Calculate the percentage of fluorometholone ($C_{22}H_{29}FO_4$) in the portion of Fluorometholone taken:

$$\text{Result} = r_U/r_S \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

~~r_S peak response from the *Standard solution*~~

~~C_S concentration of USP Fluorometholone RS in the *Standard solution* ($\mu\text{g/mL}$)~~

~~C_U concentration of Fluorometholone in the *Sample solution* ($\mu\text{g/mL}$)~~

Acceptance criteria: ~~97.0%–103.0% on the dried basis~~

■ **Mobile phase:** Mix 425 g (538 mL) of methanol and 400 g (400 mL) of water. Adjust with phosphoric acid to a pH of 2.4.

Standard stock solution: 0.25 mg/mL of USP Fluorometholone RS prepared as follows.

Transfer a suitable amount of USP Fluorometholone RS to a suitable volumetric flask and dissolve in 2% of the final volume of tetrahydrofuran. Dilute with *Mobile phase* to volume.

Standard solution: 50 $\mu\text{g/mL}$ of USP Fluorometholone RS in *Mobile phase* from *Standard stock solution*

Sample stock solution: 0.25 mg/mL of Fluorometholone prepared as follows. Transfer a suitable amount of Fluorometholone to a suitable volumetric flask and dissolve in 2% of the final volume of tetrahydrofuran. Dilute with *Mobile phase* to volume.

Sample solution: 50 $\mu\text{g/mL}$ of Fluorometholone in *Mobile phase* from *Sample stock solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 240 nm

Column: 4.6-mm \times 25-cm; 5- μm packing L1

Flow rate: 0.6 mL/min

Injection volume: 20 μL

Run time: NLT 1.6 times the retention time of fluorometholone

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.3

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of fluorometholone ($\text{C}_{22}\text{H}_{29}\text{FO}_4$) in the portion of Fluorometholone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U

= peak response of fluorometholone from the *Sample solution*

r_S

= peak response of fluorometholone from the *Standard solution*

C_S

= concentration of USP Fluorometholone RS in the *Standard solution* ($\mu\text{g/mL}$)

BRIEFING

Glyburide and Metformin Hydrochloride Tablets, USP 38 page 3689. On the basis of comments received, it is proposed to make the following changes for clarity:

1. Add a *Note* in the *Assay for Metformin Hydrochloride* to allow changes in mobile phase composition to optimize the separation.
2. Delete the requirements for *Capacity factor* and *Column efficiency* from *System suitability* in the *Assay for Glyburide*, because the remaining requirements are adequate to evaluate the system suitability.
3. Delete the requirements for *Column efficiency* from *System suitability* in the *Dissolution* test for *Glyburide*, because the remaining requirements are adequate to evaluate the system suitability.
4. Update the calculation formula under *Glyburide* in *Impurities* to be consistent with *USP* style by moving the relative response factors from the numerator into the denominator, and to recalculate the *F* value for glyburide related compound A.
5. Under the *Dissolution* test, revise the concentrations of the *Standard solution* and *Sample solution* for consistency.
6. Under the *Dissolution* test for *Metformin hydrochloride*, indicate that the *Standard solution* may be diluted with *Medium*, if necessary, and revise the calculation to include dilution factor *D*.
7. The molecular formula and molecular weight for *USP Glyburide Related Compound A* *RS* are added in the *USP Reference Standards* section for clarity and uniformity.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Glyburide and Metformin Hydrochloride Tablets

DEFINITION

Glyburide and Metformin Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of glyburide ($C_{23}H_{28}ClN_3O_5S$) and metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$).

IDENTIFICATION

- **A. Glyburide:** The retention time of the glyburide peak of the *Sample solution* corresponds to that of the major peak of the *Standard solution*, as obtained in the *Assay for Glyburide*.
- **B. Metformin Hydrochloride:** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay for Metformin Hydrochloride*.

ASSAY

Change to read:

- **Glyburide**

Solution A:

■ **Buffer:** ■ 1S (*USP39*)

28.8 g/L of monobasic ammonium phosphate

Mobile phase: Acetonitrile and *Solution A*

■ **Buffer:** ■ 1S (*USP39*)

(40:60). Adjust with 1 N sodium hydroxide to a pH of 5.3.

Diluent: Acetonitrile and water (50:50)

Standard stock solution: 0.25 mg/mL of USP Glyburide RS prepared as follows.

■ Transfer a weighed amount of USP Glyburide RS to a suitable volumetric flask. ■ 1S (USP39)

Dissolve first in the acetonitrile, using 50% of the final volume, and then dilute with water to volume.

Standard solution: 0.025 mg/mL of USP Glyburide RS in *Diluent*, from the *Standard stock solution*

System suitability solution 1: Prepare a solution containing 0.025 mg/mL of USP Glyburide Related Compound A RS in *Diluent*. Transfer 50 µL of this solution to a 50-mL volumetric flask, and dilute with *Standard solution* to volume.

System suitability solution 2: 5.0 mg/mL of USP Metformin Hydrochloride RS in *System suitability solution 1*

Sample solution: Dissolve NLT 5 Tablets in *Diluent* by stirring with a magnetic stirring bar for at least 1 h. Dilute to obtain a solution containing 0.025 mg/mL of glyburide, based on the label claim. Centrifuge a portion of this solution at 3000 rpm for 10 min and use the clear supernatant. [Note—Retain a portion of this solution for the *Assay for Metformin Hydrochloride*.]

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 15-cm; 5-µm packing L7

Column temperature: 40°

Flow rate: 1.2 mL/min

Injection volume: 100 µL

■ **Run time:** 1.25 times the retention time of glyburide ■ 1S (USP39)

System suitability

Sample: *System suitability solution 2*

[Note—The relative retention time for glyburide related compound A is about 0.30 with respect to glyburide.]

Suitability requirements

Capacity factor, k': NLT 7 for the peak due to glyburide

Column efficiency: NLT 3000 theoretical plates for the peak due to glyburide

■ 1S (USP39)

Relative standard deviation: NMT 1.5% for the glyburide peak; NMT 10% for the glyburide related compound A peak

Analysis

Samples: *Standard solution* and *Sample solution*

Record the chromatograms for about 1.25 times the retention time of the glyburide peak.

■ 1S (USP39)

Calculate the percentage of the labeled amount of glyburide (C₂₃H₂₈ClN₃O₅S) in the portion of

Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response

■ of glyburide ■_{1S} (USP39)
from the *Sample solution*

r_S = peak response

■ of glyburide ■_{1S} (USP39)
from the *Standard solution*

C_S = concentration of USP Glyburide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of glyburide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% of the labeled amount of glyburide

Change to read:

● **Metformin Hydrochloride**

Solution A:

■ **Buffer:** ■_{1S} (USP39)

Transfer 1.0 g each of sodium heptanesulfonate and sodium chloride to a 2000-mL volumetric flask. Add 1800 mL of water, and adjust with 0.06 M phosphoric acid to a pH of 3.85. Dilute with water to volume.

Mobile phase: Acetonitrile and *Solution A*

■ *Buffer* ■_{1S} (USP39)

(10:90)

■ [

Note—To improve the separation, the composition of acetonitrile and *Buffer* may be changed to 5:95, if necessary.] ■_{1S} (USP39)

Diluent: Acetonitrile and water (1:40)

Standard solution: 0.25 mg/mL of USP Metformin Hydrochloride RS in *Diluent*. [Note—Sonicate to achieve complete dissolution, if necessary.]

System suitability stock solution: 25 µg/mL each of USP Metformin Related Compound B RS and USP Metformin Related Compound C RS in *Diluent*

System suitability solution: Transfer 0.5 mL of the *System suitability stock solution* to a 50-mL volumetric flask, and dilute with *Standard solution* to volume.

Sample solution: Dilute with water a portion of the retained *Sample solution* from the *Assay for Glyburide* to obtain 0.25 mg/mL of metformin hydrochloride based on the label claim.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 218 nm

Column: 3.9-mm × 30-cm; 10-µm packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 5 µL

System suitability

Sample: *System suitability solution*

[Note—The relative retention times for metformin related compound B, metformin, and

metformin related compound C are about 0.86, 1.0, and 2.1–2.3, respectively. Metformin related compound C can have a variable retention time.

- The composition of acetonitrile and *Buffer* in *Mobile phase* may be changed to 5:95, if it elutes at a relative retention time of less than 2.1. ■1S (USP39)

]

Suitability requirements

Resolution: NLT 1.5 between metformin related compound B and metformin

Tailing factor: 0.8–2.0 for the metformin peak

Relative standard deviation: NMT 1.5% for the metformin peak; NMT 10% each for the metformin related compound B and metformin related compound C peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of

- metformin hydrochloride ■1S (USP39)

($C_4H_{11}N_5 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response

- of metformin ■1S (USP39)
- from the *Sample solution*

r_S = peak response

- of metformin ■1S (USP39)
- from the *Standard solution*

BRIEFING

Hydralazine Hydrochloride, *USP 38* page 3766. As a part of USP monograph modernization efforts, the following changes are proposed:

1. In the test for *Organic Impurities*, the preparation of the *Standard stock solution* and the *Standard solution* are added.
2. In the test for *Organic Impurities*, four specified impurities, corresponding acceptance criteria, and calculations are included to be consistent with the FDA-approved specifications.
3. An individual unspecified impurity specification in accordance with ICH guidelines and the corresponding calculation are included in the test for *Organic Impurities*.
4. Four new Reference Standards are added to the *USP Reference Standards* section.
5. The system suitability requirement for the *Relative standard deviation* in the test for *Organic Impurities* is added.
6. The reagent phthalazine in the *System suitability solution* in the *Assay* is replaced with USP Phthalazine RS.
7. The test for *Water-Insoluble Substances* is deleted as the corresponding dosage form monograph for Injection adequately tests for the presence of particulate matter.

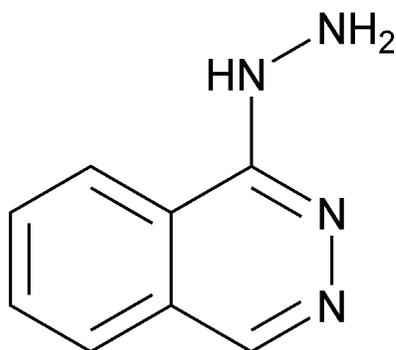

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

- **Limit of Hydrazine**

Buffer: Dissolve 5.82 g of dibasic sodium phosphate and 3.81 g of monobasic potassium phosphate in 1 L of water, and adjust with either 1 N sodium hydroxide or 1 N phosphoric acid to a pH of 7.0 ± 0.1 .

Mobile phase: Dissolve 300 mg of edetate disodium in 300 mL of water in a 1-L volumetric flask. Dilute with acetonitrile to volume.

Benzaldehyde solution: Transfer 1.0 mL of benzaldehyde to a 100-mL volumetric flask,

and dilute with a mixture of methanol and water (9:1) to volume.

Acetonitrile solution: Transfer 300 mL of water to a 1000-mL volumetric flask, and dilute with acetonitrile to volume.

Standard stock solution: 0.65 mg/mL of hydrazine dihydrochloride in water

Standard solution 1: 0.325 µg/mL of hydrazine dihydrochloride in water from *Standard stock solution*

Standard solution 2: Transfer 1.0 mL of *Standard solution 1* to a 10-mL flask. Add 4.0 mL of *Benzaldehyde solution*, and shake by mechanical means for 20 min.

Standard solution 3: Transfer 2.0 mL of *Standard solution 2* to a 5-mL volumetric flask, and dilute with *Acetonitrile solution* to volume.

Extraction column: Use a freshly conditioned solid phase extraction column containing benzenesulfonic acid strong cation-exchange packing with a sorbent-mass to column volume ratio of 500 mg per 3 mL, or equivalent. The column is conditioned as follows. Wash the column with two 2.0-mL portions of hexanes, and dry under vacuum for 2 min. Wash the column with two 2.0-mL portions of methanol, two 2.0-mL portions of water, and two 2.0-mL portions of *Buffer*. At no time after the hexanes wash should the column be allowed to dry out.

Sample solution: Transfer about 20 mg of Hydralazine Hydrochloride to a 10-mL reaction vessel, and dissolve in 1.0 mL of water. Add 4.0 mL of *Benzaldehyde solution*, and shake by mechanical means for 20 min. Pipet 2.0 mL of this solution into the *Extraction column* and elute into a 5-mL volumetric flask. Wash the *Extraction column* with two 1.5-mL portions of *Acetonitrile solution*, collecting the washings with the eluate, and dilute with *Acetonitrile solution* to volume.

BRIEFING

Hydralazine Hydrochloride Tablets, USP 38 page 3769. As part of USP monograph modernization efforts, it is proposed to include a validated HPLC-based *Organic Impurities* test procedure. The proposed test procedure is validated using the Nucleosil CN brand of

L10 column in which hydralazine elutes at about 7 min. A Reference Standard for USP Phthalazine RS is in development and hence the reagent phthalazine in the *System suitability solution* in the *Assay* is replaced with USP Phthalazine RS. The *USP Reference Standards* section is updated to include the Reference Standard for phthalazine.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Hydralazine Hydrochloride Tablets

DEFINITION

Hydralazine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of hydralazine hydrochloride ($C_8H_8N_4 \cdot HCl$).

IDENTIFICATION

• **A. Infrared Absorption** (197K)

Sample: Transfer an amount equivalent to about 100 mg of hydralazine hydrochloride from finely powdered Tablets to a glass-stoppered flask. Add 40 mL of 1 N hydrochloric acid, shake by mechanical means for 5 min, and filter. Discard the first few mL of the filtrate. Place 20 mL of the filtrate in a separator, wash with 10 mL of methylene chloride, and discard the methylene chloride washing. Mix the aqueous solution in the separator with 2 mL of 14-mg/mL sodium nitrite solution, add 10 mL of methylene chloride, shake by mechanical means for 5 min, and allow the layers to separate. Pass the methylene chloride layer through a filter of anhydrous sodium sulfate previously washed with methylene chloride and collect the solution in a 50-mL beaker. Evaporate to dryness with the aid of gentle heat and a stream of dry nitrogen.

Acceptance criteria: Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

BRIEFING

Hydroxyzine Hydrochloride Oral Solution, *USP 38* page 3814. As part of the USP monograph modernization efforts, it is proposed to revise the monograph as follows:

1. Add a stability-indicating liquid chromatographic procedure as a test for *Organic Impurities* and replace the existing *Assay* with a similar procedure. These procedures were validated using the Acquity UPLC HSS C18 SB brand of L1 column. The typical retention time for hydroxyzine is about 15.6 min.
2. Replace *Identification test A*, which is based on TLC, with a test based on the retention time agreement using the proposed *Assay*.
3. Add *Identification test B* based on the UV spectral agreement for the main peak from the proposed *Assay*.
4. Include a storage requirement in the *Packaging and Storage* section based on the information for an approved drug product.
5. Add USP 4-Chlorobenzophenone RS and USP Hydroxyzine Related Compound A RS to the *USP Reference Standards* section to support the proposed test for *Organic Impurities*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Hydroxyzine Hydrochloride Oral Solution**DEFINITION**

Hydroxyzine Hydrochloride Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of hydroxyzine hydrochloride ($C_{21}H_{27}ClN_2O_2 \cdot 2HCl$).

IDENTIFICATION**Change to read:**• **A.**

~~**Standard solution:** 0.35 mg/mL of USP Hydroxyzine Hydrochloride RS in methanol~~

~~**Sample solution:** Nominally 0.4 mg/mL of hydroxyzine hydrochloride from Oral Solution in methanol~~

~~**Chromatographic system**~~

~~(See *Chromatography* (621); *Thin-Layer Chromatography*.)~~

~~**Mode:** TLC~~

~~**Adsorbent:** Thin-layer chromatographic plate, coated with a 0.25-mm layer of chromatographic silica gel, and dried in air for 30 min, followed by drying under vacuum at 140° for 30 min~~

~~**Application volume:** 100 µL~~

~~**Developing solvent system:** Toluene, alcohol, and ammonium hydroxide (150:95:1)~~

~~**Spray reagent:** Potassium iodoplatinate TS~~

~~**Analysis**~~

~~**Samples:** Standard solution and Sample solution~~

~~Apply the solutions on a chromatographic plate, and allow the spots to dry. Develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots by lightly spraying with *Spray reagent*.~~

~~**Acceptance criteria:** The R_f value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.~~

- The retention time of the major peak of the *Sample solution* corresponds to that of the hydroxyzine peak of the *Standard solution*, as obtained in the Assay. ■ 1S (USP39)

Add the following:

- ● **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay. ■ 1S (USP39)

 $C_{17}H_{19}ClN_2$ 286.80 ■ 1S (USP39)

BRIEFING

Imipramine Hydrochloride Tablets, USP 38 page 3844. As part of USP monograph modernization efforts, it is proposed to make the following changes:

1. Replace the spectrophotometric *Assay* procedure with a stability-indicating liquid chromatographic procedure using the Acquity UPLC BEH C8 brand of L7 column. The retention time of imipramine in the analysis is about 10.5 min.
2. Add *Identification* test *B* using a retention time agreement based on the proposed method for the *Assay*.
3. Add a specific equation in the test for *Dissolution* to provide additional information.
4. Add a liquid chromatographic procedure as the test for *Organic Impurities* that uses the same chromatographic parameters as the proposed *Assay*.
5. Add a storage requirement in the *Packaging and Storage* section that is consistent with FDA-approved drug products.
6. Add USP Desipramine Hydrochloride RS, USP Depramine RS, and USP Iminodibenzyl RS to the *Reference Standards* section to support the proposed procedures in the *Assay* and the test for *Organic Impurities*.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

Imipramine Hydrochloride Tablets**DEFINITION**

Imipramine Hydrochloride Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of imipramine hydrochloride ($C_{19}H_{24}N_2 \cdot HCl$).

IDENTIFICATION**Change to read:**

•

■ **A.** ■ 1S (USP39)

Infrared Absorption 〈 197K〉

Sample: Powder a suitable number of Tablets, equivalent to 100 mg of imipramine hydrochloride, and macerate the powder with 10 mL of chloroform. Filter the chloroform extract through paper into a wide-mouth test tube, and evaporate the filtrate to 3 mL. Carefully add ether until the liquid becomes turbid, heat on a steam bath to produce a clear solution, cool, and allow to stand. The precipitate that is formed may be recrystallized from acetone. Filter the crystalline precipitate, wash with ether, and dry under vacuum at 105° for 30 min. Use the precipitate.

Acceptance criteria: Meet the requirements

Add the following:

- • **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■ 1S (USP39)

ASSAY

Change to read:

• **Procedure**

Diluent A: 0.5 N hydrochloric acid

Diluent B: hydrochloric acid in water (1 in 25)

Standard solution: 25 µg/mL USP Imipramine Hydrochloride RS in *Diluent A*

Sample stock solution: Nominally 0.5 mg/mL of imipramine hydrochloride from Tablets prepared as follows. Weigh and finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 100 mg of imipramine hydrochloride, to a 200-mL volumetric flask; add 100 mL of *Diluent B*, and shake vigorously by mechanical means for 1 h. Dilute with *Diluent B* to volume, pass through a suitable and filter, and discard the first 20 mL of the filtrate.

Sample solution: Pipet 5 mL of the *Sample stock solution* into a separator, add 10 mL of 1 N sodium hydroxide, and extract with four 20-mL portions of ether, shaking each portion for 2 min and collecting the extracts in a second separator. Extract the combined ether extracts with four 20-mL portions of *Diluent A*, and combine the extracts in a 250-mL beaker. Aerate this solution with nitrogen to remove residual ether, then transfer to a 100-mL volumetric flask, and rinse the beaker with *Diluent A*, collecting the rinsings in the flask. Add *Diluent A* to volume.

Instrumental conditions-

(See *Spectrophotometry and Light Scattering* 〈 851〉.)

Mode: UV-Vis

Analytical wavelength: 250 nm

Cell: 1 cm

Analysis-

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of imipramine hydrochloride ($C_{19}H_{24}N_2 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

~~A_U~~ absorbance of the *Sample solution*

~~A_S~~ absorbance of the *Standard solution*

~~C_S~~ concentration of USP Imipramine Hydrochloride RS in the *Standard solution* (mg/mL)

~~C_U~~ nominal concentration of imipramine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: ~~93.0%–107.0%~~

■ **Solution A:** 0.02 M ammonium bicarbonate in water. Adjust with 28%–30% ammonia solution to a pH of 8.0.

Solution B: Acetonitrile and methanol (70:30)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.0	90	10
1.0	90	10
5.0	60	40
7.0	60	40
10.0	48	52
13.0	48	52
14.0	20	80
16.0	20	80
16.1	90	10
18.0	90	10

Diluent: Acetonitrile and water (40:60)

Standard solution: 0.25 mg/mL of USP Imipramine Hydrochloride RS in *Diluent*

Sample stock solution: Nominally 1.0 mg/mL of imipramine hydrochloride from Tablets prepared as follows. Powder NLT 10 Tablets and transfer a sufficient portion of powder to a volumetric flask. Add 75% of the final flask volume of *Diluent*. Sonicate as needed to aid in dissolution. Allow to cool to room temperature, then dilute with *Diluent* to volume. Centrifuge and use the supernatant. [Note—The use of a centrifuge speed of 3000 rpm for 10 min may be suitable.]

Sample solution: Nominally 0.25 mg/mL of imipramine from *Sample stock solution* in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 2.1-mm × 10-cm, 1.7-μm packing L7

Column temperature: 35°

Flow rate: 0.4 mL/min

Acceptance criteria: Meet the requirements

IMPURITIES

Add the following:

Organic Impurities

Solution A, Solution B, Mobile phase, Diluent, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 0.002 mg/mL each of USP Imipramine Hydrochloride RS, USP Depramine RS, USP Desipramine Hydrochloride RS, and USP Iminodibenzyl RS in *Diluent*. Sonicate if necessary to aid dissolution.

Sample solution: Nominally 1.0 mg/mL of imipramine hydrochloride from Tablets prepared as follows. Powder NLT 10 Tablets and transfer a portion to a volumetric flask. Add about 75% of the final flask volume of *Diluent*. Sonicate as necessary to aid dissolution. Allow to cool to room temperature, then dilute with *Diluent* to volume. Centrifuge and use the supernatant. [Note—The use of a centrifuge speed of 3000 rpm for 10 min may be suitable.]

System suitability

Sample: *Standard solution*

[Note—See *Table 2* for relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between the depramine and desipramine peaks

Relative standard deviation: NMT 2.5% each for depramine, desipramine, imipramine, and iminodibenzyl

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each identified impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of each impurity from the *Sample solution*

r_S peak response of each corresponding Reference Standard from the *Standard solution*

C_S concentration of each corresponding Reference Standard in the *Standard solution* (mg/mL)

C_U nominal concentration of imipramine hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of each unspecified degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of each unspecified degradation product from the *Sample solution*

r_S peak response of imipramine from the *Standard solution*

C_S concentration of USP Imipramine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U nominal concentration of imipramine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*. Disregard any impurity peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Desipramine	0.82	0.10
Depramine	0.84	0.10
Imipramine	1.0	—
Iminodibenzyl	1.18	0.10
Any individual unspecified degradation product	—	0.20
Total degradation products	—	1.5

BRIEFING

Indapamide, *USP 38* page 3849. As part of the USP monograph modernization effort, the following revisions are proposed:

1. Revise the acceptance criterion in the *Definition* from NLT 98.0% and NMT 101.0% to NLT 98.0% and NMT 102.0%, which is typical for chromatographic procedures.
2. Replace the UV-based *Identification* test *B* with a retention time agreement for indapamide based on the *Assay*.
3. Replace the existing HPLC *Assay* procedure, which depends on an internal standard, with a stability-indicating HPLC procedure with conditions similar to the proposed *Organic Impurities* test. The proposed liquid chromatographic procedure is based on an analysis performed with the YMC-Pack Pro C8 brand of L7 column. The typical retention time for indapamide is about 22.8 min.
4. Replace the current TLC-based *Organic Impurities* procedure with a validated liquid chromatography based test procedure.
5. Add two new Reference Standards and an existing Reference Standard to the *USP Reference Standards* section: USP Indapamide Related Compound A RS, USP Indapamide Related Compound B RS, and USP Indapamide Related Compound C RS, in support of the newly proposed *Organic Impurities* procedure.

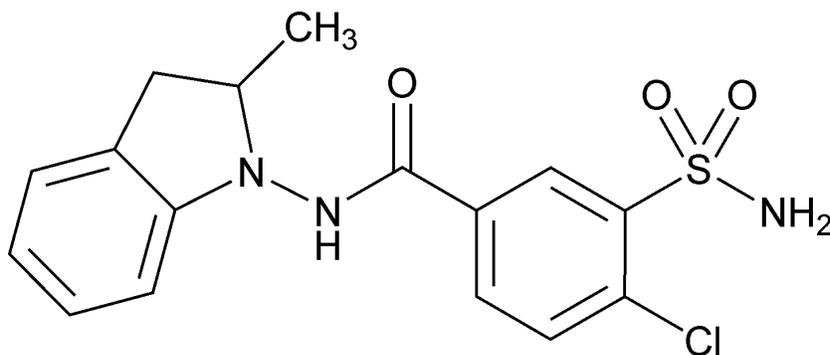

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Indapamide Tablets

DEFINITION

Indapamide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of indapamide ($C_{16}H_{16}ClN_3O_3S$).

IDENTIFICATION

• A. Infrared Absorption (197K)

Sample: Crush a quantity of Tablets, equivalent to 15 mg of indapamide, remove and discard any coating material, and finely powder the remaining Tablet cores. Agitate the powdered Tablets with two 30-mL portions of 0.2 N sodium hydroxide in a centrifuge tube for 10 min. Centrifuge each mixture, and combine the supernatants in a 250-mL separator. Acidify the liquid with 12 mL of dilute hydrochloric acid (1 in 10). Extract the acidic solution with two 4.0-mL portions of ether, filter the extracts through anhydrous sodium sulfate contained in a filter paper, and evaporate the ether, with the aid of a current of dry air, on a water bath. Dry the crystals at 105° for 1 h.

Acceptance criteria: The crystals so obtained meet the requirements.

- B. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

Change to read:

• Procedure

Solution A: 1.54 mg/mL of sodium 1-octanesulfonate in water

Mobile phase: Acetonitrile, *Solution A*, and glacial acetic acid (30:70:1)

Internal standard solution: 0.25 mg/mL of 2'-chloroacetophenone in acetonitrile

Standard stock solution: 0.1 mg/mL of USP Indapamide RS in acetonitrile

Standard solution: 0.01 mg/mL of USP Indapamide RS from *Standard stock solution*, *Internal standard solution*, and a mixture of water and acetonitrile (50:10)

Sample stock solution: Equivalent to 0.05 mg/mL of indapamide from Tablets prepared as follows. Transfer NLT 20 finely powdered Tablets, equivalent to 2.5 mg to a 50-mL volumetric flask. Add 25 mL of acetonitrile and sonicate for 20 min. Cool, dilute with acetonitrile to volume, and mix. Transfer this solution to a 50-mL centrifuge tube, and centrifuge at 2000 rpm for about 10 min.

Sample solution: Equivalent to 0.01 mg/mL of indapamide from *Sample stock solution*, *Internal standard solution*, and mixture of water and acetonitrile (70:4)

[Note—The relative retention times for indapamide and the internal standard are about 1.0 and 1.18, respectively.]

Suitability requirements

Resolution: NLT 3.0 between the analyte peak and the internal standard peak

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of $C_{16}H_{16}ClN_3O_3S$ in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U peak response ratio of indapamide to the internal standard from the *Sample solution*

R_S peak response ratio of indapamide to the internal standard from the *Standard solution*

C_S concentration of USP Indapamide RS in the *Standard solution* (mg/mL)

C_U nominal concentration of indapamide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

■ **Solution A:** 10 mM ammonium acetate solution. Adjust with glacial acetic acid to a pH of 5.0.

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.0	90	10
3.0	90	10
27	50	50
33	50	50
35	90	10
40	90	10

Diluent: Methanol and water (70:30)

Standard solution: 0.1 mg/mL of USP Indapamide RS in *Diluent*

Sample stock solution: Nominally 0.5 mg/mL of indapamide in *Diluent* prepared as follows. Transfer 25 mg of indapamide, from NLT 20 finely powdered Tablets, to a 50-

mL volumetric flask. Dissolve in 35 mL of *Diluent* by sonicating for 15 min with intermittent shaking. Dilute with *Diluent* to volume. Centrifuge the solution for 10 min.

Sample solution: Nominally 0.1 mg/mL of indapamide in *Diluent* prepared as follows.

Pipette 5.0 mL of the clear supernatant into a 25-mL volumetric flask and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 242 nm

Column: 4.6-mm × 15-cm; 5-μm packing L7

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of indapamide (C₁₆H₁₆ClN₃O₃S) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U

= peak response from the *Sample solution*

r_S

= peak response from the *Standard solution*

C_S

= concentration of USP Indapamide RS in the *Standard solution* (mg/mL)

C_U

= nominal concentration of indapamide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% ■ 1S (USP39)

PERFORMANCE TESTS

● Dissolution 〈 711 〉

Medium: 0.05 M pH 6.8 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*); 900 mL

Apparatus 1: 100 rpm

Time: 45 min

Solution A: 1.54 mg/mL of sodium 1-octanesulfonate in water

Mobile phase: Acetonitrile, *Solution A*, and glacial acetic acid (30:70:1)

Standard solution: USP Indapamide RS in methanol, and dilute, if necessary, with a mixture of *Medium* and methanol (99:1) to obtain a solution with a known concentration equivalent to the solution under test

Sample solution: Pass a portion of the solution under test through a suitable filter.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 242 nm

Column: 4.6-mm × 15-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 50 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Determine the percentage of the labeled amount of indapamide (C₁₆H₁₆ClN₃O₃S) dissolved.

Tolerances: NLT 75% (Q) of the labeled amount of indapamide (C₁₆H₁₆ClN₃O₃S) is dissolved.

- **Uniformity of Dosage Units** { 905 } : Meet the requirements

IMPURITIES

Add the following:

■ • Organic Impurities

Solution A, Solution B, Mobile phase, Diluent, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 2 µg/mL each of USP Indapamide RS, USP Indapamide Related Compound A RS, USP Indapamide Related Compound B RS, and USP Indapamide Related Compound C RS in *Diluent*

Sample solution: Nominally 1.0 mg/mL of indapamide in *Diluent* prepared as follows. Transfer an amount equivalent to 20 mg of indapamide, from NLT 20 finely powdered Tablets, to a 20-mL volumetric flask. Dissolve in 15 mL of *Diluent* by sonicating for 15 min with intermittent shaking. Dilute with *Diluent* to volume. Centrifuge the solution for 10 min and use the supernatant.

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between indapamide related compound C and indapamide; NLT 2.0 between indapamide related compound B and indapamide related compound A

Relative standard deviation: NMT 3.0% for any peak

Analysis

Samples: *Standard solution and Sample solution*

Calculate the percentage of indapamide related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of indapamide related compound A from the *Sample solution*

r_S peak response of indapamide related compound A from the *Standard solution*

C_S concentration of USP Indapamide Related Compound A RS in the *Standard solution* (mg/mL)

C_U nominal concentration of indapamide in the *Sample solution* (mg/mL)

Calculate the percentage of any individual unspecified impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of any individual unspecified impurity from the *Sample solution*

r_S peak response of indapamide from the *Standard solution*

C_S concentration of USP Indapamide RS in the *Standard solution* (mg/mL)

C_U nominal concentration of indapamide in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Indapamide related compound C	0.89	— ^a
Indapamide	1.0	—
Indapamide related compound B	1.11	— ^a
Indapamide related compound A	1.15	0.2
Any individual unspecified impurity	—	0.1
Total impurities	—	1.0

^a Indapamide related compound B and indapamide related compound C are process impurities that are both controlled in the drug substance. They are not reported in the drug product and should not be included in the total impurities. Indapamide related compound A is both a degradant and a process impurity.

BRIEFING

Leucovorin Calcium Compounded Oral Suspension. Because there is currently no existing *USP* monograph for this dosage form, a new compounded preparation monograph is proposed based on a validated stability-indicating method used to assess stability. The liquid chromatographic procedure in the *Assay* is based on analyses validated using the Poroshell 120 SB-C8 brand of L7 column. The typical retention time for leucovorin calcium is about 20.3 min.

Please submit comments to CompoundingSL@usp.org.

(CMP: J. Sun.)

Correspondence Number—C154508

Comment deadline: May 31, 2015

Add the following:

■ **Leucovorin Calcium Compounded Oral Suspension**

DEFINITION

Leucovorin Calcium Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of leucovorin ($C_{20}H_{23}N_7O_7$).

Prepare Leucovorin Calcium Compounded Oral Suspension containing 5 mg/mL of leucovorin as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* 〈 795 〉).

Leucovorin Calcium tablets ^a equivalent to	500 mg of leucovorin
Sodium Hydroxide (1 N)	To adjust pH to 7.1–7.6
Syrup, a sufficient quantity to make	100 mL
^a Leucovorin calcium 25-mg tablets, Teva Pharmaceuticals, Sellersville, PA.	

Place the *Leucovorin Calcium* tablets into a suitable container. Wet the tablets with a small amount of *Syrup* and triturate to make a smooth paste. Add the *Syrup* to make the contents pourable. Transfer contents stepwise and quantitatively to a calibrated container using the *Syrup*. Adjust with *Sodium Hydroxide (1 N)* to a pH of 7.1–7.6. Add sufficient *Syrup* to bring to final volume. Shake to mix well. [Note—pH may decrease to 6.1 after bringing to final volume with *Syrup* without affecting the stability of the preparation.]

ASSAY

- **Procedure**

Solution A: Methanol and 5 mM tetrabutylammonium phosphate (20:80). Adjust with tetrabutylammonium hydroxide to a pH of 6.6.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Methanol (%)	Solution A (%)
0	0	100
20	10	90
20.1	0	100
30	0	100

Diluent: Methanol and water (20:80)

Standard solution: 0.05 mg/mL of leucovorin prepared from USP Leucovorin Calcium RS and *Diluent*. Vortex and sonicate until dissolved.

Sample solution: Transfer 1.0 mL of Oral Suspension to a 100-mL volumetric flask, and rinse the pipette with about 2 mL of *Diluent*. Dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV-Vis 290 nm

Column: 4.6-mm × 15-cm; 2.7-μm packing L7

Column temperature: 55°

Flow rate: 0.75 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

[Note—The retention time for leucovorin is about 20.3 min.]

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of leucovorin (C₂₀H₂₃N₇O₇) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of leucovorin from USP Leucovorin Calcium RS in the *Standard solution* (mg/mL)

C_U nominal concentration of leucovorin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **pH** 〈 791 〉: 6.1–7.1

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Package in tight, light-resistant plastic containers. Store in a refrigerator (2°–8°) or at controlled room temperature.
- **Beyond-Use Date:** NMT 90 days after the date on which it was compounded when stored in a refrigerator (2°–8°); NMT 30 days after the date on which it was compounded when stored at controlled room temperature
- **Labeling:** Label it to be well shaken before use, and to state the *Beyond-Use Date*.

■ pyroantimonate precipitation ■ 1S (USP39)

test.

ASSAY

- **Procedure**

Mobile phase: Acetonitrile and water (4:6) that contains 0.5 mL of phosphoric acid in each 1000 mL

Solution A: 400 mg of sodium hydroxide in 500 mL of water. Cool and add 500 mL of methanol.

Levothyroxine stock solution: 0.4 mg/mL of USP Levothyroxine RS in *Solution A*

Liothyronine stock solution: 0.4 mg/mL of liothyronine from USP Liothyronine RS in *Solution A*. Make a 1:100 dilution of this solution using *Mobile phase*.

Standard solution: 10 µg/mL of levothyroxine from *Levothyroxine stock solution* and 0.2 µg/mL of liothyronine from *Liothyronine stock solution* in *Mobile phase*

Sample solution: 10 µg/mL of Levothyroxine Sodium in *Mobile phase*. [Note—A small amount of 0.01 M methanolic sodium hydroxide can be used to facilitate the dissolution of the sample.]

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 25-cm; packing L10

Flow rate: 1.5 mL/min

Injection volume: 100 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 5.0 between liothyronine and levothyroxine

Relative standard deviation: NMT 2.0% for levothyroxine

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of levothyroxine sodium ($C_{15}H_{10}I_4NNaO_4$) in the portion of Levothyroxine Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of levothyroxine from the *Sample solution*

r_S = peak response of levothyroxine from the *Standard solution*

C_S = concentration of USP Levothyroxine RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = concentration of Levothyroxine Sodium in the *Sample solution* ($\mu\text{g/mL}$)

M_{r1} = molecular weight of levothyroxine sodium, 798.85

M_{r2} = molecular weight of levothyroxine, 776.87

Acceptance criteria: 97.0%–103.0% on the anhydrous basis

IMPURITIES

[Note—On the basis of the synthetic route, perform either *Organic Impurities, Procedure 1* or *Organic Impurities, Procedure 2*. *Procedure 2* is recommended when related compounds listed in *Table 3* may be present.]

• **Organic Impurities, Procedure 1**

Diluent: Acetonitrile and water (1:1)

Solution A: Dilute 5 mL of phosphoric acid with *Diluent* to 100.0 mL.

Mobile phase: Dissolve 1.0 g of sodium 1-heptanesulfonate in 200 mL of water. Add 200 mL of acetonitrile, 400 mL of methanol, and 1.0 mL of phosphoric acid. Dilute with water to 1 L.

Standard stock solution 1: Transfer 25 mg of USP Levothyroxine RS to a 100-mL volumetric flask. Add 50 mL of *Diluent* and 1 drop of 10 N sodium hydroxide, and sonicate until dissolved. Add 7 mL of *Solution A*, and dilute with *Diluent* to volume.

Standard stock solution 2: Transfer 25 mg of USP Liothyronine RS to a 100-mL volumetric flask. Add 50 mL of *Diluent* and 1 drop of 10 N sodium hydroxide, and sonicate until dissolved. Add 7 mL of *Solution A*, and dilute with *Diluent* to volume.

System suitability solution: Transfer 5.0 mL of *Standard stock solution 1* and 5.0 mL of *Standard stock solution 2* to a 100-mL volumetric flask. Add 7 mL of *Solution A*, and dilute with *Diluent* to volume.

Standard solution: Pipet 4.0 mL of the *System suitability solution* into a 100-mL volumetric flask. Add 7 mL of *Solution A*, and dilute with *Diluent* to volume.

Sample solution: Transfer 25 mg of Levothyroxine Sodium to a 100-mL volumetric flask. Add 50 mL of *Diluent*, and sonicate until dissolved. Add 7 mL of *Solution A*, and dilute with *Diluent* to volume.

Blank solution: Transfer 7 mL of *Solution A* to a 100-mL volumetric flask, and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 15-cm; 5-µm packing L7

Column temperature: 35°

Flow rate: 1.5 mL/min

Injection volume: 15 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 5.0 between levothyroxine and liothyronine, *System suitability solution*

Relative standard deviation: NMT 2.0% for the levothyroxine peak, *Standard solution*

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank solution*

[Note—Record the chromatograms for at least six times the retention time of the levothyroxine peak. Verify that no peaks elute in the *Blank solution* at the expected retention times for levothyroxine and related compounds.]

Calculate the area percentage of each related compound in the portion of Levothyroxine Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of levothyroxine from the *Standard solution*

C_S = concentration of levothyroxine in the *Standard solution* (mg/mL)

C_U = concentration of Levothyroxine Sodium in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of levothyroxine sodium, 798.85

M_{r2} = molecular weight of levothyroxine, 776.87

[Note—The relative response factor for the impurities listed in *Table 1* is 1.00. Any unspecified impurity peaks should be assigned a relative response factor of 1.00.]

Disregard peaks corresponding to those of the *Blank solution*, and disregard peaks corresponding to less than 0.03%.

Acceptance criteria: See *Table 1*.

Table 1

● **Organic Impurities, Procedure 2**

Solution A: Dissolve 9.7 g of sulfamic acid in 2000 mL of water. Add 1.5 g of sodium hydroxide, mix to dissolve, and adjust with 2 N sodium hydroxide to a pH of 2.0.

Solution B: Acetonitrile

Diluent 1: Methanol and *Solution A* (90:10)

Diluent 2: Acetonitrile and *Solution A* (30:70); mix with *Diluent 1* (1:1).

Mobile phase: See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	70	30
10	70	30
40	20	80
50	20	80
53	70	30
75	70	30

Identification solution: Dissolve 5.0 mg of USP Levothyroxine for Peak Identification RS in 4.5 mL of methanol. Add 0.5 mL of *Solution A*. Further dilute a portion of this solution with *Diluent 2* to obtain a solution containing about 0.2 mg/mL.

Standard stock solution: 0.1 mg/mL each of USP Levothyroxine RS and USP Liothyronine RS in *Diluent 1*

Standard solution: 0.002 mg/mL each of USP Levothyroxine RS and USP Liothyronine RS, prepared using the *Standard stock solution* in *Diluent 2*

Sensitivity solution: 0.0002 mg/mL each of USP Levothyroxine RS and USP Liothyronine RS, prepared using the *Standard solution* in *Diluent 2*

Sample solution: Dissolve an amount of Levothyroxine Sodium in *Diluent 1* to obtain a solution with a known concentration of about 1.0 mg/mL. Further dilute a portion of this solution with *Diluent 2* to obtain a solution with a known concentration of about 0.2 mg/mL.

Blank solution: Use *Diluent 2*.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.0-mm × 15-cm; 3-μm packing L1

Flow rate: 1.0 mL/min

Injection volume: 25 μL

System suitability

Samples: *Standard solution* and *Sensitivity solution*

Suitability requirements

Resolution: NLT 5 between levothyroxine and liothyronine, *Standard solution*

Signal-to-noise ratio: NLT 5 for each peak from the *Sensitivity solution*, calculated as follows:

$$\text{Result} = (2H)/h$$

H = measured height of the peak

h = amplitude of the average measured baseline noise

Analysis

Samples: *Blank solution*, *Standard solution*, *Identification solution*, and *Sample solution*

[Note—Identify the components on the basis of their relative retention times as listed in *Table 3*.]

Calculate the percentage of liothyronine sodium in the portion of Levothyroxine Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of liothyronine from the *Sample solution*

r_S = peak response of liothyronine from the *Standard solution*

C_S = concentration of liothyronine in the *Standard solution* (mg/mL)

C_U = concentration of Levothyroxine Sodium in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of liothyronine sodium, 672.96

M_{r2} = molecular weight of liothyronine, 650.98

Calculate the percentage of any other impurity in the portion of Levothyroxine Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of any impurity from the *Sample solution*

r_S = peak response of levothyroxine from the *Standard solution*

C_S = concentration of levothyroxine in the *Standard solution* (mg/mL)

C_U = concentration of Levothyroxine Sodium in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of levothyroxine sodium, 798.85

M_{r2} = molecular weight of levothyroxine, 776.87

[Note—The relative response factor for the impurities listed in *Table 3* is 1.00. Any

unspecified impurity peaks should be assigned a relative response factor of 1.00.]

Disregard peaks corresponding to those of the *Blank solution*, and disregard peaks corresponding to less than 0.03%.

Acceptance criteria: See *Table 3*.

Table 3

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

BRIEFING

Losartan Potassium Tablets, *USP 38* page 4152. Based on the comments received, it is proposed to include a chromatographic procedure for *Dissolution, Test 1*. The liquid chromatographic procedure for analysis is based on a 5- μ m, Inertsil ODS-3 brand of L1 column. The typical retention time for losartan is about 6 min under the specified conditions.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM2: S. Ramakrishna.)

Correspondence Number—C154346

Comment deadline: May 31, 2015

Losartan Potassium Tablets

DEFINITION

Losartan Potassium Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of losartan potassium ($C_{22}H_{22}ClKN_6O$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **Procedure**

Buffer: 1.25 mg/mL of monobasic potassium phosphate and 1.5 mg/mL of dibasic sodium phosphate in water. The resulting pH is approximately 7.0. Pass the solution through a PTFE or equivalent filter of 0.45- μ m pore size, and degas before use.

Solution A: Acetonitrile and *Buffer* (15:85)

Solution B: Use acetonitrile.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	80	20
10	40	60
11	80	20

Time (min)	Solution A (%)	Solution B (%)
15	80	20

System suitability stock solution: Dissolve 12 mg of USP Losartan Potassium RS in a 50-mL volumetric flask, first using 5 mL of water, followed by 5 mL of 0.1 N hydrochloric acid. Place the flask in a 105° oven for 1–2 h, and allow to cool to room temperature. Pipet 5 mL of 0.1 N sodium hydroxide into the flask, and dilute with water to volume. Adjust with either 0.1 N hydrochloric acid or 0.1 N sodium hydroxide to a pH of 6.0. [Note—The resulting solution contains the 1*H*-dimer and 2*H*-dimer, and the resulting solution may be cloudy.]

System suitability solution: Add 3 mL of acetonitrile to 7 mL of *System suitability stock solution* to clear the cloudy solution, and mix well.

Standard solution: 0.25 mg/mL of USP Losartan Potassium RS in *Solution A*. Pass through a PTFE or equivalent filter of 0.45- μ m pore size.

Sample stock solution: Transfer 10 Tablets to a 500-mL volumetric flask, add *Solution A* to fill the flask to about 50% of the final volume, and sonicate with intermittent shaking for 15 min. Sonicate for an additional 10 min. Dilute with *Solution A* to volume, and mix well.

Sample solution: 0.25 mg/mL of losartan potassium in *Solution A* from the *Sample stock solution*. Mix well. Pass an aliquot of the solution through a PTFE filter of 0.45- μ m pore size, and use the filtrate.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 250 nm

Column: 3.9-mm \times 15-cm; 5- μ m packing L7

Flow rate: 1.0 mL/min

Injection volume: 10 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0 for the losartan, 1*H*-dimer, and 2*H*-dimer peaks; *System suitability solution*

• Uniformity of Dosage Units 〈 905 〉

Procedure for content uniformity

Buffer: Dissolve 1.36 mg/mL of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 2.5.

Diluent: Dissolve 17.42 g of dibasic potassium phosphate in 900 mL of water. Adjust with phosphoric acid to a pH of 8.0. Dilute with water to a volume of 1000 mL, and mix well. Further dilute with water (1 in 10), and mix well.

Mobile phase: Acetonitrile and *Buffer* (60:40)

Standard solution: 0.05 mg/mL of USP Losartan Potassium RS in *Diluent*

Sample stock solution: Transfer 1 Tablet to a 100-mL volumetric flask, add about 65 mL

of *Diluent*, and shake mechanically for 30 min. Dilute with *Diluent* to volume, and mix well.

Sample solution: 0.05 mg/mL of losartan potassium in *Diluent* from the *Sample stock solution*. Filter an aliquot of the solution, and use the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 25-cm; 10-μm packing L7

Flow rate: 1.4 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 3000 theoretical plates

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of losartan potassium ($C_{22}H_{22}ClKN_6O$) in the portion of the Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of losartan from the *Sample solution*

r_S peak response of losartan from the *Standard solution*

C_S concentration of USP Losartan Potassium RS in the *Standard solution* (mg/mL)

C_U nominal concentration of losartan potassium in the *Sample solution* (mg/mL)

Acceptance criteria: Meet the requirements

IMPURITIES

• Organic Impurities

Solution A, Solution B, Mobile phase, System suitability solution, Sample solution, and Chromatographic system: Prepare as directed in the *Assay*.

Standard stock solution: Use the *Standard solution*, prepared as directed in the *Assay*.

Standard solution: 2.5 μg/mL of USP Losartan Potassium RS in *Solution A* from the *Standard stock solution*

Sensitivity solution: Dilute 1 mL of the *Standard solution* to 10 mL in *Solution A*.

System suitability

Samples: *System suitability solution*, *Standard solution*, and *Sensitivity solution*

Suitability requirements

Tailing factor: NMT 2.0 for the losartan, 1*H*-dimer, and 2*H*-dimer peaks; *System suitability solution*

Resolution: NLT 2.0 between the 1*H*-dimer and 2*H*-dimer, *System suitability solution*

Column efficiency: NLT 3000 theoretical plates, *Standard solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Signal-to-noise ratio: NLT 10 for the losartan peak from the first injection. If this is not met, then the *Signal-to-noise ratio* must be greater than 3 with a relative standard deviation of area counts less than 25% for three replicate injections, *Sensitivity solution*.

Analysis

Samples: *Standard solution* and *Sample solution*

[Note—Identify the peaks using the relative retention times provided in *Table 4*.]

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of losartan from the *Standard solution*

C_S = concentration of USP Losartan Potassium RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of losartan potassium in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 4*.

Table 4

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Losartan	1.0	—
1 <i>H</i> -Dimer ^a	2.4	0.5
2 <i>H</i> -Dimer ^b	2.9	0.5
Total impurities ^c	—	1.0

^a 5-[4'-({2-Butyl-5-[(5-{4'-[(2-butyl-4-chloro-5-hydroxymethyl-1*H*-imidazol-1-yl)methyl]biphenyl-2-yl})-1*H*-tetrazol-1-yl)methyl]-4-chloro-1*H*-imidazol-1-yl)methyl]biphenyl-2-yl]tetrazol, potassium salt.

^b 5-[4'-({2-Butyl-5-[(5-{4'-[(2-butyl-4-chloro-5-hydroxymethyl-1*H*-imidazol-1-yl)methyl]biphenyl-2-yl})-2*H*-tetrazol-2-yl)methyl]-4-chloro-1*H*-imidazol-1-yl)methyl]biphenyl-2-yl]tetrazol, potassium salt.

^c The total impurities include the sum of all the specified impurities and the sum of all the unspecified impurities. Disregard peaks less than 0.1%.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Store in tightly closed containers, protected from light, at controlled room temperature.
- **Labeling:** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.
- **USP Reference Standards** { 11 }
USP Losartan Potassium RS

BRIEFING

Methylprednisolone, *USP 38* page 4351. As part of the USP monograph modernization effort, the following revisions are proposed:

1. Add an *Identification* test based on HPLC with the retention time match for

methylprednisolone.

2. Delete the *Ultraviolet Absorption* test for *Identification* because it is nonspecific and the monograph now has two orthogonal identification tests.
3. Delete the wet chemical test as it is nonspecific and adds no value to ensuring the quality of the drug substance.
4. Replace the existing *Assay* with a validated stability-indicating HPLC procedure which also is used in the newly introduced test for *Organic Impurities*. The proposed liquid chromatographic procedure is based on analyses performed with the Acquity UPLC BEH C18 brand of L1 column.
5. Add a test for *Organic Impurities* based on the HPLC procedure and performed with the Acquity UPLC BEH C18 brand of L1 column. The typical retention time for methylprednisolone is about 11.1 min.
6. Add the following three new Reference Standards, introduced by the proposed HPLC procedure, to the *USP Reference Standards* section: USP Methylprednisolone Related Compound A RS, USP Methylprednisolone Related Compound C RS, and USP Methylprednisolone Related Compound D RS.

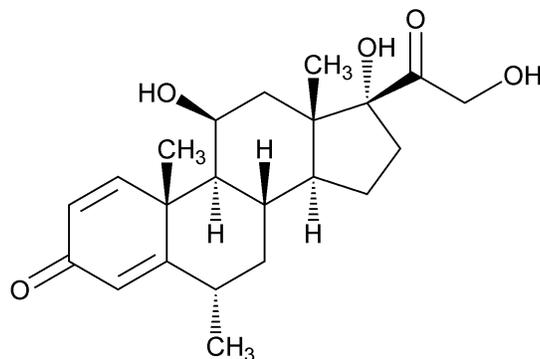

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for methylprednisolone and methylprednisolone related compound C are 1.0 and 1.08, respectively.]

Suitability requirements

Resolution: NLT 2.0 between methylprednisolone and methylprednisolone related compound C, *System suitability solution*

Tailing factor: NMT 2.0 for methylprednisolone, *Standard solution*

Relative standard deviation: NMT 0.73%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methylprednisolone (C₂₂H₃₀O₅) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U

= peak response from the *Sample solution*

r_S

= peak response from the *Standard solution*

C_S

= concentration of USP Methylprednisolone RS in the *Standard solution* (mg/mL)

C_U

= nominal concentration of methylprednisolone in the *Sample solution* (mg/mL)

Acceptance criteria: 92.5%–107.5% $\pm 1S$ (USP39)

PERFORMANCE TESTS

• Dissolution 〈 711 〉

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard solutions: 20 µg/mL of USP Methylprednisolone RS in alcohol and water prepared as follows. Dissolve a suitable quantity of USP Methylprednisolone RS in 0.1% the flask volume of methanol and dilute with water to volume. Prepare quantitative dilutions of this solution for the development of a standard curve.

Sample solution: Filtered aliquots removed from the *Medium* and suitably diluted, if necessary.

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum at about 246 nm

Cell: 1 cm

Blank: Water

Analysis

Samples: *Standard solutions* and *Sample solution*

Using a standard curve, representing the absorbance versus concentration of the *Standard solutions*, determine the amount of methylprednisolone dissolved in the *Sample solution*.

Acceptance criteria: NLT 70% (Q) of the labeled amount of methylprednisolone ($C_{22}H_{30}O_5$) is dissolved.

• Uniformity of Dosage Units 〈 905 〉

Procedure for content uniformity

Mobile phase: Butyl chloride, water-saturated butyl chloride, tetrahydrofuran, methanol,

and glacial acetic acid (95:95:14:7:6)

Solution A: Chloroform and glacial acetic acid (97:3)

Internal standard solution: 0.2 mg/mL of USP Prednisone RS in *Solution A*

Standard solution: 0.2 mg/mL of USP Methylprednisolone RS in the *Internal standard solution*

Sample solution: Place 1 Tablet in a suitable container. For tablet-labeled strengths of 10 mg or less, add 0.5 mL of water. For tablet-labeled strengths greater than 10 mg, add 1.0 mL of water. Allow the Tablet to stand for 2 min, then swirl the container to disperse the Tablet. Add 5.0 mL of *Internal standard solution* for each mg of labeled Tablet strength, shake for 15 min, and filter or centrifuge a portion of the resulting solution to obtain a clear solution. Use the clear solution.

Chromatographic system

(See *Chromatography* 〈621〉, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.0-mm × 25.0-cm; packing L3

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

[Note—The relative retention times for prednisone and methylprednisolone are about 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 4.0 between methylprednisolone and prednisone

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methylprednisolone (C₂₂H₃₀O₅) in the Tablet taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U peak response ratio of methylprednisolone to prednisone from the *Sample solution*

R_S peak response ratio of methylprednisolone to prednisone from the *Standard solution*

C_S concentration of USP Methylprednisolone RS in the *Standard solution* (mg/mL)

C_U nominal concentration of methylprednisolone in the *Sample solution* (mg/mL)

Acceptance criteria: Meets the requirements

IMPURITIES

Add the following:

Organic Impurities

Solution A, Solution B, Diluent, Mobile phase, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 2.5 µg/mL each of USP Methylprednisolone RS, USP Methylprednisolone Related Compound A RS, USP Methylprednisolone Related Compound C RS, and USP Methylprednisolone Related Compound D RS in *Diluent*, prepared as follows. Dissolve

suitable quantities of USP Methylprednisolone RS, USP Methylprednisolone Related Compound A RS, USP Methylprednisolone Related Compound C RS, and USP Methylprednisolone Related Compound D RS in methanol in a volumetric flask and dilute with *Diluent* to volume.

Sample solution: Nominally 0.5 mg/ mL of methylprednisolone in *Diluent* prepared as follows. Transfer an appropriate amount of methylprednisolone from NLT 20 finely powdered Tablets to a suitable volumetric flask, and add 10% of the flask volume of water. Allow the powder to stand for 2 min and then swirl the flask to disperse the powder. Add 50% of the flask volume of methanol and shake for 15 min. Dilute with *Diluent* to the mark, shake for 5 min, and filter.

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between methylprednisolone and methylprednisolone related compound C

Relative standard deviation: NMT 2.0% for methylprednisolone, methylprednisolone related compound A, methylprednisolone related compound C, and methylprednisolone related compound D

Analysis

Samples: *Standard solution and Sample solution*

Calculate the percentage of methylprednisolone related compound A, methylprednisolone related compound C, or methylprednisolone related compound D in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of methylprednisolone related compound A, methylprednisolone related compound C, or methylprednisolone related compound D from the *Sample solution*

r_S peak response of the corresponding related compound from the *Standard solution*

C_S concentration of the corresponding USP Reference Standard in the *Standard solution* (mg/mL)

C_U nominal concentration of methylprednisolone in the *Sample solution* (mg/mL)

Calculate the percentage of any individual unspecified impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of any unspecified impurity from the *Sample solution*

r_S peak response of methylprednisolone from the *Standard solution*

C_S concentration of USP Methylprednisolone RS in the *Standard solution* (mg/mL)

C_U nominal concentration of methylprednisolone in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Methylprednisolone related compound A ^a	0.80	0.20

BRIEFING

Miconazole Compounded Ophthalmic Solution. Because there is no existing *USP* monograph for this dosage form, a new compounded preparation monograph is proposed based on a validated stability-indicating method used to assess stability. The liquid chromatographic procedure in the *Assay* is based on analyses validated using the Luna C18(2) brand of L1 column. The typical retention time for miconazole is about 18.0 min.

Please submit comments to CompoundingSL@usp.org.

(CMP: J. Sun.)

Comment deadline: May 31, 2015

Add the following:**■ Miconazole Compounded Ophthalmic Solution****DEFINITION**

Miconazole Compounded Ophthalmic Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of miconazole ($C_{18}H_{14}Cl_4N_2O$).

Prepare Miconazole Compounded Ophthalmic Solution 1% (10 mg/mL) as follows (see *Pharmaceutical Compounding—Sterile Preparations* 〈 797 〉).

Miconazole	1 g
Polyoxyl 40 Hydrogenated Castor Oil	11.5 mL
Lactic Acid Solution (88%)	0.4 mL
Sterile Water for Injection, a sufficient amount to make	100 mL

Add the *Miconazole* to a sterile container and gradually add the *Polyoxyl 40 Hydrogenated Castor Oil*. Mix into a smooth viscous mixture. Add the *Lactic Acid Solution* (88%) and mix thoroughly. Add 80 mL of the *Sterile Water for Injection* and stir vigorously until the *Miconazole* is completely dissolved. Transfer the contents stepwise and quantitatively to a sterile calibrated container and bring to final volume with *Sterile Water for Injection*. Pass through a sterile filter of 0.22- μ m pore size into an empty sterile dropper bottle. [Note—Room temperature *Sterile Water for Injection* should be used to assist in solubilization.]

ASSAY**• Procedure**

Mobile phase: Dissolve 5.7 g of ammonium acetate in 380 mL of water, and add 320 mL of methanol and 300 mL of acetonitrile. Mix well.

Standard solution: 0.05 mg/mL of miconazole prepared from USP Miconazole RS in methanol

Sample solution: Transfer 0.5 mL of Ophthalmic Solution to a 100-mL volumetric flask, dilute with methanol to volume, and vortex to mix.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV-Vis 230 nm

Column: 2.0-mm \times 10-cm; 2.5- μ m packing L1

Column temperature: 55 $^{\circ}$

Flow rate: 0.35 mL/min

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

[Note—The retention time for miconazole is about 18.0 min.]

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of miconazole ($C_{18}H_{14}Cl_4N_2O$) in the portion of Ophthalmic Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of miconazole from the *Sample solution*

r_S = peak response of miconazole from the *Standard solution*

C_S = concentration of USP Miconazole RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of miconazole in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **pH** $\langle 791 \rangle$: 2.9–3.9
- **Sterility Tests** $\langle 71 \rangle$: It meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined, Membrane Filtration*.
- **Particulate Matter in Ophthalmic Solutions** $\langle 789 \rangle$: It meets the requirements.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Package in sterile plastic ophthalmic dropper bottles. Store in a refrigerator (2° – 8°) or at controlled room temperature.
- **Beyond-Use Date:** In the absence of performing and completing a sterility test, the storage conditions for *High-Risk Level CSPs in Pharmaceutical Compounding—Sterile Preparations* $\langle 797 \rangle$ apply. After successful completion of sterility testing, NMT 30 days after the date on which it was compounded when stored in a refrigerator (2° – 8°); NMT 21 days after the date on which it was compounded when stored at controlled room temperature.
- **Labeling:** Label it to indicate that it is for ophthalmic use only and to state the *Beyond-Use Date*.
- **USP Reference Standards** $\langle 11 \rangle$
 USP Miconazole RS
 ■ 1S (USP39)

BRIEFING

Miconazole Nitrate Topical Powder, *USP 38* page 4395. As part of the USP monograph modernization effort, it is proposed to make the following changes:

1. Add a stability-indicating HPLC test for *Organic Impurities*. The HPLC procedure in the test for *Organic Impurities* is based on analyses performed with the Kinetex Phenyl-Hexyl brand of L11 column manufactured by Phenomenex. The typical retention time for miconazole is 25 min.
2. Replace the GC procedure that requires the use of an internal standard for the *Assay* with an advanced HPLC method. The method for the proposed *Assay* uses the same HPLC parameters as those used for the proposed test for *Organic Impurities*.
3. Add *Identification* test *B* based on retention time agreement in the proposed *Assay*.

4. Add an additional storage requirement to the *Packaging and Storage* section.
5. Add USP Miconazole Related Compound F RS to the *USP Reference Standards* section.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM1: D. Min.)

Comment deadline: May 31, 2015

Miconazole Nitrate Topical Powder

DEFINITION

Miconazole Nitrate Topical Powder contains NLT 90.0% and NMT 110.0% of the labeled amount of miconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$).

IDENTIFICATION

• **A.**

Sample: Transfer nominally 100 mg of miconazole nitrate from Topical Powder to a 50-mL beaker, disperse in 40 mL of methanol, and mix for a minimum of 5 min. Allow to settle for 5–10 min and filter into a 100-mL beaker. Evaporate on a steam bath to dryness. Dry the residue at 105° for 10 min.

Acceptance criteria: The IR absorption spectrum of a potassium bromide dispersion of the residue obtained from the *Sample* exhibits maxima only at the same wavelengths as those of a similar preparation of USP Miconazole Nitrate RS.

Add the following:

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■1S (USP39)

ASSAY

Change to read:

• **Procedure**

~~**Internal standard solution:** 0.5 mg/mL of cholestane in chloroform~~

~~**Standard solution:** 2 mg/mL of USP Miconazole Nitrate RS, prepared as follows. Transfer 5.0 mL of 0.8 mg/mL of USP Miconazole Nitrate RS in a mixture of chloroform and methanol (1:1) to a test tube, and add 2.0 mL of *Internal standard solution*. Evaporate to dryness at a temperature not higher than 40° with the aid of a current of nitrogen. Dissolve the residue in 2.0 mL of a mixture of chloroform and methanol (1:1).~~

~~**Sample solution:** Nominally 2 mg/mL of miconazole nitrate, prepared as follows. Transfer an equivalent to 20 mg of miconazole nitrate from Topical Powder to a 50-mL centrifuge tube. Add 25.0 mL of methanol, and shake by mechanical means for 30 min to dissolve the miconazole nitrate. Centrifuge to obtain a clear supernatant. Transfer 5.0 mL of this solution to a test tube, add 2.0 mL of *Internal standard solution*, and evaporate to dryness at a temperature not higher than 40° with the aid of a current of nitrogen.~~

Dissolve the residue in 2.0 mL of a mixture of chloroform and methanol (1:1).

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 2-mm × 1.2-m glass; packed with 3% phase G32 on support S1A

Temperatures

Column: 250 °

Injection port: 250 °

Detector: 300 °

Carrier gas: Helium

BRIEFING

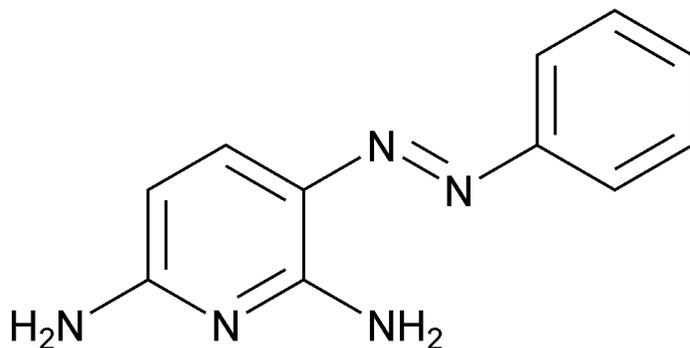

Phenazopyridine Hydrochloride, USP 38 page 4828. As part of USP monograph modernization efforts, the following revisions are proposed:

1. Replace the TLC procedure using hazardous solvent (chloroform) in *Identification* test C with the retention time agreement proposed in the HPLC Assay procedure.
2. Add the *Identification* test D for the counter ion.
3. Replace the UV procedure in the *Assay* with a stability-indicating HPLC procedure. The liquid chromatographic procedure is based on analyses performed with the Luna C18 (2) brand of L1 column. The typical retention time for phenazopyridine is about 21 min.
4. Revise the acceptance criteria in the *Definition* and *Assay* from "NLT 99.0% and NMT 101.0%" to "NLT 98.0% and NMT 102.0%", which are typical for chromatographic procedures.
5. Replace the *Organic Impurities* test by TLC with a validated HPLC procedure. The liquid chromatographic procedure is similar to the *Assay* procedure.
6. The acceptance criteria for 2,6-diaminopyridine and the individual unspecified impurities are proposed at 0.2% and 0.1%, respectively, based on sponsor's submission. Stakeholders with different impurities and/or limits than those in this revision are strongly encouraged to submit their FDA approved acceptance criteria, along with the list of specified degradation products, for the Expert Committee's consideration.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

USP Phenazopyridine Hydrochloride RS

BRIEFING

Phenazopyridine Hydrochloride Tablets, *USP 38* page 4829. As part of USP monograph modernization efforts, the following revisions are proposed:

1. Replace *Identification* test *A* using hazardous solvent (chloroform) with a UV procedure.
2. Add an orthogonal *Identification* test *B* based on the retention time agreement proposed in the *HPLC Assay* procedure.
3. Add a validated stability-indicating HPLC procedure for the *Organic Impurities* test. The liquid chromatographic procedure is based on analyses performed using the Luna C18 (2) brand of L1 column. The typical retention time for phenazopyridine is about 21 min.
4. Replace the *Assay* by HPLC with an HPLC procedure that uses the same parameters as the proposed test for *Organic Impurities*.
5. The limit for unspecified impurities is based on ICH guidelines. Stakeholders are encouraged to submit their FDA-approved acceptance criteria, along with the list of specified degradation products, for the Expert Committee's consideration.
6. Add the storage temperature to the *Packaging and Storage* section.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Phenazopyridine Hydrochloride Tablets

DEFINITION

Phenazopyridine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of phenazopyridine hydrochloride ($C_{11}H_{11}N_5 \cdot HCl$).

IDENTIFICATION

Delete the following:

● ~~A.~~

~~**Analysis:** Transfer a quantity of finely ground Tablets, nominally equivalent to 50 mg of phenazopyridine hydrochloride, to a 125 mL separator, add 50 mL of water, 1 mL of 1 N hydrochloric acid, and 5 mL of a saturated sodium chloride solution, and shake to dissolve. Extract with two 25 mL portions of chloroform, and discard the chloroform. Add 5 mL of 1 N sodium hydroxide to the aqueous solution, and extract with one 50 mL portion of chloroform. Transfer the chloroform layer to a second 125 mL separator, and wash with one 50 mL portion of 0.1 N sodium hydroxide. Filter the chloroform layer through a pledget of cotton previously washed with chloroform. Add 5 drops of hydrochloric acid to the filtrate, and evaporate on a steam bath under a current of air to dryness. Add 5 mL of~~

alcohol, and evaporate. Dry the residue at 105° for 4 h.

Acceptance criteria: The IR-absorption spectrum of a potassium bromide dispersion of the dried residue exhibits maxima only at the same wavelengths as that of a similar preparation of USP Phenazopyridine Hydrochloride RS. ■1S (USP39)

Add the following:

- **A. Infrared Absorption (197K):** The UV spectrum of the phenazopyridine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay. ■1S (USP39)

Add the following:

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay. ■1S (USP39)

ASSAY

Change to read:

● **Procedure**

Buffer: 2.64 g of dibasic ammonium phosphate in 900 mL of water. Adjust with phosphoric acid to a pH of 3.0, dilute with water to 1000 mL, and mix.

Mobile phase: Methanol and *Buffer* (500:500)

Standard solution: 0.5 mg/mL of USP Phenazopyridine Hydrochloride RS. Initially add 50% final volume of methanol, and swirl to dissolve. Dilute with *Buffer* to volume, and pass through a filter of 0.5 µm or finer pore size.

Sample solution: Transfer an amount nominally equivalent to 100 mg of phenazopyridine hydrochloride from finely powdered Tablets (NLT 20) to a 200-mL volumetric flask. Add 100 mL of methanol, and sonicate for 10 min. Add 75 mL of *Buffer*, and sonicate for an additional 10 min with occasional mixing. Dilute with *Buffer* to volume, and mix. Pass this solution through a filter of 0.5 µm or finer pore size.

Chromatographic system

USP Phenazopyridine Hydrochloride RS

BRIEFING

Rabeprazole Sodium, PF 38(2) [Mar.–Apr. 2012]. On the basis of comments received, the earlier proposal presented in PF 38(2) is cancelled and replaced with a new proposal based on the monographs for *Rabeprazole Sodium* and *Rabeprazole Sodium Hydrate* proposed in *Pharmeuropa 26.3*.

1. In the *Definition* and *Assay* sections, the *Acceptance criteria* include both the anhydrous and hydrated forms.
2. A procedure for polymorphic equalization is added to *Identification* test A.
3. This proposal includes a new HPLC procedure for the *Assay* and *Organic Impurities* test which was shown to separate impurities listed in the earlier PF proposal and also listed in the draft Pending monograph posted for public comments on the USP website. The HPLC procedure in the *Assay* and the test for *Organic Impurities* is based on analyses performed with the Hypersil BDS C18 brand of L1 column. The typical retention time for rabeprazole is about 19 min.
4. The tests for *Loss on Drying* and *Water Determination* are included to accommodate specifications suitable for anhydrous and hydrated forms. The labeling statement is added to distinguish these two forms.

Analysis: Equip a cone-and-plate rheometer¹ following *Method III*. The shear rate under the test condition is 11.5 s^{-1} and temperature is 25° .

Acceptance criteria: 15–200 mPa·s ■ 1S (USP39)

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers.
- **USP Reference Standards** $\langle 11 \rangle$
USP Rimexolone RS

Brookfield cone-and-plate rheometer, with spindle CP-42 (#42), is operated at 3 rpm. Any other equivalent rheometer is suitable as well. ■_{1S} (USP39)

BRIEFING

Risedronate Sodium, USP 38 page 5188. In preparation for the omission of the flame tests from *Identification Tests—General* 〈 191 〉, proposed in PF 41(2) [Mar.–Apr. 2015], it is proposed to replace the use of the flame test in *Identification* test B with the pyroantimonate precipitation test currently described in 〈 191 〉. This test is also consistent with test (a) in 2.3.1. *Identification reactions of ions and functional groups* in the *European Pharmacopoeia*, and is employed in the *European Pharmacopoeia* monograph for *Risedronate Sodium*.

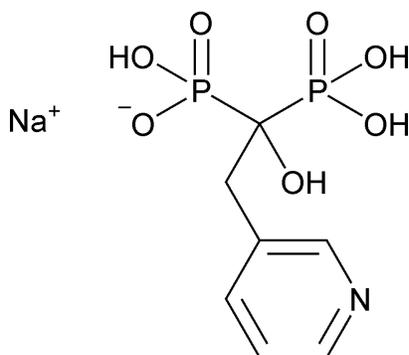

Additionally, minor editorial changes have been made to update the monograph to current USP style.

Risedronate Sodium

$C_7H_{10}NNaO_7P_2$	305.09
$C_7H_{10}NNaO_7P_2 \cdot H_2O$	323.12
$C_7H_{10}NNaO_7P_2 \cdot 2.5 H_2O$	350.13

Phosphonic acid, [1-hydroxy-2-(3-pyridinyl)ethylidene]bis-, monosodium salt;

Sodium trihydrogen [1-hydroxy-2-(3-pyridyl)ethylidene]diphosphonate;

Hemi-pentahydrate [329003-65-8].

Monohydrate [353228-19-0].

DEFINITION

Risedronate Sodium contains one or two and one-half molecules of hydration. The monohydrate form contains NLT 98.0% and NMT 102.0% of risedronate sodium ($C_7H_{10}NNaO_7P_2$), calculated on the dried basis. The hemi-pentahydrate form contains NLT 98.0% and NMT 102.0% of risedronate sodium ($C_7H_{10}NNaO_7P_2$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. Infrared Absorption** 〈 197 〉: The spectra of trifluorovinyl chloride polymer and mineral oil dispersions of it, separately prepared from a test specimen, exhibit maxima in the regions of $4000\text{--}1350\text{ cm}^{-1}$ and $1350\text{--}450\text{ cm}^{-1}$, respectively, only at the same wavelengths as those of similar preparations of USP Risedronate Sodium RS. [Note—If a difference appears in the infrared spectra of the analyte and the standard, dissolve equal portions of the test specimen and the USP Reference Standard in equal volumes of water containing about 50 mg/mL of potassium bromide. Evaporate the solutions to dryness at 105° for 120 min. Repeat the test on the residues.]

Change to read:

- **B. Identification Tests—General, Sodium** 〈 191 〉: Meets the requirements of the flame test ■ pyroantimonate precipitation test. [Note—Complete dissolution of the sample is achieved only after the addition of the 15% potassium carbonate.] ■ 1S (USP39)

ASSAY

● **Procedure**

Mobile phase: 1.8 g/L of edetate disodium in water. Adjust with 1 N sodium hydroxide to a pH of 9.5 ± 0.1 .

Standard solution: Dissolve USP Risedronate Sodium RS and USP Risedronate Related Compound A RS in *Mobile phase* to obtain a solution containing 1.0 mg/mL of anhydrous risedronate sodium and 0.1 mg/mL of risedronate related compound A.

Sample solution: 1.1 mg/mL of Risedronate Sodium in *Mobile phase*

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 263 nm

Column: 4.0-mm \times 25-cm; 10- μ m packing L48

Flow rate: 0.8 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 2.3 between risedronate related compound A and risedronate

Tailing factor: NMT 1.6 for the risedronate peak

Relative standard deviation: NMT 1.0% for the risedronate peak from three replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of risedronate sodium ($\text{C}_7\text{H}_{10}\text{NNaO}_7\text{P}_2$) in the portion of Risedronate Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

$C_{\bar{s}}$ concentration of USP Risedronate Sodium RS in the *Standard solution* (mg/mL)

$C_{\bar{r}}$ concentration of Risedronate Sodium in the *Sample solution* (mg/mL)

Acceptance criteria

Monohydrate: 98.0%–102.0% on the dried basis

Hemi-pentahydrate: 98.0%–102.0% on the anhydrous basis

IMPURITIES

Delete the following:

•

• Heavy Metals

Lead nitrate solution: Add 1 mL of nitric acid to 100 mL of water. Dissolve 100 mg of lead nitrate in it, and dilute with water to 1000 mL.

Sodium bicarbonate solution: Transfer 0.840 g of sodium bicarbonate to a 1000-mL volumetric flask containing about 950 mL of water. Dissolve in and dilute with water to volume. Adjust with 0.1 N sodium hydroxide or 0.1 N hydrochloric acid, as necessary, to a pH of 4.40 ± 0.02 .

Hydrogen sulfide solution: Transfer 200 mL of *Sodium bicarbonate solution* to a suitable conical flask, and bubble hydrogen sulfide gas through the solution until it turns a strip of lead acetate test paper black (see *Reagents, Indicators, and Solution—Indicator and Test Papers*).

Standard solutions: Transfer 500 mg of Risedronate Sodium to each of three separate beakers. Add 41 mL of water to each beaker, and stir to dissolve. Adjust with 0.1 N sodium hydroxide or 0.1 N hydrochloric acid, as necessary, to a pH of 4.40 ± 0.02 . Label the first beaker as *Standard solution 1*. Add 200 μ L of *Lead nitrate solution* to the second beaker (*Standard solution 2*) and 400 μ L to the third beaker (*Standard solution 3*). These solutions contain the equivalent of 0, 12.5, and 25 μ g of lead (representing 0, 10, and 20 ppm, respectively).

Sample solution: Transfer 1.75 g of Risedronate Sodium to a suitable beaker. Add 41 mL of water, and stir to dissolve. Adjust with 0.1 N sodium hydroxide or 0.1 N hydrochloric acid, as necessary, to a pH of 4.40 ± 0.02 .

Analysis: Add 7 mL of *Hydrogen sulfide solution* to each of the beakers containing the *Standard solutions* and the *Sample solution*. Allow the solutions to stand for at least 5 min. Add 60 μ L of 1 N hydrochloric acid to each of the beakers containing the *Standard solutions*, add 200 μ L of 1 N hydrochloric acid to the beaker containing the *Sample solution*, and stir. Transfer the solutions into 50-mL color-comparison tubes, and view downward over a white surface.

Acceptance criteria: The color of the solution obtained from the *Sample solution* is not darker than that of the solution from *Standard solution 3* (NMT 20 ppm).

•(Official 1-Dec-2015)

• Organic Impurities, Procedure 1

[Note—Perform both *Procedure 1* and *Procedure 2*.]

Mobile phase, Standard solution, Sample solution, and Chromatographic system:

Proceed as directed in the *Assay*.

Diluted standard solution: Dilute a portion of the *Standard solution* with *Mobile phase* to

obtain a solution containing 5 µg/mL of anhydrous risedronate sodium and about 0.5 µg/mL of risedronate related compound A.

System suitability

Samples: *Standard solution and Diluted standard solution*

Suitability requirements

Resolution: NLT 2.3 between risedronate related compound A and risedronate, *Standard solution*

Tailing factor: NMT 1.6 for the risedronate peak, *Standard solution*

Relative standard deviation: NMT 1.0% for the risedronate peak from three replicate injections, *Standard solution*; NMT 15% for the risedronate related compound A peak from three replicate injections, *Diluted standard solution*

Analysis

Samples: *Sample solution and Diluted standard solution*

Calculate the percentage of each impurity in the portion of Risedronate Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of risedronate from the *Diluted standard solution*

C_S = concentration of USP Risedronate Sodium RS in the *Diluted standard solution* (mg/mL)

C_U = concentration of Risedronate Sodium in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 1*)

Table 1

Name	Relative Response Factor	Relative Retention Time
3-Pyridyl acetic acid	1.65	0.22
2-Pyridinyl isomer (USP Risedronate Related Compound A RS)	1.0	0.84
Risedronate sodium	—	1.0

Acceptance criteria

Any individual impurity: NMT 0.10%

[Note—Disregard the peak due to the sodium ion, eluting at about 1.6 min, and any peak observed in the blank. The reporting level for impurities is 0.05%.]

• Organic Impurities, Procedure 2

Mobile phase: Transfer 16.15 g of dibasic potassium phosphate and 0.46 g of edetate disodium to a 1-L beaker, and dissolve in about 400 mL of water. Add 1 vial of commercially available tetrabutylammonium dihydrogen phosphate buffered solution in methanol¹ and 1 mL of hydrochloric acid. Adjust with 1 N sodium hydroxide or 1 N hydrochloric acid, as necessary, to a pH of 7.5 ± 0.1, and dilute with water to 480 mL. Add 20 mL of methanol, mix well, pass the solution through a nylon filter of 0.45-µm pore size, and degas.

Diluent: Transfer 0.46 g of edetate disodium to a 1-L beaker, and dissolve in 500 mL of water. Adjust with 1 N sodium hydroxide to a pH of 7.5 ± 0.1.

Standard solution: 5 µg/mL of USP Risedronate Related Compound B RS in *Diluent*

Diluted standard solution: 0.5 µg/mL of USP Risedronate Related Compound B RS in *Diluent* from the *Standard solution*

Sample solution: 2 mg/mL of Risedronate Sodium in *Diluent*, using sonication if necessary

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 263 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1.0 mL/min

Injection volume: 10 µL

System suitability

Samples: *Standard solution* and *Diluted standard solution*

Suitability requirements

Capacity factor: Greater than 2, *Standard solution*

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 5% from three replicate injections, *Standard solution*; NMT 10% from three replicate injections, *Diluted standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

[Note—Disregard any peak eluting before risedronate related compound B. The risedronate peak elutes unretained at the void volume.]

Calculate the percentage of each impurity in the portion of Risedronate Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of risedronate related compound B from the *Standard solution*

C_S = concentration of USP Risedronate Related Compound B RS in the *Standard solution* (mg/mL)

C_U = concentration of Risedronate Sodium in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of risedronate related compound B as a free acid, 530.20

M_{r2} = molecular weight of risedronate related compound B as a tetrahydrate disodium salt, 646.22

Acceptance criteria

Risedronate related compound B: NMT 0.10%

Individual impurities: NMT 0.10%

Total impurities: NMT 0.50%, *Procedure 1* and *Procedure 2* being combined

[Note—Disregard any peak observed in the blank. The reporting level for impurities is 0.05%.]

SPECIFIC TESTS

- **Water Determination, Method Ic** { 921 } (where it is labeled as a hemi-pentahydrate): 11.9%–13.9%. Perform the test by direct introduction of solid sample into the titrator. Alternatively, *Method 1a* may be used.
- **Loss on Drying** (where it is labeled as a monohydrate)

(See *Thermal Analysis* 〈 891 〉.)

Analysis: Determine the percentage of volatile substances by thermogravimetric analysis on an appropriately calibrated instrument, using 7–15 mg of Risedronate Sodium. Heat the specimen under test at a rate of 10°/min in a stream of nitrogen at a flow rate of about 40 mL/min. Record the thermogram from ambient temperature to 250°.

