be controlled to support reproducible clearance. The testing of each critical variable (when it is well understood) at worst-case conditions helps to evaluate the process robustness of the step.

To measure virus clearance by a column chromatography system, analysts must perform preliminary cytotoxicity and viral interference analyses (see *Sample Matrix Effects on Viral Quantitation Assays* for details). The column load dilution that will be used in the clearance study is that dilution shown not to cause cytotoxicity or interference. [Note—Interference and cytotoxicity studies also can be performed on collected fractions, if warranted.]

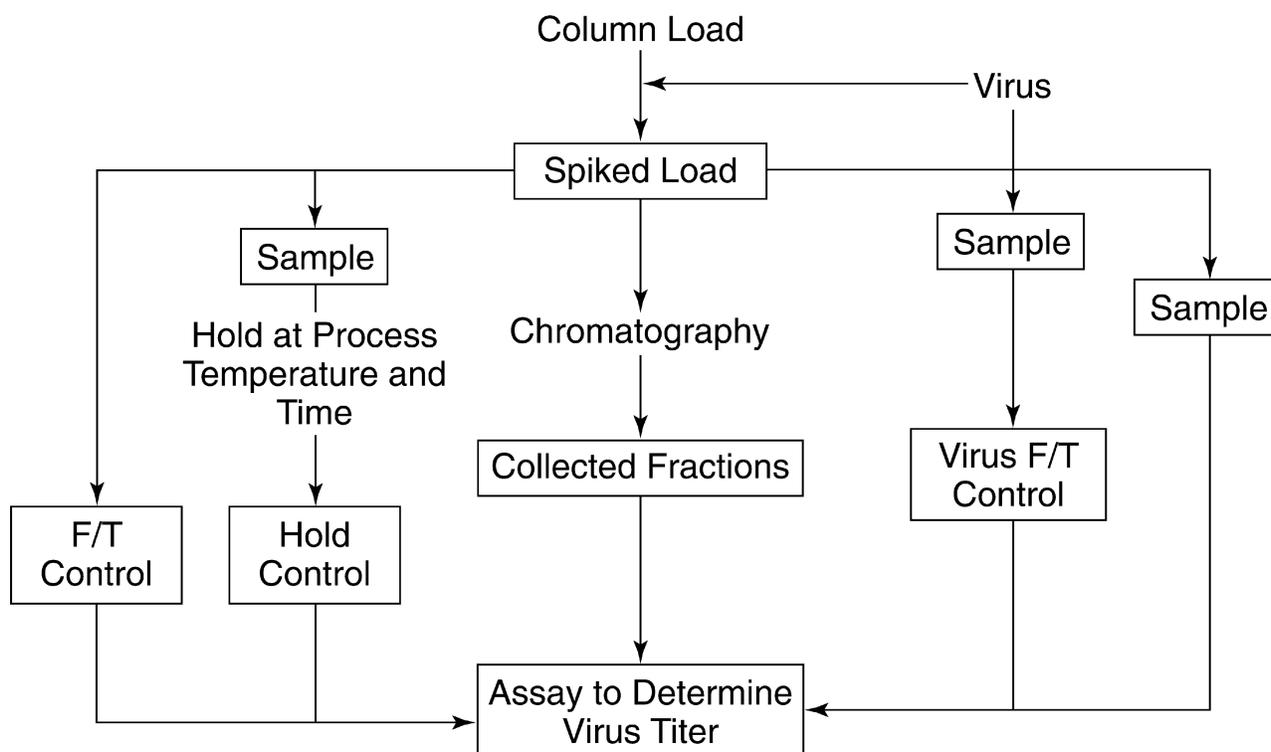

Figure 3. Clearance of virus by a column chromatography system.

Study design: *Figure 3* shows the general approach to study design for assessing viral clearance by chromatography. The column load is the material applied to the chromatography column. The load material in small-scale viral clearance studies should be comparable to material from clinical or commercial manufacturing in terms of composition and physicochemical attributes. The virus stock is a freshly thawed virus material of predetermined infectivity titer that is used to perform virus spiking of the column load material and also is used in the interference study. The virus stock can be sampled to determine the actual virus titer immediately after thaw. The spiked load control should be tested immediately for virus titer, and additional samples should be tested as soon as possible or frozen. The titer of the frozen sample and other samples will be determined at the end of the chromatography step run. In certain cases, filtration of the spiked load with a 0.22- μm or 0.45- μm prefilter may be necessary to remove any viral aggregates formed when the process intermediate was spiked with the model virus.

The chromatography step experiment for viral clearance should closely mimic the actual manufacturing process step parameters. It should be performed under worst-case conditions (e.g., flow, protein concentration, and elution conditions) if they have been established. The product pool or multiple fractions can be collected, and the virus titer can be determined in each collected fraction (such as flow-through, washes, pre-peak, peak, post-peak, strip, and others). The titers of virus in all the fractions that comprise the product pool are used to calculate the clearance factor of the step. Interference and cytotoxicity studies also can be performed on collected fractions, if warranted. For the duration of the step, the hold control (the load plus virus) should be kept at the temperature at which the chromatography is performed. At the end of the chromatography run, the hold control should be titrated along with other collected samples/fractions (these can be titrated immediately, or if not feasible, can be frozen and tested at a later time). The titer of the hold control or an average of the titers of hold control and spiked load (if within assay variability) should be used as the starting

titer in the viral clearance calculation. Samples are evaluated using virus titration assays. Test samples may require neutralization to appropriate pH levels for cell-culture-based titration assays.

GLOSSARY

(See also *Viral Safety Evaluation of Biotechnology Products Derived from Cell Lines of Human or Animal Origin* { 1050 }, *Glossary*.)¹

Process Robustness of Viral Clearance: Ability of the downstream process or a single-unit operation to exhibit the characteristic performance and effectiveness in clearing viruses after minor or moderate changes of standard operating parameters or conditions.

Process Solutions: Production intermediates that are obtained for viral clearance studies. They should be obtained from a full-scale production facility or from a scaled-down process that has been shown to be representative of full-scale production.

Production Process: The manufacturing processes for biotechnology products are often varied and complex, and they are typically divided into upstream and downstream processing. Upstream activities produce the protein of interest, usually by cell culture or fermentation, and considerations include integrity and quality of the process, cell banks, expression systems, cultivation, media, process/product purity, impurities, and contaminants. Downstream processing involves separation and purification of the bulk bioproduct to make it suitable for its end use, e.g., purification, sterilization, and final formulation. Downstream activities include filtration, centrifugation, precipitation, numerous chromatographic separations, sterilization by terminal filtration, or lyophilization.

Purification Process: Separating and isolating the product of interest, in its desired form, from the fermentation supernatant or cell homogenate.

Viral Clearance Effectiveness: The efficacy of the entire purification process or an individual process step within a purification process to clear viruses, as determined by the viral reduction factor. In general, for a virus clearance step to be considered effective 4 logs or more of clearance must be demonstrated with 95% confidence ($\alpha = 0.05$).

Viral Load: The amount of virus added to the load material of a purification step and then subjected to an inactivation/removal treatment. The experimental determination of viral load before and after treatment enables calculation of a reduction factor that is specific to the virus and the treatment used.

Viral Reduction Factor (VRF): The VRF of an individual clearance step represents the \log_{10} of the ratio of the virus load in the pretreatment material (used to challenge the clearance step) to the virus load in the post-treatment material. The overall VRF is calculated by adding all the individual steps with a \log_{10} reduction factor >1 . The \log_{10} viral reduction factor is determined by the following equation:

$$\log_{10} \text{ initial virus load} - \log_{10} \text{ final virus load} = \log_{10} \text{ Viral Reduction Factor}$$

The \log_{10} viral reduction value expresses levels of decreased viral contamination by factors of 10 that could be easily converted to percent reduction. For instance, a 1-log reduction is equivalent to a 90% reduction, a 2-log reduction is a 99% reduction, a 3-log reduction is a 99.9% reduction, and a 4-log reduction is a 99.99% reduction.

Virus Removal/Inactivation Validation: Virus removal/inactivation validation studies evaluate the capacity of the process to eliminate and/or to inactivate the viruses. Typically, this involves spiking the product with a known virus and then subjecting the product to inactivation/removal processes. ■ 1S (USP39)

BRIEFING

〈 1176 〉 **Prescription Balances and Volumetric Apparatus Used in Compounding**, *USP* 38 page 1331. The USP Compounding Expert Committee is proposing a title change and revisions to *Prescription Balances and Volumetric Apparatus* 〈 1176 〉. This new title will better represent the contents of the revised chapter, which has been updated by the deletion of obsolete terminology and the addition of concise and practical information on mechanical and electronic balances as well as volumetric apparatus. The new information proposed for 〈 1176 〉 will educate the reader on testing balances and determining the minimum accurately weighable quantity on the balance. The revised chapter also contains guidance on selection and use of cylindrical graduates and additional information on other types of volumetric apparatus that are used in compounding.

The proposed chapter is available at <http://www.usp.org/usp-nf/notices/general-chapter-1176> with line numbers. Please provide the line numbers corresponding to your comments when submitting comments to CompoundingSL@usp.org.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style.

■ USED IN COMPOUNDING ■ 1S (USP39)

Change to read:

Prescription Balances

~~Note—Balances other than the type described herein may be used if these afford equivalent or better accuracy. This includes micro-, semimicro-, or electronic single-pan balances (see *Weights and Balances* 〈 417 〉). Some balances offer digital or direct-reading features. All balances should be calibrated and tested frequently using appropriate test weights, both singly and in combination.~~

~~**Description**—A prescription balance is a scale or balance adapted to weighing medicinal and other substances required in prescriptions or in other pharmaceutical compounding. It is~~

constructed so as to support its full capacity without developing undue stresses, and its adjustment is not altered by repeated weighings of the capacity load. The removable pans or weighing vessels should be of equal weight. The balance should have leveling feet or screws. The balance may feature dial-in weights and also a precision spring and dial instead of a weighbeam. A balance that has a graduated weighbeam must have a stop that halts the rider or poise at the zero reading. The reading edge of the rider is parallel to the graduations on the weighbeam. The distance from the face of the index plate to the indicator pointer or pointers should be not more than 1.0 mm, the points should be sharp, and when there are two, their ends should be separated by not more than 1.0 mm when the scale is in balance. The indicating elements and the lever system should be protected against drafts, and the balance lid should permit free movement of the loaded weighing pans when the lid is closed. The balance must have a mechanical arresting device.

Definitions—

Capacity—Maximum weight, including the weight of tares, to be placed on one pan. The *N.B.S. Handbook 44*, 4th ed., states: "In the absence of information to the contrary, the nominal capacity of a Class A balance shall be assumed to be 15.5 g (½ apothecaries' ounce)." Most of the commercially available Class A balances have a capacity of 120 g and bear a statement to that effect.

Weighbeam or Beam—A graduated bar equipped with a movable poise or rider. Metric graduations are in 0.01-g increments up to a maximum of 1.0 g.

Tare Bar—An auxiliary ungraduated weighbeam bar with a movable poise. It can be used to correct for variations in weighing glasses or papers.

Balance Indicator—A combination of elements, one or both of which will oscillate with respect to the other, to indicate the equilibrium state of the balance during weighing.

Rest Point—The point on the index plate at which the indicator or pointer stops when the oscillations of the balance cease; or the index plate position of the indicator or pointer calculated from recorded consecutive oscillations in both directions past the zero of the index plate scale. If the balance has a two-pointer indicating mechanism, the position or the oscillations of only one of the pointers need be recorded or used to determine the rest point.

Sensitivity Requirements (SR)—The maximum change in load that will cause a specified change, one subdivision on the index plate, in the position of rest of the indicating element or elements of the balance.

Class A Prescription Balance—A balance that meets the tests for this type of balance has a sensitivity requirement of 6 mg or less with no load and with a load of 10 g on each pan. The Class A balance should be used for all the weighing operations required in prescription compounding.

In order to avoid errors of 5% or more that might be due to the limit of sensitivity of the Class A prescription balance, do not weigh less than 120 mg of any material. If a smaller weight of dry material is required, mix a larger known weight of the ingredient with a known weight of dry diluent, and weigh an aliquot portion of the mixture for use.

Testing the Prescription Balance—A Class A prescription balance meets the following four basic tests. Use a set of test weights, and keep the rider on the weighbeam at zero unless

~~directed to change its position.~~

~~1. *Sensitivity Requirement*—Level the balance, determine the rest point, and place a 6-mg weight on one of the empty pans. Repeat the operation with a 10-g weight in the center of each pan. The rest point is shifted not less than one division on the index plate each time the 6-mg weight is added.~~

~~2. *Arm Ratio Test*—This test is designed to check the equality of length of both arms of the balance. Determine the rest point of the balance with no weight on the pans. Place in the center of each pan a 30-g test weight, and determine the rest point. If the second rest point is not the same as the first, place a 20-mg weight on the lighter side; the rest point should move back to the original place on the index plate scale or farther.~~

~~3. *Shift Tests*—These tests are designed to check the arm and lever components of the balance.~~

~~A. Determine the rest point of the indicator without any weights on the pans.~~

~~B. Place one of the 10-g weights in the center of the left pan, and place the other 10-g weight successively toward the right, left, front, and back of the right pan, noting the rest point in each case. If in any case the rest point differs from the rest point determined in Step A, add a 10-mg weight to the lighter side; this should cause the rest point to shift back to the rest point determined in Step A or farther.~~

~~C. Place a 10-g weight in the center of the right pan, and place a 10-g weight successively toward the right, left, front, and back of the left pan, noting the rest point in each case. If in any case the rest point is different from that obtained with no weights on the pans, this difference should be overcome by addition of the 10-mg weight to the lighter side.~~

~~D. Make a series of observations in which both weights are simultaneously shifted to off-center positions on their pans: both toward the outside, both toward the inside, one toward the outside and the other toward the inside, both toward the back, and so on until all combinations have been checked. If in any case the rest point differs from that obtained with no weights on the pan, the addition of the 10-mg weight to the lighter side should overcome this difference.~~

~~A balance that does not meet the requirements of these tests must be adjusted.~~

~~4. *Rider and Graduated Beam Tests*—Determine the rest point for the balance with no weight on the pans. Place on the left pan the 500-mg test weight, move the rider to the 500-mg point on the beam, and determine the rest point. If it is different from the zero rest point, add a 6-mg weight to the lighter side. This addition should bring the rest point back to its original position or farther. Repeat this test, using the 1-g test weight and moving the rider to the 1-g division on the beam. If the rest point is different, it should be brought back at least to the zero rest point position by the addition of 6 mg to the lighter pan. If the balance does not meet this test, the weighbeam graduations or the rider must be corrected.~~

~~*Metric or apothecaries' weights*—for use with a prescription balance should be kept in a special rigid and compartmentalized box and handled with plastic or plastic-tipped forceps to prevent scratching or soiling. For prescription use, analytical weights (Class P or better) are recommended. However, Class Q weights have tolerances well within the limits of accuracy of the prescription balance, and they retain their accuracy for a long time with proper care. Coin-type (or disk-shaped) weights should not be used.~~

~~Test weights—consisting of two 20-g or two 30-g, two 10-g, one 1-g, one 500-mg, one 20-mg, one 10-mg, and one 6-mg (or suitable combination totaling 6 mg) weights, adjusted to N.B.S. tolerances for analytical weights (Class P or better) should be used for testing the prescription balances. These weights should be kept in a tightly closed box and should be handled only with plastic or plastic-tipped forceps. The set of test weights should be used only for testing the balance or constantly used weights. If properly cared for, the set lasts indefinitely.~~

Volumetric Apparatus

~~Pharmaceutical devices for measuring volumes of liquids, including burets, pipets, and cylinders graduated either in metric or apothecary units meet the standard specifications for glass volumetric apparatus described in NTIS COM-73-10504 of the National Technical Information Service.¹ Conical graduates meet the standard specifications described in N.B.S. Handbook 44, 4th Edition, of the National Institute of Standards and Technology.² Graduated medicine droppers meet the specifications (see *Medicine Dropper* (1101)). An acceptable ungraduated medicine dropper has a delivery end 3 mm in external diameter and delivers 20 drops of water, weighing 1 g at a temperature of 15°. A tolerance of ±10% of the delivery specification is reasonable.~~

Selection and Use of Graduates—

~~*Capacity*—The capacity of a graduate is the designated volume, at the maximum graduation, that the graduate will contain, or deliver, as indicated, at the specified temperature.~~

~~*Cylindrical and Conical Graduates*—The error in a measured volume caused by a deviation of ±1 mm in reading the lower meniscus in a graduated cylinder remains constant along the height of the uniform column. The same deviation of ±1 mm causes a progressively larger error in a conical graduate, the extent of the error being further dependent upon the angle of the flared sides to the perpendicular of the upright graduate. A deviation of ±1 mm in the meniscus reading causes an error of approximately 0.5 mL in the measured volume at any mark on the uniform 100-mL cylinder graduate. The same deviation of ±1 mm can cause an error of 1.8 mL at the 100-mL mark on an acceptable conical graduate marked for 125 mL.~~

~~A general rule for selection of a graduate for use is to use the graduate with a capacity equal to or just exceeding the volume to be measured. Measurement of small volumes in large graduates tends to increase errors, because the larger diameter increases the volume error in a deviation of ±1 mm from the mark. The relation of the volume error to the internal diameters of graduated cylinders is based on the equation $V = \pi r^2 h$. An acceptable 10-mL cylinder having an internal diameter of 1.18 cm holds 109 μ L in 1 mm of the column. Reading 4.5 mL in this graduate with a deviation of ±1 mm from the mark causes an error of about ±2.5%, and the same deviation in a volume of 2.2 mL in the same graduate causes an error of about ±5%. Minimum volumes that can be measured within certain limits of error in graduated cylinders of different capacities are incorporated in the design details of graduates in N.B.S. Handbook 44, 4th ed., of the National Institute of Standards and Technology. Conical graduates having a capacity of less than 25 mL should not be used in prescription compounding.~~

1. BALANCES

Pharmacies that perform materials measurements for compounding and dispensing should have access to a well-maintained National Institute of Standards and Technology (NIST) Class III torsion prescription balance or superior balance (preferably an electronic balance) to weigh masses accurately. The pharmacy should have a set of calibration weights, or the balance should have internal calibration capability to standardize the precision and accuracy of the balance.

For more information regarding standards for weights and balances, see *Balances* (41). The standards in NIST Handbook 44 called "Specifications, Tolerances, and Other Technical Requirements for Weighing and Measuring Devices" may also be useful to compounders.¹ Some balances offer digital or direct-reading features and printing capabilities, which may be desirable for ease of use. All balances should be calibrated or verified and tested frequently using appropriate test weights.

1.1 Mechanical Prescription Balances

A NIST Class III torsion prescription balance, formerly referred to as a Class A prescription balance, is a device designed to accurately weigh drugs and other substances and materials required in compounding and dispensing practices. The NIST Class III torsion balance is constructed to support its full capacity without developing undue stresses, and adjustments to the balance are not altered by repeated weighings of the capacity load. The removable pans or weighing vessels should be of equal weight. The balance should have leveling feet or screws. The balance may feature dial-in weights and also a precision spring and dial. The indicating elements (i.e., index plate) and the weighing lever system should be protected against drafts, and the balance lid should permit free movement of the loaded weighing pans with weighing papers or boats when the lid is closed. The balance must have a mechanical arresting device.

WEIGHTS

Metric or apothecaries' weights for use in testing or compounding with a NIST Class III torsion prescription balance should be kept in a special rigid and compartmentalized box and handled

with plastic or plastic-tipped forceps to prevent scratching or soiling. Weights should meet or exceed ASTM Class 4 criteria.

BALANCE TESTING PROCEDURE

Prescription balances should be tested in the location where they are used to ensure that they are operating properly. Testing should be conducted monthly or more frequently if the balance is used extensively. Additional testing should be done when the balance has been moved, unlevelled, contaminated, or otherwise damaged, misaligned, or misused.

Four tests are required to evaluate the suitability of a Class III torsion prescription balance. A balance is acceptable if it passes all four tests. If the balance fails any test, it should not be used until it has been repaired to meet specifications and retested. The four tests are:

1. Sensitivity requirement
2. Arm ratio test
3. Shift test
4. Rider and graduated beam

The index plate of this type of balance is required to determine rest points. The significance of any additional markings on the index plate is at the discretion of the balance manufacturer. The designations of the markings should be available from the manufacturer or contained in the documentation for the balance.

The markings on the index plate will be used to execute the tests by establishing a correlation between a marking and an actual test weight. The sensitivity requirement for this type of balance is 0.1 grain, or 6 mg. A 6-mg weight is not available in most weight sets, but a 10-mg weight is usually included. The testing procedure described below is a practical method used to establish the relationship between the markings on the index plate and actual test weights; the information may be used to calculate the sensitivity requirement equivalent to one marking on the index plate.

Sensitivity requirement test: The balance should have a maximum sensitivity of 6 mg with no load and with a load of 10 g on each pan. This test should be performed without the use of weighing boats or weighing papers. Because 6-mg weights are not in calibration weight sets, a 10-mg weight is used in this test.

1. With the pans clean, dry, and empty, and the lid closed, level the balance.
2. Disengage the arrest mechanism of the pan and adjust the leveling until the pointer either rests on the central zero line or the pointer oscillates the same distance of <0.5-scale unit to either side of center.
3. Place a 10-mg weight on the right-hand pan.
4. When the balance comes to rest, record the number of scale divisions visually estimated to the nearest 0.5-scale unit that the pointer was shifted. The whole- or 1-scale unit lines on the visual pointer scale of a balance are the second tallest in comparison to the tallest or zero line on the scale. The shortest lines, which occur midway between the center line and the nearest whole-unit lines and between whole-unit lines, represent 0.5-scale units.
5. Repeat steps 1–4 with a 10-g weight centered on both pans in addition to the 10-mg weight on the right-hand pan.

The balance is suitable for pharmaceutical measurement only with the following conditions:

- a. For balances with scales marked in two or more whole- and half-scale units on both sides of the center or zero line, i.e., a total of four or more marking lines, the 10-mg weight shall displace the pointer from 1.5 to less than one-half the distance between the 1.5- and 2-scale unit lines. [Note—The 10-mg pointer displacement of 1.5-scale units is proportional to a 1-scale unit displacement by 6.67 mg. A visual observation of 10 mg moving the pointer to, or to the right of, the 1.5-scale unit mark but not to the 2-scale unit mark or off-scale, is equivalent to 6 mg displacing the pointer scale 1-scale unit, because 0.67 mg > 6 mg represents a visually indeterminable pointer displacement of 0.1-scale unit past the 1-scale unit mark. The distance between 2 whole-scale units on balances ranges from 2 to 4 mm, which corresponds proportionally to 0.2–0.4 mm for 0.1-scale division.]
- b. For balances with scales marked in three or fewer total whole- and half-scale units on both sides of the center or zero line, i.e., a total of three marking lines, the 10-mg weight shall displace the pointer from 1.5 to less than the off-scale stop point at the extreme right side of the scale.

Arm ratio test: The arm ratio test will determine whether both arms of the balance are of equal length.

1. Level the balance.
2. With the pans empty, adjust the balance until the pointer is in the middle of the marker plate.
3. Place a 30-g weight in the center of each pan.
4. When the balance comes to rest, record the rest point.
5. If the rest point has changed from the middle of the marker plate, place a 30-mg weight on the lighter side.
6. When the balance comes to rest, this new rest point should either return to or go farther than the middle of the marker plate.

Shift test: The shift test checks the mechanics of the arm and lever components of the balance.

1. Level the balance.
2. With the pans empty, adjust the balance until the pointer is in the middle of the marker plate.
3. Place a 10-g weight in the center of the left pan and place another 10-g weight successively toward the right, left, front, and back side of the right pan, noting the rest point in each case.
4. In any case where the rest point has changed from the center of the marker plate, add a 10-mg weight to the lighter side.
5. When the balance comes to rest, this new rest point either should return to or go farther than the middle of the marker plate.
6. Level the balance and adjust the balance until the pointer is in the middle of the marker plate.
7. Repeat the procedure with the 10-g weight in the center of the right pan, and vary the position of the 10-g weight on the left pan.
8. Level the balance and adjust the balance until the pointer is in the middle of the marker plate. Make several observations in which both 10-g weights are shifted simultaneously

to off-center positions on their pans (i.e., both toward the inside, both toward the outside, one front and the other back). In any case where the rest point is shifted from the middle of the marker plate, the addition of a 10-mg weight on the lighter side should equalize or overcome the shift.

Rider and graduated beam test: The rider and graduated beam test checks the accuracy of the calibrated dial or rider on the balance.

1. Level the balance.
2. With the pans empty, adjust the balance until the pointer is in the middle of the index plate.
3. Place a 500-mg weight on the left pan and move the dial or rider to the 500-mg point.
4. When the balance comes to rest, record the rest point.
5. If the rest point has changed from the middle of the index plate, place a 10-mg weight on the lighter side.
6. When the balance comes to rest, this new rest point should either return to or go farther than the middle of the index plate.
7. Follow the same procedure using a 1-g weight on the left pan and the dial or rider on the 1-g point. If the new rest point is shifted from the middle of the index plate, a 10-mg weight to the lighter side should equalize or overcome the shift.

1.2 Electronic Balances

A typical electronic prescription balance is an instrument that provides essential readability for materials weighed within the range of capacities for the balance. The display should have prompts to guide users through the balance function, as well as an output port for printing if necessary. Most balances sold for prescription compounding meet or exceed Class I or II accuracy requirements according to NIST Handbook 44 and come with certificates issued under the National Type Evaluation Program (NTEP) of the National Conference on Weights and Measures.

Calibration/certification of the balance should be performed according to the standard operating procedures of the facility. Many electronic balances contain internal calibration programs that automatically calibrate the balance daily. If there is no internal calibration feature, external calibration may be conducted using a calibration weight, according to the procedure supplied by the manufacturer. Weights for use in calibrating an electronic balance should be kept in a special rigid and compartmentalized box and handled with plastic or plastic-tipped forceps, or gloves that are provided with the weights, to prevent scratching or soiling. These calibration weights should meet or exceed ASTM Class 1 criteria. In addition, there are companies that offer calibration services to certify that the balance is performing adequately. For more information regarding the use of electronic balances, see [41](#) and *Weighing on an Analytical Balance* [1251](#).

1.3 Minimum Accurately Weighable Quantity on the Balance

The minimum accurately weighable quantity (MAWQ) is the smallest weight or mass that will produce no greater than a predetermined fraction of error on a properly calibrated, situated, and operated balance. The predetermined weighing error is assigned based on either a professional standard (such as NMT 0.05 or 5% error in the weight of any prescription ingredient) or scientific rigor, for example, NMT 0.005 or 0.5% error in the weight of an

ingredient that is in limited supply. The compounder should use professional judgment when assigning the acceptable error for each process.

The formula for determining MAWQ for a typical Class III torsion balance is:

$$\text{MAWQ} = \text{Sensitivity requirement/Acceptable error}$$

Example: Calculate the MAWQ for a Class III torsion balance with a sensitivity requirement of 6 mg and an acceptable error of 5% or 0.05.

$$\text{MAWQ} = 6 \text{ mg}/0.05 = 120 \text{ mg}$$

For electronic balances, the MAWQ is calculated using the linearity or the absolute error over the range of the balance. This value is provided by the balance manufacturer. Note that the balance linearity and the readability of the smallest mass unit may not be the same.

Example: Calculate the MAWQ for an electronic balance with a linearity of 0.002 g and an acceptable error of 5% or 0.05.

$$\text{MAWQ} = 0.002 \text{ g}/0.05 = 0.04 \text{ g or } 40 \text{ mg}$$

2. VOLUMETRIC APPARATUS

An assortment of appropriate volumetric devices should also be available to accurately measure fluids and liquids of different volumes and densities. Pharmaceutical devices approved for measuring volumes of liquids, including burets, pipets, and cylindrical graduates marked in metric or metric and apothecary units, are to meet the standard specifications for glass volumetric apparatus described in "Specifications and Tolerances for Reference Standards and Field Standard Weights and Measures, 2. Specifications and Tolerances for Field Standard Measuring Flasks".² Conical graduates are to meet the standard specifications described in NIST Handbook 44.¹ There are ASTM standards (ASTM E542) for the calibration of laboratory volumetric apparatus that may be useful to compounders as well.³

2.1 Selection and Use of Graduates

CAPACITY

The capacity of a cylindrical graduate is the volume at the maximum graduation mark at the specified temperature. Volumes for prescription compounding and dispensing that are measured in cylindrical graduates should be adequate to not exceed 5% error.

CYLINDRICAL AND CONICAL GRADUATES

The error in a measured volume caused by a deviation of ± 1 mm in reading the lower meniscus in a graduated cylinder remains constant along the height of the uniform column. The same deviation of ± 1 mm causes a progressively larger error in a conical graduate, the extent of the error being further dependent upon the angle of the flared sides to the perpendicular of the upright graduate. A deviation of ± 1 mm in the meniscus reading causes an error of approximately 0.5 mL in the measured volume at any mark on the uniform 100-mL cylinder graduate. The same deviation of ± 1 mm can cause an error of 1.8 mL at the 100-mL mark on an acceptable conical graduate marked for 125 mL.

A general rule for selection of a graduate for use is to use the graduate with a capacity equal to or just exceeding the volume to be measured. Measurement of small volumes in large

graduates tends to increase errors, because the larger diameter increases the volume error in a deviation of ± 1 mm from the mark. The relation of the volume error to the internal diameters of graduated cylinders is based on the equation:

$$V = \pi r^2 h$$

V = volume

r = radius

h = height

An acceptable 10-mL cylinder having an internal diameter of 1.18 cm holds 109 μL in 1 mm of the column. Reading 4.5 mL in this graduate with a deviation of ± 1 mm from the mark causes an error of about $\pm 2.5\%$, and the same deviation in a volume of 2.2 mL in the same graduate causes an error of about $\pm 5\%$. *Table 1* shows the accuracy limits for cylindrical graduates.

Table 1. Tolerance or Accuracy Limits for Class A Cylindrical Graduates^a

Capacity (mL)	Smallest Graduation Mark Interval (mL)	Tolerance (\pm mL) ^b	Minimum Volume for 5% Error (mL) ^c
5	0.1	0.05	1.0
10	0.1 or 0.2	0.10	2.0
25	0.2 or 0.5	0.17	3.4
50	1	0.25	5.0
100	1	0.50	10.0
250	2	1.00	20.0
500	5	2.00	40.0
1000	10	3.00	60.0
2000	20	6.00	120.0
4000	50	14.50	290.0

^a ASTM E1272—Standard specification for laboratory glass graduated cylinders (<http://www.astm.org/Standards/E1272.htm>). Some brands exceed the ASTM limits; for example, one source of a class A 10-mL graduate lists the tolerance as ± 0.08 mL.

^b The constant volume error in each measurement.

^c The minimum volume for $N\%$ error = [Tolerance (mL) \times 100]/ N (%); e.g., for $N = 5\%$ for a 10-mL graduate, the minimum volume is 2.0 mL. (The minimum volume for 5% error = $(0.1 \text{ mL} \times 100)/5 = 2.0$.)

There is an inverse relationship between the temperature and density of liquids. For compounding and dispensing purposes, deviations will be negligible when volume measurements are performed at temperatures NMT 5° from that specified on the particular cylindrical graduate, which is usually 20° . For example, the densities in g/mL of water, ethanol, and glycerin vary, respectively, from 0.999 to 0.997, 0.791 to 0.785, and 1.265 to 1.262 over the temperature range of 15° – 25° . The accuracy of each cylindrical graduate used in pharmacy

practice is recommended to be verified as follows, at a measuring temperature of 20°–25° with the assumption that deviations follow a normal or Gaussian distribution:

1. Tare a clean, dry graduate on a properly calibrated balance of adequate capacity, linearity, and readability for the volumes to be measured.
2. Fill the tared, dry graduate identically five or more times on a level surface to the smallest, a mid-range, and the maximum capacity graduation marks with *Purified Water* or deionized water, precluding and wiping spills and splashes from the exterior and interior above the target fill line.
3. Record the weight of each filling.
4. Calculate the mean weight of each set of fillings.
5. Calculate the percent deviation of each weight from the theoretical weight as follows:

$$\text{Percent deviation weight} = \frac{[(\text{Actual weight} - (\text{intended volume} \times 0.9975)) / (\text{Intended volume} \times 0.9975)] \times 100\%}{}$$

6. Calculate the percent mean deviation weight as follows:

$$\text{Percent mean deviation weight} = \frac{[(\text{Mean actual weight} - (\text{intended volume} \times 0.9975)) / (\text{Intended volume} \times 0.9975)] \times 100\%}{}$$

Deviations for cylindrical graduates used in compounding and dispensing should not exceed 5.0% for individual weights or 2.5% for mean weights of the corresponding volumes of *Purified Water*. *Table 1* and *Table 2* show that a wider range of volumes can be measured in Class A cylindrical graduates compared to Class B. According to ASTM standards, Class A cylindrical graduates must be marked with the letter "A" to designate compliance with applicable construction and accuracy requirements. Class B cylindrical graduates are the same basic design as Class A cylindrical graduates and are considered to be for general purpose use. However, volumetric tolerances may be up to twice the allowable range for Class A cylindrical graduates.

Table 2. Tolerance or Accuracy Limits for Class B Cylindrical Graduates^a

Capacity (mL)	Smallest Graduation Mark Interval (mL)	Tolerance (\pm mL) ^b	Minimum Volume for 5% Error (mL) ^c
5	0.1	0.10	2.0
10	0.1 or 0.2	0.2	4.0
25	0.2 or 0.5	0.34	6.8
50	1	0.50	10.0
100	1	1.00	20.0
250	2	2.00	40.0
500	5	4.00	80.0
1000	10	6.00	120.0
2000	20	12.00	240.0
4000	50	29.00	580.0

^a ASTM E1272—Standard Specification for Laboratory Glass Graduated Cylinders (<http://www.astm.org/Standards/E1272.htm>).

b The constant volume error in each measurement.

c The minimum volume for $N\%$ error = $[\text{Tolerance (mL)} \times 100]/N (\%)$; e.g. for $N = 5\%$ for a 5-mL graduate, the minimum volume is 2.0 mL. (The minimum volume for 5% error = $(0.1 \text{ mL} \times 100)/5 = 2.0$.)

2.2 Medicine Droppers

Medicine droppers meet the specifications in *Packaging and Storage Requirements* (659). Medicine droppers should be used only for qualitative purposes, such as pH adjustment with an acid, alkali, or buffer, and visual identification testing with reagents. Medicine droppers are not approved for volumetric measurements for compounding. Calibrated medicine droppers have markings to guide delivery of the prescribed quantity of medication. Their purpose should be limited to the measurement of a dose for administration.

2.3 Dispensing Bottles

Some dispensing bottles may be supplied by the manufacturer as part of the packaging, whereas others may be selected and supplied by the pharmacist. These containers are not necessarily accurately calibrated and should not be used for measurement during compounding and dispensing unless they are appropriately calibrated by the compounder.

2.4 Syringes

Syringes are available in a variety of sizes with calibrated increments used for measuring and may be used to accurately measure and deliver a wide range of liquid volumes. For viscous liquids, measurements made with syringes are usually more accurate than those made with cylindrical graduates.

ORAL SYRINGES

Oral syringes are available as a device for accurately providing a dose of liquid medication to a patient. The performance of the syringes may be user dependent. For this reason, it is important that suitable operating procedures are documented and followed, and that operators are specifically trained in the correct use of the instruments. Users should be cautious about relying on manufacturers' performance figures. It is more appropriate to perform calibration, taking into account the variation between different users. Oral syringes provide an improvement in dosing accuracy for viscous medications, compared with medication droppers.

SYRINGE CALIBRATION

Syringe calibration is based on the gravimetric determination of the quantity of water either contained or delivered, and the conversion of this value to true volume at the standard temperature of 20° . At 80% of the nominal syringe volume, 5–10 measurements should be performed.

Calibration procedure:

1. Aspirate and dispense an exact volume of deionized water that is 80% of the nominal syringe volume.
2. Determine the mass of the dispensed water.

3. Calculate the volume of the dispensed water using mass and density.
4. Document the measurement values.
5. Calculate the accuracy (R).

Calibration formula:

$$\text{Accuracy } (R) = [(\text{Average value} - \text{target value})/\text{Target value}] \times 100$$

2.5 Pipets

Pipets are thin glass tubes used to deliver volumes <25 mL. The two types of pipets are the single-volume pipet and the calibrated pipet. The single-volume pipet is the most accurate and the simplest to use, but the single-volume pipet is limited to the measurement of a single fixed volume; it is not capable of partial volume measurements.

The calibrated pipet has graduation marks from a point near the tip of the pipet to the capacity of the pipet. In addition to delivering its entire contents, the calibrated pipet can be used to deliver partial volumes with good volumetric precision.

Micropipets generally are used when very small volumes (<1 mL) are required; micropipets are available in a variety of sizes. Each micropipet can be adjusted, usually by turning a dial, to deliver a volume within a limited range. For example, one micropipet may deliver volumes of 0–20 μL , another delivers 0–100 μL , and yet another delivers 0–1000 μL . The pipet selected should provide the greatest accuracy for the volume to be measured. Pipets should be calibrated/certified periodically as specified in the facility's standard operating procedures. Calibrating micropipets is a very specialized process that requires adequate training and appropriate equipment. There are companies that offer contract calibration services to certify that pipets are performing correctly.

2.6 Volumetric Flasks

Volumetric flasks have a slender neck and wide, bulb-like base. They are single-volume glassware and come in a variety of sizes. Only one calibration mark is etched on the neck of the flask. When the flask is filled to that mark, the flask contains the volume indicated on the flask. Volumetric flasks are difficult to use if dissolving solids in liquid because of the narrowness of the neck. If solids are to be dissolved, the flask should be partially filled with liquid, the solid material added and completely dissolved, and then the flask should be filled to the calibration mark.

2.7 Additional Considerations When Using Volumetric Apparatus

The use of volumetric apparatus requires some working knowledge of viscosity, density, surface tension, and adhesion. Each of these properties may affect measurement accuracy. For example, higher-viscosity liquids will be drawn into the vessel at a slower rate, and the operator should allow time for complete filling. Delivery can also be slow, because higher-viscosity fluids travel through the orifice at a slower rate. Density can affect filling and emptying in a manner similar to viscosity. In addition, liquids with very low surface tension may tend to "crawl up" the vessel wall or leak from the tip of a syringe or pipet. Adhesion can affect accuracy by resulting in a slow rate of vessel emptying. The operator should confirm that all of the liquid has been drained from the vessel if performing a quantitative transfer.

Understanding the terms To Contain (TC) and To Deliver (TD) is important, because they apply to glassware. TC and TD glassware consists of vessels that range from 1 to about 100 mL and

are individually marked to indicate whether they are TC or TD vessels. A TC vessel is designed to deliver the entire measured content of the operation, and it may require forced air to expel the final quantity. A TD vessel is designed to deliver the entire measured amount via gravity flow.

3. GLOSSARY OF TERMS

Accuracy: The closeness of the displayed weight, as measured by the balance, to the true weight, as known by the use of a calibration weight or weights.

Capacity: The maximum weight, including containers and tares, that should be placed on a balance pan. The maximum capacity should be stated in the manufacturer's specifications for the balance.

Linearity: The ability to maintain the same sensitivity over the entire weighing range of the balance. This is the constant weighing error in every amount weighed within the capacity range of the balance. This term is used only with electronic balances. Analogous terms are absolute error or linear accuracy. The linearity is determined by the balance manufacturer.

Minimum accurately weighable quantity (MAWQ): The smallest weight or mass that will produce no greater than a predetermined fraction of error on a properly calibrated, situated, and operated balance.

Precision: The reproducibility of the weighing measurement as expressed by a standard deviation. A similar term, repeatability, is sometimes used in specifications for electronic balances.

Readability: The smallest division at which the balance increments.

Repeatability: An instrument's ability to consistently deliver the same weight reading for a given object, and to return to a zero reading after each weighing cycle. This is tested by repeatedly weighing the same test weight.

Rest point: The point on the index plate at which the indicator or pointer stops when the oscillations of the balance cease. Index plates are found on mechanical balances.

Sensitivity: Also referred to as "Sensitivity requirement", is the smallest weight that gives a perceptible change in the indicating element (e.g., one subdivision marking on the index plate of a mechanical balance or one number change on the digital display of an electronic balance). A similar term, linearity, is sometimes used in specifications for electronic balances. ■ 1S (USP39)

BRIEFING

《1229.5》 **Biological Indicators for Sterilization.** The General Chapters–Microbiology Expert Committee proposes this new general information chapter as an addition to the 《1229》 family of chapters. The content on the use of biological indicators (BIs) in this proposal is consistent with that presented in that series of chapters. This proposed chapter contains information on BIs with respect to their types, characterization, and selection for specific types of sterilization, as well as responsibilities of the BI manufacturer and user. This chapter will replace *Biological Indicators for Sterilization* 《1035》, which will be proposed for deletion in the next issue of *Pharmacopeial Forum*.

(GCM: R. Tirumalai.)

■ 《1229.5》 BIOLOGICAL INDICATORS FOR STERILIZATION

INTRODUCTION

A biological indicator (BI) is a well-characterized preparation of a specific microorganism that has known resistance to a specific sterilization process.¹ BIs are used to demonstrate the effectiveness of processes that render a product sterile in its final package or container, as well as the effectiveness of the sterilization of equipment, product contact materials, and packaging components as required. BIs may also be used to monitor established sterilization cycles and are used for periodic reassessment of sterilization process effectiveness. BIs are process aids and can support the correlation of physical parameters to microbiological destruction. Microorganisms recognized as suitable for BIs are spore-forming bacteria, because the spores of these microorganisms are significantly more resistant than the vegetative cells that comprise the majority of normal bioburden.

PROPER USE OF BIOLOGICAL INDICATORS

BIs provide microbiological evidence of process effectiveness that should be correlated to physical measurements (see *Sterilization of Compendial Articles* 《1229》). Microbiological

resistance to sterilization varies with the physical conditions; however, there are no established means for accurately predicting microbial destruction based solely on physical measurements, with the exception of radiation sterilization. BI placement locations within or on materials to be sterilized are chosen to confirm that the desired sterilizing conditions have been attained. BIs are typically spore-forming bacteria of the genera *Geobacillus*, *Bacillus*, and *Clostridium*. BIs are chosen for their greater resistance to a specific sterilization process as compared to the expected bioburden. Preference in BI selection should be given to well-characterized strains.

RESPONSIBILITIES

BI Manufacturer's Responsibility

The responsibility for determining the performance characteristics of each BI lot resides with the BI manufacturer. The manufacturer should provide, with each lot of BIs, a certificate of analysis that attests to the validity of BI performance claims. The manufacturer should provide information concerning the microbial population and resistance (*D* and *z* values, respectively, where appropriate) as well as storage and expiry information. The resistance of the BI should be determined by the manufacturer under defined conditions. The manufacturer should provide directions for use, including the medium and conditions used for the recovery of microorganisms after exposure to the sterilization process. Disposal instructions also should be provided by the manufacturer of the BI.

BI User's Responsibility

When BIs are purchased, their suitability for use in a specific sterilization process must be established. The BI user should obtain a certificate of analysis for each lot of BI and verify the manufacturer's label claims for spore population. When a BI is used in accordance with the BI manufacturer's directions, the resistance of the BI need not be reconfirmed.

User-Prepared Biological Indicators

A user of BIs may elect to propagate spore crops of a single species for use as a suspension. Alternatively, these spore suspensions may be purchased from a BI manufacturer. When liquid suspensions are applied to a substrate, it is the user's responsibility to determine the population and resistance of the microorganism used. The resistance determined for liquid suspensions relates only to other lots of the same suspension and is not representative of how that microorganism will perform on a substrate or in a different suspending medium. In these circumstances, the BI resistance and population should be re-established (see *Biological Indicators—Resistance Performance Tests* (55)).

CHARACTERIZATION OF BIOLOGICAL INDICATORS

The use of BIs should include procedures for their acceptance and control. The following elements outline the major considerations. Resistance performance is addressed separately in (55), which provides methods for evaluating BI resistance.

Packaging and Storage

Store under the conditions recommended on the label or under validated conditions, and protect from light, toxic substances, excessive heat, and moisture.

Expiration Date

Use within the BI's labeled or determined expiration date.

Identification

Where identification of the BI species is deemed appropriate or necessary, use either a phenotypic or genotypic identification method (see *Microbial Characterization, Identification, and Strain Typing* { 1113 } for additional information).

Purity

By examination of the colonies derived from the spores on a suitable plate culture medium, determine that there is no evidence of contamination with other microorganisms.

Disposal

Prior to discarding used spores, sterilize using a method recommended by the BI manufacturer or other equivalent means.

TYPES OF BIOLOGICAL INDICATORS

A BI is a well-characterized preparation of a specific bacterial spore of known resistance to a specific sterilization process. Some BIs may contain two different species and concentrations of bacterial spores for use in the evaluation of two different sterilization processes.

One form of BI preparation includes spores that are placed on a carrier (e.g., a disk or strip of paper, glass, plastic, metal, or other material) and may be packaged to maintain the integrity and viability of the spores inoculated onto the carrier. The carrier and primary packaging should not be damaged or degraded by the specific sterilization process. Another preparation of BI is a spore suspension that is inoculated on or into representative units of the article to be sterilized. A surrogate article may be used if it is not practical to inoculate the actual article. A surrogate article is a preparation that differs in one or more ways from the actual article but performs as the actual article during cycle development, validation, and routine use. The physical design of actual or surrogate articles can affect the resistance of spore suspensions that are inoculated on or into an article (see { 55 }). In the case of liquid inoculated products, it is essential to determine the population, *D* value (and, in terminal sterilization applications, *z* value) of the relevant BI spore in the liquid product, and any simulated product substrate (if utilized).

A third form of BI is a sealed system that includes the growth medium (either in direct contact with the BI during the sterilization or placed in contact with the BI after sterilization) for recovery of process-exposed BI microorganisms. Some BI systems may contain a growth

indicator or sensor in addition to growth media.

SELECTION FOR SPECIFIC STERILIZATION PROCESSES

The selection of a BI requires knowledge of the resistance of the BI system to the specific sterilization process. It must be established that the BI system provides a challenge to the sterilization process greater than the resistance of the native bioburden. The recommendations for BI with each sterilization process are not exclusive; they represent only the more common choices.

Steam Sterilization by Direct Contact

For steam sterilization by direct contact, the commonly used BI contains spores of *G. stearothermophilus* (ATCC 12980 or ATCC 7953), a thermophilic microorganism with a moist heat resistance substantially greater than that of most vegetative microorganisms (see *Steam Sterilization by Direct Contact* (1229.1)).

Moist Heat Sterilization of Aqueous Liquids

Heat-resistant spore-forming microorganisms such as *C. sporogenes* (ATCC 7955), *B. subtilis* (ATCC 35021), or *B. atrophaeus* (ATCC 9372) are used. *B. subtilis*, *B. atrophaeus*, and *C. sporogenes* are preferred for use in sterilization of aqueous solutions or where their lower thermal resistance is more appropriate.

Dry Heat Sterilization

For dry heat sterilization, spores of *B. atrophaeus* (ATCC 9372) are typically used (see *Gaseous Sterilization* (1229.7)). Where dry heat depyrogenation has been demonstrated (*Dry Heat Depyrogenation* (1228.1)), sterilization by dry heat need not be reconfirmed, and a BI is not required.

Ionizing Radiation

The use of a resistant BI is unnecessary for the evaluation of radiation sterilization processes. Dose setting involves the evaluation of preirradiation bioburden as well as dosimetric evaluation and allied tests as defined in ISO 11137-1, -2, and -3, as well as in *Radiation Sterilization* (1229.10).

Gas Sterilization

For ethylene oxide sterilization, spores of *B. atrophaeus* are commonly used. For other gaseous agents, spores of *G. stearothermophilus* or *B. atrophaeus* are commonly used (see (1229.7)).

Chemical Sterilization

The sterilization of items using a liquid sterilant is accomplished using spores of an appropriate

strain such as *B. atrophaeus*, *B. subtilis*, or other appropriate spore-forming species, as determined by the user. Whichever strain is chosen for this purpose should have greater resistance than does the bioburden.

Vapor Phase Sterilization

The biphasic nature of these materials precludes the accurate determination of specific lethal conditions (for *D* values, see *Vapor Phase Sterilization* 〈 1229.11 〉). BIs using either *G. stearothermophilus* or *B. atrophaeus* have been utilized in the evaluation of these processes.

■ 〈 1229.9〉 **PHYSICOCHEMICAL INTEGRATORS AND INDICATORS FOR STERILIZATION**

INTRODUCTION

Physicochemical integrators provide some assessment of sterilization process efficacy and may be used in cases where validation of a sterilization process is not required—an exception is the validation and monitoring of radiation sterilization with dosimetry. The physicochemical indicator provides an immediate visual confirmation that an item has been exposed to a sterilization process. Performance standards both within and between lots of physicochemical integrators or indicators from a given manufacturer should be consistent. Integrators or indicators should not interact physically or chemically with any container or product when placed in the sterilizer load, and should not alter the strength, quality, or purity of the sterilized article. The integrator or indicator should be positioned such that it does not alter the effectiveness of the sterilization process.

PHYSICOCHEMICAL INTEGRATORS

A physicochemical integrator is defined as a device that responds to one or more sterilization process critical parameters, which results in a measurable value that can be correlated to microbial lethality. The manufacturers of physicochemical integrators should provide data to demonstrate that the labeled performance characteristics tests of the integrators are met. Physicochemical integrators require precautions for use and the appropriate interpretive criteria to define their performance characteristics. Performance of the sterilization apparatus must be ascertained from records generated by calibrated instruments (temperature, pressure, exposure time, gas concentration, and others, as applicable). The integrator can demonstrate only inadequate or adequate exposure to a combination of sterilization parameters.

Physicochemical integrators for radiation sterilization are designed to react predictably to the delivered radiation dose and can provide primary evidence of sterilization process effectiveness. The use of dosimeters in radiation sterilization cycle development and routine process control is addressed in ANSI/AAMI/ISO 11137-3—Sterilization of health care products—Radiation—Part 3: Guidance on dosimetric aspects (1).

PHYSICOCHEMICAL INDICATORS

A physicochemical indicator is defined as a device that provides visual evidence of exposure to one or more critical sterilization parameters. Physicochemical indicators cannot provide primary evidence of sterilization efficacy.

BRIEFING

《1229.12》 **New Sterilization Methods.** The General Chapters—Microbiology Expert Committee proposes this new general chapter as an addition to the *Sterilization of Compendial Articles* 《1229》 family of sterilization chapters. Commonly available sterilization processes are intended for the elimination of microorganisms from the materials subjected to them. However, certain situations may arise in which the user may need to develop and implement a new or novel sterilization process. This chapter provides information on the important steps to be considered for such a process.

Comment deadline: May 31, 2015

Add the following:

■ 《1229.12》 NEW STERILIZATION METHODS

INTRODUCTION

Sterilization processes are developed for the elimination of viable microorganisms while preserving the essential physical, chemical, and biological properties of the materials subjected to them. Where this cannot be accomplished by the sterilization methods described in *Sterilization of Compendial Articles* 《1229》, it may be possible to sterilize by using a proposed method not commonly used. When doing so, it is the end user's responsibility to demonstrate that the proposed new method can be used safely.

POINTS TO CONSIDER FOR A NEW STERILIZATION METHOD

The major steps in the implementation of a new sterilization method include the following:

- A literature review to identify supportive information on the proposed method

- Elimination of any established method through experimental evidence and/or comprehensive literature review of any materials used
- Identification and confirmation of reproducible lethality against a broad range of microorganisms, including bacterial spore-formers
- Identification and definition of critical process parameters necessary to ensure sufficient lethality. The effective range of these parameters should be explored to identify necessary conditions for the proposed sterilization process. Among the parameters to be considered, depending upon the nature of the process under consideration, are process dwell time, temperature, concentration, energy or power, and relative humidity. This evaluation should include positive and negative controls to ensure that the proposed method is in fact responsible for microbial destruction.
- The selection of a biological indicator (usually a spore-forming microorganism) with increased resistance to the sterilization method
- Evaluation of the proposed method against anticipated bioburden microorganisms and comparison of relative resistance of the bioburden microorganism to that of the chosen biological indicator
- The identification of in-process and/or post-process measurements and/or analysis that can reliably confirm the effectiveness of the proposed sterilization process.

Where the proposed new method is used for materials intended for human and/or veterinary use, the relevant regulatory authorities should be contacted to secure their acceptance before either investigational or clinical usage. Validation of the proposed new method should be completed before use on a commercial basis. ■ 1S (USP39)

BRIEFING

Casein, Hammarsten, *USP 38* page 1828. It is proposed to correct the name of this reagent and remove the information about a possible supplier as there are multiple possible suppliers for it.

Additionally, minor editorial changes have been made to update the reagent to current *USP* style.

■ **Teniposide:** White to off-white, crystalline powder. Very soluble in acetone and in dimethylformamide; slightly soluble in methanol; insoluble in water and in ether. ■ 1S (USP39)

Add the following:

■ **Zolmitriptan:** White to off-white, crystalline powder. Freely soluble to soluble in methanol; soluble in water; sparingly soluble in dichloromethane; practically insoluble in toluene.

■ 1S (USP39)

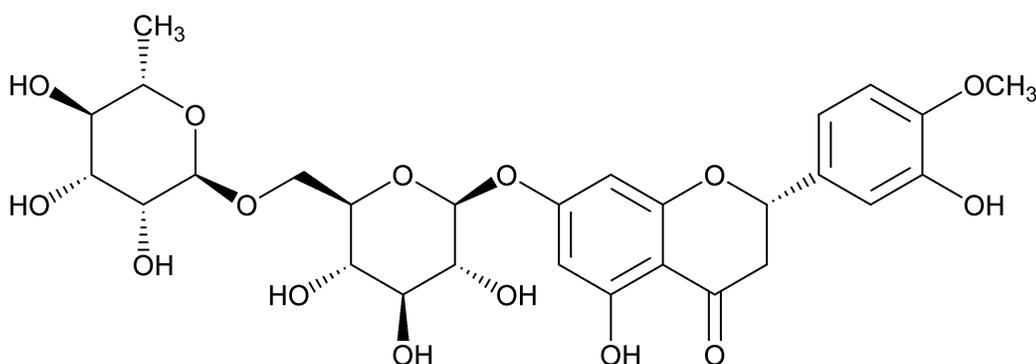

BRIEFING

Hesperidin. Because there is no existing *USP* monograph for this dietary ingredient, a new monograph is proposed. The liquid chromatographic procedures in the *Assay* and the test for *Related Compounds* are based on analyses performed with the Waters Nova-Pak C18 brand of L1 column. Typical retention times for eriocitrin, isonaringin, hesperidin, neohesperidin, diosmin, naringenin, didymin, and hesperetin are 3.2, 5.2, 7.3, 8.6, 10.9, 18.9, 22.4, and 27.5 min, respectively.

(DS: H. Dinh.)

Correspondence Number—C141757

Comment deadline: May 31, 2015

Add the following:■ **Hesperidin**

$C_{28}H_{34}O_{15}$ 610.57

4*H*-1-Benzopyran-4-one, 7-[[6-*O*-(6-deoxy- α -L-mannopyranosyl)- β -D-glucopyranosyl]oxy]-2,3-dihydro-5-hydroxy-2-(3-hydroxy-4-methoxyphenyl)-, (2*S*)-; (*S*)-5-Hydroxy-2-(3-hydroxy-4-methoxyphenyl)-4-oxo-3,4-dihydro-2*H*-chromen-7-yl 6-*O*-(α -L-rhamnopyranosyl)- β -D-glucopyranoside [520-26-3].

DEFINITION

Hesperidin contains NLT 90.0% and NMT 102.0% of hesperidin ($C_{28}H_{34}O_{15}$), calculated on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY● **Procedure**

Solution A: Dilute 5 mL of glacial acetic acid with water to 1000 mL.

Mobile phase: Methanol and *Solution A* (30:70)

System suitability solution: 0.2 mg/mL each of USP Isonaringin RS, USP Hesperidin RS, USP Neohesperidin RS, USP Diosmin RS, and USP Didymin RS in dimethyl sulfoxide

Standard solution: 1.0 mg/mL of USP Hesperidin RS in dimethyl sulfoxide

Sample solution: 1.0 mg/mL of Hesperidin in dimethyl sulfoxide

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 284 nm

Column: 3.9-mm × 15-cm; 4-μm packing L1

Column temperature: 40°

Flow rate: 1.0 mL/min

Injection volume: 10 μL

Run time: At least 5 times the retention time of hesperidin

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for hesperidin and its related compounds are shown in *Table 1*.]

Suitability requirements

Resolution: NLT 1.8 between hesperidin and neohesperidin, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of hesperidin (C₂₈H₃₄O₁₅) in the portion of Hesperidin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Hesperidin RS in the *Standard solution* (mg/mL)

C_U concentration of Hesperidin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–102.0% on the dried basis

IMPURITIES● **Residue on Ignition** 〈 281 〉

Sample: 1.0 g

Acceptance criteria: NMT 0.2%

● **Related Compounds**

Solution A, Mobile phase, System suitability solution, Chromatographic system, and

System suitability: Proceed as directed in the *Assay*.

Standard solution: 0.05 mg/mL of USP Hesperidin RS in dimethyl sulfoxide

Sample solution: 1.0 mg/mL of Hesperidin in dimethyl sulfoxide

Analysis**Samples:** *Standard solution and Sample solution*

Calculate the percentage of each impurity in the portion of Hesperidin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

 r_U = peak response of each impurity from the *Sample solution* r_S = peak response of hesperidin from the *Standard solution* C_S = concentration of USP Hesperidin RS in the *Standard solution* (mg/mL) C_U = concentration of Hesperidin in the *Sample solution* (mg/mL) F = correction factor for each individual impurity (see *Table 1*)**Acceptance criteria:** See *Table 1*. [Note—Disregard any impurity less than 0.1%.]**Table 1**

BRIEFING

Krill Oil, USP 38 page 6115. On the basis of comments received, the following changes are proposed:

1. Add the content of myristic acid and palmitic acid, and the ratio of palmitic acid to myristic acid content to *Table 1* of the *Fatty Acid Profile* in the *Identification* section.
2. Change the upper limits and lower limits for several fatty acids listed in *Table 1* to reflect new data recently received.
3. Change the range of total phospholipids content from 28%–52% to 30%–55% and the range of phosphatidylcholine from 60%–90% (w/w) to 60%–96% (w/w) of the total phospholipids content in the *Acceptance criteria* for the *Content of Total Phospholipids* test.
4. Change the range of phosphatidylcholine from 60%–90% (w/w) to 60%–96% (w/w) of the total phospholipids content in *Identification* test *B—Phospholipid Profile*.
5. Add a table of molecular weight values and approximate chemical shift values (in reference to triphenyl phosphate) for the phospholipids of importance to krill oil analysis in the test for *Total Phospholipids* in order to clarify the proper use of the NMR data obtained. The values proposed are based on data and comments received. Additionally, equations are included for the calculations required by this test.
6. Remove the tests for *Acid Value* and *Unsaponifiable Matter* in the *Specific Tests* section that provide minimum added value to the monograph.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(DS: H. Dinh.)

Correspondence Number—C153348

Comment deadline: May 31, 2015

Krill Oil

DEFINITION

Change to read:

Krill Oil is the fixed oil extracted from Antarctic krill (*Euphausia superba* Dana) biomass using appropriate food-grade organic solvents. Krill Oil contains ~~NLT 28% (w/w) and NMT 52% (w/w) of total phospholipids, of which 60% to 90% is phosphatidylcholine.~~

■ NLT 30% (w/w) and NMT 55% (w/w) of total phospholipids, of which 60%–96% is phosphatidylcholine. ■ 1S (*USP39*)

It contains NLT 10% (w/w) of eicosapentaenoic acid (EPA) and NLT 5.0% (w/w) of docosahexaenoic acid (DHA)

■ mostly ■ 1S (*USP39*)

in the form of phospholipids. It also contains NLT 0.01% of astaxanthin.

IDENTIFICATION

Change to read:

● **A. Fatty Acid Profile**

Antioxidant solution, System suitability solution 1, and Chromatographic system:

Proceed as directed in *Fats and Fixed Oils* { 401 }, *Omega-3 Fatty Acids Determination and Profile*.

Standard solution: Prepare as directed in *Test Solution 1* in *Fats and Fixed Oils* { 401 }, *Omega-3 Fatty Acids Determination and Profile*, except use 250 mg of USP Krill Oil RS.

Sample solution: Prepare as directed in the *Standard solution*, except replace USP Krill Oil RS with Krill Oil.

System suitability

Samples: *System suitability solution 1* and *Standard solution*

Suitability requirements

Chromatogram similarity: The chromatogram obtained from the *Standard solution* is similar to the reference chromatogram provided with the lot of USP Krill Oil RS being used.

Resolution: NLT 1.0 between the methyl oleate and methyl *cis*-vaccinate peaks, *Standard solution*

Theoretical area percentages: Meets the requirements for *System suitability solution 1*

Analysis

Sample: *Sample solution*

Identify the retention times of the relevant fatty acid methyl esters in the *Sample solution*

by comparing the chromatogram of the *Sample solution* with that of the *Standard solution* and the USP reference chromatogram.

Calculate the area percentage for each fatty acid as methyl esters in the portion of Krill Oil taken:

$$\text{Result} = (r_A/r_B) \times 100$$

r_A peak area of each individual fatty acid from the *Sample solution*

r_B total area from all peaks, except the solvent and butylated hydroxytoluene peaks, from the *Sample solution*

Acceptance criteria: The fatty acids obtained from the *Sample solution* meet the limit requirements in *Table 1*.