Acceptance criteria: 5.5%–7.5%

ADDITIONAL REQUIREMENTS

- **Labeling:** Label to indicate whether it is the monohydrate or the hemi-pentahydrate form.
- **Packaging and Storage:** Preserve in well-closed containers. Store at room temperature.
- **USP Reference Standards** 〈 11 〉

¹ Available from Waters Corp. as Part #85101 (PIC A).

BRIEFING

Salicylic Acid Topical Foam, *USP 38* page 5243. As part of the USP monograph modernization effort, the following revisions are proposed:

1. Add *Identification* test *B* based on the UV spectrum match of the main peak from the proposed UHPLC procedure for the *Assay*.
2. Replace the current HPLC procedure that uses an ion-pairing reagent and an internal standard with a straightforward stability-indicating UHPLC procedure. The liquid chromatographic procedure replaces the 4-mm internal diameter column previously used with a Waters Acquity UPLC BEH-C18, 1.7-µm brand of column containing L1 packing. The typical retention time for salicylic acid is about 5.2 min.
3. Add a test for *Organic Impurities* based on the proposed UHPLC procedure in the *Assay*. This method monitors impurities that are consistent with those found in the API.
4. Add three new Reference Standards, introduced by the proposed HPLC procedure, to the *USP Reference Standards* section: USP Salicylic Acid Related Compound A RS, USP Salicylic Acid Related Compound B RS, and USP Phenol RS.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

BRIEFING

Sodium Thiosulfate, *USP 38* page 5338. Based on the comments received and as part of USP monograph modernization efforts, the monograph is revised as follows:

1. Replace the wet chemistry-based *Identification* tests A and C with the IR *Identification* test.
2. For *Identification* test B, it is proposed to express the *Sample solution* concentration

in g/mL to be consistent with the classic version.

3. Revise the *Assay* to allow the use of dilute acid or dilute base for pH adjustments.
4. For clarity, add the method number to the *Water Determination* test.
5. USP Sodium Thiosulfate RS is added to the *USP Reference Standards* section to support the proposed revision in the *Identification* test by IR.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Sodium Thiosulfate Injection

DEFINITION

Sodium Thiosulfate Injection is a sterile solution of Sodium Thiosulfate in freshly boiled Water for Injection. It contains NLT 95.0% and NMT 105.0% of the labeled amount of sodium thiosulfate ($\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$).

IDENTIFICATION

- **A. Procedure**

Sample solution: Equivalent to ~~100 mg/mL~~

■ 0.1 g/mL ■ 1S (USP39)

of sodium thiosulfate in water

Analysis: Add a few drops of iodine TS.

Acceptance criteria: The color is discharged.

Change to read:

- **B. Identification Tests—General**, *Sodium* 〈 191 〉

Sample solution: Equivalent to ~~100 mg/mL~~

■ 0.1 g/mL ■ 1S (USP39)

of sodium thiosulfate in water

Acceptance criteria: Meets the requirements

Change to read:

● **C. Identification Tests—General, Thiosulfate** 〈 191 〉

Sample solution: Equivalent to ~~100 mg/mL~~

■ 0.1 g/mL ■ 1S (USP39)

of sodium thiosulfate in water

Acceptance criteria: Meets the requirements

ASSAY

Change to read:

● **Procedure**

Sample solution: Equivalent to 1 g of sodium thiosulfate from Injection. Adjust with ~~3-N~~ hydrochloric acid

■ a suitable solution of dilute hydrochloric acid or dilute sodium hydroxide ■ 1S (USP39)

to a pH of 6.2–6.7, and dilute with water to about 20 mL.

Titrimetric system

(See *Titrimetry* 〈 541 〉.)

Mode: Direct titration

Titrant: 0.1 N iodine VS

Endpoint detection: Visual

Analysis: Titrate the *Sample solution* with *Titrant*, adding 3 mL of starch TS as the endpoint is approached. Each mL of *Titrant* is equivalent to 24.82 mg of sodium thiosulfate ($\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$).

Acceptance criteria: 95.0%–105.0%

SPECIFIC TESTS

● **Bacterial Endotoxins Test** 〈 85 〉: NMT 0.03 USP Endotoxin Units/mg of sodium thiosulfate

● **pH** 〈 791 〉: 6.0–9.5

● **Other Requirements:** Meets the requirements in *Injections and Implanted Drug Products* 〈 1 〉

ADDITIONAL REQUIREMENTS

● **Packaging and Storage:** Preserve in single-dose containers of Type I glass.

● **USP Reference Standards** 〈 11 〉

USP Endotoxin RS

BRIEFING

Succinylcholine Chloride, *USP 38* page 5363. As part of the USP monograph modernization effort, it is proposed to revise the monograph as follows:

1. The liquid chromatographic procedure in the test for *Limit of Choline* is difficult to execute and, in addition, one of the *Mobile phase* components, 1-hexanesulfonic acid, is unavailable outside of the United States. The current procedure is replaced with a liquid chromatographic procedure based on validated methods of analysis performed with the Dionex IonPac CS19 brand of L## column and the Dionex IonPac CG19 brand of L## guard column. The typical retention time for choline is about 11 min.
2. The *Definition* is revised to make it less ambiguous and a *Caution* statement is added.
3. *Identification* test C is deleted because *Identification* test A and *Identification* test B are two orthogonal methods sufficient to ensure the identity of the drug substance.
4. An *Identification* test for chloride is added.
5. The particle size for the column used in the *Assay* is specified, the *Note* is deleted, and the *Standard solution* preparation is updated.
6. The test for the counter ion, *Content of Chloride*, is deleted because it is not needed.
7. Citric acid and succinic acid are replaced with USP Citric Acid RS and USP Succinic Acid RS, respectively, in the test for *Organic Impurities*.
8. The *Sterility Tests* and *Bacterial Endotoxins Test* are deleted because they are redundant as the testing is performed on the drug product, *Succinylcholine Chloride Injection*.
9. The *Packaging and Storage* section is updated to remove the reference to a storage temperature.
10. The *Labeling* statement is deleted because it is redundant as the requirements are covered in the *Definition* and in the drug product monograph, *Succinylcholine Chloride Injection*.
11. USP Potassium Chloride RS, USP Citric Acid RS, and USP Succinic Acid RS are added to the *Reference Standards* section in support of the proposed changes to the tests for *Limit of Choline* and *Organic Impurities*.
12. USP Endotoxin RS is deleted from the *USP Reference Standards* section due to the proposed omission of the *Bacterial Endotoxins Test*.

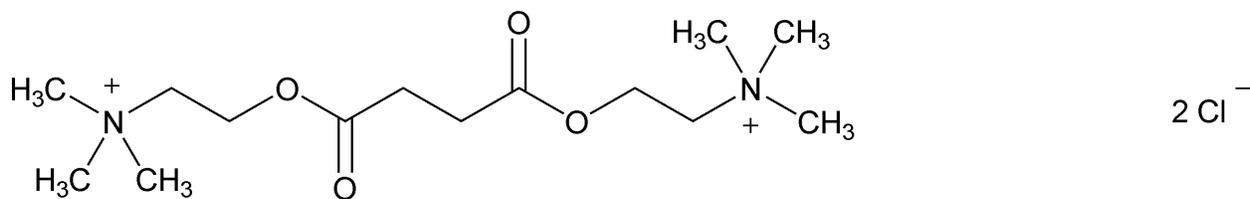

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

BRIEFING

Sulfamethoxazole and Trimethoprim Oral Suspension, USP 38 page 5397 and PF 40(1) [Jan.-Feb. 2014]. On the basis of a comment received, the revision appearing in PF 40(1) is

canceled and replaced with the following proposal. It is proposed to modernize the monograph with the following changes:

1. Replace the *Limit of Trimethoprim Degradation Product* and *Limit of Sulfanilamide, Sulfanilic Acid, and Sulfamethoxazole N₄-Glucoside* tests based on TLC with a selective and validated HPLC method for *Organic Impurities*. The HPLC procedure in the test for *Organic Impurities* is based on analysis performed with the Sunfire C18 brand of L1 column. The typical retention times of trimethoprim and sulfamethoxazole are 14.4 and 20.4 min, respectively.
2. Revise the *Identification* test based on TLC with the retention time agreement for sulfamethoxazole and trimethoprim in the *Assay*.
3. Add additional storage requirements based on the drug package insert.
4. Add USP Diaveridine RS, USP Sulfamethoxazole Related Compound C RS, USP Trimethoprim Related Compound A RS, and USP Trimethoprim Related Compound B RS to the *USP Reference Standards* section to ensure the system suitability performance for the HPLC procedure and quantitative control of impurities in the product.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Sulfamethoxazole and Trimethoprim Oral Suspension

DEFINITION

Sulfamethoxazole and Trimethoprim Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amounts of sulfamethoxazole (C₁₀H₁₁N₃O₃S) and trimethoprim (C₁₄H₁₈N₄O₃).

IDENTIFICATION

Delete the following:

- ~~A. The *R_f* values of the principal spots of the *Sample solution* correspond to those of the *Standard solutions* of USP Trimethoprim RS and USP Sulfamethoxazole RS, as obtained in the *Impurities* tests. ■1S (USP39)~~

Add the following:

- A. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■1S (USP39)

ASSAY

Change to read:

● Procedure

Mobile phase: Mix 1400 mL of water, 400 mL of acetonitrile, and 2.0 mL of triethylamine in a 2000-mL volumetric flask. Allow to equilibrate to room temperature, and adjust with 0.2 N sodium hydroxide or dilute glacial acetic acid (1 in 100) to a pH of 5.9 ± 0.1. Dilute with

water to volume, and pass through a filter of 0.45- μm pore size.

Standard stock solution: 0.32 mg/mL of USP Trimethoprim RS and 0.32*J* mg/mL of USP Sulfamethoxazole RS in methanol, where *J* is the ratio of the labeled amount, in mg, of sulfamethoxazole to the labeled amount, in mg, of trimethoprim in the dosage form

Standard solution: 0.032 mg/mL of USP Trimethoprim RS per mL and 0.032*J* mg/mL of USP Sulfamethoxazole RS per mL in *Mobile phase* from *Standard stock solution*

Sample stock solution: Transfer a volume of Oral Suspension, equivalent to 80 mg of sulfamethoxazole, to a 50-mL volumetric flask with the aid of 30 mL of methanol. Sonicate the mixture for 10 min with occasional shaking. Allow to equilibrate to room temperature, dilute with methanol to volume, and centrifuge. Use the filtrate in the preparation of the *Sample solution*.

Sample solution: Nominally 0.16 mg/mL of sulfamethoxazole in *Mobile phase* from *Sample stock solution*. Filter the solution.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm \times 30-cm;

■ 10- μm ■ 1S (USP39)

packing L1

Flow rate: 2 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

[Note—The relative retention times for trimethoprim and sulfamethoxazole are 1.0 and 1.8, respectively.]

Suitability requirements

Resolution: NLT 5.0 between sulfamethoxazole and trimethoprim

Tailing factor: NMT 2.0 for sulfamethoxazole and trimethoprim

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of trimethoprim ($\text{C}_{14}\text{H}_{18}\text{N}_4\text{O}_3$) and sulfamethoxazole ($\text{C}_{10}\text{H}_{11}\text{N}_3\text{O}_3\text{S}$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of trimethoprim or sulfamethoxazole from the *Sample solution*

r_S = peak response of trimethoprim or sulfamethoxazole from the *Standard solution*

C_S = concentration of the USP Trimethoprim RS or USP Sulfamethoxazole RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of trimethoprim or sulfamethoxazole in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% each of sulfamethoxazole ($\text{C}_{10}\text{H}_{11}\text{N}_3\text{O}_3\text{S}$) and trimethoprim ($\text{C}_{14}\text{H}_{18}\text{N}_4\text{O}_3$)

PERFORMANCE TESTS

- **Uniformity of Dosage Units** (905): Meets the requirements for oral suspension packaged in single-unit containers
- **Deliverable Volume** (698): Meets the requirements for oral suspension packaged in multiple-unit containers

IMPURITIES**Delete the following:**

- **Limit Of Trimethoprim Degradation Product**

Diluent: Chloroform and methanol (8:2)

Standard solution A: 20 mg/mL of USP Trimethoprim RS in *Diluent*

Standard solution B: 0.1 mg/mL of USP Trimethoprim RS in *Diluent* from *Standard solution A*

Sample solution: Transfer a measured volume of Oral Suspension, equivalent to 40 mg of trimethoprim, to a separatory funnel. Extract with three 25-mL portions of *Diluent*, collecting the extracts in a 125-mL conical flask. Evaporate the combined extracts with the aid of a current of air to dryness on a steam bath. Dissolve the residue in 2.0 mL of *Diluent*, then centrifuge.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 5- μ L

Developing solvent system: Chloroform, methanol, and ammonium hydroxide (80:20:3)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatogram until the solvent front has moved at least 15 cm. Remove the plate from the chamber, air-dry, and view under short-wavelength UV light. Trimethoprim produces a spot at about R_f 0.7, and the trimethoprim degradation product can be seen at R_f 0.3–0.5.

Acceptance criteria: Any spot from the *Sample solution* at about R_f 0.3–0.5 is not greater in size and intensity than the spot produced by *Standard solution B* at about R_f 0.7, corresponding to NMT 0.5%. ■ 1S (USP39)

Injection volume: 20 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 1.5 between trimethoprim and trimethoprim related compound A; and NLT 1.5 between sulfamethoxazole and trimethoprim related compound B

Relative standard deviation: NMT 2.0% for sulfanilic acid, sulfanilamide, sulfamethoxazole related compound C, sulfamethoxazole *N*₄-glucoside, diaveridine, trimethoprim, trimethoprim related compound A, sulfamethoxazole, and trimethoprim related compound B

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of sulfanilic acid, sulfanilamide, sulfamethoxazole related compound C, and sulfamethoxazole *N*₄-glucoside in the portion of Oral Suspension taken:

$$\text{Result} = (r_i/r_c) \times (C_c/C_i) \times 100$$

r_U peak response of sulfanilic acid, sulfanilamide, sulfamethoxazole related compound C, or sulfamethoxazole N_4 -glucoside from the *Sample solution*

r_S peak response of sulfanilic acid, sulfanilamide, sulfamethoxazole related compound C, or sulfamethoxazole N_4 -glucoside from the *Standard solution*

C_S concentration of USP Sulfanilic Acid RS, USP Sulfanilamide RS, USP Sulfamethoxazole Related Compound C RS, or USP Sulfamethoxazole N_4 -Glucoside RS in the *Standard solution* (mg/mL)

C_U nominal concentration of sulfamethoxazole in the *Sample solution* (mg/mL)

Calculate the percentage of diaveridine, trimethoprim related compound A, trimethoprim related compound B, and any other unspecified degradation product in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of diaveridine, trimethoprim related compound A, trimethoprim related compound B, or any other unspecified degradation product from the *Sample solution*

r_S peak response of diaveridine, trimethoprim related compound A, trimethoprim related compound B, or trimethoprim (for any other unspecified degradation product) from the *Standard solution*

C_S concentration of USP Diaveridine RS, USP Trimethoprim Related Compound A RS, USP Trimethoprim Related Compound B RS, or USP Trimethoprim RS (for any other unspecified degradation product) in the *Standard solution* (mg/mL)

C_U nominal concentration of trimethoprim in the *Sample solution* (mg/mL)

Acceptance criteria See *Table 2*. Disregard limit: 0.01%.

BRIEFING

Tacrolimus, USP 38 page 5425. On the basis of comments received, the monograph is revised as follows:

1. The diluent in the *Assay* and *Organic Impurities, Procedure 2* is revised from an acetonitrile–water mixture to acetonitrile to minimize the formation of unknown impurity peaks. Because the solution does not contain water, the formation of the open ring and 19-epimer is minimized and the 3-h equilibration step is not required.
2. The requirement for storing solutions in low-actinic glassware is deleted, allowing flexibility to use other ways of protecting solutions from light.
3. *Organic Impurities, Procedure 1* is revised to correct the calculation formula.
4. Tacrolimus 8-epimer, a degradation product, and tacrolimus 8-propyl analog, a process impurity, elute close together and may switch positions depending on the column used. *Peak identification solution 1* and *Peak identification solution 2* are added to *Organic Impurities, Procedure 2* to facilitate the identification of these two peaks.
5. The *USP Reference Standards* section is revised to include the Reference Standards used in *Organic Impurities, Procedure 2*.

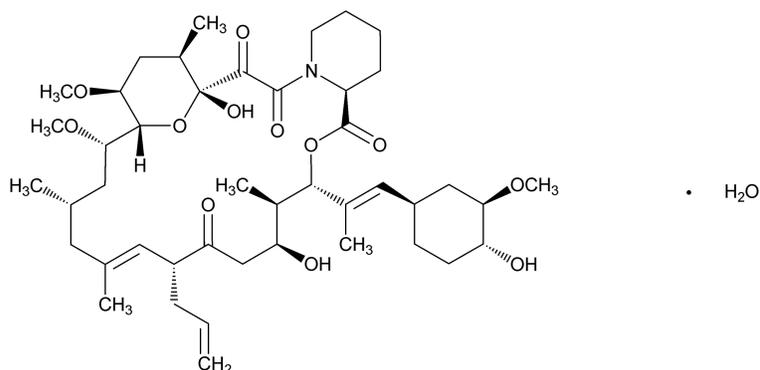

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM1: A. Wise.)

Temperatures

Column: 60°

Autosampler: 4°

Flow rate: 1.5 mL/min

Injection volume: 20 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for tacrolimus open ring, tacrolimus 19-epimer, ascomycin, tacrolimus, and are 0.52, 0.63, 0.87, and 1.0, respectively.]

■ See *Table 3* for relative retention times. ■ 1S (USP39)

]

Suitability requirements

Resolution: NLT 3.0 between ascomycin and tacrolimus, *System suitability solution*

Relative standard deviation: NMT 1.0% for the sum of the responses of tacrolimus, tacrolimus open ring, and tacrolimus 19-epimer, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of tacrolimus (C₄₄H₆₉NO₁₂) in the portion of Tacrolimus taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = sum of the peak responses of tacrolimus open ring, tacrolimus 19-epimer, and tacrolimus from the *Sample solution*

r_S = sum of the peak responses of tacrolimus open ring, tacrolimus 19-epimer, and tacrolimus from the *Standard solution*

C_S = concentration of USP Tacrolimus RS in the *Standard solution* (mg/mL)

C_U = concentration of Tacrolimus in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous and solvent-free basis

IMPURITIES

- **Residue on Ignition** 〈 281 〉: NMT 0.1%

Delete the following:

●

- **Heavy Metals, Method II** 〈 231 〉

: NMT 10 ppm (Official 1-Dec-2015)

Change to read:

- **Organic Impurities, Procedure 1**

Use *Organic Impurities, Procedure 1* when the impurity profile includes tacrolimus methylacrylaldehyde and tacrolimus diene. It is suggested that new columns be conditioned with about 500 mL of alcohol before use to meet the resolution criterion.

Mobile phase: Hexane, *n*-butyl chloride, and acetonitrile (7:2:1). Add *n*-butyl chloride to hexane, and mix well before adding acetonitrile. After adding acetonitrile, mix the mobile phase for 2 h to get a clear solution. Any deviations from the ratio of components in the

mobile phase and the order of mixing will result in a two-phase solution.

System suitability solution: 0.1 mg/mL each of USP Tacrolimus RS and USP Tacrolimus Related Compound A RS in *Mobile phase*

Sample solution: 2.0 mg/mL of Tacrolimus in *Mobile phase*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: Two 4.6-mm × 25-cm columns; 5-µm packing L20

Column temperature: 28 ± 2°

Flow rate: 1.5 mL/min

Adjust the flow rate so that the retention time of tacrolimus is approximately 15 min.

Injection volume: 20 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 1.1 between tacrolimus and tacrolimus related compound A

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Tacrolimus taken:

$$\text{Result} = (r_U/F) \times [1/\Sigma(r_U/F)] \times 100$$

~~r_U~~ = peak response of each peak from the *Sample solution*

~~F~~ = relative response factor for the corresponding peak (see *Table 2*)

■
$$\text{Result} = (r_U/F_i) \times \{1/[r_T + \Sigma(r_U/F_i)]\} \times 100$$

r_U
= peak response of each impurity from the *Sample solution*

F_i
= relative response factor for each corresponding impurity (see *Table 2*)

r_T
= peak response of tacrolimus from the *Sample solution*

■ 1S (USP39)

Acceptance criteria: See *Table 2*.

C₄₄H₇₁NO₁₂ 806.03

BRIEFING

Tacrolimus Capsules, *USP 38* page 5428. On the basis of comments received, the monograph is revised as follows:

1. A test for *Identification* based on the UV spectral comparison is added to strengthen the monograph.
2. The requirement for storing solutions in low-actinic glassware is deleted, allowing flexibility to use other ways of protecting solutions from light.
3. In *Dissolution Test 3*, the *Sample solution* is revised to reflect the validated procedure.
4. *Organic Impurities, Procedure 1* is revised to correct the calculation formula.
5. Tacrolimus 8-epimer, a degradation product, and tacrolimus 8-propyl analog, a process impurity, elute close together and may switch positions depending on the column used. *Peak identification solution 1* and *Peak identification solution 2* are added to *Organic Impurities, Procedure 2* to facilitate the identification of these two peaks.
6. The *USP Reference Standards* section is revised to include the Reference Standards used in *Organic Impurities, Procedure 2*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Tacrolimus Capsules

DEFINITION

Tacrolimus Capsules contain NLT 93.0% and NMT 105.0% of the labeled amount of tacrolimus (C₄₄H₆₉NO₁₂).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

Add the following:

- **B.** The UV absorption spectrum of the major peak of the *Sample solution* and that of the *Standard solution* exhibit maxima and minima at the same wavelengths, as obtained in the *Assay*. ■ 1S (*USP39*)

ASSAY

Change to read:● **Procedure**

Allow the *Standard solution* and *Sample solution* to stand for 3 h at ambient temperature before use. ~~Protect from light by using low-actinic glassware.~~

■ Protect solutions containing tacrolimus from light. ■ 1S (USP39)

Solution A: 6 mM phosphoric acid

Solution B: 50 g/L of polyoxyethylene (23) lauryl ether. [Note—Polyoxyethylene (23) lauryl ether is also called Brij-35.]

Solution C: Acetonitrile and *Solution B* (7:3)

Mobile phase: Acetonitrile, *tert*-butyl methyl ether, and *Solution A* (335:55:600)

Standard solution: 50 µg/mL of USP Tacrolimus RS in *Solution C*

Sample solution: Equivalent to 50 µg/mL of tacrolimus from NLT 10 Capsules in *Solution C*.
[Note—Sonicate, and stir with a magnetic stirrer.]

Chromatographic system

(See *Chromatography* 〈621〉, *System Suitability*.)

Mode: LC

Detector: UV 205 nm.

■ When this procedure is used for *Identification test B*, use a diode array detector set at 200–400 nm. ■ 1S (USP39)

Column: 4.0-mm × 5.5-cm; 3-µm packing L1

Column temperature: 60°

Flow rate: 1 mL/min

Injection volume: 5 µL

System suitability

Sample: *Standard solution*

[Note—The relative retention times for tacrolimus 19-epimer and tacrolimus are 0.67 and 1.0, respectively.]

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 3.0% for the sum of the tacrolimus and tacrolimus 19-epimer peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U sum of the peak responses of tacrolimus and tacrolimus 19-epimer from the *Sample solution*

r_S sum of the peak responses of tacrolimus and tacrolimus 19-epimer from the *Standard solution*

C_S concentration of USP Tacrolimus RS in the *Standard solution* (mg/mL)

C_U nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 93.0%–105.0%

PERFORMANCE TESTS

Change to read:

- **Dissolution** 〈 711 〉

Test 1

Medium: Hydroxypropylcellulose in water ($1:2 \times 10^4$), adjusted with 6% phosphoric acid to a pH of 4.5; 900 mL

Apparatus 2: 50 rpm with sinker (see *Dissolution* 〈 711 〉, *Figure 2a*)

Time: 90 min

Mobile phase: Acetonitrile, methanol, water, and 6% phosphoric acid (46: 18: 36: 0.1)

Standard stock solution: ($L/360$) mg/mL in acetonitrile, where L is the Capsule label claim in mg

Standard solution: To 20.0 mL of the *Standard stock solution* add 50.0 mL of *Medium*, and mix to obtain solutions with known concentrations as indicated in *Table 1*. Allow the solution to stand for NLT 6 h at 25° before use.

Sample solution: Pass 10 mL of the solution under test through a G4 glass filter. To 5.0 mL of the filtrate add 2.0 mL of acetonitrile, and mix. Allow the solution to stand for NLT 1 h at 25° before use.

Table 1

Capsule Strength (mg)	Final Concentration (µg/mL)
0.5	0.4
1	0.8
5	4

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: 210 nm

Column: 4.6-mm × 15-cm; 5-µm packing L7

Column temperature: 50°

Flow rate: Adjust the flow rate so that the retention time of tacrolimus is approximately 14 min.

Injection volume: See *Table 2*.

Table 2

Capsule Strength (mg)	Injection Volume (µL)
0.5	800
1	400
5	80

[Note—For products with strengths other than those listed in *Table 2*, adjust the injection volume to deliver an equivalent amount of tacrolimus into the column.]

]

Buffer: Dissolve 6 g of sodium dodecyl sulfate and 8.28 g of monobasic sodium phosphate in 6000 mL of water. Adjust with 2 N sodium hydroxide to a pH of 7.0.**Medium:** *Buffer*; 900 mL**Apparatus 2:** 50 rpm, with sinkers**Time:** 60 min**Standard stock solution:** 0.2 mg/mL of USP Tacrolimus RS in alcohol and *Medium* (3:7). [Note—Dissolve USP Tacrolimus RS in alcohol using 30% of the final volume. Sonicate until dissolved, and dilute with *Medium* to volume.]**Standard solution:** Dilute the *Standard stock solution* with *Medium* to obtain a final concentration of 5 µg/mL.**Sample solution:** Pass a portion of the solution under test through a suitable filter.**Solution A:** 6 mM phosphoric acid**Mobile phase:** Acetonitrile, *tert*-butyl methyl ether, and *Solution A* (335:50:600)**Chromatographic system**(See *Chromatography* { 621 }, *System Suitability*.)**Mode:** LC**Detector:** UV 205 nm**Column:** 4.0-mm × 5.5-cm; 3-µm packing L1**Column temperature:** 60°**Flow rate:** 1.2 mL/min

Injection volume: 100 μ L

System suitability

Sample: *Standard solution*

[Note—The relative retention times for tacrolimus 19-epimer and tacrolimus are 0.67 and 1.0, respectively.]

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 5.0% for the sum of the areas of tacrolimus and tacrolimus 19-epimer

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = sum of the peak responses of tacrolimus and tacrolimus 19-epimer from the *Sample solution*

r_S = sum of the peak responses of tacrolimus and tacrolimus 19-epimer from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Capsule)

V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) is dissolved.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium: 50 mg/L of hydroxypropyl cellulose in water. Adjust with phosphoric acid to a pH of 4.5; 900 mL.

Apparatus 2 (without sinker) and Time: and Sample solution:

■ **1S (USP39)**

Proceed as directed in *Test 1*.

Buffer: 3.6 g/L of monobasic potassium phosphate in water. Adjust with diluted phosphoric acid to a pH of 2.5.

Mobile phase: *Buffer* and acetonitrile (1:1)

Standard stock solution: 0.1 mg/mL of USP Tacrolimus RS in acetonitrile

Standard solution: Dilute the *Standard stock solution* with *Medium* to obtain a final concentration of $(L/900)$ mg/mL, where L is the Capsule label claim in mg.

Sample solution: Pass a portion of the solution under test through a suitable filter.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm \times 10-cm; 5- μ m packing L1

Column temperature: 60 $^{\circ}$

Flow rate: 1.3 mL/min

Injection volume: 100 μ L

System suitability

Sample: *Standard solution*

[Note—The relative retention times for tacrolimus 19-epimer, tacrolimus open ring, and tacrolimus are 0.67, 0.79, and 1.0, respectively.]

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = sum of the peak responses of tacrolimus, tacrolimus 19-epimer, and tacrolimus open ring from the *Sample solution*

r_S = sum of the peak responses of tacrolimus, tacrolimus 19-epimer, and tacrolimus open ring from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Capsule)

V = volume of *Medium*, 900 mL

Tolerances: NLT 75% (Q) of the labeled amount of tacrolimus ($C_{44}H_{69}NO_{12}$) is dissolved.

Test 4: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

Medium: Hydroxypropylcellulose in water (1 in 20,000), adjusted with phosphoric acid to a pH of 4.5. See *Table 3* for the volume.

Table 3

Capsule Strength (mg)	Volume of Medium (mL)
0.5	500
1	900
5	900

Apparatus 2: 50 rpm, with sinkers

Time: 120 min

Diluent: 1 mg/mL of hydroxypropylcellulose in water. Sonicate as needed to dissolve.

Buffer: To a solution of 1 g/L of sodium 1-hexanesulfonate in water add 0.1 mL/L of trifluoroacetic acid.

Mobile phase: Acetonitrile, methanol, and *Buffer* (550:50:400)

Standard stock solution: Dissolve USP Tacrolimus RS in acetonitrile. See *Table 4* for the concentrations (L is the Capsule label claim in mg).

Table 4

Capsule Strength (mg)	Concentration (mg/mL)
0.5	$L/25$
1	$L/45$
5	$L/45$

Standard solution: Dilute the *Standard stock solution* with *Diluent*. See *Table 5* for the concentrations (L is the Capsule label claim in mg).

Table 5

Capsule Strength (mg)	Concentration (mg/mL)
0.5	L/500
1	L/900
5	L/900

Sample solution: Pass a portion of the solution under test through a suitable filter.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Column temperature: 60°

Flow rate: 1 mL/min

Injection volume: 100 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of tacrolimus (C₄₄H₆₉NO₁₂) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Tacrolimus RS in the *Standard solution* (mg/mL)

L = label claim (mg/Capsule)

V = volume of *Medium* (mL) (see *Table 3*)

Tolerances: NLT 75% (Q) of the labeled amount of tacrolimus (C₄₄H₆₉NO₁₂) is dissolved.

- **Uniformity of Dosage Units** 〈 905 〉: Meet the requirements

IMPURITIES

Change to read:

- **Organic Impurities, Procedure 1**

Use *Organic Impurities, Procedure 1* when the impurity profile includes tacrolimus diene and tacrolimus regioisomer. It is suggested that new columns be conditioned with about 500 mL of ethanol before use to meet the resolution criterion.

Mobile phase: Hexane, *n*-butyl chloride, and acetonitrile (7:2:1). Add *n*-butyl chloride to hexane, and mix well before adding acetonitrile. After adding acetonitrile, mix the *Mobile phase* for 2 h to get a clear solution. Any deviations from the ratio of components in the *Mobile phase* and the order of mixing will result in a two-phase solution.

System suitability solution: 0.1 mg/mL each of USP Tacrolimus RS and USP Tacrolimus Related Compound A RS in *Mobile phase*

Sample solution: Transfer the contents of a suitable number of Capsules (equivalent to about 5 mg of tacrolimus for 0.5-mg Capsules or 10 mg of tacrolimus for 1-mg and 5-mg Capsules) into a centrifuge tube. Add 1.5 mL of a mixture of *n*-butyl chloride and acetonitrile (2:1), sonicate in an ultrasonic bath for 2 min, add 3.5 mL of *n*-hexane, and mix. Centrifuge this solution, and collect the supernatant or pass the solution through a 0.5- μ m membrane filter. Use the solution within 30 min of preparation.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Columns: Two 4.6-mm \times 25-cm columns; 5- μ m packing L20

Column temperature: 28 \pm 2 $^{\circ}$

Flow rate: 1.5 mL/min.

Adjust the flow rate so that the retention time of tacrolimus is approximately 15 min.

Injection volume: 20 μ L

Run time: 3 times the retention time of tacrolimus

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 1.1 between tacrolimus and tacrolimus related compound A

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/F_i) \times [1/\Sigma(r_U/F_i)] \times 100$$

■

$$\text{Result} = (r_U/F_i) \times \{1/[r_T + \Sigma(r_U/F_i)]\} \times 100 \quad \blacksquare_{1S} \text{ (USP39)}$$

r_U = peak response of each impurity from the *Sample solution*

F_i = relative response factor for each corresponding impurity (see *Table 6*)

r_T = peak response of tacrolimus from the *Sample solution*

Acceptance criteria: See *Table 6*. Disregard peaks due to the solvent.

Table 6

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

Sample solution: Equivalent to 1.5 mg/mL of tacrolimus in *Diluent*. [Note—Shake the mixture on a mechanical shaker for 30 min, and pass through a suitable filter.]

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 15-cm; 3-µm packing L1

Column temperature: 60°

Flow rate: 1.5 mL/min

Injection volume: 40 µL

System suitability

Samples: *System suitability solution*, *Standard solution*, and *Sensitivity solution*

Suitability requirements

Resolution: NLT 3.0 between tacrolimus and ascomycin, *System suitability solution*

Relative standard deviation: NMT 10.0% for the sum of the responses of tacrolimus and tacrolimus 19-epimer, *Standard solution*

Signal-to-noise ratio: NLT 10.0, *Sensitivity solution*

Analysis

Samples: *Standard solution*,

■ *Peak identification solution 1*, *Peak identification solution 2*, ■ 1S (USP39)

and *Sample solution*

Calculate the percentage of each impurity in the portion of Capsules taken:

★ $\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times (1/F) \times 100$

★(IRA 1-Jul-2014)

r_U = peak response of each impurity from the *Sample solution*

r_S = sum of the peak responses of tacrolimus 19-epimer and tacrolimus from the *Standard solution*

C_S = concentration of USP Tacrolimus RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of tacrolimus in the *Sample solution* (mg/mL)

P = potency of tacrolimus in USP Tacrolimus RS (mg/mg)

F = relative response factor (see *Table 8*) ★(IRA 1-Jul-2014)

Acceptance criteria: See *Table 8*.

■ Identify tacrolimus 8-epimer and tacrolimus 8-propyl analog using *Peak identification solution 1* and *Peak identification solution 2*. ■ 1S (USP39)

Disregard peaks that are smaller than the tacrolimus peak in the *Sensitivity solution*.

BRIEFING

Teniposide. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods of analysis, is proposed.

1. The liquid chromatographic procedure in the *Assay* and the test for *Organic Impurities* is based on analyses performed with the Synergi Polar-RP brand of L11 column manufactured by Phenomenex. The typical retention time for teniposide is about 30 min.

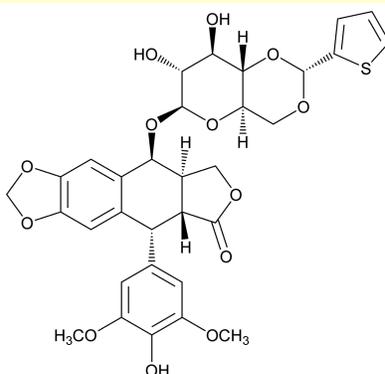

(SM3: F. Mao.)

Correspondence Number—C93995

Comment deadline: May 31, 2015

Add the following:

■ Teniposide

$C_{32}H_{32}O_{13}S$ 656.65

Comment deadline: May 31, 2015

Add the following:

■ Teniposide Injection

DEFINITION

Teniposide Injection contains NLT 90.0% and NMT 110.0% of the labeled amount of teniposide ($C_{32}H_{32}O_{13}S$). It is a sterile solution in a nonaqueous medium and may contain benzyl alcohol or other suitable preservatives.

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **Procedure**

Solution A: Acetonitrile and water (25:75)

Solution B: Acetonitrile and water (56:44)

Mobile phase: See *Table 1*. Return to original conditions and re-equilibrate the system for 10 min.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
4	100	0
16	64.5	35.5
36	64.5	35.5
60	0	100
90	0	100

Diluent: Acetonitrile and 5 μ M monobasic potassium phosphate (1:1)

Standard solution: 0.4 mg/mL of USP Teniposide RS in *Diluent*, prepared as follows.

Transfer a known amount of USP Teniposide RS into a suitable volumetric flask and add acetonitrile equivalent to 10% of the final volume. Dissolve with the aid of sonication and dilute with *Diluent* to volume.

Sample solution: Nominally equivalent to 0.4 mg/mL of teniposide in *Diluent*, prepared as follows. Dilute a portion of the Injection with *Diluent* to obtain a solution containing 0.4 mg/mL of teniposide.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; 5-μm packing L11

Flow rate: 1.3 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of teniposide ($C_{32}H_{32}O_{13}S$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Teniposide RS in the *Standard solution* (mg/mL)

C_U nominal concentration of teniposide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES

- Organic Impurities**

Solution A, Solution B, Diluent, and Sample solution: Proceed as directed in the *Assay*.

Mobile phase: See *Table 1*. Return to original conditions and re-equilibrate the system for 10 min. [Note—The duration of initial isocratic hold may be adjusted from 4 min to up to 10 min to meet the resolution requirements and to achieve the retention time of the teniposide peak to about 35 min.]

Benzaldehyde stock solution: 0.15 mg/mL of USP Benzaldehyde RS in *Diluent*

Teniposide related compound A stock solution: 0.15 mg/mL of USP Teniposide Related Compound A RS, prepared as follows. Transfer USP Teniposide Related Compound A RS to a suitable volumetric flask, add acetonitrile equivalent to 20% of the final volume, and sonicate to dissolve. Dilute with *Diluent* to volume.

System suitability solution 1: 15 μg/mL each of USP Teniposide Related Compound A RS and USP Benzaldehyde RS in *Diluent* from *Teniposide related compound A stock solution* and *Benzaldehyde stock solution*

System suitability solution 2: Use the *Standard solution* in the *Assay*. [Note—USP Teniposide RS contains a small amount of *R*-3-thienylidene regioisomer.]

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Proceed as directed in the *Assay*, except for the *Detectors*.

Detectors

UV 242 nm: For thiophenealdehyde

UV 220 nm: For all other impurities

System suitability

Samples: *System suitability solution 1* and *System suitability solution 2*

[Note—The relative retention times for benzaldehyde, teniposide related compound A, *R*-3-thienylidene regioisomer, and teniposide are about 0.42, 0.43, 0.97, and 1.0, respectively.]

Suitability requirements

Resolution 1: NLT 0.9 between benzaldehyde and teniposide related compound A, *System suitability solution 1*

Resolution 2: NLT 1.2 between *R*-3-thienylidene regioisomer and teniposide peaks, *System suitability solution 2*

Analysis

Sample: *Sample solution*

Calculate the percentage of each specified degradation product in the portion of Injection taken:

$$\text{Result} = r_U / \{ \Sigma [r_U \times (1/F)] + r_T \} \times (1/F) \times 100$$

r_U peak area of each specified degradation product from the *Sample solution* at 242 nm for thiophenealdehyde and 220 nm for all other impurities

F = relative response factor for each individual impurity (see *Table 2*)

r_T peak area of teniposide from the *Sample solution* at 220 nm

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Lignan P ^a	0.16	1.0	2.5
Thiophenealdehyde ^b	0.28	1.2	0.5
Teniposide	1.0	—	—
Picroteniposide ^c	1.11	1.0	0.25
Total specified degradation products	—	—	3.0

^a 4'-Demethylepipodophyllotoxin 9- β -d-glucopyranoside.

^b Thiophene-2-carbaldehyde. It is quantitated at 242 nm.

^c (5*R*,5*aS*,8*aR*,9*S*)-9-[4,6-*O*-(*R*)-2-Thienylidene- β -d-glucopyranosyloxy]-5,8,8*a*,9-tetrahydro-5-(4-hydroxy-3,5-dimethoxyphenyl)furo[3',4':6,7]naphtho[2,3-*d*]-1,3-dioxol-6(5*aH*)-one.

SPECIFIC TESTS

- **Bacterial Endotoxins Test** (85): It contains NMT 1.5 USP Endotoxin Units/mg of teniposide.
- **Sterility Tests** (71): Meets the requirements

- **pH** 〈 791 〉
Sample solution: Dilute 5 mL of Injection with 45 mL of water.
Acceptance criteria: 4.0–6.5
- **Particulate Matter in Injections** 〈 788 〉: It meets the requirements for small-volume injections.
- **Other Requirements:** It meets the requirements in *Injections and Implanted Drug Products* 〈 1 〉.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Store under refrigeration and protect from light.
- **Labeling:** Label it to indicate that the Injection is to be diluted with a suitable parenteral vehicle prior to intravenous infusion.
- **USP Reference Standards** 〈 11 〉
 USP Benzaldehyde RS
 USP Endotoxin RS
 USP Teniposide RS
 USP Teniposide Related Compound A RS
 4'-Demethylepipodophyllotoxin.

BRIEFING

Timolol Maleate Tablets, *USP 38* page 5585. As part of USP monograph modernization efforts, it is proposed to make the following changes:

1. Replace the current HPLC procedure in the *Assay* with the stability-indicating HPLC method as used in the proposed revision for the *Timolol Maleate* monograph. The proposed liquid chromatographic procedure is based on analysis performed with the Kinetix XB-C18 brand of L1 column manufactured by Phenomenex in which timolol elutes at about 2.8 min.
2. Replace the TLC method in *Identification* test A with the HPLC retention time agreement from the proposed *Assay*.
3. Add *Identification* test B in which the UV (or UV-Vis) spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the proposed *Assay*.
4. Add an HPLC procedure for *Organic Impurities* consistent with the proposed HPLC procedure in the *Assay*.
5. Add the following Reference Standards, introduced by the proposed HPLC procedure in the *Assay* and *Organic Impurities*, to the *USP Reference Standards* section: USP Timolol Related Compound B RS and USP Timolol Related Compound D RS.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM2: D.A. Porter.)

Timolol Maleate Tablets

DEFINITION

Timolol Maleate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of timolol maleate ($C_{13}H_{24}N_4O_3S \cdot C_4H_4O_4$).

IDENTIFICATION**Delete the following:**

- ● **A. Thin-Layer Chromatography**

Standard solution: ~~6 mg/mL of USP Timolol Maleate RS prepared as follows. Transfer 30 mg of USP Timolol Maleate RS into a 50 mL volumetric flask. Add 2 mL of 0.1 N hydrochloric acid, and shake gently. Add 30 mL of methanol, agitate for 20 min, add methanol to volume, mix, and centrifuge.~~

Sample solution: ~~Nominally 6 mg/mL of timolol maleate prepared as follows. Transfer 30 mg of timolol maleate, from a portion of powdered Tablets, into a 50 mL volumetric flask. Add 2 mL of 0.1 N hydrochloric acid, and shake gently. Add 30 mL of methanol, agitate for 20 min, add methanol to volume, mix, and centrifuge.~~

Chromatographic system

Adsorbent: ~~0.25 mm layer of chromatographic silica gel mixture~~

Application volume: ~~10 μ L~~

Developing solvent system: ~~Chloroform, methanol, and ammonium hydroxide (80:20:1)~~

Analysis

Samples: ~~Standard solution and Sample solution~~

~~Separately apply the Sample solution and the Standard solution to a thin-layer chromatographic plate (see Chromatography <621>). Develop the chromatogram using the Developing solvent system, until the solvent front has moved three-fourths of the length of the plate. Air-dry, and examine under short-wavelength UV light.~~

Acceptance criteria: ~~The R_f values of the principal spots of the Sample solution correspond to those of the Standard solution. ■ 1S (USP39)~~

Add the following:

- ● **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■ 1S (USP39)

Add the following:

- ● **B.** The UV (or UV-Vis) spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■ 1S (USP39)

ASSAY**Change to read:**

- **Procedure**

Solution A: ~~11.04 mg/mL of monobasic sodium phosphate in water. Adjust with phosphoric acid to a pH of 2.8 ± 0.05 .~~

Mobile phase: ~~Methanol and Solution A (2:3), degassed and filtered~~

Standard solution: ~~0.1 mg/mL of USP Timolol Maleate RS prepared as follows. Transfer 50 mg of USP Timolol Maleate RS into a 500-mL volumetric flask. Add 50 mL of *Solution A*. Sonicate until the standard is dissolved, add 100 mL of acetonitrile, shake, and dilute with water to volume.~~

Sample solution: ~~Nominally 0.1 mg/mL of timolol maleate prepared as follows. Transfer 10 mg of timolol maleate, from finely powdered Tablets (NLT 20), to a 100-mL volumetric flask. Add 10 mL of *Solution A*, sonicate for 5 min, and add 20 mL of acetonitrile. Sonicate for 5 min, add 20 mL of water, shake for 10 min, and dilute with water to volume.~~

Chromatographic system

~~(See *Chromatography* (621), *System Suitability*.)~~

Mode: ~~LC~~

Detector: ~~UV 295 nm~~

Column: ~~3.9 mm × 30 cm; packing L1~~

Flow rate: ~~1.8 mL/min~~

Injection size: ~~15 µL~~

System suitability

Sample: ~~Standard solution~~

Suitability requirements

Tailing factor: ~~NMT 2.0, main peak~~

Relative standard deviation: ~~NMT 2.0~~

■ **Solution A:** Transfer 0.5 mL of trifluoroacetic acid to a 1-L volumetric flask and dilute with water to volume.

Solution B: Transfer 0.5 mL of trifluoroacetic acid to a 1-L volumetric flask and dilute with acetonitrile to volume.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.0	84	16
2.4	84	16
8	20	80
8.1	84	16
11	84	16

Buffer: Transfer 11.04 g of monobasic sodium phosphate to a 1-L volumetric flask and dilute with water to volume. Adjust with phosphoric acid to a pH of 2.8 ± 0.05.

Diluent: Methanol and *Buffer* (20:80)

System suitability solution: 0.1 mg/mL of USP Timolol Maleate RS and 10.0 µg/mL of USP Timolol Related Compound D RS in *Diluent* with sonication if necessary

Standard solution: 0.1 mg/mL of USP Timolol Maleate RS in *Diluent* with sonication if necessary

Sample solution: 0.1 mg/mL of timolol maleate from NLT 20 finely ground Tablets (ground with a mortar and pestle) in *Diluent* with sonication if necessary, and filtration with 0.2-µm syringe filters, discarding the first 2 mL

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 295 nm. For *Identification* test B, use a diode array detector in the range of 210–400 nm.

Column: 2.1-mm × 10-cm; 2.6-μm packing L1

Flow rate: 0.4 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times are listed in *Table 2*.]

Suitability requirements

Resolution: NLT 2.5 between timolol and timolol related compound D, *System suitability solution*

Tailing factor: NMT 2.5, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

■ 1S (USP39)

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of timolol maleate ($C_{13}H_{24}N_4O_3S \cdot C_4H_4O_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Timolol Maleate RS in the *Standard solution* (mg/mL)

C_U nominal concentration of timolol maleate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

● **Dissolution** 〈 711 〉

Medium: 0.1 N hydrochloric acid; 500 mL

Apparatus 1: 100 rpm

Time: 20 min

Standard solution: USP Timolol Maleate RS in *Medium*

Sample solution: Sample per the chapter. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.

Analysis: Determine the amount of timolol maleate in solution in filtered portions of the *Sample solution*, in comparison with the *Standard solution*, using the procedure in the *Assay*.

Tolerances: NLT 80% (Q) of the labeled amount of timolol maleate ($C_{13}H_{24}N_4O_3S \cdot C_4H_4O_4$) is dissolved.

● **Uniformity of Dosage Units** 〈 905 〉: Meet the requirements

IMPURITIES**Add the following:****Organic Impurities**

Mobile phase, Buffer, Diluent, and Chromatographic system: Proceed as directed in the Assay.

System suitability solution: 0.1 mg/mL of USP Timolol Maleate RS and 10 µg/mL of USP Timolol Related Compound D RS in *Diluent* with sonication if necessary

Standard solution: 2.0 µg/mL each of USP Timolol Maleate RS, USP Timolol Related Compound B RS, and USP Timolol Related Compound D RS in *Diluent*

Sample solution: 1.0 mg/mL of timolol maleate from NLT 20 finely ground Tablets (ground with a mortar and pestle) in *Diluent* with sonication if necessary, and filtration with 0.2-µm syringe filters, discarding the first 2 mL

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times are listed in *Table 2*.]

Suitability requirements

Resolution: NLT 3 between timolol and timolol related compound D, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of timolol maleate related compound B and timolol maleate related compound D the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of each impurity from the *Sample solution*

r_S peak response of each impurity from the *Standard solution*

C_S concentration of each impurity in the *Standard solution* (mg/mL)

C_U nominal concentration of timolol maleate in the *Sample solution* (mg/mL)

Calculate the percentage of any individual unspecified impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of any impurity from the *Sample solution*

r_S peak response of timolol from the *Standard solution*

C_S concentration of USP Timolol Maleate RS in the *Standard solution*

C_U nominal concentration of timolol maleate in the *Sample solution*

Acceptance criteria: See *Table 2*. Disregard any impurity peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Timolol related compound B	0.5	0.4

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Timolol related compound D	0.8	0.4
Timolol	1.0	—
Any individual impurity	—	0.2
Total impurities	—	1.0

BRIEFING

Triamcinolone Acetonide Nasal Spray. Because there is no existing *USP* monograph for this drug product, a new monograph is being proposed based on validated methods.

1. The procedures for the *Assay* and *Organic Impurities* were validated using the Phenomenex Luna C18(2) brand of L1 column, in which triamcinolone acetonide elutes at about 27 min. A Phenomenex Luna C18 column may also be suitable for these tests.
2. The procedure for *Content of Edetate Disodium* was validated using the Hamilton PRP-1 brand of L21 column manufactured by the Hamilton Company, from which EDTA elutes at about 6 min.
3. The procedure for *Content of Benzalkonium Chloride* was validated using the Kinetex C18 brand of L1 column manufactured by Phenomenex, in which the C₁₀, C₁₂, C₁₄, and C₁₆ homologs of benzalkonium elute at about 1.1, 1.7, 2.3, and 2.7 min, respectively.
4. The procedures for *Delivered Dose Uniformity* were validated using the Ultracarb 5 ODS 30 brand of L1 column, in which triamcinolone acetonide elutes at about 3 min.

(SM4: R. Ravichandran.)

Correspondence Number—C85166

Comment deadline: May 31, 2015

Add the following:**■ Triamcinolone Acetonide Nasal Spray****DEFINITION**

Triamcinolone Acetonide Nasal Spray is an aqueous suspension of Triamcinolone Acetonide. It is supplied in a form suitable for nasal administration. It contains NLT 90.0% and NMT 110.0% of the labeled amount of triamcinolone acetonide ($C_{24}H_{31}FO_6$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **Procedure**

Buffer A: 3.4 g/L of monobasic potassium phosphate prepared as follows. Dissolve 3.4 g of monobasic potassium phosphate in 900 mL of water, adjust with 5 M sodium hydroxide to a pH of 7.0, and dilute with water to 1000 mL.

Buffer B: 3.4 g/L of monobasic potassium phosphate prepared as follows. Dissolve 3.4 g of monobasic potassium phosphate in 900 mL of water, adjust with phosphoric acid to a pH of 3.0, and dilute with water to 1000 mL.

Solution A: Acetonitrile and *Buffer A* (27.5: 72.5)

Solution B: Acetonitrile and *Buffer A* (60:40)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
30	60	40
30.1	0	100
44	0	100
44.1	100	0
52	100	0

Diluent: Acetonitrile and *Buffer B* (27.5: 72.5)

Standard stock solution: 0.4 mg/mL of USP Triamcinolone Acetonide RS in acetonitrile. Sonication for 15 min may be used to affect the complete dissolution.

System suitability stock solution: 0.04 mg/mL of USP Triamcinolone Acetonide Related Compound B RS and USP Triamcinolone Acetonide Related Compound C RS in *Diluent*

System suitability solution: 40 µg/mL of USP Triamcinolone Acetonide RS and 0.8 µg/mL each of USP Triamcinolone Acetonide Related Compound B RS and USP Triamcinolone Acetonide Related Compound C RS in suitable volumes of *Standard stock solution* and *System suitability stock solution* in *Diluent*

Standard solution: 40 µg/mL of USP Triamcinolone Acetonide RS from *Standard stock solution* in *Diluent*

Sample solution: Nominally 40 µg/mL of triamcinolone acetonide prepared as follows. Transfer a portion of the Nasal Spray, equivalent to 4 mg of triamcinolone acetonide, to a

100-mL volumetric flask. Dissolve in 28 mL of acetonitrile with the aid of sonication. Allow to cool to room temperature and dilute with *Buffer B* to volume. Centrifuge and use the clear supernatant.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 239 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Column temperature: 40°

Flow rate: 0.75 mL/min

Injection volume: 100 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—See *Table 4* for the relative retention times.]

Suitability requirements

Resolution: NLT 3.0 between triamcinolone acetonide related compound C and triamcinolone acetonide related compound B; NLT 3.0 between triamcinolone acetonide related compound B and triamcinolone acetonide, *System suitability solution*

Tailing factor: NMT 1.3 for triamcinolone acetonide, *System suitability solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of triamcinolone acetonide (C₂₄H₃₁FO₆) in the portion of Nasal Spray taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Triamcinolone Acetonide RS in the *Standard solution* (μg/mL)

C_U nominal concentration of triamcinolone acetonide in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–110.0 %

OTHER COMPONENTS

• Content of Edetate Disodium

Perform this test if edetate disodium is a known component in the Nasal Spray.

Buffer: Add 990 mL of water into a 1000-mL beaker, followed by 10.0 mL of 1.0 M tetrabutylammonium hydroxide in methanol. Adjust with phosphoric acid to a pH of 7.0.

Mobile phase: Acetonitrile and *Buffer* (15:85)

Solution A: 40 g/L of sodium chloride and 2 g/L of sodium acetate. Adjust with glacial acetic acid to a pH of 5.5.

Solution B: 1.0 g/L of cupric sulfate in water

Diluent: Acetonitrile and water (50:50)

Standard stock solution: 0.5 mg/mL of edetate disodium in water. Sonication may be used to aid dissolution.

Standard solution: 0.05 mg/mL of edetate disodium. Transfer 5.0 mL of *Standard stock*

solution to a 50-mL volumetric flask. Next add 10 mL of *Solution A* and then add 5.0 mL of acetonitrile. Mix the resulting solution and then add 20.0 mL of *Solution B*, dilute with *Diluent* to volume, and mix.

Sample solution: Combine the contents of NLT 5 bottles of Nasal Spray and mix the contents to obtain a composite suspension. Transfer a 5.0-g portion of the Nasal Spray to a 50-mL volumetric flask. Add 10 mL of *Solution A* and 5.0 mL of acetonitrile. Mix and sonicate for 10 min and allow the solution to equilibrate to room temperature. Add 20.0 mL of *Solution B*, and sonicate for 10 min. Allow the sample to equilibrate to room temperature and dilute with *Diluent* to volume. Centrifuge a portion for 15 min, and use the supernatant. [Note—Centrifuging at 4000 rpm for 15 min may be suitable.]

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.1-mm × 15-cm; 5-μm packing L21

Flow rate: 1 mL/min

Injection volume: 25 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of edetate disodium ($C_{10}H_{14}N_2Na_2O_8$) in the portion of Nasal Spray taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of edetate disodium in the *Standard solution* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Nasal Spray in the *Sample solution* (mg)

Acceptance criteria: 0.045%–0.055%

● Content of Benzalkonium Chloride

Perform this test if benzalkonium chloride is a known component in the Nasal Spray.

Buffer: Dissolve 10.8 g of monobasic sodium phosphate dihydrate in 90 mL of water, and adjust with phosphoric acid a pH of 2.5. Dilute with water to 100 mL.

Solution A: Mix 50 mL of *Buffer*, 750 mL of water, and 200 mL of methanol. Add 5 mL of triethylamine. Mix and adjust with phosphoric acid to a pH of 2.5.

Solution B: Methanol and phosphoric acid prepared as follows. Mix 1 L of methanol with 50 mL of phosphoric acid.

Mobile phase: See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	55	45
3.0	5	95
3.2	55	45
5.0	55	45

Diluent: 1% (v/v) hydrochloric acid in methanol

System suitability solution: 0.4 mg/mL of USP Benzalkonium Chloride RS prepared as follows. Transfer the required quantity of USP Benzalkonium Chloride RS to a suitable volumetric flask, and add 30% of the flask volume of water. Dilute with *Diluent* to volume.

Standard stock solution: 0.2 mg/mL of USP Benzalkonium Bromide RS in water. [Note—A few drops of methanol may be used to resolve the formation of foam prior to dilution.]

Standard solution: 0.04 mg/mL of USP Benzalkonium Bromide RS. Transfer an aliquot of *Standard stock solution* to a suitable volumetric flask, and add water equal to 30% of the flask volume. Dilute with *Diluent* to volume.

Sample solution: Combine the contents of NLT 5 bottles of Nasal Spray and mix the contents to obtain a composite suspension. Transfer a 5.0-g portion of the Nasal Spray to a 10-mL volumetric flask. Dilute with *Diluent* to volume. Centrifuge and use the supernatant. [Note—Centrifuging at 4000 rpm for 15 min may be suitable. Supernatant may be passed through a suitable filter with a pore size of NMT 0.2 μm .]

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm \times 3.0-cm; 2.6- μm packing L1

Column temperature: 50 $^{\circ}$

Flow rate: 2 mL/min

Injection volume: 100 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—See *Table 3* for the relative retention times.]

Suitability requirements

Resolution: NLT 2.5 between the pairs of C12 and C14 homologs and C14 and C16 homologs of benzalkonium, *System suitability solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 2%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the sum of each corrected benzalkonium peak response (r_U) as follows:

$$\text{Result} = \sum(r_U) \times (1/F)$$

$r_{\bar{r}}$ peak response of each benzalkonium homolog

F relative response factor of the corresponding benzalkonium homolog relative to benzalkonium bromide (see *Table 3*)

Table 3

Benzalkonium Chloride Analog	Relative Retention Time	Relative Response Factor
C10	0.65	1.3
C12	1.0	1.2
C14	1.35	1.0
C16	1.59	0.98

Calculate the percentage of benzalkonium chloride in the portion of Nasal Spray taken:

$$\text{Result} = (\Sigma r_U / r_S) \times C_S \times (V/W) \times 100$$

Σr_U = sum of the corrected peak responses for benzalkonium homologs from the *Sample solution*

r_S = response for benzalkonium from the *Standard solution*

C_S = concentration of USP Benzalkonium Bromide RS in the *Standard solution* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Nasal Spray in the *Sample solution* (mg)

Acceptance criteria: 0.0135%–0.0165%

PERFORMANCE TESTS

• Delivered Dose Uniformity (Between Containers)

Buffer: 7.0 g/L of sodium perchlorate prepared as follows. Dissolve 7.0 g of sodium perchlorate in 900 mL of water, adjust with perchloric acid to a pH of 3.0, and dilute with water to 1000 mL.

Mobile phase: Acetonitrile and *Buffer* (50:50)

Standard solution: 40 µg/mL of USP Triamcinolone Acetonide RS in *Mobile phase*

Sample solution: Nominally 40 µg/mL of triamcinolone acetonide, prepared as follows.

Transfer a portion of Nasal Spray equivalent to 4.0 mg of triamcinolone acetonide to a suitable volumetric flask. Add 80% of the flask volume of *Mobile phase* to the flask.

Sonicate for 15 min. Allow to equilibrate to room temperature. Dilute with *Mobile phase* to volume. Centrifuge and pass the supernatant through a filter of 0.45-µm pore size. [Note—Centrifuging at 4000 rpm for 45 min may be suitable.]

Repeat this procedure with 9 additional units.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 239 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 40 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2

Relative standard deviation: NMT 2%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of triamcinolone acetonide ($C_{24}H_{31}FO_6$) in the portion of Nasal Spray taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Triamcinolone Acetonide RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U nominal concentration of triamcinolone acetonide in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria

Tier 1: The content of each of the 10 units is within 90.0%–110.0% of the labeled amount of triamcinolone acetonide ($C_{24}H_{31}FO_6$).

If the criterion in *Tier 1* cannot be met, proceed to *Tier 2*.

Tier 2: If the content of 1 unit is outside 90.0%–110.0% of the labeled amount of triamcinolone acetonide ($C_{24}H_{31}FO_6$) and the content of none of the units is outside 85.0%–115.0% of the labeled amount of triamcinolone acetonide ($C_{24}H_{31}FO_6$), test an additional 20 units. All the 30 results (including the results from *Tier 1*) meet the following acceptance criteria.

1.The content of each of 29 of 30 units is within 90.0%–110.0% of the labeled amount of triamcinolone acetonide ($C_{24}H_{31}FO_6$).

2.The content of each of the 30 units is within 85.0%–115.0% of the labeled amount of triamcinolone acetonide ($C_{24}H_{31}FO_6$).

- Delivered Dose Uniformity (Within Container)**

Buffer: 7.0 g/L of sodium perchlorate prepared as follows. Dissolve 7.0 g of sodium perchlorate in 900 mL of water, adjust with perchloric acid to a pH of 3.0, and dilute with water to 1000 mL.

Mobile phase: Acetonitrile and *Buffer* (60:40)

Standard solution: 4.8 $\mu\text{g/mL}$ of USP Triamcinolone Acetonide RS in *Mobile phase*

Beginning sample solution (BOU): Hold the pump upright, actuate five times, and wipe the nosepiece dry. Hold a 25-mL volumetric flask in an inverted position and actuate the pump. Quickly turn the flask upright, wait 10 s, and repeat the process. Add 15 mL of *Mobile phase* while rinsing the neck of the flask and sonicate for 15 min. Allow the flask to equilibrate to room temperature, and dilute with *Mobile phase* to volume. Centrifuge and use the clear supernatant. [Note—Centrifuging at 4000 rpm for 15 min may be suitable.]

Middle sample solution (MOU): Using the same pump as above, discharge an appropriate number of actuations to arrive at 50% of the labeled number of actuations to waste and wipe the nosepiece dry. Hold a 25-mL volumetric flask in an inverted position and actuate the pump to collect the next actuation. Quickly turn the flask upright, wait 10 s, and repeat the process to collect the next actuation. Add 15 mL of *Mobile phase* while rinsing the neck of the flask and sonicate for 15 min. Allow the flask to equilibrate to room temperature, and dilute with *Mobile phase* to volume. Centrifuge and use the clear supernatant. This is the MOU sample. [Note—Centrifuging at 4000 rpm for 15 min may be suitable.]

End sample solution (EOU): Using the same pump as above, discharge the next

appropriate number of actuations to arrive at 100% of the labeled number of actuations to waste, and wipe the nosepiece dry. Hold a 25-mL volumetric flask in an inverted position and actuate the pump to collect the next actuation. Quickly turn the flask upright, wait 10 s, and repeat the process to collect the next actuation. Add 15 mL of *Mobile phase* while rinsing the neck of the flask and sonicate for 15 min. Allow the flask to equilibrate to room temperature, and dilute with *Mobile phase* to volume. Centrifuge and use the clear supernatant. This is the EOU sample. [Note—Centrifuging at 4000 rpm for 15 min may be suitable.]

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 239 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 200 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution, Beginning sample solution, Middle sample solution, and End sample solution*

Calculate the percentage of the labeled amount of the triamcinolone acetonide ($C_{24}H_{31}FO_6$) delivered dose:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U response from the appropriate *Sample solution*

r_S response from the *Standard solution*

C_S concentration of USP Triamcinolone Acetonide RS in the *Standard solution* (μg/mL)

C_U nominal concentration of triamcinolone acetonide in the *Sample solution* (μg/mL)

Acceptance criteria

Calculate the mean dose delivered from the BOU results from all 10 containers.

Calculate the mean dose delivered from the MOU results from all 10 containers.

Calculate the mean dose delivered from the EOU results from all 10 containers.

Calculate mean dose delivered from the BOU, MOU, and EOU results from each of the 10 containers.

Tier 1

1. Mean delivered dose of BOU samples from all 10 units is within 85.0%–115.0% of the labeled amount of triamcinolone acetonide ($C_{24}H_{31}FO_6$).
2. Mean delivered dose of MOU samples from all 10 units is within 85.0%–115.0% of the labeled amount of triamcinolone acetonide ($C_{24}H_{31}FO_6$).
3. Mean delivered dose of EOU samples from all 10 units is within 85.0%–115.0% of

the labeled amount of triamcinolone acetonide (C₂₄H₃₁FO₆).

4.NMT 1 of 10 mean delivered doses is outside 80.0%–120.0% of the labeled amount of triamcinolone acetonide (C₂₄H₃₁FO₆).

5.None of the 10 mean delivered doses is outside 75.0%–125.0% of the labeled amount of triamcinolone acetonide (C₂₄H₃₁FO₆).

If the criterion in *Tier 1* cannot be met, proceed to *Tier 2*.

Tier 2: If NMT 3 of 10 mean of BOU, MOU, and EOU delivered doses for each unit are outside 80.0%–120.0% of the labeled amount of triamcinolone acetonide (C₂₄H₃₁FO₆) and none of the mean delivered doses is outside 75.0%–125.0% of the labeled amount of triamcinolone acetonide (C₂₄H₃₁FO₆), test an additional 20 units. All 30 results (including the results from *Tier 1*) meet the following acceptance criteria.

1.NMT 3 of 30 mean delivered doses are outside 80.0%–120.0% of the labeled amount of triamcinolone acetonide (C₂₄H₃₁FO₆).

2.None of the 30 mean delivered doses is outside 75.0%–125.0% of the labeled amount of triamcinolone acetonide (C₂₄H₃₁FO₆).

IMPURITIES

BRIEFING

Valproic Acid Capsules, USP 38 page 5737. In an effort to modernize the monograph, it is proposed to revise the monograph as follows:

1. Replace the non-specific visual colorimetric test in *Identification* test B with a spectral match based on the diode array spectra of the major peaks in the *Assay*.
2. Replace the existing packed column gas chromatographic procedure within the *Dissolution* section with a liquid chromatographic procedure that is similar to the *Assay*. The proposed procedure is based on analyses performed with a Zorbax Eclipse XDB-C8 column in which valproic acid elutes at about 6 min.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

(SM4: R. Ravichandran.)

Valproic Acid Capsules**DEFINITION**

Valproic Acid Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of valproic acid (C₈H₁₆O₂).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

Change to read:

- **B.**

Sample: Equivalent to 250 mg of valproic acid

Analysis: Place the *Sample* in a separator, add 20 mL of 1 N sodium hydroxide, shake, and allow the layers to separate. Transfer the aqueous layer to a second separator, add 4 mL of hydrochloric acid, mix, and extract with 40 mL of *n*-heptane. Filter the *n*-heptane layer through glass wool into a beaker, and evaporate the solvent completely on a steam bath with the aid of a current of air. Transfer 2 drops of the residue to a test tube containing 0.5 mL each of potassium iodide solution (1 in 50) and potassium iodate solution (1 in 25), and mix.

Acceptance criteria: A yellow color is produced.

- The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■ 1S (USP39)

ASSAY

Change to read:● **Procedure**

Buffer: 3.5 g/L of monobasic sodium phosphate in water. Adjust with phosphoric acid to a pH of 3.5.

Mobile phase: Acetonitrile and *Buffer* (45:55)

Diluent: Acetonitrile and water (45:55)

System suitability solution: 0.5 mg/mL of USP Valproic Acid RS and 50 µg/mL of USP Valproic Acid Related Compound B RS in *Diluent*

Standard solution: 0.5 mg/mL of USP Valproic Acid RS in *Diluent*

Sample solution: Nominally 0.5 mg/mL of valproic acid from the contents of the Capsules in *Diluent*, prepared as follows. Transfer a suitable portion of the contents of NLT 20 Capsules to an appropriate volumetric flask, and dilute with *Diluent* to volume. Sonicate the resulting solution for 5 min. Alternatively, stir the resulting solution for 1 h. Centrifuge a portion of the solution for about 10 min.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 215 nm.

BRIEFING

Warfarin Sodium, *USP 38* page 5801 and *PF 39(2)* [Mar.–Apr. 2013]. On the basis of comments received, the previously published proposal for the test for *Organic Impurities*, which appeared in *PF 39(2)* [Mar.–Apr. 2013], is canceled and replaced with the following revised proposal:

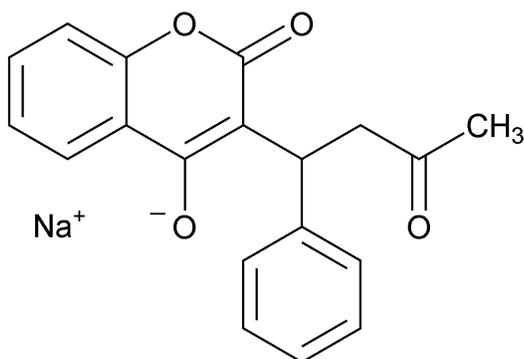

1. The flame test for *Identification test C* is replaced with *Sodium Identification test B* in *2.3.1 Identification Reactions of Ions and Functional Groups* in the *European Pharmacopoeia*. This test is also used in the *European Pharmacopoeia* monograph *Warfarin Sodium* for sodium identification.
2. The specified impurities and limits are proposed based on the FDA-approved specification.
3. The *Column temperature* and *Run time* are added for clarification.
4. The *System suitability solution* is added and the *Suitability requirements* are revised to assure that Alice's ketone is adequately resolved from warfarin at the *Sample solution* concentration.
5. A filtration step is added in the *Sample* preparation in the *Absorbance in Alkaline Solution*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Warfarin Sodium

C₁₉H₁₅NaO₄ 330.31

2*H*-1-Benzopyran-2-one, 4-hydroxy-3-(3-oxo-1-phenylbutyl)-, sodium salt;

3-(~~α~~-Acetonylbenzyl)-4-hydroxycoumarin sodium salt [129-06-6].

DEFINITION

Warfarin Sodium is an amorphous solid or a crystalline clathrate. The crystalline form consists principally of warfarin sodium and isopropyl alcohol in a 2:1 molecular ratio. It contains NLT 8.0% and NMT 8.5% of isopropyl alcohol. Warfarin Sodium contains NLT 97.0% and NMT 102.0% of warfarin sodium ($C_{19}H_{15}NaO_4$), calculated on the anhydrous basis for the amorphous form or on the anhydrous and isopropyl alcohol-free basis for the crystalline form.

IDENTIFICATION

Change to read:

- **A. Infrared Absorption** ~~(197K)~~

Sample: Dissolve 100 mg in 25 mL of water, and adjust with hydrochloric acid to a pH of less than 3, using short-range pH indicator paper. Stir the mixture, and allow the precipitate to coagulate. Filter the mixture, ~~and retain the filtrate for Identification test C.~~
Wash

■ wash ■_{1S} (USP39)

the precipitate with four, 5-mL portions of water, and dry under vacuum over phosphorus pentoxide for 4 h. Use the warfarin obtained.

Standard: Use USP Warfarin RS.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

Delete the following:

- **C. Identification Tests—General, Sodium** ~~(191)~~

Sample: The filtrate obtained in *Identification test A*

Acceptance criteria: Meets the requirements of the flame test ■_{1S} (USP39)

Add the following:

- **C.**

Methoxyphenylacetic reagent: Dissolve 2.7 g of methoxyphenylacetic acid in 6 mL of 10% tetramethylammonium hydroxide aqueous solution, and add 20 mL of absolute alcohol.

Diluted ammonia: Dilute 41 g of ammonium hydroxide with water to 100 mL.

Ammonium carbonate solution: 158 mg/mL of ammonium carbonate in water

Sample solution: Dissolve 30 mg of warfarin sodium in 0.5 mL of water.

Analysis: Add 1.5 mL of *Methoxyphenylacetic reagent* in the *Sample solution*, and cool in ice water for 30 min.

Acceptance criteria: A voluminous, white, crystalline precipitate is formed. Place in water at 20° and stir for 5 min. The precipitate does not disappear. Add 1 mL of *Diluted ammonia*. The precipitate dissolves completely. Add 1 mL of *Ammonium carbonate solution*. No precipitate is formed. ■_{1S} (USP39)

ASSAY● **Procedure**

Buffer: Transfer 1.36 g of monobasic potassium phosphate to a 200-mL volumetric flask, and dissolve in 50 mL of water. Add 39.1 mL of 0.2 N sodium hydroxide, and dilute with water to volume. Adjust with sodium hydroxide or phosphoric acid to a pH of 7.4 ± 0.1 .

Mobile phase: Methanol, glacial acetic acid, and water (64:1:36)

Standard stock solution: 0.376 mg/mL of USP Warfarin RS prepared as follows. Transfer USP Warfarin RS to a suitable volumetric flask, and dissolve in 0.1 N sodium hydroxide equivalent to 39% of the final volume. Add 0.2 M monobasic potassium phosphate, equivalent to 25% of the final volume, and dilute with water to volume.

Standard solution: Transfer 5 mL of *Standard stock solution* and 15 mL of *Buffer* into a conical flask, and mix.

Sample stock solution: 0.4 mg/mL of Warfarin Sodium prepared as follows. Transfer 100 mg of Warfarin Sodium, accurately weighed, to a 250-mL volumetric flask, and dissolve in 97.8 mL of 0.1 N sodium hydroxide. Add 62.5 mL of 0.2 M monobasic potassium phosphate, and dilute with water to volume.

Sample solution: Transfer 5 mL of *Sample stock solution* and 15 mL of *Buffer* into a conical flask, and mix.

BRIEFING

meso-Zeaxanthin Preparation, USP 38 page 6481. On the basis of comments received, it is proposed to modify the *Stereoisomeric Composition* test to improve the resolution of three zeaxanthin isomers: (3*S*,3'*S*)-zeaxanthin, (3*R*,3'*S*-*meso*)-zeaxanthin, and (3*R*,3'*R*)-zeaxanthin.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(DS: H. Dinh.)

Comment deadline: May 31, 2015

meso-Zeaxanthin Preparation

DEFINITION

meso-Zeaxanthin Preparation is a combination of *meso*-Zeaxanthin with one or more inert substances. It may be in a solid or a liquid form. It contains NLT 95.0% and NMT 130.0% of the labeled amount of total carotenoids, calculated as zeaxanthin ($C_{40}H_{56}O_2$) on the anhydrous basis. It contains NLT 85.0% of zeaxanthin and NMT 9.0% of lutein of the total carotenoid content.

IDENTIFICATION● **A.**

Sample solution: Prepare as directed for *Sample solution A* or *Sample solution B* in the test for *Content of Total Carotenoids*.

Analysis: Record the UV-Vis spectrum from 300 to 600 nm.

Acceptance criteria: The *Sample solution* shows a shoulder at about 427 nm, an absorption maximum at about 453 nm, and another maximum at about 480 nm.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Content of Zeaxanthin*.
- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of (3*R*,3'*S*)-*meso*-zeaxanthin from the *Standard solution*, as obtained in the test for *Stereoisomeric Composition*.

COMPOSITION**Change to read:**● **Content of Total Carotenoids**

Sample stock solution A (for solid Preparations): Transfer an amount of Preparation equivalent to 7.5 mg of zeaxanthin to a 100-mL low-actinic volumetric flask, add 5 mL of water, and sonicate at 60° for 5 min. Add 50 mL of alcohol, and dilute with methylene chloride to volume. Shake thoroughly to obtain a fine dispersion, transfer 10 mL of this dispersion to a centrifuge tube, and centrifuge. Discard the foremost 2 mL of the supernatant. Use the clear solution.

Sample solution A: Transfer 1.0 mL of *Sample stock solution A* to a 50-mL low-actinic flask, and dilute with a mixture of cyclohexane and alcohol (9:1) to volume.

Sample stock solution B (for liquid *meso*-zeaxanthin suspensions in oil Preparations): ■ 1S (USP39)

Transfer an amount of Preparation equivalent to 7.5 mg of *meso*-zeaxanthin to a 100-mL low-actinic volumetric flask, add 20 mL of chloroform, and sonicate for 5 min. Cool the solution to room temperature, and dilute with cyclohexane to volume. Shake thoroughly to obtain a fine dispersion, transfer 10 mL of this dispersion to a centrifuge tube, and centrifuge.

Sample solution B: Transfer 1.0 mL of *Sample stock solution B* to a 50-mL low-actinic flask, and dilute with cyclohexane to volume.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* { 851 } .)

BRIEFING

Zinc Sulfate Compounded Injection. Because of a need for a zinc sulfate compounded injection in the event of manufactured product unavailability or drug shortage, a new

compounded preparation monograph is proposed based on a validated method used to assess stability. The liquid chromatographic procedure in the *Assay* is based on analyses validated using the Metrosep C4-250 brand of L76 column. The typical retention time for zinc sulfate is about 7.0 min.

Please submit comments to CompoundingSL@usp.org.

(CMP: J. Sun.)

Correspondence Number—C154508

Comment deadline: May 31, 2015

Add the following:

■ Zinc Sulfate Compounded Injection

DEFINITION

Zinc Sulfate Compounded Injection contains NLT 90.0% and NMT 110.0% of the labeled content of zinc (Zn). Prepare Zinc Sulfate Compounded Injection containing 1 mg/mL or 5 mg/mL of zinc as follows (see *Pharmaceutical Compounding—Sterile Preparations* 〈 797 〉).

For 1-mg/mL Zinc Sulfate Compounded Injection

Zinc (as Zinc Sulfate Heptahydrate)	100 mg (440 mg)
Sulfuric Acid or Sodium Hydroxide	To adjust pH to 2.0–4.0
Sterile Water for Injection, a sufficient quantity to make	100 mL

For 5-mg/mL Zinc Sulfate Compounded Injection

Zinc (as Zinc Sulfate Heptahydrate)	500 mg (2199 mg)
Sulfuric Acid or Sodium Hydroxide	To adjust pH to 2.0–4.0
Sterile Water for Injection, a sufficient quantity to make	100 mL

Dissolve the *Zinc Sulfate Heptahydrate* in 95 mL of *Sterile Water for Injection*. Adjust with *Sulfuric Acid or Sodium Hydroxide* to a pH between 2.0 and 4.0. Add sufficient *Sterile Water for Injection* to bring to final volume, and mix well. Pass through a compatible filter of 1.2- μ m pore size to remove particulate matter and sterilize by autoclave.

ASSAY

• Procedure

Mobile phase: 3 mM nitric acid

Standard stock solution: 1 mg/mL of zinc prepared from USP Zinc Sulfate RS in water

Standard solution: 0.01 mg/mL of zinc prepared from *Standard stock solution* and water

Sample solution: For a 1-mg/mL Injection, transfer 1.0 mL of the compounded preparation to a 100-mL volumetric flask, dilute with water to volume, and mix well. For a 5-mg/mL Injection, transfer 0.2 mL of the compounded preparation to a 100-mL volumetric flask, dilute with water to volume, and mix well.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

BRIEFING

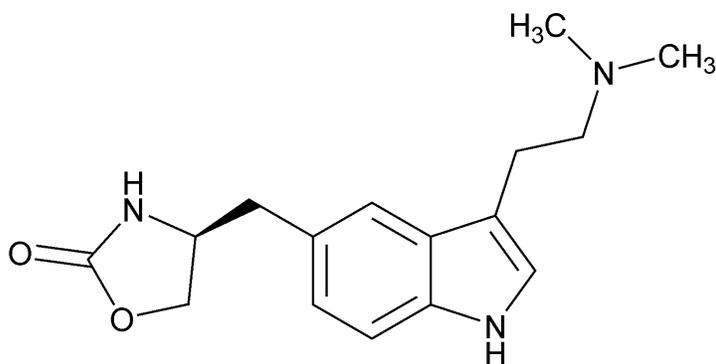

Zolmitriptan. Because there is no *USP* monograph for this drug substance, a new monograph based on validated methods of analysis is proposed.

1. The liquid chromatographic procedures in the *Assay* and the test for *Organic Impurities* are based on analyses performed with the Spherisorb ODS2 brand of L1 column manufactured by Waters Corporation. The typical retention time for zolmitriptan is about 5 min in both of the tests.
2. The test for *Limit of Zolmitriptan R-isomer and Other Impurities* is based on a validated capillary electrophoresis procedure with UV detection performed with a fused silica capillary column and a run buffer containing cyclodextrin. The migration time for zolmitriptan is about 31 min.
3. The gas chromatographic procedure in the *Limit of Zolmitriptan Related Compound H* test is based on analyses performed with the CP-Sil 5 CB brand of G1 column manufactured by Varian-Chrompack. The typical retention time for zolmitriptan related compound H is about 6 min.

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of zolmitriptan related compound H in the portion of Zolmitriptan taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of zolmitriptan related compound H from the *Sample solution*

r_S peak response of zolmitriptan related compound H from the *Standard solution*

C_S concentration of USP Zolmitriptan Related Compound H RS in the *Standard solution* (mg/mL)

C_U concentration of Zolmitriptan in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.1% of zolmitriptan related compound H

- **Limit of Zolmitriptan R-isomer and Other Impurities**

Buffer: 19.1 g/L of sodium borate decahydrate in water. Adjust with phosphoric acid to a pH of 2.2.

Run buffer: 50 mg/mL of hydroxypropylcyclodextrin in *Buffer*

Diluent: 0.02 M hydrochloric acid

Internal standard solution: 0.2 mg/mL of tryptamine hydrochloride in *Diluent*

System suitability solution: 0.01 mg/mL of tryptamine hydrochloride from the *Internal standard solution*, 1 mg/mL of USP Zolmitriptan RS, and 0.01 mg/mL each of USP Zolmitriptan Related Compound F RS, USP Zolmitriptan Related Compound G RS, and USP Zolmitriptan R-isomer RS, in *Diluent*

Standard solution: 0.01 mg/mL of tryptamine hydrochloride from *Internal standard solution* and 0.001 mg/mL of USP Zolmitriptan RS in *Diluent*

Sample solution: 0.01 mg/mL of tryptamine hydrochloride from *Internal standard solution* and 1 mg/mL of Zolmitriptan in *Diluent*. Filter the solution and protect from light.

Electrophoretic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: CE

Detector: UV 200 nm

Column: 75- μ m \times 0.5-cm uncoated fused-silica

Applied voltage: 15 kV

Run time: 1.5 times the migration time of zolmitriptan

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—See *Table 1* for relative migration times.]