Analysis: Proceed as directed in the *Analysis (for triglycerides)* in *Fats and Fixed Oils* { 401 }, *Omega-3 Fatty Acids Determination and Profile*.

Acceptance criteria: NLT 10.0% (w/w) of EPA and NLT 5.0% (w/w) of DHA

Change to read:

- **Content of Total Phospholipids**

(See *Nuclear Magnetic Resonance Spectroscopy* { 761 }, *Qualitative and Quantitative NMR Analysis*.)

[Note—All deuterated solvents used in this method should be NLT 99.8 atom % D. Whenever water is used in this method, it should be of sufficient quality to ensure that no trace metals or other contaminants that may affect the analysis are present.]

Solution A: 0.2 M EDTA, adjusted with a 1 M cesium carbonate solution to a pH of 7.2–7.5. Document the final pH and the amount of 1 M cesium carbonate solution necessary to attain the desired pH. [Note—Use cesium carbonate of a sufficient grade for trace metals analysis.]

Line shape standard (¹H): 1% Chloroform in acetone-d₆

Sensitivity standard (¹H): 0.1% Ethylbenzene in chloroform-d

Sensitivity standard (³¹P): 0.0485 M triphenyl phosphate in acetone-d₆

Internal standard: Use a suitable triphenyl phosphate NMR analytical standard with purity NLT 99.0%.

Sample solution: [Note—NMR solvents containing tetramethylsilane (TMS) are readily available. If the solvents used do not contain TMS, it must be added to the *Sample solution* at an approximate concentration of 0.05% (v/v) for use as a chemical shift scale reference.] Transfer 300–350 mg of Krill Oil to a 5-mL sealable glass vial. Add 25.0 mg of

the *Internal standard* to the vial. Add 1 mL each of deuterated chloroform (chloroform-d) and deuterated methanol (methanol-d₄) of a grade suitable for NMR analysis to the vial to dissolve the sample. Once dissolution is complete, add 1 mL of *Solution A*, seal the vial, and shake the solution for 10–20 min, then centrifuge the contents of the vial. Transfer the lower organic phase to an appropriate NMR tube. It is critical to collect the entire organic phase and transfer it to the NMR tube. It may be unavoidable to also transfer small amounts of the aqueous phase when collecting the organic phase in the NMR tube. This is acceptable practice, so long as the aqueous phase remains completely separated and atop the organic phase in the NMR tube. The entire amount of aqueous phase must be above the probe's radio frequency (RF) coil (outside the analysis area of the tube). Should the organic phase contain undissolved materials, they must remain suspended at the aqueous-organic interface and be outside the analysis area of the tube as well. The organic phase must be free of bubbles and suspended materials that may interfere with NMR data acquisition.

Standard solution: Prepare as directed in the *Sample solution*, using 300–350 mg of USP Krill Oil RS in place of the sample.

Instrumental conditions

(See *Nuclear Magnetic Resonance Spectroscopy* { 761 }.)

Magnetic field strength: NLT 300 MHz for ¹H frequency

Probe: Direct observe probe capable of tuning to the resonance frequency of ³¹P (dependent on the specific magnetic field strength used)

Instrument performance qualification

[Note—Testing for sensitivity and line shape should be performed on the interval specified by the manufacturer of the instrument used. Performing these tests on a minimum of a monthly basis is required for this method, but may be done more often, as required. Resolution testing is to be performed during each analysis and documented as a part of the analytical results.]

¹H Line shape test: Using the *Line shape standard* (¹H) and the protocol recommended by the instrument manufacturer, the instrument must achieve the line shape specifications for the probe in use, as required by the instrument manufacturer. [Note—A different standard solution may be required or recommended by the manufacturer of the instrument; 1% chloroform in acetone-d₆ is most commonly used.]

¹H Sensitivity test: Using the *Sensitivity standard* (¹H) and the protocol recommended by the instrument manufacturer, the instrument must achieve the sensitivity specifications required by the instrument manufacturer. [Note—A different standard solution may be required or recommended by the manufacturer of the instrument; 0.1% ethylbenzene in chloroform-d is most commonly used.]

~~**³¹P Resolution test:** The resolution is demonstrated using the phosphatidylcholine ether peak and the phosphatidylcholine peak. The separation of these peaks (with line broadening factor of 1.0) must be demonstrated as follows. Using the baseline as a reference, determine the total peak height of the phosphatidylcholine ether peak, and draw a line at 30% of that total peak height (intensity). The phosphatidylcholine ether peak and the neighboring phosphatidylcholine peak must be fully resolved at a point that is NMT 30% of the peak height of the phosphatidylcholine ether peak.~~

³¹P Sensitivity test: Using the *Sensitivity standard* (³¹P) and the protocol recommended by the instrument manufacturer, the instrument must achieve the

sensitivity specifications required by the instrument manufacturer. [Note—A different standard solution may be required or recommended by the manufacturer of the instrument; 0.0485 M triphenyl phosphate in acetone-d is most commonly used.]

■ 1S (USP39)

¹H Resolution test: The resolution is demonstrated by the ability to detect both of the ²⁹Si satellite signals of TMS. The satellites must be resolved from the TMS signal in the spectrum with a line broadening factor of NMT 0.5 ppm.

³¹P Resolution test: The resolution is demonstrated using the phosphatidylcholine ether peak and the phosphatidylcholine peak. The separation of these peaks (with

■ an applied ■ 1S (USP39)

line broadening factor of 1.0) must be demonstrated as follows. Using the baseline as a reference, determine the total peak height of the phosphatidylcholine ether peak

■ [Note—The PC ether signal appears just downfield from the PC signal.] ■ 1S (USP39)

, and draw a line at 30% of that total peak height (intensity). The phosphatidylcholine ether peak and the neighboring phosphatidylcholine peak must be fully resolved at a point that is NMT 30% of the peak height of the phosphatidylcholine ether peak.

Data collection: Use the parameters specified in Table 2. Use 90 degree pulses, and calibrate pulses before use according to the recommendations supplied by the instrument manufacturer.

Table 2

Parameter	³¹ P NMR Quantitative Measurement	¹ H NMR Qualitative Measurement
Pulse program	¹ H-decoupled ³¹ P ■ (inverse gated) ■ 1S (USP39)	Single pulse ¹ H
Spectral width	50 ppm (25 ppm to -25 ppm)	20 ppm (-3 ppm to 17 ppm)
Transmitter offset	Center of spectral width, 0 ppm	Center of spectral width, 7 ppm
Relaxation delay	2–5 s ■ 5–15 s ■ 1S (USP39)	2–5 s
Acquisition time	1–6 s	1–6 s
Sum of relaxation delay and acquisition time	NLT 15 s ■ 1S (USP39)	NLT 15 s ■ 1S (USP39)
Size of data set	NLT 64k (32k with zero-filling)	NLT 64k (32k with zero-filling)

[Note—The acquisition time is dependent upon the field strength and the time domain
■ the dwell time and the number of data points collected. ■ 1S (USP39)

The number of scans acquired using a 300 MHz instrument must be NLT 512.]

System suitability: Under the conditions outlined in *Data collection*, the ^{31}P NMR signal of triphenyl phosphate should be observed at -17.80 ppm, and the ^1H NMR spectrum should be referenced to the ^1H signal of TMS (0 ppm) for all spectra acquired in the *Analysis*. For quantitative analysis, a sufficient number of scans should be acquired such that the signal-to-noise ratio for the phosphatidylcholine signal in the ^{31}P spectrum of the *Sample solution* acquired in the *Analysis* is NLT 2000.

Analysis: Acquire the data outlined in *Data collection*. Minimally acquire the ^1H spectrum (fingerprint) of the *Sample solution* and the *Standard solution* as well as the quantitative ^{31}P spectrum of the *Sample solution* and the *Standard solution*. Record the resulting spectra, and perform integration by hand or automated means on the quantitative ^{31}P NMR spectrum of the *Sample solution*. Integration of the peaks contained in the spectrum of the *Sample solution* must be performed such that the complete set of phospholipid peaks (as identified by comparison to the spectrum of the *Standard solution* and its reference spectrum) is included in the integration. The integration region for each signal must extend ± 0.05 ppm on either side of the ^{31}P signal. Quantify the total phospholipids present, the phosphatidylcholine ether content, and the phosphatidylcholine content in the *Sample solution* using comparison to the concentration of the *Internal standard*.

Compare the ^1H spectrum of the *Sample solution* to that of the *Standard solution* to determine the similarity of fingerprints according to which phospholipids identified in the reference spectrum of the *Standard solution* are present in the spectrum of the *Sample solution*.

■ **Calculations:** Use the following equations and molecular weights listed in *Table 3* to determine the phospholipids content in the sample taken:

$$\text{mmol}_{IS} = (W_{IS} \times C_{IS}) / (MW_{IS} \times 100)$$

mmol_{IS}

= millimoles of the *Internal standard* in the *Sample solution* (mmol)

W_{IS}

= weight of the *Internal standard* added to the *Sample solution* (mg)

C_{IS} = purity value of the *Internal standard*, based on quantitative ^{31}P NMR analysis (% by weight)

MW_{IS} = molecular weight of the *Internal standard* (326.28 g/mol for triphenyl phosphate)

$$\text{mmol}_{PL} = (I_{PL} \times A_{IS} \times \text{mmol}_{IS}) / (I_{IS} \times A_{PL})$$

mmol_{PL} = millimoles of the phospholipid of interest in the *Sample solution* (mmol)

I_{PL} = integrated area under the phospholipid signal of interest obtained from the spectrum of the *Sample solution*

A_{IS} = number of phosphorus atoms per molecule expected from the *Internal standard* (1 for triphenyl phosphate)

mmol_{IS} = millimoles of the *Internal standard* in the *Sample solution*

I_{IS} = integrated area under the *Internal Standard* obtained from the spectrum of the *Sample solution*

A_{PL} = number of phosphorus atoms per molecule expected from the phospholipid of interest (1 for any phospholipid listed in *Table 3*)

$$C_{PL} = (MW_{PL} \times \text{mmol}_{PL} \times 100) / W_S$$

C_{PL} = concentration of the phospholipid of interest in the *Sample solution* (% w/w)

MW_{PL} = molecular weight of the phospholipid of interest (g/mol, from *Table 3*) in the *Sample solution* (mg)

mmol_{PL} = millimoles of the phospholipid of interest in the *Sample solution* (mmol)

W_S = weight of sample present in the *Sample solution* (mg)

[Note—Use the molecular weight specified in *Table 3* for the calculations.]

Table 3

Component	Approximate chemical shift (ppm) in reference to triphenyl phosphate	Molecular weight (g/mol)
Triphenyl phosphate (Internal standard)	−17.8	—
Phosphatidylcholine (PC)	−0.89	791
1-Lysophosphatidylcholine (1-LPC) ^a	−0.48	534.5
2-Lysophosphatidylcholine (2-LPC) ^a	−0.4	534.5
Phosphatidylethanolamine (PE)	−0.24	770
<i>N</i> -Acylphosphatidylethanolamine (NAPE)	0	1032
Lysophosphatidylethanolamine (LPE)	0.25	492.5
Other	—	800

^a Ability to resolve the signals of 1-lysophosphatidylcholine and 2-lysophosphatidylcholine will depend upon the applied magnetic field strength of the NMR spectrometer used for the test procedure.

BRIEFING

meso-Zeaxanthin, *USP 38* page 6479. On the basis of comments received, it is proposed to modify the *Stereoisomeric Composition* test to improve the resolution of three zeaxanthin isomers: (3*S*,3'*S*)-zeaxanthin, (3*R*,3'*S*)-*meso*-zeaxanthin, and (3*R*,3'*R*)-zeaxanthin.

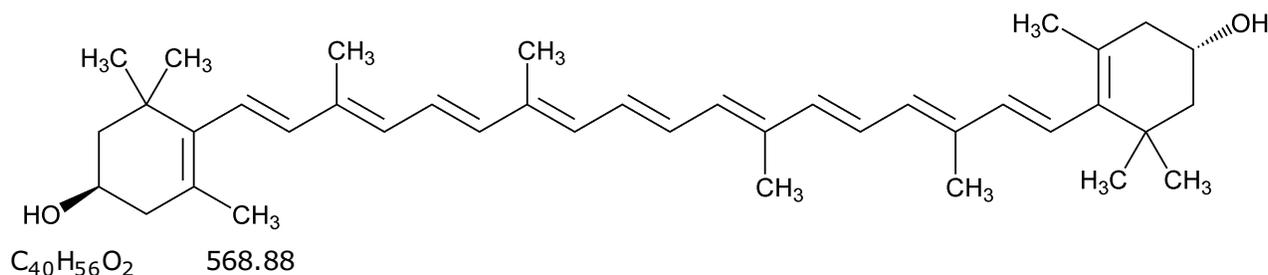

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(DS: H. Dinh.)

Correspondence Number—C155285

Comment deadline: May 31, 2015

meso-Zeaxanthin

β,β -Carotene-3,3'-diol (3*R*,3'*S*)-;
(3*R*,3'*S*)-*meso*-Zeaxanthin [31272-50-1].

DEFINITION

meso-Zeaxanthin consists chiefly of the 3*R*,3'*S*-isomer of zeaxanthin. It contains NLT 80.0% of total carotenoids calculated as zeaxanthin ($C_{40}H_{56}O_2$) and NLT 74.0% of zeaxanthin ($C_{40}H_{56}O_2$) on the anhydrous basis.

IDENTIFICATION

- **A.**
Sample solution: Use the *Sample solution* of the test for *Content of Total Carotenoids*.
Analysis: Record the UV-Vis spectrum from 300–600 nm.
Acceptance criteria: The *Sample solution* shows a shoulder at about 427 nm and a maximum absorption at about 453 nm and at about 480 nm.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Content of Zeaxanthin*.
- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of (3*R*,3'*S*)-*meso*-zeaxanthin from the *Standard solution*, as obtained in the test for *Stereoisomeric Composition*.

COMPOSITION

• **Content of Total Carotenoids**

[Note—Use low-actinic glassware.]

Sample stock solution: Transfer 25.0 mg of *meso*-Zeaxanthin to a 100-mL volumetric flask, add 20 mL of chloroform, and place the flask in an ultrasonic bath at 30° for 2–5 min

to obtain a clear solution. Dilute with cyclohexane to volume to obtain a solution containing 250 µg/mL.

Sample solution: 2.5 µg/mL of the *Sample stock solution* in cyclohexane

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* { 851 } .)

Analytical wavelength: 453 nm

Cell: 1 cm

Blank: Cyclohexane

Analysis

Sample: *Sample solution*

Calculate the percentage of total carotenoids as zeaxanthin (C₄₀H₅₆O₂) in the portion of *meso*-Zeaxanthin taken:

$$\text{Result} = A / (C \times F)$$

A = absorbance of the *Sample solution*

C = concentration of the *Sample solution* (g/mL)

F = coefficient of extinction (E_{1%}) of zeaxanthin in cyclohexane (100 mL·g₋₁·cm₋₁), 2540

Acceptance criteria: NLT 80.0% of total carotenoids (*T*) as zeaxanthin (C₄₀H₅₆O₂) on the anhydrous basis

• **Content of Zeaxanthin**

[Note—Use low-actinic glassware.]

Mobile phase: Hexane and ethyl acetate (75:25)

Standard solution: 150 µg/mL of USP *meso*-Zeaxanthin RS prepared as follows. Dissolve 15.0 mg of USP *meso*-Zeaxanthin RS in 10 mL of chloroform, swirling briefly, and dilute with *Mobile phase* to 100 mL.

Sample solution: Transfer 15.0 mg of sample to a 100-mL volumetric flask, add 10 mL of chloroform, and place the flask in an ultrasonic bath at 30° for 2–5 min to obtain a clear solution. Dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: 453 nm

Column: 4.6-mm × 25-cm; 3-µm packing L3

Column temperature: 25°

Flow rate: 1.5 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

[Note—The approximate relative retention times for lutein and zeaxanthin are 0.95 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.0 between zeaxanthin and lutein

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis: Inject the *Sample solution*, and measure the peak areas. [Note—The peak response of zeaxanthin is NLT 90.0% of the sum of all the peak responses.]

Calculate the percentage of zeaxanthin ($C_{40}H_{56}O_2$) in the sample taken:

$$\text{Result} = (r_U/r_T) \times T$$

r_U peak response of zeaxanthin

r_T sum of all the peak responses

T = percentage of total carotenoids as determined in the test for *Content of Total Carotenoids*

Acceptance criteria: NLT 74.0% of zeaxanthin ($C_{40}H_{56}O_2$) on the anhydrous basis

• **Lutein and Other Related Compounds**

[Note—Use low-actinic glassware.]

Mobile phase, Standard solution, Sample solution, and Chromatographic system:

Proceed as directed in the test for *Content of Zeaxanthin*.

Analysis

Sample: *Sample solution*

[Note—The peak response of lutein is NMT 9.0% of the sum of all the peak responses.]

Calculate the percentage of lutein in the portion of *meso*-Zeaxanthin taken:

$$\text{Result} = (r_U/r_T) \times T$$

r_U peak response of lutein

r_T sum of all the peak responses

T = percentage of total carotenoids as determined in the test for *Content of Total Carotenoids*

Calculate the percentage of other related compounds in the portion of *meso*-Zeaxanthin taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U individual peak response of any other peak (excluding zeaxanthin and lutein)

r_T sum of all the peak responses

Acceptance criteria

Lutein: NMT 8.5%

Other related compounds: NMT 1.0% of any other individual related compound

Change to read:

• **Stereoisomeric Composition**

BRIEFING

Guar Gum, NF 33 page 6689. As part of the USP monograph modernization effort, it is proposed to making the following revisions:

1. Update the *Definition*.
2. Replace the test for *Content of Galactomannans*, which is based on subtracting from 100.0 the total percentages from the tests for *Articles of Botanical Origin*, *Total Ash*; *Acid-Insoluble Matter*; *Protein*; and *Loss on Drying*, with a liquid chromatographic method. Change the title to *Content of Galactomannans and Ratio of Constituting Mannose and Galactose*. The HPLC method was validated using the Shodex Sugar SP 0810 brand of L22 column. The glucose, xylose, galactose, and mannose peaks elute at approximately 11.4, 12.1, 12.9, and 14.2 min, respectively.
3. Add the *Acceptance criteria* of "1.4–2.2" in the test for *Ratio of Constituting Mannose and Galactose*.
4. Add USP Dextrose RS and USP Xylose RS to the *USP Reference Standards* section.

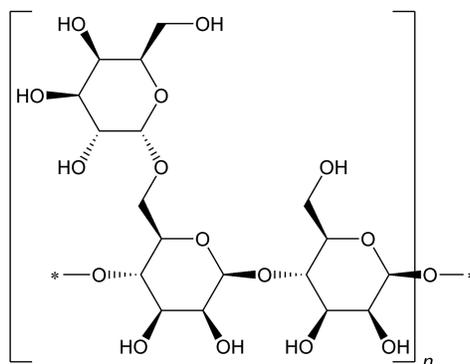

Additionally, minor editorial changes have been made to update the monograph to current USP style.

(EXC: H. Wang.)

Correspondence Number—C122232

Guar Gum

[9000-30-0].

DEFINITION

Change to read:

Guar Gum is the flour obtained by grinding the endosperms of seeds of *Cyamopsis tetragonolobus* (L.) Taub. (Fam. Leguminosae). It consists chiefly of high molecular weight hydrocolloidal polysaccharides composed of galactomannans

galactomannan. The content of galactomannan is NLT 66.0%. Galactomannan consists of a linear main chain of β -(1→4)-glycosidically linked mannopyranoses and single α -(1→6)-glycosidically linked galactopyranoses, and the ratio of the mannose and galactose is from 1.4:1 to 2.2:1. 1S (NF34)

IDENTIFICATION

• **A. Indication for a Polymeric Compound and Distinction from Locust Bean Gum**

Sample: 2 g

Analysis 1: Place the *Sample* in a 400-mL beaker, and moisten it with 4 mL of isopropyl

alcohol. Add 200 mL of cold water with vigorous stirring, and continue stirring until the *Sample* is completely and uniformly dispersed.

Acceptance criteria 1: An opalescent, viscous dispersion results.

Analysis 2: Transfer 100 mL of the sample dispersion prepared above to a 400-mL beaker, heat in a boiling water bath for about 10 min, and then cool to room temperature.

Acceptance criteria 2: No appreciable increase in viscosity is produced (distinction from locust bean gum: see *Reagents, Indicators, and Solutions—Reagent Specifications*).

• **B. Identification of Constituting Mannose and Galactose by Thin-Layer Chromatography**

Mobile phase: Acetonitrile and water (85:15)

Standard solution: Dissolve 10 mg of USP Galactose RS and 10 mg of USP Mannose RS in 2 mL of water, and dilute with methanol to 20 mL.

Sample solution: Transfer 20 mg of Guar Gum to a test tube, add 4 mL of a 100 mg/mL solution of trifluoroacetic acid, and shake vigorously to dissolve the forming gel. Stopper the tube, and heat the mixture at 115° for 1 h 20 min in a dry bath (heating block) or oil bath. Cool, transfer the hydrolysate to a centrifuge tube, and centrifuge. Some suspended particles/gel are formed. Pass the supernatant solution through a 0.45- μ m disc filter. Wash the test tube and the centrifuge tube with two 5-mL portions of water, and filter. Combine the washing filtrate with the filtered supernatant of the hydrolysate. Transfer the combined clear filtrate to a 50-mL flask, and evaporate the solution to dryness under reduced pressure. To the resulting residue add 0.2 mL of water and 1.8 mL of methanol.

Chromatographic system

(See *Chromatography* { 621 }, *Thin-Layer Chromatography*.)

Mode: TLC

Absorbent layer: 0.25-mm silica gel 60 F₂₅₄

Application volume: 5 μ L, as 9-mm bands, using an automated apparatus

Spray reagent: Dissolve 3 g of phthalic acid and 0.3 g of aminohippuric acid in ethyl alcohol, and dilute with ethyl alcohol to 100 mL.

Analysis

Samples: *Standard solution* and *Sample solution*

Develop over a path of 15 cm. Spray with *Spray reagent*, and dry at 120° for 5 min.

Acceptance criteria: The chromatogram from the *Standard solution* shows, in the lower region, two clearly separated brownish or yellowish zones due to galactose and mannose in order of increasing R_F value. The chromatogram from the *Sample solution* shows two zones due to galactose and mannose.

BRIEFING

Acetaminophen and Caffeine Tablets, *USP 38* page 2013. As part of the USP monograph modernization initiative and based on correspondence from the FDA regarding modernization, the addition of an HPLC procedure for monitoring 4-aminophenol, based on general chapter *4-Aminophenol in Acetaminophen-Containing Drug Products* 〈 227 〉, is being proposed. This liquid chromatographic procedure is based on analyses performed with the Dionex Acclaim Mixed Mode WCX-1 brand of L85 column. The typical retention time for 4-aminophenol is about 4.2–5.3 min. The proposed limit of this nephrotoxin is 0.15% and is based on input provided by the FDA and the pharmaceutical industry to the USP Acetaminophen Expert Panel, which reports to the Small Molecules-2 Expert Committee.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM2: C. Anthony.)

Acetaminophen and Caffeine Tablets

DEFINITION

Acetaminophen and Caffeine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of acetaminophen ($C_8H_9NO_2$) and caffeine ($C_8H_{10}N_4O_2$).

IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, relative to the internal standard, as obtained in the *Assay*.

ASSAY

Change to read:

- **Procedure**

Solution A: Methanol and glacial acetic acid (95:5)

Mobile phase: Methanol, glacial acetic acid, and water (28:3:69)

Internal standard solution: 6 mg/mL of benzoic acid in methanol

Standard stock solution: 0.25 mg/mL of USP Acetaminophen RS and 0.25*J* mg/mL of USP Caffeine RS in *Solution A*; *J* being the ratio of the labeled amount, in mg, of caffeine to the labeled amount, in mg, of acetaminophen per Tablet

Standard solution: 0.1 mg/mL of USP Acetaminophen RS and 0.1*J* mg/mL of USP Caffeine RS, prepared by transferring 20.0 mL of *Standard stock solution* and 3.0 mL of *Internal standard solution* to a 50-mL volumetric flask, and diluting with *Solution A* to volume

Sample stock solution: Nominally 2.5 mg/mL of acetaminophen in *Solution A*, prepared as follows. Transfer a portion of the powder equivalent to 250 mg of acetaminophen, from NLT 20 finely powdered Tablets, to a 100-mL volumetric flask. Add 75 mL of *Solution A*, and shake by mechanical means for 30 min. Dilute with *Solution A* to volume.

Sample solution: Transfer 2.0 mL of the *Sample stock solution* and 3.0 mL of *Internal standard solution* to a 50-mL volumetric flask, and dilute with *Solution A* to volume.

BRIEFING

Acetylcysteine Compounded Solution. Because of a need for an acetylcysteine compounded solution in the event of manufactured product unavailability or drug shortage, a new compounded preparation monograph is proposed based on a validated stability-indicating method used to assess stability. The liquid chromatographic procedure in the Assay is based on analyses validated using the Zorbax SB-Aq brand of L## column. The typical retention time for acetylcysteine is about 3.8 min.

Please submit comments to CompoundingSL@usp.org.

(CMP: J. Sun.)

Correspondence Number—C154508

Comment deadline: May 31, 2015

Add the following:

- **Acetylcysteine Compounded Solution**

DEFINITION

Acetylcysteine Compounded Solution contains NLT 90.0% and NMT 100.0% of the labeled amount of acetylcysteine ($C_5H_9NO_3S$). Prepare Acetylcysteine Compounded Solution 20% as follows (see *Pharmaceutical Compounding—Sterile Preparations* 〈 797 〉).

Acetylcysteine	2 g
Edetate Disodium Dihydrate	5.5 mg
Sodium Hydroxide 10% Solution	To adjust pH to 6.5–7.5
Sterile Water for Injection, a sufficient quantity to make	10 mL ^a

^a It is necessary to adjust the formula and compound an additional amount to completely fill each single-dose container to minimize exposure to oxygen because the preparation is susceptible to oxidation.

Dissolve *Edetate Disodium Dihydrate* in 7 mL of *Sterile Water for Injection*. Slight heating may be necessary. Allow to cool. Dissolve *Acetylcysteine* in the edetate disodium solution. Add *Sodium Hydroxide 10% Solution* dropwise with mixing to adjust the pH to between 6.5 and 7.5. Bring to final volume with *Sterile Water for Injection* and mix well. Pass through a sterile filter of 0.22- μ m pore size into single-dose sterile containers. It is necessary to completely fill the container to minimize the amount of oxygen present because the preparation is susceptible to oxidation.

ASSAY

• Procedure

Mobile phase: Acetonitrile, phosphoric acid, and water (3: 0.5: 96.5)

Standard solution: 0.4 mg/mL of acetylcysteine prepared from USP Acetylcysteine RS in *Mobile phase*

BRIEFING

Adapalene Gel. Because there is no existing *USP* monograph for this drug product, a new monograph, based on validated methods of analysis, is proposed.

1. The liquid chromatographic procedures in the *Assay* and the test for *Organic Impurities* are based on analyses performed with the Hypersil BDS C18 brand of L1 column manufactured by Thermo Scientific. The typical retention time for adapalene is about 6.5 min in the *Assay* and about 39 min in the test for *Organic Impurities*.

(SM3: F. Mao.)

Correspondence Number—C141748

Comment deadline: May 31, 2015

Add the following:

■ **Adapalene Gel**

DEFINITION

Adapalene Gel contains NLT 90.0% and NMT 110.0% of the labeled amount of adapalene ($C_{28}H_{28}O_3$).

IDENTIFICATION

- **A. Ultraviolet Absorption** (197U)
 - Diluent:** Use *Mobile phase* in the *Assay*.
 - Sample stock solution:** Use *Sample stock solution* in the *Assay*.
 - Sample solution:** Nominally equivalent to 0.4 µg/mL of adapalene, prepared as follows. Dilute 2.0 mL of *Sample stock solution* with *Diluent* to 100.0 mL. Pass a portion through a Teflon filter of 0.45-µm pore size and use the filtrate.
 - Acceptance criteria:** Meets the requirements
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

● **Procedure**

Mobile phase: Acetonitrile, tetrahydrofuran, trifluoroacetic acid, and water (43: 36: 0.02: 21)

Standard stock solution: 0.25 mg/mL of USP Adapalene RS, prepared as follows. Transfer USP Adapalene RS to a suitable volumetric flask, add tetrahydrofuran equivalent to 1% of the final volume, and sonicate to dissolve. Dilute with *Mobile phase* to volume.

Standard solution: 20 µg/mL of USP Adapalene RS in *Mobile phase*, from *Standard stock solution*

Sample stock solution: Nominally equivalent to 20 µg/mL of adapalene, prepared as follows. Transfer 2.0 g of Gel to a 100-mL volumetric flask, add 25 mL of tetrahydrofuran, and sonicate to dissolve. Add 25 mL of acetonitrile and sonicate for 20 min. Cool to room temperature and dilute with *Diluent* to volume.

Sample solution: Pass a portion of *Sample stock solution* through a Teflon filter of 0.45-µm pore size and use the filtrate.

BRIEFING

Alendronate Sodium, USP 38 page 2082.

1. In preparation for the omission of the flame tests from general chapter *Identification Tests—General* { 191 }, proposed in PF 41(2) [Mar.–Apr. 2015], it is proposed to replace the use of the flame test in *Identification* test B with the pyroantimonate precipitation test currently described in this general chapter. This test is also consistent with test (a) in 2.3.1 *Identification reactions of ions and functional groups* in the *European Pharmacopoeia*, and is employed in the *European Pharmacopoeia* monograph for *Sodium Alendronate Trihydrate*.
2. In the *Assay*, the requirement for *Column efficiency* is deleted from the system suitability requirements as the remaining requirements are adequate to evaluate the *System suitability*.

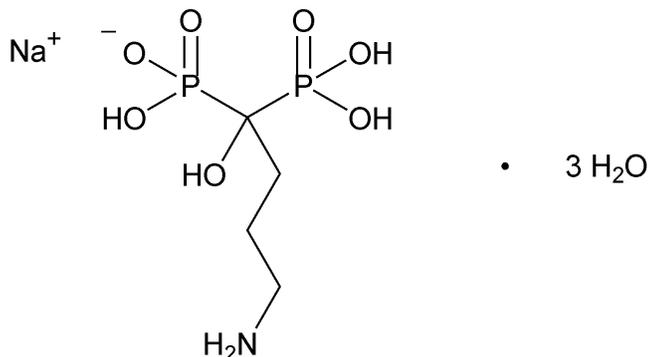

Additionally, minor editorial changes have been made to update the monograph to current USP style.

Alendronate Sodium

C₄H₁₂NNaO₇P₂·3H₂O 325.12

Phosphonic acid, (4-amino-1-hydroxybutylidene) bis-, monosodium salt, trihydrate;
Sodium trihydrogen (4-amino-1-hydroxybutylidene)diphosphonate, trihydrate [121268-17-5].

DEFINITION

Alendronate Sodium contains NLT 98.0% and NMT 102.0% of alendronate sodium ($C_4H_{12}NNaO_7P_2$), calculated on the dried basis.

IDENTIFICATION

test

ASSAY

Change to read:

• Procedure

Buffer solution: 14.7 g/L of sodium citrate dihydrate and 7.05 g/L of anhydrous dibasic sodium phosphate. Adjust with phosphoric acid to a pH of 8.

Mobile phase: Acetonitrile, methanol, and *Buffer solution* (25:5:70)

Diluent: 29.4 g/L of sodium citrate dihydrate

Borate solution: 19.1 g/L of sodium borate

Solution A: 0.5 mg/mL of 9-fluorenylmethyl chloroformate in acetonitrile. [Note—Prepare this solution fresh just before use.]

Standard stock solution: 0.1 mg/mL of USP Alendronate Sodium RS in *Diluent*

Standard solution: Transfer 5.0 mL of the *Standard stock solution* to a 50-mL polypropylene, screw-cap centrifuge tube containing 5 mL of *Borate solution*. Add 5 mL of *Solution A*, and shake for 30 s. Allow to stand at room temperature for 25 min. Add 25 mL of methylene chloride, and shake vigorously for 1 min. Centrifuge for 5–10 min. Use a portion of the clear upper aqueous layer.

Reagent blank: Transfer 5.0 mL of *Diluent* to a 50-mL polypropylene, screw-cap centrifuge tube containing 5 mL of *Borate solution*. Add 5 mL of *Solution A*, and shake for 30 s. Allow to stand at room temperature for 25 min. Add 25 mL of methylene chloride, and shake vigorously for 1 min. Centrifuge for 5–10 min. Use a portion of the clear upper aqueous layer.

Sample stock solution: 0.1 mg/mL of Alendronate Sodium in *Diluent*

Sample solution: Transfer 5.0 mL of the *Sample stock solution* to a 50-mL polypropylene, screw-cap centrifuge tube containing 5 mL of *Borate solution*. Add 5 mL of *Solution A*, and shake for 30 s. Allow to stand at room temperature for 25 min. Add 25 mL of methylene chloride, and shake vigorously for 1 min. Centrifuge for 5–10 min. Use a portion of the clear upper aqueous layer.

Chromatographic system

(See *Chromatography \langle 621 \rangle , System Suitability.*)

Mode: LC

Detector: UV 266 nm

Column: 4.1-mm \times 25-cm; packing L21

Column temperature: 35 $^{\circ}$

Flow rate: 1.2 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: ~~NLT 1500 theoretical plates~~

■ ~~1S (USP39)~~

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution, Reagent blank, and Sample solution*

Calculate the percentage of alendronate sodium (C₄H₁₂NNaO₇P₂) in the portion of Alendronate Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak area from the *Sample solution*

r_S peak area from the *Standard solution*

C_S concentration of USP Alendronate Sodium RS in the *Standard stock solution* (mg/mL)

C_U concentration of Alendronate Sodium in the *Sample stock solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

Delete the following:

•

• **Heavy Metals, Method III** (231)

: 0.001% (Official 1-Dec-2015)

• **Organic Impurities**

Buffer solution: 2.94 g/L of sodium citrate dihydrate and 1.42 g/L of anhydrous dibasic sodium phosphate. Adjust with phosphoric acid to a pH of 8 and pass through a filter of 0.5-µm or finer pore size.

Solution A: Acetonitrile and *Buffer solution* (3:17)

Solution B: Acetonitrile and *Buffer solution* (7:3)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
15	50	50
25	0	100
27	100	0

Time (min)	Solution A (%)	Solution B (%)
32	100	0

Diluent and Borate solution: Proceed as directed in the *Assay*.

Solution C: 4 mg/mL of 9-fluorenylmethyl chloroformate in acetonitrile. [Note—Prepare this solution fresh just before use.]

Standard stock solution: 0.6 mg/mL of USP Alendronate Sodium RS in *Diluent*

Standard solution A: Transfer 5.0 mL of the *Standard stock solution* to a 50-mL polypropylene, screw-cap centrifuge tube containing 5 mL of *Borate solution*. Add 5 mL of acetonitrile and 5 mL of *Solution C*, and shake for 45 s. Allow to stand at room temperature for 30 min. Add 20 mL of methylene chloride, and shake vigorously for 1 min. Centrifuge for 5–10 min, and use a portion of the clear upper aqueous layer.

Standard solution B: 0.6 µg/mL of USP Alendronate Sodium RS in *Diluent* from *Standard stock solution*. Transfer 5 mL of this diluted solution (0.6 µg/mL) to a 50-mL polypropylene, screw-cap centrifuge tube containing 5 mL of *Borate solution*. Add 5 mL of acetonitrile and 5 mL of *Solution C*, and shake for 45 s. Allow to stand at room temperature for 30 min. Add 20 mL of methylene chloride, and shake vigorously for 1 min. Centrifuge for 5–10 min, and use a portion of the clear upper aqueous layer.

Reagent blank: Transfer 5.0 mL of *Diluent* to a 50-mL polypropylene, screw-cap centrifuge tube containing 5 mL of *Borate solution*. Add 5 mL of acetonitrile and 5 mL of *Solution C*, and shake for 45 s. Allow to stand at room temperature for 30 min. Add 20 mL of methylene chloride, and shake vigorously for 1 min. Centrifuge for 5–10 min, and use a portion of the clear upper aqueous layer.

Sample stock solution: 0.6 mg/mL of Alendronate Sodium in *Diluent*

Sample solution: Transfer 5.0 mL of *Sample stock solution* to a 50-mL polypropylene, screw-cap centrifuge tube containing 5 mL of *Borate solution*. Add 5 mL of acetonitrile and 5 mL of *Solution C*, and shake for 45 s. Allow to stand at room temperature for 30 min. Add 20 mL of methylene chloride, and shake vigorously for 1 min. Centrifuge for 5–10 min, and use a portion of the clear upper aqueous layer.

Alprazolam Extended-Release Tablets

DEFINITION

Alprazolam Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of alprazolam (C₁₇H₁₃CIN₄).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

Change to read:

- **Procedure**

Mobile phase: Acetonitrile, water, and phosphoric acid (350:650:1)

Standard solution: 0.05 mg/mL of USP Alprazolam RS in methanol

Sample solution: Transfer an appropriate number of Tablets into a suitable volumetric flask to obtain a nominal concentration of about 0.05 mg/mL of alprazolam. Sonicate in 80% of the flask volume of methanol for 15 min, and shake mechanically for 30 min. Dilute with methanol to final volume, filter a portion of the solution, and discard the first 3 mL of filtrate.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 15-cm; 5-µm packing L7

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Tailing factor: NMT 2.0

Column efficiency: NLT 3000 theoretical plates

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 500 mL

Tolerances: See *Table 1*.

Table 1

Time (h)	Amount Dissolved		
	0.5-mg Tablet	2-mg Tablet	3-mg Tablet
1	NMT 25%	NMT 20%	NMT 20%
4	40%–60%	30%–55%	30%–55%
8	70%–90%	65%–90%	65%–90%
12	NLT 85%	NLT 85%	NLT 85%

The percentages of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$) released at the times specified conform to *Acceptance Table 2 in Dissolution < 711 >*.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: pH 6.0 phosphate buffer (8.0 g/L of monobasic potassium phosphate and 2.0 g/L of dibasic potassium phosphate in water; adjust with phosphoric acid or potassium hydroxide to a pH of 6.0 ± 0.1); 500 mL

Apparatus 1: 100 rpm

Times: 1, 4, 8, and 16 h

Mobile phase: Acetonitrile, tetrahydrofuran, and *Medium* (35:5:60)

Standard stock solution: 0.05 mg/mL of USP Alprazolam RS in methanol

Standard solution: ($L/500$) mg/mL of USP Alprazolam RS in *Medium* from the *Standard stock solution*, where L is the label claim in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter.

Chromatographic system

(See *Chromatography < 621 >*, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 7.5-cm; 5- μ m packing L7

Flow rate: 1.3 mL/min

Injection volume: 80 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of alprazolam ($C_{17}H_{13}ClN_4$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (r_U/r_S) \times C_S$$

r_U peak response of alprazolam from the *Sample solution* at each time point

r_S peak response of alprazolam from the *Standard solution*

C_S concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$) dissolved at each time point (i):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_S)] + (C_1 \times V_S)\} \times (1/L) \times 100$$

$$\text{Result}_3 = (\{C_3 \times [V - (2 \times V_S)]\} + [(C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

$$\text{Result}_4 = (\{C_4 \times [V - (3 \times V_S)]\} + [(C_3 + C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

C_i concentration of alprazolam in the *Sample solution* at the specified time point (mg/mL)

V = volume of *Medium*, 500 mL

L = label claim (mg/Tablet)

V_s = volume of the *Sample solution* withdrawn at each time point and replaced with *Medium* (mL)

Tolerances: See *Table 2*.

Table 2

Time Point (<i>i</i>)	Time (h)	Amount Dissolved			
		0.5-mg Tablet	1-mg Tablet	2-mg Tablet	3-mg Tablet

4	16	NLT 85%	NLT 85%	NLT 85%	NLT 80%

The percentages of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$) released at the times specified conform to *Acceptance Table 2* in *Dissolution* 〈 711 〉.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium: pH 6.0 phosphate buffer (8.0 g/L of monobasic potassium phosphate and 2.0 g/L of dibasic potassium phosphate in water; adjust with phosphoric acid or potassium hydroxide to a pH of 6.0 ± 0.1); 500 mL, deaerated

Apparatus 1: 100 rpm

Times: 1, 4, and 8 h for Tablets labeled to contain 0.5 mg or 1 mg; 1, 4, 8, and 16 h for Tablets labeled to contain 2 mg or 3 mg

Mobile phase: Acetonitrile and *Medium* (40:60)

Standard stock solution: 0.5 mg/mL of USP Alprazolam RS in methanol

Standard solution: ($L/500$) mg/mL of USP Alprazolam RS in *Medium* from the *Standard stock solution*, where L is the label claim in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter of 1- μ m pore size.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 10-cm; 3- μ m or 5- μ m packing L7

Flow rate: 1 mL/min

Injection volume: 100 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of alprazolam ($C_{17}H_{13}ClN_4$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (r_U/r_S) \times C_S$$

r_U = peak response of alprazolam from the *Sample solution* at each time point

r_S = peak response of alprazolam from the *Standard solution*

C_S = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$) dissolved at each time point (i):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_S)] + (C_1 \times V_S)\} \times (1/L) \times 100$$

$$\text{Result}_3 = (\{C_3 \times [V - (2 \times V_S)]\} + [(C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

$$\text{Result}_4 = (\{C_4 \times [V - (3 \times V_S)]\} + [(C_3 + C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

C_i = concentration of alprazolam in the *Sample solution* at the specified time point (mg/mL)

V = volume of *Medium*, 500 mL

L = label claim (mg/Tablet)

V_S = volume of the *Sample solution* withdrawn at each time point and replaced with *Medium* (mL)

Tolerances: See *Table 3*.

Table 3

Time Point (<i>i</i>)	Time (h)	Amount Dissolved			
		0.5-mg Tablet	1-mg Tablet	2-mg Tablet	3-mg Tablet
1	1	15%–35%	10%–30%	10%–30%	5%–25%
2	4	50%–75%	45%–65%	30%–55%	25%–50%
3	8	NLT 75%	NLT 70%	60%–80%	50%–75%
4	16	—	—	NLT 85%	NLT 80%

The percentages of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$) released at the times specified conform to *Acceptance Table 2* in *Dissolution* $\langle 711 \rangle$.

Test 4: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

Medium: pH 6.0 phosphate buffer (8.0 g/L of monobasic potassium phosphate and 2.0 g/L of dibasic potassium phosphate in water; adjust with phosphoric acid or potassium hydroxide to a pH of 6.0); 500 mL

Apparatus 1 (20-mesh basket): 100 rpm

Times: 1, 4, 8, and 16 h

Mobile phase: Acetonitrile and *Medium* (32:68)

Standard stock solution: 0.4 mg/mL of USP Alprazolam RS in methanol

Standard solution: ($L/500$) mg/mL of USP Alprazolam RS in *Medium* from the *Standard stock solution*, where L is the label claim in mg/Tablet. Pass through a suitable filter of

0.45- μm pore size, and use the filtrate.

Sample solutions: At the end of specified time intervals, withdraw a known volume (V_S) of the solution from the dissolution vessel, and replace an equal volume of fresh *Medium* into the dissolution vessel. Pass the withdrawn sample through a suitable filter of 0.45- μm pore size, and use the filtrate.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Calculate the concentration (C_i) of alprazolam ($C_{17}H_{13}ClN_4$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (r_U/r_S) \times C_S$$

r_U peak response of alprazolam from the *Sample solution* at each time point

r_S peak response of alprazolam from the *Standard solution*

C_S concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$) dissolved at each time point (i):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_S)] + (C_1 \times V_S)\} \times (1/L) \times 100$$

$$\text{Result}_3 = (\{C_3 \times [V - (2 \times V_S)]\} + [(C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

$$\text{Result}_4 = (\{C_4 \times [V - (3 \times V_S)]\} + [(C_3 + C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

C_i = concentration of alprazolam in the *Sample solution* at the specified time point (mg/mL)

V = volume of *Medium*, 500 mL

L = label claim (mg/Tablet)

V_S = volume of the *Sample solution* withdrawn at each time point (mL)

Tolerances: See *Table 5*.

Table 5

Time Point (i)	Time (h)	Amount Dissolved
1	1	NMT 25%
2	4	40%–65%
3	8	65%–95%
4	16	NLT 85%

The percentages of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$) released at the times specified conform to *Acceptance Table 2 in Dissolution* { 711 }.

*(RB 1-Apr-2014)

IMPURITIES

Change to read:

- **Organic Impurities**

Buffer: 5.4 g/L of monobasic potassium phosphate (KH_2PO_4) in water. Adjust with phosphoric acid to a pH of 3.4.

Solution A: Acetonitrile, methanol, and *Buffer* (27:10:63)

Solution B: Acetonitrile, methanol, and *Buffer* (7:3:10)

Mobile phase: See *Table 6*.

Table 6

Time (min)	Solution A (%)	Solution B (%)
0	95	5
22	95	5
25	15	85

Time (min)	Solution A (%)	Solution B (%)
60	15	85
60.1	95	5
70	95	5

System suitability solution: 1 µg/mL each of USP Chlordiazepoxide Related Compound A RS, USP Alprazolam Related Compound A RS, and USP Nordazepam RS; and 0.4 µg/mL of USP Alprazolam RS in methanol

Standard solution: 0.4 µg/mL of USP Alprazolam RS in methanol

Sample solution: From NLT 20 Tablets ground to a fine powder, transfer an amount of powder to a suitable flask to obtain a nominal concentration of 0.2 mg/mL of alprazolam in methanol. [Note—Sonicate for 15 min to dissolve the contents.] Filter a portion, and discard the first 1 mL of filtrate.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 25-cm; 5-µm packing L7

Flow rate: 1.5 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times are listed in *Table 6*.]

Suitability requirements

Resolution: NLT 1.5 between nordazepam and alprazolam; NLT 1.5 between chlordiazepoxide related compound A and alprazolam related compound A, *System suitability solution*

Tailing factor: NMT 2.0 for the alprazolam peak, *System suitability solution*

Relative standard deviation: NMT 5%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of the impurity from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of alprazolam in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 7*)

Acceptance criteria: See *Table 7*.

Table 7

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

Aminobenzoate Potassium, *USP 38* page 2174. As part of the USP monograph modernization effort, the following revisions are proposed:

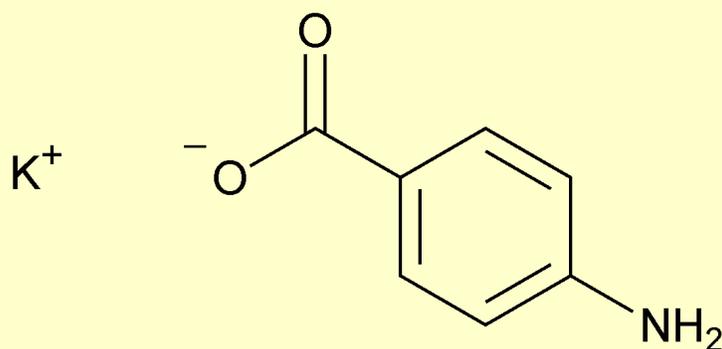

1. Revise the *Definition* from NLT 98.5% and NMT 101.0% to NLT 98.0% and NMT 102.0%, which is typical for chromatographic procedures as proposed in the *Assay*.
2. Replace *Identification test A* based on *Ultraviolet Absorption* with the more specific *Infrared Absorption* test.
3. Replace *Identification test B* based on melting temperature with the retention time agreement of the chromatographic peaks in the proposed *Assay* method.
4. Replace the existing titrimetric procedure in the *Assay* with a validated stability-indicating HPLC procedure. The proposed liquid chromatographic procedure is based on an analysis performed with the Eclipse XBD-Phenyl brand of L11 column. The typical retention time for aminobenzoic acid is about 6.0 min.
5. Delete the tests for *Chloride* and *Sulfate* because they do not add any additional value to ensure the quality of the drug substance.
6. Replace the spectrometric *Volatile Diazotizable Substances* procedure with a gas chromatographic method based on analyses performed with the DB-5MS fused silica capillary brand of G27 column. The typical retention times for aniline and *p*-toluidine are about 4.1 and 5.1 min, respectively.
7. Add a test for *Organic Impurities* based on the HPLC procedure in the *Assay* using the Eclipse XBD-Phenyl brand of L11 column. The typical retention time for aminobenzoic acid is about 5.4 min.
8. Add three new Reference Standards and an existing Reference Standard, introduced by the proposed HPLC procedure, to the *USP Reference Standards* section: USP 4-Nitrobenzoic Acid RS, USP Aniline RS, USP *p*-Toluidine RS, and USP Benzocaine RS.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Standard stock solution: 0.1 mg/mL of *p*-toluidine, prepared by dissolving a quantity of *p*-toluidine in 5% of the volumetric flask volume of methanol, and diluting with water to volume

Standard solution: 1 µg/mL of *p*-toluidine from the *Standard stock solution*

Sample solution: Transfer 5.0 g of Aminobenzoate Sodium to a suitable flask, and add a volume of 1.25 N sodium hydroxide that is just sufficient to dissolve the sample and to render the solution just alkaline to phenolphthalein TS. Dilute with water to 50 mL, and steam distill the solution, collecting 95 mL of the distillate in a 100 mL volumetric flask. Dilute with water to volume.

Blank: Water

Instrumental conditions

Mode: Vis

Analytical wavelength: Wavelength of maximum absorbance at about 405 nm

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Transfer 20.0 mL each of the *Standard solution*, *Sample solution*, and *Blank* to three separate 100 mL beakers, and treat each as follows. Add 5.0 mL of 1 N hydrochloric acid, and cool in an ice bath. Add 2.0 mL of 0.1 M sodium nitrite dropwise, with stirring. Allow to stand for 5 min for the diazotization reaction to be complete, add quickly to 10.0 mL of a cold solution of guaiacol (freshly prepared by dissolving 0.20 g of guaiacol in 100 mL of 1 N sodium hydroxide), and allow to stand for 30 min. Concomitantly determine the absorbances of the solutions.

Acceptance criteria: The absorbance of the solution from the *Sample solution* does not exceed that of the solution from the *Standard solution*, corresponding to NMT 0.002% of volatile diazotizable substances as *p*-toluidine. ■1S (USP39)

Add the following:

- **Limit of Aniline and *p*-Toluidine**

Diluent: Methylene chloride

Standard stock solution: 0.1 mg/mL each of USP Aniline RS and USP *p*-Toluidine RS in
Diluent

Standard solution: 1.0 µg/mL each of USP Aniline RS and USP *p*-Toluidine RS in *Diluent* from *Standard stock solution*

Sample solution: 100 mg/mL of Aminobenzoate Sodium in *Diluent* prepared as follows. Add an appropriate quantity of Aminobenzoate Sodium to a suitable volumetric flask and dilute with *Diluent* to volume. Agitate for 10 min on a shaker and centrifuge at 3000 rpm for 5 min. Use the supernatant.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: GC

Detectors

Flame ionization: 300°

Hydrogen: 40 mL/min

Air: 400 mL/min

Column: 30-m × 0.32-mm fused silica capillary; coated with 0.5-µm film of phase G27

Temperatures

Injection port: 280°

Detector: 300°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
130	—	130	4
130	20	180	5

Carrier gas: Helium

Flow rate: 1 mL/min

Injection volume: 2 µL

Injection type: Split ratio, 1:10

System suitability

Sample: *Standard solution*

[Note—The relative retention times of aniline and *p*-toluidine are about 4.1 and 5.1 min, respectively.]

Suitability requirements

Resolution: NLT 7.0 between aniline and *p*-toluidine

Tailing factor: NMT 1.5 for aniline and *p*-toluidine

Relative standard deviation: NMT 6.0% for aniline and *p*-toluidine

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of *p*-toluidine or aniline in the portion of Aminobenzoate Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of *p*-toluidine or aniline from the *Sample solution*

r_S = peak response of *p*-toluidine or aniline from the *Standard solution*

C_s concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)

C_T concentration of Aminobenzoate Sodium in the *Sample solution* (mg/mL)

Acceptance criteria

Aniline: NMT 10 ppm

p-Toluidine: NMT 20 ppm

■ 1S (USP39)

Add the following:

■ • Organic Impurities

Solution A: 1.5% Acetic acid, prepared by mixing 690 mL of water with 10 mL of glacial acetic acid

Solution B: Methanol

Mobile phase: See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0.0	85	15
4.0	85	15
4.1	45	55
10.0	45	55
10.1	85	15
13	85	15

Diluent: Methanol and water (85:15)

System suitability solution: 1 mg/mL of USP Aminobenzoate Sodium RS, 0.01 mg/mL of USP 4-Nitrobenzoic Acid RS, and 0.01 mg/mL of USP Benzocaine RS in *Diluent* prepared as follows. Transfer 1 mL each of 0.1 mg/mL of USP 4-Nitrobenzoic Acid RS in methanol and 0.1 mg/mL of USP Benzocaine RS in *Diluent* to a 10-mL volumetric flask containing the appropriate amount of USP Aminobenzoate Sodium RS, and dilute with *Diluent* to volume.

Standard solution: 1 µg/mL each of USP Aminobenzoate Sodium RS, USP 4-Nitrobenzoic Acid RS, and USP Benzocaine RS in *Diluent*

Sample solution: 1 mg/mL of Aminobenzoate Sodium in *Diluent*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.0-mm × 15-cm; 3.5-µm packing L11

Flow rate: 0.4 mL/min

Injection volume: 5 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.5 between benzocaine and 4-nitrobenzoic acid, *System suitability solution*

Relative standard deviation: NMT 3% for the aminobenzoate sodium, 4-nitrobenzoic

acid, and benzocaine peaks, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of 4-nitrobenzoic acid or benzocaine in the portion of Aminobenzoate Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of 4-nitrobenzoic acid or benzocaine from the *Sample solution*

Amitraz, *USP 38* page 2200. As part of the USP monograph modernization initiative, the following revisions are proposed:

1. *Identification* test *A*, currently based on infrared absorption, is revised to allow more flexibility to the users.
2. Omit TLC-based *Identification* test *B*. The remaining *Identification* tests are sufficient to establish identity of the article.
3. Replace the packed-column gas chromatographic *Assay* with a capillary-column procedure adapted from the *British Pharmacopoeia* monograph. This procedure is based on analysis performed with the Chrompack CP-Sil 5 CB brand of G9 column. The typical retention time of the amitraz peak is about 11 min.
4. Replace the TLC *Organic Impurities* procedure with a capillary-column gas chromatographic procedure adapted from the *British Pharmacopoeia* monograph. This procedure is based on analysis performed with the Chrompack CP-Sil 8 CB brand of G27 column. The typical retention time of the amitraz peak is about 32 min. The *impurities Acceptance criteria* are taken from the 2013 edition of the *British Pharmacopoeia*.
5. Revise the test for *Water Determination* to provide flexibility in the solvent system used based on comments and supporting data received.
6. Add the new Reference Standards used in the test for *Organic Impurities* to the *USP Reference Standards* section.

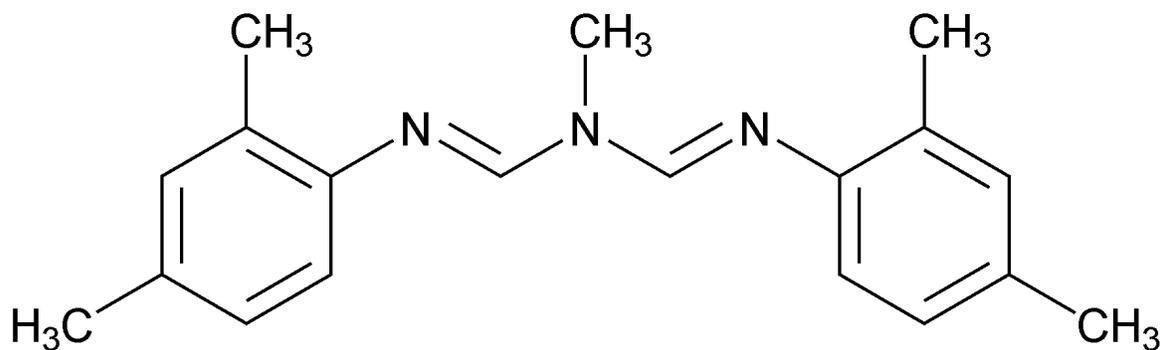

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM3: M. Puderbaugh.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 2 μ L

Developing solvent system: Cyclohexane, ethyl acetate, and triethylamine (5:3:2)

Spray reagent: 0.5% solution of *N*-(1-naphthyl) ethylenediamine dihydrochloride in methanol

Analysis

Samples: *Sample solution*, *Standard solution A*, and *Standard solution B*

Stand the plate to a depth of 3.5 cm in a solution prepared by dissolving 35 g of acetamide in 100 mL of methanol, adding 100 mL of triethylamine, and diluting to 250 mL with methanol. Allow the wet plate to stand in a current of cold air for 30 s. Immediately apply *Samples* separately to the plate, at a level about 1 cm below the top of the impregnated zone. Promptly develop the plate until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber and allow to air-dry. Examine the plate under short-wavelength UV light (*Acceptance criteria 1*). Expose the plate to the vapor of hydrochloric acid for 10 min, then expose it to the vapor of nitrogen dioxide (prepared by the reaction of nitric acid and zinc) for 10 min, remove any excess nitric oxide by air exhaust, spray the plate with *Spray reagent*, and examine the plate (*Acceptance criteria 2*).

Acceptance criteria 1: Any secondary spot from the *Sample solution* is not more intense than the corresponding spot from *Standard solution A* (2.0%).

Acceptance criteria 2: Any secondary spot from the *Sample solution* corresponding to 2,4-dimethylaniline is not more intense than the spot from *Standard solution B* (0.30%).

■ **Standard solution:** 0.05 mg/mL of 2,4-dimethylaniline, 1.0 mg/mL of USP Amitraz Related Compound A RS, 0.5 mg/mL of USP Amitraz Related Compound B RS, and 1.0 mg/mL of USP Amitraz Related Compound C RS in methyl acetate

Atomoxetine Capsules

DEFINITION

Atomoxetine Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of atomoxetine (C₁₇H₂₁NO).

IDENTIFICATION

- **A. Infrared Absorption** 〈 197K 〉 or 〈 197A 〉

Standard: 6 mg/mL of USP Atomoxetine Hydrochloride RS in methanol. Dry the solution to a dry powder under an air or nitrogen purge for a minimum of 3 h.

Sample: Shake the contents of a sufficient number of Capsules, equivalent to about 60 mg of atomoxetine, with 10 mL of methanol. Centrifuge at 4000 rpm for 5 min. Evaporate the solution to a dry powder with the aid of a current of air or stream of nitrogen.

Acceptance criteria: The IR spectrum exhibits main bands at (± 2) wavenumbers (cm⁻¹) 2955, 2855, 1599–1604, 1492, 1048, 1023, and 1010.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **Procedure**

Buffer: 5.8 g/L of monobasic potassium phosphate in water. To each liter of this solution add 3.0 mL of triethylamine, and adjust with phosphoric acid to a pH of 2.5.

Mobile phase: Acetonitrile and *Buffer* (38:62)

System suitability solution: 0.1 mg/mL of atomoxetine (free base) from USP Atomoxetine Hydrochloride RS and 0.02 mg/mL of *o*-cresol in *Mobile phase*. Sonicate to aid in dissolution.

Standard solution: 0.1 mg/mL of atomoxetine (free base) from USP Atomoxetine Hydrochloride RS in *Mobile phase*. Sonicate to aid in dissolution.

Sample stock solution: From NLT 10 Capsules (including shells) prepared as follows. Add the intact Capsules to a suitable volumetric flask. Add *Mobile phase* to fill 65% of the final volume. Allow to stand for at least 10 min, then shake for 20 min. Dilute with *Mobile phase* to volume.

Sample solution: Nominally 0.1 mg/mL of atomoxetine, prepared by diluting a suitable volume of *Sample stock solution* with *Mobile phase*

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 7.5-cm; 3.5- μ m packing L7

Column temperature: 35^o

Flow rate: 1.5 mL/min

Injection volume: 10 μ L

Run time: 1.7 times the retention time of atomoxetine

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for atomoxetine and *o*-cresol are 1.0 and 1.3, respectively.]

Suitability requirements

Resolution: NLT 3.5 between atomoxetine and *o*-cresol, *System suitability solution*

Tailing factor: NMT 2.0 for atomoxetine, *System suitability solution*

Relative standard deviation: NMT 1.0% for atomoxetine, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of atomoxetine ($C_{17}H_{21}NO$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of atomoxetine in the *Standard solution* (mg/mL)

C_U nominal concentration of atomoxetine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **Dissolution** 〈 711 〉

Medium: 0.1 N hydrochloric acid; 1000 mL, deaerated

Apparatus 2: 50 rpm, with three-prong sinker

Time: 30 min

Buffer and Mobile phase: Prepare as directed in the *Assay*.

Standard stock solution: 0.1 mg/mL of atomoxetine (free base) from USP Atomoxetine Hydrochloride RS in *Medium*. Sonicate to aid in dissolution.

Standard solution: Dilute the *Standard stock solution* with *Medium* to obtain a final concentration of $(L/1000)$ mg/mL, where L is the Capsule label claim in mg.

Sample solution: Pass a portion of the solution under test through a suitable filter.

Chromatographic system: Proceed as directed in the *Assay*.

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 1.4%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of atomoxetine ($C_{17}H_{21}NO$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_{\bar{f}}$ peak response from the *Sample solution*

$r_{\bar{s}}$ peak response from the *Standard solution*

$C_{\bar{s}}$ concentration of atomoxetine in the *Standard solution* (mg/mL)

L = label claim (mg/Capsule)

V = volume of *Medium* (mL)

Tolerances: NLT 80% (Q) of the labeled amount of atomoxetine ($C_{17}H_{21}NO$) is dissolved.