Suitability requirements

Resolution: NLT 1.5 between zolmitriptan and zolmitriptan R-isomer peaks, *System suitability solution*

Relative standard deviation: NMT 5% for the peak response ratio of zolmitriptan and tryptamine peaks, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the corrected peak responses:

$$\text{Result} = (r/m)$$

r = peak response

m = migration time of the peak (min)

Calculate the percentage of each impurity in the portion of Zolmitriptan taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times (1/F) \times 100$$

R_U = corrected peak response ratio of the impurity to the internal standard from the *Sample solution*

R_S = corrected peak response ratio of zolmitriptan to the internal standard from the *Standard solution*

C_S = concentration of USP Zolmitriptan RS in the *Standard solution* (mg/mL)

C_U = concentration of Zolmitriptan in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*. Disregard peak due to zolmitriptan related compound E. Disregard peaks less than 0.10% of the area of the principal peak from the *Sample solution*.

Table 1

Name	Relative Migration Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Zolmitriptan related compound F	0.68	0.39	1.2
Zolmitriptan related compound G	0.71	0.63	0.1
Tryptamine	0.78	1.0	—
Zolmitriptan	1.0	—	—
Zolmitriptan R-isomer	1.07	1.0	0.2
Any individual unspecified impurity	—	1.0	0.1

• Organic Impurities

Mobile phase: Acetonitrile, water, trifluoroacetic acid, and triethylamine (135: 865: 1: 0.25)

■ 1S (USP39)

BRIEFING

Zolmitriptan Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph based on validated methods of analysis is proposed.

1. The liquid chromatographic procedures in the *Assay* and the *Dissolution* test are based on analyses performed with the Unisphere C18 brand of L1 column manufactured by Unichrome Associates. The typical retention time for zolmitriptan is about 3 min.
2. The liquid chromatographic procedure proposed in the test for *Organic Impurities* is based on analyses performed with the YMC Pack ODS-A brand of L1 column manufactured by YMC Corporation in which the typical retention time for zolmitriptan

is about 20 min.

(SM4: R. Ravichandran.)

Correspondence Number—C142336

Comment deadline: May 31, 2015

Add the following:

■ **Zolmitriptan Tablets**

DEFINITION

Zolmitriptan Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of zolmitriptan ($C_{16}H_{21}N_3O_2$).

IDENTIFICATION

- **A.** The UV spectrum of the zolmitriptan peak in the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

● **Procedure**

Buffer: Dissolve 2 mL of triethylamine in 1 L of water. Adjust with phosphoric acid to a pH of 3.0.

Mobile phase: Acetonitrile and *Buffer* (15:85)

Standard stock solution: 0.25 mg/mL of USP Zolmitriptan RS in methanol. Sonicate if necessary to aid dissolution.

Standard solution: 0.025 mg/mL of USP Zolmitriptan RS in *Mobile phase* from *Standard stock solution*

Sample stock solution: Nominally 0.25 mg/mL of zolmitriptan from Tablets in methanol prepared as follows. Transfer NLT 5 Tablets to a suitable volumetric flask. Add 70% of the flask volume of methanol. Sonicate for 30 min. Cool to room temperature, and dilute with methanol to volume.

Sample solution: Nominally 0.025 mg/mL of zolmitriptan in *Mobile phase* from *Sample stock solution* passed through a suitable membrane filter of 0.45- μ m pore size

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 225 nm; for *Identification* test A, a diode-array detector can be used in the wavelength range of 200–300 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Temperature: 30 $^{\circ}$

Flow rate: 1 mL/min

Injection volume: 20 μ L

Run time: NLT 2.5 times the retention time of zolmitriptan

System suitability

Sample: *Standard solution*

Suitability requirements**Tailing factor:** NMT 2.0**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Stage 4 Harmonization

This section contains monographs or chapters undergoing harmonization by the Pharmacopoeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization consists of several steps (**Stages 1** through **7**, as defined below). Stage 4 drafts are available for comments. Below are descriptions of the developmental Stages as defined by the United States Pharmacopeia, the European Pharmacopoeia, and the Japanese Pharmacopoeia.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

BRIEFING

Propylene Glycol, *USP 38* page 5065. The *European Pharmacopoeia (EP)* is the coordinating pharmacopeia (CP) for the international harmonization of the compendial standards for the *Propylene Glycol* monograph, as part of the process of international harmonization of monographs and general analytical methods of the *European, Japanese, and U.S. Pharmacopeias*. The following monograph, which is the **OFFICIAL INQUIRY STAGE 4, REVISION 1** document, is based on the **OFFICIAL INQUIRY STAGE 4** draft published in *PF 33(2)* [Mar.–Apr. 2007] as well as comments from all pharmacopeias. Changes from the current *Propylene Glycol* monograph include the following:

1. *Definition*. Increased the limit to NLT 99.7% of propylene glycol (C₃H₈O₂) according to Stage 4 PDG global text.
2. *Identification test B*. No changes. *Limit of Diethylene Glycol and Ethylene Glycol* remains as an identification test in the *USP–NF* monograph upon FDA's request. It is an impurity test in the Stage 4 PDG global text.
3. *Assay*. A new *Assay* using a capillary GC column replaced the previous method using a packed GC column. A suitable column is the Agilent Technologies HP-5, 0.32-mm × 30-m, 0.5-μm, G27 column. The retention time for propylene glycol is about 2 min.
4. *Heavy Metals*. Delete the test according to *General Notices and Requirements 5.60.30* in *USP 38*. For further details, see *Elemental Impurities* on the Key Issues page on the USP website.
5. *Color and Clarity of Solution*. New test was added to detect the color and the clarity of the sample.
6. *Oxidizing Substances*. New test was added by titration with sodium thiosulfate.
7. *Aldehydes*. New test was added by detection at 655 nm after reaction with methylbenzothiazolone hydrazone hydrochloride and ferric chloride. The proposed limit is 20 ppm, expressed as formaldehyde (HCHO).
8. *Acidity*. Modified the procedure and acceptance criteria based on Stage 4 PDG global text.
9. *Water Determination*. Added sample amount of 5.00 g.
10. *Identification test A and Packaging and Storage*. No changes.
11. *Identification test C, Residue on Ignition, Chloride and Sulfate, and Specific Gravity*. No changes from existing *USP–NF* text. These attributes are not part of the Stage 4 PDG global text. Future decision on inclusion as nonharmonized attributes or local requirements will be made at Stage 6.

[Note—USP maintains a separate section of *Description and Solubility*, where the “description” and “solubility” statements pertaining to an article are general in nature. The properties are not in themselves standards or tests for purity even though they may indirectly assist in the preliminary evaluation of the integrity of an article. *EP* as CP has proposed the following as “Characters” to be included as part of the Stage 4: “Appearance: viscous, clear, colorless, hygroscopic liquid; Solubility: miscible with water and with ethanol (96%).” USP will maintain *Description and Solubility/Characters* as a nonharmonized attribute.]

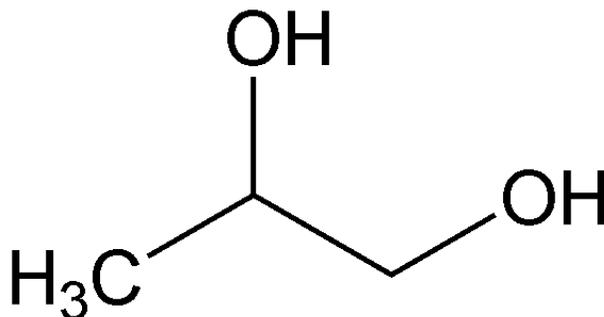

Additionally, minor editorial changes have been made to update the monograph to current USP style.

Comment deadline: May 31, 2015

Propylene Glycol

$C_3H_8O_2$ 76.09

1,2-Propanediol;
Propane-1,2-diol [57-55-6].

DEFINITION

Change to read:

Propylene Glycol contains NLT ~~99.5%~~
99.7%

of propylene glycol ($C_3H_8O_2$).

IDENTIFICATION

[Note—Compliance is determined by meeting the requirements of *Identification* tests *A*, *B*, and *C*.]

- **A. Infrared Absorption** 〈 197F 〉

[Note—Undried specimen.]

- **B. Limit of Diethylene Glycol and Ethylene Glycol**

Diluent: Methanol

Standard solution: 2.0 mg/mL of USP Propylene Glycol RS, 0.050 mg/mL of USP Ethylene Glycol RS, 0.050 mg/mL of USP Diethylene Glycol RS, and 0.10 mg/mL of 2,2,2-trichloroethanol (internal standard) in methanol

Sample solution: 50 mg/mL of Propylene Glycol and 0.10 mg/mL of 2,2,2-trichloroethanol (internal standard) in methanol

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm × 30-m fused-silica coated with 3.0- μ m G43 stationary phase, and a

deactivated split liner with glass wool

Temperatures

Injector: 220°

Detector: 250°

Column: See the temperature program in *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
100	—	100	4
100	50	120	10
120	50	220	6

Carrier gas: Helium

Flow rate: 4.5 mL/min

Injection volume: 1.0 µL

Injection type: The split flow ratio is about 10:1.

System suitability

Sample: *Standard solution*

[Note—For informational purposes only. See *Table 2* for relative retention times for ethylene glycol, internal standard, and diethylene glycol. The retention time for propylene glycol is 4 min.]

Table 2

Component	Relative Retention Time
Ethylene glycol	0.8
Propylene glycol	1.0
Internal standard	1.7
Diethylene glycol	2.4

Suitability requirements

Resolution: NLT 5 between ethylene glycol and propylene glycol

Analysis

Sample: *Sample solution*

Acceptance criteria

Diethylene glycol: If a peak at the retention time for diethylene glycol is present in the *Sample solution*, the peak response ratio relative to 2,2,2-trichloroethanol is NMT the peak response ratio for diethylene glycol relative to 2,2,2-trichloroethanol in the *Standard solution*: NMT 0.10% for diethylene glycol.

Ethylene glycol: If a peak at the retention times for ethylene glycol is present in the *Sample solution*, the peak response ratio relative to 2,2,2-trichloroethanol is NMT the peak response ratio for ethylene glycol relative to 2,2,2-trichloroethanol in the *Standard solution*: NMT 0.10% for ethylene glycol.

- **C.**

Analysis: Examine the chromatograms obtained in *Identification test B*.

Acceptance criteria: The retention time of the propylene glycol peak of the *Sample*

solution corresponds to that of the *Standard solution*.

ASSAY

Change to read:

• Procedure

~~**Sample:** Propylene Glycol~~

~~**Chromatographic system**~~

~~(See *Chromatography* \langle 621 \rangle , *System Suitability*.)~~

~~**Mode:** GC~~

~~**Detector:** Thermal conductivity~~

~~**Column:** 1-m \times 4-mm; 5% phase G16; support S5~~

~~**Temperature**~~

~~**Injector:** 240 $^{\circ}$~~

~~**Detector:** 250 $^{\circ}$~~

~~**Column:** Increase from 120 $^{\circ}$ to 200 $^{\circ}$ at a rate of 5 $^{\circ}$ /min.~~

~~**Carrier gas:** Helium~~

~~**Injection size:** 10 μ L~~

~~[Note—The approximate retention time for propylene glycol is 5.7 min, and the approximate retention times for the three isomers of dipropylene glycol, when present, are 8.2, 9.0, and 10.2 min, respectively.]~~

~~**Analysis:** Calculate the percentage of $C_3H_8O_2$ in the *Sample* by dividing the area under the propylene glycol peak by the sum of the areas under all of the peaks, excluding those due to air and water, and multiplying by 100:~~

$$\text{Result} = [r_U / (r_U + \sum r_I)] \times 100$$

~~r_U = peak response for Propylene Glycol from the *Sample*~~

~~$\sum r_I$ = sum of individual impurity peak responses, excluding those due to air and water, from the *Sample*~~

~~**Acceptance criteria:** NLT 99.5%~~

Use the gas chromatography normalization procedure.

Diluent: Anhydrous ethanol

Sample solution: To 1 g of Propylene Glycol and 1 g of diethylene glycol, add *Diluent* and dilute with the same solvent to 20 mL. Dilute 1 mL of this solution with *Diluent* to 50 mL.

Chromatographic system

(See *Chromatography* \langle 621 \rangle , *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm \times 30-m fused-silica coated with 0.5- μ m G27 stationary phase

Temperatures

Injector: 250 $^{\circ}$

Detector: 250 $^{\circ}$

Column: 150 $^{\circ}$

Carrier gas: Helium

Flow rate: 1.4 mL/min

Injection volume: 1.0 μ L

Injection type: Split flow ratio, about 70:1

Run time: 2.5 times the retention time of propylene glycol.

[Note—The retention time for propylene glycol is about 2 min. The relative retention time for diethylene glycol is about 1.2.]

System suitability

Sample: *Sample solution*

Suitability requirements

Resolution: NLT 5.0 between propylene glycol and diethylene glycol

Analysis

Sample: *Sample solution*

Calculate the percentage of propylene glycol ($C_3H_8O_2$) in the portion of Propylene Glycol taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U

= peak area of propylene glycol from the *Sample solution*

r_T

= sum of all the peak areas except those due to air and water from the *Sample solution*

Acceptance criteria: NLT 99.7% of propylene glycol ($C_3H_8O_2$)

IMPURITIES

- **Residue on Ignition** 〈 281 〉

Sample: 50 g

Analysis: Heat the *Sample* in a tared 100-mL shallow dish until it ignites, and allow it to burn without further application of heat in a place free from drafts. Cool, moisten the residue with 0.5 mL of sulfuric acid, and ignite to constant weight.

Acceptance criteria: NMT 3.5 mg

- **Chloride and Sulfate, Chloride** 〈 221 〉: A 1-mL portion shows no more chloride than corresponds to 0.10 mL of 0.020 N hydrochloric acid (70 ppm).

- **Chloride and Sulfate, Sulfate** 〈 221 〉: A 5.0-mL portion shows no more sulfate than corresponds to 0.30 mL of 0.020 N sulfuric acid (60 ppm).

Delete the following:

-

- **Heavy Metals** 〈 231 〉

Analysis: Mix 4.0 mL with water to make 25 mL.

Acceptance criteria: NMT 5 ppm (Official 1-Dec-2015)

SPECIFIC TESTS**Add the following:**

- **Color and Clarity of Solution**

Reference solution: Immediately before use, mix 3.0 mL of ferric chloride CS, 3.0 mL of cobaltous chloride CS, and 2.4 mL of cupric sulfate CS with 1.6 mL of hydrochloric acid [10 g/L of hydrochloride (HCl)]. Dilute 1.0 mL of this solution with hydrochloric acid [10 g/L of hydrochloride (HCl)] to 100.0 mL.

Hydrazine sulfate solution: Dissolve 1.0 g of hydrazine sulfate in water and dilute with the same solvent to 100.0 mL. Allow to stand for 4–6 h.

Hexamethylenetetramine solution: In a 100-mL ground-glass-stoppered flask, dissolve 2.5 g of hexamethylenetetramine in 25.0 mL of water.

Primary opalescent suspension (formazin suspension): To the *Hexamethylenetetramine solution* in the flask, add 25.0 mL of the *Hydrazine sulfate solution*. Mix and allow to stand for 24 h. This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.

Standard of opalescence: Dilute 15.0 mL of the *Primary opalescent suspension* with water to 1000.0 mL. This suspension is freshly prepared and may be stored for up to 24 h.

Reference suspension: To 5.0 mL of *Standard of opalescence* add 95.0 mL of water. Mix and shake before use.

Sample: Propylene Glycol

Analysis: Make the comparison by viewing the solutions downward in matched color-comparison tubes against a white surface (see *Spectrophotometry and Light-Scattering* 〈 851 〉, *Visual Comparison*).

Acceptance criteria: The *Sample* is clear (its clarity is the same as that of water or its opalescence is not more pronounced than that of the *Reference suspension*) and colorless as water or not more intensely colored than the *Reference solution*.

Add the following:

- **Aldehydes**

Formaldehyde methanol solution: A solution containing respectively 37% (m/m) of formaldehyde and 10%–15% (m/m) of methanol in water.¹

Determine the percentage of formaldehyde in the solution before using in the *Standard stock solution*. To 2.0 g of *Formaldehyde methanol solution*, add 100 mL of a freshly prepared 100-g/L solution of sodium sulfite in deionized distilled water. Add 0.1 mL of phenolphthalein TS. Titrate with 0.25 M sulfuric acid until the color changes from pink to colorless. Carry out a blank titration.

Calculate the percentage of formaldehyde in *Formaldehyde methanol solution*:

$$\text{Result} = (V - B) \times 2M \times (3.0/m)$$

V = volume of 0.25 M sulfuric acid used in the sample titration (mL)

B = volume of 0.25 M sulfuric acid used in the blank titration (mL)

M = molarity of the titrant

m = mass of sample (g)

Standard stock solution: To 0.300 g of *Formaldehyde methanol solution* add deionized distilled water and dilute with the same solvent to 100.0 mL. Dilute 10.0 mL

of this solution with deionized distilled water to 1000.0 mL. Dilute 20.0 mL of this solution with deionized distilled water to 500.0 mL.

Standard solutions: In six volumetric flasks add, respectively, 1.0, 3.0, 5.0, 10.0, 15.0, and 25.0 mL of *Standard stock solution*. To each flask, add 2 mL of a freshly prepared 5-g/L solution of methylbenzothiazolone hydrazone hydrochloride adjusted with 0.02 M sodium hydroxide to a pH of 4.0. Allow the solutions to stand for 30 min. Add 5 mL of a freshly prepared 7-g/L solution of ferric chloride. Cap and swirl the flasks. Allow to stand for 5 min. Add methanol to each flask and dilute with the same solvent to 50.0 mL. Mix thoroughly, then allow to stand for 1 min.

Sample solution: Add 1.00 g of Propylene Glycol into a volumetric flask and add about 5 mL of deionized distilled water. To the sample flask, add 2 mL of a freshly prepared 5-g/L solution of methylbenzothiazolone hydrazone hydrochloride adjusted with 0.02 M sodium hydroxide to a pH of 4.0. Allow the solutions to stand for 30 min. Add 5 mL of a freshly prepared 7-g/L solution of ferric chloride. Cap and swirl the flasks. Allow to stand for 5 min. Add methanol to each flask and dilute with the same solvent to 50.0 mL. Mix thoroughly, then allow to stand for 1 min.

Blank solution: Prepare in the same manner as for the *Standard solutions* but omit the *Standard stock solution*.

Analysis: Measure the absorbance of the *Standard solutions* and the *Sample solution* at 655 nm, using *Blank solution* as the blank. Calculate the content of aldehydes expressed as formaldehyde (HCHO) in the substance to be examined from the calibration curve obtained by using the *Standard solutions*.

Acceptance criteria: NMT 20 ppm, expressed as formaldehyde (HCHO)

Add the following:

- **Oxidizing Substances**

Sample: 10 mL of Propylene Glycol

Titrimetric system

(See *Titrimetry* 〈 541 〉.)

Mode: Direct titration

Titrant: 0.05 M sodium thiosulfate

Endpoint detection: Visual

Analysis: To the *Sample* add 5 mL of water, 2 mL of potassium iodide TS, and 2 mL of dilute sulfuric acid and allow to stand in a ground-glass-stoppered flask protected from light for 15 min. Titrate with *Titrant*, using 1 mL of starch TS as an indicator.

Acceptance criteria: NMT 0.2 mL of *Titrant* is required [170 ppm expressed as hydrogen peroxide (H₂O₂)].

- **Specific Gravity** 〈 841 〉: 1.035–1.037

Change to read:

- **Acidity**

Sample: ±0

50.0

mL of Propylene Glycol

Analysis: Add 1 mL of phenolphthalein TS to 50 mL of water, then add 0.1 N

0.01 N

sodium hydroxide until the solution remains pink for 30 s. Add the *Sample*, and titrate with ~~0.10~~
N

0.01 N

sodium hydroxide until the original pink color returns and remains for 30 s.

1 mL of 0.01 N sodium hydroxide is equivalent to 0.6 mg of acetic acid (CH₃COOH).

Acceptance criteria: ~~NMT 0.20 mL of 0.10 N sodium hydroxide~~
NMT 100 mg/L, calculated as acetic acid (CH₃COOH)

Change to read:

- **Water Determination, Method I** 〈 921 〉

Sample: 5.00 g

Acceptance criteria: NMT 0.2%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers.

- **USP Reference Standards** 〈 11 〉

STIMULI TO THE REVISION PROCESS

Stimuli articles do not necessarily reflect the policies of the USPC or the USP Council of Experts

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of Expert Committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues.

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* section. Readers interested in submitting comments should see *Instructions to Authors*.

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP-NF* revision will be considered for publication in *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously in any language or medium and that they are not simultaneously under consideration by any other publication. All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication they will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention (USPC) and may not be subsequently published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

Style and Usage—*Stimuli* articles generally follow the current *Chicago Manual of Style* except in scientific usage (numbers, abbreviations, etc.). For the latter, authors should use the current *AMA Manual of Style* or the current *ACS Style Guide*. Authors may usefully consult a current edition of *Pharmacopeial Forum*.

References—Consult the current *AMA Manual of Style*, which is generally consistent with the National Library of Medicine's *Recommended Formats for Bibliographic Citation*. A current edition of *Pharmacopeial Forum* will offer examples of reference formats.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Disclosure of Potential Conflicts of Interest—Maintaining independence and impartiality are critical to the integrity and credibility of USP's public health mission. Accordingly, authors are expected to conform to the Conflict of Interest provisions of the USP Code of Ethics (see link below), including as part of their manuscript submission disclosure of all financial and personal relationships that may potentially influence, or be perceived to influence, their article. USP staff are available to provide additional guidance to authors on the range of disclosure that would be appropriate. Although USP *Stimuli* articles are not the type of source likely to be relied on as a basis for governmental actions (e.g., not a vehicle for reports of human clinical research), USP nevertheless supports the overall policies of the International Committee of Medical Journal Editors (ICMJE) regarding Uniform Requirements for Manuscripts Submitted to Biomedical Journals and Ethical Considerations in the Conduct and Reporting of Research (links below).

USP Code of Ethics:

<http://www.usp.org/aboutUSP/governance/policies/codeOfEthics.html>

ICMJE Uniform Requirements:

http://www.icmje.org/urm_main.html

ICMJE Conflicts of Interest:

<http://www.icmje.org/conflicts-of-interest/>

Contact Person—USP will designate a Scientific Liaison in the Documentary Standards Division as the corresponding author. This ensures that USP receives all comments generated by the *Stimuli* article. Authors should contact the Scientific Liaison if they would like to receive copies of comments generated by their *Stimuli* articles.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

Modernization of Identification Tests in *USP-NF*

Nancy Lewen,^a Anthony C Bevilacqua,^b Bernard A Olsen,^b Anne Warner,^b Michelle Adamson,^b Geoffrey Carr,^b Pei Chen,^b Jonathan DeVries,^b Maryna Dmitrieva,^b Michael Hornig,^b Jeffrey Rohrer,^b Antonio Hernandez-Cardoso^{c,d}

ABSTRACT For consistency with the overall USP effort to modernize monographs and general chapters, *Identification Tests—General* 〈 191 〉 was identified for revision to address safety and environmental concerns, clarity and accuracy of the description of wet-chemistry tests, harmonization with other pharmacopeias, and provision of an option to use instrumental methods. This *Stimuli* article accompanies the proposed revision of general chapter 〈 191 〉, also published in this issue of *Pharmacopeial Forum*, and describes the rationale and strategy used to revise the chapter.

INTRODUCTION

Identity is a critical quality attribute of a pharmaceutical, and identification tests are critical for any pharmacopeial monograph. In *USP-NF*, some procedures for identification testing are included in individual monographs, and two general chapters containing identification procedures are referenced frequently in monographs. General chapter *Identification Tests—General* 〈 191 〉 is applied for the identification of ions or counterions of drug salts. Infrared (IR) and ultraviolet (UV) spectrophotometric tests, described in general chapter *Spectrophotometric Identification Tests* 〈 197 〉, are used frequently for identification of active ingredients or their salts.

For consistency with the overall USP effort to modernize monographs and general chapters, chapter 〈 191 〉 was identified for revision to address safety and environmental concerns, clarity and accuracy of the description of wet-chemistry tests, harmonization with other pharmacopeias, and the option to use instrumental methods. Existing flame tests in chapter 〈 191 〉 will be replaced; affected monographs will show other complementary tests (e.g., wet-chemistry tests from other pharmacopeias) or introduction of a specific flame test to a specific monograph. The proposed revision of chapter 〈 191 〉 is included in this issue of *Pharmacopeial Forum*.

The potential impact of changes to 〈 191 〉 is significant. Wet-chemistry tests have been used for many years and may still provide valid options; however, a revised chapter 〈 191 〉 will provide greater flexibility by providing options for wet-chemical and/or instrumental approaches to identification tests. Although qualitative wet-chemistry tests may continue to be used, the instrumental options in the proposed revision of the chapter can provide results that are less subjective, and in many cases, quantitative. If a quantitative test is required for a given ion in a monograph, an additional qualitative identification test is usually not necessary. In cases where multiple identification tests are required in a monograph, different (non-redundant) methods must be used. For example, if an IR identification test with reference to

chapter $\langle 197 \rangle$ is included in a monograph and an additional identification test is included in the monograph with reference to chapter $\langle 191 \rangle$, a test option from chapter $\langle 191 \rangle$ other than IR must be used.

RATIONALE FOR MODERNIZATION—SURVEY RESULTS

In August 2011, USP staff conducted an international survey to obtain industry feedback regarding chapter $\langle 191 \rangle$ and the potential need to modernize the chapter. A total of 392 responses to the online survey were received. The survey was designed to determine industry practices for identification testing and preferences regarding chapter $\langle 191 \rangle$. Questions in the survey addressed demographics, use of chapter $\langle 191 \rangle$, use of alternatives to chapter $\langle 191 \rangle$ tests, level of satisfaction with chapter $\langle 191 \rangle$, and suggestions for modernization of chapter $\langle 191 \rangle$.

The survey revealed that although many of the wet-chemistry tests in chapter $\langle 191 \rangle$ are used (because they are the official tests), almost 65% of the respondents use, or would like to use, instrumental tests to fulfill identification test requirements. Some alternative tests are already being used to quantify counterions, to provide process information, and to meet regulatory requirements. Other survey results indicated a strong interest in harmonizing tests with other pharmacopeias and in clarifying the procedures as well as the acceptance criteria. There has also been interest from the Food and Drug Administration in more rigorous identification tests that could help in the fight against adulteration and counterfeiting. *Table 1* lists the top 10 ions tested by survey respondents. Also included in *Table 1* is the number of monographs referencing chapter $\langle 191 \rangle$ for each ion. Not surprisingly, the listing of the top ions identified by survey respondents overlaps significantly with the most frequently referenced ions in monographs.

Table 1. Top 10 Ions Tested by Survey Respondents and Frequency of Reference to Chapter $\langle 191 \rangle$ in USP Monographs (Second Supplement to USP 36–NF 31)

Ion	Percentage of Survey Respondents Testing for Ion (in rank order)	Number of USP Monographs Referencing Chapter $\langle 191 \rangle$ for Ion Identification (rank)
Chloride	86%	286 (1)
Sodium	75%	195 (2)
Calcium	63%	60 (5)
Sulfate	61%	103 (3)
Potassium	60%	79 (4)
Phosphate	57%	28 (9)
Magnesium	55%	50 (6)
Bicarbonate/Carbonate	52%	16 (12)
Iron/Ferrous salts	51%	<12
Acetate	50%	17 (11)

The top two suggestions for improving chapter $\langle 191 \rangle$ were to include instrumental procedures and to clarify existing procedures (*Figure 1*). One of seven respondents indicated a preference

for not changing the wet-chemistry procedures.

The most frequent survey comments concerning replacement of wet-chemistry procedures are shown in *Figure 2*. The main conclusion from these comments is that wet-chemistry procedures should be maintained, but alternatives should be available.

Suggestions for Improving or Modernizing USP-NF Chapter < 191 >

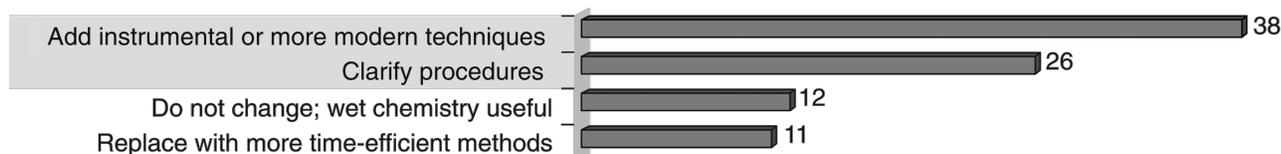

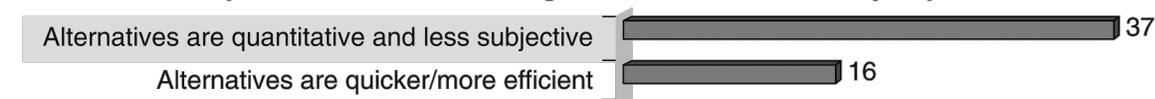

Figure 1. Top suggestions for improving or modernizing general chapter <191>. **Explanations Given for Being in Favor of Wet-Chemistry Replacement**

Explanations Given for Opposing Complete Replacement of Wet-Chemistry Tests

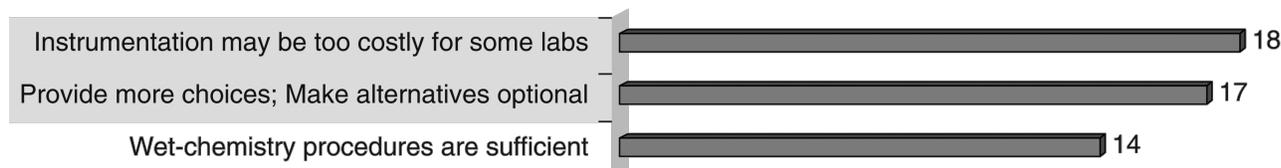

Figure 2. Survey comments concerning replacement of wet-chemistry tests.

Survey respondents also indicated which methods they use for testing various ions. *Table 2* shows that although wet-chemistry is used widely (probably because it is currently required in < 191 >), additional instrumental tests are used for many ions.

Table 2. Identification Testing Methods Used for Top Ions^a

Ion	Wet Chemistry (WC)	Atomic Absorption (AA)	Spectrophotometric Methods	Ion Chromatography (IC)	Inductively Coupled Plasma (ICP)	Other Method
	(Percentage of only those who test the ion)					
Chloride	93%	3%	4%	14%	2%	2%
Sodium	84%	26%	4%	7%	10%	4%
Calcium	79%	28%	5%	5%	12%	1%
Sulfate	91%	1%	7%	10%	2%	0%
Potassium	80%	29%	3%	7%	7%	2%
Phosphate	91%	4%	9%	9%	4%	1%
Magnesium	76%	28%	2%	5%	16%	1%
Bicarbonate/Carbonate	90%	2%	7%	8%	1%	2%
Iron/Ferrous salts	77%	26%	7%	4%	16%	1%
Acetate	89%	1%	12%	12%	1%	2%
Citrate	88%	0%	9%	9%	2%	3%

PROCESS FOR ADDRESSING COMMENTS ARISING FROM THE SURVEY

An Expert Panel was formed to address issues with wet-chemistry tests in chapter < 191 > and to consider including the option of instrumental identification tests in the chapter. The panel's goals included minimizing ambiguity in procedures and subjectivity in the interpretation of results. The panel sought to provide flexibility in the chapter by allowing the use of instrumental tests that have been validated appropriately by the user.

Wet-Chemistry Tests

Safety and environmental issues have been associated with some existing tests. Flame tests and toxic reagents pose hazards, and their use is discouraged or prohibited in many laboratories. Another concern is country-specific environmental regulations, which may also preclude the use of some reagents prescribed in chapter < 191 >. The Expert Panel evaluated and revised several tests that involve safety concerns. For example, the proposed revision of the chapter will eliminate all flame tests, which will remove a safety concern as well as the potential for ambiguous results with flame tests.

Additionally, the Expert Panel focused on some of the more frequently used or referenced tests: aluminum, calcium, magnesium, potassium, sodium, zinc, halides (chloride, bromide, iodide), sulfate, acetate, carbonate, citrate, hypophosphite, phosphate, and tartrate. For these tests, the panel attempted to harmonize with the procedures of the *European Pharmacopoeia*, clarify procedures, and clarify interpretation of the results. The potential impact of changes to the procedures was also evaluated. USP laboratory staff worked to assess the validity of the revised procedures as well as the clarity of instructions and consistency of results.

The laboratory evaluation of revised identification testing methods was performed in USP laboratories by executing the test procedure and documenting the results and observations (e.g., photographing the solution/precipitate). The samples utilized were three USP Reference Standards along with a blank, each evaluated by two scientists. The preparation of reagents was performed independently. There were some sample preparation issues, and adjustments were made to the techniques, as appropriate, by the scientists overseeing the project. Despite the adjustments, the results showed that the revised procedures still produced subjective results. Thus, many of the revisions initially considered will not be made.

Instrumental Techniques

On the basis of survey feedback and procedures currently used in various monographs, a number of instrumental techniques were identified as having potential for inclusion in chapter <

191). In addition to providing qualitative identification information regarding various ions, many instrumental tests also provide quantitative information. A number of instrumental techniques are useful for identification of the drug substance moiety or salt, but the Expert Panel focused on techniques used for counterion identification. Counterions can often be identified using several techniques, and the proposed revision to chapter 191 allows the analyst to choose the technique. This novel concept is consistent with the survey results, which indicated a desire for options beyond the wet-chemistry tests. The inclusion of instrumental techniques provides a variety of alternatives to help ensure compliance. As described in the revised chapter, any alternative technique must be validated by the user for counterion specificity to be suitable for counterion identification.

In considering instrumental techniques, the Expert Panel included X-ray fluorescence (XRF), atomic spectroscopy [atomic absorption (AA); inductively coupled plasma (ICP)–optical emission spectroscopy (OES); ICP–mass spectrometry (MS)], mid-IR, Raman, ion chromatography (IC), and other chromatographic techniques. A list of these techniques and the ions to which they might be applied is given in *Table 3*. This listing is not exhaustive, and other techniques, such as nuclear magnetic resonance, ion-selective electrodes, and near-IR, may be used, provided they meet validation requirements for specificity (for additional information, see the general chapter *Validation of Compendial Procedures* 1225).

Table 3. Alternative Instrumental Techniques for Counterion Identification

Ion	Atomic Absorption	Mid IR	Raman Spectroscopy	Ion Chromatography	Inductively Coupled Plasma	X-Ray Fluorescence
Chloride				•	•(MS)	•
Bromide				•	•(MS)	•
Iodide				•	•(MS)	•
Acetate		•	•	•		
Bi/Carbonate		•	•	•		
Citrate		•	•	•		
Phosphate		•	•	•		
Sulfate		•	•	•		
Tartrate		•	•	•		
Aluminum	•			•	•(OES/MS)	•
Calcium	•			•	•(OES/MS)	•
Magnesium	•			•	•(OES/MS)	•
Potassium	•			•	•(OES/MS)	•
Sodium	•			•	•(OES/MS)	
Zinc	•			•	•(OES/MS)	•

Although other general chapters address some of the above-mentioned instrumental techniques, they do not specifically address the use of those techniques for identification.

Chapter 197 does describe the use of UV and IR for identification purposes, but this chapter is primarily used for identification of the drug moiety or salt as a whole, rather than for counterions. In chapter 191, the use of IR will reference procedures in chapter 197, but demonstration of the counterion specificity will still be needed. USP plans to develop a general chapter on Raman spectroscopy and to include Raman as an identification test in chapter 197. Validation of specificity for the counterion of interest is also required when using Raman to satisfy the chapter 191 identification requirements.

IMPLEMENTATION

Removal of the flame tests from chapter 〈 191 〉 was done in coordination with the affected monographs to provide a replacement test that would complement the set of tests in each monograph. In some cases, a new test was proposed for the monograph. If the flame test was considered suitable, it was incorporated into the specific monograph.

This article describes the first step in achieving modernization of the identification tests in *USP-NF*. USP will continue exploring different approaches to address the safety and environmental concerns, to improve the clarity and accuracy of the description of wet-chemistry tests, and to work toward harmonizing with other pharmacopeias.

Although not directly related to chapter 〈 191 〉 revisions, another initiative of the USP monograph development committees is the removal or omission of counterion identification tests for drug product monographs. In many cases, the potential for interference by excipients in different formulations of a product prevents identification of a counterion because of the drug substance salt. These monographs will be handled on a case-by-case basis.

The Expert Panel is hopeful that USP will receive feedback regarding the removal of the flame tests and the addition of instrumental approaches for identification testing. In particular, any problems encountered when testing with existing monographs using the revised chapter 〈 191 〉 should be referred to the liaison for that monograph.

Please address comments on *Pharmacopeial Forum* content to

USP Executive Secretariat

12601 Twinbrook Parkway

Rockville, MD 20852

execsec@usp.org

ISSN: 1542-1945

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI)*, in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences*.

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling. **Pharmacopeial Forum's Public Review and Comment Process**

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum (PF)*, for the development of official standards in the *United States Pharmacopeia* and the *National Formulary (USP–NF)*.

USP publishes *PF* on a bimonthly basis to provide an opportunity to review and comment on new or revised standards.

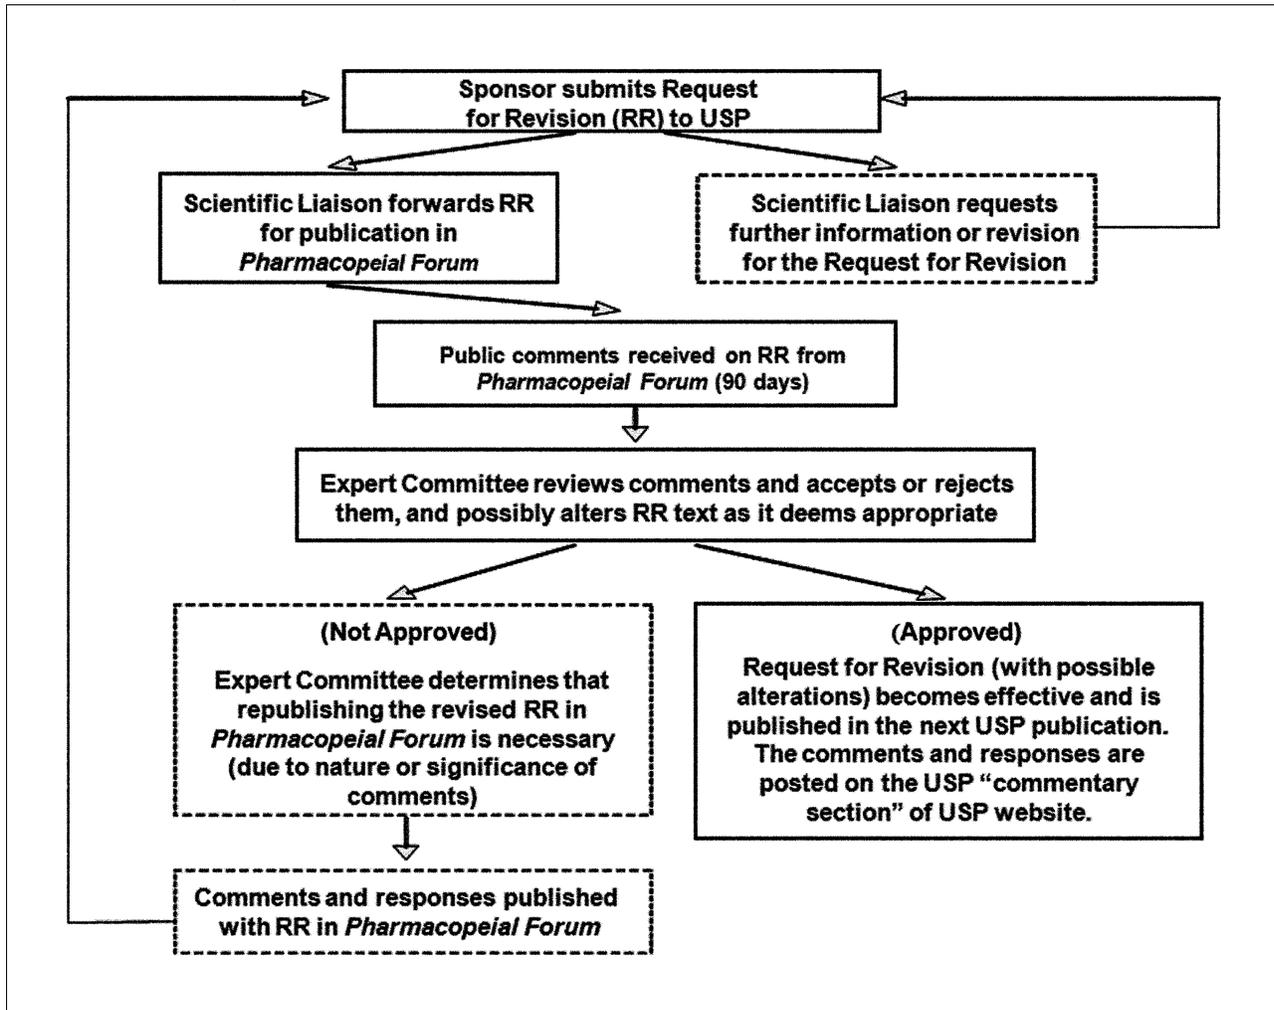

There are two types of proposed revisions in *PF*:

1. **Proposed Revisions**—New or revised standards targeted for adoption through USP's Standard Revision Process. USP's Revision Process calls for publication of a proposed revision in *PF* for a 90-day notice and comment period. After the comment period and subsequent review of comments and approval by the relevant USP Expert Committee, the official standard is published in the next available *USP–NF* or *Supplement*. If comments received are significant, or if the Expert Committee's consideration of comments results in significant additional changes, the Expert Committee may determine that republishing in *PF* is necessary prior to the revision becoming official. See the *In-Process Revision* section for current proposed revisions.
2. **Proposed Interim Revision Announcements**—New or revised standards that become

official through an accelerated process in accordance with USP’s Guideline on Accelerated Revisions (available on the USP Web site). *Interim Revision Announcements (IRAs)* allow for a revision to become official prior to the next *USP–NF* or *Supplement*. *IRAs* are first presented for a 90-day public comment period in the *Proposed Interim Revision Announcement* section of the *PF*. Note that final *IRAs*, as well as *Errata*, and *Revision Bulletins*, which also are defined in the Accelerated Revision Guideline, appear only on the USP Web site.

USP welcomes comments and data on proposed revisions. A summary of comments received, along with USP’s responses, will be published in the *Revisions and Commentary* section of the USP website (<http://www.usp.org/USPNF/revisions/>).

The chart below shows the public review and comment process and its relationship to standards development.

Questions on the process should be addressed to the USP Executive Secretariat, United States Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE *PF*

The various sections of *PF* are briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a *Request for Revision* is available in the *Guideline for*

Submitting Requests for Revision to the USP–NF on the USP Web site (www.usp.org/USPNF/submitMonograph/subGuide.html). Note that the Expert Committee listing and the Scientific Staff Directory also are located on the USP Web site (see below for links).

Proposed and Adopted Revisions to the USP–NF

Names and contact information of key USP scientific staff members who work on the development of USP compendial standards

(<http://www.usp.org/USPNF/devProcess/contactScientists.html>)

Proposed Interim Revision Announcements

This section includes proposals for *Interim Revision Announcements (IRAs)* that will be published as official *USP* or *NF* standards. There is a 90-day comment period for these proposals (see <http://www.usp.org/USPNF/pf/pfRedesign.html> for the *PF* comment schedule). Readers should review material in this section and provide comments to the Scientific Liaison using the contact information appearing at the end of each proposed *IRA*. Information on how to comment can be found under the "Participation" section of www.usp.org. It is important to send comments promptly so that the Expert Committee members can consider reader's input as they are deciding whether to advance standards to official status. The approved official text will be published under *IRAs* in the "New Official Text" section of USP's Web site.

Each proposal is preceded by a Briefing that indicates the proposed revisions.

Symbols—New text is enclosed in symbols and set off from the current official text as shown in the following example:

•new text•

Where the symbols appear together with no enclosed text, such as

••

, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the date the proposal, if approved, will become official as an *IRA*. For example, •(IRA 1-Apr-2011)

BRIEFING

《 87 》 **Biological Reactivity Tests, In Vitro**, *USP 38* page 156. On the basis of comments received, it is proposed to make the following revisions. USP Positive Bioreaction RS, which is used as a *Positive Control* in the current chapter, is being discontinued due to the inability to acquire the material needed for the replacement lot. In the effort to find a replacement, a polyurethane film containing zinc diethyldithiocarbamate (ZDEC) and zinc dibutyldithiocarbamate (ZDBC) from Hatano Research Institute was identified and determined to be suitable as a *Positive Control*. Thus, the chapter is being revised to remove the reference to USP Positive Bioreaction RS and will include a reference for an alternate *Positive Control* that is suitable.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style.

The comment period for this revision ends May 31, 2015. In the absence of any significant adverse comments, it is proposed to implement this revision via an *Interim Revision Announcement*, with an official date of September 1, 2015.

(GCPS: D. Hunt.)

Correspondence Number—C154278

Comment deadline: July 31, 2015

《 87 》 **BIOLOGICAL REACTIVITY TESTS, IN VITRO**

The following tests are designed to determine the biological reactivity of mammalian cell cultures following contact with the elastomeric plastics and other polymeric materials with

direct or indirect patient contact or of specific extracts prepared from the materials under test. It is essential that the tests be performed on the specified surface area. When the surface area of the specimen cannot be determined, use 0.1 g of elastomer or 0.2 g of plastic or other material for every mL of extraction fluid. Exercise care in the preparation of the materials to prevent contamination with microorganisms and other foreign matter.

Three tests are described (i.e., the *Agar Diffusion Test*, the *Direct Contact Test*, and the *Elution Test*).¹ The decision as to which type of test or the number of tests to be performed to assess the potential biological response of a specific sample or extract depends upon the material, the final product, and its intended use. Other factors that may also affect the suitability of sample for a specific use are the polymeric composition; processing and cleaning procedures; contacting media; inks; adhesives; absorption, adsorption, and permeability of preservatives; and conditions of storage. Evaluation of such factors should be made by appropriate additional specific tests before determining that a product made from a specific material is suitable for its intended use. Materials that fail the *in vitro* tests are candidates for the *in vivo* tests described in *Biological Reactivity Tests* (88), *In Vivo*.

Change to read:

•

TEST CONTROL

Positive Control

Polyurethane film containing zinc diethyldithiocarbamate (ZDEC)² or zinc dibutyldithiocarbamate (ZDBC) •(IRA 1-Sep-2015)

Cell Culture Preparation

Prepare multiple cultures of L-929 (ATCC cell line CCL 1, NCTC clone 929; alternative cell lines obtained from a standard repository may be used with suitable validation) mammalian fibroblast cells in serum-supplemented minimum essential medium having a seeding density of about 10^5 cells per mL. Incubate the cultures at $37 \pm 1^\circ$ in a humidified incubator for NLT 24 h in a $5 \pm 1\%$ carbon dioxide atmosphere until a monolayer, with greater than 80% confluence, is obtained. Examine the prepared cultures under a microscope to ensure uniform, near-confluent monolayers. [Note—The reproducibility of the *In Vitro Biological Reactivity Tests* depends upon obtaining uniform cell culture density.]

Extraction Solvents

Sodium Chloride Injection [see monograph—use Sodium Chloride Injection containing 0.9% of sodium chloride (NaCl)]. Alternatively, serum-free mammalian cell culture media or serum-supplemented mammalian cell culture media may be used. Serum supplementation is used when extraction is done at 37° for 24 h.

APPARATUS

Autoclave

Employ an autoclave capable of maintaining a temperature of $121 \pm 2^\circ$, equipped with a thermometer, a pressure gauge, a vent cock, a rack adequate to accommodate the test containers above the water level, and a water cooling system that will allow for cooling of the

test containers to about 20° , but not below 20° , immediately following the heating cycle.

Oven

Use an oven, preferably a mechanical convection model, that will maintain operating temperatures in the range of 50° – 70° within $\pm 2^{\circ}$.

Incubator

Use an incubator capable of maintaining a temperature of $37 \pm 1^{\circ}$ and a humidified atmosphere of $5 \pm 1\%$ carbon dioxide in air.

Extraction Containers

Use only containers, such as ampuls or screw-cap culture test tubes, or their equivalent, of Type I glass. If used, culture test tubes, or their equivalent, are closed with a screw cap having a suitable elastomeric liner. The exposed surface of the elastomeric liner is completely protected with an inert solid disk 50–75 μm in thickness. A suitable disk can be fabricated from polytef.

Preparation of Apparatus

Cleanse all glassware thoroughly with chromic acid cleansing mixture and, if necessary, with hot nitric acid followed by prolonged rinsing with Sterile Water for Injection. Sterilize and dry by a suitable process for containers and devices used for extraction, transfer, or administration of test material. If ethylene oxide is used as the sterilizing agent, allow NLT 48 h for complete degassing.

PROCEDURE

Preparation of Sample for Extracts

Prepare as directed in the *Procedure* under $\langle 88 \rangle$.

Preparation of Extracts

Prepare as directed for *Preparation of Extracts* in $\langle 88 \rangle$ using either Sodium Chloride Injection [0.9% sodium chloride (NaCl)] or serum-free mammalian cell culture media as *Extraction Solvents*. [Note—If extraction is done at 37° for 24 h in an incubator, use cell culture media supplemented by serum. The extraction conditions should not in any instance cause physical changes, such as fusion or melting of the material pieces, other than a slight adherence.]

AGAR DIFFUSION TEST

This test is designed for elastomeric closures in a variety of shapes. The agar layer acts as a cushion to protect the cells from mechanical damage while allowing the diffusion of leachable chemicals from the polymeric specimens. Extracts of materials that are to be tested are applied to a piece of filter paper.

Sample Preparation

Use extracts prepared as directed, or use portions of the test specimens having flat surfaces

NLT 100 mm² in surface area.

Positive Control Preparation

Proceed as directed for *Sample Preparation*.

Negative Control Preparation

Proceed as directed for *Sample Preparation*.

Procedure

Using 7 mL of cell suspension prepared as directed under *Cell Culture Preparation*, prepare the monolayers in plates having a 60-mm diameter. Following incubation, aspirate the culture medium from the monolayers, and replace it with serum-supplemented culture medium containing NMT 2% of agar. [Note—The quality of the agar must be adequate to support cell growth. The agar layer must be thin enough to permit diffusion of leached chemicals.] Place the flat surfaces of *Sample Preparation*, *Negative Control Preparation*, and *Positive Control Preparation* or their extracts in an appropriate extracting medium, in duplicate cultures in contact with the solidified agar surface. Use no more than three specimens per prepared plate. Incubate all cultures for NLT 24 h at $37 \pm 1^{\circ}$, preferably in a humidified incubator containing $5 \pm 1\%$ of carbon dioxide. Examine each culture around each *Sample*, *Negative Control*, and *Positive Control*, under a microscope, using a suitable stain, if desired.

Interpretation of Results

The biological reactivity (cellular degeneration and malformation) is described and rated on a scale of 0–4 (see *Table 1*). Measure the responses of the cell cultures to the *Sample Preparation*, the *Negative Control Preparation*, and the *Positive Control Preparation*. The cell culture test system is suitable if the observed responses to the *Negative Control Preparation* is grade 0 (no reactivity) and to the *Positive Control Preparation* is at least grade 3 (moderate). The *Sample* meets the requirements of the test if the response to the *Sample Preparation* is not greater than grade 2 (mildly reactive). Repeat the procedure if the suitability of the system is not confirmed.

Table 1. Reactivity Grades for Agar Diffusion Test and Direct Contact Test

Grade	Reactivity	Description of Reactivity Zone
0	None	No detectable zone around or under specimen
1	Slight	Some malformed or degenerated cells under specimen
2	Mild	Zone limited to area under specimen and less than 0.45 cm beyond specimen
3	Moderate	Zone extends 0.45–1.0 cm beyond specimen
4	Severe	Zone extends greater than 1.0 cm beyond specimen

DIRECT CONTACT TEST

This test is designed for materials in a variety of shapes. The procedure allows for simultaneous extraction and testing of leachable chemicals from the specimen with a serum-supplemented medium. The procedure is not appropriate for very low- or high-density materials that could cause mechanical damage to the cells.

Sample Preparation

Use portions of the test specimen having flat surfaces NLT 100 mm² in surface area.

Positive Control Preparation

Proceed as directed for *Sample Preparation*.

Negative Control Preparation

Proceed as directed for *Sample Preparation*.

Procedure

Using 2 mL of cell suspension prepared as directed under *Cell Culture Preparation*, prepare the monolayers in plates having a 35-mm diameter. Following incubation, aspirate the culture medium from the cultures, and replace it with 0.8 mL of fresh culture medium. Place a single *Sample Preparation*, a *Negative Control Preparation*, and a *Positive Control Preparation* in each of duplicate cultures. Incubate all cultures for NLT 24 h at $37 \pm 1^{\circ}$ in a humidified incubator containing $5 \pm 1\%$ of carbon dioxide. Examine each culture around each *Sample*, *Negative Control*, and *Positive Control Preparation*, under a microscope, using a suitable stain, if desired.

Interpretation of Results

Proceed as directed for *Interpretation of Results* under *Agar Diffusion Test*. The *Sample* meets the requirements of the test if the response to the *Sample Preparation* is not greater than grade 2 (mildly reactive). Repeat the procedure if the suitability of the system is not confirmed.

ELUTION TEST

This test is designed for the evaluation of extracts of polymeric materials. The procedure allows for extraction of the specimens at physiological or nonphysiological temperatures for varying time intervals. It is appropriate for high-density materials and for dose-response evaluations.

Sample Preparation

Prepare as directed in *Preparation of Extracts*, using either Sodium Chloride Injection [0.9% sodium chloride (NaCl)] or serum-free mammalian cell culture media as *Extraction Solvents*. If the size of the *Sample* cannot be readily measured, a mass of NLT 0.1 g of elastomeric material or 0.2 g of plastic or polymeric material per mL of extraction medium may be used. Alternatively, use serum-supplemented mammalian cell culture media as the extracting medium to simulate more closely physiological conditions. Prepare the extracts by heating for 24 h in an incubator containing $5 \pm 1\%$ of carbon dioxide. Maintain the extraction temperature at $37 \pm 1^{\circ}$, because higher temperatures may cause denaturation of serum proteins.

Positive Control Preparation

Proceed as directed for *Sample Preparation*.

Negative Control Preparation

Proceed as directed for *Sample Preparation*.

Procedure

Using 2 mL of cell suspension prepared as directed under *Cell Culture Preparation*, prepare the

monolayers in plates having a 35-mm diameter. Following incubation, aspirate the culture medium from the monolayers, and replace it with extracts of the *Sample Preparation*, *Negative Control Preparation*, or *Positive Control Preparation*. The serum-supplemented and serum-free cell culture media extracts are tested in duplicate without dilution (100%). The Sodium Chloride Injection extract is diluted with serum-supplemented cell culture medium and tested in duplicate at 25% extract concentration. Incubate all cultures for 48 h at $37 \pm 1^\circ$ in a humidified incubator preferably containing $5 \pm 1\%$ of carbon dioxide. Examine each culture at 48 h, under a microscope, using a suitable stain, if desired.

Interpretation of Results

Proceed as directed for *Interpretation of Results* under *Agar Diffusion Test* but use *Table 2*. The *Sample* meets the requirements of the test if the response to the *Sample Preparation* is not greater than grade 2 (mildly reactive). Repeat the procedure if the suitability of the system is not confirmed. For dose-response evaluations, repeat the procedure, using quantitative dilutions of the sample extract.

Table 2. Reactivity Grades for Elution Test

Grade	Reactivity	Conditions of All Cultures
0	None	Discrete intracytoplasmic granules; no cell lysis
1	Slight	Less than or equal to 20% of the cells are round, loosely attached, and without intracytoplasmic granules; occasional lysed cells are present
2	Mild	Greater than 20% to less than or equal to 50% of the cells are round and devoid of intracytoplasmic granules; no extensive cell lysis and empty areas between cells
3	Moderate	Greater than 50% to less than 70% of the cell layers contain rounded cells or are lysed
4	Severe	Nearly complete destruction of the cell layers

BRIEFING

Powdered Digitalis, *USP 38* page 3111. The following revisions are proposed:

1. Because of the discontinuation of USP Gitoxin RS, it is proposed to replace *Identification* test *B* by thin-layer chromatography with an HPLC procedure.

2. *Identification* test A is revised to remove the subsections for *Unground Digitalis* and *Histology* and to update the *Botanic Characteristics* for *Ground Digitalis*.
3. The *USP Reference Standards* section is revised to remove USP Digitoxin RS and USP Gitoxin RS and to add USP Digoxin RS.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

The comment period for this revision ends on July 31, 2015. In the absence of significant comments, it is proposed to implement this revision through an *Interim Revision Announcement*, with an official date of November 1, 2015.

Powdered Digitalis

DEFINITION

Powdered Digitalis is *Digitalis* (*Digitalis purpurea*) dried at a temperature not exceeding 60°, reduced to a fine or a very fine powder, and adjusted, if necessary, to conform to the official potency by admixture with sufficient Lactose, Starch, or exhausted marc of digitalis, or with Powdered Digitalis having either a lower or a higher potency.

The potency of Powdered Digitalis is such that, when assayed as directed, 100 mg is equivalent to 1 USP Digitalis Unit.¹

[Note—When Digitalis is prescribed, Powdered Digitalis is to be dispensed.]

IDENTIFICATION

Change to read:

- **A. Botanic Characteristics**

Unground Digitalis: ~~This occurs as more or less crumpled or broken leaves. The leaf blades are ovate, oblong-ovate to ovate-lanceolate, mostly 10–35 cm in length and 4–11 cm in width and contracted into a winged petiole. The apex is obtuse; the margin irregularly crenate or serrate; the lower surface densely pubescent, the upper surface wrinkled and finely hairy. The venation is conspicuously reticulate, the mid-rib and principal veins broad and flat, and the lower veins are continued into the wings of the petiole. The color of the upper surface is dark green, of the lower surface grayish from the dense pubescence, the larger veins often purplish. The odor is slight when dry, peculiar and characteristic when moistened.~~

Histology: ~~Digitalis shows an upper epidermis whose cells possess slightly wavy anticlinal walls, numerous hairs, and no stomata; a lower epidermis with wavy anticlinal walls, numerous oval stomata, and many hairs, and frequently not attached over irregular areas to the cell layer within, especially near the veins; a broad chlorenchyma of a single layer of short palisade cells and several layers of spongy parenchyma; and numerous vascular bundles in the larger veins and petioles, separated by vascular rays one cell in width. On the apex of each marginal tooth, one or two water stomata occur.~~

●●(IRA 1-Nov-2015)

Ground Digitalis: This is dark green in color.

•The powder is dark green in color. •(IRA 1-Nov-2015)

Present are chiefly numerous irregular fragments of epidermis and chlorenchyma; nonglandular hairs that are frequently curved or crooked, up to 500 μm in length, uniseriate, two- to eight-celled, some of the cells collapsed so that the planes of adjoining cells may be at right angles, the terminal cell pointed or rounded; few, small glandular hairs, usually with a one- or two-celled stalk, and a one- or two-celled head; fragments of veins and petioles with annular, reticulate, spiral and simple pitted vessels and tracheids. Calcium oxalate is absent.

Delete the following:

•• **B. Procedure**

(See *Chromatography* (621).)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Sample solution: Transfer 100 mg to a 15-mL centrifuge tube containing 2.0 mL of diluted alcohol and 1.0 mL of lead acetate TS, shake, and boil for 2 min. Centrifuge, decant the supernatant into a second 15-mL centrifuge tube, and add 2.0 mL of chloroform. Centrifuge, then remove the lower layer, and filter it through a chloroform-washed small column of anhydrous sodium sulfate (100 to 300 mg) into a 5-mL centrifuge tube. Evaporate the chloroform solution under a stream of nitrogen to dryness, and dissolve the residue in 100 μL of a mixture of methanol and chloroform (1:1).

Standard solutions: Prepare a *Standard solution* in the same manner, using 100 mg of USP Digitalis RS (*Standard solution A*). Prepare a second *Standard solution* by dissolving USP Digitoxin RS and USP Gitoxin RS in a mixture of methanol and chloroform (1:1) such that the final concentration of each is approximately 0.2 mg/mL (*Standard solution B*).

Application volume: 10 μL

Developing solvent system: Ethyl acetate, methanol, and water (30:4:3)

Analysis

Samples: Apply the *Sample solution*, *Standard solution A*, and *Standard solution B*, each as a narrow band about 15 mm long, to a thin-layer chromatographic plate.

Allow the bands to dry. Develop the chromatogram in a saturated chamber, using a solvent system, until the solvent front has moved about 15 cm from the origin. Mix 10 mL of chloramine T solution (3 in 100) with 40 mL of a solution (1 in 4) of trichloroacetic acid in alcohol (store the mixture in a cool place, and use it within 1 week), and spray the air-dried chromatographic plate with this mixture. Heat the plate at 110° for 15–20 min, and examine it under long-wavelength UV light. Locate the 2 prominent bands from *Standard solution A* corresponding in R_f value to the 2 bands obtained from *Standard solution B*. The chromatogram obtained from the solution under test shows bands corresponding to them, and also shows bands corresponding to the 3 other bands most prominent in the chromatogram from *Standard solution A* but of lower R_f value.

Acceptance criteria: Relative R_f values for the 5 bands are: 1.0 (digitoxin); 0.8 to 0.9 (gitoxin); 0.6 to 0.7; 0.4 to 0.5; and 0.3 to 0.4. •(IRA 1-Nov-2015)

Add the following:

•• **B.**

Solution A: Water

Solution B: Acetonitrile

Mobile phase: (See *Table 1.*)

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	80	20
35	70	30
45	60	40
48	60	40
48.1	80	20
50	80	20

Diluent: Water and acetonitrile (80:20)

Standard solution A: 0.1 mg/mL of USP Digoxin RS in *Diluent*

Standard solution B: Extract 0.5 g of USP Digitalis RS, accurately weighed, with 10 mL of 70% aqueous methanol by sonication at room temp for 15 min. Centrifuge at 4000 rpm for 3 min, and pass through a membrane filter of 0.45- μ m pore size.

Sample solution: Prepare a sample as directed in *Standard solution B.*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability.*)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm \times 7.5-cm; 3.5- μ m packing L1

Column temperature: 20 $^{\circ}$

Flow rate: 1.0 mL/min

Injection volume: 10 μ L

Analysis

Samples: *Standard solution A, Standard solution B, and Sample solution*

Using the chromatograms of *Standard solution A* and *Standard solution B* and *Table 2*, identify the retention times of the peaks corresponding to deacetyllanatoside C, digoxigenin-bis-digitoxoside, gitoxigenin, digitoxigenin, α -acetyldigoxin, β -acetyldigoxin, gitoxin, lanatoside A, and digitoxinin the *Sample solution*.

Table 2

Name	Relative Retention Time
Deacetyllanatoside C	0.57
Digoxigenin-bis-digitoxoside	0.59
Gitoxigenin	0.69
Digoxin (standard)	1.00
Digitoxigenin	1.48
α -Acetyldigoxin	1.70
β -Acetyldigoxin	1.95

Name	Relative Retention Time
Gitoxin	2.12
Lanatoside A	2.57
Digitoxin	2.68

*(IRA 1-Nov-2015)

ASSAY

Change to read:

● Procedure

Standard solution: Weigh the contents of 1 container of USP Digitalis RS to the nearest mg, either in the original container or in a weighing bottle, and transfer to a dry, hard-glass, glass-stoppered container or centrifuge tube of at least 50-mL capacity. Complete the weighing within 5 min after opening the ampul. Add a menstruum consisting of 4 volumes of alcohol and 1 volume of water so that the total volume of menstruum added corresponds to 10 mL for each g of powder. Insert the stopper, the upper third of which is greased lightly with petrolatum. Shake the mixture for 24 ± 2 h at $25 \pm 5^\circ$ by mechanical means, which continuously brings the solid material into fresh contact with the liquid phase. Immediately thereafter transfer, if necessary, to a centrifuge tube, centrifuge, and decant the supernatant tincture into a dry, hard-glass bottle having a tight closure. Preserve under refrigeration, and use within 30 days.

Sample solution: Transfer 5 g of Digitalis, reduced to a fine powder, to a hard-glass, glass-stoppered container or centrifuge tube of at least 50-mL capacity. Proceed as directed under *Standard solution*, beginning with "Add a menstruum". Preserve under refrigeration, and use within 30 days.

Pigeons: Use adult pigeons free from gross evidence of disease or emaciation, and of such weight that the heaviest weighs less than twice the weight of the lightest. Divide the pigeons into groups as nearly alike as practicable with respect to breed and weight so that the average weight of the group assigned by random choice to the *Standard solution* shall not differ by more than 30% from the average weight of the group assigned to the preparation to be assayed. Withhold food but not water for 16–28 h before use. Preparatory to injection, lightly anesthetize the pigeon with ether, and immobilize it; expose an alar vein, and cannulate with a suitable cannula. Maintain the anesthesia during cannulation and throughout the subsequent injection period at such a level that pain is absent, the pupillary and corneal reflexes are present, and the voluntary musculature is not relaxed beyond permitting the pigeon to make some voluntary movement occasionally.

Preparation of sample dilutions: On the day of the *Assay*, dilute portions of the *Standard solution* and of the preparation to be assayed (*Sample solution*) with isotonic sodium chloride solution in such a way that the estimated fatal dose of each dilution will be 15 mL/kg of body weight.

Injection of sample dilutions: Arrange to inject the appropriate sample dilution by suitable means such as a small-bore buret calibrated to 0.05 mL. Start the injection after ensuring the absence of air bubbles from the injection apparatus, by infusing, within a few seconds, a volume of the test dilution equivalent to 1 mL/kg of body weight. Repeat this dose at 5-min intervals thereafter until the pigeon dies of cardiac arrest. Use a total of

NLT 6 pigeons for the *Standard solution* and NLT 6 pigeons for the preparation to be assayed. If the average number of doses for any given dilution required to produce death is less than 13 or greater than 19, or if the larger exceeds the smaller in the same assay by more than 4 doses, regard these data as preliminary. Use them as a guide, and repeat with a fresh, higher or lower dilution. Complete the assay within 30 days for preservation of the *Standard solution* and *Sample solution*.

Calculation of potency: Tabulate and average the number of doses of the *Standard solution*, designating the average \bar{z}_S , and likewise obtain the corresponding average, \bar{z}_U , for the *Sample solution*. Compute the potency in USP Digitalis Units/mL (i.e., per 100 mg) of the *Sample solution* as:

$$\text{Potency} = \bar{z}_S R / \bar{z}_U$$

$$\text{Potency} = [\bar{z}_S \times (v_S/v_U)] / \bar{z}_U \text{ (IRA 1-Nov-2015)}$$

\bar{z}_S = average number of doses of the *Standard solution* (IRA 1-Nov-2015)

$R = v_S/v_U$

(IRA 1-Nov-2015)

v_S = number of USP Digitalis Units/mL of *Standard solution* dilution

v_U = volume of *Sample solution* per mL of dilution (mL)

\bar{z}_U = average number of doses of the *Sample solution* (IRA 1-Nov-2015)

Compute the confidence interval, L [see Equation (31) in *Design and Analysis of Biological Assays* (111), *The Confidence Interval and Limits of Potency, Confidence Intervals for Individual Assays*]. If L exceeds 0.30, repeat the Assay or inject more pigeons with one or both preparations until the confidence interval is 0.30 or less.

Acceptance criteria: The potency of Powdered Digitalis, calculated from that of the *Sample solution*, is satisfactory if the result is NLT 0.85 USP Digitalis Units and NMT 1.20 USP Digitalis Units/100 mg.

IMPURITIES

- **Articles of Botanical Origin** (561), *Acid-Insoluble Ash*: NMT 5.0%

SPECIFIC TESTS

- **Microbial Enumeration Tests** (61) and **Tests for Specified Microorganisms** (62): It meets the requirements of the tests for absence of *Salmonella species*.
- **Water Determination** (921), *Method III, Procedure for Articles of Botanical Origin*: NMT 5.0%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight, light-resistant containers. A package of a suitable desiccant may be enclosed in the container.

• (IRA 1-Nov-2015)

¹ One USP Digitalis Unit represents the potency of 100 mg of USP Digitalis RS.

BRIEFING

Digoxin, USP 38 page 3115. The following revisions are proposed:

1. Because of the discontinuation of USP Gitoxin RS, a new quantitative HPLC procedure is being added in the test for *Related Glycosides*.
2. *Identification* test C is being deleted to accommodate this revision.
3. In the *Assay*, the *Chromatographic system* is being updated with new column dimensions, column temperature, and flow rate.
4. The *USP Reference Standards* section is revised to remove USP Gitoxin RS.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

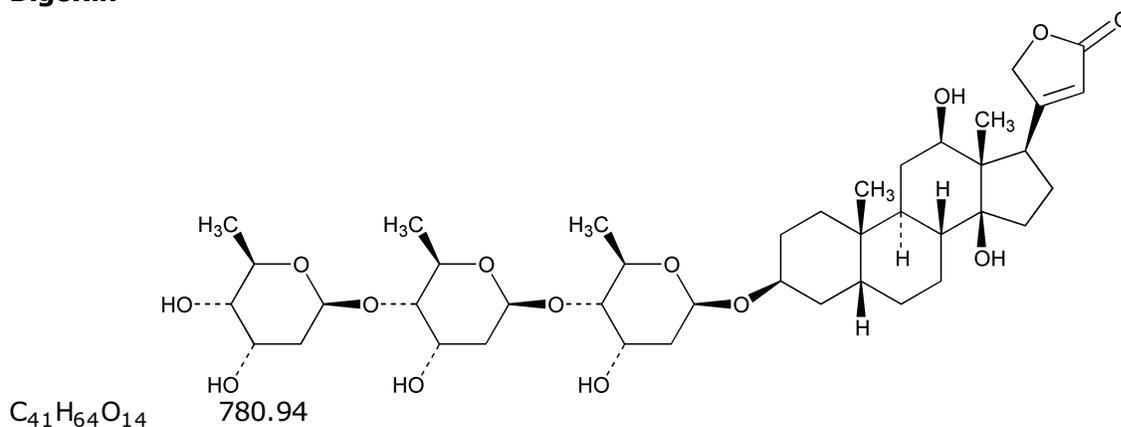

The comment period for this revision ends on July 31, 2015. In the absence of significant comments, it is proposed to implement this revision through an *Interim Revision Announcement*, with an official date of November 1, 2015.

BRIEFING

Omega-3-Acid Ethyl Esters, *USP 38* page 4627; *PF 40(5)* [Sept.–Oct. 2014]. On the basis of comments received on the proposed revisions to the Omega-3-Acid Ethyl Esters monograph published in *PF 40(5)*, the following additional changes are proposed:

1. The *Definition* section is revised by removing some of the statements related to acceptance criteria and purification processes because ingredients obtained through more than one purification process are now permitted in the monograph.
2. A new *Identification* test to distinguish the approved APIs from other non-approved lower concentrations of omega-3-acid ethyl esters is added. The new test is also linked to a labeling requirement to identify the type of omega-3-acid ethyl esters contained in the drug products as type A.
3. The *Assay* acceptance criteria is revised by adding a new column titled *Acceptance criteria II* in *Table 1*, for articles labeled as containing Omega-3-Acid Ethyl Esters type A.
4. A labeling requirement is added to the *Labeling* section to indicate whether the article contains Omega-3-Acid Ethyl Esters type A.
5. The *Impurities* test for the limit of lead, arsenic, cadmium, and mercury in the revised monograph is retained, based on the implementation of *Elemental Impurities—Limits* 〈 232 〉.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

The comment period for this revision ends on July 31, 2015. In the absence of significant comments, it is proposed to implement this revision through an *Interim Revision Announcement*, with an official date of November 1, 2015.

IMPURITIES

- **Fats and Fixed Oils** 〈 401 〉: NMT 0.1 ppm each of lead (Pb), cadmium (Cd), arsenic (As), and mercury (Hg)

Change to read:

- **Cholesterol**

Internal standard stock solution: 3 mg/mL of 5 α -cholestane in *n*-heptane. [Note—Prepare fresh before use.]

Internal standard solution: 0.3 mg/mL of 5 α -cholestane in *n*-heptane. [Note—Prepare fresh before use.]

Standard stock solution: 3.0 mg/mL of cholesterol in *n*-heptane. [Note—This solution is stable for 6 months stored in a freezer.] Transfer 1.0 mL of this solution to a 10.0-mL volumetric flask. Dilute with *n*-heptane to volume. [Note—Prepare this solution fresh daily.]

Standard solution: Transfer 1.0 mL of *Standard stock solution* and 1.0 mL of *Internal standard solution* to a 15-mL centrifuge tube. Proceed as directed in the *Sample solution* beginning with "Evaporate to dryness".

Alpha tocopherol stock solution: 1.5–2.0 mg/mL of USP Alpha Tocopherol RS in *n*-heptane. [Note—This solution is stable for 12 months stored in a freezer.]

System suitability solution: Mix 1.0 mL of *Standard stock solution*, 1.0 mL of *Internal standard stock solution*, and 2.0 mL of *Alpha tocopherol stock solution* in a 50-mL volumetric flask. Evaporate to dryness with the aid of heat, and dilute with ethyl acetate to volume. Dilute 1.0 mL of this solution with ethyl acetate to 10.0 mL. [Note—This solution is stable for 6 months stored in a freezer.]

Sample solution: Transfer 100 mg of Omega-3-Acid Ethyl Esters to a 15-mL centrifuge tube. Add 1.0 mL of *Internal standard solution*. Evaporate to dryness at about 50° with a gentle stream of nitrogen. Add 0.5 mL of 50% potassium hydroxide and 3 mL of alcohol, fill the tube with nitrogen, and cap. Heat the sample at 100° for 60 min, using a heating block. Cool for about 10 min. Add 6 mL of water to the tube, and shake for 1 min. Extract the solution four times with 2.5-mL portions of ethyl ether, using a vortex mixer or suitable shaker for 1 min for each extraction. Transfer and combine the extracts into a large centrifuge tube, and wash with 5 mL of water, mixing completely with gentle inversion. Remove the water phase, and add 5 mL of 0.5 M potassium hydroxide to the ether phase, mixing carefully to avoid an emulsion. Remove the potassium hydroxide, and add another 5 mL of water, mixing carefully. Transfer the ether phase to a small centrifuge tube. [Note—If an emulsion has occurred, a small amount of sodium chloride may be added to obtain a separation of the phases.] Evaporate the ether phase to dryness under a stream of nitrogen with careful heating. Dissolve the sample in 600 μ L of ethyl acetate, and mix well.

Transfer 200 µL of this solution to a sample vial, and dilute with ethyl acetate to about 2 mL.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm × 30-m capillary; coated with a G27 phase of 0.25-µm thickness

Temperatures

Injection port: 320°

Detector: 300°

Column: See the temperature program table below

•Table 2.

Table 2 • (IRA 1-Nov-2015)

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
170	0	170	1
170	4	320	1.5

Carrier gas: Helium

Flow rate: 1.3 mL/min

Injection volume: 1 µL

Injection type: Splitless injection system

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 1.2 between alpha tocopherol and cholesterol

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the content of total cholesterol in the portion of Omega-3-Acid Ethyl Esters taken:

$$\text{Result} = (R_U/R_S) \times (W_S/W_U)$$

R_U = peak area ratio of the cholesterol peak to the internal standard from the *Sample solution*

R_S = peak area ratio of the cholesterol peak to the internal standard from the *Standard solution*

W_S = weight of cholesterol in the *Standard solution* (mg)

W_U = weight of Omega-3-Acid Ethyl Esters in the *Sample solution* (g)

Acceptance criteria: NMT 3.0 mg/g

• Oligomers

Mobile phase: Tetrahydrofuran

System suitability solution: Monodocosahexaenoin, didocosahexaenoin, and tridocosahexaenoin in *Mobile phase*, with concentrations of about 0.5, 0.3, and 0.2 mg/mL, respectively. [Note—Suitable grades of monodocosahexaenoin, didocosahexaenoin, and tridocosahexaenoin may be obtained from Nu-Chek Prep.]

Sample solution 1: 5.0 mg/mL of Omega-3-Acid Ethyl Esters in tetrahydrofuran

Sample solution 2: [Note—Use *Sample solution 2* where the results of this test using *Sample solution 1* exceed the *Acceptance criteria* due to the presence of monoglycerides.] Weigh 50 mg of Omega-3-Acid Ethyl Esters into a quartz tube, add 1.5 mL of a 20-g/L solution of sodium hydroxide in methanol, cover with nitrogen, cap tightly with a polytef-lined cap, mix, and heat on a water bath for 7 min. Allow to cool. Add 2.0 mL of boron trichloride–methanol solution, cover with nitrogen, cap tightly, mix, and heat on a water bath for 30 min. Cool to 40°–50°, add 1 mL of isooctane, cap, and shake vigorously for NLT 30 s. Immediately add 5 mL of saturated sodium chloride solution, cover with nitrogen, cap, and shake thoroughly for NLT 15 s. Transfer the upper layer to a separate tube. Shake the methanol layer with 1 mL of isooctane. Wash the combined isooctane extracts with 2 quantities, each of 1 mL of water. Carefully evaporate the solvent under a stream of nitrogen, then add 10.0 mL of tetrahydrofuran to the residue. Add a small amount of anhydrous sodium sulfate, and filter.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: Differential refractometer

Columns: Three concatenated 7.8-mm × 30-cm columns; 7-μm packing L21, with pore sizes in the range 5–50 nm, arranged with decreasing pore size from the injector to the detector to fulfill the system suitability requirements.

Flow rate: 0.8 mL/min

Injection volume: 40 μL

System suitability

Sample: *System suitability solution*

Suitability requirements

Elution order: Tridocosahexaenoin, didocosahexaenoin, and monodocosahexaenoin

Resolution: NLT 2.0 between monodocosahexaenoin and didocosahexaenoin; NLT 1.0 between didocosahexaenoin and tridocosahexaenoin

Analysis

Samples: *Sample solution 1* and *Sample solution 2*

Measure the areas of the major peaks.

Calculate the percentage of oligomers in the portion of Omega-3-Acid Ethyl Esters taken to prepare *Sample solution 1*:

$$\text{Result} = (r_I/r_T) \times 100$$

r_I sum of the areas of the peaks with a retention time less than that of the ethyl esters peaks

r_T sum of the areas of all peaks

Calculate the percentage of oligomers in the portion of Omega-3-Acid Ethyl Esters taken to prepare *Sample solution 2*:

$$\text{Result} = (r_I/r_T) \times 100$$

r_I sum of the areas of all peaks with a retention time less than that of the methyl esters peaks

r_T sum of the areas of all peaks

Acceptance criteria: NMT 1.0% of oligomers

- **Limit of Dioxins, Furans, and Polychlorinated Biphenyls (PCBs):** Determine the content of polychlorinated dibenzo-para-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs) by method No. 1613 revision B of the Environmental Protection Agency. Determine the content of polychlorinated biphenyls (PCBs) by method No. 1668 revision A of the Environmental Protection Agency.

Acceptance criteria: The sum of PCDDs and PCDFs is NMT 1 pg/g of WHO toxic equivalents. The sum of PCBs (polychlorinated biphenyls, IUPAC congeners PCB-28, PCB-52, PCB-101, and PCB-118, PCB-138, PCB-153, PCB-180) is NMT 0.5 ppm.

Change to read:

- **Limit of Total Unidentified Fatty Acids Ethyl Esters**

● [Note—This test is not required for the articles labeled as Omega-3-Acid Ethyl Esters type A.]

● (IRA 1-Nov-2015)

From the chromatogram obtained with *Test solution 4* in the *Assay for Content of EPAee, DHAee, and Total Omega-3-Acids Ethyl Esters*, determine the peak area of the largest single unidentified peak with a relative retention time different from those in the following table

● *Table 3.*

Table 3 ● (IRA 1-Nov-2015)

Identified Ethyl Ester	Relative Retention Time
Phytanic acid	0.416
C16:3 n-4	0.431
C16:4 n-1	0.468
C18:3 n-6	0.557
C18:3 n-4	0.574
C18:3 n-3	0.585
C18:4 n-3	0.608
C18:4 n-1	0.618
Furan acid 5	0.691
C19:5	0.710
C20:3 n-6	0.720
C20:4 n-6	0.736
Furan acid 7	0.744
C20:4 n-3	0.777
Furan acid 8	0.783
EPA	0.796
Furan acid 9	0.867
C21:5 n-3	0.889

Identified Ethyl Ester	Relative Retention Time
C22:4	0.917
Furan acid 10	0.922
C22:5 n-6	0.939
Furan acid 11	0.963
C22:5 n-3	0.977
DHA	1.000

Calculate the content of unidentified fatty acids ethyl esters in area percentage:

$$\text{Result} = 100 - (100 \times \Sigma A_{iee}/r_T)$$

A_{iee} = peak area of each identified ethyl ester in the table above

★*Table 3*★(IRA 1-Nov-2015)

r_T = sum of the areas of all peaks except solvents and BHT

Acceptance criteria: The area of the largest single unidentified peak is NMT 0.5% of the total area. The total area of unidentified peaks as calculated above is NMT 2%.

Add the following:

●● **Limit of Non-Omega-3-Acid Ethyl Esters**

[Note—This test is only required for the articles labeled as Omega-3-Acid Ethyl Esters type A.]