- **Uniformity of Dosage Units** { 905 } : Meet the requirements

IMPURITIES

Change to read:

- **Organic Impurities**

Buffer: Dissolve 4.9 g of sodium 1-decanesulfonate and 6.9 g of monobasic potassium phosphate in 1 L of water. Adjust with phosphoric acid to a pH of 3.1.

Mobile phase: Acetonitrile and *Buffer* (41:59)

Sensitivity solution: 0.1 µg/mL of atomoxetine in *Mobile phase*

System suitability solution: 1 mg/mL of atomoxetine containing atomoxetine *N*-amide prepared as follows. Weigh equal amounts of USP Atomoxetine Hydrochloride RS and urea, and place in a volumetric flask. Add water to fill 10% of the final volume. Sonicate for 3 min. Place the flask in an 85° oven for 40 min. Allow the solution to cool to room temperature. Dilute with *Mobile phase* to volume. [Note—The oven temperature and time in the oven can be adjusted to give a suitable level of atomoxetine *N*-amide peak.]

Sample solution: 1 mg/mL of atomoxetine in *Mobile phase*, from the contents of NLT 5 Capsules prepared as follows. Transfer the Capsule contents to a suitable volumetric flask. Fill 50% of the final volume with *Mobile phase*. Swirl, and let stand for 15 min. Dilute with *Mobile phase* to volume.

Chromatographic system

BRIEFING

Carbamazepine Extended-Release Tablets, USP 38 page 2586. As part of USP monograph modernization efforts, it is proposed to make the following changes:

1. Replace the two liquid chromatographic procedures used in *Organic Impurities, Procedure 1* and *Organic Impurities, Procedure 2* with a single more specific, stability-indicating liquid chromatographic procedure. This proposed procedure was developed for the Carbamazepine family and was validated with the Waters Acquity UPLC HSS Cyano brand of L10 column. The typical retention time for carbamazepine is about 10.2 min.
2. Replace the liquid chromatographic procedure in the *Assay* with a procedure similar to the proposed test for *Organic Impurities*.
3. Add *Acceptance criteria* for a specified degradation product to the monograph. Manufacturers are encouraged to submit their approved specifications to USP if they are different from those proposed in this revision.

4. Add USP Carbamazepine Related Compound A RS and USP Carbamazepine Related Compound B RS to the *USP Reference Standards* section to support the proposed revision.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Carbamazepine Extended-Release Tablets

DEFINITION

Carbamazepine Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of carbamazepine ($C_{15}H_{12}N_2O$).

IDENTIFICATION

- **A. Ultraviolet Absorption** (197U)

Standard solution: 10 µg/mL of USP Carbamazepine RS in methanol

Sample solution: Finely powder 1 Tablet, and quantitatively transfer the powder, with the aid of methanol, to a 100-mL volumetric flask. Add about 70 mL of methanol, and shake by mechanical means for 60 min. Sonicate for 15 min, and dilute with methanol to volume. Allow to stand for 10–15 min. Dilute a portion of the clear solution with methanol to obtain a solution containing about 10 µg/mL of carbamazepine.

Acceptance criteria: Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

Change to read:

- **Procedure**

~~**Mobile phase:** Methanol, methylene chloride, and water (450:45:600)~~

~~**Internal standard solution:** 600 µg/mL of phenytoin in methanol~~

R_U ~~peak response ratio of carbamazepine to the internal standard from the Sample solution~~

R_S ~~peak response ratio of carbamazepine to the internal standard from the Standard solution~~

C_S ~~concentration of USP Carbamazepine RS in the Standard solution (µg/mL)~~

C_U ~~nominal concentration of carbamazepine in the Sample solution (µg/mL)~~

Acceptance criteria: ~~90.0%–110.0%~~

■ **Solution A:** Add 0.5 mL of triethylamine and 0.5 mL of formic acid to 1000 mL of water.

Solution B: Add 0.25 mL of formic acid to 1000 mL of methanol.

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.0	80	20
3.0	80	20
12.0	60	40
18.0	45	55
20.0	45	55
20.1	80	20

Time (min)	Solution A (%)	Solution B (%)
23.0	80	20

System suitability solution: 0.002 mg/mL each of USP Carbamazepine RS and USP Carbamazepine Related Compound A RS in methanol

Standard solution: 0.1 mg/mL of USP Carbamazepine RS in methanol

Sample solution: Nominally 0.1 mg/mL of carbamazepine from Tablets prepared as follows. Powder NLT 10 Tablets and transfer a sufficient portion of the powder to a suitable volumetric flask. Add 60% of the final flask volume of methanol. Shake by mechanical means for about 1 h. Dilute with methanol to volume. Centrifuge to obtain a clear supernatant and use the clear supernatant. [Note—The use of a centrifuge speed of 3000 rpm for 10 min may be suitable.]

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 2.1-mm × 10-cm; 1.8-µm packing L10

Column temperature: 40°

Flow rate: 0.3 mL/min

Injection volume: 2 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.7 between carbamazepine related compound A and carbamazepine, *System suitability solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of carbamazepine (C₁₅H₁₂N₂O) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U

= peak response from the *Sample solution*

r_S

= peak response from the *Standard solution*

C_S

= concentration of USP Carbamazepine RS in the *Standard solution* (mg/mL)

C_U

= nominal concentration of carbamazepine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% $\pm 1S$ (USP39)

PERFORMANCE TESTS

• Dissolution 〈 711 〉

Medium

For Tablets labeled to contain 100 mg or 200 mg: Water; 900 mL

For Tablets labeled to contain 400 mg: Water; 1800 mL

Apparatus 1: 100 rpm

Times: 3, 6, 12, and 24 h

Standard solution: USP Carbamazepine RS in *Medium*

Sample solution: Filtered portions of the solution under test, diluted with *Medium* if necessary

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum absorbance at about 284 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Determine the percentage of the labeled amount of carbamazepine ($C_{15}H_{12}N_2O$) dissolved at each time using the UV absorption.

Tolerances: See *Table 2*.

Table 2

Time (h)	Amount Dissolved
3	10%–35%
6	35%–65%
12	65%–90%
24	NLT 75%

The percentages (*Q*) of the labeled amount of carbamazepine ($C_{15}H_{12}N_2O$) dissolved at the times specified conform to *Acceptance Table 2* in 〈 711 〉.

• Uniformity of Dosage Units 〈 905 〉: Meet the requirements

IMPURITIES

Delete the following:

• Organic Impurities: Procedure 1

Mobile phase: Methanol, methylene chloride, and water (450:45:600)

System suitability solution: 60 $\mu\text{g/mL}$ of phenytoin and 20 $\mu\text{g/mL}$ of USP Carbamazepine RS in methanol

Standard solution: 4 $\mu\text{g/mL}$ of USP Carbamazepine RS in methanol

Sample solution: Use *Sample stock solution A* from the Assay.

Chromatographic system and System suitability: Proceed as directed in the Assay.

Analysis**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 r_U peak response of each impurity from the *Sample solution* r_S peak response of carbamazepine from the *Standard solution* C_S concentration of USP Carbamazepine RS in the *Standard solution* (mg/mL) C_U nominal concentration of carbamazepine in the *Sample solution* (mg/mL)**Acceptance criteria****Any individual unspecified degradation product:** NMT 0.2%

BRIEFING

Carbidopa and Levodopa Extended-Release Tablets, USP 38 page 2592. It is proposed to revise the monograph as follows:

1. Revise the disregard statement in the test for *Organic Impurities* to consider whether a peak is associated with carbidopa or levodopa.
2. Revise the relative response factor for levodopa related compound A based on additional supporting data.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

(SM4: H. Joyce.)

Comment deadline: May 31, 2015

Carbidopa and Levodopa Extended-Release Tablets

DEFINITION

Carbidopa and Levodopa Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of carbidopa ($C_{10}H_{14}N_2O_4$) and of levodopa ($C_9H_{11}NO_4$).

IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **Procedure**

Protect the volumetric preparations from light.

Solution A: 0.24 g/L of sodium 1-decanesulfonate in water

Solution B: 11.6 g/L of monobasic sodium phosphate in water

Mobile phase: *Solution A*, *Solution B*, and water (0.13: 95: 4.87), prepared as follows. Add 0.13% of the final volume of *Solution A* to 95% of the final volume of *Solution B*. Adjust with phosphoric acid to a pH of 2.8. Dilute with water to final volume.

Standard solution: 0.1 mg/mL of USP Carbidopa RS and 0.4 mg/mL of USP Levodopa RS in solution, prepared as follows. Transfer accurately weighed portions of the Reference Standards into a suitable volumetric flask, and dissolve in 0.1 N phosphoric acid using 8% of the final volume. Sonication may be used to promote dissolution. Dilute with water to the final volume.

Sample solution: Nominally 0.1 mg/mL of carbidopa and 0.4 mg/mL of levodopa from NLT 20 finely powdered Tablets, prepared as follows. Transfer an accurately weighed portion of the powder, equivalent to 1 Tablet weight, into a suitable volumetric flask, and dissolve in 0.1 N phosphoric acid, using 10% of the final volume. Sonicate for 10 min, and then stir for 30 min. Dilute with water to volume, and stir for another 20 min. Pass the solution through a suitable filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm \times 10-cm; 5- μ m packing L1

Flow rate: 2 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

[Note—The relative retention times for levodopa and carbidopa are 1.0 and 2.8, respectively.]

Suitability requirements

Tailing factor: NMT 1.5 for carbidopa; NMT 1.5 for levodopa

Resolution: NLT 6 between levodopa and carbidopa

Relative standard deviation: NMT 1.0% for carbidopa; NMT 1.0% for levodopa

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of carbidopa ($C_{10}H_{14}N_2O_4$) or levodopa ($C_9H_{11}NO_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of carbidopa or levodopa from the *Sample solution*

r_S peak response of carbidopa or levodopa from the *Standard solution*

C_S concentration of USP Carbidopa RS or USP Levodopa RS in the *Standard solution* (mg/mL)

C_U nominal concentration of carbidopa or levodopa in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% each of the labeled amounts of carbidopa and levodopa

PERFORMANCE TESTS

• Dissolution 〈 711 〉

Test 1

Medium: 0.1 N hydrochloric acid; 900 mL degassed with helium

Apparatus 2: 50 rpm

Times

For Tablets that contain 25 mg of carbidopa and 100 mg of levodopa: 0.5, 1, and 4 h

For Tablets that contain 50 mg of carbidopa and 200 mg of levodopa: 0.5, 1, 2.5, and 4 h

Solution A: 0.24 g/L of sodium 1-decanesulfonate in water

Solution B: 12.7 g/L of monobasic sodium phosphate monohydrate in water

Mobile phase: *Solution A*, *Solution B*, and water (0.13: 95: 4.87), prepared as follows. Add 0.13% of the final volume of *Solution A* to 95% of the final volume of *Solution B*. Adjust with phosphoric acid to a pH of 2.8. Dilute with water to final volume.

Standard solution: 0.03 mg/mL of USP Carbidopa RS and 0.1 mg/mL of USP Levodopa RS in *Medium*. Sonication may be used to aid in dissolution.

Sample solution

For Tablets that contain 25 mg of carbidopa and 100 mg of levodopa: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size, and discard the first 1–3 mL.

For Tablets that contain 50 mg of carbidopa and 200 mg of levodopa: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size, discard the first 1–3 mL, and dilute with *Medium* (50:50).

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm \times 30-cm; 10- μ m packing L1

Flow rate: 2 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

[Note—The relative retention times for levodopa and carbidopa are 0.4 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between levodopa and carbidopa

Relative standard deviation: NMT 2.0% for carbidopa and NMT 2.0% for levodopa for six replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of carbidopa ($C_{10}H_{14}N_2O_4$) or of levodopa ($C_9H_{11}NO_4$) in the sample withdrawn from the vessel at each time point i :

$$\text{Result} = (r_U/r_S) \times C_S$$

r_U peak response of carbidopa or levodopa from the *Sample solution*

r_S peak response of carbidopa or levodopa from the *Standard solution*

C_S concentration of USP Carbidopa RS or USP Levodopa RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amounts (Q_i) of carbidopa ($C_{10}H_{14}N_2O_4$) or of levodopa ($C_9H_{11}NO_4$) dissolved at each time point i :

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_S)] + (C_1 \times V_S)\} \times (1/L) \times 100$$

$$\text{Result}_3 = (\{C_3 \times [V - (2 \times V_S)]\} + [(C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

$$\text{Result}_4 = (\{C_4 \times [V - (3 \times V_S)]\} + [(C_3 + C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

C_i concentration of carbidopa or levodopa in the portion of sample withdrawn at time point i (mg/mL)

V = volume of the *Medium*, 900 mL

L = label claim of carbidopa or levodopa (mg/Tablet)

V_S volume of the *Sample solution* withdrawn from the *Medium* (mL)

Tolerances

For Tablets that contain 25 mg of carbidopa and 100 mg of levodopa: See *Table 1*.

Table 1

Time Point (i)	Time (h)	Amount of Carbidopa Dissolved	Amount of Levodopa Dissolved
1	0.5	15%–40%	14%–39%
2	1	37%–62%	36%–61%
3	4	NLT 80%	NLT 80%

For Tablets that contain 50 mg of carbidopa and 200 mg of levodopa: See *Table 2*.

Table 2

Time Point (i)	Time (h)	Amount of Carbidopa Dissolved	Amount of Levodopa Dissolved
1	0.5	8%–33%	8%–33%
2	1	26%–51%	26%–51%
3	2.5	62%–87%	64%–89%
4	4	NLT 80%	NLT 80%

The percentages of the labeled amounts of carbidopa ($C_{10}H_{14}N_2O_4$) and of levodopa ($C_9H_{11}NO_4$) dissolved at the times specified conform to *Acceptance Table 2* in $\langle 711 \rangle$.

Test 2: If the product complies with this test, the labeling indicates that it meets *USP Dissolution Test 2*.

Medium: Simulated gastric fluid TS (prepared without enzymes); 900 mL

Apparatus 2: 50 rpm

Times: 0.5, 1, 2, and 3 h

Buffer: 6.8 g/L of monobasic potassium phosphate and 1.0 g/L of 1-hexanesulfonic acid in water. Adjust with phosphoric acid to a pH of 3.3.

Mobile phase: Filtered and degassed mixture of methanol and *Buffer* (20:80)

Standard solution: ($L/900$) mg/mL of USP Carbidopa RS and ($L/900$) mg/mL of USP Levodopa RS in *Medium*, where L is the label claim, in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography* $\langle 621 \rangle$, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L7

Flow rate: 1 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

[Note—The relative retention times for levodopa and carbidopa are 1.0 and 1.4, respectively.]

Suitability requirements

Resolution: NLT 2.0 between levodopa and carbidopa

Column efficiency: NLT 4000 theoretical plates for carbidopa; NLT 4000 theoretical plates for levodopa

Tailing factor: NMT 2.0 for carbidopa; NMT 2.0 for levodopa

Relative standard deviation: NMT 1.0% for carbidopa; NMT 1.0% for levodopa

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of carbidopa ($C_{10}H_{14}N_2O_4$) or of levodopa ($C_9H_{11}NO_4$) in the sample withdrawn from the vessel at each time point i :

$$\text{Result} = (r_U/r_S) \times C_S$$

r_U = peak response of carbidopa or levodopa from the *Sample solution*

r_S = peak response of carbidopa or levodopa from the *Standard solution*

C_S = concentration of USP Carbidopa RS or USP Levodopa RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amounts (Q_i) of carbidopa ($C_{10}H_{14}N_2O_4$) or of levodopa ($C_9H_{11}NO_4$) dissolved at each time point i :

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_S)] + (C_1 \times V_S)\} \times (1/L) \times 100$$

$$\text{Result}_3 = (\{C_3 \times [V - (2 \times V_S)]\} + [(C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

$$\text{Result}_4 = (\{C_4 \times [V - (3 \times V_S)]\} + [(C_3 + C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

C_i = concentration of carbidopa or levodopa in the portion of sample withdrawn at time point i (mg/mL)

V = volume of the *Medium*, 900 mL

L = label claim of carbidopa or levodopa (mg/Tablet)

V_S = volume of the *Sample solution* withdrawn from the *Medium* (mL)

Tolerances: See *Table 3*.

Table 3

Time Point (i)	Time (h)	Amount Dissolved
1	0.5	20%–35%
2	1	35%–60%
3	2	65%–95%
4	3	NLT 80%

The percentages of the labeled amounts of carbidopa ($C_{10}H_{14}N_2O_4$) and of levodopa ($C_9H_{11}NO_4$) dissolved at the times specified conform to *Acceptance Table 2* in $\langle 711 \rangle$.

Test 3: If the product complies with this test, the labeling indicates that it meets *USP Dissolution Test 3*.

Medium, Apparatus 2, Solution A, Solution B, Mobile phase, Standard solution, Chromatographic system, and System suitability: Proceed as directed in *Test 1*.

Times: 0.5, 1, 2.5, and 4 h

Sample solution: Pass a portion of the solution under test through a suitable filter.

Tolerances: See *Table 4*.

Table 4

Time Point (i)	Time (h)	Amount Dissolved for Tablets That Contain 25 mg of Carbidopa and 100 mg of Levodopa	Amount Dissolved for Tablets That Contain 50 mg of Carbidopa and 200 mg of Levodopa
1	0.5	15%–40%	15%–35%
2	1	25%–65%	25%–65%
3	2.5	NLT 60%	NLT 60%
4	4	NLT 80%	NLT 80%

The percentages of the labeled amounts of carbidopa ($C_{10}H_{14}N_2O_4$) and of levodopa ($C_9H_{11}NO_4$) dissolved at the times specified conform to *Acceptance Table 2* in $\langle 711 \rangle$.

Test 4: If the product complies with this test, the labeling indicates that it meets *USP Dissolution Test 4*.

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Times: 1, 3, and 6 h

Solution A: 0.24 g/L of sodium 1-decanesulfonate in water

Solution B: 11.6 g/L of monobasic sodium phosphate monohydrate in water

Mobile phase: *Solution A*, *Solution B*, and water (0.13: 95: 4.87), prepared as follows.

Add 0.13% of the final volume of *Solution A* to 95% of the final volume of *Solution B*.

Adjust with phosphoric acid to a pH of 2.8. Dilute with water to final volume.

Standard solution: ($L/900$) mg/mL of USP Carbidopa RS and ($L/900$) mg/mL of USP Levodopa RS in *Medium*, where L is the label claim, in mg/Tablet

Sample solution: Withdraw a 10.0-mL aliquot at each time point, and pass a portion of the solution under test through a suitable filter. Replace the 10.0-mL aliquot withdrawn for analysis with a 10.0-mL aliquot of *Medium*.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm × 30-cm; 10- μ m packing L1

Flow rate: 2 mL/min

Injection volume: 50 μ L

Run time: NLT 3 times the retention time of levodopa

System suitability

Sample: *Standard solution*

[Note—The relative retention times for levodopa and carbidopa are 1.0 and 2.5, respectively.]

Suitability requirements

Resolution: NLT 2.0 between levodopa and carbidopa

Tailing factor: NMT 2.0 for carbidopa; NMT 2.0 for levodopa

Relative standard deviation: NMT 2.0% for carbidopa; NMT 2.0% for levodopa

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of carbidopa ($C_{10}H_{14}N_2O_4$) or of levodopa ($C_9H_{11}NO_4$) in the sample withdrawn from the vessel at each time point i :

$$\text{Result} = (r_U/r_S) \times C_S$$

r_U peak response of carbidopa or levodopa from the *Sample solution*

r_S peak response of carbidopa or levodopa from the *Standard solution*

C_S concentration of USP Carbidopa RS or USP Levodopa RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amounts (Q_i) of carbidopa ($C_{10}H_{14}N_2O_4$) or of levodopa ($C_9H_{11}NO_4$) dissolved at each time point i :

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times V) + (C_1 \times V_S)] \times (1/L) \times 100$$

$$\text{Result}_3 = \{[C_3 \times V] + [(C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

C_i = concentration of carbidopa or levodopa in the portion of sample withdrawn at time point i (mg/mL)

V = volume of the *Medium*, 900 mL

L = label claim of carbidopa or levodopa (mg/Tablet)

V_s = volume of the *Sample solution* withdrawn from the vessel and replaced with *Medium*, 10 mL

Tolerances: See *Table 5*.

Table 5

Time Point (i)	Time (h)	Amount Dissolved for Tablets That Contain 25 mg of Carbidopa and 100 mg of Levodopa	Amount Dissolved for Tablets That Contain 50 mg of Carbidopa and 200 mg of Levodopa
1	1	35%–70%	25%–60%
2	3	NLT 65%	NLT 65%
3	6	NLT 80%	NLT 80%

The percentages of the labeled amounts of carbidopa ($C_{10}H_{14}N_2O_4$) and of levodopa ($C_9H_{11}NO_4$) dissolved at the times specified conform to *Acceptance Table 2* in $\langle 711 \rangle$.

Test 5: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Times: 0.5, 1, 2.5, and 4 h

Mobile phase: 13.6 g/L of monobasic potassium phosphate adjusted with phosphoric acid to a pH of 3.0

Standard solution: ($L/900$) mg/mL of USP Carbidopa RS and in ($L/900$) mg/mL of USP Levodopa RS in *Medium*, where L is the label claim, in mg/Tablet. [Note—This solution is stable for 1 day if stored at 23°–27°.]

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size, and discard the first 4–5 mL. [Note—This solution is stable for 1 day if stored at 23°–27°.]

Chromatographic system

(See *Chromatography* $\langle 621 \rangle$, *System Suitability*.)

Mode: LC

Detector: UV 282 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L7

Flow rate: 1.5 mL/min

Injection volume: 20 μ L

Run time: NLT 3 times the retention time of levodopa

System suitability

Sample: *Standard solution*

[Note—The relative retention times for levodopa and carbidopa are 1.0 and 1.6, respectively.]

Suitability requirements

Resolution: NLT 2.0 between levodopa and carbidopa

Tailing factor: NMT 2.0 for carbidopa; NMT 2.0 for levodopa

Relative standard deviation: NMT 2.0% for carbidopa; NMT 2.0% for levodopa

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of carbidopa ($C_{10}H_{14}N_2O_4$) or of levodopa ($C_9H_{11}NO_4$) in the sample withdrawn from the vessel at each time point i :

$$\text{Result} = (r_U/r_S) \times C_S$$

r_U = peak response of carbidopa or levodopa from the *Sample solution*

r_S = peak response of carbidopa or levodopa from the *Standard solution*

C_S = concentration of USP Carbidopa RS or USP Levodopa RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amounts of carbidopa ($C_{10}H_{14}N_2O_4$) or of levodopa ($C_9H_{11}NO_4$) dissolved at each time point i :

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_S)] + (C_1 \times V_S)\} \times (1/L) \times 100$$

$$\text{Result}_3 = (\{C_3 \times [V - (2 \times V_S)]\} + [(C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

$$\text{Result}_4 = (\{C_4 \times [V - (3 \times V_S)]\} + [(C_3 + C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

C_i = concentration of carbidopa or levodopa in the portion of sample withdrawn at time point i (mg/mL)

V = volume of the *Medium*, 900 mL

L = label claim of carbidopa or levodopa (mg/Tablet)

V_S = volume of the *Sample solution* withdrawn from the *Medium* (mL)

Tolerances: See *Table 6*.

Table 6

Time Point (i)	Time (h)	Amount Dissolved for Tablets That Contain 25 mg of Carbidopa and 100 mg of Levodopa	Amount Dissolved for Tablets That Contain 50 mg of Carbidopa and 200 mg of Levodopa
1	0.5	25%–45%	20%–40%
2	1	40%–65%	30%–60%
3	2.5	NLT 65%	NLT 55%
4	4	NLT 80%	NLT 75%

The percentages of the labeled amounts of carbidopa ($C_{10}H_{14}N_2O_4$) and of levodopa ($C_9H_{11}NO_4$) dissolved at the times specified conform to *Acceptance Table 2* in $\langle 711 \rangle$.

- **Uniformity of Dosage Units** $\langle 905 \rangle$: Meet the requirements

IMPURITIES

Change to read:

- **Organic Impurities**

Protect all analytical solutions from light and maintain them at 2°–8° until they are injected into the chromatograph.

Buffer: 6 g/L of anhydrous monobasic sodium phosphate in water. Adjust with phosphoric acid to a pH of 2.2.

Mobile phase: Alcohol and *Buffer* (5:95)

System suitability solution: 1 µg/mL of USP Levodopa Related Compound B RS and 125 µg/mL of USP Carbidopa RS in *Mobile phase*

Standard solution: 1.25 µg/mL of USP Carbidopa RS and 5 µg/mL of USP Levodopa RS in *Mobile phase*

Sensitivity solution: 0.125 µg/mL of USP Carbidopa RS and 0.5 µg/mL of USP Levodopa RS in *Mobile phase* from the *Standard solution*

Sample

■ solution: ■_{1S} (USP39)

Nominally 0.125 mg/mL of carbidopa and nominally 0.5 mg/mL of levodopa in *Mobile phase* from NLT 10 finely powdered Tablets, prepared as follows. Transfer an accurately weighed portion of the powder into a suitable volumetric flask, dissolve in *Mobile phase*, and pass through a suitable filter.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1 mL/min

Run time: 6 times the retention time of carbidopa

Autosampler temperature: 6°

Injection volume: 20 µL

System suitability

Samples: *System suitability solution*, *Standard solution*, and *Sensitivity solution*

[Note—For the relative retention times, see *Table 7*.]

Suitability requirements

Resolution: NLT 1.5 between carbidopa and levodopa related compound B, *System suitability solution*

Relative standard deviation: NMT 3.0% for carbidopa and NMT 3.0% for levodopa for five replicate injections, *Standard solution*

Signal-to-noise ratio: NLT 10 for carbidopa in the *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of dihydroxybenzaldehyde, dihydroxyphenylacetone, and any unspecified carbidopa degradant based on the label claim of carbidopa in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_{\bar{U}}$ peak response of dihydroxybenzaldehyde, dihydroxyphenylacetone, or any unspecified carbidopa degradant from the *Sample solution*

r_S peak response of carbidopa from the *Standard solution*

C_S concentration of USP Carbidopa RS in the *Standard solution* (mg/mL)

C_U nominal concentration of carbidopa in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 7*)

Calculate the percentage of levodopa related compound A and any unspecified levodopa degradant based on the label claim of levodopa in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U peak response of levodopa related compound A or any unspecified levodopa degradant from the *Sample solution*

r_S peak response of levodopa from the *Standard solution*

C_S concentration of USP Levodopa RS in the *Standard solution* (mg/mL)

C_U nominal concentration of levodopa in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 7*)

Acceptance criteria: See *Table 7*. ~~Disregard any peak less than 0.05% of the carbidopa peak from the *Sample solution*.~~

- For peaks associated with carbidopa, disregard peaks less than 0.05% of carbidopa from the *Sample solution*. For peaks associated with levodopa, disregard peaks less than 0.05% of levodopa from the *Sample solution*. ■ 1S (USP39)

 - USP Levodopa RS
 - USP Levodopa Related Compound B RS
 - 3-Methoxy-L-tyrosine.
C₁₀H₁₃NO₄ 211.21

BRIEFING

Carbidopa and Levodopa Orally Disintegrating Tablets, *USP 38* page 2596 and the *Revision Bulletin* posted on the USP website with an official date of Aug. 1, 2014. On the basis of comments received, it is proposed to add a requirement in the test for *Organic Impurities* to analyze the *Sample solution* within 2 h of preparation due to solution stability issues.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM4: H. Joyce.)

Correspondence Number—C140972

Comment deadline: May 31, 2015

Carbidopa and Levodopa Orally Disintegrating Tablets

DEFINITION

Carbidopa and Levodopa Orally Disintegrating Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of carbidopa ($C_{10}H_{14}N_2O_4$) and levodopa ($C_9H_{11}NO_4$).

IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY

Change to read:

- **Procedure**

• Protect the volumetric solutions from light. • (ERR 1-Apr-2014)

Buffer: 6.6 g/L of monobasic sodium phosphate in water, adjusted with phosphoric acid to a pH of 2.2

Mobile phase: Alcohol and *Buffer* (5:95)

Standard solution: 0.025 mg/mL of USP Carbidopa RS and 0.25 mg/mL of USP Levodopa RS in *Mobile phase*

Sample stock solution: Transfer NLT 10 Tablets to a 1-L volumetric flask. Add 750 mL of *Mobile phase*, sonicate for 20 min, and then stir for 20 min. Dilute with *Mobile phase* to volume.

Sample solution: Dilute the *Sample stock solution* with *Mobile phase* to obtain a nominal concentration of carbidopa of between 0.025 and 0.07 mg/mL and a nominal concentration of levodopa of 0.25 mg/mL.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5- μ m packing L1

Autosampler temperature: 6°

Flow rate: 1 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

[Note—The relative retention times for levodopa and carbidopa are 0.42 and 1.0, respectively.]

Suitability requirements

Tailing factor: NMT 2.4 for both the levodopa and carbidopa peaks

Relative standard deviation: NMT 2.0% for both carbidopa and levodopa

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amounts of carbidopa ($C_{10}H_{14}N_2O_4$) and levodopa ($C_9H_{11}NO_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of carbidopa or levodopa from the *Sample solution*

r_S = peak response of carbidopa or levodopa from the *Standard solution*

C_S concentration of USP Carbidopa RS or USP Levodopa RS in the *Standard solution* (mg/mL)

C_T nominal concentration of carbidopa or levodopa in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% each of the labeled amounts of carbidopa and levodopa

PERFORMANCE TESTS

- **Disintegration** 〈 701 〉: NMT 60 s

- **Dissolution** 〈 711 〉

Medium: 0.1 N hydrochloric acid; 750 mL

Apparatus 2: 50 rpm

Time: 10 min

Solution A: 0.24 g/L of sodium 1-decanesulfonate in water

Mobile phase: Dissolve 11.0 g of monobasic sodium phosphate monohydrate in 1 L of water. Add 1.3 mL of *Solution A*, and adjust with phosphoric acid to a pH of 2.8.

Standard solution: ($L/800$) mg/mL each of USP Carbidopa RS and USP Levodopa RS in *Medium*, where L is the label claim in mg/Tablet of carbidopa or levodopa

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size, and discard the first 3 mL.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm \times 15.0-cm; 5- μ m packing L1

Autosampler temperature: 4 $^{\circ}$

Flow rate: 2 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

[Note—The relative retention times for levodopa and carbidopa are 0.4 and 1.0, respectively.]

Suitability requirements

Tailing factor: NMT 2.0 for both levodopa and carbidopa

Relative standard deviation: NMT 2.0% for both levodopa and carbidopa

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amounts of carbidopa ($C_{10}H_{14}N_2O_4$) and levodopa ($C_9H_{11}NO_4$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_T peak response of carbidopa or levodopa from the *Sample solution*

r_S peak response of carbidopa or levodopa from the *Standard solution*

C_S concentration of USP Carbidopa RS or USP Levodopa RS in the *Standard solution* (mg/mL)

V = volume of the *Medium*, 750 mL

L = label claim of carbidopa or levodopa (mg/Tablet)

Tolerances: NLT 75% (Q) of the labeled amount of carbidopa ($C_{10}H_{14}N_2O_4$) is dissolved, and NLT 75% (Q) of the labeled amount of levodopa ($C_9H_{11}NO_4$) is dissolved.