From the chromatogram obtained with *Test solution 4* in the *Assay for Content of EPA_{ee}, DHA_{ee}, and Total Omega-3-Acids Ethyl Esters*, calculate the amounts of C18:1 n-9 ethyl ester and C20:4 n-6 ethyl ester in the portion of Omega-3-Acid Ethyl Esters taken:

$$\text{Result} = (A_{iep}/r_T) \times 100$$

A_{iep} = peak area of C18:1 n-9 ethyl ester or C20:4 n-6 ethyl ester

r_T = sum of the areas of all peaks except solvents and BHT

Acceptance criteria

C18:1 n-9 ethyl ester: NMT 6.0%

C20:4 n-6 ethyl ester: NMT 4.0%

★(IRA 1-Nov-2015)

SPECIFIC TESTS

- **Fats and Fixed Oils** (401), *Acid Value:* NMT 2.0 mg of KOH/g
- **Fats and Fixed Oils** (401), *Anisidine Value:* NMT 15
- **Fats and Fixed Oils** (401), *Peroxide Value :* NMT 10.0
- **Absorbance**

Sample solution: Transfer 300 mg, accurately weighed, to a 50-mL volumetric flask.

Dissolve in and dilute immediately with isooctane to volume. Pipet 2.0 mL into a 50-mL volumetric flask, and dilute with isooctane to volume.

Acceptance criteria: NMT 0.55, determined at 233 nm, with isooctane being used as the blank

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight, light-resistant containers under a nitrogen atmosphere. Store at controlled room temperature.

Change to read:

- **Labeling:** The label states the content of DHA ethyl ester and EPA ethyl ester in mg/g, the sum of the EPA and DHA ethyl esters contents in mg/g, and the content of the total omega-3-acid ethyl esters in percentage (w/w). It also states the name of any added antioxidant.
- Articles intended to meet *Acceptance criteria II* of the *Assay* and the *Limit of Non-Omega-3-Acid Ethyl Esters* are labeled as Omega-3-Acid Ethyl Esters type A. (IRA 1-Nov-2015)

BRIEFING

Omega-3-Acid Ethyl Esters Capsules, *USP 38* page 4630; *PF 40(5)* [Sept.–Oct. 2014]. On the basis of comments received on the proposed revision published in *PF 40(5)*, the following additional changes are proposed:

1. Add a new *Identification* test to distinguish the Capsule contents with APIs that contain different concentrations of Omega-3-Acid Ethyl Esters with reference to the *Acceptance criteria in Specific Tests, Concentration of Omega-3-Acid Ethyl Esters*.
2. Add the *Concentration of Omega-3-Acid Ethyl Esters* test in *Specific Tests*. The *Acceptance criteria* for this test will include *Acceptance criteria I*, for APIs having NLT 90% (w/w) of total omega-3-acid ethyl esters, and *Acceptance criteria II*, for APIs having NLT 78% (w/w) of total omega-3-acid ethyl esters, which is intended for Capsules labeled as containing Omega-3-Acid Ethyl Esters type A.
3. Add a requirement to the *Labeling* section to indicate whether the Capsules contain Omega-3-Acid Ethyl Esters type A.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

The comment period for this revision ends on July 31, 2015. In the absence of significant comments, it is proposed to implement this revision through an *Interim Revision Announcement*, with an official date of November 1, 2015.

System suitability solution: 5.5 mg/mL of docosahexaenoic acid methyl ester and 0.5 mg/mL of tetracos-15-enoic acid methyl ester in *Antioxidant solution*

Standard solution: Dissolve 60.0 mg of USP Docosahexaenoic Acid Ethyl Ester RS and 90.0 mg of USP Eicosapentaenoic Acid Ethyl Ester RS in 10.0 mL of *Internal standard solution*.

• **Retention time identification solution:** Prepare a mixture containing suitable concentrations of alpha-linolenic acid ethyl ester (C18:3 n-3, EE), moroctic acid ethyl ester (C18:4 n-3, EE), eicosatetraenoic acid ethyl ester (C20:4 n-3, EE), heneicosapentaenoic acid ethyl ester (C21:5 n-3, EE), and docosapentaenoic acid ethyl ester (C22:5 n-3, EE) in *Antioxidant solution*.¹•(IRA 1-Nov-2015)

Sample solution: Weigh NLT 10 Capsules in a tared weighing bottle. With a sharp blade, carefully open the Capsules, without loss of shell material, and transfer the combined Capsule contents to a 100-mL beaker. Remove any adhering substance from the emptied Capsules by washing with several small portions of diethyl ether. Discard the washings, and allow the empty Capsules to air-dry over a period of NMT 30 min, taking precautions to avoid uptake or loss of moisture. Weigh the empty Capsules in the original tared weighing bottle, and calculate the average fill weight per Capsule (W_{AF}). Transfer ~~250 mg of the combined Capsule contents~~

•an amount of the combined Capsule contents equivalent to 225 mg of the labeled amount of total omega-3-acid ethyl esters•(IRA 1-Nov-2015)

to a suitable flask, and dissolve with 10.0 mL of *Internal standard solution*.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm × 25–50-m fused silica capillary; coated with a 0.25-µm film of G16

Temperatures

Injection port: 250°

Detector: 270°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
170	0	170	2
170	3.5	255	9

Carrier gas: Hydrogen or helium

Linear velocity: Adjust to obtain a retention time for docosahexaenoic acid ethyl ester of 26 ± 3 min.

Injection volume: 1 µL

Injection type: Split; split ratio,1:220

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.2 between docosahexaenoic acid methyl ester and tetracos-15-enoic acid methyl ester peaks, *System suitability solution*

Relative standard deviation: NMT 2.0% for the ratios of the peak responses of DHAee and EPAee relative to the internal standard, *Standard solution*

Analysis

Samples: *Standard solution*,

• *Retention time identification solution*, • (IRA 1-Nov-2015)

and *Sample solution*

• Identify the retention times of the relevant fatty acid ethyl esters by comparing the peaks in the chromatogram of the *Sample solution* with those in the chromatogram of the *Retention time identification solution*. • (IRA 1-Nov-2015)

Calculate the content, in mg/g, of EPAee and DHAee in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U)$$

R_U = peak area ratio of the EPAee or DHAee peak to the internal standard peak from the *Sample solution*

R_S = peak area ratio of the EPAee or DHAee peak to the internal standard peak from the *Standard solution*

C_S = concentration of USP Eicosapentaenoic Acid Ethyl Ester RS or USP Docosahexaenoic Acid Ethyl Ester RS in the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (g/mL)

Acceptance criteria: *Table 2*

Table 2

Name	Acceptance Criteria, NLT (mg/g)	Acceptance Criteria, NMT (mg/g)
EPAee	430	495
DHAee	347	403
EPAee + DHAee	800	880

• • (IRA 1-Nov-2015)

Calculate the percentage of the labeled sum of EPAee and DHAee in the portion of Capsules taken:

$$\text{Result} = (EPAee + DHAee) \times W_{AF} \times (100/L)$$

$EPAee$ = content of EPAee in the portion of Capsules taken (mg/g)

$DHAee$ = content of DHAee in the portion of Capsules taken (mg/g)

W_{AF} = average fill weight of the Capsules taken (g)

L = sum of the labeled content of EPAee and DHAee (mg/Capsule)

• Calculate the percentage of the labeled amount of total omega-3-acids ethyl esters in the

portion of Capsules taken:

$$\text{Result} = \{r_{FA\Omega-3ee} \times [(EPAee + DHAee)/(r_{EPAee} + r_{DHAee})] + EPAee + DHAee\} \times W_{AF} \times (100/L)$$

$r_{FA\Omega-3ee}$ = sum of the peak areas of alpha-linolenic acid ethyl ester (C18:3 n₃, EE), morotic acid ethyl ester (C18:4 n₃, EE), eicosatetraenoic acid ethyl ester (C20:4 n₃, EE), heneicosapentaenoic acid ethyl ester (C21:5 n₃, EE), and docosapentaenoic acid ethyl ester (C22:5 n₃, EE) from the *Sample solution*

$EPAee$ = content of EPAee (mg/g)

$DHAee$ = content of DHAee (mg/g)

r_{EPAee} = peak area of EPAee from the *Sample solution*

r_{DHAee} = peak area of DHAee from the *Sample solution*

W_{AF} = average fill weight of the Capsules taken (g)

L = label claim of total omega-3-acids ethyl esters (g/Capsule)

Acceptance criteria: 95.0%–105.0% of the labeled sum of EPAee and DHAee and NLT 95% of the labeled amount of total omega-3-acid ethyl esters per Capsule (IRA 1-Nov-2015)

PERFORMANCE TESTS

- **Uniformity of Dosage Units** { 905 }, *Weight Variation*: Meet the requirements
- **Disintegration** { 701 }
 - Medium, tier 1:** Water
 - Medium, tier 2:** Simulated gastric fluid TS
 - Time:** 30 min
 - Analysis:** Perform the test with water as *Medium, tier 1*. Repeat the test with simulated gastric fluid TS as *Medium, tier 2*, if the disintegration time is more than 30 min in *Medium, tier 1*.
 - Acceptance criteria:** Meet the requirements

IMPURITIES

- **Oligomers**
 - Mobile phase:** Tetrahydrofuran
 - System suitability solution:** Monodocosahexaenoin, didocosahexaenoin, and tridocosahexaenoin in *Mobile phase*, with concentrations of about 0.5, 0.3, and 0.2 mg/mL, respectively. [Note—Suitable grades of monodocosahexaenoin, didocosahexaenoin, and tridocosahexaenoin may be obtained from Nu-Chek Prep.]
 - Sample solution 1:** 5.0 mg/mL of the Capsule contents in tetrahydrofuran
 - Sample solution 2:** [Note—Use *Sample solution 2* where the results of this test using *Sample solution 1* exceed the *Acceptance criteria* due to the presence of monoglycerides.] Weigh 50 mg of the Capsule contents into a quartz tube, add 1.5 mL of a 20-g/L solution of sodium hydroxide in methanol, cover with nitrogen, cap tightly with a polytef-lined cap, mix, and heat on a water bath for 7 min. Allow to cool. Add 2.0 mL of boron trichloride–methanol solution, cover with nitrogen, cap tightly, mix, and heat on a water bath for 30 min. Cool to 40°–50°, add 1 mL of isooctane, cap, and shake vigorously for NLT 30 s. Immediately add 5 mL of saturated sodium chloride solution, cover with

nitrogen, cap, and shake thoroughly for NLT 15 s. Transfer the upper layer to a separate tube. Shake the methanol layer with 1 mL of isoctane. Wash the combined isoctane extracts with 2 quantities, each of 1 mL of water. Carefully evaporate the solvent under a stream of nitrogen, then add 10.0 mL of tetrahydrofuran to the residue. Add a small amount of anhydrous sodium sulfate, and filter.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: Differential refractometer

Columns: Three concatenated 7.8-mm × 30-cm columns; 7-μm packing L21, with pore sizes in the range 5–50 nm, arranged with decreasing pore size from the injector to the detector to fulfill the system suitability requirements

Flow rate: 0.8 mL/min

Injection volume: 40 μL

System suitability

Sample: *System suitability solution*

Suitability requirements

Elution order: Tridocosahexaenoin, didocosahexaenoin, and monodocosahexaenoin

Resolution: NLT 2.0 between monodocosahexaenoin and didocosahexaenoin; NLT 1.0 between didocosahexaenoin and tridocosahexaenoin

Analysis

Samples: *Sample solution 1* and *Sample solution 2*

Measure the areas of the major peaks.

Calculate the percentage of oligomers in the portion of omega-3-acid ethyl esters taken to prepare *Sample solution 1*:

$$\text{Result} = (r_I/r_T) \times 100$$

r_I sum of the peak areas with retention times less than that of the ethyl esters peak

r_T sum of the areas of all peaks

Calculate the percentage of oligomers in the portion of the Capsules contents taken to prepare *Sample solution 2*:

$$\text{Result} = (r_I/r_T) \times 100$$

r_I sum of the peak areas with retention times less than that of the methyl esters peak

r_T sum of the areas of all peaks

Acceptance criteria: NMT 2% of oligomers

SPECIFIC TESTS

Add the following:

•• Concentration of Omega-3-Acid Ethyl Esters

Antioxidant solution, Internal standard solution, System suitability solution, Standard solution, Retention time identification solution, Sample solution, Chromatographic system, System suitability, and Analysis: Proceed as directed in the *Assay for Content of EPAee and DHAee and Total Omega-3-Acids Ethyl Esters*.

Calculate the concentration, in mg/g, of EPAee and DHAee in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U)$$

R_U = peak area ratio of the EPAee or DHAee peak to the internal standard peak from the *Sample solution*

R_S = peak area ratio of the EPAee or DHAee peak to the internal standard peak from the *Standard solution*

C_S = concentration of USP Eicosapentaenoic Acid Ethyl Ester RS or USP Docosahexaenoic Acid Ethyl Ester RS in the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (g/mL)

Calculate the concentration, in mg/g, of total omega-3-acids ethyl esters in the portion of Capsules taken:

$$\text{Result} = r_{FA\omega-3ee} \times [(EPAee + DHAee)/(r_{EPAee} + r_{DHAee})] + EPAee + DHAee$$

$r_{FA\omega-3ee}$ = sum of the peak areas of alpha-linolenic acid ethyl ester (C18:3 n-3, EE), moroctic acid ethyl ester (C18:4 n-3, EE), eicosatetraenoic acid ethyl ester (C20:4 n-3, EE), heneicosapentaenoic acid ethyl ester (C21:5 n-3, EE), and docosapentaenoic acid ethyl ester (C22:5 n-3, EE) from the *Sample solution*

$EPAee$ = content of EPAee (mg/g)

$DHAee$ = content of DHAee (mg/g)

r_{EPAee} = peak area of EPAee from the *Sample solution*

r_{DHAee} = peak area of DHAee from the *Sample solution*

Acceptance criteria: It meets the requirements in *Table 2*. Capsules labeled as containing Omega-3-Acid Ethyl Esters type A meet *Acceptance criteria II*.

Table 2

Name	Acceptance criteria I		Acceptance criteria II (for Capsules labeled as containing Omega-3-Acid Ethyl Esters type A)	
	NLT	NMT	NLT	NMT
EPAee	430 mg/g	495 mg/g	365 mg/g	435 mg/g
DHAee	347 mg/g	403 mg/g	290 mg/g	360 mg/g
EPAee + DHAee	800 mg/g	880 mg/g	700 mg/g	749 mg/g
Total omega-3-acid ethyl esters ^a	90% (w/w)	—	78% (w/w)	—

^a Sum of alpha-linolenic acid ethyl ester (C18:3 n-3, EE), moroctic acid ethyl ester (C18:4 n-3, EE), eicosatetraenoic acid ethyl ester (C20:4 n-3, EE), eicosapentaenoic acid ethyl ester (EPAee) (C20:5 n-3, EE), heneicosapentaenoic acid ethyl ester (C21:5 n-3, EE), docosapentaenoic acid ethyl ester (C22:5 n-3, EE), and docosahexaenoic acid ethyl ester (DHAee) (C22:6 n-3, EE).

- **Fats and Fixed Oils** 〈 401 〉, *Acid Value*

Sample solution: Dissolve about 5.0 g of the oil, accurately weighed, in 100 mL of a mixture of equal volumes of alcohol and ether (which has been neutralized to phenolphthalein with 0.1 M potassium hydroxide) contained in a flask.

Acceptance criteria: NMT 2.0 mg KOH/g

- **Fats and Fixed Oils** 〈 401 〉, *Anisidine Value:* NMT 25

- **Fats and Fixed Oils** 〈 401 〉, *Peroxide Value:* NMT 10 mEq/kg

- **Absorbance**

Sample solution: Transfer 300 mg, accurately weighed, to a 50-mL volumetric flask.

Dissolve in and dilute immediately with isooctane to volume. Pipet 2.0 mL into a 50-mL volumetric flask, and dilute with isooctane to volume.

Acceptance criteria: NMT 0.60, determined at 233 nm in a 1-cm cell, with isooctane being used as the blank

- **Microbial Enumeration Tests** 〈 61 〉: NMT 10^3 cfu/g for the total aerobic microbial count, and NMT 10^2 cfu/g for the total combined yeasts and molds count.

- **Tests for Specified Microorganisms** 〈 62 〉: Meet the requirements for absence of *Escherichia coli* in 1 g and for absence of *Salmonella* species in 10 g

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers, and store at controlled room temperature. Do not freeze. Protect from light.

Change to read:

- **Labeling:** The label states the amount of docosahexaenoic acid (DHA) ethyl ester and eicosapentaenoic acid (EPA) ethyl ester, and the minimum amount of total content of omega-3-acid ethyl esters in mg/Capsule.

● Capsules intended to meet *Acceptance criteria II* of the test for *Concentration of Omega-3-Acid Ethyl Esters* are labeled as containing Omega-3-Acid Ethyl Esters type A.

● (IRA 1-Nov-2015)

It also states the name and content of any added antioxidant.

BRIEFING

Oxycodone Hydrochloride, *USP 38* page 4705. On the basis of comments received, it is proposed to make the following changes:

1. Add *Identification* test C based on the retention time agreement using the existing *Assay* procedure.
2. Update the *Run time* for the *Assay* to be consistent with the current *USP* style.
3. Move the *Limit of Alcohol* test from the *Organic Impurities* section to another section under *Impurities*. The designations for the existing procedures under *Organic Impurities* are revised accordingly.
4. Add *Procedure 3* to the *Organic Impurities* section to accommodate products approved with noroxycodone as a potential impurity. The proposed HPLC procedure is based on analyses performed using the Inertsil ODS-3 brand of L1 column. The typical retention time for oxycodone is about 38 min.
5. Add chemical names of impurities to *Table 1* and update the chemical information in the *USP Reference Standards* section.
6. Add one Reference Standard to the *USP Reference Standards* section to support the proposed test for *Organic Impurities, Procedure 3*.
7. Add a *Labeling* section to indicate with which organic impurity procedure the article complies.

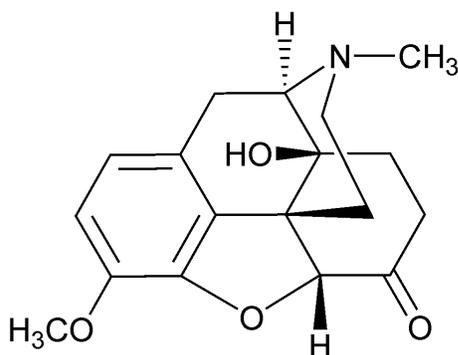

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

The comment period for this revision ends on July 31, 2015. In the absence of significant adverse comments, it is proposed to implement this revision through an *Interim Revision Announcement*, with an official date of November 1, 2015.

(SM2: H. Cai.)

Correspondence Number—C148391

Comment deadline: July 31, 2015

Oxycodone Hydrochloride

• HCl

$C_{18}H_{21}NO_4 \cdot HCl$ 351.82

Morphinan-6-one, 4,5-epoxy-14-hydroxy-3-methoxy-17-methyl-, hydrochloride, (5 α)-;
4,5 α -Epoxy-14-hydroxy-3-methoxy-17-methylmorphinan-6-one hydrochloride [124-90-3].

DEFINITION

Oxycodone Hydrochloride contains NLT 97.0% and NMT 103.0% of oxycodone hydrochloride ($C_{18}H_{21}NO_4 \cdot HCl$), calculated on the anhydrous, solvent-free basis.

IDENTIFICATION

• A. Procedure

Sample solution: Dissolve 250 mg in 25 mL of water.

Analysis: Render the 25 mL of *Sample solution* alkaline with 6 N ammonium hydroxide. Allow the mixture to stand until a precipitate is formed. Filter, wash the precipitate with 50 mL of cold water, and dry at 105° for 2 h.

Acceptance criteria: The precipitate melts between 218° and 223° , but the range between the beginning and the end of melting does not exceed 2° (see *Melting Range or Temperature* 〈 741 〉).

- **B. Infrared Absorption** 〈 197K 〉: Use a portion of the dried precipitate obtained in *Identification test A*.

Add the following:

- **C.** The retention time of the oxycodone peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. •(IRA 1-Nov-2015)

ASSAY

Change to read:

• Procedure

Mobile phase: 0.005 M sodium 1-hexanesulfonate, methanol, triethylamine, and phosphoric acid (900:100:2:5). Adjust with 50% sodium hydroxide solution to a pH of 2.5 ± 0.1 , and filter.

System suitability solution: 13 $\mu\text{g/mL}$ of codeine phosphate and 9 $\mu\text{g/mL}$ of oxycodone in *Mobile phase*

Standard solution: 0.9 mg/mL of USP Oxycodone RS in *Mobile phase*

Sample solution: 1 mg/mL of Oxycodone Hydrochloride in *Mobile phase*. [Note—Pass a portion of this solution through a filter of 0.5- μm or finer pore size, and use the filtrate as the *Sample solution*.]

Chromatographic system

System suitability solution: 100 μ g/mL of USP Oxycodone Hydrochloride RS and 5 μ g/mL

each of USP Oxycodone Related Compound A RS and USP Oxycodone Related Compound C RS in *Diluent*

Standard solution: 50 mg/mL of USP Oxycodone Hydrochloride RS and 0.5 µg/mL each of USP Oxycodone Related Compound A RS and USP Oxycodone Related Compound C RS in *Diluent*

Sample solution: 50 mg/mL of Oxycodone Hydrochloride in *Diluent*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 3.0-mm × 15-cm; 3.5-µm packing L1

Column temperature: 40°

Flow rate: 0.7 mL/min

Injection volume: 5 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for oxycodone related compound C, oxycodone related compound A, and oxycodone are about 0.44, about 0.85, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 4 between oxycodone related compound A and oxycodone related compound C, *System suitability solution*

Tailing factor: NMT 2.0, *System suitability solution*

Relative standard deviation: NMT 20% for oxycodone related compound A and oxycodone related compound C, *Standard solution*

Analysis

Samples: *Diluent*, *Standard solution*, *Unspiked oxycodone hydrochloride solution*, and *Sample solution*

Calculate the percentage of oxycodone related compound A and oxycodone related compound C in the portion of Oxycodone Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of oxycodone related compound A or oxycodone related compound C from the *Sample solution*

r_S peak response of oxycodone related compound A or oxycodone related compound C minus the response of the *Unspiked oxycodone hydrochloride solution* from the *Standard solution*

C_S concentration of USP Oxycodone Related Compound A RS or USP Oxycodone Related Compound C RS in the *Standard solution* (mg/mL)

C_U concentration of Oxycodone Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Oxycodone related compound C ^a	0.44	0.001
Oxycodone related compound A ^b	0.85	0.001
Oxycodone	1.0	—
^a Codeinone (C ₁₈ H ₁₉ NO ₃).		
^b 14-Hydroxycodone (C ₁₈ H ₂₁ NO ₄).		

(Procedure 3

2 (IRA 1-Nov-2015)

postponed indefinitely)

Procedure 3

Buffer: Mix 4.0 mL of heptafluorobutyric acid with 2000 mL of water and adjust with ammonium hydroxide to a pH of 2.3 ± 0.1.

Solution A: Methanol and *Buffer* (23:77)

Solution B: Methanol, tetrahydrofuran, and *Buffer* (20:3:77)

Mobile phase: See *Table 3*.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	100	0
2	100	0
30	0	100
55	0	100
55.1	100	0
65	100	0

Diluent: Mix 3.0 mL of trifluoroacetic acid with 1000 mL of water.

System suitability solution: 0.0067 mg/mL of USP Hydrocodone RS, 0.0067 mg/mL of USP Oxycodone Related Compound A RS, and 3.0 mg/mL of USP Oxycodone Hydrochloride RS in *Diluent*

Standard solution: 0.0067 mg/mL of USP Hydrocodone RS in *Diluent*

Sample solution: 3.0 mg/mL of Oxycodone Hydrochloride in *Diluent*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 3-µm packing L1

In-Process Revision

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) proposed revisions placed directly under *In-Process Revision*, or (2) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the Scientific Liaison using the contact information appearing at the end of each proposal. Information on how to comment can be found under the "Participation" section of www.usp.org. It is important to send comments promptly, using the comment deadline listed after each title.

Briefings Each Proposal is preceded by a Briefing in the following format:

Briefing
Name of Item , citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Expert Committee acronym (the name of the Scientific Liaison who handled the particular monograph or general chapter, and the USP tracking correspondence number, as shown in the example below:
(Expert Committee Acronym: Liaison Name.)
Correspondence Number—CXXXXX

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed out. All *USP–NF* revisions use the following symbols that indicate the final destination of the official text:

•new text•

if slated for an *IRA*;

▲new text▲

if slated for *USP–NF*;

■new text■

if slated for a *Supplement to USP–NF*. The same symbols indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as

• •
, or

■ ■
, or

▲▲

, it means that text has been deleted and no new text was proposed to replace it.

In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA*, *Supplement*, or the *USP* or *NF* as the publication where the revision will appear if approved. For example, ■

2S (*USP 34*) indicates that the proposed revision is slated for the *Second Supplement to USP 34*, and ▲

USP35 and  *NF30* indicates that the revisions are proposed for *USP 35* and *NF 30*, respectively.

Official Title Changes Where the specification "**Monograph title change**" is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

BRIEFING

《 17 》 **Prescription Container Labeling**, *USP 38* page 96. The Nomenclature, Safety, and Labeling Expert Committee proposes revisions to this general chapter to accomplish two objectives:

1. To point to methodologies that simplify administration instructions for oral dosage forms.
2. To provide information on alternative-access methods that can meet the needs of visually impaired individuals.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style.

《 17 》 PRESCRIPTION CONTAINER LABELING

Change to read:

INTRODUCTION

Medication misuse has resulted in more than 1 million adverse drug events per year in the United States. Patients' best source (and often only source) of information regarding the medications they have been prescribed is on the prescription container label. Although other written information and oral counseling ~~sometimes~~

■ ■ 1S (*USP39*)

may be available, the prescription container label must fulfill the professional obligations of the prescriber and pharmacist. These obligations include giving patients the ~~most~~

■ ■ 1S (*USP39*)

essential information ~~needed~~

■ they will need ■ 1S (*USP39*)

to understand how to safely and appropriately use the medication and

■ how ■ 1S (*USP39*)

to adhere to the prescribed medication regimen.

Inadequate understanding of prescription directions for use and auxiliary information

■ provided ■ 1S (*USP39*)

on dispensed containers is widespread. Studies have found that 46% of patients misunderstood one or more dosage instructions, and 56% misunderstood one or more auxiliary warnings. The problem of misunderstanding is particularly

■ common and ■ 1S (USP39)

troublesome in patients with low or marginal literacy and in patients receiving multiple medications that are scheduled for administration using unnecessarily complex, nonstandardized time periods. In one study, patients with low literacy were 34 times more likely to misinterpret prescription medication warning labels. However, even patients with adequate literacy often misunderstand common prescription directions and warnings. In addition, there is great variability in the actual auxiliary warning and supplemental instructional information that has been applied by individual practitioners to the same prescription. The specific evidence to support a given auxiliary statement often is unclear, and patients often ignore such information. The essential

■ 1S (USP39)

need for, and benefit of, auxiliary label information (both text and icons) in

■ for ■ 1S (USP39)

improving patient understanding about safe and appropriate use of their medications vs-

■ requires further study in comparison to ■ 1S (USP39)

explicit, simplified language alone. ~~require further study.~~

■ 1S (USP39)

Lack of universal standards for labeling on dispensed prescription containers is a root cause for

■ of ■ 1S (USP39)

patient misunderstanding, nonadherence, and medication errors. ~~On May 18, 2007, the USP Safe Medication Use Expert Committee established an Advisory Panel to: 1) determine optimal prescription label content and format to promote safe medication use by critically reviewing factors that promote or distract from patient understanding of prescription medication instructions and 2) create universal prescription label standards for format/appearance and content/language.~~

~~In November 2009, the Health Literacy and Prescription Container Labeling Advisory Panel presented its recommendations to the Safe Medication Use Expert Committee, which then requested that USP develop~~

■ USP developed ■ 1S (USP39)

patient-centered label standards for the format, appearance, content, and language of prescription medication instructions to promote patient understanding. These recommendations form the basis of this general chapter.

Note—These standards do not apply when a prescription drug will be administered to a patient by licensed personnel who are acting within their scope of practice.

Change to read:

PRESCRIPTION CONTAINER LABEL STANDARDS TO PROMOTE PATIENT UNDERSTANDING

Organize the Prescription Label in a Patient-Centered Manner

Information shall be organized in a way that best reflects how most patients seek out and understand medication instructions. Prescription container labeling should feature only the most important patient information needed for safe and effective understanding and use.

Emphasize Instructions and Other Information Important to Patients

Prominently display information that is critical for the patient's safe and effective use of the medicine. At the top of the label, specify the patient's name, the drug name (spell out full generic and brand name) and

■ drug ■ 1S (USP39)

strength, and explicit clear directions for use in simple language.

The prescription directions should follow a standard format so

■ that ■ 1S (USP39)

the patient can expect that each element will be

■ presented ■ 1S (USP39)

in a regimented

■ specific, predictable ■ 1S (USP39)

order each time a prescription is received.

■ Use of a methodology that simplifies the administration instructions for the patient's medication should improve the individual's ability to understand prescription instructions, to take the correct dose, and to organize multi-drug regimens. Employing best practices of patient-centered instructions—which utilize the principles of health literacy, medication therapy management, and education, to explicitly describe how to take daily-use, solid dose-form medications—has resulted in improved patient understanding. One such patient-centered method is the universal medication schedule (UMS). The UMS shifts medication-taking into four standardized time periods (morning, noon, evening, bedtime) and uses simplified language and formatting to promote understanding (e.g., “take 1 pill in the morning and 1 pill at bedtime” rather than “take one tablet twice daily”). Such methods may be particularly useful for simplifying daily medication regimens that include multiple oral therapies. [Note—The word “pill” is used in the UMS to enhance health literacy and may not reflect a USP definition for an oral dosage form (see *Compendial Nomenclature, Nomenclature Guidelines* on the USP website at www.usp.org/usp-nf/development-process).]

When oral liquid dosage forms are prescribed, the appropriate dosing component (e.g., oral syringe, dosing cup) shall be provided to the patient or caregiver to accurately measure and administer the oral medication. The graduations on the component shall be legible and indelible, and the associated volume markings shall be in metric units and limited to a single measurement scale that corresponds with the dose instructions on the prescription container label (see

Packaging and Storage Requirements (659)). ■ 1S (USP39)

Other, less-critical but important content (e.g., pharmacy name and phone number, prescriber name, fill date, refill information, expiration date, prescription number, drug quantity, physical description, and evidence-based auxiliary information) should not supersede critical patient information. Such less-critical information should be placed away from dosing instructions (e.g., at the bottom of the label or in another less prominent location) because it ~~distracts~~

■ can distract ■ 1S (USP39)

patients, which can impair their recognition and understanding.

Simplify Language

The language on the label should be clear, simplified, concise, and familiar, and should be used in a standardized manner. Only common terms and sentences should be used. Do not use unfamiliar words (including Latin terms) or medical jargon.

Use of readability formulas and software is not recommended to simplify

■ for simplifying ■ 1S (USP39)

short excerpts of text like

■ such as ■ 1S (USP39)

those on prescription labels. Instead, use simplified, standardized sentences that have been

■ were ■ 1S (USP39)

developed to ensure ease of understanding the instructions correctly

■ ■ 1S (USP39)

by seeking feedback from samples of diverse consumers.

■ Such language will promote correct understanding of the instructions. ■ 1S (USP39)

Give Explicit Instructions

Instructions for use (i.e., the SIG or signatur) should clearly separate the dose itself from the timing of each dose in order to explicitly convey the number of dosage units to be taken and when (e.g., specific time periods each day such as morning, noon, evening, and bedtime). Instructions shall include specifics on time periods. Do not use alphabetic characters for numbers. For example, write "Take 2 tablets in the morning and 2 tablets in the evening" rather than "Take two tablets twice daily").

Whenever available, use standardized directions (e.g., write "Take 1 tablet in the morning and 1 tablet in the evening" if the prescription reads b.i.d.). Vague instructions based on dosing intervals such as twice daily or 3 times daily, or hourly intervals such as every 12 hours, generally should be avoided because such instructions are implicit rather than explicit, they may involve numeracy skills, and patient interpretation may vary

■ differ ■ 1S (USP39)

from prescriber intent. Although instructions that use specific hourly times (e.g., 8 a.m. and 10 p.m.) may seem to be more easily understood than implicit vague instructions, recommending dosing by

■ at ■ 1S (USP39)

precise hours of the day is less readily understood and may present greater adherence issues due to individual lifestyle patterns, e.g., shift work,

■ (due to individual lifestyle patterns such as shift work) ■ 1S (USP39)

than more general time frames such as in the morning, in the evening, after breakfast, with lunch, or at bedtime. Consistent use of the same terms should help avoid patient confusion.

■ A set of standardized, explicit instructions (the universal medication schedule, UMS) were developed and tested in English and other languages to improve patient understanding.¹

■ 1S (USP39)

Ambiguous directions such as "take as directed" should be avoided unless clear and unambiguous supplemental instructions and counseling are provided (e.g., directions for use that will not fit on the prescription container label). A clear statement referring the patient to

such supplemental materials should be included on the container label.

Include Purpose for Use

If the purpose of the medication is included on the prescription, it should be included on the prescription container label unless the patient prefers that it not appear.

■ Practitioners should ~~■ 1S (USP39)~~

always ask patients their preference when ~~prescriptions are submitted for filling~~

■ writing the prescription. ■ 1S (USP39)

Confidentiality and FDA approval for intended use (e.g., labeled ~~vs.~~

■ versus ■ 1S (USP39)

off-label use) may limit inclusion of the purpose on labels. Current evidence supports inclusion of purpose-for-use language in clear, simple terms (e.g., "for high blood pressure" rather than "for hypertension").

Limit Auxiliary Information

Auxiliary information on the prescription container label should be evidence-based

■ and presented ■ 1S (USP39)

in simple explicit language that is minimized to avoid distracting patients with nonessential information. Most patients, particularly those with ~~low~~

■ limited ■ 1S (USP39)

literacy, pay little attention to auxiliary information. The information should be presented in a standardized manner and should be critical for patient understanding and safe medication use (e.g., warnings and critical administration alerts). Icons are frequently misunderstood by patients. In addition, icons that provide abstract imagery for messages that are difficult to ~~visually depict~~

■ depict visually ■ 1S (USP39)

may be ineffective at improving understanding compared with simplified text alone. Use only icons for which there is adequate evidence, through consumer testing, that they improve patient understanding about correct use. Evidence-based auxiliary information, both text and icons, should be standardized so that it is applied consistently and does not depend on individual practitioner choice.

Address Limited English Proficiency

Whenever possible, the directions for use on a prescription container label should be provided in the patient's preferred language. Otherwise there is a risk of misinterpretation of instructions by patients with limited English proficiency, which could lead to medication errors and adverse health outcomes. Additionally, whenever possible, directions for use should appear in English as well, to facilitate counseling; the drug ~~name~~

■ name(s) ■ 1S (USP39)

shall be in English so that emergency personnel and other intermediaries can have quick access to the information.

■ Standardized translations of universal medication schedule instructions are available.²

■ 1S (USP39)

Translations of prescription medication labels should be produced using a high-quality translation process. An example of a high-quality translation process is:

- Translation by a trained translator who is a native speaker of the target language
- Review of the translation by a second trained translator and reconciliation of any differences
- Review of the translation by a pharmacist who is a native speaker of the target language and reconciliation of any differences
- Testing of comprehension with target audience.

If a high-quality translation process cannot be provided, labels should be printed in English, ~~and~~ **with the use of** **1S (USP39)**

trained interpreter services ~~used~~

1S (USP39)

whenever possible to ensure patient comprehension. The use of computer-generated translations should be limited to programs with demonstrated quality because dosage instructions can be ~~inconsistent and~~

translated inconsistently or incorrectly, which is **1S (USP39)**

potentially hazardous. Standardized translated instructions and technology advances are needed to ensure the accuracy and safety of prescription container labeling for patients with ~~low~~

limited **1S (USP39)**

English proficiency.

Improve Readability

Labels should be designed and formatted so they are easy to read. Currently, no strong evidence supports the superiority, in

terms of **1S (USP39)**

legibility, of serif ~~vs.~~

versus **1S (USP39)**

sans serif typefaces, ~~so~~

therefore **1S (USP39)**

simple uncondensed fonts of either type can be used.

Optimize typography by using the following techniques:

- High-contrast print (e.g., black print on white background).
- Simple, uncondensed familiar fonts with sufficient space within letters and between letters (e.g., Times **New** **1S (USP39)**

Roman or Arial).

- Sentence case (i.e., punctuated like a sentence in English: Initial capital

letter **1S (USP39)**

followed by lower-case words except proper nouns).

- Large font size (e.g., minimum 12-point Times

New **1S (USP39)**

Roman or 11-point Arial) for critical information. Note that point size is not the actual size of the letter, so two fonts with the same nominal point size can have different actual letter sizes.

~~x-height, the height of the lower-case x in typeface,~~

■ The height of the typeface, x-height, ■ 1S (USP39)

has been used as a more accurate indicator of apparent size than point size. For example, for a given point size, the x-height and apparent size of Arial are actually bigger than those for Times

■ New ■ 1S (USP39)

Roman. Do not use type smaller than 10-point Times

■ New ■ 1S (USP39)

Roman or the equivalent size øf

■ in ■ 1S (USP39)

another font. Older adults, in particular, have difficulty reading small print.

- Adequate white space between lines of text (25%–30% of the point size).

- White space to distinguish

■ to separate ■ 1S (USP39)

sections on the label such as directions for use vs-

■ versus ■ 1S (USP39)

pharmacy information.

- Horizontal text only.

Other measures that can also improve readability:

- If possible,

- ■ 1S (USP39)

Minimize the need to turn the container in order to read lines of text.

- Never truncate or abbreviate critical information.

- ■ Use ■ 1S (USP39)

highlighting, bolding, and other typographical cues should

■ cues to ■ 1S (USP39)

preserve readability (e.g., high-contrast print and light color for highlighting) and should

■ ■ 1S (USP39)

emphasize patient-centric

■ patient-centered ■ 1S (USP39)

information or information that facilitates adherence (e.g., refill ordering).

- Limit the number of colors used for highlighting (e.g.,

■ i.e., ■ 1S (USP39)

no more than one or

■ ■ 1S (USP39)

two).

- Use of separate lines to distinguish when each dose should be taken.

Alternative-Access Methods to Address Visual Impairment

Patients with visual impairment who are unable to read printed prescription container labels often report inadvertently taking the wrong medication or amount, or taking it at the wrong time or under the wrong instructions, compromising their own safety. Similarly, if a caregiver is visually impaired, the patient they care for is at risk for medication errors. The magnitude of this problem increases with aging, as the risk of visual impairment and the number of prescribed medications both increase with age.

- Follow standards for patient-centered prescription labels. ■ 1S (USP39)

- Provide alternative access for visually impaired patients (e.g.,

■ alternative-access methods include ■ 1S (USP39)

tactile, auditory, or enhanced visual systems that may employ advanced mechanics of assistive technology).

■ 3

- Enhance communication between the pharmacist and visually impaired patients (and their designated representatives) such that the pharmacist can explain alternative-access options and together they can identify those best suited to the patient's needs.

- Once an alternative-access method is identified for the individual patient, the pharmacist shall provide the service or direct the patient to a pharmacy that offers that type of alternative access.

- Ensure that duplicate accessible labels preserve the integrity of the print prescription drug container label and provide the same sequence of information as the printed label.

- Follow specific best practices for each respective alternative-access format employed.

BRIEFING

《 476 》 **Organic Impurities in Drug Substances and Drug Products**, PF 40(3) [May–June 2014]. This revision is proposed on the basis of public comments received on its previous publication in PF. As part of an ongoing monograph modernization initiative, USP is updating the general chapter *Impurities in Drug Substances and Drug Products* 《 1086 》 and proposing this new chapter that addresses organic impurities testing for articles subject to applicable monographs in compendia of the USP, including USP–NF. This new chapter has been created to align with current scientific and regulatory approaches and to help ensure the appropriate control of organic impurities and degradation products in drug substances and drug products. The goal is to provide a science-based approach for the control of impurities in relevant monographs, and thereby ensure the quality of the product as it relates to safety and efficacy. Over time, *Ordinary Impurities* 《 466 》 may be used less frequently and may be withdrawn.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style.

{ 476 }

■ CONTROL OF ■_{1S} (USP39)

ORGANIC IMPURITIES IN DRUG SUBSTANCES AND DRUG PRODUCTS

Change to read:

INTRODUCTION

~~This chapter covers formal requirements for controlling organic process impurities and degradation products in drug substances, and degradation products in drug products. Impurities are critical quality attributes of drug substances and drug products because they have the potential to affect safety and efficacy. Therefore, all drug substances and drug products are subject to control of impurities. When a detected impurity is not described in the individual monograph, the manufacturer is responsible for developing appropriate specifications (analytical procedures and acceptance criteria).~~

~~For medicines marketed in the United States, drug substances and drug products covered by this chapter can, in general, be placed in one of two categories: (1) those that are covered by ICH and/or Food and Drug Administration (FDA) guidances, for example, most New Drug Application (NDA) and Abbreviated New Drug Application (ANDA) products; and (2) those that are not covered by drug applications, for example, over the counter (OTC) products.~~

~~Impurities that arise from excipients present in the drug product or that are leached from the container-closure system are not covered in this chapter. Also excluded from this chapter are veterinary products, biological/biotechnological products, peptides, oligonucleotides, fermentation products and semisynthetic products derived from them, radiopharmaceuticals, herbal products, and crude products of animal or plant origin. These products are excluded from this chapter because impurities of these types of drug substances and drug products may require special considerations. Current regulatory guidance documents, such as those from ICH, and sound scientific principles may be used to control the level of impurities in products that are excluded from this chapter.~~

~~Also excluded from this chapter are the following:~~

- ~~• Extraneous contaminants that should not occur in drug substances or drug products and are more appropriately addressed as good manufacturing practice issues~~
- ~~• Polymorphic forms~~
- ~~• Impurities arising from residual solvents (see *Residual Solvents* ~~{467}~~)~~
- ~~• Elemental impurities (see *Elemental Impurities—Limits* ~~{232}~~ and *Elemental Impurities—Procedures* ~~{233}~~).~~

IDENTIFICATION OF IMPURITIES IN DRUG SUBSTANCES AND DRUG PRODUCTS

Drug substance and drug product organic impurities shall include process-related impurities that result from the manufacturing process, and degradation products observed during manufacture and stability studies. Identification of impurities shall be based on sound scientific appraisal of potential degradation pathways in the drug substance and drug product, including those impurities that arise from interactions of the drug with the environment, excipients, or the primary container closure system.

Impurities observed in stability studies conducted at the recommended storage conditions shall be identified when above the identification threshold, which can be established using currently applicable regulations or other scientific means. Impurities present at a level below the identification threshold generally do not require identification.

ANALYTICAL PROCEDURES FOR IMPURITIES AND DEGRADATION PRODUCTS

Manufacturers shall validate analytical procedures and demonstrate their suitability for the detection and quantitation of impurities. Manufacturers of drug substances and drug products shall refer to current applicable regulatory guidances and shall develop control strategies for establishing acceptance criteria for impurities. These acceptance criteria shall be justified with appropriate safety considerations.

Analytical procedures for OTC drug products may require a case-by-case approach, depending on the diversity and complexity of dosage forms. These procedures shall be verified or validated and shall be suitable for their intended purpose.

For impurities that are known or suspected to be highly toxic (e.g., genotoxic) or that produce undesired pharmacological effects, the quantitation/detection limit of the analytical procedures shall be commensurate with the acceptance criteria.

REPORTING IMPURITIES AND DEGRADATION PRODUCTS

Impurities present at a level above the reporting threshold (i.e., the disregard limit) shall be reported according to the relevant analytical method(s). The reporting threshold can be established using currently applicable regulations/guidances or other acceptable scientific means.

Quantitative test results shall be reported as numerical values and rounded according to conventional rules (see *General Notices 7.20*). Impurities at a level greater than the reporting threshold shall also be summed and reported as total impurities.

SETTING ACCEPTANCE CRITERIA FOR IMPURITIES AND DEGRADATION PRODUCTS

Acceptance criteria shall be set for all impurities expected to be present at levels above the reporting thresholds, and these criteria shall be based on an applicable guidance or on scientific rationale. Acceptance criteria should not be based solely on process capability. Acceptance criteria shall cover the drug substance through its intended period of use and the drug product through its shelf life. Generally, drug substance impurities need not be monitored or specified in drug products unless they are also degradation products.

~~The acceptance criteria shall include the following, where applicable:~~

- ~~• Each specified identified impurity and degradation product~~
- ~~• Each specified unidentified impurity and degradation product~~
- ~~• Any unspecified impurity or degradation product with an acceptance criteria NMT the identification threshold~~
- ~~• Total impurities and degradation products.~~

~~For a given impurity, manufacturers shall establish the acceptance criteria based on its qualified level, its increase during stability studies and proposed shelf life, and its labeled storage conditions.~~

~~For OTC products, manufacturers may need to determine acceptance criteria on a case-by-case basis. They also can consider the historical safety record of drug substances; the quantitative structure-activity relationship (QSAR); the route of administration; and the likely consumption patterns, such as duration of treatment for the patient population.~~

~~QUALIFICATION OF IMPURITIES AND DEGRADATION PRODUCTS~~

~~Establishment of acceptance criteria for impurities should focus on safety considerations. The level of any impurity or degradation product present in a drug substance or drug product that has been adequately tested in safety or clinical studies is generally considered qualified. However, highly toxic (e.g., genotoxic) impurities or degradation products shall be addressed using applicable guidances. Impurities or degradation products that are also significant metabolites are generally considered qualified.~~

~~Qualification of impurities shall be based on applicable guidances, scientific rationale, or history of product use. Higher or lower thresholds for qualification of impurities may be appropriate for some products based on scientific rationale and level of concern, including drug class effects and clinical experience.~~

~~For additional guidance and definition of terms, see *Impurities in Drug Substances and Drug Products* (1086).~~

INTRODUCTION

This chapter covers requirements for controlling organic impurities in drug substances and drug products described in *USP* monographs. All drug substances and drug products are subject to control of organic impurities. A threshold-based approach described in the ICH Q3A and Q3B guidances may be used for the control of organic impurities in drug substances or drug products generated during the manufacturing process or storage. The organic impurities to be controlled in the drug substance are the process impurities and degradation products. The organic impurities to be controlled in the drug product are only the degradation products of the drug substance or those resulting from the interaction of the drug substance with excipients and/or the primary container closure. Drug substance process impurities need not be controlled in the drug product unless they are also degradation products.

This chapter covers drug substances and drug products marketed in the United States based on approval by the Food and Drug Administration (FDA) either via New Drug Applications (NDAs) or Abbreviated New Drug Applications (ANDAs) or through the FDA over-the-counter (OTC)

monograph system.

This chapter does not cover veterinary products, biological/biotechnological products, peptides, oligonucleotides, fermentation products and semisynthetic products derived from them, polymorphic forms, radiopharmaceuticals, herbal products, or crude products of animal or plant origin. In addition, impurities present in the drug product originating from excipients or leached from the container–closure system, inorganic/elemental impurities, and residual solvents are out of the scope of this chapter.

If a new impurity is uncovered or when the level of a known impurity increases as compared to an existing monograph, the manufacturer is responsible for evaluating the impact on the safety and efficacy of the drug. If an individual monograph is inadequate to control an impurity, the manufacturer is responsible for developing and validating appropriate analytical procedures, establishing acceptance criteria, and communicating with USP.

IDENTIFICATION OF IMPURITIES AND DEGRADATION PRODUCTS

Impurities present at or above the identification threshold for drug substances and drug products at release and on storage shall be identified. The identification threshold can be established using current applicable regulatory guidances or other acceptable scientific means. Lower thresholds may be required for impurities known or suspected to be highly toxic (e.g., genotoxic) or that produce undesired pharmacological effects.

ANALYTICAL PROCEDURES FOR IMPURITIES AND DEGRADATION PRODUCTS

Manufacturers shall validate analytical procedures and must demonstrate their suitability for the detection and quantitation of impurities in drug substances and drug products. Manufacturers shall develop acceptance criteria for impurities justified by appropriate safety considerations and consistent with current applicable regulatory guidances.

Analytical procedures for FDA OTC monograph drug products may require a case-by-case approach, depending on the complexity of dosage forms. These procedures shall be verified or validated to be suitable for their intended purpose.

A lower limit of detection and limit of quantitation may be required for impurities known or suspected to be highly toxic (e.g., genotoxic) or to produce undesired pharmacological effects.

REPORTING IMPURITIES AND DEGRADATION PRODUCTS

Impurities present at or above the reporting threshold shall be reported according to the relevant analytical procedure. The reporting threshold can be established using current applicable regulatory guidances or other acceptable scientific means.

Impurity results shall be reported as numerical values and rounded according to conventional rules (see *General Notices and Requirements*, 7.20). Individual impurity values shall be summed and reported as total impurities.

SETTING ACCEPTANCE CRITERIA FOR IMPURITIES AND DEGRADATION PRODUCTS

Acceptance criteria shall be set for all impurities present at or above the qualification

thresholds for drug substances and drug products at release and through the shelf life. The acceptance criteria shall be based on applicable guidances or other acceptable scientific means, with safety as the primary consideration and not solely based on process capability. Drug substance process impurities need not be monitored or specified in drug products unless they are also degradation products.

The acceptance criteria for drug substances shall include the following, where applicable:

- Each specified identified impurity
- Each specified unidentified impurity
- Any unspecified impurity with an acceptance criterion of NMT the identification threshold
- Total impurities

The acceptance criteria for drug products shall include the following, where applicable:

- Each specified identified degradation product
- Each specified unidentified degradation product
- Any unspecified degradation product with an acceptance criterion of NMT the identification threshold
- Total degradation products

For FDA OTC monograph products, manufacturers may need to determine acceptance criteria on a case-by-case basis. Factors such as quantitative structure-activity relationship (QSAR) of the drug substance, route of administration, the likely consumption patterns such as duration of treatment and the patient population, and historical safety of the drug may be considered in justifying the acceptance criteria.

Acceptance criteria for highly toxic (e.g., genotoxic) impurities or degradation products shall be addressed using current applicable guidances.

QUALIFICATION OF IMPURITIES AND DEGRADATION PRODUCTS

Qualification of impurities shall be based on safety, applicable guidances, scientific rationale, or history of product use. Higher or lower qualification thresholds may be appropriate for some impurities based on scientific rationale.

The level of any impurity or degradation product present in a drug substance or drug product that has been adequately tested in safety and/or clinical studies would be considered qualified. Impurities or degradation products that are also significant metabolites present in animal and/or human studies are also generally considered qualified.

(For additional guidance and definition of terms, see *Impurities in Drug Substances and Drug Products* { 1086 }.)

■ 1S (USP39)

BRIEFING

{ 659 } **Packaging and Storage Requirements**, *USP 38* page 443. The General Chapters—Packaging, Storage, and Distribution Expert Committee proposes this revision to update and clarify definitions related to proper packaging and storage.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style.

The following Briefing list includes monographs and/or chapters that both reference the General Chapter under revision and require revision to keep references to the General Chapter accurate. Other monographs and/or chapters may also be listed, even where the reference to the General Chapter remains unchanged, as additional notice to stakeholders where there is believed to be potential for the change in the general chapter itself to affect pass-fail determinations for particular monograph articles. <http://www.usp.org/usp-nf/notices/general-chapter-packaging-and-storage-requirements>

Comment deadline: July 31, 2015

〈 659 〉 PACKAGING AND STORAGE REQUIREMENTS

Delete the following:

■ **(Chapter to become official May 1, 2016)**

■ 1S (*USP39*)

Delete the following:

Every monograph in the *USP* and *NF* shall have packaging and storage requirements. For the packaging portion of the statement, the choice of containers is given in this chapter. For drug product packaging requirements, definitions are provided to guide selection and adaptation. For active pharmaceutical ingredients (APIs), the choice would be tight, well-closed or, where needed, a light-resistant container. For excipients, given their typical presentation as large-volume commodity items (containers ranging from drums to tank cars), a well-closed container is an appropriate default.

Where no specific directions or limitations are provided in the article's labeling, articles shall be protected from moisture, freezing, and excessive heat and, where necessary, from light during shipping and distribution. Drug substances are exempt from this standard. ▲*USP38*

Change to read:

PACKAGING

~~Packaging must not interact physically or chemically with official articles in any way that causes their safety, identity, strength, quality, or purity to fail to conform to requirements.~~

▲Packaging container choices are given in this chapter. For drug products and active pharmaceutical ingredients (APIs), the container choices are tight, well-closed, or, where needed, light-resistant. For excipients, given their typical presentation as large-volume commodity items (containers ranging from drums to tank cars), a well-closed container is an appropriate default. For articles other than drug substances and drug products, where no specific directions or limitations are provided, articles shall be protected from moisture,

freezing, and excessive heat, and, where necessary, from light during shipping and distribution.

The compendial requirements for the use of specified containers apply also to articles as packaged by the pharmacist or other dispenser, unless otherwise indicated in the individual monograph. **▲USP38**

GENERAL DEFINITIONS

Packaging system (also referred to as a container closure system): The sum of packaging components that together contain and protect the article. This includes primary packaging components and secondary packaging components, if the latter is intended to provide additional protection.

Container: A receptacle that holds an intermediate compound, active pharmaceutical ingredient, excipient, or dosage form and is

▲or may be ▲USP38

in direct contact with the articles.

▲The immediate container is that which is in direct contact with the article at all times. The closure is a part of the container. Before being filled, the container should be clean. Special precautions and cleaning procedures may be necessary to ensure that each container is clean and that extraneous matter is not introduced into or onto the article. **▲USP38**

Packaging component: Any single part of the package or container closure system including the container (e.g., ampuls, prefilled syringes, vials, bottles); container liners (e.g., tube cartridge liners); closures (e.g., screw caps, stoppers); ferrules and overseals; closure liners; inner seals; administration ports; overwraps; administration accessories; and labels.

Primary packaging component: Packaging components that are in direct contact or may become in direct contact with the article.

Secondary packaging component: Packaging components that are not and will not be in direct contact with the article.

▲▲USP38

Tertiary packaging: Packaging components that are not in direct contact with the article but facilitate the handling and transport in order to prevent damage from physical handling and storage conditions to which the article is subjected.

Materials of construction: Refers to the materials (e.g., glass, plastic, elastomers, metal) used to manufacture a packaging component.

Multiple-dose

▲container ▲USP38

(also referred to as multi-dose): A packaging system that permits withdrawal of successive portions of an article for parenteral administration without changing the safety, strength, quality, or purity of the remaining portion. See

▲

~~Multi-Dose Containers in Container Content for Injections (697):~~ ~~▲USP38~~

Multiple-unit

~~▲container:~~ ~~▲USP38~~

~~A packaging system that permits withdrawal of successive portions of an article without changing the safety, strength, quality, or purity of the remaining portion.~~

Single-unit

~~▲container:~~ ~~▲USP38~~

~~A packaging system that holds a quantity of an article intended for administration as a single dose or a single finished device intended for~~

~~▲use promptly after the container is opened. Preferably, the immediate container and/or the outer container or protective packaging shall be so designed as to show evidence of any tampering with the contents.~~ ~~▲USP38~~

Single-dose

~~▲container:~~

~~A single-dose container is a container of sterile medication for parenteral administration (injection or infusion) that is not required to meet the antimicrobial effectiveness testing criteria. [Note—For this definition only, container is synonymous with packaging system and container closure system.] A single-dose container is designed for use with a single patient as a single injection/infusion.³ A single-dose container is labeled as such and, when space permits, should include appropriate discard instructions on the label. Examples of single-dose containers are vials, ampuls, and prefilled syringes.~~ ~~▲USP38~~

Unit-dose

~~▲container:~~ ~~▲USP38~~

~~A single-unit packaging system for an article intended for administration by other than the parenteral route as a single dose.~~

Unit-of-use

~~▲container:~~ ~~▲USP38~~

~~A packaging system that contains a specific quantity of an article that is intended to be dispensed as such without further modification except for the addition of appropriate labeling. Unit-of-use packaging may not be repackaged for sale.~~

Pharmacy bulk package:A

~~▲packaging system~~ ~~▲USP38~~

~~of a sterile preparation for parenteral use that contains many single doses. The contents are intended for use in a pharmacy admixture program and are restricted to the preparation of admixtures for infusion or, through a sterile transfer device, for the filling of empty sterile syringes.~~

~~▲The closure shall be penetrated only one time after constitution, if necessary,~~ ~~▲USP38~~

~~with a suitable sterile transfer device or dispensing set that allows measured dispensing of the contents. The *Pharmacy bulk package* is to be used only in a suitable work area such as a~~

~~laminar flow hood (or an equivalent clean air compounding area).~~

Designation as a *Pharmacy bulk package* is limited to

~~▲Injection, for Injection, or Injectable Emulsion dosage forms as defined in~~

~~Nomenclature (1121), General Nomenclature Forms. ▲USP38~~

~~*Pharmacy bulk package*, although containing more than one single dose, is exempt from the multiple-dose container volume limit of 30 mL and the requirement that it contains a substance or suitable mixture of substances to prevent the growth of microorganisms.~~

~~▲See~~

~~Labeling (7) for labeling requirements. ▲USP38~~

Small-volume injections:

~~▲An injection that ▲USP38~~

~~is packaged in containers labeled as containing 100 mL or less.~~

Large-volume injections:

~~▲An ▲USP38~~

~~injection that is intended for intravenous use, and is packaged in containers labeled as containing more than 100 mL.~~

Child-resistant

~~▲packaging: ▲USP38~~

~~A packaging system designed or constructed to meet Consumer Product Safety Commission standards pertaining to opening by children (16 CFR §1700.20).~~

Senior-friendly

~~▲packaging: ▲USP38~~

~~A packaging system designed or constructed to meet Consumer Product Safety Commission standards pertaining to opening by senior adults (16 CFR §1700.20).~~

Tamper-evident

~~▲packaging: ▲USP38~~

~~A packaging system that may not be accessed without obvious destruction of the seal or some portion of the packaging system.~~

~~▲Tamper-evident packaging shall be used for a sterile article intended for ophthalmic or otic use, except where extemporaneously compounded for immediate dispensing on prescription.~~

~~Articles intended for sale without prescription are also required to comply with the tamper-evident packaging and labeling requirements of the FDA where applicable. Preferably, the immediate container and/or the outer container or protective packaging used by a manufacturer or distributor for all dosage forms that are not specifically exempt is designed so as to show evidence of any tampering with the contents.~~

~~**Hermetic container:** A packaging system that is impervious to air or any other gas under the ordinary or customary conditions of handling, shipment, storage, and distribution.~~

~~▲USP38~~

Tight**▲container:**▲USP38

A packaging system that protects the

▲contents▲USP38

—from contamination by extraneous liquids, solids, or vapors; from loss of the article; and from efflorescence, deliquescence, or evaporation under the ordinary or customary conditions of handling, shipment, storage, and distribution

▲and is capable of tight reclosure. Where a tight container is specified, it may be replaced by a hermetic container for a single dose of an article. [Note—

Where packaging and storage in a tight container or well-closed container is specified in the individual monograph, the container used for an article when dispensed on prescription meets the requirements in *Containers—Performance Testing* ~~(671)~~.]▲USP38

Well-closed**▲container:**▲USP38

A packaging system that protects the

▲contents▲USP38

—from contamination by extraneous solids

▲▲USP38

—and from loss of the article under the ordinary or customary conditions of handling, shipment, storage, and distribution. See *Containers—Performance Testing* ~~(671)~~.

Light-resistant**▲container:**▲USP38

A packaging system that protects

▲the contents▲USP38

—from the effects of light by virtue of the specific properties of the material of which it is composed, including any coating applied to it. A clear and colorless or a translucent container may be made light-resistant by means of an opaque covering or by use of secondary packaging, in which case the label of the container bears a statement that the opaque covering or secondary packaging is needed until the articles are to be used or administered.

▲Where it is directed to “protect from light” in an individual monograph, preservation in a light-resistant container is intended. See

Containers—Performance Testing ~~(671)~~, *Light Transmission Test*.

Black closure system or black bands:The use of a black closure system on a vial (e.g., a black cap-overseal and a black ferrule to hold the elastomeric closure) or the use of a black band or series of bands above the constriction on an ampul is prohibited, except for *Potassium Chloride for Injection Concentrate*. See *Labeling* ~~(7)~~.

▲USP38**INJECTION PACKAGING**

Validation of container-closure integrity must demonstrate no penetration of microbial contamination or chemical or physical impurities. In addition, the solutes and the vehicle must maintain their specified total and relative quantities or concentrations when exposed to

anticipated extreme conditions of manufacturing and processing, storage, shipment, and distribution. Closures for multiple-dose packaging systems permit the withdrawal of the contents without removal or destruction of the closure. The closure permits penetration by a needle and, upon withdrawal of the needle, closes at once, protecting the contents against contamination. Validation of the multiple-dose container closure integrity must include verification that such a package prevents microbial contamination or loss of product contents under anticipated conditions of multiple entry and use.

Piggyback packaging systems are usually intravenous infusion container closure systems used to administer a second infusion through a connector of some type or an injection port on the administration set of the first fluid, thereby avoiding the need for another injection site on the patient's body. Piggyback packaging systems also are known as secondary infusion containers.

The volume of injection in a single-dose packaging system provides the amount specified for one-time parenteral administration and in no case is more than sufficient to permit the withdrawal and administration of 1 L.

Preparations intended for intraspinal, intracisternal, or peridural administration are packaged only in single-dose packaging systems.

Unless otherwise specified in the individual monograph, a multiple-dose packaging system contains a volume of injection sufficient to permit the withdrawal of NMT 30 mL.

The following injections are exempt from the 1-L restriction of the foregoing requirements relating to packaging:

1. Injections packaged for extravascular use as irrigation solutions or peritoneal dialysis solutions.
2. Injections packaged for intravascular use as parenteral nutrition or as replacement or substitution fluid to be administered continuously during hemofiltration.

Injections packaged for intravascular use that may be used for intermittent, continuous, or bolus replacement fluid administration during hemodialysis or other procedures, unless excepted above, must conform to the 1-L restriction. Injections labeled for veterinary use are exempt from packaging and storage requirements concerning the limitation to single-dose packaging systems and the limitation on the volume of multiple-dose containers.

Sterile solids packaging: Containers, including the closures, for dry solids intended for injection do not interact physically or chemically with the preparation in any manner to alter the strength, quality, or purity beyond the official requirements under the ordinary or customary conditions of handling, shipment, storage, sale, and use. A packaging system for a sterile solid permits the addition of a suitable solvent and withdrawal of portions of the resulting solution or suspension in such manner that the sterility of the product is maintained. Where the Assay in a monograph provides a procedure for the *Sample solution*, in which the total withdrawable contents are to be withdrawn from a single-dose packaging system with a hypodermic needle and syringe, the contents are to be withdrawn as completely as possible into a dry hypodermic syringe of a rated capacity not exceeding three times the volume to be withdrawn and fitted with a 21-gauge needle NLT 2.5 cm (1 inch) in length, with care being taken to expel any air bubbles, and discharged into a container for dilution and assay.

MEDICAL GAS PACKAGING

Gas cylinder: A gas cylinder is a metallic packaging system constructed of steel or aluminum designed to hold medical gases under pressure. Medical gases include Carbon Dioxide USP, Helium USP, Medical Air USP, nitric oxide, Nitrous Oxide USP, Nitrogen NF, and Oxygen USP. As a safety measure, for carbon dioxide, cyclopropane, helium, medical air, nitrous oxide, and oxygen, the Pin Index Safety System of matched fittings is recommended for cylinders of Size E or smaller.

ASSOCIATED COMPONENTS

Many associated components are graduated for dose administration. It is the responsibility of the manufacturer to ensure that the appropriate dosing component is provided or that a general purpose component, such as those described in this section, is specified for delivering the appropriate dose with the intended accuracy. The graduations should be legible and indelible.

Graduated associated components described in this section are for general use. Graduated markings should be legible, indelible, and on an extraoral nonproduct contact surface. Under ideal conditions of use, the volume error incurred in measuring liquids for individual dose administration by means of such graduated components should be NMT 10% of the indicated amount of the liquid preparation with which the graduated component will be used. Few liquid preparations have the same surface and flow characteristics. Therefore, the volume delivered varies materially from one preparation to another.

Polymers and ingredients added to polymers that are used in the fabrication of associated components must conform to the requirements in the applicable sections of the Code of Federal Regulations, Title 21, *Indirect Food Additives*.

Dosing cup: A measuring device consisting of a small cup that is packaged with oral liquid articles or that may be sold and purchased separately.

Dosing spoon: A measuring device consisting of a bowl and a handle that is packaged with oral liquid articles or that may be sold and purchased separately. The handle may be a graduated tube.

Medicine dropper: A measuring device consisting of a transparent or translucent barrel or tube that is generally fitted with a collapsible bulb. It is packaged with oral liquid articles or may be sold and purchased separately.

Droppers typically vary in capacity; however, the delivery end should be a round opening having an external diameter of about 3 mm. The barrel may be graduated. [Note—Few medicinal liquids have the same surface and flow characteristics as water, and therefore the size of drops varies materially from one preparation to another.]

Oral syringe: A measuring device consisting of a plunger and barrel made of suitable rigid, transparent or translucent plastic material and a seal on the end. It is packaged with oral liquid articles or may be sold and purchased separately. The syringe should expel a measured amount of a liquid article directly into the patient's mouth. Finger grips located at the open end of the barrel should be the appropriate size, shape, and strength, and should allow the syringe to be held securely during use. The barrel may be graduated.

Teaspoon: A measuring device consisting of a shallow bowl, oval or round, at the end of a

handle. A teaspoon has been established as containing 4.93 ± 0.24 mL. For the practice of administering articles, the teaspoon may be regarded as representing a volume of 5 mL.

Articles intended for administration by teaspoon should be formulated on the basis of dosage in 5 mL units, such that any component used to administer liquid articles should deliver 5 mL wherever a teaspoon calibration is indicated. A household spoon is not an acceptable alternative to the graduated teaspoon described herein.

POISON PREVENTION PACKAGING ACT (PPPA)

This act requires special packaging of most human oral prescription drugs, oral controlled drugs, certain non-oral prescription drugs, certain dietary supplements, and many over-the-counter (OTC) drug preparations in order to protect the public from personal injury or illness from misuse of these preparations (16 CFR §1700.14).

The immediate packaging of substances regulated under the PPPA must comply with the special packaging standards (16 CFR §1700.15 and 16 CFR §1700.16) and applies to all packaging types including reclosable, nonclosable, and unit-dose types.

Special packaging is not required either for drugs dispensed within a hospital setting for inpatient administration or by manufacturers and packagers of bulk-packaged prescription drugs repackaged by the pharmacist. PPPA-regulated prescription drugs may be dispensed in nonchild-resistant packaging upon the request of the purchaser or when directed in a legitimate prescription (15 U.S.C. §1473).

Manufacturers or packagers of PPPA-regulated OTC preparations are allowed to package one size in nonchild-resistant packaging as long as popular size, special packages are also supplied. The nonchild-resistant packaging requires special labeling (16 CFR §1700.5).

STORAGE CONDITIONS

Specific directions are stated in some monographs with respect to storage conditions, e.g., the temperature or humidity at which an article must be stored and shipped. Such directions apply, except where the label on the article has different storage conditions that are based on stability studies. Where no specific storage conditions are provided in the individual monograph, but the label of an article states storage conditions based on stability studies, such labeled storage directions apply.

▲▲USP38

Freezer: A place in which the temperature is maintained between -25° and -10° (-13° and 14° F).

Refrigerator: A

▲cold ▲USP38

place in which the temperature is maintained between 2° and 8° (36° and 46° F).

Cold: Any temperature not exceeding 8° (46° F).

Cool: Any temperature between 8° and 15° (46° and 59° F). [Note—An article for which storage in a cool place is directed may, alternatively, be stored and shipped as refrigerated, unless otherwise specified by the individual monograph.]

Room temperature: The temperature prevailing in a work area.

Controlled room temperature: The temperature maintained

▲thermostatically that encompasses ▲USP38

at the usual and customary working environment of 20°–25° (68°–77° F). The following conditions also apply.

▲Mean kinetic temperature not to exceed 25° . ▲USP38

Excursions between 15° and 30° (59° and 86° F) that are experienced in pharmacies, hospitals, and warehouses, and during shipping are allowed.

▲Provided ▲USP38

the mean kinetic temperature does not exceed 25° ,

▲transient ▲USP38

spikes up to 40° are permitted as long as they do not

▲exceed ▲USP38

24 h. Spikes above 40° may be permitted only if the manufacturer so instructs.

Articles may be labeled for storage at “controlled room temperature” or at “up to 25° ,” or other wording based on the same mean kinetic temperature.

An article for which storage at *Controlled room temperature* is directed may, alternatively, be stored and shipped in a cool place or refrigerated, unless otherwise specified in the individual monograph or on the label.

Warm: Any temperature between 30° and 40° (86° and 104° F).

Excessive heat: Any temperature above 40° (104° F).

Dry place: The term “dry place” denotes a place that does not exceed 40% average relative humidity at 20° (68° F) or the equivalent water vapor pressure at other temperatures. The determination may be made by direct measurement at the place or may be based on reported climatic conditions. Determination is based on NLT 12 equally spaced measurements that encompass either a season, a year, or, where recorded data demonstrate, the storage period of the article. There may be values of up to 45% relative humidity provided that the average value does not exceed 40% relative humidity. Storage in a container validated to protect the article from moisture vapor, including storage in bulk, is considered a dry place.

Protection from freezing: Where, in addition to the risk of breakage of the container, freezing subjects an article to loss of strength or potency, or to destructive alteration of its characteristics, the container label bears an appropriate instruction to protect the article from freezing.

Protection from light: Where light subjects an article to loss of strength or potency, or to destructive alteration of its characteristics, the container label bears an appropriate instruction

~~to protect the article from light.~~

INTRODUCTION

The purpose of this chapter is to provide packaging definitions, auxiliary packaging information, and storage condition definitions relevant to the storage and distribution of active ingredients, excipients, and medical products, such as pharmaceuticals, devices, combination products (e.g., drug-eluting stents), and dietary supplements.

PACKAGING

Packaging materials must not interact physically or chemically with a packaged article in a manner that causes its safety, identity, strength, quality, or purity to fail to conform to established requirements. Any plastic material used to construct a packaging system must meet the applicable requirements of *Plastic Materials of Construction* 〈 661.1 〉. All Packaging systems must meet the applicable requirements specified in *Elastomeric Closures for Injections* 〈 381 〉, *Containers—Glass* 〈 660 〉, *Plastic Packaging Systems for Pharmaceutical Use* 〈 661.2 〉, and *Auxiliary Packaging Components* 〈 670 〉.

Packaging component/system choices are described in this chapter. For excipients, given their typical presentation as large-volume commodity items (*Packaging systems* ranging from drums to tank cars), a well-closed container is an appropriate default requirement. Articles must be protected from moisture, freezing, and excessive heat (see *General Definitions*) when no specific directions or limitations are provided.

The compendial requirements for the use of specified containers apply also to articles packaged by *Dispensers*, *Repackagers*, or other individuals, unless otherwise indicated in the individual drug product monograph.

POISON PREVENTION PACKAGING ACT (PPPA)

This act, which is administered by the United States Consumer Product Safety Commission (CPSC), requires special packaging for most human oral prescription drugs, oral controlled drugs, certain non-oral prescription drugs, certain dietary supplements, and many over-the-counter (OTC) drug preparations, to protect the public from personal injury or illness from misuse of these preparations (16 CFR§1700.14).

The primary packaging of substances regulated under the PPPA must comply with the special packaging standards (16 CFR§1700.15 and 16 CFR§1700.16) and which apply to all packaging types, including reclosable, non-closable, and unit-dose types.

Special packaging is not required for drugs dispensed within a hospital setting for inpatient administration. Also, special packaging does not need to be used by manufacturers and packagers of bulk-packaged prescription drugs that will be repackaged by the pharmacist. PPPA-regulated prescription drugs may be dispensed in non-*Child-resistant packaging* upon the request of the purchaser or when directed in a legitimate prescription (15 U.S.C.§1473).

Manufacturers or packagers of PPPA-regulated OTC preparations are allowed to package one

size in non-*Child-resistant packaging* as long as popular-size, special packages are also supplied. The non-*Child-resistant packaging* requires special labeling (16 CFR§1700.5).

TEMPERATURE AND STORAGE

Specific directions are stated in some monographs with respect to storage conditions, e.g., the temperature or humidity, at which an article must be stored and shipped. Such directions apply except where the label on the article has different storage conditions that are based on stability studies. Where no specific storage conditions are provided in the individual monograph, the labeled article storage conditions, based on stability studies, will apply.

GENERAL DEFINITIONS

Packaging Definitions

Packaging system (also referred to as a Container–closure system): The sum of packaging components and materials that together contain and protect the article. This includes *Primary packaging components* as well as *Secondary* and *Tertiary packaging components* when such components are required to provide additional protection.

Container: A receptacle that holds an intermediate compound, active pharmaceutical ingredient, excipient, or dosage form and is in direct contact with the article.

Closure: A material that seals an otherwise open space of a *Container* and provides protection for the contents. It also provides access to the contents of the *Container*.

Packaging component: Any single part of the *Package* or *Container–closure system* including: the *Container* (e.g., ampules, prefilled syringes, vials, and bottles); *Closures* (e.g., screw caps and stoppers); ferrules and overseals; closure liners (e.g., tube cartridge liners); inner seals; administration ports; overwraps; administration accessories; labels; cardboard box; and shrink wrap.

Primary packaging component: A *Packaging component* that is in direct contact with or may come into direct contact with the article.

Secondary packaging component: A *Packaging component* that is in direct contact with a *Primary packaging component* and may provide additional protection for the article.

Tertiary packaging component: A *Packaging component* that is in direct contact with a *Secondary packaging component* and may provide additional protection for the article during transportation and/or storage.

Ancillary component: A component or entity that may come into contact with a *Tertiary packaging component* during the distribution, storage, and/or transportation of the packaged article (e.g., pallets, skids, shrink wrap, and active containers).

Associated component: A *Packaging component* that is typically intended to deliver the drug article to the patient but is not stored in contact with the article for its entire shelf life (e.g., spoons, dosing cups, and dosing syringes).

Materials of construction: The materials (e.g., glass, plastic, elastomers, and metal) of which a packaging component consists.

Small-volume injection (Small-volume parenteral): An injectable dosage form that is packaged in *Containers* labeled as containing 100 mL or less.

Large-volume injection (Large-volume parenteral): An injectable dosage form that is packaged in *Containers* labeled as containing more than 100 mL.

Child-resistant packaging: A *Packaging system* designed or constructed to meet CPSC standards pertaining to opening by children (16 CFR § 1700.20 et seq).

Senior-friendly packaging: A *Packaging system* designed or constructed to meet CPSC standards pertaining to opening by senior adults (16 CFR § 1700.15 and 16 CFR § 1700.20).

Restricted delivery system: A *Packaging system* designed or constructed to restrict the amount of the drug product that may be delivered in order to limit access by children. *Restricted delivery systems* should meet and may exceed CPSC standards for special packaging [*Child-resistant* and *Senior-friendly packaging* (16 CFR § 1700.15 et seq)]. For oral medicinal liquids, surface and flow characteristics vary. It is the responsibility of the manufacturer to ensure that all components of the *Restricted delivery system* provide the intended safety protection. One component of the *Restricted delivery system* is the flow restrictor, which is a packaging component that restricts the flow of liquid. The flow restrictor may be used as part of a *Restricted delivery system* or as an adaptor to facilitate use of a measuring device for oral medicinal liquids. A flow restrictor should not compromise CPSC standards for special packaging [*Child-resistant* and *Senior-friendly packaging* (16 CFR § 1700 et seq)].

Tamper-evident packaging: A *Packaging system* that may not be accessed without obvious destruction of the seal or some portion of the *Packaging system*. *Tamper-evident packaging* must be used for sterile drug products intended for ophthalmic or otic use, except where extemporaneously compounded for immediate dispensing on prescription. Drug products intended for sale without prescription are also required to comply with the *Tamper-evident packaging* and labeling requirements of the Food and Drug Administration (FDA) where applicable. Preferably, the immediate *Container* and/or the outer *Container* or protective packaging used by a manufacturer or distributor for all dosage forms that are not specifically exempt is designed to show evidence of any tampering with the contents.

Reclosables packaging: A package that after it has been initially opened is capable of being reclosed with a similar degree of security, and is capable of being used a sufficient number of times to dispense the total contents without loss of security. *Reclosable packaging* may incorporate child-resistance capabilities.

Non-reclosables packaging: A package or part of a package that cannot be closed again after all or part of the contents have been removed. Examples of *Non-reclosables packaging* are blisters, sachets, strips, and other single-unit containers. *Non-reclosables packaging* may include cold-formed foil blisters, foil strip packs, and PVC/Aclar® combining multilayer materials that are thermo-formed or cold-formed foil blisters. *Non-reclosables packaging* may be child resistant depending on the intended use and place of use. Household non-reclosables are subject to the PPPA as defined in 16 CFR § 1700.14.

Tight container: Well-closed container; Light-resistant container: See *Containers—Performance Testing* (671).

Equivalent container–closure system: A *Packaging system* that is as protective as or more protective than the original manufacturer's packaging system in terms of moisture-vapor

transmission rate, oxygen transmission, light transmission, and compatibility. System equivalency extends to any special protective materials, such as those for seals or desiccants associated with the original packaging system.

Table 1. Packaging Systems Definitions: Injection versus Non-Injection

Injection	Non-Injection
Multiple-dose	Multiple-unit
Single-dose	Single-unit
—	Unit-dose
—	Unit-of-use
Single-patient-use	—
Pharmacy bulk package	—
Imaging bulk package	—

Injection Packaging Systems

Multiple-dose container (also referred to as Multi-dose): A *Packaging system* that holds a sterile medication for parenteral administration (injection or infusion); that has met antimicrobial effectiveness testing requirements, or is excluded from such testing requirements by FDA regulation. A *Multiple-dose container* is intended to contain more than one dose of an article. When space permits, a *Multiple-dose container* is labeled as such. *Multiple-dose containers* are generally expected to contain 30 mL or less of medications. The beyond-use date for an opened or entered (e.g., needle-punctured) *Multiple-dose container* is 28 days unless otherwise specified by the manufacturer on the label. An example of a *Multiple-dose container* is a vial.

Single-dose container: A *Packaging system* that holds a sterile medication for parenteral administration (injection or infusion) that is not required to meet the antimicrobial effectiveness testing requirements. A *Single-dose container* is designed for use with a single patient as a single injection/infusion¹. When space permits a *Single-dose container* is labeled as such and should include on the label appropriate discard statements. Examples of *Single-dose containers* are vials, ampules, and prefilled syringes.

Single-patient-use container: A *Packaging system* that holds a sterile medication for parenteral administration (injection or infusion) that is intended to be used multiple times with a single patient. When space permits, a *Single-patient-use container* is labeled as such and should include on the label appropriate discard statements. Examples of *Single-patient-use containers* are patient controlled analgesia cartridges and certain pens for injection.

Pharmacy bulk package: A *Packaging system* of a sterile preparation for parenteral use that contains multiple single doses. The contents are intended for use in a pharmacy admixture program and are restricted to the preparation of admixtures for infusion or, through a sterile transfer device, for the filling of empty sterile syringes. The *Closure* must be penetrated only one time after constitution, if necessary, with a suitable sterile transfer device or dispensing set that allows measured dispensing of the contents. The *Pharmacy bulk package* is to be used only in a suitable work area such as a laminar flow hood (or an equivalent clean-air compounding area). Designation as a *Pharmacy bulk package* is limited to *Injection*, for *Injection*, or *Injectable Emulsion* dosage forms as defined in *Nomenclature* { 1121 }, *General Nomenclature Forms*.

Pharmacy bulk packages, although containing more than one single dose, are exempt from the *Multiple-dose container* volume limit of 30 mL and the requirement that they contain a substance or suitable mixture of substances to prevent the growth of microorganisms. See *Labeling* 〈 7 〉 for labeling requirements.

Imaging bulk package: A *Packaging system* that holds a sterile preparation for parenteral use that contains multiple single doses of a contrast agent (medical imaging drug product) for use with a medical imaging device. The contents are restricted to use in direct conjunction with either an automated imaging injection system or contrast management system which has features to mitigate the risk of cross-contamination and which is approved or cleared for use with an *Imaging bulk package*. The sterility assurance of the *Imaging bulk package* contents in part is dependent upon the automated contrast imaging injection system or the contrast management system.

The *Imaging bulk package closure* shall be penetrated only one time with a suitable sterile dispensing set that allows measured dispensing of the *Imaging bulk package* contents. The *Imaging bulk package* is to be used only in a room designated for at least minimally invasive radiological procedures that involve intravascular administration of a contrast agent. Using aseptic technique, the *Imaging bulk package closure* shall be penetrated only one time with a suitable sterile component of the automated contrast injection system or contrast management system. This procedure room should have a door, a separate ventilation system and be restricted to designated personnel only while the *Imaging bulk package* is in use. If the integrity of the bulk package and the delivery system cannot be assured through direct continuous supervision, the *Imaging bulk package* and all associated disposables for the automated contrast the imaging injection system or contrast management system should be discarded.

Designation as an *Imaging bulk package* is limited to *Injections, for Injections, or Injectable Emulsions* dosage forms as defined in *Injections and Implanted Drug Products* 〈 1 〉, and in *General Nomenclature Forms* 〈 1121 〉.

Imaging bulk packages, although containing more than one single dose, are exempt from the *Multiple-dose container* volume limit of 30 mL. The contents of the *Imaging bulk package* must have demonstrated the ability to limit the growth of microorganisms over the labeled period of use.

Where a *Container* is offered as an *Imaging bulk package*, the label shall 1) state prominently "Imaging bulk package" and in juxtaposition with this statement include the following use statement: "For use only with an automated imaging contrast injection system or contrast management system approved or cleared for use with this contrast agent in this Imaging Bulk Package"; 2) bear a statement limiting the time frame in which the container may be used once it has been entered, provided it is held under the labeled storage conditions; 3) bear the statement "See drug and device labeling for information on devices indicated for use with this Imaging bulk package and techniques to help assure safe use."

Non-Injection Packaging Systems

Multiple-unit container: A *Packaging system* that permits withdrawal of successive portions of a non-injection article without changing the safety, strength, quality, or purity of the remaining portion (e.g., bottle of capsules, tablets, and oral or topical liquids).

Single-unit container: A *Packaging system* that holds a quantity of a non-injection article intended for administration as a single dose and intended for use promptly after the *Packaging system* is opened.

Unit-dose container: A single-unit *Packaging system* for an article intended for administration by other than the parenteral route as a single dose.

Unit-of-use container: A *Packaging system* that contains a specific quantity of an article that is intended to be dispensed as such without further modification except for the addition of appropriate labeling. It is not permitted to repackage *Unit-of-Use containers* for sale.

Miscellaneous

Repackaging: The act of removing a drug product from the original manufacturer's *Packaging system* (bulk or marketed container) and placing it into another *Packaging system*, usually one of smaller size.

Repackager: A firm that repackages drug products for distribution (e.g., for resale to distributors, hospitals, or pharmacies), a function that is beyond the regular practice of a pharmacy. The distribution is not patient specific in that there are no prescriptions. Unlike dispensers, repackaging organizations are required to register with the FDA and to comply with the Current Good Manufacturing Practice regulations in 21 CFR § 210 and § 211.

Contract packager/contract repackager: A firm that is contracted by another organization, such as a manufacturer, to package bulk into a marketed container of a drug product. A *Contract packager* does not take ownership from the manufacturer and generally receives the assigned expiration date from the manufacturer.

Dispenser: A licensed or registered practitioner who is legally responsible for providing the patient with a preparation that is in compliance with a prescription or a medication order and contains a specific patient label. In addition, dispensers may prepare limited quantities in anticipation of a prescription or medication order from a physician. *Dispensers* are governed by the board of pharmacy of the individual state. The terms "dispenser" and "pharmacy" are used interchangeably.

Beyond use date: See ⟨ 7 ⟩.

Expiration date: See ⟨ 7 ⟩.

Black closure system or black bands: The use of a *Black closure system* on a vial (e.g., a black cap overseal and a black ferrule to hold the elastomeric closure) or the use of a *Black band* or series of bands above the constriction on an ampule is prohibited, except for *Potassium Chloride for Injection Concentrate*. See ⟨ 7 ⟩.

INJECTION PACKAGING

Packaging for sterile products intended for injection must be validated as meeting the containment and protection requirements that are essential for maintaining the article's quality.

Refer to *Sterile Product Packaging—Integrity Evaluation* ⟨ 1207 ⟩ for further information regarding sterile product container closure integrity testing and validation. *Closures* for *Multiple-dose containers* permit the withdrawal of the contents without removal or destruction of the

Closure. The *Closure* permits penetration by a needle and, upon withdrawal of the needle, closes at once, protecting the contents against contamination. Refer to *Elastomeric Closures for Injections* (381) for *Closure* reseal tests that are useful for screening multiple-dose closures for their reseal properties. Additional testing may be needed to ensure that the specific closure selected for a product package is able to prevent loss of product contents and microbial contamination under anticipated conditions of multiple entry and use. Piggyback packaging systems are usually intravenous infusion *Container-closure systems* that are used to administer a second infusion through a connector of some type or an injection port on the administration set of the first fluid, thereby avoiding the need for another injection site on the patient's body. Piggyback packaging systems also are known as secondary infusion containers.

The volume of injection in a *Single-dose container* provides the amount specified for one-time parenteral administration, and in no case is more than sufficient to permit the withdrawal and administration of 1 L. Preparations intended for intraspinal, intracisternal, or peridural administration are packaged in *Single-dose containers* only. Unless otherwise specified in the individual monograph, a *Multiple-dose container* contains a volume of injection sufficient to permit the withdrawal of NMT 30 mL.

The following injections are exempt from the 1-L restriction of the foregoing requirements relating to packaging:

- Injections packaged for extravascular use as irrigation solutions or peritoneal dialysis solutions.
- Injections packaged for intravascular use as parenteral nutrition or as replacement or substitution fluid to be administered continuously during hemofiltration.

Injections packaged for intravascular use that may be used for intermittent, continuous, or bolus replacement fluid administration during hemodialysis or other procedures, unless excepted above, must conform to the 1-L restriction. Injections labeled for veterinary use are exempt from the packaging and storage requirements concerning the limitation to single-dose packaging systems and the limitation on the volume of *Multiple-dose containers*.

Packaging for constitution: *Containers*, including the *Closures*, for dry solids intended for injection must not interact physically or chemically with the preparation in any manner that alters the strength, quality, or purity beyond the official requirements under the ordinary or customary conditions of handling, shipment, storage, sale, and use. A *Packaging system* for a sterile solid permits the addition of a suitable solvent and withdrawal of portions of the resulting solution or suspension in such manner that the sterility of the product is maintained. Where the Assay in a monograph provides a procedure for the Sample solution, in which the total withdrawable contents are to be withdrawn from a *Single-dose container* with a hypodermic needle and syringe, the contents are to be withdrawn as completely as possible into a dry hypodermic syringe of a rated capacity not exceeding three times the volume to be withdrawn and fitted with a 21-gauge needle NLT 2.5 cm (1 in) in length. Care must be taken to expel any air bubbles, and the contents are then discharged into a container for dilution and assay.

MEDICAL GAS PACKAGING

Gas cylinder: A metallic *Packaging system* constructed of steel or aluminum and designed to hold medical gases under pressure; these gases may include: Carbon Dioxide USP, Helium USP, Medical Air USP, Nitric Oxide, Nitrous Oxide USP, Nitrogen NF, and Oxygen USP. As a safety

measure, for carbon dioxide, cyclopropane, helium, medical air, nitrous oxide, and oxygen, the Pin-Index Safety System of matched fittings is recommended for cylinders of Size E or smaller.

ASSOCIATED COMPONENTS

Many associated components are graduated for dose administration. It is the responsibility of the manufacturer to ensure that the appropriate dosing component is provided or that a general purpose component, such as those described in this section, is specified for delivering the appropriate dose with the intended accuracy.

Graduated associated components described in this section are for general use. Graduated markings should be legible, indelible, and on an extraoral surface that does not contact the product. The associated volume markings shall be in metric units and limited to a single measurement scale that corresponds with the dose instructions on the prescription container label (see *Prescription Container Labeling* 〈 17 〉). Under expected conditions of use, the volume error incurred in measuring liquids for individual dose administration by means of such graduated components should be NMT 10% of the indicated amount of the liquid preparation with which the graduated component will be used.

Dosing cup: A measuring device consisting of a small cup that may be packaged with oral liquid articles.

Dosing spoon: A measuring device consisting of a bowl and handle that may be packaged with oral liquid articles. The handle may be a graduated tube.

Medicine dropper: A measuring device consisting of a transparent or translucent barrel or tube that is generally fitted with a collapsible bulb. It may be packaged with oral liquid articles.

Oral syringe: A measuring device consisting of a plunger and barrel made of transparent or translucent plastic material and a seal on the end. It may be packaged with oral liquid articles. The syringe should deliver a measured amount of a liquid drug product.

TEMPERATURE AND STORAGE DEFINITIONS

Freezer: A place in which the temperature is controlled between -25° and -10° (-13° and 14° F).

Refrigerator: A cold place in which the temperature is controlled between 2° and 8° (36° and 46° F).

Cold: Any temperature not exceeding 8° (46° F).

Cool: Any temperature between 8° and 15° (46° and 59° F). [Note—An article for which storage in a cool place is directed may, alternatively, be stored and shipped as refrigerated, unless otherwise specified by the individual monograph.]

Room temperature (also referred to as Ambient temperature): The temperature prevailing in a working environment.

Controlled room temperature: The temperature maintained thermostatically that

encompasses the usual and customary working environment of 20°–25° (68°–77° F). The following conditions also apply.

Mean kinetic temperature not to exceed 25°. Excursions between 15° and 30° (59° and 86° F) that are experienced in pharmacies, hospitals, and warehouses, and during shipping are allowed. Provided the mean kinetic temperature does not exceed 25°, transient spikes up to 40° are permitted as long as they do not exceed 24 h. Spikes above 40° may be permitted only if the manufacturer so instructs.

Articles may be labeled for storage at “controlled room temperature” or at “20°–25°,” or other wording based on the same mean kinetic temperature [see also *Good Storage and Distribution Practices for Drug Products* (1079), *Quality Management System, Mean Kinetic Temperature (MKT) Calculation*].

An article for which storage at *Controlled room temperature* is directed may, alternatively, be stored and shipped in a cool place or refrigerated, unless otherwise specified in the individual monograph or on the label.

Warm: Any temperature between 30° and 40° (86° and 104° F).

Excessive heat: Any temperature above 40° (104° F).

Dry place: A place that does not exceed 40% average relative humidity at 20° (68° F) or the equivalent water vapor pressure at other temperatures. The determination may be made by direct measurement at the place. Determination is based on NLT 12 equally spaced measurements that encompass either a season, a year, or, where recorded data demonstrate, the storage period of the article. There may be values of up to 45% relative humidity provided that the average value does not exceed 40% relative humidity. Storage in a *Container* validated to protect the article from moisture vapor, including storage in bulk, is considered a *Dry place*.

Protect from freezing: The *Container* label will bear an appropriate instruction to protect the article from freezing in cases where freezing exposes an article to loss of strength or potency or to destructive alteration of its characteristics. These risks are present in addition to the risk that the container may break if exposed to freezing temperatures.

Protect from light: Where light subjects an article to loss of strength or potency or to destructive alteration of its characteristics, the *Container* label bears an appropriate instruction to protect the article from light. The article must be packaged in a light resistant *Container*.

■ 1S (USP39)

¹ Exceptions may be considered only under conditions described in *Pharmaceutical Compounding—Sterile Preparations* (797).

BRIEFING

(791) pH, USP 38 page 556. The revision proposal harmonizes some terminology for

consistency with other pharmacopoeia and explicitly permits more calibration options. There are no revisions to the instrument performance requirements or calibration procedures.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style.

Comment deadline: July 31, 2015

〈 791 〉 pH

Change to read:

INTRODUCTION

For compendial purposes, pH is defined as the value given by a suitable, properly ~~standardized~~ **calibrated**, **1S (USP39)**

potentiometric sensor and measuring system. [Note—The measuring system has traditionally been referred to as the “pH meter.” While the pH meter is still in common use, the measuring system can also be embedded inside the pH sensor, and the pH signal can be transmitted digitally to an external device such as a computer, Programmable Logic Controller (PLC), Distributed Control System (DCS), data acquisition system, terminal, or other microprocessor-controlled device.] By definition, pH is equal to $-\log_{10}[a_{\text{H}^+}]$ where a_{H^+} is the activity of the hydrogen (H^+) or hydronium ion (H_3O^+), and the hydrogen ion activity very closely approximates the hydrogen ion concentration.

The practical pH scale is defined:

$$\text{pH} = \text{pH}_s + [(E - E_s)/k]$$

E = measured potential where the galvanic cell contains the solution under test (pH)

E_s = measured potential where the galvanic cell contains the appropriate buffer solution for ~~standardization~~

calibration, **1S (USP39)**

(pH_s)

k = change in potential/unit change in pH and is derived from the Nernst equation (as follows)

$$k = \log_e(10) \times (RT/nF)$$

R = 8.314 J/mole/ $^\circ\text{K}$

T = temperature ($^\circ\text{K}$)

n = moles/half-reaction

F = Faraday constant, 96485 C/mole

The resulting equation is $[0.05916 + 0.0001984(T - 25^\circ)]$ volts at temperature T . Values of k

from 15°–35° are provided in *Table 1*.

Table 1. Values of k for Various Temperatures

Temperature (°C)	k (V)
15.00	0.05718
20.00	0.05817
25.00	0.05916
30.00	0.06016
35.00	0.06115

Values of k at other temperatures can be determined from the equation above. For practical purposes, values of k are determined from pH sensor calibration.

PH MEASUREMENT SYSTEM

The measurement system consists of: (1) a measuring electrode sensitive to hydrogen-ion activity, typically a glass electrode, though other electrode types are possible, (2) a suitable reference electrode, for example, a silver–silver chloride electrode, and (3) a voltage measurement system with an input resistance capable of measuring at a high input impedance of the pH sensor. The measuring and reference electrode may be separated or combined. The voltage measurement system may be separated from the pH sensor or integrated into the sensor. For most applications, a temperature measurement will be necessary for compensation of the Nernst temperature influence described above. A temperature device may be embedded into the pH sensor, or an external temperature device may be used.

Change to read:

INSTRUMENT REQUIREMENTS

The measurement system shall be capable of performing a 2-point

■ (or more) ■ 1S (USP39)

pH calibration (see below). The accuracy of the pH measurement system is described in the *Calibration* section. The resolution of the pH measurement system shall be at least 0.01 pH. The instrument shall be capable of temperature-compensating the pH sensor measurement to convert the millivolt signal to pH units at any temperature, either automatically using a temperature device built into the sensor system or by manual entry of the sample temperature into the measurement system. The accuracy of the temperature measurement system shall be $\pm 1^\circ$. The resolution of the temperature measurement system shall be at least 0.1° . Lab-based pH measurements are typically performed at $25 \pm 2^\circ$ unless otherwise specified in the individual monograph or herein. However, temperatures outside this range are acceptable if samples are more conveniently prepared at alternative temperatures. Examples of non-lab-based measurements include test samples inside process pipes, vessels, tanks, and other non-standard processing conditions. [Note—The definitions of pH, the pH scale, and the values assigned to the buffer solutions for standardization

■ calibration ■ 1S (USP39)

are for the purpose of establishing a practical, operational system so that results may be compared between laboratories. The measured pH values do not necessarily correspond exactly to those obtained by the definition, $\text{pH} = -\log a_{\text{H}^+}$, rather the values obtained are closely related to the activity of the hydrogen-ion in aqueous solutions.] [Note—Where a pH measurement system is **standardized**

■ calibrated ■ 1S (USP39)

by use of an aqueous buffer and then used to measure the “pH” of nonaqueous systems, the ionization constant of the acid or base, the dielectric constant of the medium, the liquid-junction potential (which may give rise to errors of approximately 1 pH unit), and the hydrogen-ion response of the glass electrode are all changed. For these reasons, the values so obtained with solutions that are only partially aqueous in character can be regarded only as apparent pH values.]

Change to read:

BUFFER SOLUTIONS FOR STANDARDIZATION

■ CALIBRATION ■ 1S (USP39)

OF THE pH MEASUREMENT SYSTEM

Buffer solutions for **standardization**

■ calibration ■ 1S (USP39)

are prepared as directed in *Table 2*.¹ Buffer salts of requisite purity can be obtained from the National Institute of Standards and Technology, other national authorities, or other suppliers. Buffer solutions should be stored in appropriate containers that ensure stability of the pH through the expiry date, and fitted with a tight closure. For buffer solutions greater than 11, the storage should be in containers that are resistant to or reduce carbon dioxide intrusion which would lower the pH of the buffer. For buffer solutions lower than 11, they should typically be prepared at intervals not to exceed 3 months. For buffer solutions greater than 11, they should typically be prepared and used fresh unless carbon dioxide ingress is restricted. All buffer solutions should be prepared using *Purified Water*. *Table 2* indicates the pH of the buffer solutions as a function of temperature. The instructions presented here are intended for the preparation of solutions having the designated molal (m) concentrations. However, in order to facilitate their preparation, the instructions are given in molarity. The difference in concentration between molality and molarity preparations for these buffer solutions is less than 1%, and the pH difference is negligible. Calibration using buffer solutions shall be done in the temperature range of the buffers listed in *Table 2*. [Note—The Nernst temperature compensation corrects only for the electrode millivolt output change with temperature, not the actual pH change of the buffer solution with temperature which is unique for each buffer.] Features such as automatic buffer recognition or buffer pH-temperature correction are available for convenience in accommodating the temperature influence on buffer solutions. The pH-temperature response can be determined from the values in *Table 2*.

Table 2. pH Values of Buffer Solutions for Standardization

Preparation of alternative volumes at the same concentrations to those indicated below is acceptable.

Potassium tetraoxalate, 0.05 m: Dissolve 12.61 g of $\text{KH}_3(\text{C}_2\text{O}_4)_2 \cdot 2\text{H}_2\text{O}$, and dilute with water to make 1000.0 mL.

Potassium hydrogen tartrate, saturated at 25°: Add $\text{C}_4\text{H}_5\text{KO}_6$ to water until saturation is exceeded at 25°. Then filter or decant.

Potassium dihydrogen citrate, 0.05 M: Dissolve 11.41 g of $\text{C}_6\text{H}_7\text{KO}_4$, and dilute with water to make 1000.0 mL.

Potassium biphthalate, 0.05 m: Dissolve 10.12 g of $\text{KHC}_8\text{H}_4\text{O}_4$, previously dried at 110° for 1 h, and dilute with water to make 1000.0 mL.

Equimolal phosphate, 0.05 m: Dissolve 3.53 g of disodium hydrogen phosphate (Na_2HPO_4) and 3.39 g of potassium dihydrogen phosphate (KH_2PO_4), each previously dried at 120° for 2 h, and dilute with water to make 1000.0 mL.

Potassium dihydrogen phosphate, 0.0087 M, and disodium hydrogen phosphate, 0.0303 M: Dissolve 1.18 g of KH_2PO_4 and 4.30 g Na_2HPO_4 , both dried for 2 h at $120 \pm 2^\circ$, and dilute with water to make 1000.0 mL.

Sodium tetraborate, 0.01 m: Dissolve 3.80 g of $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$, and dilute with water to make 1000.0 mL. Protect from absorption of carbon dioxide.

Sodium carbonate, 0.025 M, and sodium bicarbonate, 0.025 M: Dissolve 2.64 g of sodium carbonate (Na_2CO_3) and 2.09 g of sodium bicarbonate (NaHCO_3), and dilute with water to make 1000.0 mL.

Calcium hydroxide, saturated at 25°: Add $\text{Ca}(\text{OH})_2$ to water until saturation is exceeded at 25°. Use water that has been recently boiled and protected from the atmosphere to limit carbon dioxide absorption. Then filter or decant.

CALIBRATION

Because of variations in the nature and operation of the available pH measurement systems, it is not practical to provide universal directions for the ~~standardization~~

■ calibration ■ 1S (USP39)

of the measurement system. However, the general principles to be followed are set forth in the following paragraphs. Examine the electrodes, especially the reference electrode and electrolyte level, if a liquid electrolyte is used. If necessary, replenish electrolyte supply, and observe other precautions indicated by the instrument and electrode manufacturers.

The calibration or verification of the pH measurement system should be periodically executed. The historical performance of the measurement system, the criticality of the pH measurement, the maintenance of the pH sensor, and the frequency of measurement operation is used to determine the frequency of the calibration/verification.

■ In addition to the 2-point calibration process described below, other multipoint methods may be available for use. These are acceptable if the pH sensor slope and the offset criteria (see step 10 below) as well as the calibration accuracy (see step 14 below) are met. ■ 1S (USP39)

If the pH of the buffer is sensitive to ambient carbon dioxide, then use *Purified Water* that has been recently boiled, and subsequently stored in a container designed to minimize ingress of carbon dioxide.

1. To ~~standardize~~

■ calibrate ■ 1S (USP39)

the pH measurement system, select three buffer solutions for ~~standardization~~

■ calibration, ■ 1S (USP39)

preferably from those given in *Table 2*, such that the expected pH of the material under test falls within their range. Two of the buffers are used for the calibration process, and the third buffer is used for verification. The value of the verification buffer ~~should be between~~

■ shall be between two of ■ 1S (USP39)

the calibration buffers. If the operational range of the pH sensor is beyond the pH range of the buffer solutions in *Table 2*, then either 1) select two nearby pH buffers from *Table 2* or 2) select one from *Table 2* and another documented prepared buffer that is outside the range.

2. Rinse the pH sensor several times with water, then with the first buffer solution.
3. Immerse the pH sensor in the first buffer solution at a temperature within the range of *Table 2*.
4. If automatic temperature measurement and compensation is not included in the measuring system, manually enter the temperature of the buffer and pH value of the buffer solution at that temperature into the instrument. For temperatures not listed in *Table 2*, use linear interpolation to determine the pH value as a function of temperature.
5. Initiate the 2-point calibration sequence with the first buffer according to the manufacturer's instructions.
6. Remove the pH sensor from the first buffer and rinse the electrode(s) with water, and then with the second buffer solution.
7. Immerse the pH sensor in the second buffer at a temperature within the range of *Table 2*.
8. If automatic temperature measurement and compensation is not included in the measuring system, manually enter the temperature of the buffer and pH value of the buffer solution at that temperature into the instrument.

9. Continue the 2-point calibration sequence with the second buffer according to the manufacturer's instructions.
10. After completion of the 2-point calibration process, verify that the pH slope and offset are within acceptable parameters. Typical acceptable parameters ~~are slopes ranging from 90%–105% and an offset of ± 30~~
 - are a slope of 90.0%–105.0% and an offset of 0.0 ± 30.0 ■ 1S (USP39)
 - mV (0.5 pH units at 25° C). Depending on the pH instrumentation, the pH slope and offset may be determined in software or by manual methods.
 - If using manual methods, follow supplier instructions to calculate the pH sensor slope/offset. ■ 1S (USP39)
 - If these parameters are not within acceptable parameters, the sensor should be properly cleaned, replenished, serviced, or replaced, and the 2-point calibration process shall be repeated.
11. Remove the pH sensor from the second buffer, and rinse thoroughly with water, and then the verification buffer.
12. Immerse the pH sensor in the verification buffer at a temperature within the range of *Table 2*.
13. If automatic temperature measurement and compensation are not included in the measuring system, manually enter the temperature of the buffer and pH value of the buffer solution at that temperature into the instrument.
14. The pH reading shall be within ± 0.05 pH of the value in *Table 2* at the buffer solution temperature.

Change to read:

OPERATION

All test samples should be prepared using *Purified Water*, unless otherwise specified in the monograph. All test measurements should use manual or automated Nernst temperature compensation.

1. Prepare the test material according to requirements in the monograph or according to specific procedures. If the pH of the test sample is sensitive to ambient carbon dioxide, then use *Purified Water* that has been recently boiled, and subsequently stored in a container designed to minimize ingress of carbon dioxide.
2. Rinse the pH sensor with water, then with a few portions of the test material.
3. Immerse the pH sensor into the test material and read
 - record ■ 1S (USP39)

the pH value and temperature.

In all pH measurements, allow sufficient time for stabilization of the temperature and pH measurement.

Diagnostic functions such as glass or reference electrode resistance measurement may be available to determine equipment deficiencies. Refer to the electrode supplier for diagnostic tools to assure proper electrode function.

Where approximate pH values suffice, indicators and test papers (see *Indicators* and *Indicator and Test Papers*) may be suitable.

For a discussion of buffers, and for the composition of standard buffer solutions called for in compendial tests and assays, see *Buffer Solutions* in the section *Solutions*. This referenced section is not intended to replace the use of the pH calibration buffers in *Table 2*.

¹ Commercially available buffer solutions for pH measurement system, ~~standardized~~
~~calibrated~~ ^{1S (USP39)}

by methods traceable to the National Institute of Standards and Technology (NIST) or other national authorities, labeled with a pH value accurate to 0.02 pH unit may be used. Solutions prepared from ACS reagent grade materials or other suitable materials, may be used provided the pH of the resultant solution is the same as that of the solution prepared from the NIST (or other national authorities) certified material. Buffer solutions that are greater than 12 should be used immediately, or should be prepared using freshly boiled water, and stored under conditions to minimize carbon dioxide absorption and ingress.

BRIEFING

〈 1035 〉 **Biological Indicators for Sterilization**, *USP 38* page 814. This chapter is proposed for omission from *USP*. A new general chapter, *Biological Indicators for Sterilization* 〈 1229.5 〉, has been proposed in *PF 41(2)* as part of the new series of chapters on sterilization. The chapters impacted are *Sterilization and Sterility Assurance of Compendial Articles* 〈 1211 〉, *Pharmaceutical Compounding—Sterile Preparations* 〈 797 〉, and *Sterility Testing—Validation of Isolator Systems* 〈 1208 〉. In these chapters, references to 〈 1035 〉 will be replaced by 〈 1229.5 〉.

The following Briefing list includes monographs and/or chapters that both reference the General Chapter under revision and require revision to keep references to the General Chapter accurate. Other monographs and/or chapters may also be listed, even where the reference to the General Chapter remains unchanged, as additional notice to stakeholders where there is believed to be potential for the change in the general chapter itself to affect pass-fail determinations for particular monograph articles.

- 〈 797 〉 *Pharmaceutical Compounding—Sterile Preparations*
- 〈 1208 〉 *Sterility Testing—Validation of Isolator Systems*
- 〈 1209 〉 *Sterilization—Chemical and Physicochemical Indicators and Integrators*
- 〈 1211 〉 *Sterilization and Sterility Assurance of Compendial Articles*

~~■ 〈 1035 〉 **BIOLOGICAL INDICATORS FOR STERILIZATION**~~

~~A biological indicator is broadly defined as a characterized preparation of a specific microorganism that provides a defined and stable resistance to a specific sterilization process.~~

Microorganisms widely recognized as suitable for biological indicators are spore-forming bacteria, because, with the exception of ionizing radiation processes, these microorganisms are significantly more resistant than normal microflora. A biological indicator can be used to assist in the performance qualification of the sterilization equipment and in the development and establishment of a validated sterilization process for a particular article. Biological indicators are used in processes that render a product sterile in its final package or container, as well as for the sterilization of equipment, materials, and packaging components used in aseptic processing. Biological indicators may also be used to monitor established sterilization cycles and in periodic revalidation of sterilization processes. Biological indicators may also be used to evaluate the capability of processes used to decontaminate isolators or aseptic clean room environments.

The principles and requirements for these applications are described under *Sterilization and Sterility Assurance of Compendial Articles* (1211).

TYPES OF BIOLOGICAL INDICATORS

There are at least three types of biological indicators. Each type of indicator incorporates a known species of a microorganism of known sterilization resistance to the sterilization mode. Some biological indicators may also contain two different species and concentrations of microorganisms.

One form of biological indicator includes spores that are added to a carrier (a disk or strip of filter paper, glass, plastic, or other materials) and packaged to maintain the integrity and viability of the inoculated carrier.

Carriers and primary packaging shall not contain any contamination (physical, chemical, or microbial) that would adversely affect the performance or the stability characteristics of the biological indicator. The carrier and primary packaging shall not be degraded by the specific sterilization process, which is used in a manner that will affect the performance of the biological indicator. The carrier should withstand transport in the primary and secondary packaging and handling at the point of use. The design of the carrier and primary packaging should minimize the loss of the original inoculum during transport, handling, and shelf life storage.

Another form of biological indicator is a spore suspension that is inoculated on or into representative units of the product to be sterilized. This represents an inoculated product; however, a simulated inoculated product may be used if it is not practical to inoculate the actual product. A simulated product is a preparation that differs in one or more ways from the actual product, but performs as the actual product using test conditions or during actual production sterilization processing. Spore suspensions with a known D value should be used to inoculate the actual or simulated product. If a simulated inoculated product is used, it must be demonstrated that it will not degrade the sterilization resistance of the bioindicator. The physical design of actual or simulated product can affect the resistance of spore suspensions that are inoculated on or into the products. In the case of liquid inoculated products, it is often advisable to determine both the D value and z value of the specific biological indicator microorganism in the specific liquid product. The population, D value, z value where applicable, and endpoint kill time of the inoculated actual or simulated product should be determined.

A third form of biological indicator is a self-contained indicator. A self-contained biological indicator is designed so that the primary package, intended for incubation following sterilization processing, contains the growth medium for recovery of the process-exposed microorganisms.

This form of biological indicator together with the self-contained growth medium can be considered a system. In the case of self-contained biological indicators, the entire system provides resistance to the sterilization process.

If the biological indicator is a paper strip or disk in a self-contained package that includes an available culture medium, the package design should be readily penetrable by the sterilizing agent. To allow for the time lag that may occur while the sterilizing agent reaches the contained microorganisms in the system, the D value, process endpoint kill time, and the survival time should be characterized for the system and not solely for the paper strip in the self-contained unit. Following the sterilizing treatment, the spore strip or disk is immersed in the self-contained medium by manipulation, which allows contact with the culture medium.

Self-contained biological indicators may also consist of a spore suspension in its own medium, and they often also contain a dye, which indicates positive or negative growth following incubation. Resistance of the self-contained system is dependent upon penetration of the sterilant into the package. Penetration may be controlled by the manufacturer through varying designs and composition of the self-contained biological indicator package, ampul, or container. Self-contained ampul biological indicators may be incubated directly following exposure to the sterilization process. The entire system is then incubated under the specified conditions. Growth or no growth of the treated spores is determined visually (either by observing a specified color change of an indicator incorporated in the medium or by turbidity) or by microscopic examination of the inoculated medium.

The self-contained system resistance characteristics must also comply with the labeling of the self-contained system and the relevant biological indicator monograph. The self-contained biological indicator system should withstand transport in the secondary packaging and handling at the point of use without breakage. The design of the self-contained system should be such to minimize the loss of the original inoculum of microorganisms during transport and handling. During or after the sterilization process, the materials used in the self-contained system shall not retain or release any substance that can inhibit the growth of low numbers of surviving indicator microorganism under culture conditions. Adequate steps must be taken to demonstrate that the recovery medium has retained its growth support characteristics after exposure to the sterilization process.

Preparation

All operations associated with the preparation of biological indicators are controlled by a documented quality system. Traceability is maintained for all materials and components incorporated in or coming into direct contact with the microorganism suspension, the inoculated carrier, or the biological indicator.

The preparation of stock spore suspensions of selected microorganisms used as biological indicators requires the development of appropriate procedures, including mass culturing, harvesting, purification, and maintenance of the spore suspensions. The stock suspension should contain predominantly dormant (nongerminating) spores that are held in a nonnutritive liquid.

The finished product (microbial suspension, inoculated carriers, or biological indicators) supplied by commercial manufacturers shall have no microorganisms, other than the test microorganism, present in sufficient numbers to adversely affect the product. The system to minimize the presence of microorganisms other than the biological indicator microorganism in the product will

be validated, monitored, and recorded.

Selection for Specific Sterilization Processes

The selection of a biological indicator requires a knowledge of the resistance of the biological indicator system to the specific sterilization process. It must be established that the biological indicator system provides a challenge to the sterilization process that exceeds the challenge of the natural microbial burden in or on the product.

The effective use of biological indicators for the cycle development, process, and product validation, and routine production monitoring of a sterilization process requires a thorough knowledge of the product being sterilized, along with its component parts (materials and packaging). Only the widely recognized biological indicators specified in the particular biological indicator monograph should be used in the development or validation of a sterilization process. This will ensure that the biological indicator selected provides a greater challenge to the sterilization process than the bioburden in or on the product. Some users may require biological indicators with characteristics that differ from those widely available commercially. In such cases, users may grow their own spore cultures for the express purpose of preparing in-house biological indicators for their specific use. In such a case, the user is well advised to use organisms already described in the scientific literature as indicator organisms, and the user must have the capability of determining D and z values for in-house biological indicators. When biological indicators are prepared in-house, users must confirm the population, purity, and shelf life of the biological indicator to ensure the validity of any test conducted using the in-house biological indicator. When a bioburden-based sterilization process design is used, data comparing the resistance of the biological indicator to that of bioburden are essential. Enumeration of the bioburden content of the articles being sterilized is also required. The process must result in a biologically verified lethality sufficient to achieve a probability of obtaining a nonsterile unit that is less than one in a million.

Alternatively, the overkill method may be used in the design of a sterilization process. In this case, specific assumptions are made regarding the resistance assumption used in establishing sterilization process lethality requirements. In general, all overkill processes are built upon the assumption that the bioburden is equal to one million organisms and that the organisms are highly resistant. Thus, to achieve the required probability of a nonsterile unit that is less than one in a million, a minimum 12-D process is required. A 12-D process is defined as a process that provides a lethality sufficient to result in a 12-log reduction, which is equivalent to 12 times a D value for organisms with sufficiently higher resistance than the mean resistance of bioburden. Because the bioburden is assumed to be one million, an overkill process will result in a probability of nonsterility at much less than 10^{-6} in actual practice. Overkill process design and evaluation may differ depending upon the sterilization process under test. The use of an overkill design and validation approach may minimize or obviate the need for bioburden enumeration and identification.

Moist Heat—For moist heat sterilization process, spores of suitable strains of *Bacillus stearothermophilus* are commercially available as biological indicators and frequently employed. Other heat-resistant spore-forming microorganisms such as *Clostridium sporogenes*, *Bacillus subtilis*, and *Bacillus coagulans* have also been used in the development and validation of moist heat sterilization processes.

Dry Heat—For dry heat sterilization, spores of *Bacillus subtilis* spp. are sometimes used to

validate the process. During the validation of dry heat sterilization processes, endotoxin depyrogenation studies are frequently conducted in lieu of microbial inactivation studies during the establishment of sterilization cycles because the inactivation rate of endotoxin is slower than the inactivation rate of *Bacillus subtilis* spores. In practice the reduction of endotoxin titer by three or more logs will result in a process that also achieves a probability of nonsterility substantially lower than 10^{-6} .

Ionizing Radiation—Spores of *Bacillus pumilus* have been used to monitor sterilization processes using ionizing radiation; however, this is a declining practice. Radiation dose setting methods that do not use biological indicators have been widely used to establish radiation processes. Furthermore, certain bioburden microorganisms can exhibit greater resistance to radiation than *Bacillus pumilus*.

Ethylene Oxide—For ethylene oxide sterilization, spores of a subspecies of *Bacillus subtilis* (*Bacillus subtilis* var. *niger*) are commonly used. The same biological indicator systems are generally used when 100% ethylene oxide or different ethylene oxide and carrier gas systems are used as sterilants.

Vapor-Phase Hydrogen Peroxide (VPHP)—This process has been shown to be an effective surface sterilant or decontaminant. VPHP is capable of achieving sterilization (probability of nonsterility of less than one in a million) when process conditions so dictate and if the target of sterilization is suitably configured. However, VPHP is also commonly used as a surface decontaminating agent in the treatment of sterility testing, biological and chemical containment, manufacturing isolators, and clean rooms.

Surface decontamination is a process that is distinct from sterilization of product contact materials, container closure systems, or product. It is a process designed to render an environment free of detectable or recoverable microorganisms. Biological indicators are widely used to verify the efficacy of the decontamination process. However, in the case of decontamination, a spore log reduction value of three to four is adequate because the goal is decontamination rather than sterilization.

Table 1. Typical Characteristics for Commercially Supplied Biological Indicator Systems

Sterilization Mode	Example of a Typical D value (minutes)	Range of D values for Selecting a Suitable Biological Indicator (minutes)	Limits for a Suitable Resistance (depending on the particular D value [minutes])	
			Survival Time	Kill Time
Dry heat ^a	1.9	Min. 1.0	Min. 4.0	10.0
160 ^c	-	Max. 3.0	Max. 14.0	32.0
Ethylene oxide ^b	-	-	-	-
600 mg per L	3.5	Min. 2.5	Min. 10.0	25.0
54 ^c	-	Max. 5.8	Max. 27.0	68.0

^a For 1.0×10^6 to 5.0×10^6 spores per carrier.

^b For 1.0×10^6 to 5.0×10^7 spores per carrier.

^c For 1.0×10^5 to 5.0×10^6 spores per carrier.

Sterilization Mode	Example of a Typical D value (minutes)	Range of D values for Selecting a Suitable Biological Indicator (minutes)	Limits for a Suitable Resistance (depending on the particular D value {minutes})	
			Survival Time	Kill Time
60% relative humidity	-	-	-	-
Moist heat ^c	1.9	Min. 1.5	Min. 4.5	13.5
121 ^e	-	Max. 3.0	Max. 14.0	32.0
^a For 1.0×10^6 to 5.0×10^6 spores per carrier. ^b For 1.0×10^6 to 5.0×10^7 spores per carrier. ^c For 1.0×10^5 to 5.0×10^6 spores per carrier.				

Bacillus stearothermophilus is the most prevalently used biological indicator for validating VPHP. Other microorganisms that may be useful as biological indicators in VPHP processes are spores of *Bacillus subtilis* and *Clostridium sporogenes*. Other microorganisms may be considered if their performance responses to VPHP are similar to those of the microorganisms cited above.

These spores may be inoculated on the surface of various gas impervious carrier systems having glass, metal, or plastic surfaces. Highly absorbent surfaces, such as fibrous substrates, or any other substrate that readily absorbs VPHP or moisture may adversely influence the VPHP concentration available for inactivation of inoculated microorganisms. Paper substrates are not used because VPHP will degrade cellulose based materials.

For representative characteristics of commercially supplied biological indicators, see *Table 1*.

The biological indicator may also be individually packaged in a suitable primary overwrap package that does not adversely affect the performance of the indicator, and is penetrable by VPHP. Spunbound polyolefin materials have proven to be well suited as an overwrap of biological indicators intended for use in evaluation of VPHP processes. The overwrap material may facilitate laboratory handling of the biological indicators following exposure to VPHP. Also, the use of an overwrap material to package VPHP biological indicators must be carefully assessed to ensure that, following VPHP exposure, residual hydrogen peroxide is not retained by the packaging material, possibly inducing bacteriostasis during the recovery steps. Microbial D values will be influenced by the presence of a biological indicator overwrap material relative to the rate of inactivation and the potential presence of residual VPHP. In cases where biological indicators (inoculated carriers) are being used without the primary package, stringent adherence to aseptic techniques is required.

PERFORMANCE EVALUATION

Manufacturer's Responsibility

The initial responsibility for determining and providing to the users the performance characteristics of a biological indicator³ lot resides with the manufacturer of biological indicators. The manufacturer should provide with each lot of biological indicators a certificate of analysis that attests to the validity of biological indicator performance claims cited on the

biological indicator package label or in the package insert of the label package. The manufacturer should define the sterilization process that the biological indicator will be used to evaluate. The characterization of each type of biological indicator, which provides the basis for label claims, should be performed initially by the manufacturer of the biological indicator using specialized and standardized apparatus under precisely defined conditions.⁴ The manufacturer should also provide information concerning the *D value*, the method by which the *D value* was determined, and microbial count and resistance stability of the biological indicator throughout the labeled shelf life of the indicator. Optimum storage conditions should be provided by the manufacturer, including temperature, relative humidity, and any other requirements for controlled storage. The data obtained from the various required performance assays should be cited in a package insert or on the label of the biological indicator package. The manufacturer should provide directions for use, including the medium and conditions to be used for the recovery of microorganisms after exposure to the sterilization process. Disposal instructions should also be provided by the manufacturer of the biological indicator.

User's Responsibility

Commercial Product—When biological indicators are purchased from a commercial source, their suitability for use in a specific sterilization process should be established through developmental sterilization studies unless existing data are available to support their use in the process. The user should establish in-house acceptance standards for biological indicator lots and consider rejection in the event the biological indicator lot does not meet the established in-house performance standards. A Certificate of Performance should be obtained for each lot of indicators, and the user should routinely perform audits of the manufacturer's facilities and procedures. If certificates are not obtained and audits have not been performed, or if the biological indicators are to be used outside of the manufacturer's label claims, verification and documentation of performance under conditions of use must exist.

Upon initial receipt of the biological indicator from a commercial supplier, the user should verify the purity and morphology of the purchased biological indicator microorganisms. Verification of at least the proper genus is desirable. Also, a microbial count to determine the mean count per biological indicator unit should be conducted. The manufacturer's comments relative to *D value* range, storage conditions, expiration dating, and stability of the biological indicator should be observed and noted. The user may consider conducting a *D value* assessment before acceptance of the lot. Laboratories that have the capability of performing *D value* assays could conduct a *D value* determination using one of the three methods cited in the general test chapter *Biological Indicators—Resistance Performance Tests* (55) and in the appropriate USP monographs for specific biological indicators. Particularly important is the verification of the *D value* and count stability of the biological indicator system if long-term storage is employed.

In the event the spore crop is maintained for longer than 12 months under documented storage conditions, both spore count and resistance analysis must be conducted, unless performance of an original parent crop has been validated for a longer storage period. The result of spore count and resistance assays should be within the range of acceptability established during initial acceptance of the spore crop lot.

Noncommercial Product—A user of biological indicator systems may elect to propagate microorganisms for developing in-house biological indicators to develop or validate sterilization processes. In the event a user becomes a "manufacturer" of biological indicators, biological indicator performance requirements must be met. If the biological indicator system is used for

the development of new sterilization processes or validation of existing processes, the same performance criteria described for commercial manufacturers of biological indicators must be followed.

Spore Crop Preparation

Because most biological indicators use microbial spores, accurate records of spore crop identification must be maintained by commercial and noncommercial biological indicator manufacturers. These records should include records pertaining to the source of the initial culture, identification, traceability to the parent spore crop, subculture frequency, media used for sporulation, changes in media preparation, any observation of crop contamination, and pre- and post-heat shock data. Records of usage of the spore crop and resistance to sterilization (namely, D values and z values where applicable) should also be maintained.

Instrumentation

The instrumentation used to evaluate the sterilization resistance of spore crops must be consistent with existing standards² related to the performance evaluation of biological indicator systems.

Equipment for the determination of D values of microorganisms exposed to VPHP should be able to closely control equipment operating parameters as described for other biological indicator systems under *Biological Indicators—Resistance Performance Tests* (55). Particularly important is the assurance of a consistently reproducible VPHP concentration, delivered within a finite time, and maintained within a specified concentration range or VPHP pressure range for a defined increment of time. Introduction of biological indicators into a stabilized concentration of VPHP conditions should be via a system that permits rapid entry and removal of the test units from the chamber. Also, the design of the test chamber should allow for the attainment of steady-state VPHP concentrations and pressure, or the use of a defined amount of cubic feet of free flowing VPHP at a standardized pressure and temperature. Currently, VPHP concentration measurement devices may not be widely used. Therefore, exposure conditions may need to be based on the maintenance of steady-state VPHP pressures or flow rates resulting from a known initial weight of hydrogen peroxide, admitted to the chamber in a defined unit of time. Using this information, together with the known fixed volume of the chamber environment, a calculation of the approximate VPHP concentration can be made. If conditions are maintained constant throughout each D value assessment run, comparisons of relative resistance among different biological indicator lots may be readily determined.

USE FOR IN-PROCESS VALIDATION

Regardless of the mode of sterilization, the amount of the initial population of the microorganisms, its resistance to sterilization, and the site of inoculation on or in the product can all influence the rate of biological indicator inactivation.

During product microbial challenges, various areas of the product should be inoculated with biological indicators. If, for example, a container with a closure system is sterilized, both the product solution and the closure should be challenged to ensure that sterilization equivalent to a 10^{-6} (one in a million probability of a nonsterile unit) sterilization assurance level (SAL) will be obtained in the solution as well as at the closure site.

~~One may need to determine through laboratory studies whether product components are more difficult to sterilize than, for example, a solution or drug within the product. Depending on the locations of the product components most difficult to sterilize, different process parameters may be involved in assuring microbial inactivation to an SAL of 10^{-6} . The product performance qualification phase should identify the most important process parameters for inactivation of microorganisms at the sites most difficult to sterilize. Once these critical processing parameters are determined, during sterilization in-process validation of the product, they should be operated at conditions less than the conditions stated in the sterilization process specifications. Biological indicator survival is predicated upon both resistance and population. Therefore, a 10^6 -biological indicator population is not always required to demonstrate a 10^{-6} SAL. The appropriate use for biological indicators is to employ them to confirm that the developed process parameters result in the desired SAL. In moist heat sterilization, the biological indicator is used to establish that physically measured lethality can be verified biologically. Biological indicators with substantive D values and populations substantially less than 10^6 are adequate to validate many sterilization and decontamination processes. It is important that the users be able to scientifically justify their selection of a biological indicator.~~

BRIEFING

《 1058 》 **Analytical Instrument Qualification**, *USP 38* page 971. The General Chapters—Physical Analysis Expert Committee is proposing the following revisions to this general information chapter:

1. The *Introduction* is being modified to include the classification of instruments previously included as a separate section.
2. Several other modifications are introduced in *Qualification Phases* under *Analytical Instrument Qualification Process*.
3. Changes are also proposed under *Roles and Responsibilities*, *Software Validation*, *Change Control*, and *AIQ Documentation*.
4. The *Instrument Categories* section is being deleted.
5. A new *Glossary* is being added.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style.

(GCPA: H. Pappa.)

《 1058 》 ANALYTICAL INSTRUMENT QUALIFICATION

Change to read:

INTRODUCTION

A large variety of laboratory equipment, instruments, and computerized analytical systems, ranging from simple nitrogen evaporators to complex multiple-function technologies (see *Instrument Categories*), are used in the pharmaceutical industry to acquire data to help ensure that products are suitable for their intended use. An analyst's objective is to consistently obtain reliable and valid data suitable for the intended purpose. Depending on the applications, users validate their procedures, calibrate their instruments, and perform additional instrument checks, such as system suitability tests and analysis of in-process quality control check samples to help ensure that the acquired data are reliable. With the increasing sophistication and automation of analytical instruments, an increasing demand has been placed on users to qualify their instruments.

Unlike method validation and system suitability activities, analytical instrument qualification (AIQ) currently has no specific guidance or procedures. Competing opinions exist regarding instrument qualification and validation procedures and the roles and responsibilities of those who perform them. Consequently, various approaches have been used for instrument qualification, approaches that require varying amounts of resources and generate widely differing amounts of documentation. This chapter provides a scientific approach to AIQ and considers AIQ as one of the major components required for generating reliable and consistent data. Note that the amount of rigor applied to the qualification process will depend on the complexity and intended use of the instrumentation. This approach emphasizes AIQ's place in the overall process of obtaining reliable data from analytical instruments.

Validation versus Qualification

In this chapter, the term validation is used for manufacturing processes, analytical procedures, and software procedures and the term qualification is used for instruments. Thus, the phrase "analytical instrument qualification" (AIQ) is used for the process of ensuring that an instrument is suitable for its intended application.

■ A large variety of analytical instruments, ranging from simple apparatus to complex computerized systems are used in the pharmaceutical industry to acquire data to help ensure that products meet their specifications. The majority of these instruments combine a metrological function with software control. There are many ways of demonstrating that an instrument is qualified and under control and these can include qualification, calibration, validation, and maintenance. In order to assure "fitness for purpose" an integrated approach based upon a risk assessment is recommended. For the purposes of this chapter, the term "instrument" used in this chapter includes any apparatus, equipment, instrument, or instrument system used in the laboratory.

This chapter provides a scientific approach for carrying out analytical instrument qualification (AIQ); it is left to each laboratory to justify and document their specific approaches.

The instrument owner/user, and their management, are accountable for the qualification and validation work outlined in this general chapter.

This general chapter outlines the principles and frame work of risk-based instrument qualification to ensure fitness for the intended use in pharmacopeial analysis. The detailed operating parameters to be qualified are found in the respective general chapters for specific instrument types.

The risk assessment begins with the classification of the instrument to determine the extent of qualification needed to demonstrate fitness for purpose. Generally, the more complex that an instrument is, or higher criticality of the measurement, the greater the amount of work that is required to ensure that quality data will be generated. In addition, attention must be paid to ensuring that data integrity and security are maintained.

Instruments can generally be classified as belonging to Groups A, B, or C. It should be noted that the same type of instrument can fit into one or more categories depending on its intended use. Therefore, no specific examples are provided.

Group A includes the least complex, standard instruments that are used without measurement capability or user requirement for calibration such as a magnetic stirrer or vortex mixer. Proper function is assured by observation and no further qualification activities are needed for this group.

Group B includes instruments which may provide a measurement or a quantitative condition that can affect a measurement. Examples may include a pH meter or an oven. Proper function of instruments in this group may require only some elements of qualification, such as routine calibration, maintenance, or performance checks. The level of qualification will also depend on the criticality of the application. Generally these instruments may have firmware but not software that is changed by the user.

Group C comprises the majority of analytical instruments and normally includes a significant degree of computerization and complexity. All elements of qualification, including software validation, must be considered to assure proper functioning of instruments in this group.

■ 1S (USP39)

COMPONENTS OF DATA QUALITY

There are four critical components involved in the generation of reliable and consistent data (quality data). *Figure 1* shows these components as layered activities within a quality triangle. Each layer adds to the overall quality. Analytical instrument qualification forms the base for generating quality data. The other components essential for generating quality data are analytical method validation, system suitability tests, and quality control check samples. These quality components are described below.

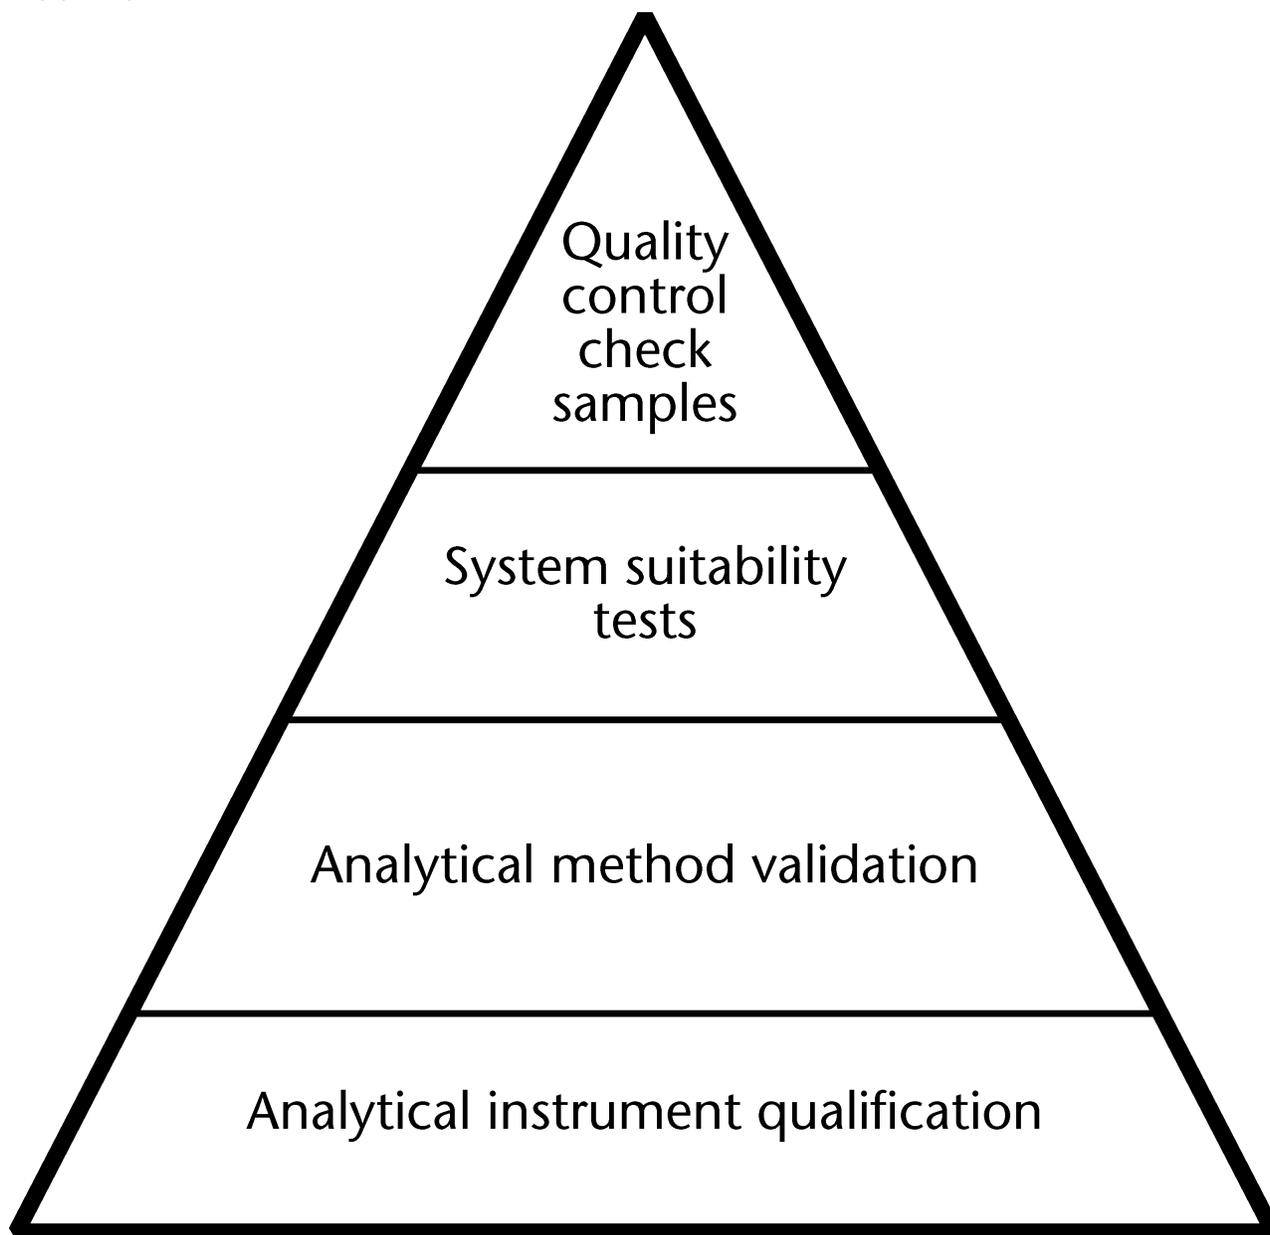

Figure 1. Components of data quality.

Analytical Instrument Qualification

AIQ is the collection of documented evidence that an instrument performs suitably for its intended purpose. Use of a qualified instrument in analyses contributes to confidence in the validity of generated data.

Analytical Method Validation

Analytical method validation is the collection of documented evidence that an analytical procedure is suitable for its intended use. Use of a validated procedure with qualified analytical instruments provides confidence that the procedure will generate test data of acceptable quality. Additional guidance on validation of compendial procedures may be found in the general information chapter *Validation of Compendial Procedures* (1225).

System Suitability Tests

System suitability tests verify that the system will perform in accordance with the criteria set forth in the procedure. These tests are performed along with the sample analyses to ensure that the system's performance is acceptable at the time of the test. USP general chapter *Chromatography* (621) presents a more detailed discussion of system suitability tests as related to chromatographic systems.

Quality Control Check Samples

Many analysts carry out their tests on instruments standardized using reference materials and/or calibration standards. Some analyses also require the inclusion of quality control check samples to provide an in-process or ongoing assurance of the test's suitable performance. In this manner, AIQ and analytical method validation contribute to the quality of analysis *before* analysts conduct the tests. System suitability tests and quality control checks help ensure the quality of analytical results *immediately before or during* sample analysis.

Change to read:

ANALYTICAL INSTRUMENT QUALIFICATION PROCESS

The following sections address in detail the AIQ process. The other three components of building quality into analytical data—analytical method validation, system suitability tests, and quality control check samples—are not within the scope of this chapter.

Qualification Phases

Instrument qualification is not a single continuous process, but instead results from several discrete activities

- over the life time of the instrument. ■ 1S (USP39)

For convenience, these activities can be grouped into four phases: design qualification (DQ), installation qualification (IQ), operational qualification (OQ), and performance qualification (PQ).

Some AIQ activities cover more than one qualification phase, and analysts potentially could perform them during more than one of the phases (see *Table 1*). However, in many instances there is need for

- a ■ 1S (USP39)

specific order to the AIQ activities; for example, installation qualification must occur first in order to initiate other qualification activities. ~~The AIQ activities will be defined and documented.~~

- All AIQ activities should be defined and documented. ■ 1S (USP39)

- Routine analytical tests do not constitute OQ testing. OQ tests are specifically designed to verify the instrument's operation according to specifications in the user's environment

- as documented in the DQ, ■ 1S (USP39)

- and repeating the testing at regular intervals may not be required. However, when the instrument undergoes major repairs or modifications, relevant OQ and/or PQ tests should be repeated to verify whether the instrument continues to operate satisfactorily. If an instrument

is moved to another location, an assessment should be made of what, if any, OQ test should be repeated.

Table 1. Timing, Applicability, and Activities for Each Phase of Analytical Instrument Qualification^a

Design Qualification	Installation Qualification		Operational Qualification		Performance Qualification
Timing and Applicability					
Prior to purchase of a new model of instrument	At installation of each instrument (new, old, or existing unqualified)		After installation or major repair of each instrument		Periodically at specified intervals for each instrument
Activities					
Assurance of manufacturer's DQ	Description	↔	Fixed parameters		Preventive maintenance and repairs
Assurance of adequate support availability from manufacturer	Instrument delivery				Establish practices to address operation, calibration, maintenance, and change control
Instrument's fitness for use in laboratory	Utilities/facility	↔	Environment		
	Assembly and installation				
	Network and data storage	↔	Secure data storage, backup, and archive		
	Installation verification	↔	Instrument function tests ■ and software validation ■ 1S (USP39)	↔	Performance checks
<p>^a Activities under each phase are usually performed as given in the table. However, in some cases, it may be more appropriate to perform or combine a given activity with another phase. Such activities spanning more than one qualification phase are shown as connected by double arrows. If an activity listed under a given phase is performed under another phase, it is not necessary to repeat the activity under the phase where the activity is listed. Performing the activity is far more important than the phase under which the activity is performed.</p>					

DESIGN QUALIFICATION

Design qualification (DQ) is the documented collection of activities that define the functional and operational specifications of the instrument and criteria for selection of the vendor, based on the intended purpose of the instrument. Design qualification (DQ) may be performed not only by the instrument developer or manufacturer but also may be performed by the user. The manufacturer is generally responsible for robust design and maintaining information describing how the analytical instrument is manufactured (design specifications, functional requirements, etc.) and tested before shipment to users. Nonetheless, the user should ensure that commercial off-the-shelf (COTS) instruments are suitable for their intended application and that the manufacturer has adopted a quality system that provides for reliable equipment. Users

~~should also determine the manufacturer's capability for support installation, services, and training. This determination might be aided by the user's previous interaction with the manufacturer.~~

■ Design qualification (DQ) is the documented collection of activities that define the functional and operational specifications of the instrument, including the criteria for selection of the supplier, based on the intended purpose of the instrument. DQ states what the laboratory wants the instrument to do and shows that the selected one is suitable. Design qualification (DQ) may be performed by the instrument manufacturer or the user. It is expected that DQ requirements will be minimal for commercial, off-the-shelf (COTS) instruments. Verification that the instrument specifications meet the desired functional requirements may suffice.

The supplier is generally responsible for robust design and maintaining documentation describing how the analytical instrument and any associated controlling software are manufactured (for example, design specifications, functional requirements, etc.) and tested, sometimes called Factory Acceptance Tests (FAT). Nonetheless, the user should ensure that instruments are suitable for their intended application and that the supplier has adopted a quality system that provides for reliable instrumentation, software, and network connectivity. Users should also determine the supplier's capability to support installation, services, and training. This determination might be aided by the user's previous interaction with the supplier.

When use of an instrument changes or it is subject to a major upgrade, it may be necessary to review and/or update the user's DQ documentation.

■ 1S (USP39)

INSTALLATION QUALIFICATION

Installation qualification (IQ) is the documented collection of activities necessary to establish that an instrument is delivered as designed and specified, and is properly installed in the selected environment, and that this environment is suitable for the instrument. IQ applies to an instrument that is new or was pre-owned. ~~or to any instrument that exists on site but has not been previously qualified.~~

■ For any instrument that exists on site but has not been previously qualified, existing documents should be collated and a risk assessment should be undertaken to determine the best course of action. ■ 1S (USP39)

Relevant parts of IQ would also apply to a qualified instrument that has been transported to another location or is being reinstalled for other reasons, such as prolonged storage. The activities and documentation typically associated with IQ are as follows.

~~**Description**—Provide a description of the instrument or the collection of instrument components, including its manufacturer, model, serial number, software version, and location. Use drawings and flow charts where appropriate.~~

■ ■ 1S (USP39)

Instrument delivery: Ensure that the instrument, software, manuals, supplies, and any other instrument accessories arrive as specified ~~in the purchase order~~

■ by the user ■ 1S (USP39)

and that they are undamaged. For a pre-owned or existing instrument, manuals and documentation should be obtained.

■ **Description:** Document information about the instrument and all components, including supplier(s), model(s), serial number(s), software version(s), and location. ■ 1S (USP39)

Utilities/Facility/Environment: Verify that the installation site satisfactorily meets manufacturer

■ supplier ■ 1S (USP39)

-specified environmental requirements.

~~**Assembly and Installation**—Assemble and install the instrument, and perform any preliminary diagnostics and testing. Assembly and installation may be done by the manufacturer, vendor, specialized engineers, or qualified in-house personnel. Manufacturer-established installation tests and guides provide a valuable baseline reference for determining instrument acceptance. Any abnormal event observed during assembly and installation merits documenting. Installation packages purchased from the manufacturer or the vendor may, however, need to be supplemented with user-specific criteria.~~

■ **Assembly and installation:** Assemble and install the instrument, and perform any preliminary diagnostics and testing. Assembly and installation may be done by the supplier, service agents, specialized engineers, or qualified in-house personnel. Supplier-established installation tests provide a valuable baseline reference for determining instrument acceptance. Any abnormal event observed during assembly and installation merits documenting. IQ documentation packages purchased from a supplier should be reviewed to ensure that they are acceptable by the user before and after execution. ■ 1S (USP39)

~~**Network and Data Storage**—Some analytical systems require users to provide network connections and data storage capabilities at the installation site. When required, connect the instrument to the network, and check its functionality.~~

■ **Software installation, network, and data storage:** Some analytical systems require the installation of software onto a qualified computer and be connected to a network for communications and data storage at the installation site. IT involvement is often required with computerized laboratory systems. ■ 1S (USP39)

Installation verification: Perform the initial diagnostics and testing of the instrument after installation.

■ When required, connect the instrument to the network, and check its functionality.

Software configuration and/or customization: Any configuration or customization of instrument software should occur before the OQ and documented. Unless changes are needed for specific component tests, the OQ should be performed using the software configuration that will be used for routine analysis. ■ 1S (USP39)

OPERATIONAL QUALIFICATION

~~After a successful IQ, the instrument is ready for OQ testing. Operational qualification (OQ) is the documented collection of activities necessary to demonstrate that an instrument will function according to its operational specification in the selected environment. Testing activities in the OQ phase may consist of these test parameters.~~

■ Operational Qualification (OQ) is the documented collection of activities necessary to demonstrate that an instrument will function according to its operational specification testing in the selected environment. OQ demonstrates fitness of purpose for the user's ways of working, and should reflect the contents of the DQ document. Testing activities in the OQ phase may consist of these test parameters.

■ 1S (USP39)

Fixed parameters: These tests measure the instrument's non-changing parameters such as length, height, weight, voltage inputs, acceptable pressures, and loads. If the manufacturer-supplied specifications for these parameters satisfy the user, the test requirements may be waived. However, if the user wants to confirm the parameters, testing can be performed at the user's site. Fixed parameters do not change over the life of the instrument, and therefore never need redetermination

■ to be retested. ■ 1S (USP39)

[Note—These tests could also be performed during the IQ phase (see *Table 1*); if so, fixed parameters need not be re-determined as part of OQ testing.]

■ **Software functions:** Where applicable, OQ testing should include critical elements of the configured application software to show that the whole system works as intended. Functions to test would be functions applicable to data capture, analysis of data, and reporting results under actual conditions of use and security and access control and audit trail. The user can apply risk assessment methodologies and leverage the supplier's software testing to focus the OQ testing effort. ■ 1S (USP39)

Secure data storage, backup, and archiving: When applicable, test secure data handling such as storage, backup, audit trails, and archiving at the user's site according to written procedures.

Instrument function tests: Instrument functions required by the user should be tested to verify that the instrument operates as intended by the manufacturer. ~~Manufacturer-supplied~~

■ Supplier ■ 1S (USP39)

~~information is useful in identifying specifications for these parameters and in designing tests to evaluate the identified parameters. Users, or their qualified designees, should perform these tests to verify that the instrument meets manufacturer or user specifications in the user's environment.~~

■ verify that the instrument meets supplier or user specifications in the user's environment.

■ 1S (USP39)

The extent of OQ testing that an instrument undergoes depends on its intended applications, ~~Therefore, no specific OQ tests for any instrument or application are offered in this chapter.~~

■ therefore, no specific OQ tests for any instrument or application are offered in this chapter. Parameters to qualify are described in the general chapters pertaining to a specific analytical technique. ■ 1S (USP39)

OQ tests can be modular or holistic. Modular testing of individual components of a system may facilitate interchanging of such components without requalification. ~~Holistic tests, which involve the entire system, are also acceptable.~~

■ but requires a risk assessment to justify it. Holistic tests, which involve the entire system, demonstrate that the whole system works against user specifications in the DQ.

For OQ test suites purchased from a service provider or supplier, the user must review the material to assure themselves of the scientific soundness of the tests and compliance with applicable regulations. The user should review the documents before execution and approve the tests after execution to ensure completeness and accuracy of the completed document and the test data generated.

■ 1S (USP39)

PERFORMANCE QUALIFICATION

~~Performance qualification (PQ) is the documented collection of activities necessary to demonstrate that an instrument consistently performs according to the specifications defined by the user, and is appropriate for the intended use. After IQ and OQ have been performed, the instrument's continued suitability for its intended use is demonstrated through performance qualification. The PQ phase may include the following parameters.~~

■ Performance Qualification (PQ) is the documented collection of activities necessary to demonstrate that an instrument consistently performs according to the specifications defined by the user, and is appropriate for the intended use. The PQ verifies the fitness for purpose of the instrument under actual conditions of use. After IQ and OQ have been performed, the instrument's continued suitability for its intended use is demonstrated through continued performance qualification.

The user must define the PQ plans, including test procedures, acceptance criteria, and frequency. Preventive maintenance plans and documentation of repairs and other changes are also a necessary part of the overall instrument qualification.

PQ may include the following activities.

■ 1S (USP39)

Performance checks: ~~Set up a~~

■ A ■ 1S (USP39)

test or series of tests to verify the acceptable performance of the instrument for its intended use. PQ tests are usually based on the instrument's typical on-site applications and may consist of analyzing known components or standards. The tests should be based on good science and reflect the general intended use of the instrument. Some system suitability tests

or quality control checks that are performed concurrently with the test samples can be used to demonstrate that the instrument is performing suitably. PQ tests may resemble those performed during OQ, but the specifications for their results may be set differently if required. Nevertheless, user specifications for PQ tests should demonstrate trouble-free instrument operation for the intended applications. As is the case with OQ testing, PQ tests may be modular or holistic.

Testing frequency depends on the ruggedness of the instrument and the criticality of the tests performed. Testing may be unscheduled—for example, each time the instrument is used. It may also be scheduled for regular intervals. Experience with the instrument can influence this decision,

■ which should be documented. ■ 1S (USP39)

It may be useful to repeat the same PQ tests each time the instrument is used so that a history of the instrument's performance can be compiled. Alternatively, the instrument may be incorporated into an integrated support system to assure that it remains continually qualified. ~~Some system suitability tests or quality control checks that are performed concurrently with the test samples also imply that the instrument is performing suitably.~~

■ System suitability tests that are performed concurrently with the test preparations may also assure that the instrument is performing suitably. ■ 1S (USP39)

~~**Preventive maintenance and repairs:** When an instrument fails to meet PQ test specifications, it requires maintenance or repair. A periodic preventive maintenance may also be recommended for many instruments. The relevant PQ test(s) should be repeated after the needed maintenance or repair to ensure that the instrument remains qualified.~~

■ Periodic preventive maintenance activities are required for many instruments. This may include calibration. Document the PM plans, including procedures and frequency as part of the AIQ package. When an instrument fails to meet PQ criteria or otherwise malfunctions, the cause of the failure must be investigated and documented. The instrument may require maintenance or repair. The relevant OQ or PQ test(s) should be repeated after the needed maintenance or repair to ensure that the instrument remains qualified. ■ 1S (USP39)

~~**Practices for Operation, Calibration, Maintenance, and Change Control**—Establish practices to maintain and calibrate the instrument. Each maintenance and calibration activity should be documented.~~

■ **Practices for PQ, change control, and periodic review:** Each PQ, maintenance and calibration activity should be documented. Change control should be established to control changes to the instrument configuration, including firmware and software. Critical instruments should have a periodic review to ensure that the system is still under control. Typical areas for review can include qualification/validation status, currency of user procedures, change control records, correctness and completeness of records produced by the system, backup and recovery of electronic records, review and sign-off of test results.

The instrument owner/user and their management are responsible for this work, although portions can be carried out on his/her behalf by internal staff or external suppliers or service providers. ■ 1S (USP39)

Change to read:**ROLES AND RESPONSIBILITIES****Users**

~~Users are ultimately responsible for instrument operations and data quality. The user's group encompasses analysts, their supervisors, instrument specialists, and organization management.~~

■ Users are ultimately responsible for specifying their needs and ensuring that a selected instrument meets them and that data quality and integrity is maintained. The user's group encompasses analysts, their supervisors, instrument specialists, and organization management.

■ 1S (USP39)

Users should be adequately trained in the instrument's use, and their training records should be maintained as required by the regulations.

Users should also be responsible for qualifying their instruments because their training and expertise in the use of instruments make them the best-qualified group to design the instrument test(s) and specification(s) necessary for successful AIQ. ~~Consultants, equipment manufacturer or vendors, validation specialists, and quality assurance (QA) personnel can advise and assist as needed, but the final responsibility for qualifying instruments lies with the users. The users must also maintain the instrument in a qualified state by routinely performing PQ.~~

■ Consultants, instrument manufacturer or suppliers, validation specialists, and quality assurance (QA) personnel can advise and assist as needed, but the final responsibility for qualifying instruments and validating systems lies with the users. The users must also maintain the instrument in a qualified state by routinely performing PQ. ■ 1S (USP39)

Quality Unit

The role of the Quality Unit in AIQ remains the same as for any other regulated activity. Quality personnel are responsible for assuring that the AIQ process meets compliance requirements, that processes are being followed, and that the intended use of the ~~equipment is supported by~~

■ instrument is supported by complete, ■ 1S (USP39)

valid, and documented data.

The role of the Quality Unit in AIQ remains the same as for any other regulated activity. Quality personnel are responsible for assuring that the AIQ process meets compliance requirements, that processes are being followed, and that the intended use of the equipment is supported by valid and documented data.

Manufacturers,

■ **Suppliers, Service Agents, and Consultants** ■ 1S (USP39)

~~Manufacturers and developers are responsible for DQ when designing the instrument. They are also responsible for validation of relevant processes used in manufacturing and assembly of the~~

~~instrument. Manufacturers should test the assembled instruments before shipping them to users.~~

■ Manufacturers are responsible for designing and manufacturing the instrument, and ensuring the quality of relevant processes used in manufacturing and assembly of the instrument. Manufacturers should test the assembled instruments before shipping to users. To aid the user, vendors are responsible for developing meaningful specifications for the users to compare with their needs and aid selection as shown in *Figure 1*.

Where used, software should be developed and tested using a defined life cycle and have evidence of work performed to support major and minor revisions. Release notes should accompany each version of software released.

■ 1S (USP39)

Finally, it is desirable that ~~manufacturers and vendors~~

■ suppliers ■ 1S (USP39)

should notify all known users about hardware defects discovered after a product's release; offer user training, service, repair, and installation support; and invite user audits as necessary.

■ There should be a quality or technical agreement between the user organization and manufacturers, suppliers, service agents, or consultants who supply calibration, maintenance, qualification, or validation services that define the scope of work and the responsibilities between the two parties.

■ 1S (USP39)

Change to read:

SOFTWARE VALIDATION

■ There is an increasing inability to separate the hardware and software parts of modern analytical instruments. In many instances the software is needed to qualify the instrument and the instrument operation is essential when validating the software. Therefore to avoid overlapping and potential duplication, software validation and instrument qualification can be integrated into a single activity.

■ 1S (USP39)

~~Software used for analytical work can be classified into three categories: firmware; instrument control, data acquisition, and processing software; and stand-alone software. Although software validation is not the primary focus of this chapter, the following sections describe in which cases this activity is under the scope of the analytical instrument qualification.~~

■ Software used for analytical work can be classified into four categories: firmware; instrument control, data acquisition, and processing software; and standalone software. Although software validation is not the primary focus of this chapter, the following sections describe in which cases this activity is under the scope of the analytical instrument and system qualification.

Authoritative guidance for the validation of software used in analytical instruments are the Good Automated Manufacturing Practice (GAMP) guidelines and the GAMP Good Practice Guide on Risk Based Validation of Laboratory Computerized Systems.

■ 1S (USP39)

Firmware

Computerized analytical instruments contain integrated chips with low-level software (firmware). Such instruments will not function without properly operating firmware, and

■ in most cases ■ 1S (USP39)

users generally cannot alter firmware design or

■ ■ 1S (USP39)

function. Firmware is therefore considered a component of the instrument itself. Indeed, the qualification of hardware is not possible without operating it via its firmware.

Thus, when the hardware (that is, the analytical instrument) is qualified at the user's site, the integrated firmware is also essentially qualified. No separate on-site qualification of the firmware is needed. Whenever possible, the firmware version should be recorded as part of the IQ activities. Any changes made to firmware versions should be tracked through change control of the instrument (see *Change Control*, below).

■ In some instruments firmware can also be capable of fixed calculations on the acquired data. These calculations need to be defined and verified by the user. Some instruments have firmware that enable users to define programs for the instrument's operation, similarly these user defined programs need to be defined and verified to demonstrate that they are fit for intended purpose. Any user-defined programs should be placed under change control and, if possible, access restricted to authorized personnel.

■ 1S (USP39)

Instrument Control, Data Acquisition, and Processing Software

Software for instrument control, data acquisition, and processing for many of today's computerized instruments is loaded on a computer connected to the instrument. Operation of the instrument is then controlled via the software, leaving fewer operating controls on the instrument. Also, the software is needed for data acquisition and post-acquisition calculations. Thus, both hardware and software, their functions inextricably intertwined, are critical to providing analytical results.

~~The manufacturer should perform DQ, validate this software, and provide users with a summary of validation. At the user site, holistic qualification, which involves the entire instrument and software system, is more efficient than modular validation of the software alone. Thus, the user qualifies the instrument control, data acquisition, and processing software by qualifying the instrument according to the AIQ process.~~

■ The software in this group can be classified into three types: 1) non-configurable software (the software cannot be modified to change the business process), 2) configurable software (using tools from the supplier to modify the business process supported), and 3) configurable software with custom additions (configurable software above with custom software or macros to automate the business process).

The supplier of the system should develop and test the software according to a defined life cycle and provide users with a summary of the tests that were carried out. Ideally the software development should be carried out under a quality management system.

At the user site, integrated qualification of the instrument in conjunction with validation of the software involves the entire system. This is more efficient than separating instrument

qualification from validation of the software.

■ 1S (USP39)

Stand-Alone Software

~~An authoritative guide for validating stand-alone software, such as LIMS, is available.⁴ The validation process is administered by the software developer, who also specifies the development model appropriate for the software. Validation takes place in a series of activities planned and executed through various stages of the development cycle.~~

■ 1S (USP39)

Change to read:

CHANGE CONTROL

Changes to instruments, including software, become inevitable as ~~manufacturers~~

■ ~~suppliers~~ ■ 1S (USP39)

add new features and correct known defects. However, implementing all such changes may not always benefit users. Users should therefore adopt changes they deem useful or necessary and should also assess the effects of changes to determine what, if any, requalification is required. The change control process enables them to do this.

Change control may follow the DQ/IQ/OQ/PQ classification process. For DQ, evaluate the changed parameters, and determine whether need for the change warrants implementing it. If implementation of the change is needed, install the changes to the system during IQ. Evaluate which of the existing OQ and PQ tests need revision, deletion, or addition as a result of the installed change. Where the change calls for additions, deletions, or revisions to the OQ or PQ tests, follow the procedure outlined below.

Operational Qualification

Revise OQ tests as necessitated by the change. Perform the relevant tests affected by the change. This ensures the instrument's effective operation after the change is installed.

Performance Qualification

Revise PQ tests as necessitated by the change. Perform the PQ testing after installation of the change if similar testing is not already performed during OQ. In the future, perform the revised PQ testing.

For changes to firmware and to software for instrument control, data acquisition, and processing, change control is performed through DQ/IQ/OQ/PQ of the affected instrument. ~~Change control for stand-alone software requires user-site testing of changed functionality.~~

■ 1S (USP39)

Change to read:

AIQ DOCUMENTATION

Documents obtained during instrument qualification

■ qualification activities ■ 1S (USP39)

should be retained in an accessible manner. Where multiple instruments of one kind exist, documents common to all instruments and documents specific to an instrument may be stored separately. During change control, additional documents may supplement those obtained during the qualification process, and both sets of documents should be retained and maintained in a suitable manner that allows for appropriate protection and access.

Delete the following:

■

INSTRUMENT CATEGORIES

Modern laboratories typically include a suite of instruments and equipment varying from simple nitrogen evaporators to complex automated instruments. Therefore, applying a single set of principles to qualifying such dissimilar instruments would be scientifically inappropriate. Users are most capable of establishing the level of qualification needed for an instrument. On the basis of the level needed, it is convenient to categorize instruments into three groups: A, B, and C, as defined below. Examples of instruments in each group are provided. Note that the list of instruments provided here is for illustration only and is not meant to be exhaustive. It does not provide the exact category for an instrument at a user site. That category should be determined by users for their specific instruments or applications.

The exact grouping of an instrument must be determined by users for their specific requirements. Depending on individual user requirements, the same instrument may appropriately fall into one group for one user and another group for another user. Therefore, a careful selection of groups by users is highly encouraged.

Group A

Group A includes standard equipment with no measurement capability or usual requirement for calibration, where the manufacturer's specification of basic functionality is accepted as user requirements. Conformance of Group A equipment with user requirements may be verified and documented through visual observation of its operation. Examples of equipment in this group are nitrogen evaporators, magnetic stirrers, vortex mixers, and centrifuges.

Group B

Group B includes standard equipment and instruments providing measured values as well as equipment controlling physical parameters (such as temperature, pressure, or flow) that need calibration, where the user requirements are typically the same as the manufacturer's specification of functionality and operational limits. Conformance of Group B instruments or equipment to user requirements is determined according to the standard operating procedures for the instrument or equipment, and documented during IQ and OQ. Examples of instruments in this group are balances, melting point apparatus, light microscopes, pH meters, variable pipets, refractometers, thermometers, titrators, and viscometers. Examples of equipment in this group are muffle furnaces, ovens, refrigerator freezers, water baths, pumps, and dilutors.

Group C

Group C includes instruments and computerized analytical systems, where user requirements for

functionality, operational, and performance limits are specific for the analytical application. Conformance of Group C instruments to user requirements is determined by specific function tests and performance tests. Installing these instruments can be a complicated undertaking and may require the assistance of specialists. A full qualification process, as outlined in this document, should apply to these instruments. Examples of instruments in this group include the following:

- atomic absorption spectrometers
- differential scanning calorimeters
- dissolution apparatus
- electron microscopes
- flame absorption spectrometers
- high pressure liquid chromatographs
- mass spectrometers
- microplate readers
- thermal gravimetric analyzers
- X-ray fluorescence spectrometers
- X-ray powder diffractometers
- densitometers
- diode array detectors
- elemental analyzers
- gas chromatographs
- IR spectrometers
- near-IR spectrometers
- Raman spectrometers
- UV/Vis spectrometers
- inductively coupled plasma emission spectrometers

■ 1S (USP39)

Add the following:

■

GLOSSARY

The definitions of these terms may be different in other *USP* general chapters.

Software validation: Confirmation by examination and provision of objective evidence that software conforms to user needs and intended uses, and that the particular requirements implemented through software can be consistently fulfilled.

Qualification: Action of proving that any instrument works correctly and delivers the expected results; demonstration of fitness for purpose.

Calibration: The set of operations that establish, under specified conditions, the relationship between values of quantities indicated by a measuring instrument or values represented by a material measure or a reference material, and the corresponding values realized by standards.

Maintenance: Actions performed to keep an analytical instrument in a state of proper function so that it continues to operate within the boundaries set during qualification or validation.

Software configuration: Adapting software functions to a business process using tools

provided within the application by the supplier of the software.

Software customization: Changing the way software automates a business process by the addition of externally custom coded software modules using a recognized programming language or the development of macros within the application software.

Supplier: This term is used generically and can mean the manufacturer, a vendor, a service agent, or a consultant depending on the circumstances. ■1S (USP39)

BRIEFING

《 1065 》 **Ion Chromatography**, *USP 38* page 1000 and *PF 40(3)* [May–June, 2014]. In response to comments received, the Chemical Analysis Expert Committee is proposing additional changes to this draft previously published in *PF 40(3)*. This revision is intended to align the text with current technology and terminology. Relevant sections in this chapter, particularly *Mobile Phases* and *Stationary Phases*, are extensively revised.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style.

《 1065 》 ION CHROMATOGRAPHY

Change to read:

INTRODUCTION

Ion chromatography (IC) is a high-performance liquid chromatography (HPLC) instrumental technique used in *USP* test procedures such as identification tests, and

■ ■1S (USP39)

assays,

■ limit tests, and related impurity tests. ■1S (USP39)

to measure inorganic anions and cations, organic acids, carbohydrates, sugar alcohols, aminoglycosides, amino acids, ~~proteins, glycoproteins,~~

■ amines, phosphonates, ■1S (USP39)

and ~~potentially~~

■ ■1S (USP39)

other analytes.