- **Uniformity of Dosage Units** { 905 } : Meet the requirements

IMPURITIES

Change to read:

- **Organic Impurities**

Protect all analytical solutions from light, and maintain them at 2°–8° until they are injected into the chromatograph.

Diluent: Methanol and 0.1 N hydrochloric acid (30:70)

Mobile phase: 13.8 g/L of monobasic sodium phosphate monohydrate in water, adjusted with phosphoric acid to a pH of 2.7

System suitability solution: 0.025 mg/mL each of USP Carbidopa RS, USP Levodopa RS, USP Levodopa Related Compound A RS, USP Levodopa Related Compound B RS, and USP Methyldopa RS in *Diluent*

Standard solution: 0.025 mg/mL of USP Levodopa RS in *Diluent*

Sample solution: Transfer a weighed quantity of powder equivalent to 250 mg of levodopa from NLT 20 finely powdered Tablets to a 100-mL volumetric flask. Add 80 mL of *Diluent*, sonicate for 10 min, and then stir for 30 min. Dilute with *Diluent* to volume. Centrifuge, and use the supernatant

■ inject the supernatant within 2 h. ■ 1S (USP39)

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5- μ m packing L7

Autosampler temperature: 4°

Flow rate: 1.5 mL/min

Injection volume: 20 μ L

Run time: 6 times the retention time of carbidopa

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—For the relative retention times, see *Table 1*. If peak fronting for levodopa related compound A is observed, lowering the column temperature to 15° is recommended to eliminate this problem.]

Suitability requirements

Resolution: NLT 1.5 between levodopa related compound A and levodopa, NLT 2.0 between carbidopa and levodopa related compound B, and NLT 1.5 between methyldopa and carbidopa; *System suitability solution*

Relative standard deviation: NMT 5.0% for levodopa, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of all impurities and any unspecified degradation product other than methyldopa and 3,4-dihydroxyphenylacetone, based on the label claim of levodopa in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U peak response of levodopa related compound A or any unspecified degradation product from the *Sample solution*

r_S peak response of levodopa from the *Standard solution*

C_S concentration of USP Levodopa RS in the *Standard solution* (mg/mL)

C_U nominal concentration of levodopa in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 1*)

Calculate the percentage of methyldopa and 3,4-dihydroxyphenylacetone based on the label claim of carbidopa in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U peak response of methyldopa or 3,4-dihydroxyphenylacetone from the *Sample solution*

r_S peak response of levodopa from the *Standard solution*

C_S concentration of USP Levodopa RS in the *Standard solution*

C_U nominal concentration of carbidopa in the *Sample solution*

F = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Levodopa related compound A ^a	0.45	0.80	0.2
Levodopa	0.52	—	—
Methyldopa ^b	0.84	1.0	0.5
Carbidopa	1.0	—	—
Levodopa related compound B ^c	1.2	—	—
Carbidopa related compound A ^c	3.1	—	—
3,4-Dihydroxyphenylacetone ^{b,d}	3.9	1.0	*1.0*(RB 1-Aug-2014)

Any individual unspecified degradation product^a — 1.0 0.2 Total impurities^e — — 1.0

^a Individual impurity based on the label claim of levodopa.

^b Individual impurity based on the label claim of carbidopa.

^c Process-related impurities, included for identification only; not to be included in *Total impurities*.

^d Not to be included in *Total impurities*.

^e Excluding all process impurities and 3,4-dihydroxyphenylacetone.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed, light-resistant containers, and store at controlled room temperature.
- **USP Reference Standards** { 11 }
 - USP Carbidopa RS
 - USP Levodopa RS
 - USP Levodopa Related Compound A RS
 - 3-(3,4,6-Trihydroxyphenyl)alanine.
 - $C_9H_{11}NO_5$ 213.19
 - USP Levodopa Related Compound B RS
 - 3-Methoxytyrosine.
 - $C_{10}H_{13}NO_4$ 211.21
 - USP Methyldopa RS

BRIEFING

Cefuroxime Axetil, *USP 38* page 2706 and *PF 38(4)* [July–Aug. 2012]. On the basis of comments received, the Expert Committee has canceled the monograph proposal that appeared in *PF 38(4)* and has proposed the following revisions:

1. A test for *Identification* based on HPLC retention time comparison is added to the monograph to provide a second test that is orthogonal to the currently official *Identification* test.
2. The *Definition* and the *Assay* acceptance criteria are revised to include limits based on percent purity. The limits are based on the existing acceptance criteria and are converted based on the molecular weights of cefuroxime and cefuroxime axetil. The calculation formula in the *Assay* is revised to reflect the revised limits.
3. The *Assay* and the test for *Diastereoisomer Ratio* are revised to eliminate the use of the internal standard. The *System suitability solution*, *Standard solution*, *Sample solution*, *Flow rate*, and *Injection volume* are revised to match the *European Pharmacopoeia 8.4* monograph. The column efficiency requirement in the *Assay* is deleted because the remaining criteria are adequate to evaluate system suitability. The relative standard deviation requirement specifies the relevant peaks. The calculation formulas are updated and converted to current style.
4. As part of the USP monograph modernization initiative, the monograph is revised to add a test for *Organic Impurities* based on the procedure in the *European Pharmacopoeia 8.4* monograph.
5. The Hypersil SAS brand of L13 column is suitable for the *Assay*, *Diastereoisomer Ratio*, and *Organic Impurities* procedures. The typical retention time for cefuroxime axetil diastereoisomer A is about 12 min. The Kromasil C1 and Zorbax TMS brands of L13 column are also suitable.
6. The *USP Reference Standards* section is updated to provide chemical information for USP Cefuroxime Axetil Delta-3 Isomers RS and to add a new Reference Standard that is used for peak identification.

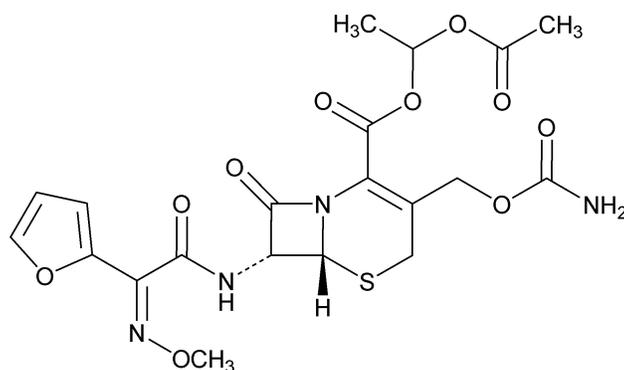

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Analysis

Samples: ~~*Standard solution* and *Sample solution*~~

Calculate the quantity, in µg/mg, of cefuroxime ($C_{16}H_{16}N_4O_8S$) in the portion of Cefuroxime Axetil taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times P$$

R_U = peak response ratio of cefuroxime axetil diastereoisomers A and B to the internal standard from the *Sample solution*

R_S = peak response ratio of cefuroxime axetil diastereoisomers A and B to the internal standard from the *Standard solution*

C_S = concentration of USP Cefuroxime Axetil RS in the *Standard solution* (mg/mL)

C_U = concentration of Cefuroxime Axetil in the *Sample solution*, corrected for water (mg/mL)

P = potency of cefuroxime, on the anhydrous basis, in USP Cefuroxime Axetil RS (µg/mg)

Acceptance criteria: ~~745–875 µg/mg on the anhydrous basis~~

■ **Solution A:** 23 g/L of monobasic ammonium phosphate

Mobile phase: Methanol and *Solution A* (38:62)

System suitability stock solution: 0.1 mg/mL of USP Cefuroxime Axetil Delta-3 Isomers RS in methanol

System suitability solution: 10 µg/mL of cefuroxime axetil delta-3 isomers from *System suitability stock solution* and 0.2 mg/mL of USP Cefuroxime Axetil RS in *Mobile phase*

Standard solution: 0.2 mg/mL of USP Cefuroxime Axetil RS in *Mobile phase*. Protect the solution from light, refrigerate, and use on the day prepared.

Sample solution: 0.2 mg/mL of Cefuroxime Axetil in *Mobile phase*. Protect the solution from light, refrigerate, and use on the day prepared.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 278 nm

Column: 4.6-mm × 25-cm; 5-µm packing L13

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—See *Table 1* for relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between cefuroxime axetil diastereoisomers A and B; NLT 1.5 between cefuroxime axetil diastereoisomer A and cefuroxime axetil delta-3 isomers, *System suitability solution*

Relative standard deviation: NMT 2.0% for the sum of cefuroxime axetil diastereoisomers A and B, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of cefuroxime ($C_{16}H_{16}N_4O_8S$) in the portion of Cefuroxime Axetil taken:

$$\text{Result} = (r_U/r_T) \times (C_S/C_U) \times P \times F \times 100$$

r_U

= sum of the peak responses of cefuroxime axetil diastereoisomers A and B from the *Sample solution*

r_T

= sum of the peak responses of cefuroxime axetil diastereoisomers A and B from the *Standard solution*

C_S

= concentration of USP Cefuroxime Axetil RS in the *Standard solution* (mg/mL)

C_U

= concentration of Cefuroxime Axetil in the *Sample solution* (mg/mL)

P

= potency of cefuroxime, on the anhydrous basis, in USP Cefuroxime Axetil RS ($\mu\text{g}/\text{mg}$)

F

= conversion factor, 0.001 mg/ μg

Acceptance criteria: 90.0%–105.0% on the anhydrous basis ■ 1S (USP39)

IMPURITIES

Add the following:

■ • Organic Impurities

Solution A, Mobile phase, System suitability solution, Sample solution, and

Chromatographic system: Proceed as directed in the *Assay*.

Peak identification solution: 30 $\mu\text{g}/\text{mL}$ of USP Cefuroxime Axetil *E*-Isomers RS in methanol

Reference solution: 2 $\mu\text{g}/\text{mL}$ of USP Cefuroxime Axetil RS in *Mobile phase*. Protect the solution from light, refrigerate, and use on the day prepared.

System suitability

Samples: *System suitability solution* and *Peak identification solution*

[Note—See *Table 1* for relative retention times. Use the *Peak identification solution* to identify the locations of the cefuroxime axetil *E*-isomers.]

Suitability requirements

Resolution: NLT 1.5 between cefuroxime axetil diastereoisomers A and B; NLT 1.5 between cefuroxime axetil diastereoisomer A and cefuroxime axetil delta-3 isomers, *System suitability solution*

Analysis

Samples: *Sample solution* and *Reference solution*

Calculate the percentage of each impurity in the portion of Cefuroxime Axetil taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U peak response of each individual impurity from the *Sample solution*

r_T sum of the peak responses of cefuroxime axetil diastereoisomers A and B from the *Sample solution*

Acceptance criteria: See *Table 1*. The reporting threshold is 0.05 times the sum of the responses of the two major peaks from the *Reference solution*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

BRIEFING

Cefuroxime Axetil Tablets, *USP 38* page 2708 and *PF 38(4)* [July–Aug. 2012]. On the basis of comments received, the Expert Committee canceled the monograph proposal that appeared in *PF 38(4)* and proposed the following revisions:

1. The Assay is revised to use the *System suitability solution*, *Standard solution*, and *Sample solution* from the Assay procedure in the *British Pharmacopoeia 2014* monograph. This modernizes the procedure because it eliminates the use of the

internal standard. The *Column efficiency* requirement in the *Assay* is deleted because the remaining criteria are adequate to evaluate system suitability. The *Relative standard deviation* requirement is revised to clarify the relevant peaks. The calculation formula is updated and converted to current style.

2. The *Identification* test is updated to reflect the changes to the *Assay*.
3. The *Dissolution* test is updated to include a calculation formula.
4. As part of USP's monograph modernization initiative, this monograph is revised to add a test for *Organic Impurities* based on the *Related Substances* procedure in the *British Pharmacopoeia 2014* monograph.
5. The Hypersil SAS brand of L13 column is suitable for the *Assay* and *Organic Impurities* procedures. The typical retention time for cefuroxime axetil diastereoisomer A is about 10 min.
6. The test for *Water Determination* is deleted because water content is formulation specific.
7. Storage conditions, based on the approved storage conditions from an FDA-approved manufacturer, are added to the *Packaging and Storage* section.
8. The *USP Reference Standards* section is updated to provide chemical information for USP Cefuroxime Axetil Delta-3 Isomers RS and to add a new Reference Standard that is used for peak identification.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Cefuroxime Axetil Tablets

DEFINITION

Cefuroxime Axetil Tablets contain the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of cefuroxime ($C_{16}H_{16}N_4O_8S$).

IDENTIFICATION

Change to read:

- **A.** ~~The retention times of the major peaks for cefuroxime axetil diastereoisomers A and B in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.~~
- The retention times of the peaks of cefuroxime axetil diastereoisomers A and B of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*. ■1S (USP39)

ASSAY

Change to read:

- **Procedure**

Solution A: 23 g/L of monobasic ammonium phosphate in water

Mobile phase: ~~Methanol and Solution A (38:62)~~

Internal standard solution: ~~5.4 mg/mL of acetanilide in methanol~~

Standard stock solution: ~~1.2 mg/mL of USP Cefuroxime Axetil RS in methanol~~

System suitability stock solution: ~~0.16 mg/mL of USP Cefuroxime Axetil Delta-3 Isomers RS in methanol~~

System suitability solution: ~~0.24 mg/mL of cefuroxime axetil from Standard stock solution, 0.54 mg/mL of acetanilide from Internal standard solution and 12.16 µg/mL of cefuroxime axetil delta-3 isomers from System suitability stock solution in Solution A~~

Standard solution: ~~0.24 mg/mL of cefuroxime axetil from Standard stock solution and 0.54 mg/mL of acetanilide from Internal standard solution in Solution A. Use this solution promptly, or refrigerate and use on the day prepared.~~

Sample stock solution: ~~Nominally 2 mg/mL of cefuroxime from finely powdered Tablets (NLT 10) prepared as follows. Transfer a suitable portion of the powder with the aid of methanol to a suitable volumetric flask. Add methanol to fill the volumetric flask to half its capacity, and shake by mechanical means for about 10 min. Dilute with methanol to volume. Pass through a suitable filter.~~

Sample solution: ~~Nominally 0.2 mg/mL of cefuroxime axetil from Sample stock solution and 0.54 mg/mL of acetanilide from Internal standard solution in Solution A containing 7.6% of the final volume of methanol. Use this solution promptly, or refrigerate and use on the day prepared.~~

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 278 nm

Column: 4.6 mm × 25 cm; 5 µm packing L13

Flow rate: 1.2 mL/min

Injection size: 10 µL

System suitability

Samples: *System suitability solution and Standard solution*

[Note—The relative retention times are about 0.4 for acetanilide, 0.8 for cefuroxime axetil diastereoisomer B, 0.9 for cefuroxime axetil diastereoisomer A, and 1.0 for cefuroxime axetil delta-3 isomers.]

Suitability requirements

Resolution: NLT 1.5 between cefuroxime axetil diastereoisomer A and B; NLT 1.5 between cefuroxime axetil diastereoisomer A and cefuroxime axetil delta-3 isomers, *System suitability solution*

Column efficiency: NLT 3000 theoretical plates for the cefuroxime axetil diastereoisomer A peak, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution and Sample solution*

Calculate the percentage of cefuroxime ($C_{16}H_{16}N_4O_8S$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times P \times F \times 100$$

R_U peak response ratio of cefuroxime axetil diastereoisomers A and B to the internal standard from the *Sample solution*

~~R_s = peak response ratio of cefuroxime axetil diastereoisomers A and B to the internal standard from the *Standard solution*~~

~~C_s = concentration of USP Cefuroxime Axetil RS in the *Standard solution* (mg/mL)~~

~~C_p = nominal concentration of cefuroxime axetil in the *Sample solution* (mg/mL)~~

~~P = potency of cefuroxime, on the anhydrous basis, in USP Cefuroxime Axetil RS ($\mu\text{g}/\text{mg}$)~~

~~F = conversion factor, 0.001 mg/ μg~~

■ Solution A:

23 g/L of monobasic ammonium phosphate in water

Mobile phase: Methanol and *Solution A* (38:62)

Buffer: 23 g/L of monobasic ammonium phosphate in water, adjusted with phosphoric acid to a pH of 2.4

System suitability stock solution: 0.1 mg/mL of USP Cefuroxime Axetil Delta-3 Isomers RS in methanol

System suitability solution: 10 $\mu\text{g}/\text{mL}$ of cefuroxime axetil delta-3 isomers from *System suitability stock solution* and 0.3 mg/mL of USP Cefuroxime Axetil RS in *Mobile phase*

Standard solution: 0.3 mg/mL of cefuroxime axetil in *Mobile phase*. Protect the solution from light, refrigerate, and use on the day prepared.

Sample stock solution: Nominally 5 mg/mL of cefuroxime from finely powdered Tablets (NLT 5), prepared as follows. Transfer a suitable portion of the powder to a volumetric flask. Disperse in *Buffer*, using 5% of the final volume. Sonicate if necessary. Add methanol to fill the volumetric flask to about half its capacity and shake by mechanical means for about 10 min. Dilute with methanol to volume, and filter.

Sample solution: Nominally 0.25 mg/mL of cefuroxime from the *Sample stock solution* in *Mobile phase*. Protect the solution from light, refrigerate, and use on the day prepared.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 278 nm

Column: 4.6-mm \times 25-cm; 5- μm packing L13

Flow rate: 1.2 mL/min

Injection volume: 20 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—See *Table 4* for relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between cefuroxime axetil diastereoisomers A and B; NLT 1.5 between cefuroxime axetil diastereoisomer A and cefuroxime axetil delta-3 isomers, *System suitability solution*

Relative standard deviation: NMT 2.0% for the sum of cefuroxime axetil diastereoisomers A and B, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of cefuroxime ($\text{C}_{16}\text{H}_{16}\text{N}_4\text{O}_8\text{S}$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times (C_S/C_U) \times P \times F \times 100$$

 r_U

= sum of the peak responses of cefuroxime axetil diastereoisomers A and B from the *Sample solution*

 r_T

= sum of the peak responses of cefuroxime axetil diastereoisomers A and B from the *Standard solution*

 C_S

= concentration of USP Cefuroxime Axetil RS in the *Standard solution* (mg/mL)

 C_U

= nominal concentration of cefuroxime in the *Sample solution* (mg/mL)

 P

= potency of cefuroxime, on the anhydrous basis, in USP Cefuroxime Axetil RS ($\mu\text{g}/\text{mg}$)

 F

= conversion factor, 0.001 mg/ μg

■ 1S (USP39)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Change to read:

● **Dissolution** 〈 711 〉

Test 1

Medium: 0.07 N hydrochloric acid; 900 mL

Apparatus 2: 55 rpm

Times: 15 and 45 min

Standard solution: 10–20 $\mu\text{g}/\text{mL}$ of cefuroxime from USP Cefuroxime Axetil RS in *Medium*

Sample solution: Pass portions of the solution under test through a suitable filter and dilute with *Medium*, if necessary, to a concentration similar to that of the *Standard solution*.

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: 278 nm

Blank: *Medium*

Analysis

Samples: *Standard solution* and *Sample solution*

- Determine the percentage (Q) of the labeled amount of cefuroxime ($\text{C}_{16}\text{H}_{16}\text{N}_4\text{O}_8\text{S}$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times P \times F \times 100$$

A_U

= absorbance of the *Sample solution*

A_S

= absorbance of the *Standard solution*

C_S

= concentration of USP Cefuroxime Axetil RS in the *Standard solution* (mg/mL)

V

= volume of *Medium*, 900 mL

L

= label claim (mg/Tablet)

P

= potency of cefuroxime, on the anhydrous basis, in USP Cefuroxime Axetil RS ($\mu\text{g}/\text{mg}$)

F

= conversion factor, 0.001 mg/ μg

■ 1S (USP39) ■

Acceptance criteria

For Tablets labeled to contain nominally 500 mg of cefuroxime: See *Table 1*.

Table 1

Time (min)	Amount Dissolved (%)
15	NLT 50
45	NLT 70

For all other Tablets: See *Table 2*.

Table 2

Time (min)	Amount Dissolved (%)
15	NLT 60
45	NLT 75

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium, Times, and Analysis: Proceed as directed in *Test 1*.

Apparatus 2: 100 rpm

Acceptance criteria: See *Table 3*.

Table 3

Time (min)	Amount Dissolved (%)
15	NLT 60
45	NLT 75

- **Uniformity of Dosage Units** { 905 } : Meet the requirements

IMPURITIES

Add the following:

• **Organic Impurities**

Solution A, Mobile phase, Buffer, System suitability solution, Sample solution, and **Chromatographic system:** Proceed as directed in the Assay.

Peak identification solution: 30 µg/mL of USP Cefuroxime Axetil E-Isomers RS in methanol
Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 278 nm

Column: 4.6-mm × 25-cm; 5-µm packing L13

Flow rate: 1.2 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Peak identification solution*

[Note—See *Table 4* for the relative retention times. The *Peak identification solution* is used to identify the locations of the cefuroxime axetil E-isomers.]

Suitability requirements

Resolution: NLT 1.5 between cefuroxime axetil diastereoisomer A and cefuroxime axetil delta-3 isomers, *System suitability solution*

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U peak response of each individual impurity from the *Sample solution*

r_T sum of the peak responses of cefuroxime axetil diastereoisomers A and B from the *Sample solution*

Acceptance criteria: See *Table 4*.

BRIEFING

Cetylpyridinium Chloride, *USP 38* page 2737. As part of USP monograph modernization efforts, it is proposed to make the following changes:

1. Replace the titration procedure in the *Assay* with a stability-indicating liquid chromatographic method using the Primesep D brand of L78 column. The retention time for cetylpyridinium in the analysis is about 3.5 min.
2. Revise the acceptance criteria in the *Definition* and *Acceptance criteria* in the *Assay* from NLT 99.0% and NMT 102.0% to NLT 98.0% and NMT 102.0%, which is typical for chromatographic procedures.
3. Replace *Identification* test *B*, which uses UV absorption, with a retention time agreement based upon the proposed method in the *Assay*.
4. Remove the organoleptic procedure for pyridine in the *Organic Impurities* test because it is now addressed as a residual solvent (see *General Notices and Requirements*).
5. Add a liquid chromatographic method to the *Organic Impurities* test based on the method used in the proposed new *Assay* procedure.
6. Delete the *Melting Range or Temperature* test. The proposed selective test for *Organic Impurities* is sufficient to monitor the purity of the drug substance.

Additionally, minor editorial changes have been made to update the monograph to current

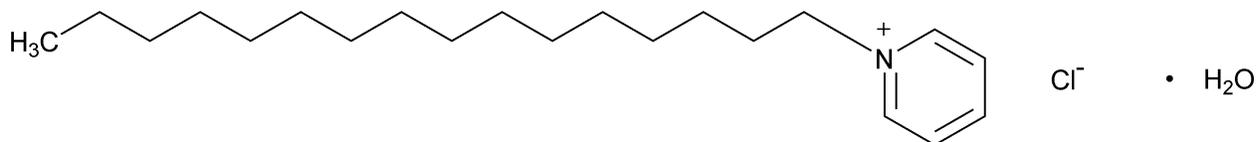

USP style.

Cetylpyridinium Chloride contains ~~NLT 99.0%~~

■ NLT 98.0% ■ 1S (USP39)

and NMT 102.0% of cetylpyridinium chloride ($C_{21}H_{38}ClN$), calculated on the anhydrous basis.

IDENTIFICATION

● A. Infrared Absorption < 197K >

Delete the following:

● B. Ultraviolet Absorption < 197U >

Sample solution: 40 µg/mL in water

Acceptance criteria: Meets the requirements ■ 1S (USP39)

Add the following:

- B. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■ 1S (USP39)

● C. Identification Tests—General, Chloride < 191 >

Sample solution: 2 mg/mL in water

Acceptance criteria: A 10-mL portion of the *Sample solution* meets the requirements, except that when silver nitrate TS is added, turbidity is produced rather than a curdy white precipitate.

ASSAY

Change to read:

- **Procedure**

Sample solution: Dissolve 200 mg of Cetylpyridinium Chloride in 75 mL of water. Add 10 mL of chloroform, 0.4 mL of bromophenol blue solution (1 in 2000), and 5 mL of a freshly prepared solution of sodium bicarbonate (4.2 in 1000).

Analysis: Titrate the *Sample solution* with 0.02 M sodium tetraphenylboron VS until the blue color disappears from the chloroform layer. Add the last portions of the sodium tetraphenylboron solution dropwise, agitating vigorously after each addition. Each mL of 0.02 M sodium tetraphenylboron is equivalent to 6.800 mg of cetylpyridinium chloride ($C_{21}H_{38}ClN$).

Acceptance criteria: 99.0%–102.0% on the anhydrous basis

- Use 0.1% trifluoroacetic acid-rinsed glassware and silanized vials for all solutions containing cetylpyridinium chloride, as cetylpyridinium may react with the surface.

Solution A: Trifluoroacetic acid and water (1:999)

Solution B: Acetonitrile and trifluoroacetic acid (999:1)

Mobile phase: *Solution A* and *Solution B* (62.5: 37.5)

Standard solution: 0.25 mg/mL of USP Cetylpyridinium Chloride RS in *Solution A*

Sample solution: 0.25 mg/mL of Cetylpyridinium Chloride in *Solution A*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

USP Cetylpyridinium Chloride RS

BRIEFING

Clemastine Fumarate Tablets, USP 38 page 2858. As part of the USP monograph modernization initiative, the following changes are proposed:

1. Add a new stability-indicating HPLC procedure in the test for *Organic Impurities*. The HPLC procedure is based on analyses performed with the Zorbax Eclipse XDB C8 brand of L7 column. The typical retention time for clemastine is about 0.8 min.
2. Replace the *Identification* by TLC procedure with the retention time agreement in the *Assay*.
3. An orthogonal *Identification* test *B* is added based on UV spectrum as proposed in the test for *Organic Impurities*.
4. Remove the UV procedure in *Uniformity of Dosage Units* to allow the flexibility for the test.
5. The *Packaging and Storage* section is revised to be consistent with the information

from the drug product package insert.

6. Add USP 4-Chlorobenzophenone RS to the *USP Reference Standards* section to support the proposed test for *Organic Impurities*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Clemastine Fumarate Tablets

DEFINITION

Clemastine Fumarate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of clemastine fumarate ($C_{21}H_{26}ClNO \cdot C_4H_4O_4$).

IDENTIFICATION

Delete the following:

■ • **Thin Layer Chromatography**

Diluent: Chloroform and methanol (50:50)

Standard solution: 2.5 mg/mL of USP Clemastine Fumarate RS in *Diluent*

Sample solution: Place a portion of powdered Tablets, equivalent to 2.5 mg of clemastine fumarate, in a glass-stoppered flask. Add 10 mL of *Diluent*, and shake for 20 min. Filter, wash the residue with two 5 mL portions of *Diluent*, and evaporate the combined filtrate and washings to dryness under vacuum. Dissolve the residue in 1 mL of *Diluent*.

Chromatographic System

Chromatography ~~(621)~~, *Thin-Layer Chromatography*

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 5 μ L

Solution A: 17 mg/mL of bismuth subnitrate in glacial acetic acid and water (1:4)

Solution B: 0.4 g/mL of potassium iodide in water

Spray reagent: Mix 5.0 mL of *Solution A*, 5.0 mL of *Solution B*, and 20 mL of glacial acetic acid in a 100 mL volumetric flask, and dilute with water to volume.

Developing solvent system: Chloroform, methanol, and ammonium hydroxide (90:10:1)

Analysis

Samples: *Standard solution* and *Sample solution*

Proceed as directed in the chapter. Dry the plate at room temperature with the aid of a current of air. Locate the spots on the plate by spraying first with *Spray reagent*, then with 3% hydrogen peroxide.

Acceptance criteria: The R_f value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*. ■ 1S (USP39)

Add the following:

- • **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the

Standard solution, as obtained in the Assay. ■1S (USP39)

Add the following:

- **B.** The UV spectrum of the clemastine peak of the *Diluted sample solution* corresponds to that of the *Standard solution*, as obtained in the proposed test for *Organic Impurities*.
■1S (USP39)

~~**Acceptance criteria:** Meet the requirements~~

■ Meet the requirements ■ 1S (USP39)

IMPURITIES

Add the following:

■ • Organic Impurities

Buffer: 4.1 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 4.0.

Solution A: Methanol, acetonitrile, and *Buffer* (35:35:30)

Solution B: Methanol, acetonitrile, and *Buffer* (40: 37.5: 22.5)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
3	100	0
3.1	0	100
18	0	100
18.1	100	0
25	100	0

Standard stock solution 1: 0.14 mg/mL of USP Clemastine Fumarate RS in *Solution A*. Sonicate for NLT 5 min or until dissolved.

Standard stock solution 2: 0.14 mg/mL of USP 4-Chlorobenzophenone RS in methanol. Sonicate for NLT 5 min or until dissolved.

System suitability solution: 2.8 $\mu\text{g/mL}$ each of USP Clemastine Fumarate RS and USP 4-Chlorobenzophenone RS in *Solution A* from *Standard stock solution 1* and *Standard stock solution 2*

Sensitivity solution: 0.14 $\mu\text{g/mL}$ of USP Clemastine Fumarate RS in *Solution A* from *Standard stock solution 1*

Standard solution: 2.8 µg/mL of USP Clemastine Fumarate RS in *Solution A* from *Standard stock solution 1*

Sample solution: Nominally 0.28 mg/mL of clemastine fumarate from Tablets in *Solution A* prepared as follows. Transfer a quantity of NLT 20 finely powdered Tablets, equivalent to 14 mg of clemastine fumarate, to a 50-mL volumetric flask. Add 25 mL of *Solution A*, shake the flask for NLT 30 min, and sonicate for NLT 15 min. Dilute with *Solution A* to volume. Pass an aliquot through a suitable filter of 0.45-µm pore size, discarding the first 3 mL of filtrate.

Diluted sample solution: Nominally 2.8 µg/mL of clemastine fumarate in *Solution A* from *Sample solution*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 220 nm. For *Identification test B*, use a diode array detector in the range of 200–300 nm.

Column: 4.6-mm × 5-cm; 1.8-µm packing L7

Flow rate: 1.2 mL/min

Injection volume: 50 µL

System suitability

Samples: *System suitability solution*, *Sensitivity solution*, and *Standard solution*

[Note—The relative retention times for clemastine and 4-chlorobenzophenone are 1.0 and 1.7, respectively.]

Suitability requirements

Resolution: NLT 1.5 between clemastine and 4-chlorobenzophenone, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Standard solution*, *Diluted sample solution*, and *Sample solution*

[Note—The *Diluted sample solution* is used for *Identification test B*.]