■ Ion chromatography (IC) is a high-performance liquid chromatography (HPLC) instrumental technique used in *USP* test procedures such as identification tests, assays, and determination

of impurities, including limit test and quantitative tests. IC is used to measure anions and cations derived from organic or inorganic molecules, from small molecules to larger biomolecules. A not exhaustive list may include organic acids, carbohydrates, sugar alcohols, aminoglycosides, amino acids, amines, phosphonates, peptides, aminoglycosides, oligosaccharides, proteins, and glycoproteins. ■1S (USP39)

~~As dictated by the nature of the analyte,~~

■1S (USP39)

IC has been applied to all aspects of the manufacturing and disposition of pharmaceutical products, including characterization of active ingredients, excipients, degradation products, impurities, and process streams. ~~The following sample types are among those that have been analyzed: raw~~

■Raw ■1S (USP39)

~~materials, intermediates (including media and culture broths), bulk active ingredients, diluents, formulated products, production equipment cleaning solutions, and waste streams. The technique is especially valuable for ionic or ionizable (in the mobile phase) analytes that have little or no native UV absorbance. The ability to couple the ion-exchange separation with numerous detection strategies, e.g., pulsed amperometric detection (PAD), expands IC applications to instances where analyte-specific detection strategies can provide the required degree of sensitivity or specificity. Utilization of such strategies allows IC applications to be implemented on appropriately configured HPLC systems. Additionally, ion-exclusion separations and pulsed amperometric detection expand the range of application of IC to aliphatic organic acids as well as to nonionic analytes of significant pharmaceutical interest including alcohols, alditols, carbohydrates, and amino acids. The wide dynamic range of the methodology makes it applicable for the quantification of trace contaminants as well as major product components.~~

~~■process water, and waste streams may be analyzed using IC. ■1S (USP39)~~

Because

■The majority of IC methods use either anion- or cation-exchange chromatography coupled with suppressed conductivity detection. IC is especially valuable for ionic or ionizable (in the mobile phase) analytes that have little or no native UV absorbance. In addition to suppressed conductivity detection, the ion-exchange separation can be coupled to other detection strategies, including pulsed amperometric detection (PAD), UV/Vis absorbance detection, ■inductively coupled plasma mass spectrometric detection (ICPMS), ■1S (USP39)

~~and mass spectrometric detection, providing a wide range of analyte sensitivity and specificity. Ion-exclusion separations expand the range of IC applications to some nonionic analytes (e.g., alcohols) and provide a different selectivity for some analytes that can also be separated by ion exchange. The wide dynamic range of the majority of the IC detection methods makes IC applicable to the quantification of trace contaminants as well as major product components in the same run. ■1S (USP39)~~

~~IC typically uses dilute acids, alkalis,~~

■ ■ 1S (USP39)

and, when necessary, after dilution with water.

IC allows separation using ion exchange, ion exclusion, or ion-pair approaches. IC separations are based on differences in charge density of the analyte species, which in turn depend on the valence and size of the individual ionic species to be measured. Separations are also performed on the basis of differences in the hydrophobic character of the ionic species. IC is typically performed at ambient temperature. As with other forms of HPLC, IC separations are based on varying capacity factors and typically follow the Knox equation. Ion chromatography is a technique complementary to the more commonly used reversed-phase and normal-phase HPLC and to atomic absorption and ion-coupled plasma (plasma spectrochemistry) techniques in pharmaceutical analysis.

■ IC is typically performed at or near ambient temperature. As with other forms of HPLC, IC separations are based on varying capacity factors and typically follow the Knox equation. ■ ■ 1S (USP39)

■ ■ 1S (USP39)

a flow-through detector, and a data system ranging in complexity from an integrator to a computerized data system (Figure 1).

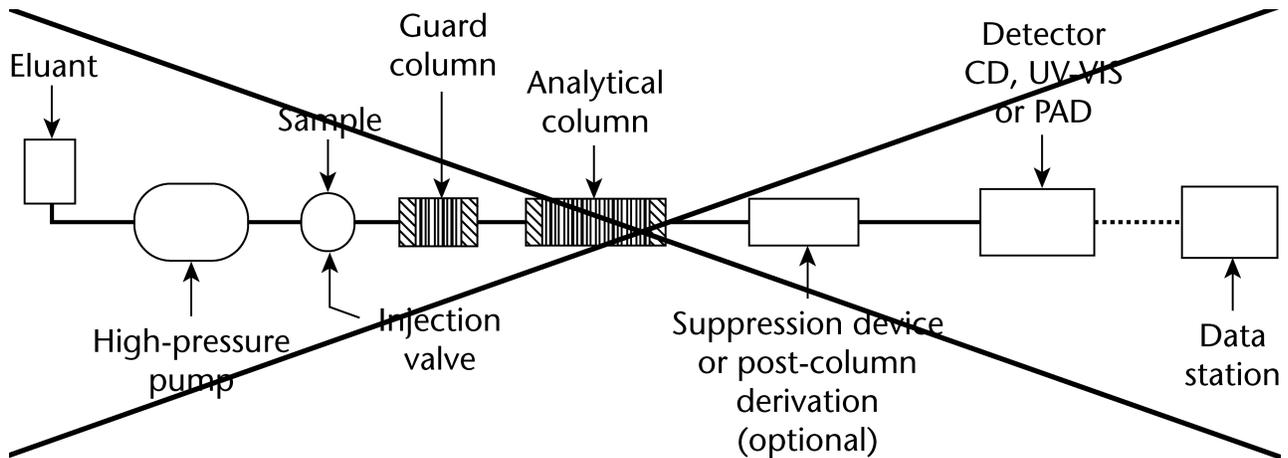

Figure 1. Components of a typical IC system illustrated schematically; CD = conductivity detector and PAD = pulsed amperometric detector.

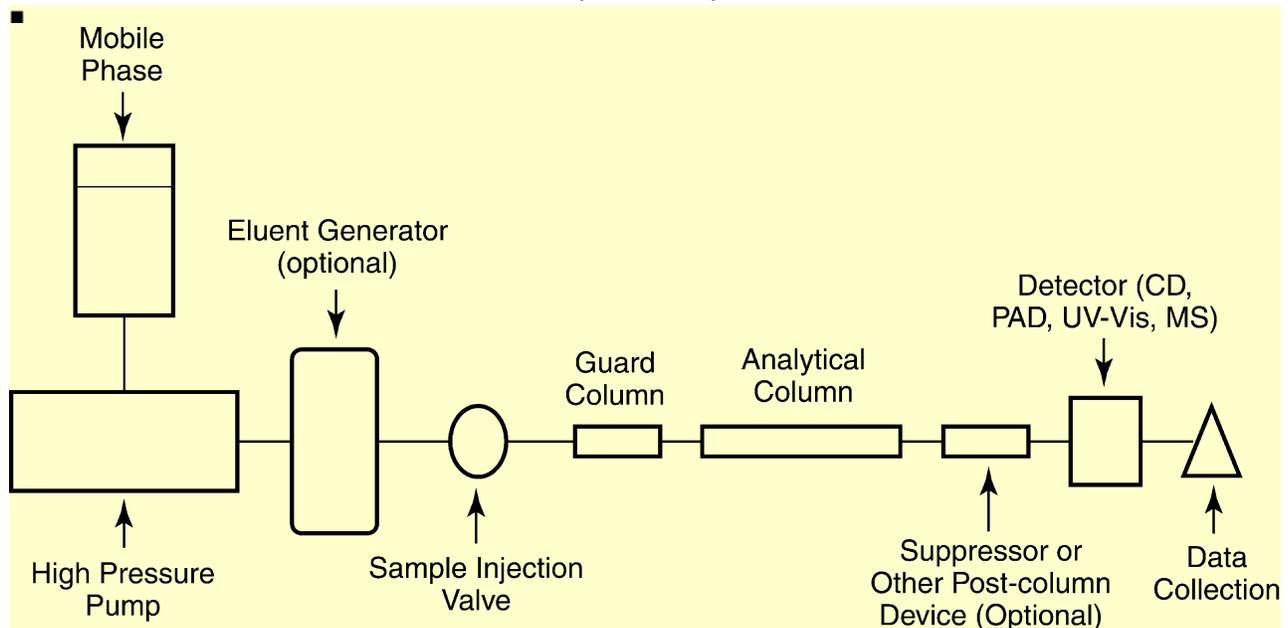

Figure 1. Components of a typical IC system illustrated schematically; CD = conductivity detector, PAD = pulsed amperometric detector, and MS = mass spectrometric detector.

[Note—Mobile phase is water when the optional *Eluent Generator* is used.]

■ 1S (USP39)

Because mobile phases generally consist of dilute acids, alkalis, or salt solutions, the components in contact with the mobile phase and the sample are typically made from inert materials, such as polyetheretherketone. Conventional HPLC systems also may be used provided that their components are compatible with the mobile phase and injected sample solutions. A metal-free system should be used for trace metal analysis. Following suitable preparation, the sample is introduced via the injection valve. After the optional chemical suppression or other post-column reaction on the column effluent, the analyte species are detected using conductivity, amperometry, UV/VIS, or other detection modes. Because IC uses a predominantly ionic mobile phase, a suppressor is often necessary prior to conductometric detection, although nonsuppressed conductometric detection has been successfully used in pharmaceutical analysis.

■ (PEEK). A conventional HPLC system can be used provided that its components are compatible

with the mobile phase and injected sample solutions, A

■ though a ■1S (USP39)

metal-free system should be used for trace metal analysis. Following suitable preparation, if needed, the sample is introduced via the injection valve. Without column effluent treatment or after chemical suppression or other post-column reaction, the analyte species are detected using conductivity, amperometry, UV/VIS, MS, or other detection mode.

■ ■1S (USP39)

Because IC uses a predominantly ionic mobile phase, a suppressor is typically necessary prior to conductometric detection when high sensitivity is needed, although nonsuppressed conductometric detection has been successfully used in pharmaceutical analysis. ■1S (USP39)

Stationary and Mobile Phases

As IC has developed and matured as an instrumental technique, the number of ion-exchange materials developed for IC has increased, facilitated by the understanding of the processes taking place at the surface of the stationary phase. In contrast to the silica-based column packing prevalent in classical HPLC, organic polymers are predominately used as support materials for IC. Such materials have a higher stability with respect to extremes in pH and in many cases are compatible with organic solvents. Typically, separation of anions requires the use of polymer-based anion exchangers and dilute bases as mobile phases. However, for cation separations, the stability over the entire pH range that is typical of organic polymers is not necessary, because dilute acids serve as mobile phases. Therefore, silica-based cation exchangers that exhibit a significantly higher chromatographic efficiency are commonly used for the separation of cations.

Depending on the separation mode (ion exchange, ion exclusion, or ion-pair), different types of stationary phases are used. For ion exchange, the stationary phase is either an anion or a cation exchanger. Typically, a strong cation exchanger is used for the ion-exclusion separation of organic acids, and a reversed-phase stationary phase is used when ion-pair is the separation mode. The ion-exchange capacity of a resin is defined as the number of ion-exchange sites per weight equivalent of the column packing and is typically expressed in terms of mEq per g of resin. With ion exchange, the retention times for the analyte ions increase with increasing ion-exchange capacity of the resin. This effect can be partly compensated for by using mobile phases of higher ionic strength. Styrene/divinylbenzene copolymers, polymethacrylate, and polyvinyl resins are the substrate materials used in the manufacturing process of the polymer-based ion exchangers. Organic polymers are functionalized directly at their surface, with the exception of latex-based ion exchangers, where the totally porous latex particle acts as an ion-exchange material. Surface-functionalized, "pellicular" substrates show a much higher chromatographic efficiency compared with the fully functionalized resins.

With ion exchange, a mobile phase consisting of mono- or divalent ionic species, alone or mixed at an optimum ratio, is used to accomplish the separation. In ion-exclusion methods, particularly for organic acids, the mobile phase consists of mineral acids to maintain organic acids in their undissociated forms. Often, the nature of the analyte dictates the mobile phase and the detection mode used. Typical mobile phases used in IC are described below in the section on detectors.

Mobile Phases

Nearly all IC separations require dilute acid

- acids ■ 1S (USP39)

or base

- bases diluted in high-purity water, generally with resistivity greater than 18 megohms-cm to prepare the ■ 1S (USP39)

mobile phases. The detection method, which is chosen for its sensitivity and selectivity for the analyte of interest, usually dictates the mobile phase choice.

- As in every chromatographic method the sensitivity dictates the detection method, and the selectivity dictates the mobile phase and column selection. ■ 1S (USP39)

For suppressed conductivity detection, the bases and acids used are suppressed to water or weakly dissociated species. The

- If the analytes are anions, the ■ 1S (USP39)

mobile phase bases used for the determination of anions

- as counterions ■ 1S (USP39)

by suppressed conductivity detection are sodium or potassium hydroxide, sodium carbonate, sodium bicarbonate, and less often sodium tetraborate. The

- If the analytes are cations, the ■ 1S (USP39)

mobile phase acids used for the determination of cations

- as counterions ■ 1S (USP39)

by suppressed conductivity detection are methanesulfonic acid, sulfuric acid, and less often hydrochloric acid.

- When determining low ion concentrations, appropriate trapping technology should be used to purify the mobile phase. ■ 1S (USP39)

When the detection chosen is

- is based on ■ 1S (USP39)

UV or visible absorbance, either with or without derivatization,

- ■ 1S (USP39)

then a wide variety of salt solutions may be used for

- into ■ 1S (USP39)

the mobile phase, ~~The typical mobile phases used for IC with nonsuppressed detection are~~
 ■ including ■ 1S (USP39)

phthalic acid and *p*-hydroxybenzoic acid for the determination of anions, and methanesulfonic acid for the determination of cations.

~~For nearly all IC methods using amperometric~~

■ Amperometric ■ 1S (USP39)

detection

■ uses ■ 1S (USP39)

~~either a strong acid or base solution is used for~~

■ as ■ 1S (USP39)

the mobile phase, although some methods can use a salt solution near neutral pH or an acid or base solution containing a salt. Most IC-MS methods use the same mobile phases used for suppressed conductivity, though volatile amines and volatile salt solutions have also been used. IC methods that use an ion-exclusion column use solutions of strong acids such as sulfuric acid as mobile phases. Organic solvents commonly used for HPLC are sometimes added to the mobile phase, typically at NMT 20% concentration. This addition is usually made to either modify selectivity or to enhance solubility of sample components that might otherwise contaminate the stationary phase.

■ Also, protein molecules may get a different surface charge distribution according to their structure and the pH of the mobile phase. In those cases, the pH, gradient of pH, ionic strength, or a combination of those parameters proved to be useful in the separation.

■ 1S (USP39)

Stationary Phases

~~Most~~

■ ■ 1S (USP39)

~~IC separations rely on ion exchange, and therefore most~~

■ ■ 1S (USP39)

stationary phases for IC are anion or cation exchangers, and less commonly phases containing both functionalities. ~~Silica-based stationary phases are less commonly used because of their incompatibility with extreme mobile phase pHs often needed in IC separations. The ion exchangers used for IC are typically constructed of polymers that allow them to be used over the entire pH range, or at a minimum, over an extended pH range compared to silica. Also, most~~

■ Stationary phases may be silica-based or polymer-based materials supporting ionic functional groups. However, due to the solubility of silica gel in water, particularly at alkaline pHs, the use of silica-based support is limited when the mobile phase is alkaline. In those cases, a polymeric support for IC is useful over an extended pH range. Most ■ 1S (USP39)

of the phases used today are constructed with highly cross-linked polymers, making them

compatible

- increasing their compatibility ■ 1S (USP39)

- with the organic solvents used for HPLC. Anion-exchange

- that sometimes are needed into the mobile phase. Polymeric anion-exchange ■ 1S (USP39)

- phases for IC are typically constructed starting with a

- from ■ 1S (USP39)

- polystyrene/divinylbenzene, ethylvinylbenzene/divinylbenzene, or polyvinyl alcohol polymeric substrate and polymethacrylate Packed columns (there are also IC columns prepared from porous polymeric monolithic backbones) have bead sizes that are as small as 4 μm , and typically no larger than 15 μm . The substrate bead can be nonporous or have pores as large as 2000 angstroms. Pore size is increased to increase capacity. To complete

- supports, with particles sizes ranging from 4 to 15 μm in diameter either non-porous or with pores up to 2000 \AA . To provide functionality to ■ 1S (USP39)

- the anion exchanger, the anion-exchange groups are attached to the substrate typically in one of two manners, electrostatically or covalently

- by condensation polymerization (a.k.a. a step-growth polymerization). ■ 1S (USP39)

- Pellicular phases use electrostatic bonding. The substrate is first sulfonated and then treated with small beads (<1 μm , the latex) that have bound anion-exchange groups. The latex beads are electrostatically bound to the substrate beads. Capacity and selectivity are varied by varying the latex size, its crosslinking, and the nature of the anion-exchange group. Condensation polymerization (also know as step-growth polymerization) also involves electrostatic bonding in distinct steps, the number of which allows control of both selectivity and capacity.

- ■ 1S (USP39)

- Cation-exchange phases for IC use the same polymeric substrates as the anion-exchange phases, but because the mobile phases for cation IC are acidic, silica can also be used. Most stationary phases for cation IC are grafted stationary phases, in which a polymer containing multiple cation-exchange groups is covalently bound to the substrate. Pellicular cation-exchange phases are less common. They are assembled with a second latex coating (i.e., an anion-exchange phase is treated with latex containing cation-exchange groups). For ion-exclusion chromatography, a porous strong cation-exchange stationary phase is used. Ion-pair ion-chromatography typically uses a polymer reversed-phase stationary phase.

- Ion-exclusion chromatography use a porous strong cation-exchange stationary phase, while ion-pair chromatography typically use a polymer reversed-phase stationary phase. ■ 1S (USP39)

- 1S (USP39)

Detectors

- **Detection** ■ 1S (USP39)

Conductivity detection is by far

- ■ 1S (USP39)

the most commonly employed mode of detection in IC, Although the original IC development work included the use of low capacity ion-exchange resins for efficient chromatographic separation and conductometric detection of ions in a chemically suppressed mobile phase, the advances in column technologies as well as instrumentation development allow the use of high-capacity ion-exchange today.

- especially

- for ■ 1S (USP39)

suppressed conductivity detection. ■ 1S (USP39)

In suppressed IC

■ conductivity detection, ■ 1S (USP39)

the background conductance of the ionic mobile phase is significantly reduced as it flows through the suppression device (suppressor). For example,

■ when ■ 1S (USP39)

diluted sodium hydroxide (10–50 mM) used as the mobile phase in IC of anions

■ flows through the suppressor, it ■ 1S (USP39)

is converted to water (poor conductivity) when the column effluent containing sodium hydroxide flows through the suppressor device present in an acidic form. The analyte ionic species in the column effluent are converted from their sodium or other metal salt forms to highly conducting acid forms (due to higher equivalent conductance of hydrogen ions compared to other cations):

■ water (H₂O), which shows very poor conductivity. ■ 1S (USP39)

Analogous reactions occur in the hydroxide form suppressor in IC of

■ using a suppressor for cations, ■ 1S (USP39)

where in

■ ■ 1S (USP39)

the acidic mobile phase is converted to water, and the analyte cations are converted to highly conducting hydroxide forms (due to higher equivalent conductance of hydroxide ions compared to other anions).

The reduced background conductance and the enhanced signal due to the ionic species result in an

■ a significantly ■ 1S (USP39)

enhanced signal-to-noise ratio for the conductometric detection of ions in suppressed IC. This results in reduced background noise and increasing sensitivity and reproducibility of the analysis. The commonly used chemical suppression devices fall into three broad categories. In the first type, the reactions occur across an ion-exchange membrane with the regenerant ions furnished by either a chemical or as products of electrolysis of water.

■ This results in reduced baseline noise while increasing the sensitivity and reproducibility of the analysis. Commonly used suppressors can be classified into two categories. In the first type, the reactions occur across an ion-exchange membrane with the regenerant ions furnished by either a chemical or as products of electrolysis of water. ■ 1S (USP39)

In the second type, the suppression reactions occur in a packed bed of high-exchange capacity resin

■ or monolith ■ 1S (USP39)

material, with regeneration either by a chemical or by electrolysis of water. In the third type, although not commonly used, the suppression reactions occur as the eluant stream mixes with the flowing stream of high capacity resin material.

For pharmaceutical analyses, suppressed conductometric detection may be used for detection of trace ions in high purity waters. The commonly used mobile phases for the separation of anions by suppressed IC include hydroxide ions or a mixture of bicarbonate and carbonate ions. The common mobile phases for separation of cations usually consist of mineral acids or methanesulfonic acid.

Ion chromatographic analyses also can be performed without chemical suppression, in which case the analytical column effluent flows directly to a conductivity detector. The typical eluants used in nonsuppressed IC are phthalic acid and *p*-hydroxybenzoic acid for the determination of anions and methanesulfonic acid for the determination of cations. The equivalent conductance values of chloride, sulfate, and other common anions are significantly greater than that of the eluant anion, and therefore, a positive peak is detected as the anions are carried through the detector. The equivalent conductance values of sodium, potassium, calcium, magnesium, and other common cations are significantly lower than that of the cation (H^+) in the eluant. In this instance, a negative peak is detected as the cations are carried through the detector.

Nonsuppressed IC is easier to perform, and it is a useful technique for determining ions of weak acids such as cyanide and sulfide, which are nonconductive after chemical suppression but show a higher baseline noise. Pharmaceutical analyses can be performed in the nonsuppressed mode because the quantification limits are usually in the upper mg per L to low percentage levels. While suppressor-based methodologies must often be implemented on the instrument systems specifically designed for this purpose, IC may be performed without the suppressor on an existing HPLC. This is possible because the commonly used eluants in IC include dilute bases or acids that are compatible for use on existing HPLC instruments. When this approach is considered, analysts are encouraged to consult the instrument manufacturer for applicability of the instrument for the IC analysis.

OTHER DETECTORS

Other commonly used detection modes in IC include pulsed amperometry, direct UV detection, or post-column derivatization followed by UV/VIS detection.

Pulsed amperometric detection mode (PAD)—PAD uses a specialized mode of the conventional amperometric technique. This type of detector is commonly used for the detection of electroactive species, e.g., organic compounds such as carbohydrates, sugar alcohols, amino acids, and organic sulfur species. In PAD, analytes are detected by an oxidative desorption process at the surface of an electrode located in the column effluent stream. Following the detection process, a series of potentials are applied for fixed time periods to clean the electrode surface. Unlike conventional amperometry that suffers from electrode surface fouling, a rapidly repeating sequence of different working potentials, referred to as waveform, helps the removal of the products of redox reactions from the electrode surface.

Direct and indirect UV detection—Direct UV detection is used for inorganic and organic ions that possess a UV chromophore. These include organic acids, bromide, iodide, nitrate, nitrite, thiosulfate, and cyano-metal complexes. Analogous to the inverse conductometric detection of cations, UV detection may also be performed indirectly. This method is called indirect photometric chromatography (IPC).

Photometric detection—Photometric detection involves chelation of the metal ions in column effluent with a color-forming reagent prior to detection with a visible wavelength. A classic example is the separation of metal ions in which the column effluent is chelated with 4-(2-pyridylazo)-resorcinol followed by detection at 510 to 530 nm.

■ Nonsuppressed (direct) conductivity detection is most often used for cation analysis and in situations that do not require high sensitivity, detecting concentrations in the range of mg/L.

~~Other commonly used IC detection techniques include pulsed/integrated amperometry, direct UV detection, mass spectrometry, and UV/VIS detection following post-column derivatization.~~

■ ■ 1S (USP39)

Pulsed/integrated amperometric detection (PAD/IPAD):

PAD and IPAD are modes of amperometric detection that apply more than one potential to the working electrode. These detection modes are commonly used for the detection of electroactive species, e.g., organic compounds such as carbohydrates, sugar alcohols, amino acids, amines, and organic sulfur species that can be easily oxidized. Analytes are detected by an oxidative desorption process at the surface of an electrode located in the column effluent stream. PAD uses one potential for detection while IPAD uses multiple potentials. The current generated during the fixed time periods these detection potentials are applied is integrated to yield charge. Following detection, a series of potentials are applied for fixed time periods to clean the electrode surface. Unlike conventional direct current amperometry that suffers from electrode surface fouling, this rapidly repeating sequence of potentials for detection and electrode cleaning, referred to as a waveform, allows detection and removal of the products of redox reactions from the working electrode surface.

Direct

■ ■ 1S (USP39)

UV detection: Direct UV detection is used for inorganic and organic ions that absorb UV light, typically at low wavelengths. These include organic acids, bromide, iodide, nitrate, nitrite, thiosulfate, and cyano-metal complexes.

■ Indirect UV detection uses eluents that strongly absorb in the visible or ultraviolet spectral region. A wavelength is selected where the eluent absorbs but the sample ions do not, and then negative peaks proportional to the analyte concentration are detected. In spectral detection after post-column reaction, some analytes are detected after the column effluent is combined with a reagent resulting in the formation of a compound that absorbs light at either a UV or visible wavelength. A classic example is the determination of metal ions, where the metal ions in the column effluent are chelated with 4-(2-pyridylazo)-resorcinol followed by detection at 510 and 530 nm.

■ 1S (USP39)

~~UV/visible detection after post-column reaction~~

~~—Some analytes can be detected after the column effluent is combined with a reagent that results in formation of a compound that absorbs light at either a UV or visible wavelength. A classic example is the separation of metal ions in which the metal ions in the column effluent are chelated with 4-(2-pyridylazo)-resorcinol followed by detection at 510–530 nm.~~

■ ■ 1S (USP39)

Mass spectrometry (MS):

Typically, analytes are detected after they have first passed through a suppressor to make the resulting effluent compatible with the mass spectrometer. Negative mode electrospray ionization is used for anions while the positive mode is used for cations. The suppressor effluent

is sometimes augmented with an organic solvent to improve ionization for increased sensitivity. Certain metal ions can be determined by an ion-exchange separation followed by ICP-MS.

■ 1S (USP39)

Change to read:

SAMPLE PREPARATION

Typically sample preparation for IC includes dilution or filtering through a 0.45- μm filter, or both. Under certain circumstances, samples may require removal of undesirable species through solid-phase extraction (SPE) techniques. For example, a highly alkaline sample can be neutralized by having it pass through an SPE cartridge packed with cation-exchange material in the acidic form.

■ As in many other analytical techniques, sample

■ Sample ■ 1S (USP39)

preparation may range from simple sample dissolution or dilution to the proper concentration, often followed by filtration, and in other cases more complex preparations including

■ need solid-phase extraction ■ 1S (USP39)

(SPE). approaches are needed.

■ ■ 1S (USP39)

If the solution is cloudy and/or contains particulates, then filtration through a syringe filter of 0.45- μm pore size that is suitable for IC is needed. Samples containing a high concentration of ions of the same charge as the target analyte may require a sample pretreatment to selectively remove the high concentration ion. ■ 1S (USP39)

Change to read:

PROCEDURE

Conductometric detection requires high purity water (generally, resistivity greater than 18 megohm-cm) and high purity chemicals for the preparation of the mobile phase. For ion-pair separation with UV detection, water and mobile phase components of low UV absorbance should be used.

For ion-exchange, the retention time of ions increases with a decrease in the ionic strength and valency (charge) of the mobile phase components. For example, at equimolar concentrations of sodium hydroxide or sodium carbonate mobile phase, capacity factors (K') for anions are smaller with sodium hydroxide as the mobile phase than with sodium carbonate as the mobile phase. Some mobile phases, such as sodium hydroxide, can absorb ambient carbon dioxide, resulting in its composition change and often in baseline artifacts. In this instance, care should be taken to prevent absorption of carbon dioxide by the sodium hydroxide mobile phase.

For ion-exclusion, capacity factors of organic acids increase with an increase in ionic strength

~~or concentration of mineral acids but decrease with the increase of the column temperature. Because permeation volume remains constant, these effects are usually small. Addition of a solvent such as acetonitrile shortens the retention of organic acids.~~

~~Like other HPLC techniques, IC systems are calibrated by plotting peak responses in comparison with known concentrations of a reference standard, using either an external or internal standardization procedure.~~

■ ~~Ion chromatography requires high purity water (generally, resistivity greater than 18 megohm-cm) for mobile phase preparation and any sample pretreatment.~~

■ ~~1S (USP39)~~

The choice of mobile phase is typically dictated by the choice of column, which in turn is chosen based on the selectivity for the analyte(s) compared to other ions of the same charge known or likely to be present. In situations where the other ions are in high concentration, a column with higher capacity is chosen to prevent column overload. This is especially important for many limit tests, where low concentration of a target analyte is in the presence of a large concentration of another ion of the same charge state. For anion IC, some mobile phases can be prepared from the solid or from commercial concentrates or ready-to-use solutions, e.g., sodium bicarbonate/carbonate. Other mobile phases should be prepared and handled with care, e.g., sodium hydroxide solutions, minimizing air exposure, and prepared from 50% sodium hydroxide solutions. Sodium hydroxide pellets and commercial dilute solutions contain large amounts of carbonate, thus altering the desired composition of the mobile phase. The acid solutions for cation IC are prepared by diluting high-purity concentrated acids. Alternately, carbonate/bicarbonate, hydroxide, and methanesulfonic acid mobile phases can be produced by an eluent generator. Most analyses will require the injection of 5–50 μL of sample solution, but larger volumes may be required for the analysis of low concentration analytes. As in other LC techniques, quantification is made by either internal or external standardization procedures, where the concentration is calculated by interpolation of the sample response into a calibration curve. IC methods are validated according to the recommendations described in *Validation of Compendial Procedures* $\langle 1225 \rangle$. ■ 1S (USP39)

BRIEFING

$\langle 1086 \rangle$ **Impurities in Drug Substances and Drug Products**, *USP 38* page 1063 and *PF* 40(3) [May–June 2014]. This revision is proposed on the basis of public comments received on the previous publication in *PF*. As part of an ongoing monograph modernization initiative, USP is updating this general chapter and proposing a new chapter, *Organic Impurities in Drug Substances and Drug Products* $\langle 476 \rangle$, which addresses organic impurities testing for articles with monographs in relevant USP compendia. This chapter has been updated to align it with current scientific and regulatory standards and to help ensure the appropriate control of organic impurities and degradation products in drug substances and drug products. In addition to providing updated general guidelines, this chapter introduces definitions and a decision tree for addressing impurities associated with drug substances and drug products. These new resources should assist the user who may have questions related to implementation of $\langle 476 \rangle$. Over time, *Ordinary Impurities* $\langle 466 \rangle$ may be used less frequently and may be withdrawn.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style.

1086 IMPURITIES IN DRUG SUBSTANCES AND DRUG PRODUCTS

Change to read:

INTRODUCTION

This general information chapter is intended to provide common terminology for impurities and degradation products that may be present in compendial drug substances and drug products. Impurities or degradation products in drug substances can arise during the manufacturing process or during storage of the drug substance. The degradation products in drug products can arise from drug substances or reaction products of the drug substance with the environment, with an excipient, or an immediate container closure system. Biological and biotechnological products, fermentation products and semisynthetic products derived therefrom, and radiopharmaceutical products are not covered in this chapter.

Communications about impurities and degradation products in compendial articles may be improved by including in this Pharmacopeia the definitions of terms and the contexts in which these terms are used. (See *Definitions* below.) There has been much activity and discussion in recent years about the definition of terms. Certain industry-wide concerns about terminology and context deserve widespread publication and ready retrievability and are included here. See section 5.60, *Impurities and Foreign Substances* in section 5, *Monograph Components* under *General Notices and Requirements*, as well as the general chapter *Ordinary Impurities* (466). Some other general chapters added over the years have also addressed topics of purity or impurity as these have come into focus or as analytical methodology has become available. Analytical aspects are enlarged upon in the chapter *Validation of Compendial Procedures* (1225).

Purity or impurity measurements for drug products present a challenge to Pharmacopeial standards setting. Where degradation of a drug product over time is at issue, the same analytical methods that are stability indicating are also purity indicating. Resolution of the active ingredient(s) from the excipients necessary to the preparation presents the same qualitative problem. Thus, many monographs for Pharmacopeial preparations feature chromatographic assays. Where more significant impurities are known, some monographs set forth specific limit tests. In general, however, this Pharmacopeia does not repeat impurity tests in subsequent preparations where these appear in the monographs of drug substances and where these impurities are not expected to increase. It is presumed that adequate retention specimens are in storage for the exact batch of drug substances used in any specific lot of a drug product. Whenever analysis of an official article raises a question of the official attributes of any of the drug substances used, subsequent analysis of retention specimens is in order.

DRUG SUBSTANCE

~~**Classification of Impurities**—Impurities can be classified into the following categories:~~

- ~~1. Organic impurities (process and drug-related)~~
- ~~2. Inorganic impurities~~
- ~~3. Residual solvents~~

~~Organic impurities can arise during the manufacturing process and/or storage of the drug substance. They can be identified or unidentified, volatile or nonvolatile, and include the following:~~

- ~~1. Starting materials~~
- ~~2. Byproducts~~
- ~~3. Intermediates~~
- ~~4. Degradation products~~
- ~~5. Reagents, ligands, and catalysts~~
- ~~6. Geometric and stereoisomers~~

~~Inorganic impurities can result from the manufacturing process. They are normally known and identified and include the following:~~

- ~~1. Reagents, ligands, and catalysts~~
- ~~2. Heavy metals or other residual metals~~
- ~~3. Inorganic salts~~
- ~~4. Other materials (e.g. filter aids, charcoal)~~

~~Residual solvents are organic liquids used as vehicles for the preparation of solutions or suspensions in the synthesis of a drug substance. Because these are generally of known toxicity, the selection of appropriate controls is easily accomplished (see *Residual Solvents* (467)).~~

~~Concepts for setting impurity or degradation product limits in drug substances are based on chemistry and safety concerns. As such, limits for organic and inorganic impurities and residual solvents should be established for drug substances. The basic tenet for setting limits is that levels of impurities or degradation products in a drug substance must be controlled throughout its development to ensure its safety and quality for use in a drug product.~~

~~Documented evidence that the analytical procedure used to evaluate impurities or degradation products is validated and suitable for the detection and quantification of impurities or degradation products should be established.~~

~~**DRUG PRODUCT**~~

~~The specification for a drug product should include a list of degradation products expected to occur during manufacture of the commercial product and under recommended storage conditions. Stability studies, knowledge of degradation pathways, product development studies, and laboratory studies should be used to characterize the degradation profile. The selection of degradation products in the drug product specification should be based on the degradation products found in batches manufactured by the proposed commercial process.~~

~~This rationale should include a discussion of the degradation profiles observed in the safety and~~

clinical development batches and in stability studies, together with a consideration of the degradation profile of batches manufactured by the proposed commercial process. For degradation products known to be unusually potent or to produce toxic or unexpected pharmacological effects, the quantitation/detection limit of the analytical procedures should be commensurate with the level at which the degradation products should be controlled.

For drug products the concept for setting degradation product limits is based on sound scientific judgment as applied to available data on the safety and stability of the drug product, data that may include the degradation pathways of the drug substance, the manufacturing process, known excipient interactions, any safety assessment studies, stability studies conducted under the recommended storage conditions, and ancillary studies that may provide additional information on the stability profile of the drug product. Impurities that are not degradation products (e.g., process impurities from the drug substance) are often not controlled in the drug product, as they are typically controlled in the drug substance and these impurities are not expected to increase over time. Additional guidance for setting limits can be found in various ICH and FDA guidance documents, as well as in the USP monograph submission guidelines.

Documented evidence that the analytical procedure used to evaluate impurities or degradation products is validated and suitable for the detection and quantification of impurities or degradation products should be established.

Drug products should contain levels of residual solvents no higher than can be supported by safety data (see *Residual Solvents* (467)).

DEFINITIONS

Concomitant Components—Concomitant components are characteristic of many drug substances and are not considered to be impurities in the Pharmacopeial sense. Limits on contents, or specified ranges, or defined mixtures are set forth for concomitant components in this Pharmacopeia. Examples of concomitant components are geometric and optical isomers (or racemates) and antibiotics that are mixtures. Any component that can be considered a toxic impurity because of significant undesirable biological effect is not considered to be a concomitant component.

Degradation Product—An impurity resulting from a chemical change in the drug substance brought about during manufacture and/or storage of the drug product by the effect of, for example, light, temperature, pH, water, or by reaction with an excipient and/or the immediate container closure system.

Foreign Substances (Extraneous Contaminants)—An impurity that arises from any source extraneous to the manufacturing process and that is introduced by contamination or adulteration. These impurities cannot be anticipated when monograph tests and assays are selected. The presence of objectionable foreign substances not revealed by monograph tests and assays constitutes a variance from the official standard. Examples of foreign substances include ephedrine in Ipecac or a pesticide in an oral liquid analgesic. Allowance is made in this Pharmacopeia for the detection of foreign substances by unofficial methods. (See section 5.60, *Impurities and Foreign Substances* in section 5, *Monograph Components under General Notices and Requirements*.)

Identified Impurities and Identified Degradation Products—Impurities or degradation products for which structural characterizations have been achieved.

Impurity—Any component of a drug substance that is not the chemical entity defined as the drug substance and in addition, for a drug product, any component that is not a formulation ingredient.

Inorganic Impurities—Inorganic impurities can result from the manufacturing process (e.g., residual metals, inorganic salts, filter aids, etc.). Inorganic impurities are typically controlled by tests such as *Heavy Metals* (231) and *Residue on Ignition* (281). Information found in *Plasma Spectrochemistry* (730) and *Ion Chromatography* (1065) may also be of value.

Intermediate—A material that is produced during steps of the synthesis of a drug substance and that undergoes further chemical transformation before it becomes a drug substance. The intermediate is often isolated during the process.

Ordinary Impurities—Some monographs make reference to ordinary impurities. For more details see *Ordinary Impurities* (466).

Other impurities—See section 5. *Monograph Components under General Notices and Requirements*.

Polymorphs—Different crystalline forms of the same drug substance. These can include solvation or hydration products (also known as pseudopolymorphs) and amorphous forms. Although polymorphs are not impurities by definition, an understanding of the crystalline forms, hydration or solvation states, or amorphous nature is critical to the overall characterization of the drug substance.

Process Contaminants—Process contaminants are identified or unidentified substances (excluding related substances and water), including reagents, catalysts, other inorganic impurities (e.g., heavy metals, chloride, or sulfate); and may also include foreign substances (extraneous contaminants). These contaminants may be introduced during manufacturing or handling procedures.

Reagent—A substance other than a starting material, intermediate, or solvent that is used in the manufacture of a drug substance.

Related Substances—Related substances are structurally related to a drug substance. These substances may be (a) identified or unidentified impurities arising from the synthesis manufacturing process, such as starting materials, intermediates, or by-products, and do not increase on storage, or (b) identified or unidentified degradation products that result from drug substance or drug product manufacturing processes or arise during storage of a material.

Residual Solvents—An organic liquid used as a vehicle for the preparation of solutions or suspensions in the synthesis of a drug substance (see *Residual Solvents* (467)).

Specified Impurities and Specified Degradation Products—Previously referred to as Signal Impurities, specified impurities or specified degradation products are impurities or degradation products that are individually listed and limited with specific acceptance criteria in individual monographs as applicable. Specified impurities or specified degradation products can be identified or unidentified.

Starting Material—A material that is used in the synthesis of a drug substance and is incorporated as an element into the structure of an intermediate and/or of the drug substance. Starting materials are often commercially available and have well-defined chemical and physical properties and structure.

Stereomeric Impurity—A compound with the same 2-dimensional chemical structure as the drug substance but differs in the 3-dimensional orientation of substituents at chiral centers within that structure. In those cases where all chiral centers are in the opposite orientation, the impurity is an enantiomer (enantiomeric impurity). Determinations of impurities in this category often require special chiral chromatographic approaches. Diastereomeric or epimeric impurities occur when only some of the chiral centers are present in the opposite orientation.

Toxic Impurities—Toxic impurities have significant undesirable biological activity, even as minor components, and require individual identification and quantification by specific tests. These impurities may arise out of the synthesis, preparation, or degradation of compendial articles. Based on validation data, individualized tests and specifications are selected. These feature comparison to a Reference Standard of the impurity, if available. It is incumbent on the manufacturer to provide data that would support the classification of such impurities as toxic impurities.

Unidentified Impurities and Unidentified Degradation Products—Impurities or degradation products for which structural characterizations have not been achieved and that are identified solely by qualitative analytical properties (e.g., chromatographic retention times).

Unspecified Impurities and Unspecified Degradation Products—Impurities or degradation products that are limited by general acceptance criteria but not individually listed with their own specific acceptance criteria in individual monographs.

INTRODUCTION

This general information chapter provides guidance on the control of organic impurities in drug substances and drug products (generally referred to as impurities in this chapter). Impurities are critical quality attributes of drug substances and drug products because they have the potential to affect safety and efficacy of the product. Therefore, all drug substances and drug products are subject to control of organic impurities.

The regulatory and compendial standards for the control of impurities continue to evolve due to advancements in analytical science, technology, and toxicology. A threshold-based approach described in the International Conference on Harmonization (ICH) Q3A and Q3B guidances may be used for the control of organic impurities in drug substances or drug products generated during the manufacturing process or storage. The organic impurities to be controlled in the drug substance are the process impurities and degradation products. The organic impurities to be controlled in the drug product are those resulting from the degradation of the drug substance or from the interaction of the drug substance with excipients and/or the primary container closure. Drug substance process impurities need not be controlled in the drug product unless they are also degradation products.

For marketed products, the manufacturers are responsible for controlling organic impurities in accordance with current regulatory standards. Manufacturers should consider the chemical characteristics and safety aspects of impurities when they identify and classify impurities in a

drug substance or drug product. Organic impurities should be included in the specifications for drug substances and drug products with appropriate tests, methods, and acceptance criteria. Analytical procedures for the detection and quantitation of impurities should be verified or validated. (For additional information, see *Validation of Compendial Procedures* (1225)). For impurities that are known or suspected to be highly toxic (e.g., genotoxic) or that produce undesired pharmacological effects, the quantitation/detection limit of the analytical procedures should be commensurate with the acceptance criteria to ensure patient safety.

This chapter covers drug substances and drug products marketed in the United States based on approval by the Food and Drug Administration (FDA) either via New Drug Applications (NDAs) or Abbreviated New Drug Applications (ANDAs) or through the FDA Over-the-counter (OTC) monograph system.

This chapter does not cover veterinary products, biological/biotechnological products, peptides, oligonucleotides, fermentation products and semisynthetic products derived from them, polymorphic forms, radiopharmaceuticals, herbal products, and crude products of animal or plant origin. In addition, impurities present in the drug product originating from excipients or leached from the container-closure system, inorganic/elemental impurities, and residual solvents are out of the scope of this chapter.

If a new impurity is uncovered or when the level of a known impurity increases as compared to an existing monograph, the manufacturer is responsible for evaluating impact on the safety and efficacy of the drug. If an individual monograph is inadequate to control an impurity, the manufacturer is responsible for developing and validating appropriate analytical procedures, establishing acceptance criteria, and communicating with USP.

(Definitions of key terms used in this chapter can be found in *Appendix 1: Definitions*. Additional sources of guidance on impurities in drug substances and drug products may be found in *Appendix 2: Additional Sources of Information and Guidance*.)

ORGANIC IMPURITIES IN DRUG SUBSTANCES

Organic impurities in drug substances arising from the manufacturing process and/or storage should be controlled. The organic impurities to be controlled in the drug substance are the process impurities (starting materials, byproducts, intermediates, reagents, ligands, and catalysts) and degradation products. They can be identified or unidentified. Impurities that increase over time on storage are considered degradation products and should be monitored throughout the retest period.

Drug substances manufactured by alternative processes (e.g. different starting materials, synthetic pathways, and/or purification steps) should be evaluated to determine if the differences affect the impurity profile listed in the existing monograph.

A threshold-based approach as described in ICH Q3A (R2 or current version) may be used for the reporting, identification, and/or qualification of impurities in drug substances. Because toxicity is a dose-related phenomenon, the thresholds are set based on the amount of drug substance administered per day (see *Table 1*). Higher thresholds may be applied if scientifically justified. Lower thresholds may be applied if the impurity is unusually toxic.

Table 1. Drug Substance Impurity Thresholds

	Impurity Thresholds	
	≤2 g	≥2 g
Maximum daily dose	≤2 g	≥2 g
Reporting	0.05%	0.03%
Identification	0.10% (1.0 mg) ^a	0.05%
Qualification	0.15% (1.0 mg) ^a	0.05%
^a The total daily intake in parentheses applies if it is lower than the calculated value.		

Acceptance criteria shall be set for all impurities present at or above the qualification thresholds at release and through the retest period. Principles of setting acceptance criteria for impurities in drug substance are discussed in ICH and FDA guidances for NDAs and ANDAs. The acceptance criteria shall be based on applicable guidances or other acceptable scientific means, with safety as the primary consideration and not solely based on process capability.

ORGANIC IMPURITIES IN DRUG PRODUCTS

Organic impurities in drug products arising from the manufacturing process and/or storage of the drug product should be controlled. The organic impurities to be controlled in the drug product are only the degradation products resulting from the degradation of the drug substance or from the interaction of the drug substance with excipients and/or the primary container closure. They can be identified or unidentified. Drug substance process impurities need not be monitored or specified in drug products unless they are also degradation products. Principles of setting acceptance criteria for degradation products in drug products are discussed in ICH and FDA guidances for NDAs and ANDAs.

A threshold-based approach as described in ICH Q3B (R2 or current version) may be used for the reporting, identification, and/or qualification of impurities in drug products. Because the toxicity is a dose-related phenomenon, the thresholds are based on the amount of drug substance administered per day (see *Table 2*). Higher thresholds may be applied if scientifically justified. Lower thresholds may be applied if the degradation product is unusually toxic.

Table 2. Drug Product Degradation Thresholds

	Degradation Product Thresholds					
	<1 mg	1–10 mg	>10–100 mg	>100 mg–1 g	>1–2 g	>2 g
Maximum daily dose	<1 mg	1–10 mg	>10–100 mg	>100 mg–1 g	>1–2 g	>2 g
Reporting	0.1%	0.1%	0.1%	0.1%	0.05%	0.05%
Identification	1.0% or 5 µg TDI ^a	0.5% or 20 µg TDI ^a	0.2% or 2 mg TDI ^a	0.2% or 2 mg TDI ^a	0.2% or 2 mg TDI ^a	0.10%
Qualification	1.0% or 50 µg TDI ^a	1.0% or 50 µg TDI ^a	0.5% or 200 µg TDI ^a	0.2% or 3 mg TDI ^a	0.2% or 3 mg TDI ^a	0.15%
^a Whichever is lower, calculated value or Total Daily Intake (TDI).						

Acceptance criteria shall be set for all impurities present at or above the qualification thresholds at release and through the shelf life. Principles of setting acceptance criteria for impurities in drug products are discussed in ICH and FDA guidances for NDAs and ANDAs. The acceptance criteria shall be based on applicable guidances or other acceptable scientific

means, with safety as the primary consideration and not solely based on process capability.

In cases of complex impurity profiles, it may not be feasible to resolve each impurity individually or detect them and quantify them using a single analytical procedure. In such cases, manufacturers can consider the use of multiple analytical procedures to test for impurities. Also, limits may be established based on combinations of impurities, as appropriate.

Similar principles may be applied to set thresholds and acceptance criteria for degradation products in FDA OTC monograph drug products, which are not discussed in ICH or FDA guidances. Degradation products in these drugs may also need to be reported, identified, and/or qualified. Higher thresholds than those shown in *Table 2* may be justified based on historical information such as manufacturing experience with the commercial process, stability, and safety of the drug. Lower thresholds may be applied if the degradation product is known or suspected to be highly toxic or produce undesired pharmacological effects that are unusually toxic. Factors such as quantitative structure-activity relationship (QSAR) of the drug substance, route of administration, the likely consumption patterns such as duration of treatment and the patient population, and historical safety of the drug may be considered in justifying the acceptance criteria.

Measurement of degradation products can be challenging for products containing multiple drug substances and complex formulations. The use of placebo products as controls in stability studies may aid in the deconvolution of chemical changes that could be related to excipients rather than the drug substance. For drug products that contain multiple drug substances, it is recommended to quantify unidentified degradation products based on the drug substance present in the lowest amount in the formulation (which is the most conservative approach for setting impurity control).

ORGANIC IMPURITIES DECISION TREE

The decision tree shown in *Figure 1* provides guidance for impurities in drug substances and drug products.

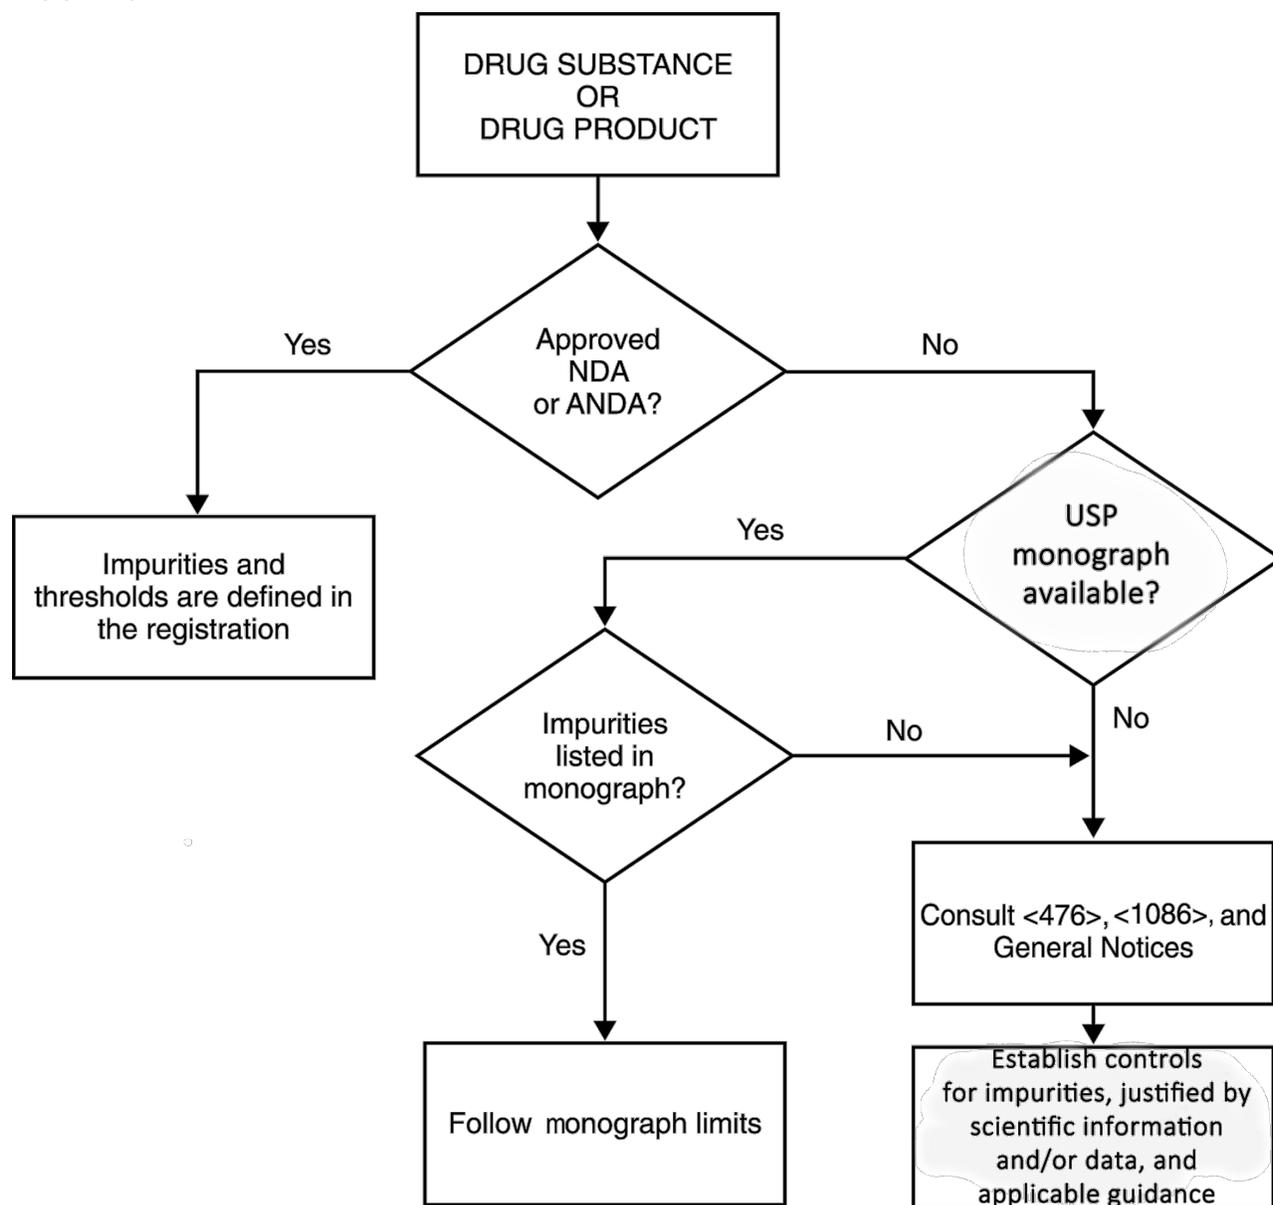

Figure 1. Decision tree for control of organic impurities in drug substances and drug products.

Note that all impurities specific to a given drug product formulation may or may not be included in the *USP* monograph. If the impurity is listed in the monograph, follow monograph limits. If the impurity is not listed, consult *Organic Impurities in Drug Substances and Drug Products* (476) and this chapter for guidance.

APPENDIX 1: DEFINITIONS

Degradation product: An impurity resulting from a chemical change in the drug substance brought about during manufacture or storage of the drug product by the effect of, for example, light, temperature, pH, or water, or by reaction with an excipient or the primary container-closure system.

Identified impurity/degradation product: An impurity or degradation product for which structural characterization has been established.

Identification threshold: A limit above which an impurity should be identified.

Impurity: For a drug substance, any component of the drug substance that is not the chemical entity that is defined as the drug substance; for a drug product, any component of a drug product that is not the drug substance or an excipient in the drug product.

Qualification: The process of acquiring and evaluating data that establish the biological safety of an individual impurity or a given impurity profile at the level(s) specified.

Qualification threshold: A limit above which an impurity should be qualified.

Reporting threshold: A limit above which an impurity should be reported.

Specified impurity/degradation product: An impurity or degradation product that is individually listed and limited with a specific acceptance criterion in the drug substance or drug product specification. A specified impurity or specified degradation product can be either identified or unidentified.

Unidentified impurity/degradation product: An impurity or degradation product for which a structural characterization has not been achieved and that is defined solely by qualitative analytical properties (e.g., chromatographic retention time).

Unspecified impurity/degradation product: An impurity or degradation product that is limited by a general acceptance criterion, but not individually listed with its own specific acceptance criterion, in the drug substance or drug product specification.

BRIEFING

〈 1209 〉 **Sterilization—Chemical and Physicochemical Indicators and Integrators**, *USP* 38 page 1424. This chapter is proposed for omission from *USP*. A new general chapter, *Physicochemical Integrators and Indicators for Sterilization* 〈 1229.9 〉, has been proposed in

PF 41(2) as part of the new series of chapters on sterilization. The chapter impacted by this omission is *Sterilization of Compendial Articles* 〈 1229 〉. The reference to 〈 1209 〉 in this chapter needs to be replaced by 〈 1229.9 〉.

The following Briefing list includes monographs and/or chapters that both reference the General Chapter under revision and require revision to keep references to the General Chapter accurate. Other monographs and/or chapters may also be listed, even where the reference to the General Chapter remains unchanged, as additional notice to stakeholders where there is believed to be potential for the change in the general chapter itself to affect pass-fail determinations for particular monograph articles.

- 〈 1229 〉 *Sterilization of Compendial Articles*

■ 〈 1209 〉 ~~STERILIZATION—CHEMICAL AND PHYSICOCHEMICAL INDICATORS AND INTEGRATORS~~

INTRODUCTION

The Federal Code of Regulations, Part 211 on Good Manufacturing Practices for Finished Pharmaceuticals in section 211.165 states: "There shall be appropriate laboratory testing, as necessary, of each batch of drug product required to be free of objectionable microorganisms." This statement has been interpreted to mean that an alternate laboratory control test for sterility is required for any batch load of a product that is parametrically released. An appropriate laboratory test for each batch may be a biological indicator, which is included in each batch of product that is terminally sterilized (see *Biological Indicators for Sterilization* 〈 1035 〉), or a physicochemical indicator or integrator. This requirement may also be met by a primary product release system that includes the documented recording of thermometric measurements systems that are calibrated with a NIST traceability system and that demonstrate a $\pm 0.5^\circ$ performance capability.

The presence of this chapter in the *USP* does not mean that chemical indicators and integrators are primary release requirements for parametric released product. The recorded and documented measurements from established thermometric measurement systems and associated process controllers (that have been calibrated and used during initial and periodic validation studies, as well as in routine production) can be considered to be primary, product-release systems for parametric release.

PERFORMANCE

Performance standards within lots and between lots of physicochemical indicators or integrators from a given manufacturer should be consistent. They should not interact physically or chemically with any container or product when placed adjacent to the product for sterilization

in the sterilizer load, and should not alter the strength, quality, or purity of the sterilized article. The safety of personnel handling the physicochemical indicators or integrators should also be assessed, and, if need be, appropriate precautions should be taken.

Similar to biological indicators, chemical indicators are considered Class II devices and require the indicator manufacturer to obtain a device 510K approval prior to commercial use.

PHYSICOCHEMICAL INDICATORS

Recorded process engineering data can be supplemented by the presence in each sterilized batch of a physicochemical indicator. A physicochemical indicator is defined as a device that responds in a measurable fashion to one or more critical sterilization parameters.

A number of different kinds of indicators dependent on chemical or physicochemical means have been developed for monitoring sterilization cycles. Some products are used in a sterilization apparatus for monitoring whether the contents have been exposed to a selected factor (i.e., temperature) of the particular sterilization cycle, but may not show the duration or intensity of such exposure. Chemical and physicochemical indicators are used to monitor a physical parameter of a sterilization apparatus and can be placed on the outside of the packages of articles to be sterilized, or they may be distributed within the sterilizer load. In the latter case, one can evaluate to some extent the effect of the packaging material and configuration of the load on the selected parameter.

PHYSICOCHEMICAL INTEGRATORS

A physicochemical integrator is defined as a device that responds to a sterilization process critical parameter, which results in a measurable or quantifiable value that can be correlated to some standard of microbial lethality. Physicochemical integrators have been designed to broadly match the predictable inactivation of those spore preparations in biological indicators that have high and defined resistance to the sterilizing agent.

The manufacturers of physicochemical integrators should provide data to demonstrate that the labeled performance characteristics tests of the integrators are met. Users of physicochemical integrators should verify that specific measured values directly correlate to successful microbial lethality in a validated sterilization cycle.

A physicochemical integrator indicates whether or not the critical combination of physical parameters of a validated sterilization cycle has been met or exceeded. The integrator is not generally used as a substitute for a biological indicator in the development and validation of sterilization cycles. An indication by a physicochemical integrator that the critical combination of physical parameters of a stated sterilization cycle has been achieved should not be considered equivalent to the inactivation of spores of a variety of biological indicators. However, the physicochemical integrator can detect whether the sterilization process has been continued for too long, at too high a temperature or gas concentration, or has been overexposed to radiation.

The interval between the lower range and the upper range of time, or any other designated set of parameters, resembles the survival time and kill time window characteristics of a biological indicator. This interval should not be wider than that desirable for the designated parameter, but may be narrower if the manufacturer is able to achieve consistent performance over a

narrower range. Even where a sterilization apparatus with consistent performance is used, cases may occur where the determined performance characteristics of the integrator differ from the label claims. This could represent a difference between the user's apparatus performance and the manufacturer's apparatus used for verifying the label claims. Closer conformity to the label claims may also be shown with any highly developed apparatus, such as a BIER vessel.¹⁷² Hence, the integrator requires its own precautions in use and has appropriate interpretive criteria within its performance characteristics. Tests for performance characteristics of physicochemical integrators include determination under applicable defined conditions of (a) the maximum time of exposure at which none of the specimens indicates that adequate exposure to the cycle has occurred, and (b) a minimum time of exposure at which all specimens show that adequate exposure to the cycle has occurred. An intermediate time of exposure, where about half the number of specimens show adequate exposure, could indicate an approaching exposure endpoint for the physicochemical integrator.

Because an indicator reflects only the interaction of the physical parameters of sterilization, it will not be affected by some of the factors that may influence the resistance of the microbial load on the products to be sterilized (e.g., progeny resistance, spore population, inoculum substrate, oil, salts, proteins, or residues or configurations), all of which may protect a contaminated area from penetration by the sterilizing agent. (Hence, the inappropriateness of these devices for cycle development.) There are other factors, however, that may affect a biological indicator that could also affect a physicochemical integrator (e.g., interfering configuration of a pack in which the integrator was placed, variations in the applied timing or temperature control, or failure of the apparatus to reach the set temperature or meet other requirements).

Defective performance of the sterilization apparatus generally can be ascertained from gauges and from records of temperature, pressure, time of exposure, and gas concentration, whichever are applicable. The integrator can only indicate inadequate, adequate, or excessive exposure to a combination of critical sterilization parameters. Where an integrator shows inadequate exposure to the sterilization parameters, it is necessary to ascertain whether the gauges and recordings reflect accurately the sterilization conditions within the sterilization chamber. Variations between sterilization vessels, which might affect the efficiency of a selected sterilization cycle, might be detectable by parallel exposure of several integrators in a number of locations in each sterilizer load.

Physicochemical integrators for steam sterilization are designed to react predictably to a particular combination of physical sterilization parameters: temperature, steam pressure, and time of exposure. Deviation to some extent of one or more of these critical parameters, not compensated by modification of other parameters, causes the integrator to indicate failure to reach the preset integrated limits.

Physicochemical integrators for ethylene oxide sterilization are designed with similar general principles as the integrators for steam sterilization, but to react predictably to the particular combination of the physical sterilization parameters: humidity, temperature, sterilizing gas concentration, and time of exposure. Deviation to some extent of one or more of these critical parameters, not compensated by modification of other parameters, causes the integrator to indicate failure to reach the preset integrated limits.

Physicochemical integrators have been designed to match broadly the predictable inactivation of spore preparations that have a high and defined resistance to the sterilizing agent. For

steam sterilization, a strain of *Bacillus stearothermophilus* is used (see *Biological Indicator for Steam Sterilization, Paper Carrier*), and for ethylene oxide sterilization, a strain of *Bacillus subtilis*, subspecies *niger*, is used (see *Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier*). Since there are no standard preparations of these strains, the performance characteristics of these physicochemical integrators must be interpreted in relation to a specific validated sterilization cycle.

Performance standards within lots and between lots of physicochemical integrators from a given manufacturer should be consistent. The integrators should not interact physically or chemically with container or product when placed adjacent to the product for sterilization in the sterilizer load, and shall not alter the strength, quality, or purity of the sterilized article beyond official requirements. Users should obtain information from integrator manufacturers on whether or not sterilization in the presence of physicochemical integrators may affect particular articles to be sterilized. In addition, safety in using these integrators should be verified.

Moist Heat Sterilization

The use of steam sterilization physicochemical integrators to supplement the information obtained through physical assessment of the critical operating parameters should be part of parametric release of moist heat sterilized products. These should be designed to enable the assurance that the lethality delivery specified for the process has been met or exceeded. The consistency of the performance of physicochemical integrators for moist heat sterilization should be ensured through the testing of performance characteristics that include testing of the performance of the indicator or integrator system at various pre-set selected moist heat process conditions.

Critical elements of this type of physicochemical integrator would include an organic compound sensitive to the combination of temperature and steam, a polymeric material penetrable by saturated steam, and a wicking device under the polymeric material that is in contact with the organic compound. As steam passes through the polymeric material, the organic compound melts in a predictable fashion in steps dependent on the steam temperature during the cycle. The liquefied material travels along the wick for a distance that can be measured on a scale. This organic compound has a stated melting temperature range. Some integrators may, for example, have melting ranges of 132.2 ° to 134.5 ° or of 137.0 ° to 142.0 °. Other melting ranges could also be specified so as to indicate the sterilization parameters to which it has actually been exposed. The combination of the sterilization parameters, applied for the exposure time required for a stated moist heat sterilization cycle, is indicated on the front of the article by the linear travel of the melt.

These types of physicochemical integrators can also be used for so-called "flash" moist heat sterilization cycles in which the successive steps of the sterilization process are rapidly carried out in such a manner as to achieve the required lethality for the validated process. Other types of physicochemical integrators for moist heat sterilization can be used if they are also calibrated against a specified validated moist heat sterilization cycle.

Ethylene Oxide Sterilization

Physicochemical integrators for ethylene oxide sterilization should be designed to match broadly the predictable inactivation of spore preparations that have a high and defined resistance to ethylene oxide sterilization. The inactivation of spores of a strain of *Bacillus subtilis*, subspecies *niger*, can be used as a model, although other spores of relevant microorganisms can also be

used. The critical elements of physicochemical integrators for ethylene oxide sterilization are a base with an organic compound along a linear indicator strip sensitive to a combination of temperature, humidity, and sterilizing gas concentration. Where the organic compound is exposed to a sterilizing gas mixture at a specific temperature and humidity, a chemical reaction triggers the appearance of a color along the linear indicator bar. This is dependent on the time of exposure under the conditions of ethylene oxide sterilization in a predictable fashion. The absence of fading or of decolorization of the indicator bar for a stated period after the sterilization cycle has been completed would confirm adequate humidification in the cycle. The integrator should be capable of detecting deviations from the prescribed parameters of temperature, sterilizing gas concentration, humidity, and time of exposure that may affect sterilization. It does not show the required reactions if exposed to reduced amounts of gas concentration, temperature, and humidity, even if exposed for prolonged periods.

Other types of physicochemical integrators for ethylene oxide sterilization based on different principles or mechanisms of integration of critical parameters of sterilization could be used if they are also calibrated against a specified validated ethylene oxide sterilization cycle.

The consistency of performance of physicochemical integrators for ethylene oxide sterilization has to be ensured through the testing of performance characteristics at various pre-set selected times for a given ethylene oxide sterilization cycle. ■ 1S (USP39)

BRIEFING

《 2251 》 **Adulteration of Dietary Supplements with Drugs and Drug Analogs.** This new general chapter provides tools for detection of dietary supplement adulteration with extraneously added synthetic compounds. The illegal addition of synthetic substances to products marketed as dietary supplements constitutes a significant threat to consumer health, considering that these products, administered without medical supervision, may contain toxic constituents or substances whose safety has never been examined, and whose interaction with medications may be unpredictable or lethal. The proposed chapter suggests multiple methods for detection of adulteration. It is advisable to use several screening techniques to maximize the potential for adulteration detection, because no single methodology is universally applicable. Presently, the chapter targets supplements adulterated with phosphodiesterase type 5 inhibitors; subsequent revisions will include methodologies specific to analysis of adulterated weight loss and sports performance enhancement products. It is anticipated that this chapter will be updated regularly.

Add the following:

■ 《 2251 》 **ADULTERATION OF DIETARY SUPPLEMENTS WITH DRUGS AND DRUG ANALOGS**

INTRODUCTION

The illegal addition of undeclared synthetic compounds to products marketed as dietary supplements¹ (DS) is a serious problem. This fraud is practiced to impart therapeutic effects that cannot be achieved by the supplement constituents alone. Increasingly, synthetic intermediates and structural analogs of the pharmaceuticals and drugs that have been discontinued or withdrawn from the market due to unsatisfactory safety profiles are being used as adulterants. Multiple adulterating compounds may be added to a single DS, frequently in erratic amounts.

The proposed test methodologies facilitate screening of DS for synthetic adulterants. No individual technique is capable of addressing all potential analytes; thus, a combination of orthogonal approaches adds certainty to the analytical outcome. Mass spectrometric techniques provide strong substantiation of the analytical findings. In some cases, e.g., with hormonal drugs, the amounts of physiologically relevant adulterants may be so low that GC-MS or LC-MS may be the only fitting analytical options.

The express purpose of assembling the procedures recommended herein is their utility in DS screening. The level of evidence achievable by application of one or several of the recommended procedures is ultimately dictated by the specific requirements of the end-user. It should be noted that structural elucidation and quantitative assessment of adulterants are beyond the scope of this chapter.

This chapter is meant to be updated regularly, thereby counteracting the efforts of adulterators, as novel analogs are being developed, new concealment methodologies for the adulterants are introduced, or improvements to the methods of analysis are realized.

DIETARY SUPPLEMENT ADULTERATION CATEGORIES

The following major categories of adulterated DS are recognized:

- **Sexual Enhancement:** This category is also referred to as the Erectile Dysfunction (ED) category. It encompasses a functionally coherent group of adulterants, including several approved drugs, their numerous approved and unapproved analogs, synthetic intermediates, and derivatives. Their functionality is manifested by selective inhibition of phosphodiesterase type 5 enzyme (PDE5), which hydrolyzes cyclic guanosine 3,5-monophosphate (cGMP); this group of drugs is frequently identified as PDE5 inhibitors. Screening methods for DS adulterated with ED drugs are presented in *Appendix A*.
- **Weight Loss (WL):** This category comprises a functionally and chemically diverse collection of compounds that include stimulants, laxatives, diuretics, anorexiant, and psychoactive drugs. Although stimulants constitute an important segment of WL adulterants, the oral anorexiant sibutramine dominates this category, frequently in combination with phenolphthalein, a laxative. Methods for analysis of DS adulterated with WL drugs will be addressed in Appendix B (to come).
- **Sports Performance Enhancement (SPE):** These compounds constitute the third major category of adulteration. Professional and amateur athletes are targeted with designer anabolic steroids and stimulants, which are systematically banned by the World Anti-Doping Agency. Functional and structural diversity, synthetic proclivity of the adulterators, and the generally small amounts of the infringing substances required to elicit a therapeutic effect make this category especially challenging to address. These supplements are customarily formulated in protein- and fat-rich matrices, thereby further complicating detection. For these reasons, GC- and LC-MSⁿ techniques constitute primary analytical methodologies within this category. Analysis

of DS adulterated with SPE drugs will be addressed in Appendix C (to come).

DIETARY SUPPLEMENT BULK POWDERS AND DOSAGE FORMS

DS may be subjected to adulteration either as bulk raw material or at any stage of the finished product manufacturing. Analysts should be mindful of the adulterants admixed to the finished dosage ingredients, including DS matrix or excipients, as well as components. In the latter, synthetic compounds may be embedded into the capsule shell body. This underscores the need for deliberate adjustment to the laboratory procedures that typically focus on the capsule contents alone. Appropriate sampling practices for powders and finished dosage forms should be exercised, particularly when only a limited amount of sample is available.

RECOMMENDED ANALYTICAL METHODOLOGIES

Analysis of DS for adulteration may be broadly categorized into targeted and nontargeted methods. The distinction between these types may be subtle, and a minor adjustment to the methodology will transform a nontargeted method into a targeted method.

Targeted

These techniques are warranted when the analytes are known. An example of a targeted approach would be monitoring a chromatographic run at a particular wavelength (or mass), and quantifying the analyte that appears within a pre-defined retention time window. Targeted analysis is conceptually straightforward, because it relies on pre-existing knowledge of the analyte and allows optimization of test methodology for its reliable detection. The targeted approach also is a rarity in the adulterant detection paradigm, where the nature of the analyte may be anticipated only tentatively, and variable amounts of multiple adulterants belonging to several functional categories are commonplace.

Nontargeted

These methods are better suited to a broad-spectrum detection requirement presented by adulterated DS. Nontargeted screening trades precise knowledge of the analyte identity, along with specificity and accuracy, for a wider detection scope. Examples of nontargeted chromatographic screening include acquisition of photodiode array data and full mass-spectral scanning following a chromatographic separation. The procedures in this chapter are written with an eye toward applying all techniques in a nontargeted mode, even the ones considered to be inherently targeted, thereby facilitating detection of a suspect adulterant even in the absence of a matching reference compound.

It is generally recommended to apply a broadly nontargeted methodology first, followed by a targeted procedure. It is crucial to clearly define the end-purpose of analysis, and only then decide on the appropriate instrumentation and assemble a logical testing strategy from the procedures provided. Thus, application of a nontargeted screening method may satisfy the requirements of a DS manufacturer for the purposes of monitoring bulk raw materials. Conversely, a laboratory requiring a higher level of evidence to enact an enforcement action may opt for a two-step procedure: a preliminary screen, followed by confirmatory analysis of suspect samples.

USP Reference Standards recommended for adulterants screening are listed at the end of each relevant Appendix. However, considering the rate of propagation of structural analogs and proliferation of newly developed "designer" molecules, establishing and maintaining an all-inclusive catalog of reference materials for potential adulterants is challenging and impractical. Several commercial sources of the compounds of interest exist.² Please note that mention of the external reference materials suppliers does not in any way constitute their endorsement, and neither does the listing of reagents, supplies, and instrumentation.

APPENDIX

- **Appendix A. Screening Methodologies for PDE5 Inhibitors**

- 1. HPLC with Photodiode Array Detection**

Solution A: 0.1% Formic acid in water

Solution B: 0.1% Formic acid in acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	95	5
15	5	95
23	5	95
24	95	5
31	95	5

Diluent: Acetonitrile and water (50:50)

Standard solution: 100 µg/mL of each USP Sildenafil Citrate RS, USP Tadalafil RS, or USP Vardenafil Hydrochloride RS in *Diluent*

Sample solution: Combine one-fifth of the dosage unit, 10–20 mg of bulk material, or a small fragment of the capsule shell (3 mm × 3 mm) with 10 mL of *Diluent*, sonicate for 30 min, and pass through a 0.2-µm PTFE syringe filter.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: Photodiode array, 200–400 nm

Analytical wavelength: 290 nm

Column: 2.1-mm × 15-cm; 5-µm packing L1³

Column temperature: 40°

Flow rate: 0.2 mL/min

Injection volume: 1 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Theoretical plates: NLT 3000 for any of the standard peaks

Tailing factor: NMT 1.5 for any of the standard peaks

Analysis

Sample: *Sample solution*

Examine UV spectra of the prominent peaks for similarity to those in the *Sample solution* or other known PDE5 inhibitor compounds (*Figure 1* and *Table 5*). Typical retention times of several PDE5 inhibitors are provided in *Table 5*. Retention time matching may provide some corroborating information; however, numerous analytes may elute within the same retention time window.

- 2. HPLC with Mass-Spectrometric Detection**

Ideally, a mass-spectrometric detector is connected in sequence to the UV-Vis detector. The settings below apply to an ion-trap mass spectrometer. Other MS detectors are suitable; however, it is advisable to use spectrometers that possess MS/MS capability.

Solution A: 0.1% Formic acid in water

Solution B: 0.1% Formic acid in acetonitrile

Mobile phase: See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	95	5
15	5	95
23	5	95
24	95	5
31	95	5

Diluent: Acetonitrile and water (50:50)

Standard solution: 5 µg/mL of each USP Sildenafil Citrate RS, USP Tadalafil RS, or USP Vardenafil Hydrochloride RS in *Diluent*

Sample solution: Combine one-fifth portion of the dosage unit, 10–20 mg of bulk material, or a small fragment of the capsule shell (3 mm × 3 mm) with 10 mL of *Diluent*, sonicate for 30 min, and pass through the 0.2-µm PTFE syringe filter. Dilute the filtrate 20-fold with *Diluent* before injection.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 290 nm

Column: 2.1-mm × 15-cm; 5-µm packing L1⁴

Column temperature: 40°

Flow rate: 0.2 mL/min

Injection volume: 1 µL

Mass spectrometric system⁵

(See *Mass Spectrometry* { 736. })

Ionization: ESI

Polarity: Positive or negative

Sheath gas: 35 mL/min

Sweep gas: 5 mL/min

Capillary temperature: 300°

Source voltage: 5 kV

Collision: 45 meV

Scanning: *m/z* 110–1050 and dependent scan on the most intense ion

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between vardenafil and sildenafil peaks

Tailing factor: NMT 1.5 for any of the standard peaks

Analysis

Sample: *Sample solution*

Compare mass-to-charge ratios of the molecular ions $[M + H]^+$ or $[M - H]^-$ and fragments to those of the *Standard solutions* or other known analytes listed in *Table 4*. Typical retention times of several common PDE5 inhibitors are provided in *Table 5*.

3. High Performance Thin-Layer Chromatography (HPTLC) with Visual, UV, and/or MS Detection

Standard solution: A 0.2-mg/mL composite of each USP Sildenafil Citrate RS, USP Tadalafil RS, and USP Vardenafil Hydrochloride RS in methanol, with sonication if necessary. Additional reference standards may be available commercially.

Sample solution: Comminute 1 dosage unit, including the capsule shell and tablet coating, or about 500 mg of raw material; combine with 10 mL of methanol, and subject to ultrasonication for 30 min. Centrifuge or filter the solution, and use the supernatant. [Note—Upon development, if the chromatographic bands appear too saturated and UV densitometric spectra are distorted, dilute the *Sample solution* 10-fold with methanol.]

Developing solvent system: *tert*-Butyl methyl ether, methanol, and 28.0% (w/w) ammonium hydroxide (20:2:1). [Note—Strength of ammonium hydroxide was found to be crucial for adequate method performance. It is therefore advisable to establish the titer of higher-concentration ammonia⁶ and to adjust the latter to exactly 28.0% immediately before the experiment.]

Chromatographic system

(See *Chromatography* 〈 621 〉, *Thin-Layer Chromatography*.)

Mode: HPTLC

Adsorbent: Chromatographic silica gel with an average particle size of 5 μm

Application volume: 3 μL , as 8-mm bands

Relative humidity: Condition the plate to a relative humidity of 47% using a suitable device in the presence of a saturated solution of potassium isothiocyanate.

Temperature: Ambient

Saturation: 20 min, with paper

Developing distance: 62 mm

Derivatization reagent: none

Drying: 5 min in a stream of cold air

Detection 1: Visual, under illumination with 254- and 365-nm UV light

Detection 2: UV spectrometry (scanning densitometer), 190–550 nm

Detection 3: Mass spectrometry, m/z 110–1050

Mass spectrometric system⁷

(See *Mass Spectrometry* 〈 736 〉.)

Ionization: ESI

Polarity: Positive, negative, or rapid switching

Desolvation gas (N₂): 300 L/h

Cone gas (N₂): 80 L/h

Temperatures

ESI probe: 105^o

Desolvation: 150^o

Capillary voltage: 3.0 kV

Cone voltage: 50 V

Scanning: m/z 110–1050

System suitability

Sample: *Standard solution*

Suitability requirements: The R_F values of sildenafil, vardenafil, and tadalafil bands are 0.28 ± 0.03 , 0.32 ± 0.03 , and 0.46 ± 0.03 , respectively.

Analysis: Inspect the plate under short-wave (254-nm) and long-wave (365-nm) UV light. PDE5 inhibitors appear as dark bands against the fluorescent background at 254 nm and typically exhibit different shades of blue fluorescence at 365 nm. Note the similarities in R_f values between the bands in the *Standard solution* and *Sample solution*; these may be informative, but co-elutions are common. Relative intensities of the bands permit approximation of the amounts. Using scanning densitometry, obtain UV spectra of the prominent bands in the *Sample solution*, and compare them to those of the PDE5 inhibitors in the *Sample solution* and those provided in *Table 5* and *Figure 1*. Mass-spectrometric interface, if available, may facilitate more definitive assignment of the analyte bands: compare mass-to-charge ratios of the molecular ions $[M+H]^+$ or $[M-H]^-$ and fragments to those of the common adulterants listed in *Table 4*.

4. Ambient Ionization Mass Spectrometry

Diluent: Acetonitrile and water (50:50), with 0.1% formic acid

Standard solution: A composite solution containing 20 $\mu\text{g/mL}$ each of USP Sildenafil Citrate RS, USP Tadalafil RS, and USP Vardenafil Hydrochloride RS in *Diluent*. Additional reference materials may be available commercially.

Sample solution: Grind the entire dosage form, including capsule shell and tablet coating, to a fine powder. Weigh about 50 mg of the resulting powder, or about 50 mg of bulk material, and combine with 5 mL of *Diluent*. Cap tightly, subject to ultrasonication for 2 min, and vortex thoroughly. Centrifuge or filter the resulting solution, and dilute an aliquot of the supernatant or filtrate 100-fold with *Diluent*.

Mass spectrometric system

(See *Applications of Mass Spectrometry* (1736), *Ambient Ionization Procedures*.)

Ionization: Ambient with thermal desorption

Mode: Thermal profile

Polarity: Positive, negative, or rapid switching

Gas temperature: 150 $^\circ$, 250 $^\circ$, 350 $^\circ$, and 450 $^\circ$

Scanning: m/z 110–1050

System suitability: Deposit 3- μL aliquots of the *Standard solution* onto the disposable sample cards. Set the compatible mass spectrometer for a 30-s acquisition from 110 to 1050 Da. Using one sample card for each temperature setting, acquire mass spectra at each of the following desorption gas temperatures: 150 $^\circ$, 250 $^\circ$, 350 $^\circ$, and 450 $^\circ$ in positive ionization mode. Switch polarity, and re-acquire spectra at the same four temperatures in the negative ionization mode. [Note—If the mass spectrometer permits rapid polarity switching, both positive and negative spectra may be acquired

simultaneously using a single sample.] Confirm that the $[M+H]^+$ or $[M-H]^-$ ions of sildenafil, tadalafil and vardenafil are observed as listed in *Table 4*.

Analysis: Deposit 3- μL aliquots of the *Sample solution* onto the disposable sample cards, and follow the procedure outlined above for the *Standard solution*. In the event that a single ion dominates the mass spectrum at every temperature setting, dilute the *Sample solutions* 10-fold with *Diluent* and re-analyze. Compare mass-to-charge ratios of the molecular ions $[M+H]^+$ or $[M-H]^-$ and fragments to those of the known analytes listed in *Table 4*.