Calculate the percentage of any individual unspecified degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of each unspecified degradation product from the *Sample solution*

r_S peak response of clemastine from the *Standard solution*

C_S concentration of USP Clemastine Fumarate RS in the *Standard solution* (mg/mL)

C_U nominal concentration of clemastine fumarate in the *Sample solution* (mg/mL)

Acceptance criteria

Any unspecified degradation product: NMT 0.5%

Total impurities: NMT 2.0%

BRIEFING

Clomipramine Hydrochloride Compounded Oral Suspension, Veterinary. Because there is currently no existing *USP* monograph for this dosage form, a new compounded preparation monograph is proposed based on a validated stability-indicating method used to assess stability. The liquid chromatographic procedure in the *Assay* is based on analyses validated using the Luna C18(2) brand of L1 column. The typical retention time for clomipramine hydrochloride is about 8.4 min.

Please submit comments to CompoundingSL@usp.org.

(CMP: J. Sun.)

Correspondence Number—C154508

Comment deadline: May 31, 2015

Add the following:

■ **Clomipramine Hydrochloride Compounded Oral Suspension, Veterinary**

DEFINITION

Clomipramine Hydrochloride Compounded Oral Suspension, Veterinary contains NLT 90.0% and NMT 110.0% of the labeled amount of clomipramine hydrochloride (C₁₉H₂₃ClN₂·HCl). Prepare Clomipramine Hydrochloride Compounded Oral Suspension, Veterinary 1 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* { 795 }).

Clomipramine Hydrochloride tablets ^a equivalent to	100 mg of clomipramine hydrochloride
Vehicle: a 1:1 mixture of Ora-Plus ^b and Ora-Sweet SF ^b , a sufficient quantity to make	100 mL
^a Clomicalm 20-mg tablets, Novartis Animal Health, Greensboro, NC.	

^b Perrigo, Allegan, MI.

Place the *Clomipramine Hydrochloride* tablets in a suitable container and comminute to a fine powder. Wet the powder with a small amount of *Vehicle* and triturate to make a smooth paste.

Add the *Vehicle* to make the mortar contents pourable. Transfer contents stepwise and quantitatively to a calibrated container using the remainder of the *Vehicle*. Add sufficient *Vehicle* to bring to final volume. Shake to mix well.

ASSAY

• Procedure

Solution A: Methanol and acetonitrile (50:50)

Solution B: 25 mM monobasic potassium phosphate adjusted with phosphoric acid to a pH of 3.2

Mobile phase: See *Table 1*.

■ 1S (USP39)

BRIEFING

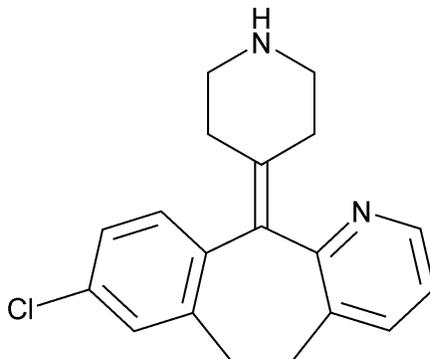

Desloratadine, PF 39(2) [Mar.–Apr. 2013]. The previous proposal for this new monograph, which appeared as an *In-Process Revision* in PF 39(2) [Mar.–Apr. 2013], is canceled and now being repropose with changes that reflect comments received.

1. To harmonize this monograph with the one in the *European Pharmacopoeia 8.0*, a validated liquid chromatographic procedure is proposed for the *Assay* and *Organic Impurities, Procedure 1*. The method is based on analyses performed using the YMC J'sphere ODS-M80 brand of L1 column. The typical retention time for desloratadine is about 21 min.
2. Because of different impurity profiles, a flexible monograph approach is proposed for impurities. Thus, the *Organic Impurities* procedure published in PF 39(2) is renamed *Organic Impurities, Procedure 2*. The method is based on analyses performed using the Hypersil BDS brand of L7 column. The typical retention time for desloratadine is about 16 min.
3. A labeling section was added to distinguish between the two impurity tests.
4. Add USP Desloratadine Related Compound B RS used in the *Assay* and test for *Organic Impurities, Procedure 1* to the *USP Reference Standards* section.
5. The *Loss on Drying* test is being replaced with the more specific *Water Determination, Method Ic* test with a limit of NMT 0.5%.
6. The *Residue on Ignition* limit is widened to NMT 0.2% to match the wider approved limits.
7. The reference to *Heavy Metals* 〈 231 〉 was removed.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Desloratadine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_{i\bar{}}$ peak response of each impurity from the *Sample solution*

$r_{s\bar{}}$ peak response of desloratadine from the *Standard solution*

$C_{s\bar{}}$ concentration of USP Desloratadine RS in the *Standard solution* ($\mu\text{g/mL}$)

$C_{i\bar{}}$ concentration of Desloratadine in the *Sample solution* ($\mu\text{g/mL}$)

F = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*. The reporting threshold is 0.05%.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Fluorodesloratadine ^a	0.8	0.6	0.2
Desloratadine related compound B	0.9	0.6	0.3
Desloratadine	1.0	—	—
Any other individual unspecified impurity	—	1.00	0.10
Total impurities	—	—	0.4

^a 8-Chloro-11-fluoro-11-(piperidin-4-yl)-6,11-dihydro-5H-benzo[5,6]cyclohepta[1,2-*b*]pyridine.

• **Organic Impurities, Procedure 2**

Use *Organic Impurities, Procedure 2*, when the impurity profile includes dechloro desloratadine, desloratadine related compound A, and dehydrodesloratadine.

Buffer: 1.36 g/L of monobasic potassium phosphate in water. Add 10 mL of triethylamine per L of the solution, and adjust with dilute phosphoric acid (1 in 10) to a pH of 2.0.

Solution A: Acetonitrile, methanol, and *Buffer* (10:10:80)

Solution B: Acetonitrile, tetrahydrofuran, and *Buffer* (70:5:30)

Mobile phase: See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	100	0
10	100	0
15	90	10
20	70	30
25	60	40
30	50	50
38	50	50
40	100	0
45	100	0

System suitability solution: 0.15 $\mu\text{g/mL}$ of USP Desloratadine Related Compound A RS and 100 $\mu\text{g/mL}$ of USP Desloratadine RS in *Solution A*

Standard solution: 0.5 $\mu\text{g/mL}$ of USP Desloratadine RS in *Solution A*

Sample solution: 500 $\mu\text{g/mL}$ of Desloratadine in *Solution A*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5-μm packing L7

Flow rate: 1 mL/min

Injection volume: 60 μL

■ 1S (USP39)

BRIEFING

Desloratadine Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph, based on validated methods of analysis, is proposed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with the Altima CN brand of L10 column. The retention time for desloratadine is about 4.7 min. The liquid chromatographic procedure in the test for *Organic Impurities* was validated with the YMC basic C8 brand of L7 column. The retention time for desloratadine is about 12.5 min.

(SM4: S. Ramakrishna, D. Vicchio.)

Correspondence Number—C129432

Comment deadline: May 31, 2015

Add the following:

■ **Desloratadine Tablets**

DEFINITION

Desloratadine Tablets contain NLT 93.0% and NMT 105.0% of the labeled amount of desloratadine (C₁₉H₁₉ClN₂).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV absorption spectra of the desloratadine peak of the *Sample solution* exhibit maxima and minima at the same wavelengths as those of the corresponding peak of the *Standard solution*, as obtained in the *Assay*.

ASSAY● **Procedure**

Use amber, low-actinic glassware.

Buffer: Dissolve 4.35 g of dibasic potassium phosphate in 1 L of water. Adjust with phosphoric acid to a pH of 3.0.

Mobile phase: Methanol and *Buffer* (20:80)

Diluent: Methanol and water (90:10)

Standard solution: 0.02 mg/mL of USP Desloratadine RS in *Diluent*

Sample stock solution: Nominally 0.2 mg/mL of desloratadine, prepared as follows.

Transfer NLT 20 Tablets into a suitable volumetric flask, add water to fill 10% of the flask volume, and allow the Tablets to disperse. Add methanol, about 50% of the flask volume, and stir for NLT 60 min. Allow the solution to cool to room temperature and dilute with methanol to volume. Centrifuge a portion of this solution and use the supernatant.

Sample solution: Nominally 0.02 mg/mL of desloratadine in *Diluent*, from *Sample stock solution*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detectors

Assay: UV 241 nm

Identification B: Diode array; UV 230–400 nm

Column: 4.6-mm × 15-cm; 5-μm packing L10

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 20 μL

Run time: NLT 4.2 times the retention time of desloratadine

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of desloratadine (C₁₉H₁₉ClN₂) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Desloratadine RS in the *Standard solution* (mg/mL)

C_U nominal concentration of desloratadine in the *Sample solution* (mg/mL)

Acceptance criteria: 93.0%–105.0%

PERFORMANCE TESTS

- **Dissolution** 〈 711 〉

Medium: 0.1 N hydrochloric acid; 500 mL

Apparatus 2: 50 rpm

Time: 45 min

Standard solution: 0.01 mg/mL of USP Desloratadine RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size. Discard the first 5 mL of the filtrate.

Instrumental conditions

Mode: UV

Analytical wavelength: 282 nm

Cell: 1.0 cm

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of desloratadine ($C_{19}H_{19}ClN_2$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

A_U absorbance of the *Sample solution*

A_S absorbance of the *Standard solution*

C_S concentration of USP Desloratadine RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 500 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of desloratadine ($C_{19}H_{19}ClN_2$) is dissolved.

- **Uniformity of Dosage Units** 〈 905 〉: Meet the requirements

IMPURITIES

- **Organic Impurities**

Solution A: Dissolve 4.35 g of dibasic potassium phosphate in 1 L of water. Adjust with phosphoric acid to a pH of 3.2.

Solution B: Acetonitrile

Solution C: Methanol

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)	Solution C (%)
0	70	15	15
12	70	15	15
30	40	30	30
45	40	30	30
47	70	15	15
55	70	15	15

Diluent: Methanol and water (90:10)

Standard solution: 0.002 mg/mL each of USP Desloratadine RS and USP Desloratadine Related Compound F RS in *Diluent*

Sensitivity solution: 0.1 µg/mL of USP Desloratadine RS in *Diluent*

Sample solution: Nominally 0.2 mg/mL of desloratadine, prepared as follows. Transfer NLT 20 Tablets into a suitable volumetric flask, add 10% of the flask volume of water, and allow the Tablets to disperse. Add methanol, about 50% of the flask volume, and stir for at least 60 min. Allow the solution to cool to room temperature, and dilute with methanol to volume. Centrifuge a portion of this solution and use the supernatant.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 241 nm

Column: 4.6-mm × 15-cm; 3-µm packing L7

Column temperature: 35°

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Samples: *Standard solution* and *Sensitivity solution*

Suitability requirements

Column efficiency: NLT 1500 theoretical plates for desloratadine, *Standard solution*

Relative standard deviation: NMT 5.0% for desloratadine, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Standard solution*, *Sensitivity solution*, and *Sample solution*

Calculate the percentage of desloratadine related compound F in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_{\bar{F}}$ peak response of desloratadine related compound F from the *Sample solution*

$r_{\bar{S}}$ peak response of desloratadine related compound F from the *Standard solution*

$C_{\bar{S}}$ concentration of USP Desloratadine Related Compound F RS in the *Standard solution* (mg/mL)

$C_{\bar{U}}$ nominal concentration of desloratadine in the *Sample solution* (mg/mL)

Calculate the percentage of any unspecified degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_{\bar{F}}$ peak response of each unspecified impurity from the *Sample solution*

$r_{\bar{S}}$ peak response of desloratadine from the *Standard solution*

$C_{\bar{S}}$ concentration of USP Desloratadine RS in the *Standard solution* (mg/mL)

$C_{\bar{U}}$ nominal concentration of desloratadine in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*. Disregard peaks less than 0.05%.

Comment deadline: May 31, 2015

Add the following:

■ **Desloratadine Orally Disintegrating Tablets**

DEFINITION

Desloratadine Orally Disintegrating Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of desloratadine ($C_{19}H_{19}ClN_2$).

IDENTIFICATION

• **A. Ultraviolet Absorption** (197U)

Standard solution and **Sample solution:** Proceed as directed in the *Assay*.

Instrumental conditions

Mode: UV

Wavelength range: 230–330 nm

[Note—Alternatively, a diode array detector may be used in the *Assay* to obtain the spectra.]

Acceptance criteria: The UV spectrum of the *Sample solution* corresponds to that of the *Standard solution*.

• **B.** The retention time of the major peak from the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **Procedure**

Buffer: 6.8 g/L of monobasic potassium phosphate. Adjust with phosphoric acid to a pH of 3.0.

Mobile phase: Acetonitrile, methanol, and *Buffer* (28:7:65)

Diluent: Methanol and 0.1N hydrochloric acid (40:60)

Standard solution: 0.05 mg/mL of USP Desloratadine RS in *Diluent*. Sonication may be used to aid dissolution.

Sample stock solution: Nominally 0.25 mg/mL of desloratadine, prepared as follows.

Transfer 10 Tablets to a suitable volumetric flask, add water to 15% of the flask volume, and shake until the Tablets disintegrate completely. Add 75% of the flask volume of *Diluent* and sonicate for 30 min with intermittent shaking, and dilute with *Diluent* to volume. Centrifuge a portion of this solution. Use the supernatant.

Sample solution: Nominally 0.05 mg/mL of desloratadine from the *Sample stock solution* in *Diluent*; centrifugate

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

■ 1S (USP39)

BRIEFING

Dexchlorpheniramine Maleate Tablets, USP 38 page 3046 and PF 40(1) [Jan.–Feb. 2014]. The U.S. Pharmacopeial Convention (USP) is engaged in the ongoing challenge of obtaining information needed to create and sustain up-to-date drug product quality monographs for drugs marketed under the FDA over-the-counter (OTC) drug monograph system (21 CFR Part 330). A revision to modernize the *Assay* and *Identification* tests is being proposed.

1. Replace the *Identification—Organic Nitrogenous Bases* procedure, which uses carbon

disulfide and requires extensive sample preparation, with retention time matching in *Identification* test A using the procedure from the *Assay*.

2. It is proposed to add *Identification* test C as an orthogonal identification test based on spectral comparison of the dexchlorpheniramine peak using photo-diode array detection (190–400 nm) with the *Assay* procedure.
3. Replace the nonstability-indicating UV procedure in the *Assay* with the liquid chromatography procedure in *Drug Product Assay Tests—Organic Chemical Medicines* { 321 }, *Procedure 1*. *Procedure 1* was validated with the Waters Acquity UPLC HSS T3 brand of L1 column. The retention time for dexchlorpheniramine is about 6.1 min.
4. Additional Reference Standards have been added to the *USP Reference Standards* section to support the revision of the *Assay*.

General chapter { 321 }, published in the *Pharmacopeial Forum* [PF 41(1)], is a procedure that was developed and validated for OTC medicines. Further information can be found in the *Stimuli* article entitled “Medicines Marketed under the Food and Drug Administration Over-the-Counter Drug Monograph System Regulations: Strategy for Developing Compendial Quality Standards”, also published in PF 41(1). This article describes in detail the rationale for the development of this chapter and other related chapters, as well as the associated effect on drug product monographs. USP plans to continue with this initiative to revise or establish standards for OTC drug products.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Dexchlorpheniramine Maleate Tablets

DEFINITION

Dexchlorpheniramine Maleate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of dexchlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$).

IDENTIFICATION

Delete the following:

- • ~~A. Identification—Organic Nitrogenous Bases { 181 }:~~ Meet the requirements ■ 1S (USP39)

Add the following:

- • **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■ 1S (USP39)

- **B.**

Analysis: Shake a quantity of finely powdered Tablets, equivalent to 150 mg of dexchlorpheniramine maleate, with 100 mL of 1 N acetic acid for 10 min, and filter through a sintered-glass funnel into a suitable vessel. Adjust the filtrate with sodium hydroxide

solution (1 in 10) to a pH of 11, and extract the solution with six 100-mL portions of solvent hexane, filtering each hexane extract using suitable means to separate the hexane layer from the aqueous layer. Concentrate the combined extracts on a steam bath to a small volume, transfer to a smaller, more suitable vessel, and evaporate just to the point where hexane vapors are no longer perceptible. Transfer the oily residue, with the aid of four 3-mL portions of dimethylformamide, to a suitable glass-stoppered graduated cylinder, dilute with dimethylformamide to 15.0 mL, mix, and centrifuge if necessary.

Acceptance criteria: The optical rotation of the solution so obtained in a 100-mm tube after correcting for the blank is between $+0.24^{\circ}$ and $+0.35^{\circ}$ (distinction from chlorpheniramine maleate).

Add the following:

- C. The UV-Vis spectrum (190–400 nm) of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■1S (USP39)

ASSAY

Delete the following:

■● **Procedure**

Diluent: Dilute hydrochloric acid (1 in 120)

Standard stock solution: 0.4 mg/mL of USP Dexchlorpheniramine Maleate RS in water

Standard solution: 40 µg/mL of USP Dexchlorpheniramine Maleate RS, prepared as follows: Transfer 10.0 mL of the *Standard stock solution* to a separator, adjust with 1 N sodium hydroxide to a pH of 11, and cool. Extract with two 50 mL portions of solvent hexane, shaking each portion for 2 min before separating the phases, and combining the hexane extracts in a second separator. Extract the hexane solution with two 40 mL portions of *Diluent*, combine the *Diluent* extracts in a 100 mL volumetric flask, and add *Diluent* to volume. Filter the solution into a glass-stoppered conical flask, discarding the first few mL of the filtrate.

Sample solution: Nominally 40 µg/mL of dexchlorpheniramine maleate, prepared as follows: Transfer an equivalent to 8 mg of dexchlorpheniramine maleate, from NLT 20 finely powdered Tablets, to a 250 mL separator. Mix with 50 mL of water for 10 min, adjust with sodium hydroxide solution (1 in 10) to a pH of 11, and cool to room temperature. Extract the mixture with two 75 mL portions of solvent hexane, and combine the extracts in a second separator. Extract the solvent hexane solution with three 50 mL portions of *Diluent*, combining the *Diluent* extracts in a 200 mL volumetric flask. Add *Diluent* to volume.

Instrumental conditions

Analytical wavelength: Maximum absorbance at about 264 nm

Cell: 1 cm

Blank: *Diluent*

Analysis

Samples: *Standard solution* and *Sample solution*

Concomitantly determine the absorbance of the *Standard solution* and *Sample solution*.

Calculate the percentage of the labeled amount of dexchlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

~~A_U~~ absorbance of the *Sample solution*

~~A_S~~ absorbance of the *Standard solution*

~~C_S~~ concentration of USP Dexchlorpheniramine Maleate RS in the *Standard solution* ($\mu\text{g/mL}$)

~~C_U~~ nominal concentration of dexchlorpheniramine maleate in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–110.0% \pm 1S (USP39)

Add the following:

- Drug Product Assay Tests—Organic Chemical Medicines, Procedure 1 (321):** 90.0%–110.0% \pm 1S (USP39)

PERFORMANCE TESTS

• Dissolution (711)

Medium: Water; 500 mL

Apparatus 2: 50 rpm

Time: 45 min

Solution A: Sodium hydroxide solution (1 in 2)

Internal standard solution: 90 $\mu\text{g/mL}$ of dexbrompheniramine maleate in water

Standard stock solution: 12.5 $\mu\text{g/mL}$ of USP Dexchlorpheniramine Maleate RS in water

Standard solution: Pipet 5 mL of the *Standard stock solution* into a 50-mL centrifuge tube, and add 10.0 mL of water and 1.0 mL of *Internal standard solution*. Adjust with *Solution A* to a pH of 11 ± 0.1 , and add 3.0 mL of chromatographic hexane. Insert the stopper in the tube, shake by mechanical means for 3 min, centrifuge, and use the clear supernatant hexane layer.

Sample solution: Pipet 15 mL of a portion of the solution under test into a 50-mL centrifuge tube, and add 1.0 mL of *Internal standard solution*. Adjust with *Solution A* to a pH of 11 ± 0.1 , and add 3.0 mL of chromatographic hexane. Insert the stopper in the tube, shake by mechanical means for 3 min, centrifuge, and use the clear supernatant hexane layer.

Chromatographic system

(See *Chromatography (621)*, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 2-mm \times 1.8-m; contains a packing consisting of 1.2% phase G16 and 0.5% potassium hydroxide on support S1AB

Temperatures

Injection port: 250 $^{\circ}$

Detector: 250 $^{\circ}$

Column: 205 $^{\circ}$

Flow rate: 60 mL/min

Carrier gas: Helium

Injection volume: 2 μL

System suitability**Sample:** *Standard solution*

[Note—The relative retention times for dexchlorpheniramine and dexbrompheniramine are about 0.7 and 1.0, respectively.]

Suitability requirements**Resolution:** NLT 1.9 between dexchlorpheniramine and dexbrompheniramine**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution and Sample solution*

Calculate the quantity of dexchlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$) dissolved by comparing the peak response ratios.

Tolerances: NLT 75% (*Q*) of the labeled amount of dexchlorpheniramine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$) is dissolved.

- **Uniformity of Dosage Units** $\langle 905 \rangle$: Meet the requirements

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers. Store at controlled room temperature.

BRIEFING

Dihydroxyaluminum Sodium Carbonate, *USP 38* page 3125. In preparation for the omission of the flame tests from general chapter *Identification Tests—General* $\langle 191 \rangle$, proposed in *PF 41(2)* [Mar.–Apr. 2015], it is proposed to replace the use of the flame test under *Identification* with the cross reference to the test for *Sodium Content*, which employs atomic absorption spectroscopy.

The chemical formula in the *Definition* and in the *Assay* is updated to be consistent with the *USAN* dictionary

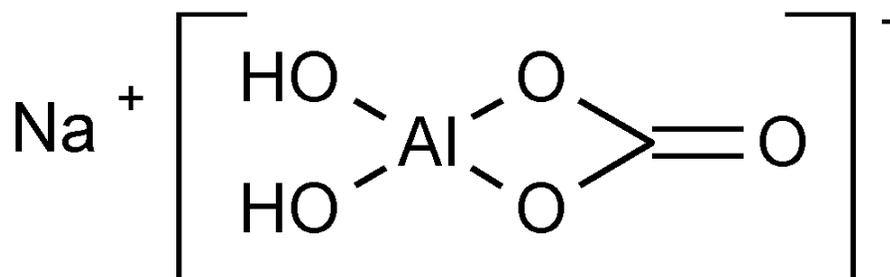

The *Identification* test is subdivided into three separate tests for clarity.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Dihydroxyaluminum Sodium Carbonate

$\text{NaAl}(\text{OH})_2\text{CO}_3$ 143.99

Aluminum, [carbonato(1-)-O]dihydroxy-, monosodium salt;
Sodium (T-4)-[carbonato(2-)-O,O']dihydroxyaluminate(1-);
Sodium (carbonato)dihydroxyaluminate(1-) [539-68-4]; [16482-55-6].

DEFINITION**Change to read:**

Dihydroxyaluminum Sodium Carbonate contains NLT 98.3% and NMT 107.9% of dihydroxyaluminum sodium carbonate ($\text{CH}_2\text{AlNaO}_5$)

■ $[\text{NaAl}(\text{OH})_2\text{CO}_3]$, ■ 1S (USP39)

calculated on the dried basis.

IDENTIFICATION**Delete the following:**

■ • ~~A.~~

~~**Sample solution:** Combine 1 g with 20 mL of 3 N hydrochloric acid.~~

~~**Acceptance criteria:** The sample dissolves with effervescence and meets the requirements of *Identification Tests—General, Aluminum* <191> and the flame test in *Identification Tests—General, Sodium* <191>.~~ ■ 1S (USP39)

Add the following:

■ • A.

Sample solution: Combine 1 g with 20 mL of 3 N hydrochloric acid.

Acceptance criteria: The sample dissolves with effervescence. ■ 1S (USP39)

Add the following:

■ • B. **Identification Tests—General, Aluminum** <191>

Sample: Sample solution prepared in *Identification test A*

Acceptance criteria: Meets the requirements ■ 1S (USP39)

Add the following:

- **C.** The *Sample solution*, prepared and tested as directed in the test for *Sodium Content*, exhibits a significant absorption at the sodium emission line at 589.0 nm. ■1S (USP39)

ASSAY**Change to read:**● **Procedure**

Edetate disodium titrant: Dissolve 18.6 g of edetate disodium in water to make 500 mL, and standardize as directed in *Reagents, Volumetric Solutions, Edetate Disodium, Twentieth-Molar (0.05 M)*.

Sample: 300 mg undried

Analysis: Transfer the *Sample* to a 250-mL beaker, add 10 mL of 2 N sulfuric acid, cover the beaker, heat to 80° for 5 min, and boil for 1 min. Add 30.0 mL of 0.1 M edetate disodium VS, again boil for 1 min, cool, and then add 10 mL of acetic acid–ammonium acetate buffer TS, 50 mL of acetone, and 2 mL of dithizone TS. Using a pH meter, adjust with the addition of ammonium hydroxide or dilute sulfuric acid to a pH of 4.5. Titrate with 0.05 M zinc sulfate VS, maintaining the pH of 4.5 by the addition of ammonium hydroxide as necessary, to an orange-pink color. Perform a blank determination, and make any necessary correction. Each mL of 0.1 M *Edetate disodium titrant* is equivalent to 14.40 mg of dihydroxyaluminum sodium carbonate ($\text{CH}_2\text{AlNaO}_5$).

■ $[\text{NaAl}(\text{OH})_2\text{CO}_3]$. ■1S (USP39)

Acceptance criteria: 98.3%–107.9% on the dried basis

IMPURITIES● **Mercury, Method IIa** (261)

Sample solution: 2.0 g in 35 mL of 1 N sulfuric acid

Acceptance criteria: NMT 1 ppm

● **Isopropyl Alcohol**

Isopropyl alcohol-free dihydroxyaluminum sodium carbonate: Use a portion of Dihydroxyaluminum Sodium Carbonate that has been previously tested as directed in this section and found to be free of isopropyl alcohol.

Sodium chloride solution: 0.2 g/mL in water

Standard stock solution: 20 mg/mL of isopropyl alcohol in *Sodium chloride solution*

Standard solution A: 0.4 mg/mL of isopropyl alcohol in *Sodium chloride solution* from *Standard stock solution*

Standard solution B: 0.8 mg/mL of isopropyl alcohol in *Sodium chloride solution* from *Standard stock solution*

Standard solution C: 1.0 mg/mL of isopropyl alcohol in *Sodium chloride solution* from *Standard stock solution*

Standard solution D: 1.2 mg/mL of isopropyl alcohol in *Sodium chloride solution* from *Standard stock solution*

Headspace containers: Use suitable 20-mL containers capable of being tightly closed with an inert septum and a metallic crimp cap.

Standard preparations: To four separate 20-mL *Headspace containers*, add 1.0 g of *Isopropyl alcohol-free dihydroxyaluminum sodium carbonate*. To the containers add, respectively, 10.0 mL of the appropriate *Standard solution*. These containers contain about 4, 8, 10, and 12 mg of isopropyl alcohol, respectively. [Note—Keep the containers cool until sealed.] Seal the containers, place in a water bath maintained at 70°, and allow to stand for 1 h.

Sample preparation: Transfer 1.0 g of the *Dihydroxyaluminum Sodium Carbonate* to a *Headspace container*, and add 10.0 mL of *Sodium chloride solution*. [Note—Keep the container cool until sealed.] Seal the container, place in a water bath maintained at 70°, and allow to stand for 1 h.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.9-m × 3-mm; packed with support S3

Temperatures

Column: 180°

Injection port: 200°

Detector: 250°

Injection volume: 1 mL of gaseous phase

System suitability

Samples: *Standard preparations* containing 10 mg per container

Suitability requirements

Relative standard deviation: NMT 4% for replicate injections

Analysis

Samples: *Standard preparations* and *Sample preparation*

[Note—Use peak areas where peak responses are indicated.]

Using a gas-tight syringe, separately inject equal volumes of the gaseous headspace of the *Standard preparations* and the *Sample preparation* into the gas chromatograph. Record the chromatograms, and measure the peak responses. Determine, based on a retention time comparison, if isopropyl alcohol is detected in the *Sample preparation*. Plot the responses of the *Standard preparations* versus the content, in mg, of isopropyl alcohol in each container, draw the straight line best fitting the plotted points, and calculate the correlation coefficient for the line. A suitable system is one that yields a line having a correlation coefficient of NLT 0.99. From the graph, determine the total amount, T_U , in mg, of isopropyl alcohol in the *Sample preparation*.

Calculate the percentage of isopropyl alcohol in the *Dihydroxyaluminum Sodium Carbonate* taken:

$$\text{Result} = 0.1 \times (T_U/W_U)$$

W_U weight of the *Dihydroxyaluminum Sodium Carbonate* taken (g)

Acceptance criteria: NMT 1.0%

SPECIFIC TESTS● **Sodium Content**

Potassium chloride solution: 38 mg/mL of potassium chloride in water

Sodium chloride stock solution: 25.42 µg/mL of sodium chloride in water (10.0 µg/mL of sodium) from sodium chloride previously dried at 105° for 2 h

Standard solution A: 0.5 µg/mL of sodium from *Sodium chloride stock solution* prepared as follows. On the day of use, transfer 4.0 mL of 1 N hydrochloric acid and 10.0 mL of *Potassium chloride solution* to a 100-mL volumetric flask. Add 5.0 mL of *Sodium chloride stock solution* and dilute with water to volume.

Standard solution B: 1.0 µg/mL of sodium from *Sodium chloride stock solution* prepared as follows. On the day of use, transfer 4.0 mL of 1 N hydrochloric acid and 10.0 mL of *Potassium chloride solution* to a 100-mL volumetric flask. Add 10.0 mL *Sodium chloride stock solution* and dilute with water to volume.

Sample solution: Transfer 250 mg of Dihydroxyaluminum Sodium Carbonate, previously dried, to a 200-mL volumetric flask. Add 40 mL of 1 N hydrochloric acid, and boil for 1 min. Cool, and dilute with water to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume. Transfer 5.0 mL of this solution to a 100-mL volumetric flask containing 4.0 mL of 1 N hydrochloric acid and 10.0 mL of *Potassium chloride solution*, and dilute with water to volume.

Blank solution: Pipet 4 mL of 1 N hydrochloric acid and 10.0 mL of *Potassium chloride solution* into a 100-mL volumetric flask, and dilute with water to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* { 851 } .)

Mode: Atomic absorption spectroscopy

Analytical wavelength: Sodium emission line at 589.0 nm

Lamp: Sodium hollow-cathode

Flame: Air-acetylene

Blank: *Blank solution*

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Sample solution*, and *Blank solution*

Plot the absorbances of the *Standard solutions* versus the concentrations, in µg/mL of sodium, and draw a straight line between the plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL of sodium in the *Sample solution*.

Calculate the percentage of sodium in the portion of Dihydroxyaluminum Sodium Carbonate taken:

$$\text{Result} = 4000 \times (C/W)$$

C = concentration of sodium in the *Sample solution* (µg/mL)

W = weight of Dihydroxyaluminum Sodium Carbonate taken (mg)

Acceptance criteria: 15.2%–16.8%

● **Acid-Neutralizing Capacity** { 301 }

Sample: 425 mg of undried material

Analysis: Proceed as directed using the *Sample*. Each mg of dihydroxyaluminum sodium carbonate [NaAl(OH)₂CO₃] has an expected acid-neutralizing capacity of 0.0278 mEq.

Acceptance criteria: NLT 75.0% of the expected mEq value, calculated in relation to the

results of the Assay

- **pH** 〈 791 〉: 9.9–10.2 in a suspension (1 in 25)

- **Loss on Drying** 〈 731 〉

Sample: Dry at 130° to constant weight.

Acceptance criteria: NMT 14.5%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers.

BRIEFING

Diphenhydramine Hydrochloride and Ibuprofen Capsules. Because there is no existing *USP* monograph for this drug product, a new monograph, based on validated methods of analysis, is proposed.

1. The liquid chromatographic procedure in the *Assay* is based on analyses performed with the Inertsil Ph-3 brand of L11 column. The typical retention times for diphenhydramine and ibuprofen are about 3.5 and 10.4 min, respectively.
2. The liquid chromatographic procedure in the *Dissolution* is based on analyses performed with the Inertsil C8 brand of L7 column. The typical retention times for ibuprofen and diphenhydramine are about 5.2 and 9.7 min, respectively.
3. The liquid chromatographic procedure in the *Organic Impurities* test is based on analyses performed with the Inertsil Ph-3 brand of L11 column. The typical retention times for diphenhydramine and ibuprofen are about 5 and 20 min, respectively.

Add the following:

■ **Diphenhydramine Hydrochloride and Ibuprofen Capsules**

DEFINITION

Diphenhydramine Hydrochloride and Ibuprofen Capsules contain NLT 95.0% and NMT 105.0% of the labeled amounts of diphenhydramine hydrochloride (C₁₇H₂₁NO·HCl) and ibuprofen (C₁₃H₁₈O₂).

IDENTIFICATION

- **A.** The retention times of the diphenhydramine and ibuprofen peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV absorption spectra of the diphenhydramine and ibuprofen peaks of the *Sample solution* and those of the *Standard solution* exhibit maxima at the same wavelengths of 265 and 273 nm, as obtained in the *Assay*.

ASSAY

- **Procedure**

Buffer: 6.8 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to

a pH of 3.0.

Mobile phase: Acetonitrile and *Buffer* (38:62)

Standard solution: 0.05 mg/mL of USP Diphenhydramine Hydrochloride RS and 0.4 mg/mL of USP Ibuprofen RS in *Mobile phase*

Sample stock solution: Nominally 0.25 mg/mL of diphenhydramine hydrochloride and 2.0 mg/mL of ibuprofen, prepared as follows. Transfer NLT 5 Capsules (including shells) to a suitable volumetric flask, add 4% of the final volume of water, and sonicate for 20 min. Dissolve and dilute with *Mobile phase* to volume. Pass a portion through a suitable filter of 0.45- μ m pore size.

Sample solution: Nominally 0.05 mg/mL of diphenhydramine hydrochloride and 0.4 mg/mL of ibuprofen in *Mobile phase* from *Sample stock solution*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detectors

Assay: UV 220 nm

Identification test A: Diode array, UV 200–400 nm

Column: 4.6-mm \times 10-cm; 3- μ m packing L11

Column temperature: 25 $^{\circ}$

Flow rate: 1.0 mL/min

Injection volume: 5 μ L

Run time: NLT 4 times the retention time of diphenhydramine

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0 for both diphenhydramine and ibuprofen

Relative standard deviation: NMT 2.0% for both diphenhydramine and ibuprofen

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amounts of diphenhydramine hydrochloride ($C_{17}H_{21}NO \cdot HCl$) and ibuprofen ($C_{13}H_{18}O_2$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of diphenhydramine or ibuprofen from the *Sample solution*

r_S peak response of diphenhydramine or ibuprofen from the *Standard solution*

C_S concentration of USP Diphenhydramine Hydrochloride RS or USP Ibuprofen RS in the *Standard solution* (mg/mL)

C_U nominal concentration of diphenhydramine hydrochloride or ibuprofen in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

• Dissolution { 711 }

Medium: Phosphate buffer, pH 7.2 (27.22 mg/mL of monobasic potassium phosphate in water and adjust with 100 mg/mL of sodium hydroxide to a pH of 7.2); 900 mL

Apparatus 1: 100 rpm

Time: 45 min

Buffer: 6.8 g/L of monobasic potassium phosphate in water. Adjust with 100 mg/mL of sodium hydroxide to a pH of 6.6.

Mobile phase: Methanol and *Buffer* (65:35)

Standard stock solution: 0.27 mg/mL of USP Diphenhydramine Hydrochloride RS and 2.2 mg/mL of USP Ibuprofen RS, prepared as follows. Transfer known amounts of USP Diphenhydramine Hydrochloride RS and USP Ibuprofen RS to a suitable volumetric flask. Add 5% of the final volume of methanol and sonicate to dissolve. Dilute with *Medium* to volume.

Standard solution: 0.027 mg/mL of USP Diphenhydramine Hydrochloride RS and 0.22 mg/mL of USP Ibuprofen RS in *Medium* from *Standard stock solution*

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size and discard the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* $\langle 621 \rangle$, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L7

Column temperature: 35 $^{\circ}$

Flow rate: 1.0 mL/min

Injection volume: 5 μ L

Run time: NLT 2.3 times the retention time of ibuprofen

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0 for both diphenhydramine and ibuprofen

Relative standard deviation: NMT 2.0% for both diphenhydramine and ibuprofen

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amounts of diphenhydramine hydrochloride ($C_{17}H_{21}NO \cdot HCl$) and ibuprofen ($C_{13}H_{18}O_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response of diphenhydramine or ibuprofen from the *Sample solution*

r_S = peak response of diphenhydramine or ibuprofen from the *Standard solution*

C_S = concentration of USP Diphenhydramine Hydrochloride RS and USP Ibuprofen RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim of diphenhydramine or ibuprofen (mg/Capsule)

Tolerances: NLT 75% (Q) of the labeled amounts of diphenhydramine hydrochloride ($C_{17}H_{21}NO \cdot HCl$) and ibuprofen ($C_{13}H_{18}O_2$) is dissolved.

- **Uniformity of Dosage Units** $\langle 905 \rangle$: Meet the requirements

IMPURITIES• **Organic Impurities**

Buffer: Proceed as directed in the *Assay*.

Mobile phase: Acetonitrile and *Buffer* (32:68)

Diluent: Acetonitrile and *Buffer* (40:60)

System suitability solution: 0.0005 mg/mL of USP Diphenhydramine Related Compound A RS and 0.25 mg/mL of USP Diphenhydramine Hydrochloride RS in *Diluent*. Sonicate if necessary to dissolve.

Standard solution: 0.00125 mg/mL of USP Diphenhydramine Hydrochloride RS and 0.01 mg/mL of USP Ibuprofen RS in *Diluent*. Sonicate to dissolve.

Sample solution: Nominally 0.25 mg/mL of diphenhydramine hydrochloride and 2 mg/mL of ibuprofen, prepared as follows. Transfer a suitable amount of Capsule contents from NLT 10 Capsules to a dry volumetric flask. Add about 60% of the final volume of *Diluent* and dissolve the contents completely by using a vortex. Dilute with *Diluent* to volume. Pass a portion through a suitable filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

■ 1S (USP39)

BRIEFING

Docosate Potassium, USP 38 page 3184. As part of USP monograph modernization efforts the monograph is revised as follows:

1. *Identification* test A is updated to include a reference to general chapter *Infrared Absorption* $\langle 197 \rangle$.
2. In preparation for the omission of the flame tests from *Identification Tests—General* $\langle 191 \rangle$, proposed in PF 41(2) [Mar.–Apr. 2015], the reference to $\langle 191 \rangle$ in *Identification* test B is deleted and a complete description of the flame test is

included in the monograph. Manufacturers are encouraged to submit a replacement wet chemistry or an instrumental procedure for the Expert Committee's consideration.

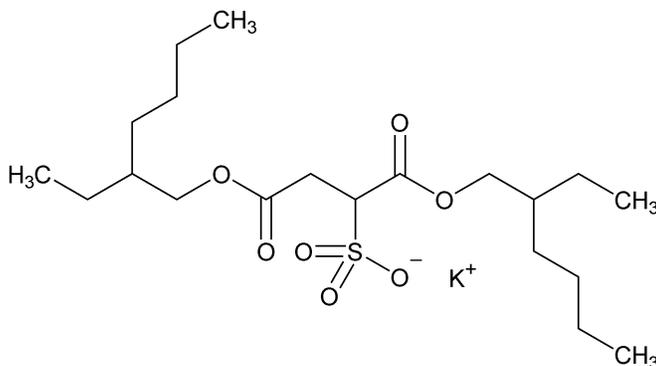

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Docusate Potassium

$C_{20}H_{37}KO_7S$ 460.67

Butanedioic acid, sulfo-, 1,4-bis(2-ethylhexyl) ester, potassium salt;
Potassium 1,4-bis(2-ethylhexyl) sulfosuccinate [7491-09-0].

DEFINITION

Docusate Potassium contains NLT 95.0% and NMT 100.5% of docusate potassium ($C_{20}H_{37}KO_7S$), calculated on the dried basis.

IDENTIFICATION

Change to read:

- **A.**

■ **Infrared Absorption** $\langle 197 \rangle$ ■ 1S (*USP39*)

Sample: Place a small piece of Docusate Potassium on a salt plate, add 1 drop of acetone, and promptly cover with another salt plate. Rub the plates together to dissolve the specimen, slide the plates apart, and allow the acetone to evaporate.

Acceptance criteria: The IR-absorption spectrum of the film exhibits maxima only at the same wavelengths as that of a similar preparation of USP Docusate Potassium RS.

■ Meets the requirements ■ 1S (*USP39*)

Delete the following:

■ • **B. Identification Tests—General, Potassium** $\langle 191 \rangle$: Meets the requirements of the flame

test ■1S (USP39)

Add the following:

- **B.** The sample imparts a violet color to a nonluminous flame. Because the presence of small quantities of sodium masks the color, screen out the yellow color produced by sodium by viewing through a blue filter that blocks emission at 589 nm (sodium) but is transparent to emission at 404 nm (potassium). [Note—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.] ■1S (USP39)

ASSAY

● **Procedure**

Solution A: 2.500 g/L of tetra-*n*-butylammonium iodide in water

Solution B: A solution containing 100 g/L of anhydrous sodium sulfate and 10 g/L of sodium carbonate in water

Sample: 100 mg

Analysis: Dissolve the *Sample* in 50 mL of chloroform in a glass-stoppered, 250-mL conical flask. Add 50 mL of *Solution B* and 500 µL of bromophenol blue TS. Titrate with *Solution A* until 1 mL from the endpoint, and shake the stoppered flask vigorously for 2 min. Continue the titration in 2-drop increments, shaking vigorously for 10 s after each addition, and then allow the flask to stand for 10 s. Continue the titration until the chloroform layer just assumes a blue color. Each mL of *Solution A* is equivalent to 3.118 mg of docusate potassium (C₂₀H₃₇KO₇S).

Acceptance criteria: 95.0%–100.5% on the dried basis

IMPURITIES

- **Residue on Ignition** 〈 281 〉: 18.0%–20.0% on the dried basis

Delete the following:

-

● **Heavy Metals, Method I** 〈 231 〉

Sample: 2.0 g

Analysis: Transfer the *Sample* to a platinum crucible, and ignite until free from carbon. Cool, moisten the residue with 1 mL of hydrochloric acid, and evaporate on a steam bath to dryness. Add 2 mL of 6 N acetic acid, digest on a steam bath for 5 min, filter into one of a pair of matched 50-mL, color-comparison tubes, and wash the residue with sufficient water to make 25 mL.

Acceptance criteria: NMT 10 ppm (Official 1-Dec-2015)

● **Limit of Bis(2-ethylhexyl) Maleate**

Mobile phase: Alcohol and water (78:22), filtered and degassed

Standard solution: 80 µg/mL of USP Bis(2-ethylhexyl) Maleate RS in alcohol

Sample solution: 20 mg/mL of Docusate Potassium in alcohol. [Note—If necessary, warm the mixture by using the steam bath to achieve a complete dissolution.]

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 210 nm
Column: 4.6-mm × 3-cm; 3.5-µm packing L1

USP Bis(2-ethylhexyl) Maleate RS

C₂₀H₃₆O₄ 340.51

USP Docusate Potassium RS

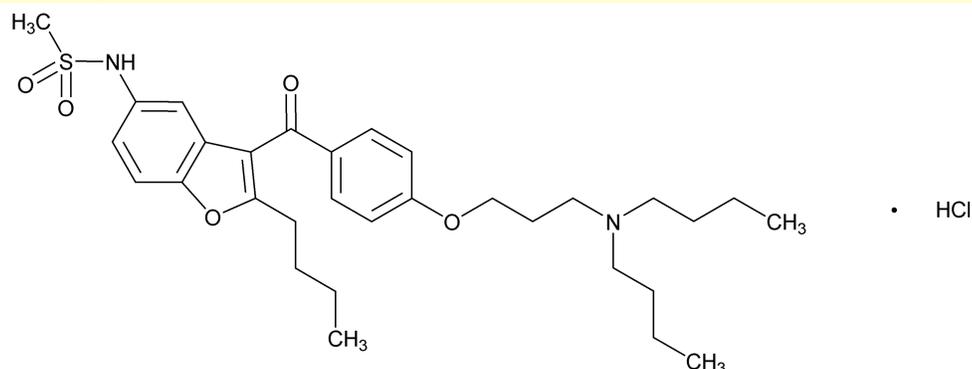

BRIEFING

Dronedarone Hydrochloride. Because there is no existing *USP* monograph for this drug substance, a new monograph is proposed based on validated methods of analysis. The liquid chromatographic procedures for the *Assay* and *Organic Impurities* are based on analyses performed with the Zorbax Stable Bond-CN brand of L10 column. The typical retention time of dronedarone is about 7 min under the *Assay* conditions and about 34 min under the *Organic Impurities* test conditions.

Add the following:

■ Dronedarone Tablets

DEFINITION

Dronedarone Tablets contain an amount of dronedarone hydrochloride equivalent to NLT 95.0% and NMT 105.0% of the labeled amount of dronedarone free base (C₃₁H₄₄N₂O₅S).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV absorption spectra of the dronedarone peak in the *Sample solution* exhibit maxima and minima at the same wavelengths as those of the corresponding peak of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **Procedure**

Buffer: Combine 2.0 mL of triethylamine with 1 L of water and adjust with phosphoric acid

to a pH of 3.0.

Mobile phase: Acetonitrile and *Buffer* (50:50)

System suitability stock solution: 0.2 mg/mL each of USP Dronedarone Hydrochloride RS and USP Dronedarone Related Compound A RS in methanol

System suitability solution: 0.01 mg/mL each of USP Dronedarone Hydrochloride RS and USP Dronedarone Related Compound A RS in *Mobile phase* from the *System suitability stock solution*

Standard stock solution: 2.13 mg/mL of USP Dronedarone Hydrochloride RS in methanol

Standard solution: 0.11 mg/mL of USP Dronedarone Hydrochloride RS in *Mobile phase* from the *Standard stock solution*

Sample stock solution: Nominally equivalent to 4 mg/mL of dronedarone in methanol prepared as follows. Dissolve and dilute in methanol to volume, an amount equivalent to 400 mg of dronedarone from NLT 20 finely powdered Tablets, taken in a 100-mL volumetric flask. Sonicate for about 5 min and allow to settle at room temperature.

Sample solution: Nominally equivalent to 0.1 mg/mL of dronedarone in *Mobile phase* from the *Sample stock solution*. Pass through a suitable filter of 0.45- μ m pore size and discard the first 3 mL of the filtrate.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detectors

Assay: UV 288 nm

Identification test B: UV diode array

Column: 4.6-mm \times 25-cm; 5- μ m packing L10

Flow rate: 0.8 mL/min

Injection volume: 20 μ L

Run time: NLT 2.15 times the retention time of dronedarone

System suitability

Sample: *System suitability solution*

[Note—The relative retention times for dronedarone related compound A and dronedarone are 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 8 between dronedarone and dronedarone related compound A

Tailing factor: 0.8–2.1 for dronedarone

Relative standard deviation: NMT 1.5%, for dronedarone

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of dronedarone free base ($C_{31}H_{44}N_2O_5S$) in the portion of Tablets taken:

$$(r_U/r_S) \times (C_S/C_U) \times (M_{r2}/M_{r1}) \times 100$$

r_U = peak response of dronedarone from the *Sample solution*

r_S = peak response of dronedarone from the *Standard solution*

C_S = concentration of USP Dronedarone Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of dronedarone in the *Sample solution* (mg/mL)

M_{r2} = molecular weight of dronedarone hydrochloride, 593.22

$M_{r\bar{f}}$ molecular weight of dronedarone free base, 556.76

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

• Dissolution 〈 711 〉

Medium: 13.61 g/L of monobasic potassium phosphate in water. Adjust with 0.1 M hydrochloric acid or 0.1 M sodium hydroxide as needed to a pH of 4.5; 1000 mL

Apparatus 2: 75 rpm, with sinker ring

Times: 30 and 90 min

Standard solution: 0.43 mg/mL of USP Dronedarone Hydrochloride RS prepared as follows.

Dissolve a suitable amount of USP Dronedarone Hydrochloride RS in 2% of the total volume of methanol and dilute with *Medium* to volume.

Sample solution: Pass a portion of sample under test through a suitable filter.

Instrumental conditions

Analytical wavelength: UV 288 nm

Cell: 1 mm

Blank: *Medium*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of dronedarone dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times (M_{r2}/M_{r1}) \times 100$$

A_U = absorbance from the *Sample solution*

A_S = absorbance from the *Standard solution*

C_S = concentration of USP Dronedarone Hydrochloride RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 1000 mL

L = label claim (mg/Tablet)

M_{r2} molecular weight of dronedarone hydrochloride, 593.22

M_{r1} molecular weight of dronedarone free base, 556.76

Tolerances

30 min: 20.0%–60.0% (Q) of the labeled amount of dronedarone free base ($C_{31}H_{44}N_2O_5S$) is dissolved.

90 min: NLT 80% (Q) of the labeled amount of dronedarone free base ($C_{31}H_{44}N_2O_5S$) is dissolved.

• Uniformity of Dosage Units 〈 905 〉: Meet the requirements

BRIEFING

Duloxetine Hydrochloride, USP 38 page 3243. It is proposed to revise the monograph as follows:

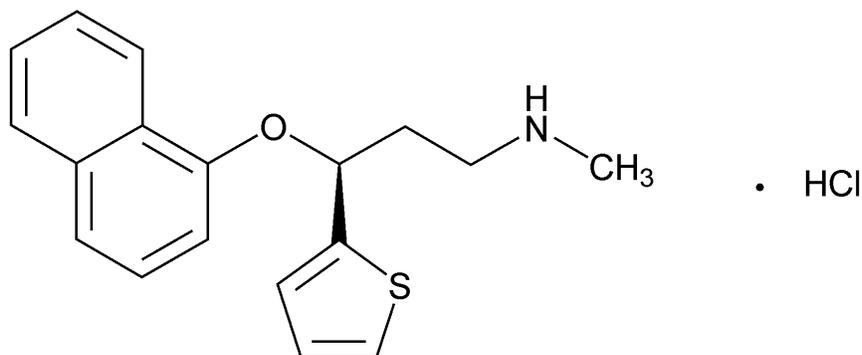

1. Revise the *System suitability solution* description within the *Assay* to clarify that duloxetine related compound F is present in USP Duloxetine Hydrochloride RS. USP has received questions about the source of duloxetine related compound F in this solution.
2. Replace the dashes and footnotes for several impurities in *Table 1* with the limit for any individual unspecified impurity.
3. Correct the chemical name for duloxetine β-naphthol-1-yl isomer.

Additionally, minor editorial changes have been made to update the monograph to current USP style

BRIEFING

Edetate Disodium, *USP 38* page 3263. As part of USP monograph modernization efforts, the following changes are proposed:

1. *Identification* test *A* is revised to remove the redundant requirement to use an undried sample. Since the label for USP Edetate Disodium RS states "Do not dry", the general chapter *Spectrophotometric Identification Tests* 〈 197 〉 indicates that the sample should also be undried.
2. In preparation for the omission of the flame tests from general chapter *Identification Tests—General* 〈 191 〉, proposed in *PF 41(2)* [Mar.–Apr. 2015], it is proposed to replace the use of the flame test in *Identification* test *C* with the pyroantimonate precipitation test currently described in this general chapter. This test is also consistent with test (a) in the 2.3.1 *Identification reactions of ions and functional groups* in *European Pharmacopoeia*, and is employed in the *European Pharmacopoeia* monograph for *Edetate Disodium*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM3: R.S. Prasad.)

Correspondence Number—C154665

Comment deadline: May 31, 2015**Edetate Disodium** $C_{10}H_{14}N_2Na_2O_8 \cdot 2H_2O$ 372.24 $C_{10}H_{14}N_2Na_2O_8$ 336.21Glycine, *N,N'*-1,2-ethanediybis[*N*-(carboxymethyl)-, disodium salt, dihydrate;

Disodium (ethylenedinitrilo)tetraacetate dihydrate [6381-92-6].

Anhydrous [139-33-3].

DEFINITION

Edetate Disodium contains NLT 99.0% and NMT 101.0% of edetate disodium ($C_{10}H_{14}N_2Na_2O_8$), calculated on the dried basis.

test.

ASSAY

- **Procedure**

Sample solution: Dissolve 5 g of Edetate Disodium in about 100 mL of water contained in a 250-mL volumetric flask. Add water to volume.**Analysis:** Place 200 mg of chelometric standard calcium carbonate, previously dried at 110 ° for 2 h and cooled in a desiccator, into a 400-mL beaker. Add 10 mL of water, and swirl to form a slurry. Cover the beaker with a watch glass, and without removing the latter, add 2 mL of 3 N hydrochloric acid from a pipet. Swirl the contents of the beaker, and dissolve the calcium carbonate. With water, wash down the sides of the beaker, the outer surface of the pipet, and the watch glass, and dilute with water to 100 mL. While stirring the solution, preferably with a magnetic stirrer, add 30 mL of the *Sample solution* from a

50-mL buret. Add 15 mL of 1 N sodium hydroxide and 0.30 g of hydroxy naphthol blue, and continue the titration with the *Sample solution* to a blue endpoint.

Calculate the weight of edetate disodium ($C_{10}H_{14}N_2Na_2O_8$) in the portion of Edetate Disodium taken:

$$\text{Result} = (V_T/V_U) \times W \times (M_{r1}/M_{r2})$$

V_T = total volume of the *Sample solution* (mL)

V_U = volume of the *Sample solution* consumed in the titration (mL)

W = weight of calcium carbonate (mg)

M_{r1} = molecular weight of edetate disodium, 336.21

M_{r2} = molecular weight of calcium carbonate, 100.09

Acceptance criteria: 99.0%–101.0% on the dried basis

BRIEFING

Ethambutol Hydrochloride Compounded Oral Suspension. Because there is currently no existing *USP* monograph for this dosage form, a new compounded preparation monograph is proposed based on a validated stability-indicating method used to assess stability. The liquid chromatographic procedure in the *Assay* is based on analyses validated using the Zorbax StableBond-CN brand of L10 column. The typical retention time for ethambutol hydrochloride is about 3.7 min.

Please submit comments to CompoundingSL@usp.org.

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Etidronic Acid Monohydrate RS in the *Standard solution* (mg/mL)

C_U = concentration of Etidronate Disodium in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of etidronate disodium, ~~250.00~~

■ 249.99 ■ 1S (USP39)

M_{r2} = molecular weight of etidronic acid monohydrate, 224.05

Acceptance criteria: 97.0%–101.0% on the anhydrous basis

IMPURITIES

Delete the following:

•

• **Heavy metals, Method II** { 231 }

Standard solution: 0.5 g of USP Etidronate Disodium RS

Standard solution: 2.5 mL of *Standard Lead Solution*

Analysis: Transfer the *Sample solution* and the *Standard solution* to separate quartz crucibles, add 0.5 g of magnesium oxide to each crucible, and mix. Evaporate the *Standard solution* to dryness at 110° for 1 h, and ignite each crucible over a flame to a light gray color. Ignite at 800° for 1 h, cool, and dissolve the residues by the dropwise addition of hydrochloric acid, and add 3 mL of water. Adjust with ammonia TS to a pH of 8.5, then adjust with acetic acid to a pH of 4. Make a final pH adjustment to 3.4 ± 0.05,

using dilute hydrochloric acid. Filter into 50-mL color comparison tubes, and dilute with water to 40 mL.

Acceptance criteria: NMT 50 ppm (Official 1-Dec-2015)

SPECIFIC TESTS

• Limit of Phosphite

Solution A: 0.65 mg/mL of anhydrous sodium carbonate and 0.40 mg/mL of sodium bicarbonate in water

Solution B: 4.68 mg/mL of anhydrous sodium carbonate and 2.89 mg/mL of sodium bicarbonate in water

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
6.0	100	0
6.1	0	100
8.0	0	100
8.1	100	0
15	100	0

Suppressor regenerant solution: 12.5 mM sulfuric acid. [Note—This solution is needed only if the chemical suppression option is used.]

Standard solution: Equivalent to 0.016 mg/mL of dibasic sodium phosphite on the anhydrous basis from USP Etidronate Disodium Related Compound A RS and 0.015 mg/mL of dibasic sodium phosphate in *Solution A*. [Note—USP Etidronate Disodium Related Compound A RS is sodium phosphite dibasic pentahydrate.]

Sample solution: 5.0 mg/mL of Etidronate Disodium in *Solution A*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: Conductivity

Columns

Guard: 4-mm × 50-mm; packing L61. [Note—Use either a 4-mm anion self-regenerating suppressor or a suitable chemical suppressor.]

Analytical: 4-mm × 25-cm; packing L61

Flow rate: 1.0 mL/min. [Note—When a chemical suppressor is used, the flow rate is 3–5 mL/min for the *Suppressor regenerant solution*.]

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

[Note—The elution order is phosphite, followed by phosphate.]

Suitability requirements

Resolution: NLT 2.5 between phosphite and phosphate

Relative standard deviation: NMT 10% for each peak, for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of phosphite, determined as monobasic sodium phosphite, in the portion of Etidronate Disodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of phosphite from the *Sample solution*

r_S = peak response of phosphite from the *Standard solution*

C_S = concentration of USP Etidronate Disodium Related Compound A RS on the anhydrous basis in the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

M_{r1} = molecular weight of monobasic sodium phosphite, 103.98

M_{r2} = molecular weight of dibasic sodium phosphite, 125.96

Acceptance criteria: NMT 1.0% of phosphite, determined as monobasic sodium phosphite

- **pH** 〈 791 〉

Sample solution: 10 mg/mL

Acceptance criteria: 4.2–5.2

- **Water Determination, Method Ic** 〈 921 〉

Sample: 100 mg of finely powdered Etidronate Disodium in 10 mL of a mixture of acetic acid and formamide (1:1)

Acceptance criteria: NMT 5.0%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers

- **USP Reference Standards** 〈 11 〉

USP Etidronate Disodium RS

USP Etidronate Disodium Related Compound A RS

Sodium phosphite dibasic pentahydrate.

$\text{Na}_2\text{HPO}_3 \cdot 5\text{H}_2\text{O}$ 216.04

USP Etidronic Acid Monohydrate RS

$\text{C}_2\text{H}_8\text{O}_7\text{P}_2 \cdot \text{H}_2\text{O}$ 224.04

BRIEFING

Fluorometholone, *USP 38* page 3547 and *PF 40(1)* [Jan.–Feb. 2014]. The previously published proposal is canceled and replaced with the following proposal based on the comments received:

1. The *Identification test B* and *Identification test C* are replaced with an *Identification test* based on HPLC retention time agreement from the *Assay*.
2. A new HPLC-based *Organic Impurities* procedure is added based on analyses performed using the Symmetry C18 brand of L1 column. The current *Assay* procedure is replaced with a similar procedure to that used in the test for *Organic Impurities*. The typical retention time for fluorometholone is about 29 min.
3. The test and *Acceptance criteria* for *Specific Rotation* are revised to eliminate the use of pyridine, which is a safety hazard.
4. A new Reference Standard is added to the *USP Reference Standards* section to support the revision.

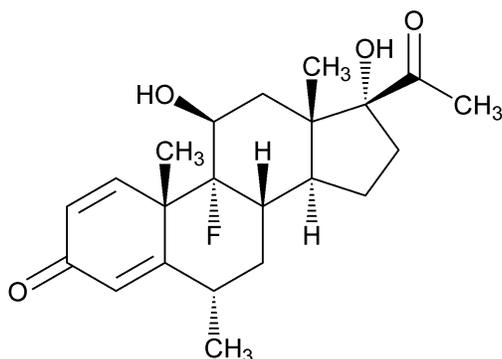

Additionally, minor editorial changes have been made to update the monograph to current USP style.

Fluorometholone

$C_{22}H_{29}FO_4$ 376.46

Pregna-1,4-diene-3,20-dione, 9-fluoro-11,17-dihydroxy-6-methyl-, (6 α ,11 β)-;
9-Fluoro-11 β ,17-dihydroxy-6 α -methylpregna-1,4-diene-3,20-dione [426-13-1].

DEFINITION

Fluorometholone contains NLT 97.0% and NMT 103.0% of fluorometholone ($C_{22}H_{29}FO_4$), calculated on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption** (197K)

Delete the following:

- **B. Ultraviolet Absorption** (197U)

Analytical wavelength: 239 nm

Sample solution: 10 $\mu\text{g}/\text{mL}$ in methanol

Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 3.0%. ■1S (USP39)

Add the following:

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■1S (USP39)

Delete the following:

- **C. Thin-Layer Chromatography**

Standard solution: 500 $\mu\text{g}/\text{mL}$ of USP Fluorometholone RS in methanol

Sample solution: 500 µg/mL of Fluorometholone in methanol

Chromatographic system

(See *Chromatography* ~~(621)~~ *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 100 µL

Developing solvent system: Methylene chloride and acetone (4:1)

Visualization: Short-wavelength UV

Analysis

Samples: *Standard solution and Sample solution*

Allow the spots to dry, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under short-wavelength UV light.

Acceptance criteria: The R_f value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*. ■1S (USP39)

ASSAY

Change to read:

● **Procedure**

Mobile phase: Prepare a suitable filtered solution of methanol and water (60:40) such that the retention time of fluorometholone is about 3 min.

Standard solution: 100 µg/mL of USP Fluorometholone RS in *Mobile phase*

Sample solution: 100 µg/mL of Fluorometholone in *Mobile phase*

Chromatographic system