5. NMR Spectroscopy—Low-Field and High-Field

(See *Nuclear Magnetic Resonance Spectroscopy* (761), *Qualitative and Quantitative*

NMR Analysis.)

[Note—Deuterated acetonitrile (CD_3CN) should be NLT 99.8 atom % D, and should contain 0.05% tetramethylsilane (TMS) as a chemical shift reference. Use of solvents in sealed ampules is recommended. NMR tubes should be suitable for use at the selected magnetic field strength.]

Standard solutions: Dissolve 10 mg of USP Sildenafil Citrate RS, USP Tadalafil RS, or USP Vardenafil Hydrochloride RS in separate 1-mL aliquots of CD_3CN , and transfer 700- μL aliquots of the resulting solutions into individual NMR tubes. Additional reference materials are available commercially.

Sample solution: Grind the entire dosage form, including capsule shell and tablet coating, to a fine powder. Transfer 100–200 mg of the ground material, or an equivalent amount of bulk raw material powder, into a 5-mL sealable glass vial. Add 1 mL of CD_3CN , vortex thoroughly, and allow the solids to settle. Transfer about 700 μL of the supernatant to an NMR tube, taking care to minimize transfer of solids.

Instrument performance qualification

(See *Nuclear Magnetic Resonance Spectroscopy* 〈 761 〉.)

Magnetic field strength: NLT 42.5 MHz (^1H operating frequency)

Data collection: Use the parameters specified in *Table 3*; perform 90° pulse width calibration before the analysis according to the recommendations of the equipment manufacturer.

Table 3

Parameter	^1H -NMR Qualitative Measurement
Pulse program	Single pulse ^1H
Spectral width	14 ppm (–1 to 13 ppm)
Transmitter offset	Center of spectral width
Relaxation delay	5–10 s
Acquisition time	2–5 s
Number of data points per FID ^a	NLT 16,000
Temperature	25 $^\circ$
^a Free induction decay.	

System suitability: Acquire a ^1H spectrum of the *Sample solution* using the settings outlined in *Data collection*. Record a sufficient number of scans to ensure that signal-to-noise ratio of the TMS signal is NLT 10.

Analysis: Acquire a ^1H spectrum of the *Sample solution* under the conditions outlined in *Data collection*. Record a sufficient number of scans to ensure that the signal-to-noise ratio of the TMS signal is NLT 10. Reference all acquired spectra to the ^1H signal of TMS (0 ppm). Measure and record the chemical shift and multiplicity of the NMR signals in the spectra of the *Standard solutions* and *Sample solution*. Compare the ^1H NMR spectrum of the *Sample solution* to those of the *Standard solutions*, paying particular attention to the aromatic region (5–9 ppm). Determine whether the chemical shift and multiplicity of the NMR signals in the *Sample solution* exhibit sufficient similarity to those found in the *Standard solutions*.

6. Bioassay⁸

PDE5 enzyme⁹ stock solution: Prepare a concentration of approximately 3000 Units/ μL . If necessary, dilute with 40 mM Tris-HCl, pH 8.0; 110 mM NaCl, 2.2 mM KCl; 3 mM DTT; and 20% glycerol. Vortex gently to mix.

PDE5 working solution (100 Units per 6.5 μL): Combine 400 μL PDE-Glo™ Reaction Buffer 5X, 10 μL of *PDE5 enzyme stock solution*, and 1590 μL purified water. Vortex gently to mix.

cGMP solution: Combine 400 μL of PDE-Glo™ Reaction Buffer 5X, 40 μL of 1-mM *cGMP stock solution*, and 1560 μL of purified water. Mix thoroughly by vortexing.

100-mM IBMX stock solution in DMSO: Prepare a 22.2-mg/mL solution of 3-isobutyl-1-methylxanthine (IBMX) in DMSO, e.g., dissolve 100 mg of IBMX in 4.5 mL of DMSO. Mix thoroughly by vortexing.

Reaction buffer: Combine 400 μL of PDE-Glo™ Reaction Buffer 5X and 1600 μL of purified water. Mix thoroughly by vortexing.

Reaction buffer with 4% DMSO: Combine 400 μL of PDE-Glo™ Reaction Buffer 5X, 80 μL of DMSO and 1520 μL of purified water. Mix thoroughly by vortexing.

Termination buffer: Combine 400 μL of PDE-Glo™ Termination Buffer 5X, 40 μL of *100-mM IBMX stock solution in DMSO*, and 1560 μL of purified water. Mix thoroughly by vortexing.

Detection buffer: Combine 400 μL of PDE-Glo™ Detection Buffer 5X, 16 μL of Protein Kinase A Solution, and 1584 μL of purified water. Vortex gently to mix.

Kinase-Glo™ reagent: Add 10 mL of Kinase-Glo™ Buffer to the vial of Kinase-Glo™ Substrate, and vortex gently.

Standard solution (400 nM): Dissolve 5 mg of USP Sildenafil Citrate RS in 3.0 mL of DMSO to obtain 2.5-mM stock solution. Combine a 10- μL aliquot of the resulting solution with 240 μL of DMSO, and mix thoroughly (100 μM). Combine a 10- μL aliquot of the resulting solution with 90 μL of DMSO, and mix thoroughly (10 μM). Combine a 10- μL aliquot of the resulting solution with 240 μL of *Reaction buffer*, and mix thoroughly (400 nM).

Control solution: Combine 10 μL of DMSO with 240 μL of *Reaction buffer*, and mix thoroughly by vortexing.

Sample solution: Grind the entire dosage form, including capsule shell and tablet coating, to a fine powder. Transfer 100 mg of the ground material into a 5-mL polypropylene vial. Add 3.0 mL of DMSO, and vortex for 60 s. Allow solids to settle, combine 50 μL of the clear supernatant with 200 μL of DMSO, and mix thoroughly by vortexing. Combine a 10- μL aliquot of the resulting solution with 90 μL of DMSO, and mix thoroughly by vortexing. Combine a 10- μL aliquot of the resulting solution with 240 μL of *Reaction buffer*, and mix thoroughly by vortexing.

Analysis

1. Dispense 12.5- μL aliquots of *Standard solution (400 nM)*, *Control solution*, and *Sample solution* into microplate wells, in triplicate. Use a white, flat-bottom, opaque polystyrene, nontreated, 96-well microtiter plate.¹⁰[Note—Do not use treated plates, black plates, or clear plates.]
2. Add 6.5 μL of *PDE5 working solution* to each well. Incubate for 5 min.
3. Add 6.0 μL of *cGMP solution* to effect a 5- μM cGMP concentration in a 25- μL volume. Incubate for 30 min.
4. Add 12.5 μL of *Termination buffer*. Incubate for 5 min.
5. Add 12.5 μL of *Detection buffer*. Incubate for 20 min.
6. Add 50 μL of *Kinase-Glo™ reagent*. Incubate for 10 min.
7. Record luminescence at 560 nm with a microplate luminometer at 0.5 s/well.

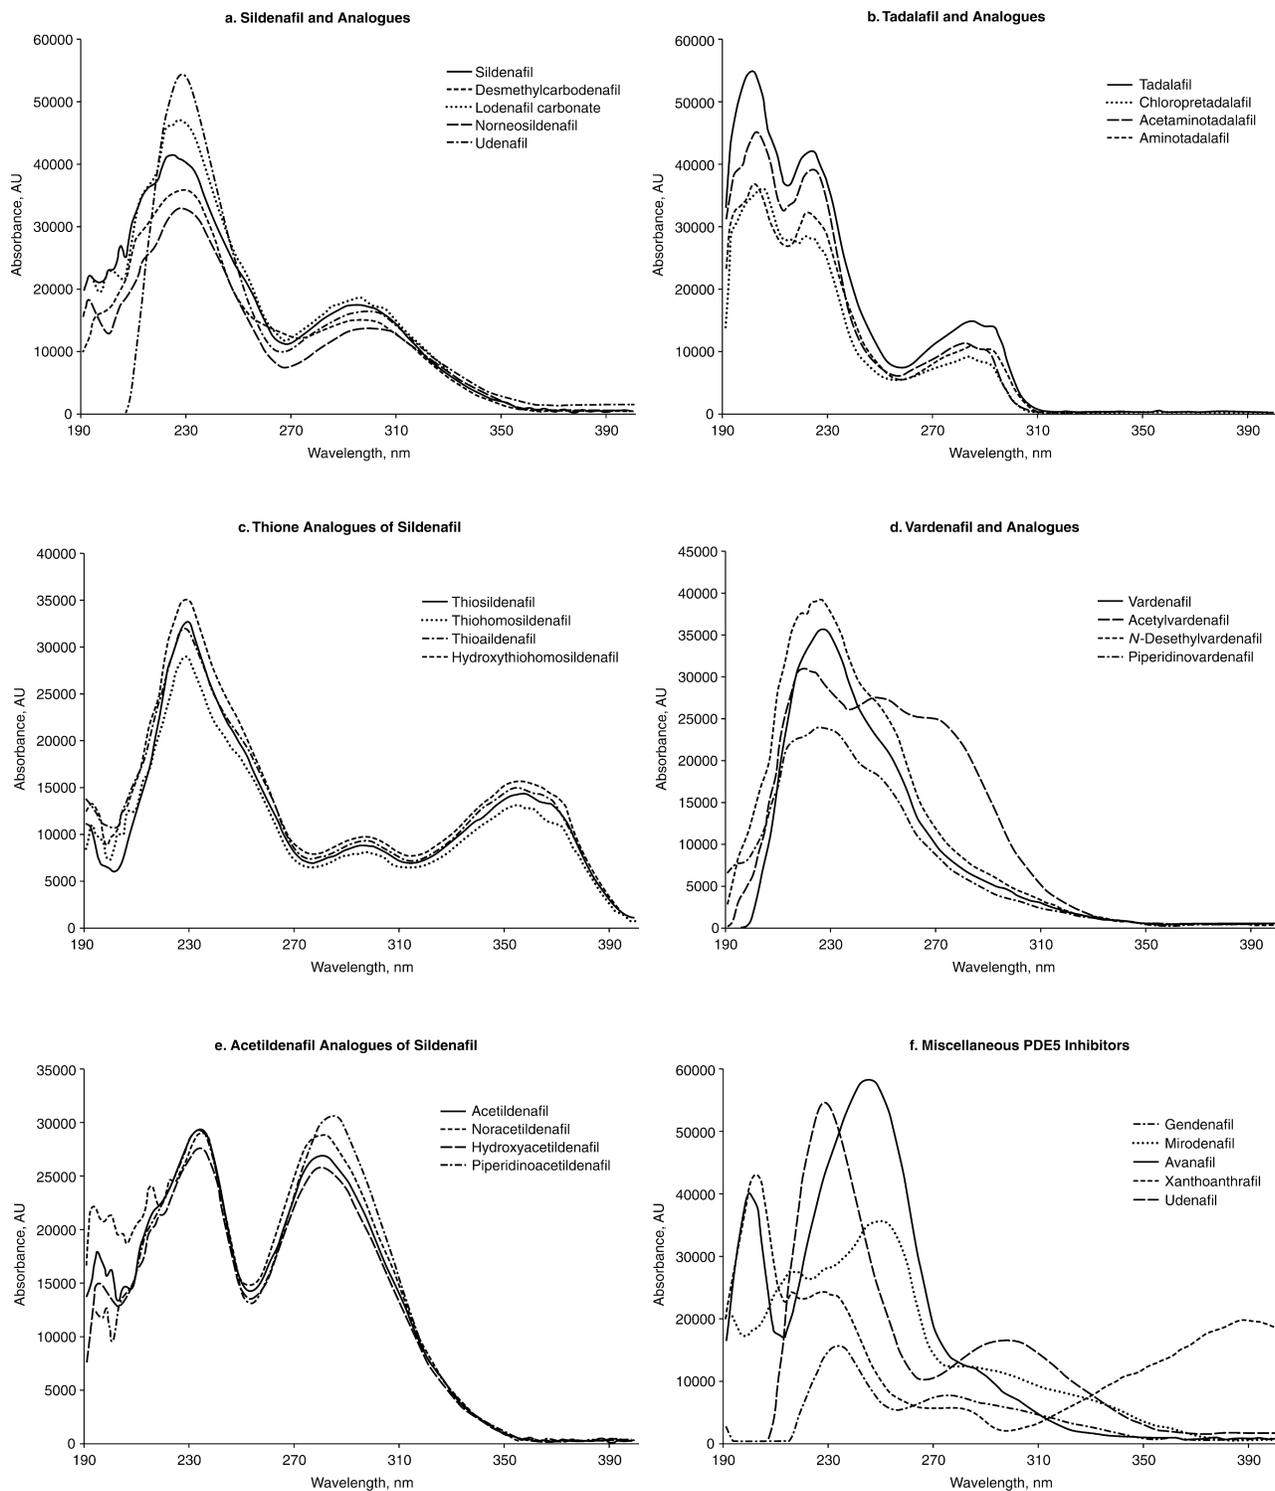

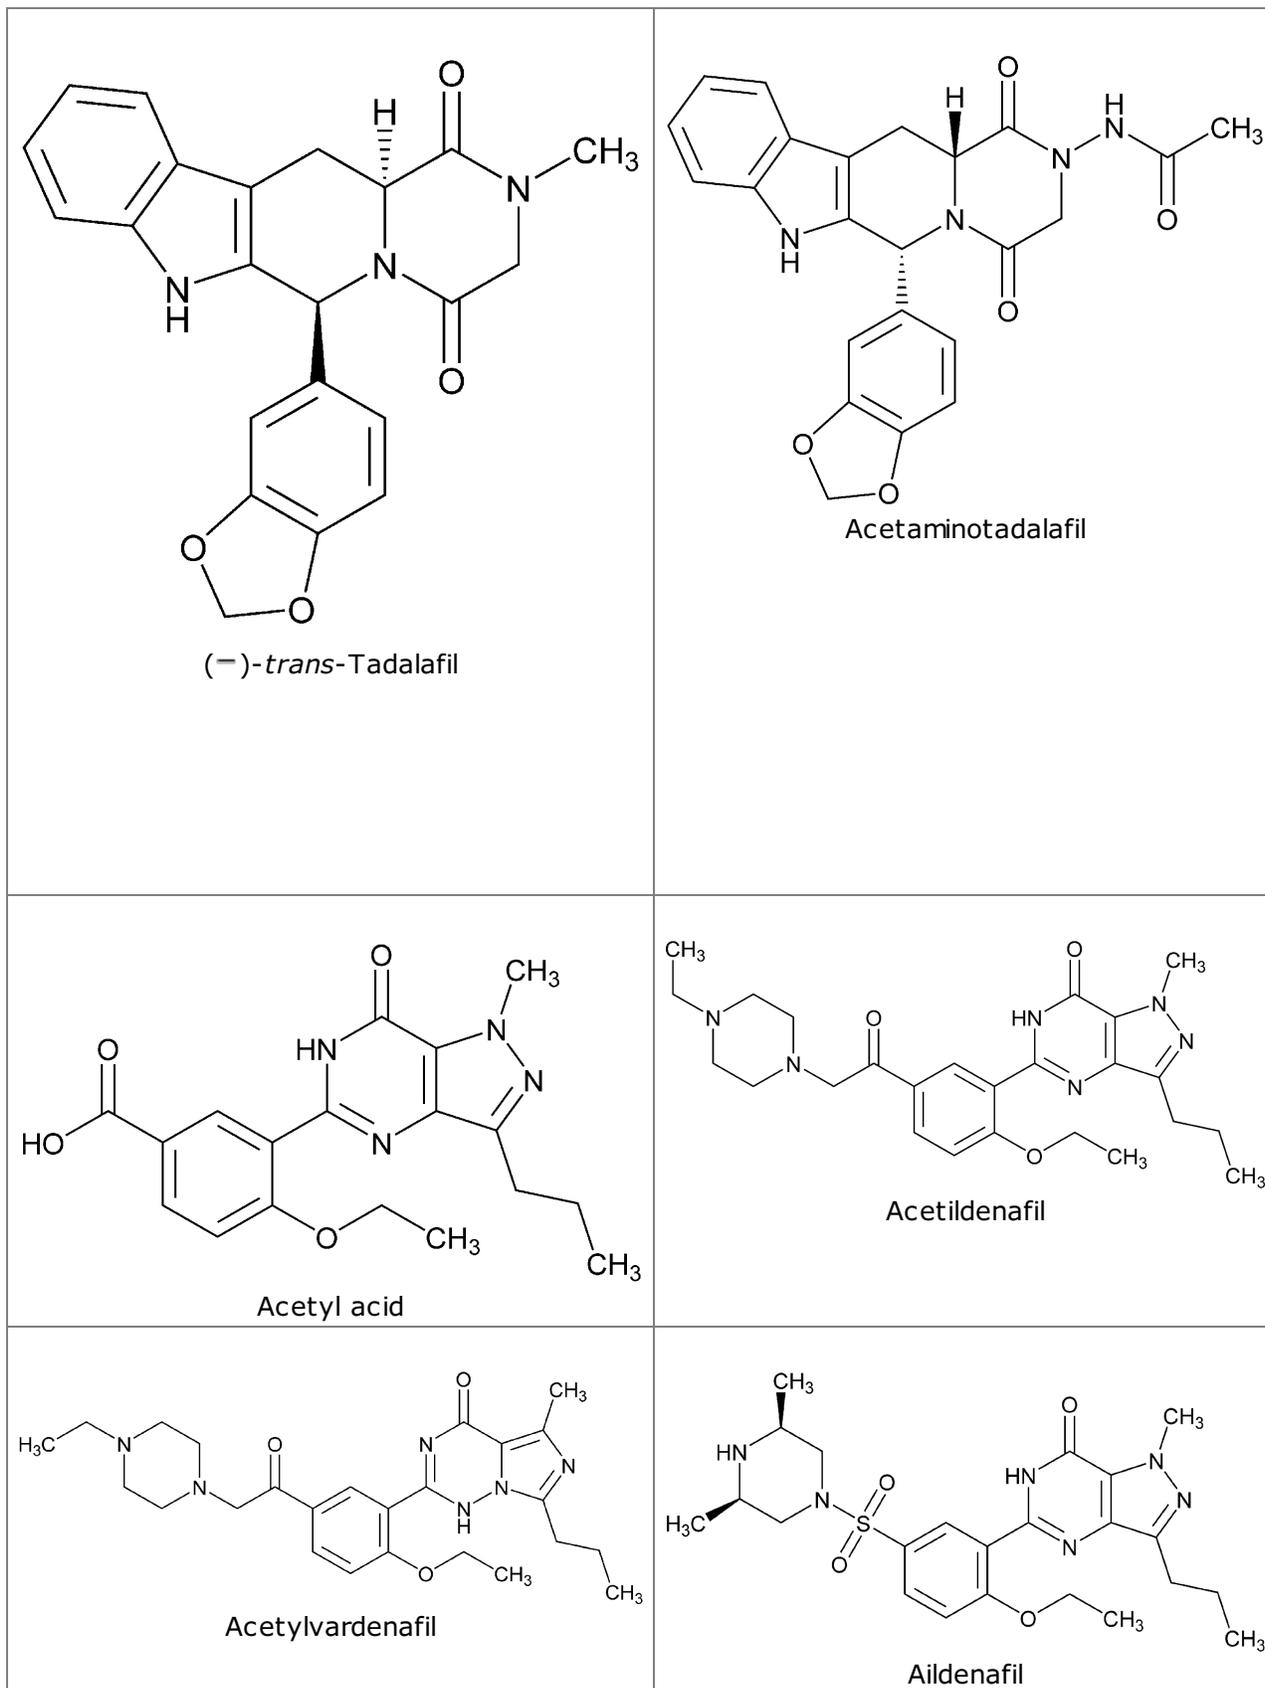

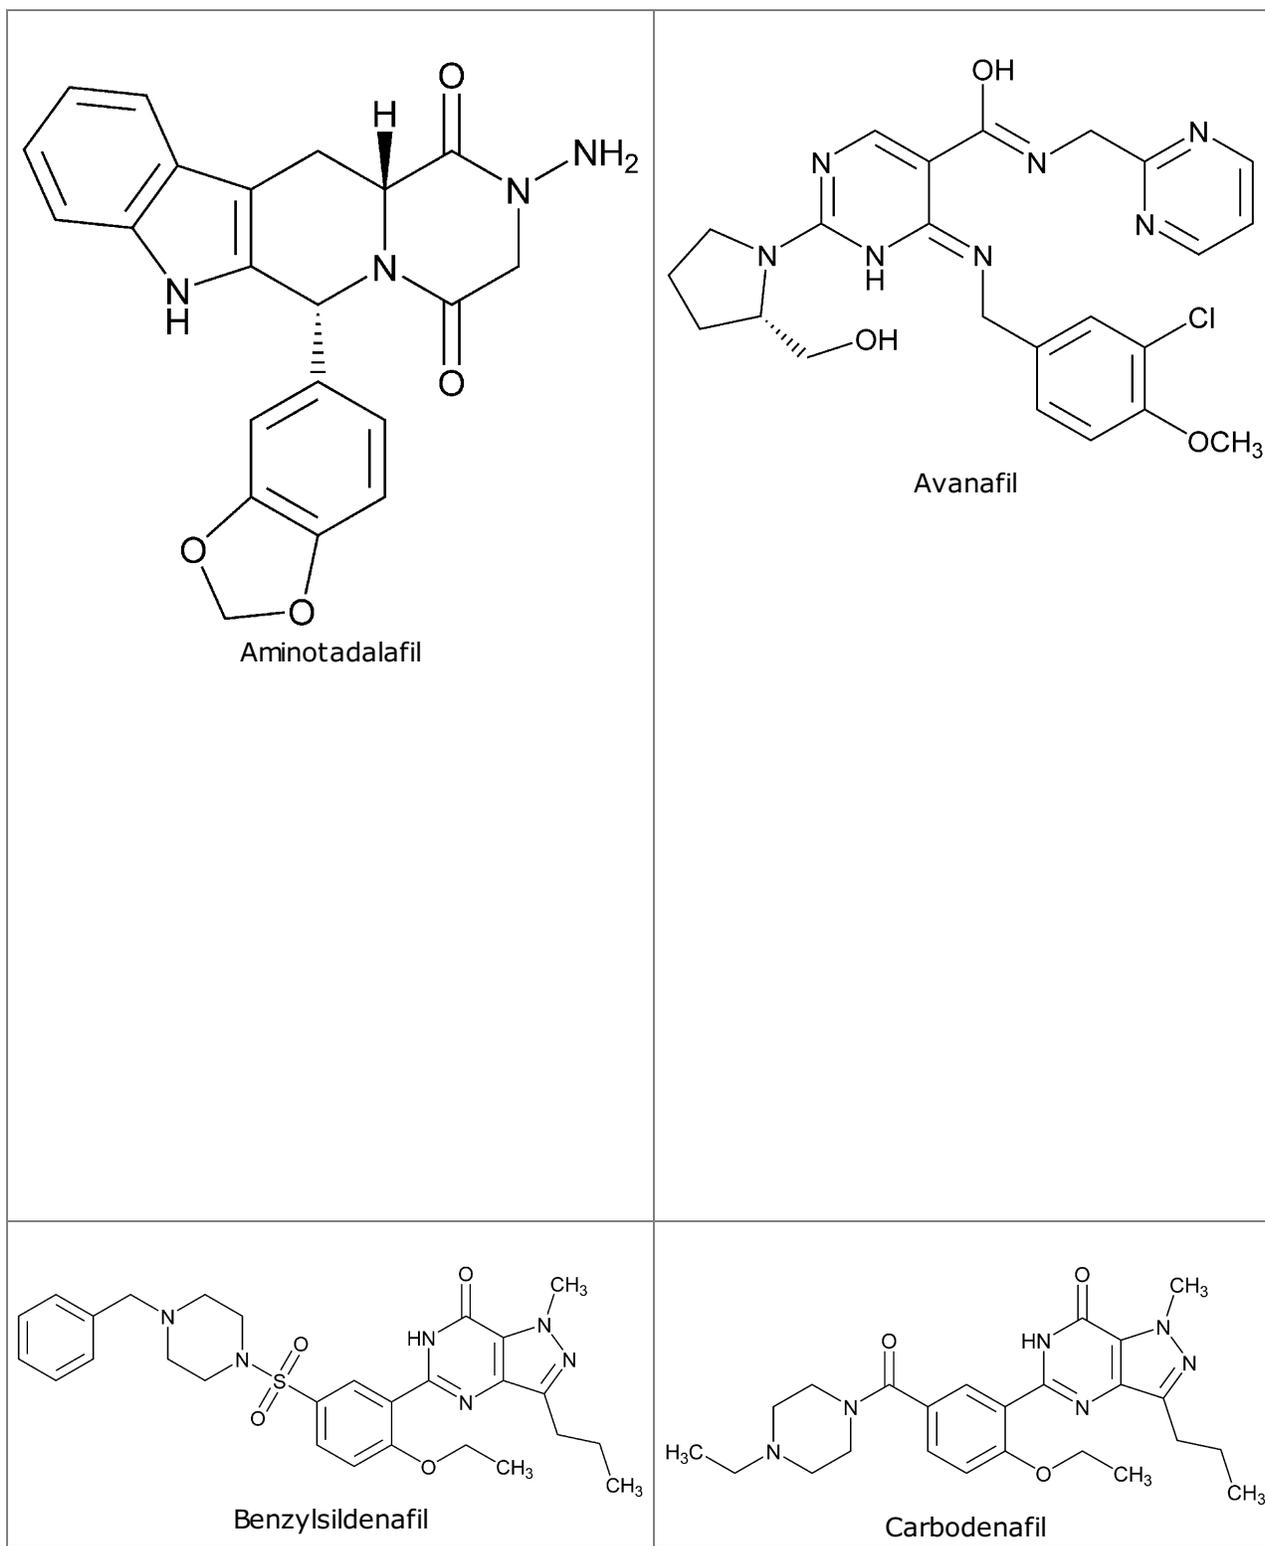

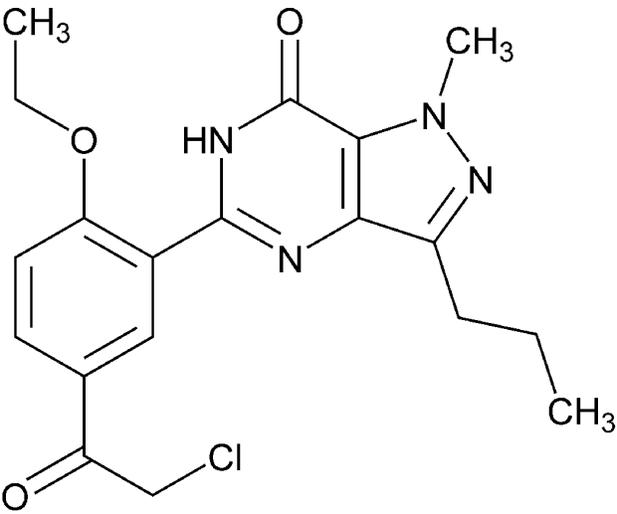

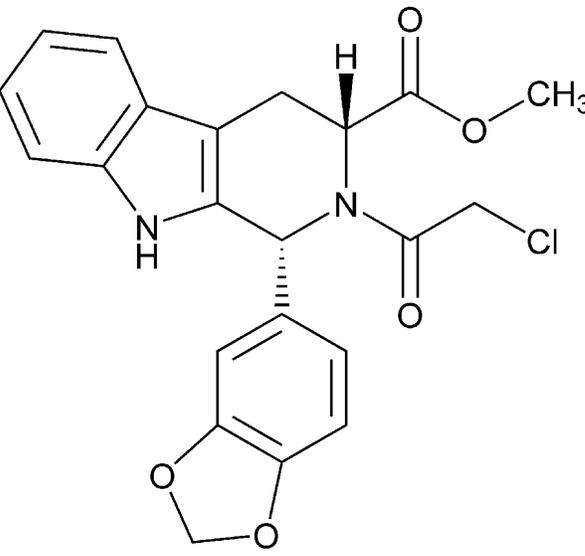

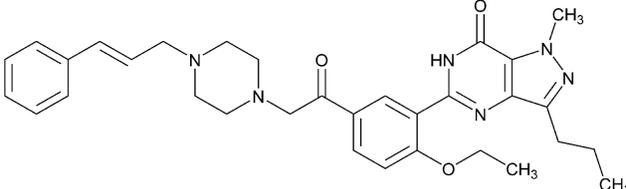

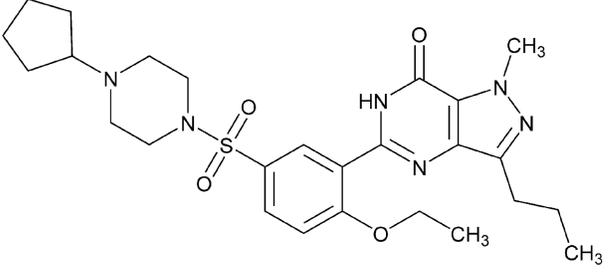

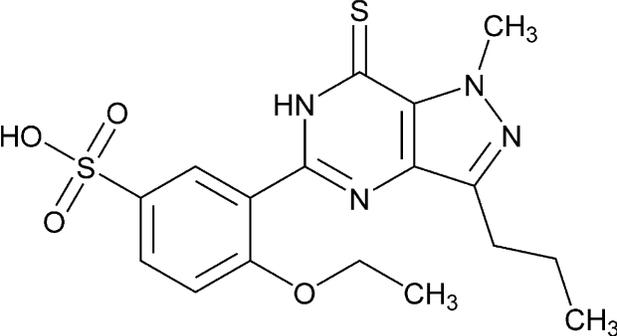

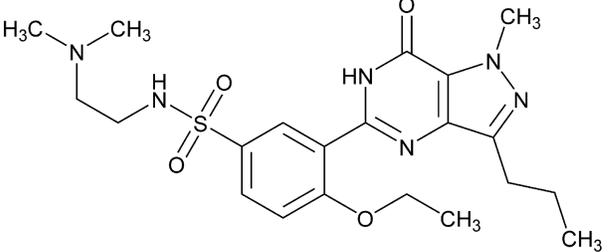

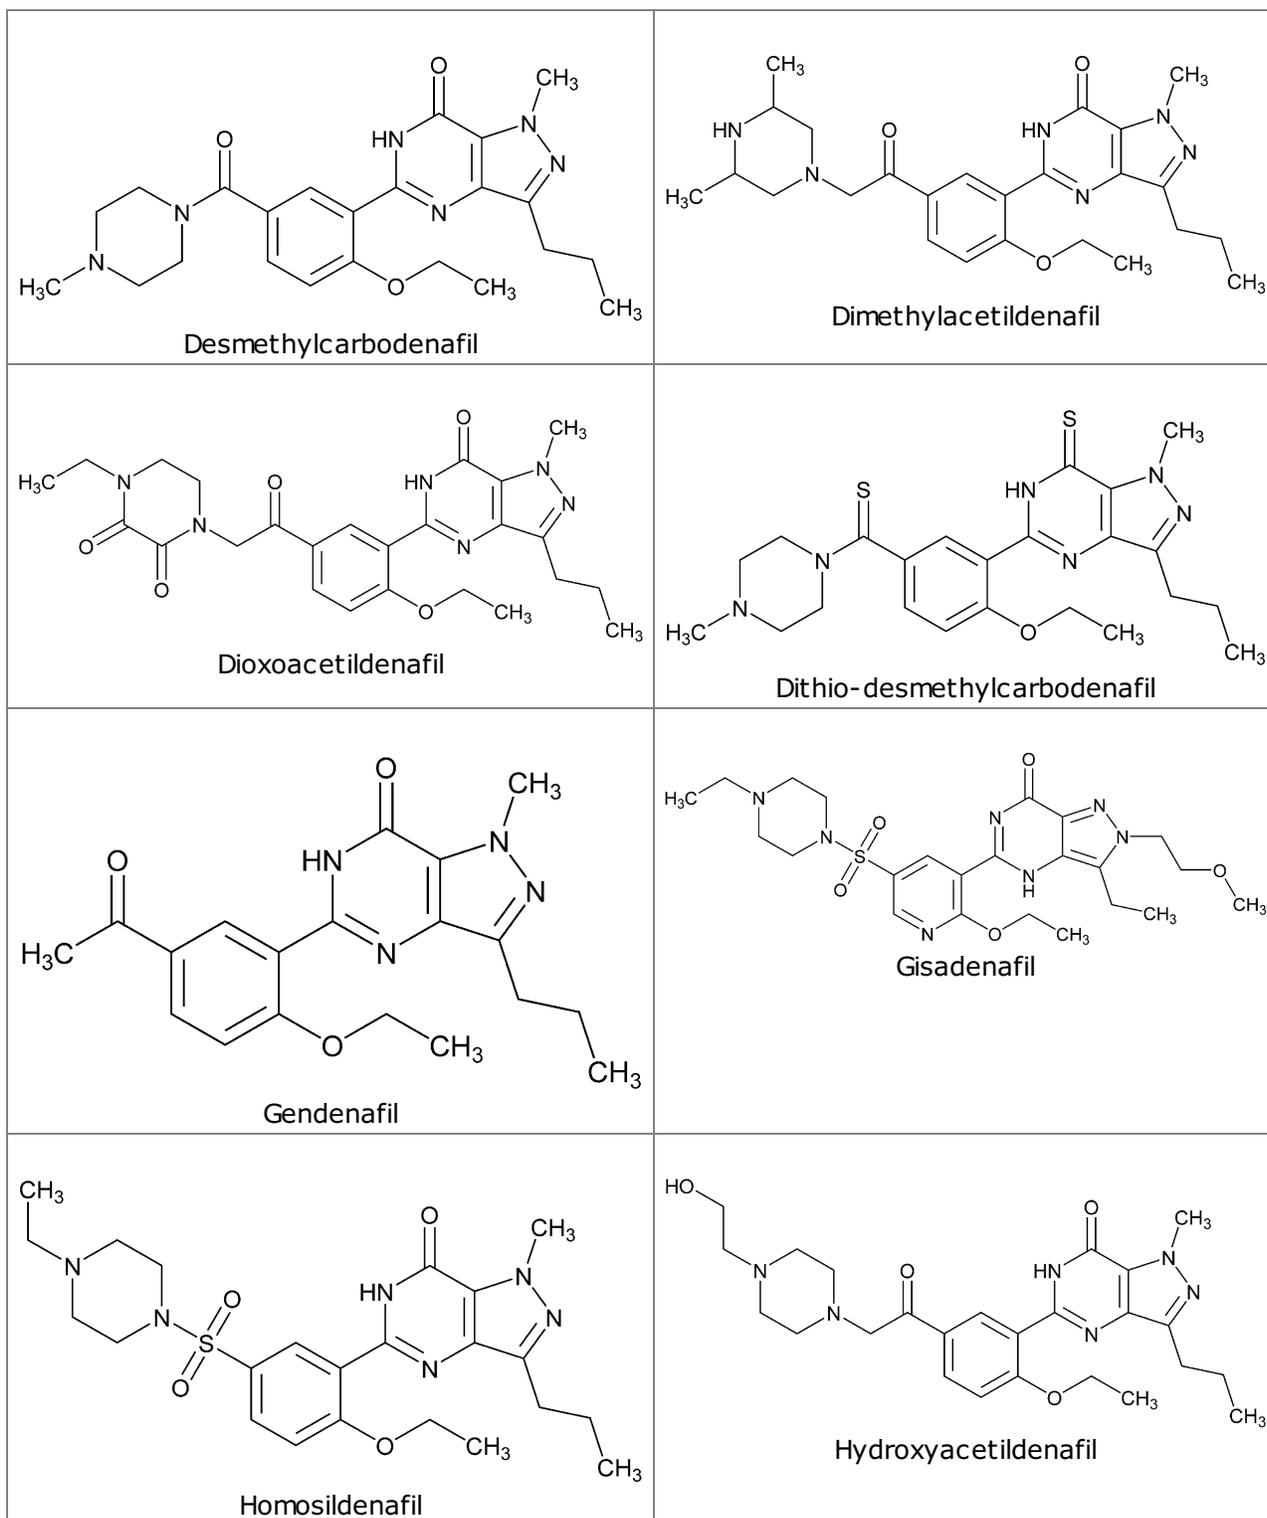

Figure 1. UV absorbance spectra of select PDE 5 inhibitors.¹¹

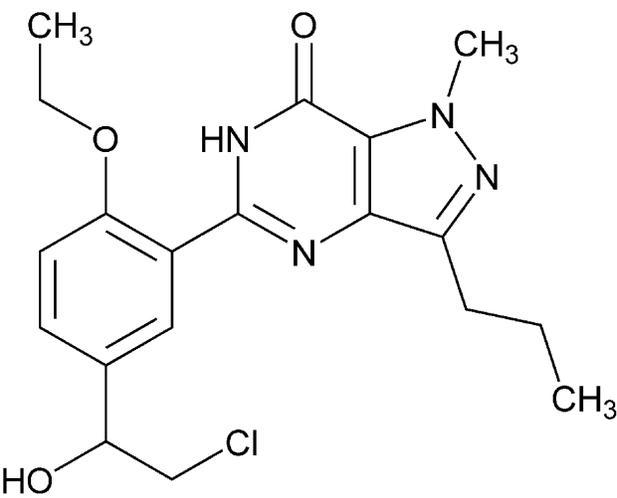

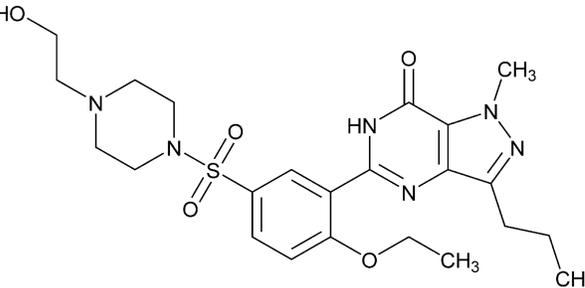

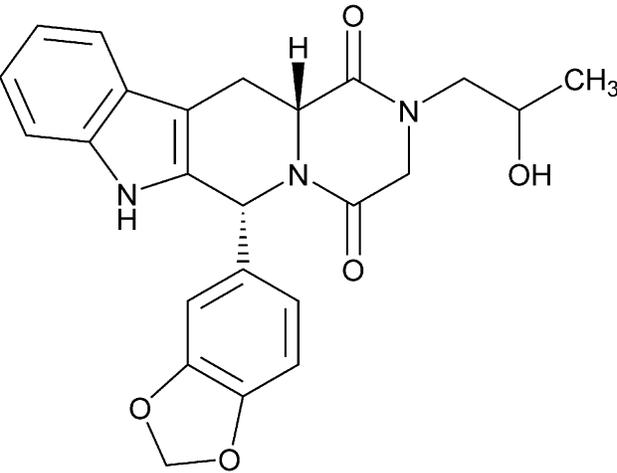

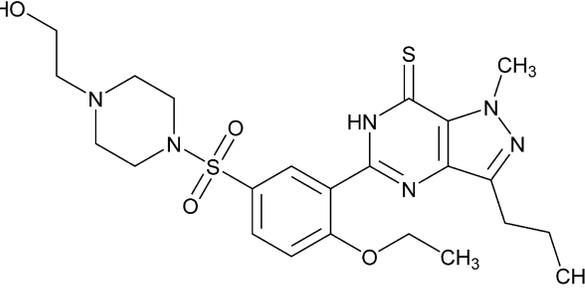

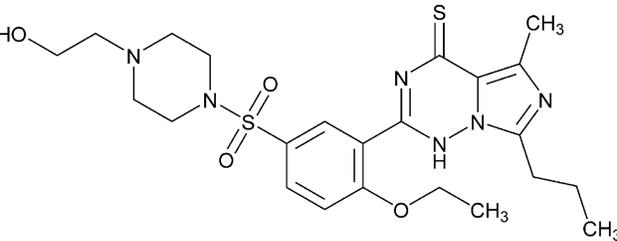

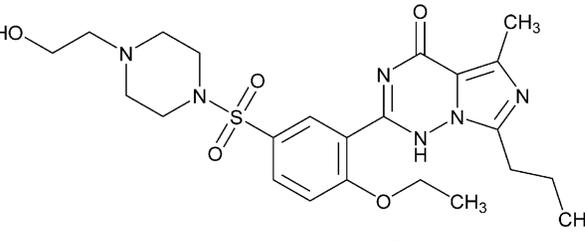

Figure 2. Chemical structures of select PDE 5 inhibitors.¹²

 <p>Chemical structure of Chlorodenafil: A 6,7-dihydro-1H-benzotriazolopyrimidin-2(1H)-one core substituted with a propyl group at position 4, a 4-(chloroacetyl)phenoxy group at position 7, and a 4-(methoxymethyl)phenoxy group at position 8.</p> <p>Chlorodenafil</p>	 <p>Chemical structure of Chloropretadalafil: A 6,7-dihydro-1H-benzotriazolopyrimidin-2(1H)-one core substituted with a propyl group at position 4, a 2-(chloroacetyl)phenyl group at position 7, and a 1-(2-(chloroacetyl)phenyl)pyrrolidine-2-carboxylate group at position 8.</p> <p>Chloropretadalafil</p>
 <p>Chemical structure of Cinnamyldenafil: A 6,7-dihydro-1H-benzotriazolopyrimidin-2(1H)-one core substituted with a propyl group at position 4, a 4-(cinnamylamino)phenoxy group at position 7, and a 4-(ethoxymethyl)phenoxy group at position 8.</p> <p>Cinnamyldenafil</p>	 <p>Chemical structure of Cyclopentynafil: A 6,7-dihydro-1H-benzotriazolopyrimidin-2(1H)-one core substituted with a propyl group at position 4, a 4-(cyclopentylamino)sulfonylphenoxy group at position 7, and a 4-(ethoxymethyl)phenoxy group at position 8.</p> <p>Cyclopentynafil</p>
 <p>Chemical structure of Depiperazinothiosildenafil: A 6,7-dihydro-1H-benzotriazolopyrimidin-2(1H)-one core substituted with a propyl group at position 4, a 4-(ethoxymethyl)phenoxy group at position 7, and a 4-(piperidin-1-ylthio)phenoxy group at position 8.</p> <p>Depiperazinothiosildenafil</p>	 <p>Chemical structure of Descarbosildenafil: A 6,7-dihydro-1H-benzotriazolopyrimidin-2(1H)-one core substituted with a propyl group at position 4, a 4-(ethoxymethyl)phenoxy group at position 7, and a 4-(dimethylamino)sulfonylphenoxy group at position 8.</p> <p>Descarbosildenafil</p>

 <p>Chemical structure of Hydroxychlorodenafil: A 6-hydroxy-1,2,3,4-tetrahydro-1H-benzotriazin-4(1H)-one core substituted with a 4-(2-chloroethyl)phenoxy group at position 2, a methyl group on the triazine ring, and a propyl group at position 4.</p> <p>Hydroxychlorodenafil</p>	 <p>Chemical structure of Hydroxyhomosildenafil: A 6-hydroxy-1,2,3,4-tetrahydro-1H-benzotriazin-4(1H)-one core substituted with a propyl group at position 4, a 4-(2-hydroxyethyl)piperazine-1-sulfonyl group at position 2, and an ethoxy group at position 6.</p> <p>Hydroxyhomosildenafil</p>
 <p>Chemical structure of 2-Hydroxypropylnortadalafil: A 1,2,3,4-tetrahydro-2H-1-benzopyrido[4,3-b]pyridin-6(1H)-one core substituted with a 2-hydroxypropyl group at position 2, a 2,3-dihydrobenzofuran-5-yl group at position 3, and a hydrogen atom at position 4.</p> <p>2-Hydroxypropylnortadalafil</p>	 <p>Chemical structure of Hydroxythiohomosildenafil: A 6-hydroxy-1,2,3,4-tetrahydro-1H-benzotriazin-4(1H)-one core substituted with a propyl group at position 4, a 4-(2-hydroxyethyl)piperazine-1-sulfonyl group at position 2, an ethoxy group at position 6, and a sulfur atom at position 5.</p> <p>Hydroxythiohomosildenafil</p>
 <p>Chemical structure of Hydroxythiovardenafil: A 6-hydroxy-1,2,3,4-tetrahydro-1H-benzotriazin-4(1H)-one core substituted with a propyl group at position 4, a 4-(2-hydroxyethyl)piperazine-1-sulfonyl group at position 2, an ethoxy group at position 6, and a sulfur atom at position 5.</p> <p>Hydroxythiovardenafil</p>	 <p>Chemical structure of Hydroxyvardenafil: A 6-hydroxy-1,2,3,4-tetrahydro-1H-benzotriazin-4(1H)-one core substituted with a propyl group at position 4, a 4-(2-hydroxyethyl)piperazine-1-sulfonyl group at position 2, an ethoxy group at position 6, and a carbonyl group at position 5.</p> <p>Hydroxyvardenafil</p>

 <p>The structure shows a piperazine ring connected via a sulfonamide group to a benzene ring. This benzene ring is part of a larger fused system including a pyrazoloquinoline core. The pyrazoloquinoline core has a methyl group at the 7-position and a propyl group at the 5-position. An ethoxy group is attached to the benzene ring at the 4-position.</p> <p><i>N</i>-Desethylsildenafil</p>	 <p>The structure is similar to N-Desethylsildenafil, but the piperazine ring is substituted with a methyl group at the 4-position.</p> <p><i>N</i>-Desmethylsildenafil</p>
 <p>The structure features a pyrazoloquinoline core with a methyl group at the 7-position and a propyl group at the 5-position. A benzene ring is attached at the 4-position, which has a nitro group (NO₂) at the para position and a methoxy group (CH₃O) at the ortho position.</p> <p>Nitrodenafil</p>	 <p>The structure is similar to N-Desethylsildenafil, but the piperazine ring is substituted with a methyl group at the 4-position and a nitroso group (NO) at the 3-position.</p> <p>Nitroso-prodenafil</p>
 <p>The structure shows a piperazine ring with an octyl chain at the 4-position. It is connected via a sulfonamide group to a benzene ring, which is part of a complex fused system including a pyrazoloquinoline core and a benzofuran moiety.</p> <p><i>N</i>-Octylnortadalafil</p>	 <p>The structure is similar to N-Desethylsildenafil, but the piperazine ring is substituted with a methyl group at the 4-position and an acetamide group (-NHCOCH₃) at the 3-position.</p> <p>Noracetildenafil</p>

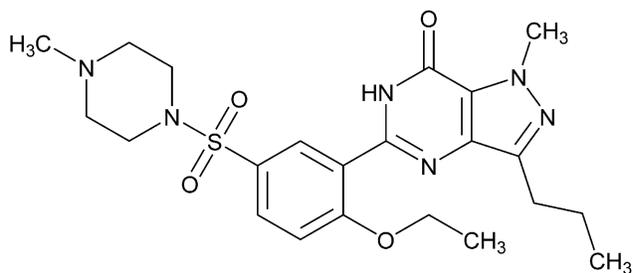

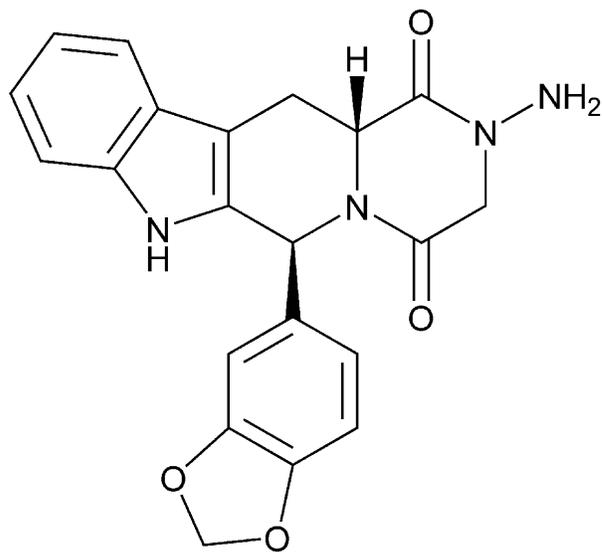

Propoxyphenyl thioaildenafil

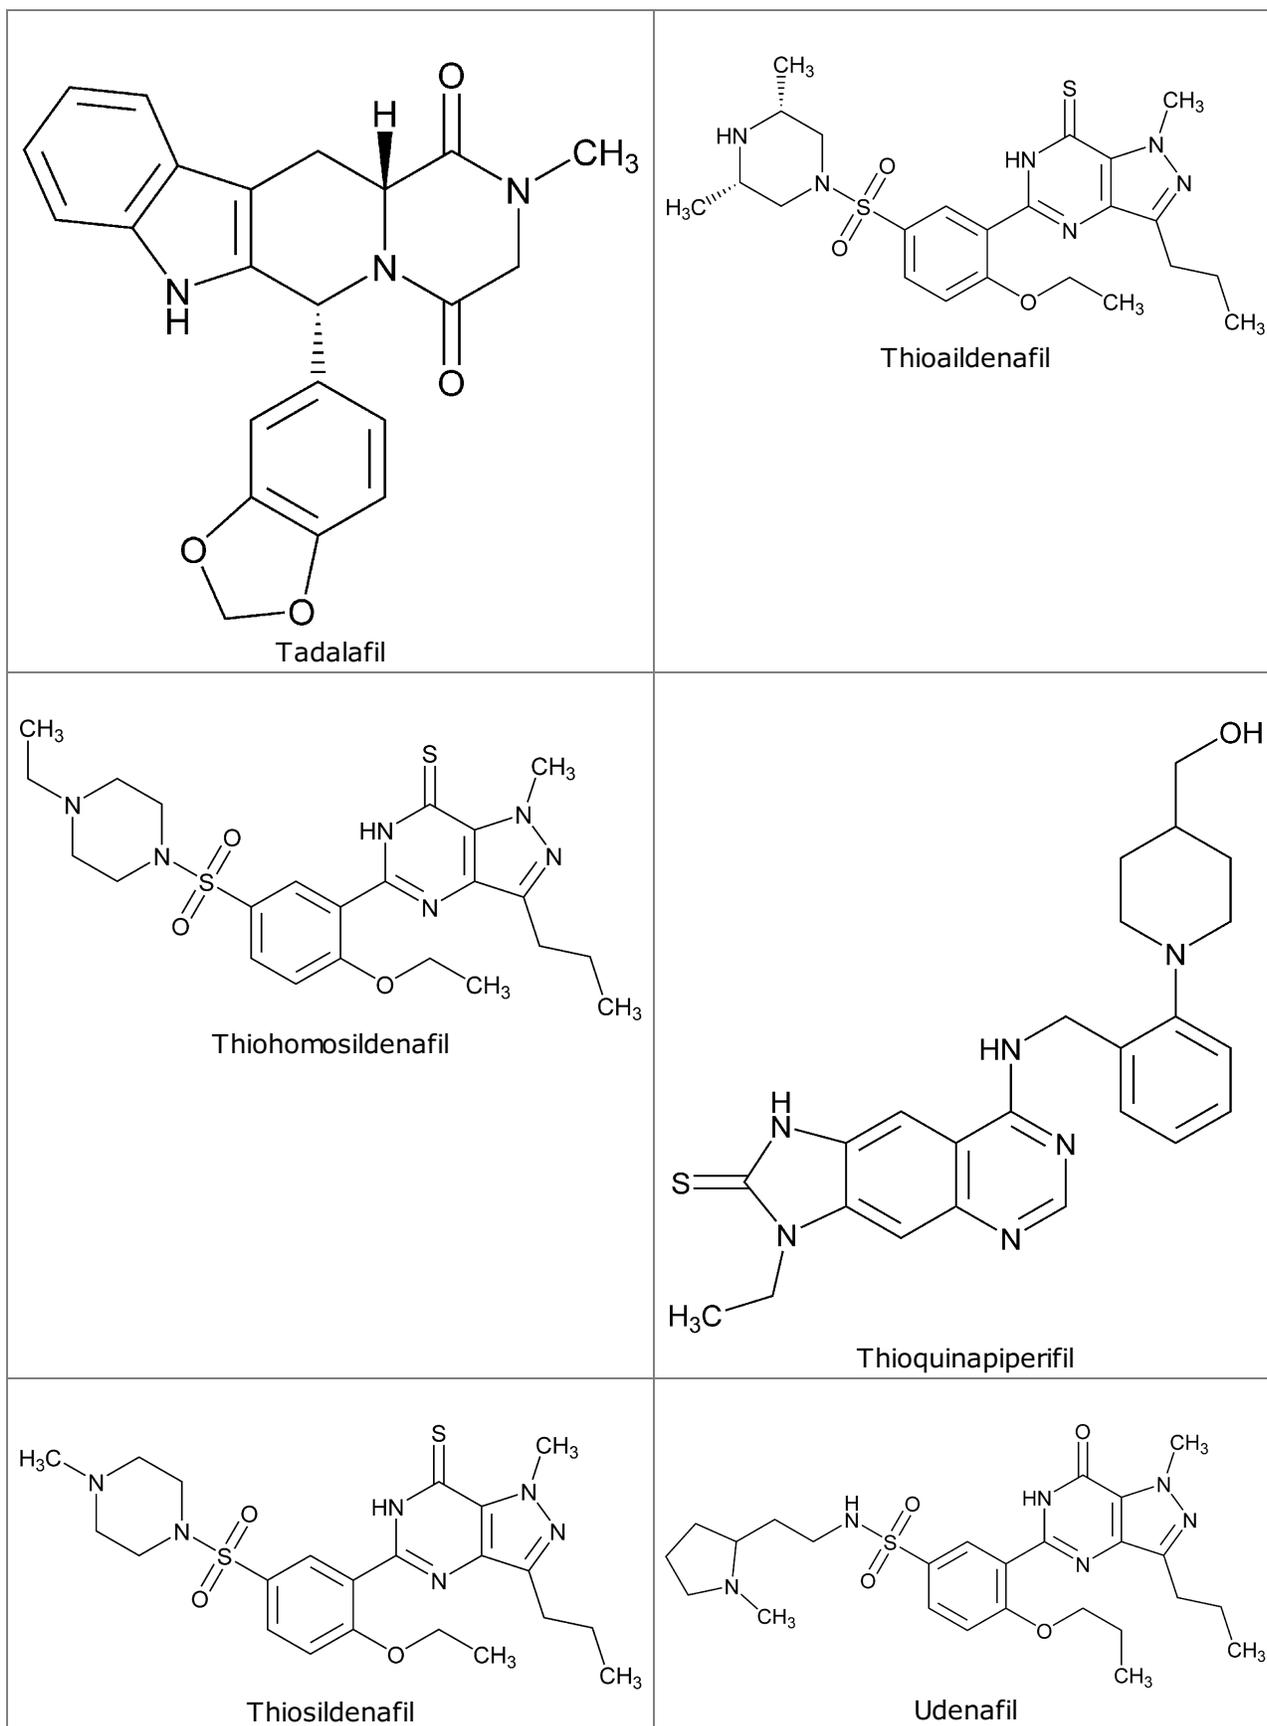

Propoxyphenyl thiohydroxyhomosildenafil

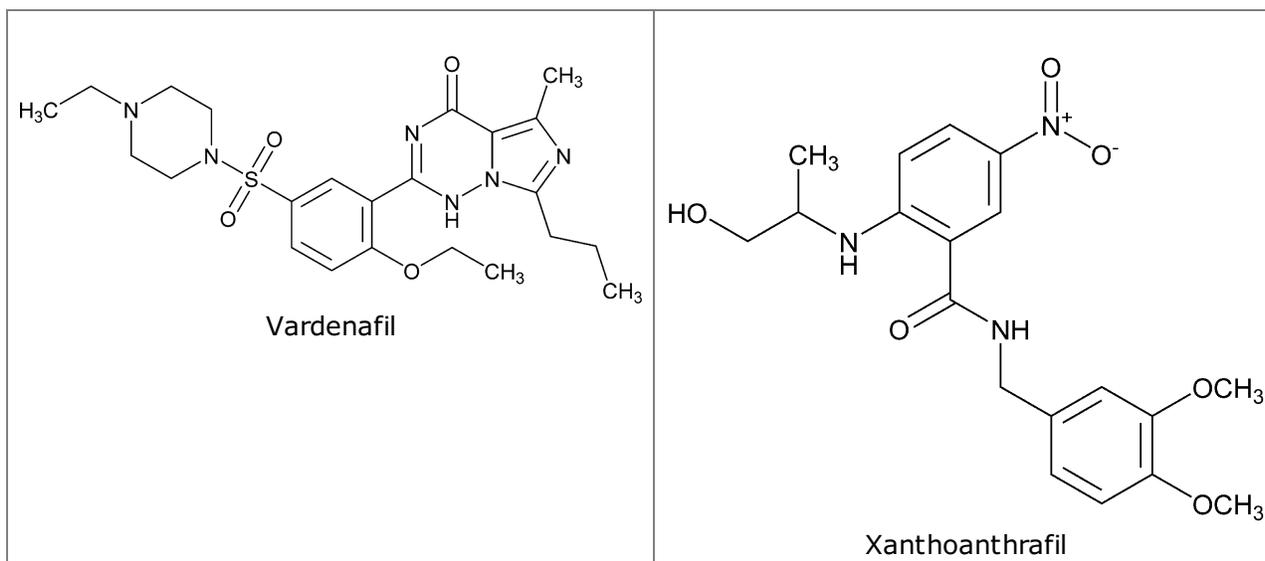

Sildenafil

(*S,R*)-Aminotadalafil

■ 1S (USP39)

¹ In the United States, dietary supplements are defined as substances that are ingested, in agreement with 21 U.S.Code §321(ff)(2)(A)(i). Definitions of dietary supplements, nutritional supplements, functional foods, and bioactive food additives may vary extensively, depending on local or national legislation. In the marketplace, there is a trend toward expanding the mode of delivery of the adulterating compounds to routes not covered by the regulatory definition for dietary supplements, i.e., topical oils, creams, lotions, e-cigarettes, chewing gums, sprays, and others. Such novel delivery systems present unique challenges, particularly from the standpoint of sample preparation, and are not considered for the purposes of this chapter to be dietary supplements. However, recognizing the emerging threat, USP chooses to highlight the existence of these products. In no way should mention of these products be interpreted as a comment on their legal status or be perceived as an expansion of the definition of DS.

² CacheSyn (<http://www.cachesyn.com/>); Santa Cruz Biotechnology, Inc. (<http://www.scbt.com>); TLC Pharmachem (<http://www.tlcpfarmachem.com/>); and Toronto Research Chemicals (<http://www.trc-canada.com/>) are some of the potential sources of rare and hard-to-find adulterant reference materials.

³ The procedure was developed on the Agilent Technologies Zorbax SB-C18 column.

⁴ The procedure was developed on the Agilent Technologies Zorbax SB-C18 column.

⁵ The settings were found appropriate for ThermoElectron LTQ XL Linear Ion Trap Mass Spectrometer. Users will need to optimize their respective instrumentation according to the manufacturer's recommendations.

⁶ 32% Ammonia solution is available from EMD Millipore.

⁷ Procedure was developed using Expression CMS mass spectrometer from Advion, equipped with a TLC-MS interface available from CAMAG. If other mass spectrometers are used, relevant settings will have to be optimized. The bands were directly eluted with a mixture of water and acetonitrile (80:20) containing 0.1% formic acid.

⁸ The procedures were developed using commercial Promega PDE-Glo™ Phosphodiesterase Assay Kit, Catalog # V1361. It includes the following reagents: PDE-Glo™ Reaction Buffer 5X (Catalog # V133A); PDE-Glo™ Detection Buffer 5X (Catalog # V134A); Protein Kinase A Solution (Catalog # V135A); PDE-Glo™ Termination Buffer 5X (Catalog # V136A); cGMP Stock Solution, 1 mM (Catalog # V641A); cAMP, 1 mM (Catalog # V642B); Kinase-Glo™ Substrate (Catalog # V672A); and Kinase-Glo™ Buffer (Catalog # V673A). Kits from alternative suppliers may also be used, e.g., BPS Science, Catalog # 60350, although re-optimization of test procedures will be required.

⁹ The procedures were developed using human phosphodiesterase 5A from BPS Bioscience Catalog # 60050. The enzyme is available from numerous suppliers, e.g., Sigma-Aldrich Catalog # E9034.

¹⁰ Conforming plates are available from Corning (Costar 3912 or Costar 3963), Thermo Scientific (Nunc™ Catalog # 236105), and other vendors.

¹¹ Data contributed by USP collaborators.

¹² Data compiled from published sources.

BRIEFING

2,6-Diaminopyridine. It is proposed to add this new reagent used in the *Organic Impurities* test in the monograph for *Phenazopyridine Hydrochloride*, previously published in PF 41(2) [Mar.–Apr. 2015].

(HDQ: M. Marques.)

Correspondence Number—C132945

Comment deadline: July 31, 2015

Add the following:

■ 2,6-Diaminopyridine, C₅H₇N₃—**109.13** [141-86-6]—Use a suitable grade with a content of NLT 98%.

[Note—A suitable grade is available as catalog number D24404 from www.sigma-aldrich.com.]

■ 1S (USP39)

BRIEFING

Benzethonium Chloride. It is proposed to add this new reagent for the preparation of 0.004 M benzethonium chloride VS used in the Assay for Sodium Lauryl Sulfate, which is posted as a Stage 6 harmonized monograph on www.usp.org.

(HDQ: M. Marques.)

Correspondence Number—C101945

Comment deadline: July 31, 2015

Add the following:

■ Benzethonium Chloride— Use *Benzethonium Chloride* (USP monograph). ■ 1S (USP39)

BRIEFING

Chelating Ion-Exchange Resin. It is proposed to add this new reagent used in the *Impurities, Gla-domainless eptacog alfa (Υ -carboxylation)* test in the monograph for *Eptacog Alfa* published elsewhere in this issue of *PF*.

(HDQ: M. Marques.)

Correspondence Number—C149307

Comment deadline: July 31, 2015

Add the following:

■ Chelating Ion-Exchange Resin—Weak cation-exchange resin composed of styrene divinylbenzene copolymer containing paired iminodiacetate ions, which act as chelating groups in binding polyvalent metal ions. [Note—A suitable grade is available as Chelex® 100 Resin from www.bio-rad.com.] ■ 1S (USP39)

BRIEFING

Benzethonium Chloride, Two Hundred Fiftieth-Molar (0.004 M). This new volumetric solution is used in the *Assay for Sodium Lauryl Sulfate*, which is posted as a Stage 6 harmonized monograph on www.usp.org.

(HDQ: M. Marques.)

Correspondence Number—C101945

Comment deadline: July 31, 2015

Add the following:

■ **Benzethonium Chloride, Two Hundred Fiftieth-Molar (0.004 M)**

$C_{27}H_{42}ClNO_2$ **448.08**

Dissolve 1.792 g of benzethonium chloride, previously dried at 100° – 105° to constant weight, in water to make 1000 mL.

Calculate the molarity of the solution from the content of benzethonium chloride in the dried benzethonium chloride determined as follows. Dissolve 0.350 g of the dried benzethonium chloride in 30 mL of glacial acetic acid and add 6 mL of mercuric acetate TS. Titrate with 0.1 N perchloric acid VS, using 0.05 mL of crystal violet TS as an indicator. Carry out a blank titration. One mL of 0.1 N perchloric acid VS is equivalent to 44.81 mg of benzethonium chloride ($C_{27}H_{42}ClNO_2$). [Note—This solution is commercially available ready to be used. Use a suitable grade.]

■ 1S (USP39)

BRIEFING

L## (Eptacog Alfa, Dionex CarboPac PA100). It is proposed to add this new column packing used in the *Glycan Analysis* test in the monograph for *Eptacog Alfa*, published elsewhere in this issue of *PF*.

(HDQ: M. Marques.)

Correspondence Number—C149307

Comment deadline: July 31, 2015

Add the following:

■ L## (Eptacog Alfa, Dionex CarboPac PA100)—Ethylvinylbenzene/divinylbenzene substrate (55% cross-linked) agglomerated with quaternary amine functionalized 275-nm latex microbeads (6% cross-linked), about 8.5 µm in diameter. ■ 1S (USP39)

BRIEFING

L## (Eptacog Alfa, Dionex DNAPac PA100). It is proposed to add this new column packing used in the test for *GLA-Domainless Eptacog Alpha (γ-Carboxylation)* in the monograph for *Eptacog Alfa*, published elsewhere in this issue of *PF*.

(HDQ: M. Marques.)

Correspondence Number—C149307

Comment deadline: July 31, 2015

Add the following:

■ L## (Eptacog Alfa, Dionex DNAPac PA100)—Sulfonated ethylvinylbenzene/divinylbenzene substrate approximately 12–14 µm in diameter agglomerated with hydrophilic quaternary amine functionalized glycidyl-derivative methacrylate microbeads. ■ 1S (USP39)

BRIEFING

L## (Metoprolol Succinate, Halo Penta-HILIC). It is proposed to add this new column packing used in the test for *Content of Metoprolol Related Compound H and Metoprolol Related Compound I* in the revision to the monograph for *Metoprolol Succinate*, published elsewhere in this issue of *PF*.

(HDQ: M. Marques.)

Correspondence Number—C142873

Comment deadline: July 31, 2015

Add the following:

■ L## (Metoprolol Succinate, Halo Penta-HILIC)—A highly polar alkyl ligand comprising five hydroxyl groups that are chemically bonded to totally porous or superficially porous silica or a monolithic silica rod. ■ 1S (USP39)

BRIEFING

L26, *USP 38* page 1902. It is proposed to expand the description of this column packing to include packings based on superficially porous particles.

Additionally, minor editorial changes have been made to update the packing to current *USP* style.

(HDQ: M. Marques.)

Correspondence Number—C156426

Comment deadline: July 31, 2015

Change to read:

L26—Butyl silane chemically bonded to totally porous

■ or superficially porous ■ 1S (USP39)

silica particles, 1.5–10 µm in diameter.

CONTAINERS FOR DISPENSING CAPSULES AND TABLETS

BRIEFING

Container Specifications for Capsules and Tablets, page 7209 of the *First Supplement to USP 38*.

(HDQ.)

Correspondence Number—C118327; C120789; C127643; C133281

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the *Packaging and Storage* requirements set forth in the individual monographs. It lists the capsules and tablets that are official in the *United States Pharmacopeia* and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive requirements stated in the individual monographs.

Container Specifications for Capsules and Tablets

Monograph Title	Container Specification
Add the following: ■ Abacavir and Lamivudine Tablets	T, LR ■ 1S (USP39)
Delete the following: ■ Oxtriphylline Delayed-Release Tablets	T ■ 1S (USP39)
Add the following: ■ Paricalcitol Capsules	T ■ 1S (USP39)
Add the following: ■ Sildenafil Tablets	W ■ 1S (USP39)

BRIEFING

Description and Relative Solubility of USP and NF Articles, page 7219 of the *First Supplement to USP 38*.

(HDQ.)

Correspondence Number—C145274; C152104

Add the following:

■ **Exemestane:** White to slightly yellow, crystalline powder. Freely soluble in *N,N*-dimethylformamide; soluble in methanol; insoluble in water. ■ 1S (USP39)

Change to read:

Nystatin: ~~Yellow to light tan powder, having an odor suggestive of cereals. Is hygroscopic, and is affected by long exposure to light, heat, and air. Freely soluble in dimethylformamide and in dimethyl sulfoxide; sparingly to slightly soluble in methanol, in *n*-propyl alcohol, and in *n*-butyl alcohol; practically insoluble in water and in alcohol; insoluble in chloroform and in ether.~~

■ Yellow to light tan powder. Is hygroscopic, and is affected by long exposure to light, heat, and air. Freely soluble in dimethylformamide and in dimethyl sulfoxide; very slightly soluble in methanol; practically insoluble or insoluble in water, in alcohol, in *n*-propyl alcohol, in *n*-butyl alcohol, in chloroform, and in ether. ■1S (USP39)

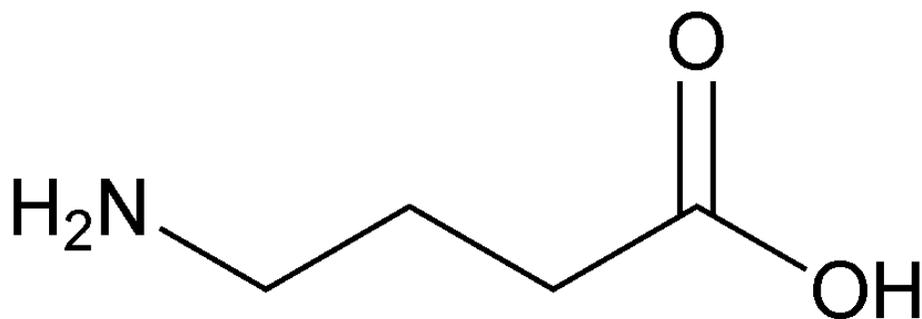

BRIEFING

Gamma-Aminobutyric Acid. Because there is no existing *USP* monograph for this dietary ingredient, a new monograph is being proposed. The liquid chromatographic procedure in the *Assay* and the test for *Related Compounds* is based on analyses performed with the Waters XBridge Amide brand of L68 column. Typical retention times for gamma-aminobutyric acid and monosodium glutamate are 7.2 and 8.7 min, respectively.

(DS: H. Dinh.)

Correspondence Number—C135182

Comment deadline: July 31, 2015

Add the following:■ **Gamma-Aminobutyric Acid**

C₄H₉NO₂ 103.12

4-Aminobutanoic acid [56-12-2].

DEFINITION

Gamma-Aminobutyric Acid contains NLT 98.0% and NMT 102.0% of gamma-aminobutyric acid (C₄H₉NO₂), calculated on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption** { 197K }
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **Procedure**

Buffer solution: 20 mM monobasic sodium phosphate. Adjust with 1 N sodium hydroxide to a pH of 5.5.

Mobile phase: Acetonitrile and *Buffer solution* (78:22)

Diluent: Acetonitrile and water (60:40)

System suitability solution: 1 mg/mL of USP Gamma-Aminobutyric Acid RS and 0.1 mg/mL of monosodium glutamate in *Diluent*

Standard solution: 1 mg/mL of USP Gamma-Aminobutyric Acid RS in *Diluent*

Sample solution: 1 mg/mL of Gamma-Aminobutyric Acid in *Diluent*

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.6-mm × 15-cm; 3.5-μm packing L68

Column temperature: 35°

Flow rate: 1.5 mL/min

Injection volume: 20 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for gamma-aminobutyric acid and monosodium glutamate are 1.0 and 1.2, respectively.]

Suitability requirements

Resolution: NLT 2.0 between gamma-aminobutyric acid and monosodium glutamate, *System suitability solution*

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of gamma-aminobutyric acid (C₄H₉NO₂) in the portion of Gamma-Aminobutyric Acid taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Gamma-Aminobutyric Acid RS in the *Standard solution* (mg/mL)

C_U = concentration of Gamma-Aminobutyric Acid in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

• **Residue on Ignition** 〈 281 〉: NMT 0.1%

• **Chloride and Sulfate** 〈 221 〉, *Chloride*

Standard solution: 0.50 mL of 0.020 N hydrochloric acid

Sample: 0.73 g

Acceptance criteria: NMT 0.05%

- **Chloride and Sulfate** 〈 221 〉, *Sulfate*

Standard solution: 0.10 mL of 0.020 N sulfuric acid

Sample: 0.33 g

Acceptance criteria: NMT 0.03%

- **Related Compounds**

Mobile phase, Diluent, System suitability solution, Chromatographic system, and

System suitability: Proceed as directed in the *Assay*.

Sample solution: 10 mg/mL of Gamma-Aminobutyric Acid in *Diluent*

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Gamma-Aminobutyric Acid taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U peak response of each impurity from the *Sample solution*

r_T sum of the peak responses of all the peaks from the *Sample solution*

Acceptance criteria

Individual impurity: NMT 0.5%

Total impurities: NMT 2.0%

SPECIFIC TESTS

- **pH** 〈 791 〉

Sample solution: 20 mg/mL in water

Acceptance criteria: 6.5–7.5

- **Loss on Drying** 〈 731 〉

Analysis: Dry at 105° for 3 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight, light-resistant containers.

- **USP Reference Standards** 〈 11 〉

USP Gamma-Aminobutyric Acid RS

■ 1S (USP39)

BRIEFING

Glutathione, *USP 38* page 6080. Based on comments received, it is proposed to add a procedure for preparing *Silver manganese paper* to the test for *Ammonium*.

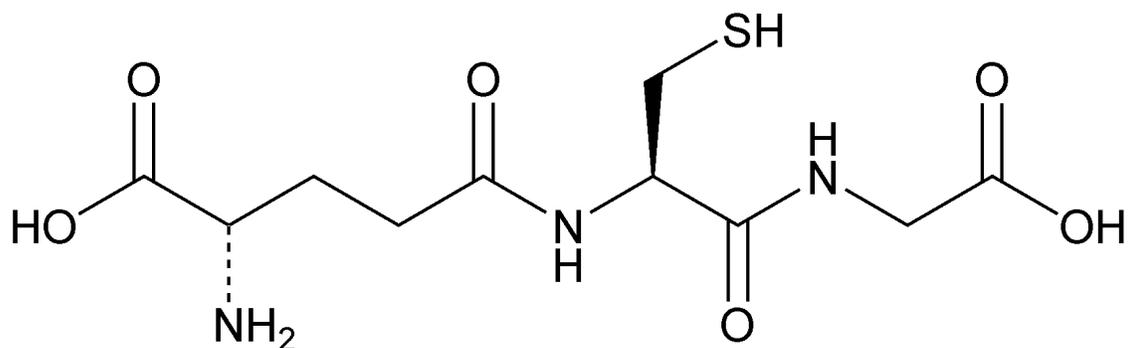

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(DS: H. Dinh.)

Correspondence Number—C157933

Comment deadline: July 31, 2015

Glutathione

$C_{10}H_{17}N_3O_6S$ 307.32

Pentanoic acid, 2-amino-5-[(*R*)-1-(carboxymethylamino)-3-mercapto-1-oxopropan-2-ylamino]-5-oxo, (*S*);

N-(*N*-L-γ-Glutamyl-L-cysteinyl)glycine [70-18-8].

DEFINITION

Glutathione contains NLT 98.0% and NMT 101.0% of glutathione ($C_{10}H_{17}N_3O_6S$), calculated on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption** 〈 197K 〉
- **B. Optical Rotation, Specific Rotation** 〈 781S 〉
Sample solution: 40 mg/mL in water
Acceptance criteria: -15.5° to -17.5° , at 20°

ASSAY

• Procedure

Sample: 500 mg of Glutathione previously dried

Blank: 50 mL of metaphosphoric acid (1 in 50)

Titrimetric system

(See *Titrimetry* 〈 541 〉.)

Mode: Direct titration

Titrant: 0.1 N iodine VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 50 mL of metaphosphoric acid (1 in 50) and titrate with the *Titrant*.

Calculate the percentage of glutathione ($C_{10}H_{17}N_3O_6S$) in the portion of Glutathione taken:

$$\text{Result} = [(V_U - V_B) \times N \times F \times 100] / W$$

V_U titrant volume of the *Sample* (mL)

V_B = titrant volume of the *Blank* (mL)
 N = titrant normality (mEq/mL)
 F = equivalency factor, 307.32 mg/mEq
 W = weight of the *Sample* (mg)

Acceptance criteria: 98.0%–101.0% on the dried basis

IMPURITIES

Change to read:

• Ammonium

Standard solution: 10 µg of ammonium from a diluted ammonium chloride solution

Sample solution: 50 mg of Glutathione

■ **Silver manganese paper:** Immerse strips of slow filter paper (Whatman® filter paper, grade 5 or equivalent) into a solution containing 8.5 mg/mL of manganese sulfate and 8.5 mg/mL of silver nitrate. Maintain for a few minutes and allow to dry over phosphorus pentoxide protected from acid and alkaline vapors. ■1S (USP39)

Analysis: Transfer the *Sample solution* and the *Standard solution* to separate 25-mL jars fitted with caps, and dissolve in 1 mL of water. Add 0.30 g of magnesium oxide. Close immediately after placing a 5-mm square piece of *Silver manganese paper*, wetted with a few drops of water, under the caps. Swirl, avoiding projections of liquid, and allow to stand at 40° for 30 min.

Acceptance criteria: If the *Silver manganese paper* shows a gray color, it is not more intense than that of the Standard (NMT 200 ppm).

- **Arsenic** 〈 211 〉: NMT 2 ppm
- **Chloride and Sulfate, Chloride** 〈 221 〉: Dissolve 0.7 g in water to make 15 mL. The solution shows no more chloride than corresponds to 0.20 mL of 0.020 N hydrochloric acid (NMT 200 ppm).
- **Chloride and Sulfate, Sulfate** 〈 221 〉: Dissolve 0.8 g in water to make 15 mL. The solution shows no more sulfate than corresponds to 0.25 mL of 0.020 N sulfuric acid (NMT 300 ppm).
- **Iron** 〈 241 〉: NMT 10 ppm
- **Residue on Ignition** 〈 281 〉: NMT 0.1%

Delete the following:

• **Heavy Metals, Method I** 〈 231 〉: NMT 10 ppm • (Official 1-Dec-2015)

- **Residue on Ignition** 〈 281 〉: NMT 0.1%
- **Related Compounds**

Mobile phase: 6.8 g/L of potassium dihydrogen phosphate with 2.02 g/L of sodium 1-heptane sulfonate. Adjust with phosphoric acid to a pH of 3.0. Mix 970 mL of this solution with 30 mL of methanol.

System suitability solution: 0.1 mg/mL of USP L-Phenylalanine RS, 0.5 mg/mL of USP Glutathione RS, and 0.5 mg/mL of USP Ascorbic Acid RS in *Mobile phase*

Standard solution: 0.01 mg/mL of USP Glutathione RS in *Mobile phase*. [Note—This solution has a concentration equivalent to 2.0% of that of the *Sample solution*.]

Sample solution: 50 mg of Glutathione in 100 mL of *Mobile phase*. [Note—Allow the solution to stand for 5 min before use.]

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Column temperature: 30°

Flow rate: Adjust so that the retention time of glutathione is about 5 min.

Injection volume: 10 μL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 5.0 between the ascorbic acid and glutathione peaks; and NLT 5.0 between the glutathione and l-phenylalanine peaks

Relative standard deviation: NMT 1.5% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of any impurity in the portion of Glutathione taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of any peak from the *Sample solution* other than glutathione

r_S peak response of the glutathione peak from the *Standard solution*

C_S concentration of USP Glutathione RS in the *Standard solution* (mg/mL)

C_U concentration of Glutathione in the *Sample solution* (mg/mL)

Acceptance criteria

Individual impurity: NMT 1.5% for the impurity with the relative retention time of about 4

Total impurities: NMT 2.0%

SPECIFIC TESTS

• Clarity and Color of Solution

Sample solution: 0.1 g/mL in water

Analysis: Using identical tubes of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm, compare the liquid to be examined with water, the depth of the layer being 40 mm. Compare the colors in diffused daylight, viewing vertically against a white background.

Acceptance criteria: The solution is clear and colorless.

• Loss on Drying 〈 731 〉

Analysis: Dry at 105° for 3 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers.
- **USP Reference Standards** { 11 }
 - USP Ascorbic Acid RS
 - USP Glutathione RS
 - USP L-Phenylalanine RS

BRIEFING

Krill Oil Capsules, *USP 38* page 6118. On the basis of comments received and to be consistent with the recent revision of the *Krill Oil* monograph published in *PF 41(2)* [Mar.–Apr. 2015], the following changes are proposed:

1. Add the content of myristic acid and palmitic acid and the ratio of palmitic acid to myristic acid content to *Table 1* of the *Fatty Acid Profile* in the *Identification* section.
2. Change the upper limits and lower limits for several fatty acids listed in *Table 1* to reflect new data recently received.
3. Change the range of total phospholipids content from 28%–52% to 30%–55% and the range of phosphatidylcholine from 60%–90% (w/w) to 60%–96% (w/w) of the total phospholipids content in the *Acceptance criteria* for the *Content of Total Phospholipids* test.
4. Change the range of phosphatidylcholine from 60%–90% (w/w) to 60%–96% (w/w) of the total phospholipids content in *Identification* test *B—Phospholipid Profile*.
5. Add a table of molecular weight values and approximate chemical shift values (in reference to triphenyl phosphate) for the phospholipids of importance to krill oil analysis in the test for *Total Phospholipids* in order to clarify the proper use of the NMR data obtained. The values proposed are based on data and comments received. Also, equations are included for the calculations required by this test.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(DS: N. Davydova.)

Correspondence Number—C157669

Comment deadline: July 31, 2015

Krill Oil Capsules**DEFINITION**

Krill Oil Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of Krill Oil where Krill Oil is the fixed oil extracted from Antarctic krill (*Euphausia superba* Dana) biomass by using a suitable extraction solvent.

IDENTIFICATION**Change to read:**

- **A. Fatty Acid Profile**

Antioxidant solution, System suitability solution 1, and Chromatographic system:

Proceed as directed in *Fats and Fixed Oils* { 401 }, *Omega-3 Fatty Acids Determination*

and Profile.

Standard solution: Proceed as directed for *Test Solution 1* in *Fats and Fixed Oils* (401), *Omega-3 Fatty Acids Determination and Profile*, except use 250 mg of USP Krill Oil RS.

Sample solution: Using the portion of oil from NLT 10 Capsules, proceed as directed for *Test Solution 1* in *Fats and Fixed Oils* (401), *Omega-3 Fatty Acids Determination and Profile*.

System suitability

Samples: *System suitability solution 1* and *Standard solution*

Suitability requirements

Chromatogram similarity: The chromatogram from the *Standard solution* is similar to the reference chromatogram provided with the lot of USP Krill Oil RS being used.

Resolution: NLT 1.0 between the methyl oleate and methyl *cis*-vaccinate peaks, *Standard solution*

Theoretical area percentages: Meet the requirements for *System suitability solution 1*

Analysis

Sample: *Sample solution*

Identify the retention times of the relevant fatty acid methyl esters in the *Sample solution* by comparing the chromatogram of the *Sample solution* with that of the *Standard solution* and the USP reference chromatogram.

Calculate the area percentage for each fatty acid as methyl esters in the portion of oil taken from the Capsules:

$$\text{Result} = (r_A/r_B) \times 100$$

r_A peak area of each individual fatty acid from the *Sample solution*

r_B total area of all peaks, except the solvent and butylated hydroxytoluene peaks, from the *Sample solution*

Acceptance criteria: See *Table 1*.

Table 1

Fatty Acid	Short-Hand Notation	Lower Limit (Area %)	Upper Limit (Area %)
■ Saturated fatty acids			
Myristic acid	14:0	6.4	13.0
Palmitic acid	16:0	17.0	24.6
Palmitic acid: myristic acid ratio	16:0/14:0	1.6	2.8 ■ 1S (USP39)
■ Monounsaturated fatty acids			
Palmitoleic acid	16:1 n-7	2.5	9.0
			7.0
<i>cis</i> -Vaccenic acid	18:1 n-7	4.7	■ 8.0 ■ 1S (USP39)
Oleic acid	18:1 n-9	7.0	14.5
			1.2
Eicosenic acid	20:1 n-9	0.1	■ 1.7 ■ 1S (USP39)

Fatty Acid	Short-Hand Notation	Lower Limit (Area %)	Upper Limit (Area %)
Erucic acid	22:1 n-9	0.0	0.9 ■ 1.3 ■ 1S (USP39)
Polyunsaturated fatty acids			
Linoleic acid	18:2 n-6	1.4	3.0

Change to read:

- **B. Phospholipid Profile**

Solution A, Line shape standard (¹H), Sensitivity standard (¹H), Sensitivity standard (³¹P), Internal standard, Sample solution, Standard solution, Instrumental conditions, System suitability, and Analysis: Proceed as directed in the test for *Content of Total Phospholipids in Strength*.

Acceptance criteria: The *Sample solution* contains all of the following phospholipids: phosphatidylcholine (60%–90%

■ 96% ■ 1S (USP39)

(w/w) of the total phospholipids content), lysophosphatidylcholine, (~~as a mixture of 1-lysophosphatidylcholine and 2-lysophosphatidylcholine~~);

■ 1S (USP39)

and phosphatidylethanolamine.

STRENGTH

- **Content of Krill Oil**

Analysis: Weigh NLT 10 Capsules in a tared weighing bottle, and carefully open the Capsules, without loss of shell material. Transfer the combined Capsule contents to a 100-mL beaker. Remove any adhering substance from the emptied Capsules by washing with several small portions of 2,2,4-trimethylpentane. Discard the washings, and allow the empty Capsules to dry in a current of dry air until the 2,2,4-trimethylpentane is completely evaporated. Weigh the empty Capsules in the original tared weighing bottle, and calculate the average net weight per Capsule.

Acceptance criteria: 95.0%–105.0%

- **Content of EPA and DHA**

Standard solution 1a, Standard solution 1b, Standard solution 2a, Standard solution 2b, System suitability solution 1, and Chromatographic system: Proceed as directed

in *Fats and Fixed Oils* { 401 }, *Omega-3 Fatty Acids Determination and Profile*.

Test solution 1: Using the portion of 250 mg of oil from NLT 10 Capsules, proceed as directed for *Test solution 1* in *Fats and Fixed Oils* { 401 }, *Omega-3 Fatty Acids Determination and Profile*.

Test solution 2: Using the portion of 250 mg of oil from NLT 10 Capsules, proceed as directed for *Test solution 2* in *Fats and Fixed Oils* { 401 }, *Omega-3 Fatty Acids Determination and Profile*.

Analysis: Proceed as directed for *Analysis (for triglycerides)* in *Fats and Fixed Oils* { 401 }, *Omega-3 Fatty Acids Determination and Profile*.

Calculate the percentage of EPA and DHA in the portion of oil taken from the Capsules.

Acceptance criteria: NLT 10.0% (w/w) of EPA and NLT 5.0% (w/w) of DHA

Change to read:

• **Content of Total Phospholipids**

(See *Nuclear Magnetic Resonance Spectroscopy* { 761 }, *Qualitative and Quantitative NMR Analysis*.)

[Note—All deuterated solvents used in this method should be NLT 99.8 atom % D. Whenever water is used in this method, it should be of sufficient quality to ensure that no trace metals or other contaminants that may affect the analysis are present.]

Solution A: 0.2 M EDTA adjusted with a 1 M cesium carbonate solution to a pH of 7.2–7.5. Document the final pH and the amount of 1 M cesium carbonate solution necessary to attain the desired pH. [Note—Use cesium carbonate of a sufficient grade for trace metals analysis.]

Line shape standard (¹H): 1% Chloroform in acetone-d₆

Sensitivity standard (¹H): 0.1% Ethylbenzene in chloroform-d

Sensitivity standard (³¹P): 0.0485 M triphenyl phosphate in acetone-d₆

Internal standard: Use triphenyl phosphate NMR reference standard with NLT 99% purity.

Sample solution: [Note—NMR solvents containing tetramethylsilane (TMS) are readily available. If the solvents used do not contain TMS, it must be added to the *Sample solution* at an approximate concentration of 0.05% (v/v) for use as a chemical shift scale reference.] Transfer the portion of 300–350 mg of oil from NLT 10 Capsules to a 5-mL sealable glass vial. Add 25.0 mg of the *Internal standard* to the vial. Add 1 mL each of deuterated chloroform (chloroform-d) and deuterated methanol (methanol-d₄) of a grade suitable for NMR analysis to the vial to dissolve the sample. Once dissolution is complete, add 1 mL of *Solution A*, seal the vial, shake the solution for 10–20 min, then centrifuge the contents of the vial. Transfer the lower organic phase to an appropriate NMR tube. It is critical to collect the entire organic phase and transfer it to the NMR tube. It may be unavoidable to also transfer small amounts of the aqueous phase when collecting the organic phase in the NMR tube. This is an acceptable practice, so long as the aqueous phase remains completely separated and atop the organic phase in the NMR tube. The entire amount of aqueous phase must be above the probe's radio frequency (RF) coil (outside the analysis area of the tube). Should the organic phase contain undissolved materials, they must remain suspended at the aqueous-organic interface and be outside the analysis area of the tube as well. The organic phase must be free of bubbles and suspended materials that may interfere with NMR data acquisition.

Standard solution: Proceed as directed in the *Sample solution*, except use 300–350 mg of

USP Krill Oil RS.

Instrumental conditions

(See 〈 761 〉.)

Magnetic field strength: NLT 300 MHz for ^1H frequency

Probe: Direct observe probe capable of tuning to the resonance frequency of ^{31}P (dependent on the specific magnetic field strength used)

Instrument performance qualification

[Note—Testing for sensitivity and line shape should be performed on the interval specified by the manufacturer of the instrument used. Performing these tests on a minimum of a monthly basis is required for this method, but it may be done more often, as required. Resolution testing is to be performed during each analysis and documented as a part of the analytical results.]

^1H Line shape test: Using the *Line shape standard* (^1H) and the protocol recommended by the instrument manufacturer, the instrument must achieve the line shape specifications for the probe in use, as required by the instrument manufacturer. [Note—A different standard solution may be required or recommended by the manufacturer of the instrument; 1% chloroform in acetone- d_6 is most commonly used.]

^1H Sensitivity test: Using the *Sensitivity standard* (^1H) and the protocol recommended by the instrument manufacturer, the instrument must achieve the sensitivity specifications required by the instrument manufacturer. [Note—A different standard solution may be required or recommended by the manufacturer of the instrument; 0.1% ethylbenzene in chloroform- d is most commonly used.]

^{31}P Sensitivity test: Using the *Sensitivity standard* (^{31}P) and the protocol recommended by the instrument manufacturer, the instrument must achieve the sensitivity specifications required by the instrument manufacturer. [Note—A different standard solution may be required or recommended by the manufacturer of the instrument; 0.0485 M triphenyl phosphate in acetone- d_6 is most commonly used.]

^1H Resolution test: The resolution is demonstrated by the ability to detect both of the ^{29}Si satellite signals of TMS. The satellites must be resolved from the TMS signal in the spectrum with a line-broadening factor of NMT 0.5 ppm.

^{31}P Resolution test: The resolution is demonstrated using the phosphatidylcholine ether peak and the phosphatidylcholine peak. The separation of these peaks (with an applied line-broadening factor of 1.0) must be demonstrated as follows. Using the baseline as a reference, determine the total peak height of the phosphatidylcholine ether peak,

■ [Note—The PC ether signal appears just downfield from the PC signal.] ■ 1S (USP39)

and draw a line at 30% of that total peak height (intensity). The phosphatidylcholine ether peak and the neighboring phosphatidylcholine peak must be fully resolved at a point that is NMT 30% of the peak height of the phosphatidylcholine ether peak.

Data collection: Use the parameters specified in *Table 2*. Use 90 degree pulses, and calibrate pulses before use according to the recommendations supplied by the instrument manufacturer.

Table 2

Parameter	³¹ P NMR Quantitative Measurement	¹ H NMR Qualitative Measurement
Pulse program	¹ H-decoupled ³¹ P ■ (inverse gated) ■ 1S (USP39)	Single pulse ¹ H
Spectral width	50 ppm (25 to -25 ppm)	20 ppm (-3 to 17 ppm)
Transmitter offset	Center of spectral width, 0 ppm	Center of spectral width, 7 ppm
Relaxation delay	2-5 s ■ 5-15 s ■ 1S (USP39)	2-5 s
Acquisition time	1-6 s	1-6 s
Sum of relaxation delay and acquisition time	NLT 15 s	NLT 15 s ■ 1S (USP39)
Size of data set	NLT 64k (32k with zero-filling)	NLT 64k (32k with zero-filling)

[Note—The acquisition time is dependent upon the field strength and the time domain

■ the dwell time and the number of data points collected. ■ 1S (USP39)

The number of scans acquired using a 300-MHz instrument must be NLT 512.]

System suitability: Under the conditions outlined in *Data collection*, the ³¹P NMR signal of triphenyl phosphate should be observed at -17.80 ppm, and the ¹H NMR spectrum should be referenced to the ¹H signal of TMS (0 ppm) for all spectra acquired in the *Analysis*. For quantitative analysis, a sufficient number of scans should be acquired such that the signal-to-noise ratio for the phosphatidylcholine signal in the ³¹P spectrum of the *Sample solution* acquired in the *Analysis* is NLT 2000.

Analysis: Acquire the data outlined in *Data collection*. Minimally acquire the ¹H spectrum (fingerprint) of the *Sample solution* and the *Standard solution* as well as the quantitative ³¹P spectrum of the *Sample solution* and the *Standard solution*. Record the resulting spectra, and perform integration by hand or automated means on the quantitative ³¹P NMR spectrum of the *Sample solution*. The integration of the peaks in the spectrum of the *Sample solution* must be performed such that the complete set of phospholipid peaks (as identified by a comparison to the spectrum of the *Standard solution* and the *Standard solution* reference spectrum) is included in the integration. The integration region for each signal must extend ±0.05 ppm on either side of the ³¹P signal. Quantify the total phospholipids present, the phosphatidylcholine ether content, and the phosphatidylcholine content in the *Sample solution* by using a comparison to the concentration of the *Internal standard*.

Compare the ¹H spectrum of the *Sample solution* to that of the *Standard solution* to determine the similarity of fingerprints according to which phospholipids identified in the reference spectrum of the *Standard solution* are present in the spectrum of the *Sample solution*.

■ **Calculations:** Use the following equations and molecular weights listed in *Table 3* to determine the phospholipids content in the sample taken:

$$\text{mmol}_{IS} = (W_{IS} \times C_{IS}) / (MW_{IS} \times 100)$$

mmol_{IS}

= millimoles of the *Internal standard* in the *Sample solution* (mmol)

W_{IS}

= weight of the *Internal standard* added to the *Sample solution* (mg)

C_{IS}

= purity value of the *Internal standard*, based on quantitative ^{31}P NMR analysis (% by weight)

MW_{IS}

= molecular weight of the *Internal standard* (326.28 g/mol for triphenyl phosphate)

$$\text{mmol}_{PL} = (I_{PL} \times A_{IS} \times \text{mmol}_{IS}) / (I_{IS} \times A_{PL})$$

mmol_{PL} = millimoles of the phospholipid of interest in the *Sample solution* (mmol)

I_{PL} = integrated area under the phospholipid signal of interest obtained from the spectrum of the *Sample solution*

A_{IS} = number of phosphorus atoms per molecule expected from the *Internal standard* (1 for triphenyl phosphate)

mmol_{IS} = millimoles of the *Internal standard* in the *Sample solution*

I_{IS} = integrated area under the *Internal standard* obtained from the spectrum of the *Sample solution*

A_{PL} = number of phosphorus atoms per molecule expected from the phospholipid of interest (1 for any phospholipid listed in *Table 3*)

$$C_{PL} = (MW_{PL} \times \text{mmol}_{PL} \times 100) / W_S$$

C_{PL} = concentration of the phospholipid of interest in the *Sample solution* (% w/w)

MW_{PL} = molecular weight of the phospholipid of interest (g/mol, from *Table 3*) in the *Sample solution* (mg)

mmol_{PL} = millimoles of the phospholipid of interest in the *Sample solution* (mmol)

W_S = weight of sample present in the *Sample solution* (mg)

[Note—Use the molecular weight specified in *Table 3* for the calculations.]

Table 3

Component	Approximate Chemical Shift (ppm) in Reference to Triphenyl Phosphate	Molecular Weight (g/mol)
Triphenyl phosphate (<i>Internal standard</i>)	-17.8	—
Phosphatidylcholine (PC)	-0.89	791
1-Lysophosphatidylcholine (1-LPC) ^a	-0.48	534.5
2-Lysophosphatidylcholine (2-LPC) ^a	-0.4	534.5
Phosphatidylethanolamine (PE)	-0.24	770
<i>N</i> -Acylphosphatidylethanolamine (NAPE)	0	1032
Lysophosphatidylethanolamine (LPE)	0.25	492.5
Other	—	800

^a Ability to resolve the signals of 1-lysophosphatidylcholine and 2-lysophosphatidylcholine will depend upon the applied magnetic field strength of the NMR spectrometer used for the test procedure.

■ 30%–55% ■ 1S (USP39)

Phosphatidylcholine: 60%–90%

■ 96% ■ 1S (USP39)

(w/w) of the total phospholipids content

● Content of Astaxanthin

[Note—Perform this analysis in subdued light using low-actinic glassware.]

Sample solution: 0.005 g/mL in chloroform using the portion of oil from NLT 10 Capsules.

[Note—If the solution is not clear, centrifuge it with an appropriate centrifuge to obtain a clear supernatant.]

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* ⟨ 851 ⟩ .)

Analytical wavelength: 486 nm

Cell path: 1 cm

Blank: Chloroform

Analysis

Sample: *Sample solution*

Calculate the percentage of astaxanthin in the portion of oil taken from the Capsules:

$$\text{Result} = A/(F \times C)$$

A = absorbance of the *Sample solution*

F = coefficient of extinction ($E_{1\%}^1$) of pure astaxanthin in chloroform ($100 \text{ mL} \cdot \text{g}^{-1} \cdot \text{cm}^{-1}$),
1692
 C = concentration of the *Sample solution* (g/mL)

Acceptance criteria: NLT 0.01%

PERFORMANCE TESTS

- **Disintegration and Dissolution** 〈 2040 〉, *Rupture Test for Soft Shell Capsules*: Meet the requirements
- **Weight Variation** 〈 2091 〉: Meet the requirements

CONTAMINANTS

• **Limit of Dioxins, Furans, and Polychlorinated Biphenyls**

Analysis: Determine the content of polychlorinated dibenzo-para-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs) by Method 1613, Revision B, of the Environmental Protection Agency. Determine the content of polychlorinated biphenyls (PCBs) by Method 1668, Revision A, of the Environmental Protection Agency.

Acceptance criteria: The sum of PCDDs and PCDFs is NMT 2.0 pg/g of World Health Organization (WHO) toxic equivalents. The sum of PCDDs, PCDFs, and dioxin-like PCBs (polychlorinated biphenyls; non-ortho IUPAC congeners PCB-77, PCB-81, PCB-126, and PCB-169; and mono-ortho IUPAC congeners PCB-105, PCB-114, PCB-118, PCB-123, PCB-156, PCB-157, PCB-167, and PCB-189) is NMT 10.0 pg/g of WHO toxic equivalents.

- **Microbial Enumeration Tests** 〈 2021 〉: The total aerobic microbial count does not exceed 10^3 cfu/g, and the combined molds and yeasts count does not exceed 10^2 cfu/g.
- **Absence of Specified Microorganisms** 〈 2022 〉: Meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

SPECIFIC TESTS

• **Astaxanthin Esterification**

Standard solution A: 10 mg/mL of USP Astaxanthin Esters from *Haematococcus pluvialis* RS in acetone

Standard solution B: 10 mg/mL of USP Astaxanthin (Synthetic) RS in acetone

Sample solution: Using the portion of oil from NLT 10 Capsules, prepare a solution of 250 mg/mL in acetone.

Chromatographic system

(See *Chromatography* 〈 621 〉, *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel. [Note—Dry silica gel at 110° for 1 h before use.]

Application volume: 5 μL

Developing solvent system: Hexane and acetone (70:30)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatogram in the *Developing solvent system* until the solvent front has

moved about 15 cm of the length of the plate. Remove the plate from the chamber, and allow to dry.

Acceptance criteria: The principal spot of *Standard solution B*, located in the bottom half of the plate, is free astaxanthin. The *Sample solution* may exhibit a light, minor spot in the same location. The principal spots of *Standard solution A* are from monoesters (primary spot, located slightly above the middle of the plate) and diesters (secondary spot, located in the top third of the plate). The principal spot of the *Sample solution* should correspond in color and R_F value to the diester spot of *Standard solution A*. The secondary spot of the *Sample solution* should correspond in color and approximately the same R_F value to the monoester spot of *Standard solution A*. [Note—Slight differences in R_F values within monoester spots and within diester spots may exist because of different intensities.]

- **Fats and Fixed Oils** 〈 401 〉, *Peroxide Value*: NMT 5.0 mEq peroxide/kg

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers, and store at room temperature. Protect from light.
- **Labeling:** The label states the amount of docosahexaenoic acid (DHA), eicosapentaenoic acid (EPA), total phospholipids, and astaxanthin.
- **USP Reference Standards** 〈 11 〉
 - USP Astaxanthin Esters from *Haematococcus pluvialis* RS
 - USP Astaxanthin (Synthetic) RS
 - USP Docosahexaenoic Acid Ethyl Ester RS
 - USP Eicosapentaenoic Acid Ethyl Ester RS
 - USP Krill Oil RS
 - USP Methyl Tricosanoate RS

BRIEFING

Krill Oil Delayed-Release Capsules, *USP 38* page 6121. On the basis of comments received and to be consistent with the recent revision to the *Krill Oil* monograph published in *PF 41(2)* [Mar.–Apr. 2015], the following changes are proposed:

1. Add the content of myristic acid and palmitic acid and the ratio of palmitic acid to myristic acid content to *Table 1* of the *Fatty Acid Profile* in the *Identification* section.
2. Change the upper limits and lower limits for several fatty acids listed in *Table 1* to reflect new data recently received.
3. Change the range of total phospholipids content from 28%–52% to 30%–55% and the range of phosphatidylcholine from 60%–90% (w/w) to 60%–96% (w/w) of the total phospholipids content in the *Acceptance criteria* for the *Content of Total Phospholipids* test.
4. Change the range of phosphatidylcholine from 60%–90% (w/w) to 60%–96% (w/w) of the total phospholipids content in *Identification* test *B—Phospholipid Profile*.
5. Add a table of molecular weight values and approximate chemical shift values (in reference to triphenyl phosphate) for the phospholipids of importance to krill oil analysis in the test for *Total Phospholipids* in order to clarify the proper use of the NMR data obtained. The values proposed are based on data and comments received. Also, equations are included for the calculations required by this test.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Comment deadline: July 31, 2015

Krill Oil Delayed-Release Capsules

DEFINITION

Krill Oil Delayed-Release Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of Krill Oil where Krill Oil is the fixed oil extracted from Antarctic krill (*Euphausia superba* Dana) biomass by using a suitable extraction solvent.

IDENTIFICATION

Change to read:

- **A. Fatty Acid Profile**

Antioxidant solution, System suitability solution 1, and Chromatographic system:

Proceed as directed in *Fats and Fixed Oils* 〈401〉, *Omega-3 Fatty Acids Determination and Profile*.

Standard solution: Proceed as directed for *Test Solution 1* in *Fats and Fixed Oils* 〈401〉, *Omega-3 Fatty Acids Determination and Profile*, except use 250 mg of USP Krill Oil RS.

Sample solution: Using the portion of oil from NLT 10 Capsules, proceed as directed for *Test Solution 1* in *Fats and Fixed Oils* 〈401〉, *Omega-3 Fatty Acids Determination and Profile*.

System suitability

Samples: *System suitability solution 1* and *Standard solution*

Suitability requirements

Chromatogram similarity: The chromatogram from the *Standard solution* is similar to the reference chromatogram provided with the lot of USP Krill Oil RS being used.

Resolution: NLT 1.0 between the methyl oleate and methyl *cis*-vaccinate peaks, *Standard solution*

Theoretical area percentages: Meets the requirements for *System suitability solution 1*

Analysis

Sample: *Sample solution*

Identify the retention times of the relevant fatty acid methyl esters in the *Sample solution* by comparing the chromatogram of the *Sample solution* with that of the *Standard solution* and the USP reference chromatogram.

Calculate the area percentage for each fatty acid as methyl esters in the portion of oil taken from the Capsules:

$$\text{Result} = (r_A/r_B) \times 100$$

r_A peak area of each individual fatty acid from the *Sample solution*

$r_{\bar{r}}$ total area of all peaks, except the solvent and butylated hydroxytoluene peaks, from the *Sample solution*

Acceptance criteria: See Table 1.

Table 1

Fatty Acid	Short-Hand Notation	Lower Limit (Area %)	Upper Limit (Area %)

Solution A, Line shape standard (¹H), Sensitivity standard (¹H), Sensitivity standard (³¹P), Internal standard, Sample solution, Standard solution, Instrumental conditions, System suitability, and Analysis: Proceed as directed in the test for *Content of Total Phospholipids in Strength*.

Acceptance criteria: The *Sample solution* contains all of the following phospholipids: phosphatidylcholine (60%–90%

■ 96% ■ 1S (USP39)

(w/w) of the total phospholipids content), lysophosphatidylcholine, ~~(as a mixture of 1-lysophosphatidylcholine and 2-lysophosphatidylcholine),~~

■ ■ 1S (USP39)

and phosphatidylethanolamine.

STRENGTH

- **Content of Krill Oil:** Weigh NLT 10 Capsules in a tared weighing bottle, and carefully open the Capsules, without loss of shell material. Transfer the combined Capsule contents to a 100-mL beaker. Remove any adhering substance from the emptied Capsules by washing with several small portions of 2,2,4-trimethylpentane. Discard the washings, and allow the empty Capsules to dry in a current of dry air until the 2,2,4-trimethylpentane is completely evaporated. Weigh the empty Capsules in the original tared weighing bottle, and calculate the average net weight per Capsule.

Acceptance criteria: 95.0%–105.0%

- **Content of EPA and DHA**

Standard solution 1a, Standard solution 1b, Standard solution 2a, Standard solution 2b, System suitability solution 1, and **Chromatographic system:** Proceed as directed in *Fats and Fixed Oils* 〈401〉, *Omega-3 Fatty Acids Determination and Profile*.

Test solution 1: Using the portion of 250 mg of oil from NLT 10 Capsules, proceed as directed for *Test Solution 1* in *Fats and Fixed Oils* 〈401〉, *Omega-3 Fatty Acids Determination and Profile*.

Test solution 2: Using the portion of 250 mg of oil from NLT 10 Capsules, proceed as directed for *Test Solution 2* in *Fats and Fixed Oils* 〈401〉, *Omega-3 Fatty Acids Determination and Profile*.

Analysis: Proceed as directed for *Analysis (for triglycerides)* in *Fats and Fixed Oils* 〈401〉, *Omega-3 Fatty Acids Determination and Profile*.

Calculate the percentage of EPA and DHA in the portion of oil taken from the Capsules.

Acceptance criteria: NLT 10.0% (w/w) of EPA and NLT 5.0% (w/w) of DHA

Change to read:

- **Content of Total Phospholipids**

(See *Nuclear Magnetic Resonance Spectroscopy* 〈761〉, *Qualitative and Quantitative NMR Analysis*).

[Note—All deuterated solvents used in this method should be NLT 99.8 atom % D. Whenever water is used in this method, it should be of sufficient quality to ensure that no trace metals or other contaminants that may affect the analysis are present.]

Solution A: 0.2 M EDTA adjusted with a 1 M cesium carbonate solution to a pH of 7.2–7.5. Document the final pH and the amount of 1 M cesium carbonate solution necessary to attain the desired pH. [Note—Use cesium carbonate of a sufficient grade for trace metals analysis.]

Line shape standard (¹H): 1% Chloroform in acetone-d₆

[Note—The acquisition time is dependent upon the field strength and the time domain ■ the dwell time and the number of data points collected. ■ 1S (USP39)

The number of scans acquired using a 300-MHz instrument must be NLT 512.]

System suitability: Under the conditions outlined in *Data collection*, the ^{31}P NMR signal of triphenyl phosphate should be observed at -17.80 ppm, and the ^1H NMR spectrum should be referenced to the ^1H signal of TMS (0 ppm) for all spectra acquired in the *Analysis*. For quantitative analysis, a sufficient number of scans should be acquired such that the signal-to-noise ratio for the phosphatidylcholine signal in the ^{31}P spectrum of the *Sample solution* acquired in the *Analysis* is NLT 2000.

Analysis: Acquire the data outlined in *Data collection*. Minimally acquire the ^1H spectrum (fingerprint) of the *Sample solution* and the *Standard solution* as well as the quantitative ^{31}P spectrum of the *Sample solution* and the *Standard solution*. Record the resulting spectra, and

perform integration by hand or automated means on the quantitative ^{31}P NMR spectrum of the *Sample solution*. The integration of the peaks in the spectrum of the *Sample solution* must be performed such that the complete set of phospholipid peaks (as identified by a comparison to the spectrum of the *Standard solution* and the *Standard solution* reference spectrum) is included in the integration. The integration region for each signal must extend ± 0.05 ppm on either side of the ^{31}P signal. Quantify the total phospholipids present, the phosphatidylcholine ether content, and the phosphatidylcholine content in the *Sample solution* by using a comparison to the concentration of the *Internal standard*.

Compare the ^1H spectrum of the *Sample solution* to that of the *Standard solution* to determine the similarity of fingerprints according to which phospholipids identified in the reference spectrum of the *Standard solution* are present in the spectrum of the *Sample solution*.

■ **Calculations:** Use the following equations and molecular weights listed in *Table 3* to determine the phospholipids content in the sample taken:

$$\text{mmol}_{IS} = (W_{IS} \times C_{IS}) / (MW_{IS} \times 100)$$

mmol_{IS}

= millimoles of the *Internal standard* in the *Sample solution* (mmol)

W_{IS}

= weight of the *Internal standard* added to the *Sample solution* (mg)

C_{IS}

= purity value of the *Internal standard*, based on quantitative ^{31}P NMR analysis (% by weight)

MW_{IS}

= molecular weight of the *Internal standard* (326.28 g/mol for triphenyl phosphate)

$$\text{mmol}_{PL} = (I_{PL} \times A_{IS} \times \text{mmol}_{IS}) / (I_{IS} \times A_{PL})$$

mmol_{PL} = millimoles of the phospholipid of interest in the *Sample solution* (mmol)

I_{PL} = integrated area under the phospholipid signal of interest obtained from the spectrum of the *Sample solution*

A_{IS} = number of phosphorus atoms per molecule expected from the *Internal standard* (1 for triphenyl phosphate)

mmol_{IS} = millimoles of the *Internal standard* in the *Sample solution*

I_{IS} = integrated area under the *Internal Standard* obtained from the spectrum of the *Sample solution*

A_{PL} = number of phosphorus atoms per molecule expected from the phospholipid of interest (1 for any phospholipid listed in *Table 3*)

$$C_{PL} = (MW_{PL} \times \text{mmol}_{PL} \times 100) / W_S$$

C_{PL} = concentration of the phospholipid of interest in the *Sample solution* (% w/w)

MW_{PL} = molecular weight of the phospholipid of interest (g/mol, from *Table 3*) in the *Sample solution* (mg)

$mmol_{PL}$ = millimoles of the phospholipid of interest in the *Sample solution* (mmol)

W_S = weight of sample present in the *Sample solution* (mg)

[Note—Use the molecular weight specified in *Table 3* for the calculations.]

Table 3

Component	Approximate Chemical Shift (ppm) in Reference to Triphenyl Phosphate	Molecular Weight (g/mol)
Triphenyl phosphate (<i>Internal standard</i>)	−17.8	—
Phosphatidylcholine (PC)	−0.89	791
1-Lysophosphatidylcholine (1-LPC) ^a	−0.48	534.5
2-Lysophosphatidylcholine (2-LPC) ^a	−0.4	534.5
Phosphatidylethanolamine (PE)	−0.24	770
<i>N</i> -Acylphosphatidylethanolamine (NAPE)	0	1032
Lysophosphatidylethanolamine (LPE)	0.25	492.5
Other	—	800

^a Ability to resolve the signals of 1-lysophosphatidylcholine and 2-lysophosphatidylcholine will depend upon the applied magnetic field strength of the NMR spectrometer used for the test procedure.

Acceptance criteria

Total phospholipids: 28%–52%

■ 30%–55% ■ 1S (USP39)

Phosphatidylcholine: 60%–90%

■ 96% ■ 1S (USP39)

(w/w) of the total phospholipids content

● Content of Astaxanthin

[Note—Perform this analysis in subdued light using low-actinic glassware.]

Sample solution: 0.005 g/mL in chloroform using the portion of oil from NLT 10 Capsules.

[Note—If the solution is not clear, centrifuge it with an appropriate centrifuge to obtain a clear supernatant.]

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* 〈 851 〉.)

Analytical wavelength: 486 nm

Cell path: 1 cm

Blank: Chloroform

Analysis

Sample: *Sample solution*

Calculate the percentage of astaxanthin in the portion of oil taken from the Capsules:

$$\text{Result} = A/(F \times C)$$

A = absorbance of the *Sample solution*

F = coefficient of extinction ($E_{1\%}^{1\text{cm}}$) of pure astaxanthin in chloroform (100 mL·g₋₁·cm₋₁),
1692

C = concentration of the *Sample solution* (g/mL)

Acceptance criteria: NLT 0.01%

PERFORMANCE TESTS

- **Disintegration and Dissolution** 〈 2040 〉, *Disintegration, Delayed-release (enteric-coated) soft shell capsules*: Meet the requirements
- **Weight Variation** 〈 2091 〉: Meet the requirements

CONTAMINANTS

- **Limit of Dioxins, Furans, and Polychlorinated Biphenyls**

Analysis: Determine the content of polychlorinated dibenzo-para-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs) by Method 1613, Revision B, of the Environmental Protection Agency. Determine the content of polychlorinated biphenyls (PCBs) by Method 1668, Revision A, of the Environmental Protection Agency.

Acceptance criteria: The sum of PCDDs and PCDFs is NMT 2.0 pg/g of World Health Organization (WHO) toxic equivalents. The sum of PCDDs, PCDFs, and dioxin-like PCBs (polychlorinated biphenyls; non-ortho IUPAC congeners PCB-77, PCB-81, PCB-126, and PCB-169; and mono-ortho IUPAC congeners PCB-105, PCB-114, PCB-118, PCB-123, PCB-156, PCB-157, PCB-167, and PCB-189) is NMT 10.0 pg/g of WHO toxic equivalents.

- **Microbial Enumeration Tests** 〈 2021 〉: The total aerobic microbial count does not exceed 10³ cfu/g, and the combined molds and yeasts count does not exceed 10² cfu/g.
- **Absence of Specified Microorganisms** 〈 2022 〉: Meet the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*

SPECIFIC TESTS

- **Astaxanthin Esterification**

Standard solution A: 10 mg/mL of USP Astaxanthin Esters from *Haematococcus pluvialis* RS in acetone

Standard solution B: 10 mg/mL of USP Astaxanthin (Synthetic) RS in acetone

Sample solution: Using the portion of oil from NLT 10 Capsules, prepare a solution of 250 mg/mL in acetone.

Chromatographic system

(See *Chromatography* 〈 621 〉, *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel. [Note—Dry silica gel at 110° for 1 h before use.]

Application volume: 5 µL

Developing solvent system: Hexane and acetone (70:30)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Develop the chromatogram in the *Developing solvent system* until the solvent front has moved about 15 cm of the length of the plate. Remove the plate from the chamber, and allow to dry.

Acceptance criteria: The principal spot of *Standard solution B*, located in the bottom half of the plate, is free astaxanthin. The *Sample solution* may exhibit a light, minor spot in the same location. The principal spots of *Standard solution A* are from monoesters (primary spot, located slightly above the middle of the plate) and diesters (secondary spot, located in the top third of the plate). The principal spot of the *Sample solution* should correspond in color and R_F value to the diester spot of *Standard solution A*. The secondary spot of the *Sample solution* should correspond in color and approximately the same R_F value to the monoester spot of *Standard solution A*. [Note—Slight differences in R_F values within monoester spots and within diester spots may exist because of different intensities.]

- **Fats and Fixed Oils** 〈 401 〉, *Peroxide Value*: NMT 5.0 mEq peroxide/kg

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers, and store at room temperature. Protect from light.
- **Labeling:** The label states the amount of docosahexaenoic acid (DHA), eicosapentaenoic acid (EPA), total phospholipids, and astaxanthin.

 - USP Eicosapentaenoic Acid Ethyl Ester RS
 - USP Krill Oil RS
 - USP Methyl Tricosanoate RS

BRIEFING

Lecithin, *NF 33* page 6726. On the basis of comments and data received, it is proposed to make the following changes:

1. In the test for *Content of Phospholipids*, add the *Acceptance criteria* for *Content of phosphatidylcholine*. This proposed specification represents the quality of a lecithin product in commerce that is intended for use in the manufacture of injectable dosage forms.
2. In the test for *Content of Acetone-Insoluble Matter*, due to variability of the test

procedure, change the *Acceptance criteria* for Lecithin intended for use in the manufacture of injectable dosage forms from NLT 90.0% to NLT 80.0%.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(EXC: H. Wang.)

Lecithin

[8002-43-5].

DEFINITION

Lecithin is a complex mixture of acetone-insoluble phosphatides, which consist chiefly of phosphatidylcholine, phosphatidylethanolamine, phosphatidylinositol, and phosphatidic acid, present in conjunction with various amounts of other substances such as triglycerides, fatty acids, and carbohydrates, as separated from the crude vegetable oil source. The content of each of the phospholipids (phosphatidylcholine, phosphatidylethanolamine, phosphatidylinositol, and phosphatidic acid) is indicated on the certificate of analysis.

IDENTIFICATION

• **A. Identification of Phospholipids by Thin-Layer Chromatography**

Mobile phase: Chloroform, methanol, water (65:25:4, v/v/v)

Standard solution A: 10 mg/mL of USP Phosphatidic Acid (Soy) Monosodium RS and 10 mg/mL of USP Phosphatidylcholine (Soy) RS in *Mobile phase*

Standard solution B: 7 mg/mL of USP Phosphatidylethanolamine (Soy) RS and 7 mg/mL of USP Lysophosphatidylcholine (Soy) RS in *Mobile phase*

Sample solution: 20 mg/mL of Lecithin in *Mobile phase*

Chromatographic system

(See *Chromatography* { 621 }, *Thin-Layer Chromatography*.)

Mode: TLC

Plate: 20-cm × 20-cm, silica gel 60 on aluminum foil, 0.2-mm layer

Application volume: 20 µL

Spray reagent: Dilute 80 mL of phosphoric acid (85%) with 600 mL of water in a 1-L volumetric flask. [Note—Add water to the flask first.] While stirring, add 100 g of anhydrous cupric sulfate. After stirring for 10 min, most of the cupric sulfate is dissolved. Add water to volume and continue stirring until the solid completely dissolves.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Fill the chromatography chamber with the *Mobile phase* to a height of about 0.5 cm. Place a fat-free, U-shaped filter paper in the glass trough and press it against the wall. Sufficient saturation is reached once the *Mobile phase* has permeated to the upper rim of the filter paper. Apply the *Samples* in different bands to the previously marked starting point on a TLC plate. Place the TLC plate in the saturated chromatography chamber. When the *Mobile phase* front has reached the mark (12 cm above the starting point),

remove the TLC plate, and dry it using a dryer. Spray or immerse the TLC plate in the *Spray reagent*, and dry it again with a dryer (a current of hot air). Heat the plate to 170° for 10 min. Develop all lipids by charring as dark brown spots.

Acceptance criteria: The R_F values of the spots for phosphatidylcholine, phosphatidylethanolamine, phosphatidic acid, and lysophosphatidylcholine from the *Sample solution* correspond to those from *Standard solution A* and *Standard solution B*. [Note—Depending on the sample tested, if a phospholipid component presents in a low amount in the sample, the corresponding spot in the *Sample solution* on the TLC may not be visualized.]

ASSAY

Change to read:

• Content of Phospholipids

[Note—Perform the test for lysophosphatidylcholine for Lecithin intended for use in the manufacture of injectable dosage forms.]

Solution A: Mix 1342 g (2.0 L) of *n*-hexane, 334.1 g (425 mL) of isopropanol (2-propanol), 39.4 g (38 mL) of glacial acetic acid, and 2.0 mL of triethylamine.

Solution B: Mix 663.5 g (850 mL) of isopropanol, 15.8 g (15 mL) of glacial acetic acid, 140 g (140 mL) of water, and 0.8 mL of triethylamine.

Solvent: *n*-Hexane, isopropanol, and water (46:46:8, v/v/v). [Note—To avoid the formation of two phases, mix the isopropanol and water first, and then add the *n*-hexane.]

Mobile phase: See *Table 1*.

10	27.0	2.0	95	5
11	29.0	1.0	95	5

Phospholipids standard stock solution (2X): 0.8 mg/mL of USP Phosphatidylcholine (Soy) RS, 0.4 mg/mL of USP Phosphatidylethanolamine (Soy) RS, 0.4 mg/mL of phosphatidylinositol prepared from USP Phosphatidylinositol (Soy) Sodium RS, and 0.2 mg/mL of phosphatidic acid prepared from USP Phosphatidic Acid (Soy) Monosodium RS in *Solvent*. [Note—Due to the highly hydroscopic nature of phospholipids, take special precaution in the Standard preparation.]

Phospholipids standard solutions: Prepare as directed in *Table 2*.

Table 2

Concentration	Phospholipids Standard Stock Solution (2X): Solvent (v/v)
0.6X	3:7
0.8X	4:6
1.0X	5:5
1.2X	6:4
1.4X	7:3

System suitability solution: *Phospholipids standard solution 1.0X*

Lysophosphatidylcholine standard stock solution (2X): 60 µg/mL of USP Lysophosphatidylcholine (Soy) RS in *Solvent*

Resolution solution: *Phospholipids standard stock solution (2X)* and *Lysophosphatidylcholine standard stock solution (2X)* (1:1)

Lysophosphatidylcholine standard solution: 30 µg/mL of USP Lysophosphatidylcholine (Soy) RS in *Solvent*

Sample solution: 1 mg/mL of Lecithin in *Solvent*. [Note—If necessary, adjust the concentration of the *Sample solution* to obtain the concentration of each of the phospholipids within the calibration range.]

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: Evaporative light-scattering

Column: 4-mm × 12.5-cm; 5-µm packing L20

Temperatures

Detector: 50°

Column: 55°

Flow rate: 1.0 mL/min with step gradient at 2.0 mL/min (see *Table 1*)

Injection volume: 20 µL

[Note—Depending on the different settings of the *Detector*, the *Detector* temperature and *Flow rate* can be adjusted as long as system suitability requirements are met.]

System suitability

Samples: *System suitability solution* and *Resolution solution*

[Note—The relative retention times for phosphatidic acid, phosphatidylethanolamine, phosphatidylcholine, phosphatidylinositol, and lysophosphatidylcholine are 0.4, 0.9, 1.0, 1.2, and 1.3, respectively, for the *Resolution solution*.]

Suitability requirements

Resolution: NLT 2.0, *System suitability solution*

Relative standard deviation: NMT 5.0%, *System suitability solution*

Analysis

Samples: *Phospholipids standard solutions*, *Lysophosphatidylcholine standard solution*, and *Sample solution*

Identify the peaks of the relevant phospholipids from the *Sample solution* by comparison with the *Phospholipids standard solutions*. Measure the areas of the phospholipid peaks. Plot the logarithms of the relevant responses versus the logarithms of the concentrations, in mg/mL, of each of the phospholipids from the *Standard solutions*, and determine the

linear regression line using a least-squares analysis. The correlation coefficient for the linear regression line is NLT 0.995.

From the graphs, determine the concentration (C), in mg/mL, of the relevant phospholipid in the *Sample solution*.

Calculate the percentage of each of the phospholipids (phosphatidic acid, phosphatidylethanolamine, phosphatidylcholine, and phosphatidylinositol) in the portion of Lecithin taken:

$$\text{Result} = (C_U/C_S) \times 100$$

C_U concentration of each of the phospholipids in the *Sample solution* (mg/mL)

C_S concentration of Lecithin (mg/mL)

Based on the *Lysophosphatidylcholine standard solution*, identify the peak of lysophosphatidylcholine. Compare the peak area of lysophosphatidylcholine from the *Lysophosphatidylcholine standard solution* and the *Sample solution*, respectively.

Acceptance criteria

Content of each of the phospholipids (phosphatidylcholine, phosphatidylethanolamine, phosphatidylinositol, and phosphatidic acid): Within the respective ranges stated on the label

For Lecithin intended for use in the manufacture of injectable dosage forms

Content of lysophosphatidylcholine: The peak area of lysophosphatidylcholine in the *Sample solution* is NMT the peak area of lysophosphatidylcholine in the *Lysophosphatidylcholine standard solution*, corresponding to NMT 3.0% of lysophosphatidylcholine in Lecithin.

■ **Content of phosphatidylcholine:** NLT 70.0% ■ 1S (NF34)

IMPURITIES

Delete the following:

●● **Heavy Metals, Method II** (231): NMT 20 ppm ● (Official 1-Dec-2015)

● **Lead** (251): NMT 10 ppm

● **Hexane-Insoluble Matter**

Sample: If the substance under test is plastic or semisolid, soften the Lecithin by warming it at a temperature not exceeding 60°, and then mix. Weigh 10.0 g into a 250-mL conical flask.

Analysis: To the *Sample* add 100 mL of hexane. Shake until solution is apparently complete or until no more residue seems to be dissolving. Pass through a coarse-porosity filtering funnel that previously has been heated at 105° for 1 h, cooled, and weighed. Wash the flask with two 25-mL portions of hexane, and pour both washings through the funnel. Dry the funnel at 105° for 1 h. [**Caution**—Hexane is flammable.] Cool to room temperature, and determine the gain in weight.

Acceptance criteria: NMT 0.3%

For Sunflower Lecithin: NMT 1.0%

SPECIFIC TESTS**Change to read:**

- **Content of Acetone-Insoluble Matter**

Sample: If the substance under test is plastic or semisolid, soften the Lecithin by warming it briefly at a temperature not exceeding 60°, and then mix. Transfer 2 g to a 40-mL centrifuge tube that previously has been tared along with a stirring rod, cool, and weigh.

Analysis: To the *Sample* add 15.0 mL of acetone, and warm carefully in a water bath to melt the test specimen without evaporating the acetone. Stir to help dissolve completely, and place in an ice-water bath for 5 min. De-oiled lecithin and fractions are suspended in acetone by stirring. Add acetone that has been previously chilled to 0°–5° to the 40-mL mark on the tube, stirring during the addition. Cool in an ice-water bath for 15 min, stir, remove the rod, clarify by centrifuging at about 2000 rpm for 5 min, and decant. Break up the residue with the stirring rod, and refill the centrifuge tube to the 40-mL mark with chilled acetone, while stirring. Cool in an ice-water bath for 15 min, stir, remove the rod, centrifuge, and decant. Break up the residue with the stirring rod. Place the tube in a horizontal position until most of the acetone has evaporated. Mix again, and heat the tube containing the acetone-insoluble residue and the stirring rod at 105° to constant weight. [Caution—Acetone is flammable.]

Determine the weight of the residue, and calculate the percentage of acetone-insoluble matter.

Acceptance criteria: NLT 50.0%

For Lecithin intended for use in the manufacture of injectable dosage forms: NLT 90.0%

■ NLT 80.0% ■ 1S (NF34)

- **Fats and Fixed Oils** 〈 401 〉, *Acid Value*

Sample: If the substance under test is plastic or semisolid, soften the Lecithin by warming it briefly at a temperature not exceeding 60°, and then mix. Transfer 2 g to a 250-mL conical flask.

Analysis: Dissolve the *Sample* in 50 mL of petroleum ether with 100°–120° boiling range. To this solution add 50 mL of alcohol, previously neutralized to phenolphthalein with 0.1 N sodium hydroxide, and mix. Add phenolphthalein TS. Titrate with 0.1 N sodium hydroxide VS to a pink endpoint that persists for 5 s.

Calculate the amount, in mg, of potassium hydroxide required to neutralize the free acids in 1.0 g of Lecithin:

$$\text{Result} = (M_r \times N \times V) / W$$

M_r = molecular weight of potassium hydroxide, 56.11

N = normality of the sodium hydroxide VS

V = volume of the sodium hydroxide VS consumed in the titration (mL)

W = weight of Lecithin taken (g)

Acceptance criteria: NMT 36

- **Peroxide Value**

Sample: 5 g of Lecithin

Analysis: Transfer the *Sample* into a 250-mL Erlenmeyer flask with a ground-glass stopper, add 35 mL of a mixture of chloroform and glacial acetic acid (2:1), and mix. Completely dissolve the test specimen while shaking gently. The solution becomes transparent. Completely replace the air in the flask with nitrogen. While purging with nitrogen, add 1 mL of potassium iodide solution (165 mg/mL of potassium iodide), then stop the flow of the nitrogen, and immediately place a stopper in the flask. Shake for 1 min, and allow to stand in a dark place for 5 min. Add 75 mL of water, replace the stopper again, and shake vigorously. Titrate with 0.01 N sodium thiosulfate VS, adding starch TS as the endpoint is approached, and continue the titration until the blue starch color has just disappeared.

Perform a blank determination (see *Titrimetry* 〈 541 〉), and make any necessary correction.

Calculate the peroxide value, as mEq of peroxide per 1000 g of Lecithin:

$$\text{Result} = (S \times N/W) \times 1000$$

S = net volume of sodium thiosulfate solution required for titration (mL)

N = normality of the sodium thiosulfate solution

W = weight of Lecithin taken (g)

Acceptance criteria: NMT 10

For Lecithin intended for use in the manufacture of injectable dosage forms: NMT 3

- **Microbial Enumeration Tests** 〈 61 〉 **and Tests for Specified Microorganisms** 〈 62 〉: The total aerobic microbial count does not exceed 10^3 cfu/g, and the total combined molds and yeasts count does not exceed 10^2 cfu/g. It meets the requirements of the tests for absence of *Salmonella* species and *Escherichia coli*.
- **Water Determination** 〈 921 〉, *Method I*: NMT 2.0%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed, light-resistant containers. Store at the temperature indicated on the label. Protect from excess heat and moisture.
- **Labeling:** Label to indicate the content of each of the phospholipids (phosphatidylcholine, phosphatidylethanolamine, phosphatidylinositol, and phosphatidic acid). The labeling also indicates the natural source of lecithin. Where Lecithin is intended for use in the manufacture of injectable dosage forms, it is so labeled. Label it to indicate the storage conditions.

 - USP Phosphatidic Acid (Soy) Monosodium RS
 - USP Phosphatidylcholine (Soy) RS
 - USP Phosphatidylethanolamine (Soy) RS
 - USP Phosphatidylinositol (Soy) Sodium RS

BRIEFING

Abacavir and Lamivudine Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph is proposed based on validated methods of analysis. The liquid chromatographic procedures used in the *Assay* and the test for *Organic Impurities* are based on analyses performed using the Waters Xterra MS C18 brand of L1 column. The

typical retention times for abacavir and lamivudine are about 7 and 11 min, respectively.

The calculations in the test for *Dissolution* are performed using multi-component analysis software typically used for analysis of multi-component mixtures.

(SM1: S. Shivaprasad.)

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of abacavir (C₁₄H₁₈N₆O) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of abacavir from the *Sample solution*

r_S = peak response of abacavir from the *Standard solution*

C_S = concentration of USP Abacavir Sulfate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of abacavir in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of abacavir multiplied by 2, 572.66

M_{r2} = molecular weight of abacavir sulfate, 670.74

Acceptance criteria: 90.0%–110.0% of the labeled amount of abacavir

Calculate the percentage of the labeled amount of lamivudine (C₈H₁₁N₃O₃S) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of lamivudine from the *Sample solution*

r_S = peak response of lamivudine from the *Standard solution*

C_S = concentration of USP Lamivudine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of lamivudine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% of the labeled amount of lamivudine

PERFORMANCE TESTS

- **Dissolution** 〈 711 〉

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 75 rpm

Time: 30 min

Standard solution 1: 0.79 mg/mL of USP Abacavir Sulfate RS in *Medium*. Sonicate to dissolve prior to final dilution.

Standard solution 2: 0.33 mg/mL of USP Lamivudine RS in *Medium*. Sonicate to dissolve prior to final dilution.

Sample solution: Pass a portion of the solution under test through a suitable filter.

Instrumental conditions

Mode: UV

Wavelength: 240–320 nm

Cell length: 0.2 mm

Blank: *Medium*

Analysis: The calculations of the percentages dissolved are performed using multi-component analysis software.

Tolerances: NLT 80% (Q) of the labeled amount of abacavir and lamivudine is dissolved.

- **Uniformity of Dosage Units** 〈 905 〉: Meet the requirements

IMPURITIES

- **Organic Impurities**

Diluent, Solution A, Solution B, Mobile phase, System suitability solution, Standard solution, Sample stock solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Analysis

Sample: *Sample solution*

Calculate the percentage of each individual abacavir related impurity and each unspecified impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_{\bar{U}}$ peak response of each abacavir related impurity or unspecified impurity

r_T sum of the peak responses of abacavir, all abacavir related impurities, and all unspecified impurities

Calculate the percentage of each lamivudine related impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_{\bar{U}}$ peak response of each lamivudine related impurity

r_T sum of the peak responses of lamivudine and all lamivudine related impurities

Acceptance criteria: See *Table 2*. Disregard any peak less than 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

BRIEFING

Acetazolamide, USP 38 page 2041. As part of the USP monograph modernization effort, it is proposed to make the following changes:

1. The nonspecific wet chemistry *Identification* test *B* is replaced with a retention time agreement based on the *Assay*.
2. The IR *Assay* is replaced with an HPLC *Assay* based on the current USP monograph for *Acetazolamide Tablets*. The liquid chromatography procedure for the *Assay* is based on analysis performed with the Phenomenex Nucleosil C18 100 **A** brand of L1 column. The typical retention time for acetazolamide is about 8 min.
3. The nonspecific tests for *Silver-Reducing Substances* and *Ordinary Impurities* are replaced with an HPLC test for *Organic Impurities* based on the current monograph for *Acetazolamide* in the *European Pharmacopoeia*. The liquid chromatography procedure in the test for *Organic Impurities* is based on analysis performed with the Phenomenex Synergi Polar RP brand of L11 column. The typical retention time for

acetazolamide is about 8 min.

- The new Reference Standards, USP Acetazolamide Related Compound D RS and USP Acetazolamide Related Compound E RS, are added in the *USP Reference Standards* section to support the proposed revision to the test for *Organic Impurities*.

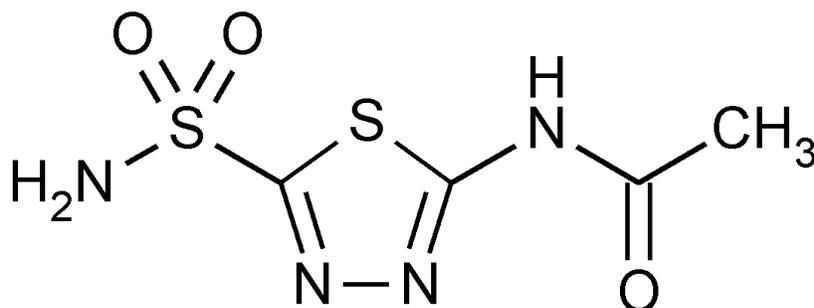

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

BRIEFING

Acetazolamide for Injection, USP 38 page 2041. On the basis of comments received, the following revisions to the monograph are proposed:

1. The nonspecific wet chemistry *Identification* test A is replaced with a retention time agreement based on the *Assay*.
2. The nonselective UV method in the *Assay* is replaced with an HPLC procedure based on the current USP monograph for *Acetazolamide Tablets*. The liquid chromatography procedure in the *Assay* is based on analysis performed with the Phenomenex Nucleosil C18 100 Å brand of L1 column. The typical retention time for acetazolamide is about 8 min.
3. The redundant test *Completeness of Solution* is deleted because the monograph already contains the test for *Constituted Solutions* from *Injections* (1).

Additionally, minor editorial changes have been made to update the monograph to current USP style.

This proposal highlights the need to add a procedure in the test for *Organic Impurities*. Interested parties are encouraged to submit comments and proposals to the Small Molecules-3 Expert Committee.

Acetazolamide for Injection

DEFINITION

Acetazolamide for Injection is prepared from Acetazolamide with the aid of sodium hydroxide. It is suitable for parenteral use. The contents of each container, when constituted as directed in the labeling, yield a solution containing NLT 95.0% and NMT 110.0% of the labeled amount of acetazolamide ($C_4H_6N_4O_3S_2$).

IDENTIFICATION

Delete the following:

■ • **A. Procedure**

Sample: Dissolve 500 mg in 5 mL of water, add 2 drops of hydrochloric acid, and allow the mixture to stand for about 15 min. Filter through a fine sintered glass funnel, wash with several small portions of water, and dry in vacuum over silica gel for 3 h: the crystals

~~meet the requirements of the following tests.~~

BRIEFING

Aminophylline, *USP 38* page 2186. As a part of USP monograph modernization efforts, the following revisions are proposed:

1. Replace the nonspecific melting temperature test in *Identification* test A with an infrared spectra agreement between the *Sample* and USP Theophylline RS.
2. Replace the wet chemistry-based *Identification* test B with a retention time agreement from the proposed chromatographic procedures in the *Assay*.
3. Replace the HPLC procedure in the *Assay* with a stability-indicating UHPLC procedure. The liquid chromatographic procedure is performed using the Acquity BEH C18 brand of L1 column. The typical retention time for theophylline is about 4 min.
4. Add a stability-indicating UHPLC procedure in the test for *Organic Impurities* using the same chromatographic system as the *Assay*.
5. Add the new Reference Standards used in the *Assay* and the test for *Organic Impurities* to the *USP Reference Standards* section.

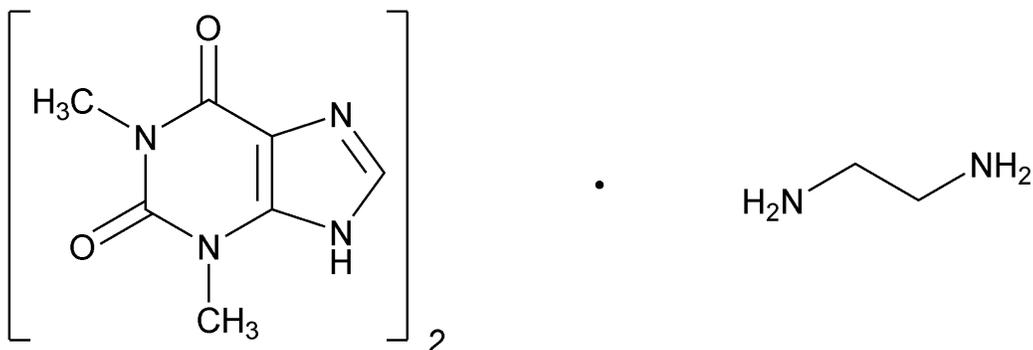

Additionally, minor editorial changes have been made to update the monograph to current USP style.

Aminophylline Injection

DEFINITION

Aminophylline Injection is a sterile solution of Aminophylline in Water for Injection, or is a sterile solution of Theophylline in Water for Injection prepared with the aid of Ethylenediamine. It contains, in each mL, an amount of aminophylline (C₁₆H₂₄N₁₀O₄) equivalent to NLT 93.0% and NMT 107.0% of the labeled amount of anhydrous theophylline (C₇H₈N₄O₂).

Aminophylline Injection may contain an excess of Ethylenediamine, but no other substance may be added for the purpose of pH adjustment.

[Note—Do not use the Injection if crystals have separated.]

IDENTIFICATION

• A.

Analysis: Dilute a volume of Injection equivalent to 500 mg of aminophylline with water to 20 mL, and add, with constant stirring, 1 mL of 3 N hydrochloric acid or enough to

completely precipitate the theophylline, and filter. To the filtrate add 0.5 mL of benzenesulfonyl chloride and 5 mL of 1 N sodium hydroxide to render alkaline. Shake by mechanical means for 10 min, add 5 mL of 3 N hydrochloric acid to acidify, chill, collect the precipitated disulfonamide of ethylenediamine, wash with water, recrystallize from water, and dry at 105° for 1 h.

Acceptance criteria: The precipitate melts at 164°–171°.

Change to read:

• B.

■ **Infrared Absorption** 〈 197K〉 ■ 1S (USP39)

Analysis: Wash the precipitated theophylline from *Identification* test A with small portions of cold water, and dry at 105° for 1 h.

BRIEFING

Aminophylline Oral Solution, USP 38 page 2188. As a part of USP monograph modernization efforts, the following revisions are proposed:

1. Replace the nonspecific melting temperature in *Identification* test A with an infrared spectra agreement between the sample and the USP Theophylline Reference Standard.
2. Replace the HPLC procedure in the *Assay* with the same UHPLC procedure that is proposed in the test for *Organic Impurities*. The liquid chromatographic procedure is performed using the Acquity BEH C18 brand of L1 column. The typical retention time for theophylline is about 4 min.
3. Add a stability-indicating UHPLC procedure in the test for *Organic Impurities* using the same chromatographic system as the *Assay*.
4. Add the new Reference Standards used in the *Assay* and the test for *Organic Impurities* to the *USP Reference Standards* section.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

Aminophylline Oral Solution

DEFINITION

Aminophylline Oral Solution is an aqueous solution of Aminophylline, prepared with the aid of Ethylenediamine. It contains an amount of aminophylline ($C_{16}H_{24}N_{10}O_4$) equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of anhydrous theophylline ($C_7H_8N_4O_2$). Aminophylline Oral Solution may contain an excess of ethylenediamine, but no other substance may be added for the purpose of pH adjustment.

IDENTIFICATION**Change to read:**• **A.**

■ **Infrared Absorption** $\langle 197K \rangle$ ■ 1S (USP39)

Analysis: Transfer a volume of Oral Solution equivalent to 500 mg of aminophylline to a suitable container and add, with constant stirring, 1 mL of 3 N hydrochloric acid or enough to completely precipitate the theophylline. Filter (retain the filtrate), wash the precipitate with small portions of cold water until free from chloride, and dry at 105° for 1 h.

Acceptance criteria: ~~The dried precipitate melts at 270° – 274° .~~

■ The IR spectrum of the precipitate of theophylline so obtained matches that of USP Theophylline RS. ■ 1S (USP39)

• **B.**

Analysis: To the filtrate obtained in *Identification* test A add 0.5 mL of benzenesulfonyl chloride and 5 mL of 1 N sodium hydroxide to render alkaline. Shake by mechanical means for 10 min, add 5 mL of 3 N hydrochloric acid to acidify, chill, collect the precipitated disulfonamide of ethylenediamine, wash with water, recrystallize from water, and dry at 105° for 1 h.

Acceptance criteria: The dried precipitate melts at 164° – 171° .

ASSAY**Change to read:**• **Procedure**

~~**Mobile phase:** 200 mL of methanol, 960 mg of sodium 1-pentanesulfonate, and sufficient water to make 1 L.~~

~~Adjust with glacial acetic acid to a pH of 2.9 ± 0.1 .~~

BRIEFING

Aminophylline Tablets, USP 38 page 2190. As a part of USP monograph modernization efforts, the following revisions are proposed:

1. Replace the wet chemistry-based *Identification* test A with an infrared spectra agreement between the *Sample* and USP Theophylline RS. The precipitation procedure of theophylline is retained in this test.
2. Replace the nonspecific melting temperature test in *Identification* test B with the

retention time agreement from the proposed chromatographic procedure in the *Assay*.

3. Replace the titration procedure in the *Assay* with a stability-indicating UHPLC procedure. The liquid chromatographic procedure is performed using the Waters Acquity BEH C18 brand of L1 column. The typical retention time for theophylline is about 4 min.
4. Add a stability-indicating UHPLC procedure in the test for *Organic Impurities* that is consistent with the chromatographic system used in the *Assay*.
5. Revise the *Packaging and Storage* requirements to be consistent with the product label.
6. Add the new Reference Standards used in the *Assay* and the test for *Organic Impurities* to the *USP Reference Standards* section.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Aminophylline Tablets

DEFINITION

Aminophylline Tablets contain an amount of aminophylline equivalent to NLT 93.0% and NMT 107.0% of the labeled amount of anhydrous theophylline ($C_7H_8N_4O_2$).

[Note—The ammoniacal odor present in the vapor space above the Tablets is often quite strong, especially when bottles having suitably tight closures are newly opened. This is due to ethylenediamine vapor pressure build-up, a natural condition in the case of aminophylline.]

IDENTIFICATION

Change to read:

- **A.**

■ **Infrared Absorption** 〈 197K〉 ■ 1S (USP39)

Analysis: Macerate a quantity of Tablets, equivalent to 500 mg of aminophylline, with 25 mL of water, and filter. The filtrate is alkaline to litmus. To the filtrate add 1 mL of 3 N hydrochloric acid, stir, and if necessary, chill to precipitate the theophylline. Filter, and retain the filtrate, free from washings.

■ Use the filtrate in *Identification* test C. ■ 1S (USP39)

Wash the theophylline crystals so obtained with small quantities of ice-cold water, and dry at 105° for 1 h. ~~Transfer 10 mg of the dried theophylline crystals to a porcelain dish, add 1 mL of hydrochloric acid and 100 mg of potassium chlorate, evaporate on a steam bath to dryness, and invert the dish over a vessel containing a few drops of 6 N ammonium hydroxide.~~

■ ■ 1S (USP39)

Acceptance criteria: ~~The residue acquires a purple color, which is destroyed by solutions of~~

~~fixed alkalis.~~

- The IR spectrum of the theophylline so obtained corresponds to that of USP Theophylline RS.
 - 1S (USP39)

Change to read:

- B.

~~**Analysis:** Recrystallize the dried theophylline crystals from *Identification test A* from water, and dry at 105° for 1 h.~~

~~**Acceptance criteria:** The recrystallized theophylline melts at 270°–274°.~~

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■ 1S (USP39)

- C.

Sample: The filtrate obtained in *Identification test A*

Analysis: To the *Sample* add 0.5 mL of benzenesulfonyl chloride and 5 mL of 1 N sodium hydroxide to render alkaline, shake by mechanical means for 10 min, and add 5 mL of 3 N hydrochloric acid to acidify. Chill, collect the precipitated disulfonamide of ethylenediamine, and wash with water. Recrystallize the washed precipitate from water, and dry at 105° for 1 h.

Acceptance criteria: The dried precipitate melts at 164°–171°.

ASSAY

Change to read:

- Procedure

~~**Sample solution:** Transfer the equivalent to 2 g of aminophylline, from finely powdered Tablets (NLT 20), to a 200-mL volumetric flask with the aid of a mixture of 50 mL of water and 15 mL of 6 N ammonium hydroxide. Allow to stand for 30 min with frequent shaking, warming to 50° if necessary to dissolve the aminophylline. Cool the mixture to room temperature if it has been warmed, and add water to volume. Centrifuge 50 mL of the mixture, and pipet a portion of the clear supernatant, equivalent to 250 mg of aminophylline, into a 250-mL conical flask, and dilute with water if necessary to make 40 mL. Add 8 mL of 6 N ammonium hydroxide and 20.0 mL of 0.1 N silver nitrate VS, mix, heat to boiling, and continue boiling for 15 min. Cool to between 5° and 10° for 20 min; filter, preferably through a filtering crucible under reduced pressure; and wash the precipitate with three 10-mL portions of water. Acidify the combined filtrate and washings with nitric acid, and add an additional 3 mL of the acid. Cool, and add 2 mL of ferric ammonium sulfate TS.~~

~~**Titrimetric system**~~

~~**Mode:** Residual titration~~

~~**Titrant:** 0.1 N ammonium thiocyanate VS~~

~~**Endpoint detection:** Visual~~

~~**Analysis:** Titrate the excess silver nitrate with *Titrant*. Each mL of 0.1 N silver nitrate is equivalent to 18.02 mg of theophylline (C₇H₈N₄O₂).~~

■ **Solution A:** 10 mM ammonium acetate prepared as follows. Transfer 770.8 mg of

ammonium acetate to a 1-L volumetric flask, and dissolve in water to 80% of the flask volume. Adjust with glacial acetic acid to a pH of 5.5 and dilute with water to volume. Pass through a suitable filter of 0.2- μ m pore size.

BRIEFING

Argatroban, PF 39(3) [May–June 2013]. On the basis of comments received, the previously published monograph proposal for this drug substance in PF 39(3) is canceled and replaced with the following new proposal. The liquid chromatographic procedures in the *Assay* and the tests for *Organic Impurities*, *Content of Argatroban Related Compound C*, and *Content of Stereoisomers* are proposed based on analysis performed with the Inertsil ODS-3 brand of L1 column. The typical retention times for (*R*)-argatroban and (*S*)-argatroban are about 31 and 32 min based on conditions specified for the *Assay* and test for *Organic Impurities*. The typical retention times for (*R*)-argatroban and (*S*)-argatroban are about 66 and 71 min based on conditions specified for *Content of Argatroban Related Compound C*. The typical retention times for (*R*)-argatroban and (*S*)-argatroban are about 49 and 52 min based on conditions specified for *Content of Stereoisomers*.

Add the following:

■ Argatroban

C₂₃H₃₆N₆O₅·H₂O 526.65

2-Piperidinecarboxylic acid, 1-[(S)-5-[(aminoiminomethyl)amino]-1-oxo-2-[(1,2,3,4-tetrahydro-3-methyl-8-quinolyl)sulfonyl]amino}pentyl]-4-methyl-, (2R,4R)-monohydrate; (2R,4R)-4-Methyl-1-{N²-[(1,2,3,4-tetrahydro-3-methyl-8-quinolyl)sulfonyl]-l-arginyl}piperidinecarboxylic acid, monohydrate [141396-28-3].

DEFINITION

Argatroban contains NLT 98.0% and NMT 102.0% of argatroban (C₂₃H₃₆N₆O₅S), calculated on the anhydrous and solvent-free basis.

IDENTIFICATION

- **A. Infrared Absorption** < 197K >
- **B.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **Procedure**

[Note—It is recommended to keep all solutions containing argatroban at about 4°.]

Solution A: 10 mM ammonium acetate and 5 mM sodium 1-heptanesulfonate

Solution B: Acetonitrile and methanol (500:300)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	60	40
20	60	40
35	50	50
50	20	80
60	20	80
60.1	60	40
72.1	60	40

Standard solution: 4 mg/mL of USP Argatroban RS in methanol

Sample solution: 4 mg/mL of Argatroban in methanol

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 259 nm

Column: 4.6-mm × 25-cm; 3-μm packing L1

Temperatures

Column: 50°

Autosampler: 4°

Flow rate: 0.6 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5 for both peaks

Relative standard deviation: NMT 1.0% for the sum of the peak responses of (R)-argatroban and (S)-argatroban

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of argatroban (C₂₃H₃₆N₆O₅S) in the portion of Argatroban taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = sum of the peak responses of (R)-argatroban and (S)-argatroban from the *Sample solution*

r_S = sum of the peak responses of (R)-argatroban and (S)-argatroban from the *Standard solution*

C_S = concentration of USP Argatroban RS in the *Standard solution* (mg/mL)

C_U = concentration of Argatroban in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% of argatroban (C₂₃H₃₆N₆O₅S) on the anhydrous and solvent-free basis

IMPURITIES

- **Residue on Ignition** 〈 281 〉: NMT 0.1%
- **Organic Impurities**

[Note—It is recommended to keep all solutions containing argatroban at about 4°.]

Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

Sensitivity solution: 2 μg/mL of USP Argatroban RS in methanol

Standard solution: 4 μg/mL each of USP Argatroban RS, USP Argatroban Related Compound A RS, and USP Argatroban Related Compound B RS in methanol

System suitability

Samples: *Sensitivity solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.2 between (*R*)-argatroban and (*S*)-argatroban, *Standard solution*

Signal-to-noise ratio: NLT 10 for (*R*)-argatroban, *Sensitivity solution*

Relative standard deviation: NMT 5% for all peaks. For argatroban, use the sum of the peak responses of (*R*)-argatroban and (*S*)-argatroban, *Standard solution*.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of argatroban related compound A and argatroban related compound B in the portion of Argatroban taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of argatroban related compound A or argatroban related compound B from the *Sample solution*

r_S peak response of argatroban related compound A or argatroban related compound B from the *Standard solution*

C_S concentration of USP Argatroban Related Compound A RS or USP Argatroban Related Compound B RS in the *Standard solution* (mg/mL)

C_U concentration of Argatroban in the *Sample solution* (mg/mL)

Calculate the percentage of any unspecified impurity in the portion of Argatroban taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of any unspecified impurity from the *Sample solution*

r_S sum of the peak responses of (*R*)-argatroban and (*S*)-argatroban from the *Standard solution*

C_S concentration of USP Argatroban RS in the *Standard solution* (mg/mL)

C_U concentration of Argatroban in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*. Disregard any peak below 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

BRIEFING

Barium Hydroxide Lime, *USP 38* page 2369. In preparation for the omission of the flame tests from *Identification Tests—General* $\langle 191 \rangle$, proposed in *PF 41(2)* [Mar.–Apr. 2015], it is proposed to revise *Identification* test *B* to include only the *Chemical Identification Tests* as described in the proposal. The optional test for the identification of potassium using the flame test is proposed for deletion for consistency with the *Soda Lime* monograph as both of

these articles are used only to remove carbon dioxide from anesthetic gases.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM4: R. Ravichandran.)

Correspondence Number—C157837

Comment deadline: July 31, 2015

Barium Hydroxide Lime

DEFINITION

Barium Hydroxide Lime is a mixture of barium hydroxide octahydrate and Calcium Hydroxide. It may also contain Potassium Hydroxide and may contain an indicator that is inert toward anesthetic gases such as Ether, Cyclopropane, and Nitrous Oxide and that changes color when the Barium Hydroxide Lime no longer can absorb carbon dioxide.

[**Caution**—Because Barium Hydroxide Lime contains a soluble form of barium, it is toxic if swallowed.]

IDENTIFICATION

- **A.**

Analysis: Place a granule of it on a piece of moistened red litmus paper.

Acceptance criteria: The paper turns blue immediately.

Delete the following:

- ~~• **B. Identification Tests—General, Barium, Calcium, and Potassium** < 191 >~~

~~**Sample solution:** 100 mg/mL in 6 N acetic acid~~

~~**Acceptance criteria:** Meets the requirements for *Barium* and for *Calcium*, and it may meet the requirement of the flame test for *Potassium*. ■ 1S (USP39)~~

Add the following:

- ~~• **B. Identification Tests—General** < 191 >, *Barium*~~

~~**Sample solution:** 100 mg/mL in 6 N acetic acid~~

~~**Acceptance criteria:** Meets the requirements ■ 1S (USP39)~~

Add the following:

- ~~• **C. Identification Tests—General** < 191 >, *Calcium*~~

~~**Sample solution:** 100 mg/mL in 6 N acetic acid~~

~~**Acceptance criteria:** Meets the requirements ■ 1S (USP39)~~

SPECIFIC TESTS

- **Particle Size Distribution Estimation by Analytical Sieving** < 786 >

Sample: 100 g

Analysis: Screen the *Sample* for 5 min as directed in the chapter, using a mechanical shaker.

Acceptance criteria: It passes completely through a No. 2 standard-mesh sieve, and NMT 2.0% passes through a No. 40 standard-mesh sieve. NMT 7.0% is retained on the coarse-mesh sieve, and NMT 15.0% passes through the fine-mesh sieve designated on the label.

- **Loss on Drying** 〈 731 〉

Sample: 10 g

Analysis: Weigh the *Sample* in a tared weighing bottle, and dry at 105° for 2 h.

Acceptance criteria: 11.0%–16.0%

- **Hardness**

Sample: 200 g

Analysis: Screen the *Sample* on a mechanical sieve shaker (see 〈 786 〉) with a frequency of oscillation of 285 ± 3 cycles/min, for 3 min, to remove granules coarser than 4-mesh and finer than 8-mesh. Weigh 50 g of the granules retained on the screen, and place them in a hardness pan that has a diameter of 200 mm and a concave brass bottom. The bottom of the pan is 7.9 mm thick at the circumference and 3.2 mm thick at the center and has an inside spherical radius of curvature of 109 cm. Add 15 steel balls of 7.9-mm diameter, and shake on a mechanical sieve shaker for 30 min. Remove the steel balls, brush the contents of the hardness pan onto a sieve of the fine-mesh size designated on the label, shake for 3 min on the mechanical sieve shaker, and weigh.

Acceptance criteria: The percentage of Barium Hydroxide Lime retained on the screen is NLT 75.0% and represents the hardness.

- **Carbon Dioxide Absorbency**

Analysis: Fill the lower transverse section of a U-shaped drying tube of about 15-mm internal diameter and 15-cm height with loosely packed glass wool. Place in one arm of the tube about 5 g of anhydrous calcium chloride, and weigh the tube and the contents. Into the other arm of the tube, place 9.5–10.5 g of Barium Hydroxide Lime, and again weigh. Insert stoppers in the open arms of the U-tube, and connect the side tube of the arm filled with Barium Hydroxide Lime to a calcium chloride drying tube, which in turn is connected to a suitable supply source of carbon dioxide. Pass the carbon dioxide through the U-tube at a rate of 75 mL/min for 20 min, timed. Disconnect the U-tube, cool to room temperature, remove the stoppers, and weigh.

Acceptance criteria: The increase in weight is NLT 19.0% of the weight of Barium Hydroxide Lime used for the test.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers.
- **Labeling:** If an indicator has been added, the name and color change of such indicator are stated on the container label. The container label indicates also the mesh size in terms of standard-mesh sieve sizes (see *Powder Fineness* 〈 811 〉).

BRIEFING

Biological Indicator for Dry-Heat Sterilization, Paper Carrier, *USP 38* page 2435. This monograph is being proposed for deletion, and appropriate content from this monograph has been moved into *USP* general information chapter *Biological Indicators for Sterilization* 〈 1229.5 〉, which was proposed in *PF 41(2)* [Mar.–Apr. 2015]. No monograph or chapter is impacted by

this omission.

■ Biological Indicator for Dry Heat Sterilization, Paper Carrier

» ~~Biological Indicator for Dry Heat Sterilization, Paper Carrier, is a defined preparation of viable spores made from a culture derived from a specified strain of *Bacillus subtilis* subspecies *niger*, on a suitable grade of paper carrier, individually packaged in a container readily penetrable by dry heat, and characterized for predictable resistance to dry heat sterilization. The packaged Biological Indicator for Dry Heat Sterilization, Paper Carrier, has a particular labeled spore count per carrier of not less than 10^4 and not more than 10^9 spores. When labeled for and subjected to dry heat sterilization conditions at a particular temperature, it has a survival time and kill time appropriate to the labeled spore count and to the decimal reduction value (*D value*, in min) of the preparation, specified by:~~

~~*Survival time* (in minutes) = not less than (labeled *D value*) × (log labeled spore count per carrier − 2); and~~

~~*Kill time* (in minutes) = not more than (labeled *D value*) × (log labeled spore count per carrier + 4).~~

~~**Packaging and storage**—Preserve in the original package under the conditions recommended on the label, and protect from light, toxic substances, excessive heat, and moisture. The packaging and container materials do not adversely affect the performance of the article used as directed in the labeling.~~

~~**Expiration date**—The expiration date is determined on the basis of stability studies and is not less than 18 months from the date of manufacture, the date of manufacture being the date on which the first determination of the total viable spore count was made.~~

~~**Labeling**—Label it to state that it is a Biological Indicator for Dry Heat Sterilization, Paper Carrier; to indicate its *D value* and the method used to determine such *D value*, i.e., by spore count or fraction negative procedure after graded exposures to the sterilization conditions; the survival time and kill time under the specified sterilization conditions stated on the label; its particular total viable spore count, with a statement that such count has been determined after preliminary heat treatment; and its recommended storage conditions. State in the labeling the size of the paper carrier, the strain and ATCC number from which the spores were derived, and instructions for spore recovery and for safe disposal of the indicator. Indicate in the labeling that the stated *D value* is reproducible only under the exact conditions under which it was determined, that the user would not necessarily obtain the same result, and that the user should determine the suitability of the biological indicator for the particular use.~~

Identification—The biological indicator organism complies substantially with the morphological, cultural, and biochemical characteristics of the strain of *Bacillus subtilis*, ATCC No. 9372, designated subspecies *niger*, detailed for that biological indicator organism under *Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier*.

Resistance performance tests—

D value— Proceed as directed for the relevant procedure for *D value* under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if the determined *D value* is within 20% of the labeled *D value* for the selected sterilizing temperature, and if the confidence limits of the estimate are within 10% of the determined *D value*.

Survival time and kill time— Proceed as directed for *Survival Time and Kill Time* in the section *Dry Heat Sterilization, Paper Carrier*, under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if all of the specimens subjected to dry-heat sterilization for the survival time show evidence of growth, while none of the specimens subjected to dry-heat sterilization for the kill time show growth. If for either the survival time test or the kill time test not more than 1 specimen out of both groups fails the survival requirement or the kill requirement (whichever is applicable), continue the corresponding test with 4 additional groups, each consisting of 20 specimens, according to the procedure described. If all of the additional specimens subjected to dry-heat sterilization either meet the survival requirement for the survival time test or meet the kill requirement for the kill time test, whichever is applicable, the requirements of the test are met.

Total viable spore count— Proceed as directed for *Total Viable Spore Count* under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if the log average number of viable spores per carrier is not less than 0.3 log of the labeled spore count per carrier and does not exceed the log labeled spore count per carrier by 0.48.

Purity—

Presence of contamination by other microorganisms— By examination of the spores on a suitable plate culture medium, there is no evidence of contamination with other microorganisms.

Disposal—Prior to destruction or discard, sterilize it by steam at 121° for not less than 30 minutes, or by not less than an equivalent method recommended by the manufacturer. This includes a test strip employed in any test procedures for the strips themselves. ■1S (USP39)

BRIEFING

Biological Indicator for Ethylene Oxide Sterilization, Paper Carrier, USP 38 page 2435. Indicate in the labeling that the stated *D value* is reproducible only under the exact conditions under which it was determined, that the user would not necessarily obtain the same result, and that the user should determine the suitability of the biological indicator for the particular use.~~

~~**Identification**—The biological indicator organism complies substantially with the morphological, cultural, and biochemical characteristics of the strain of *Bacillus subtilis*, ATCC No. 9372,~~

designated subspecies *niger*: under microscopic examination it consists of Gram-positive rods of width 0.7 to 0.8 μm , and length 2 to 3 μm ; the endospores are oval and central and the cells are not swollen; when incubated aerobically in appropriate media at 30° to 35°, growth occurs within 24 hours, and similar inoculated media incubated concomitantly at 55° to 60° show no evidence of growth in the same period; agar colonies have a dull appearance and may be cream or brown colored; when incubated in nutrient broth it develops a pellicle, and shows little or no turbidity; when examined under conventional biochemical tests for microbial characterization, it develops a black pigment with tyrosine, it liquefies gelatin, utilizes citrate but not propionate or hippurate, reduces nitrate, and hydrolyzes both starch and glucose with no gas production; it shows a positive catalase reaction and gives a positive result with the Voges-Proskauer test.

Resistance performance tests—

D value— Proceed as directed for the relevant procedure for *D value* under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if the determined *D value* is within 20% of the labeled *D value* for the selected sterilizing temperature and if the confidence limits of the estimate are within 10% of the determined *D value*.

Survival time and kill time— Proceed as directed for *Survival Time and Kill Time* in the section *Ethylene Oxide Sterilization, Paper Carrier*, under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if all of the specimens subjected to the ethylene oxide sterilization conditions for the survival time show evidence of growth, while none of the specimens subjected to the ethylene oxide sterilization conditions for the kill time shows evidence of growth. If for either the survival time test or the kill time test, not more than 1 specimen out of both groups fails the survival requirement or the kill requirement (whichever is applicable), continue the corresponding test with 4 additional groups, each consisting of 20 specimens, according to the procedure described. If all of the additional specimens subjected to ethylene oxide sterilization meet either the survival requirement for the survival time test or the kill requirement for the kill time test, whichever is applicable, the requirements of the test are met.

Total viable spore count— Follow the procedure for *Total Viable Spore Count* in the section *Ethylene Oxide Sterilization, Paper Carrier*, under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if the log average number of viable spores per carrier is not less than 0.3 log of the labeled spore count per carrier and does not exceed the log labeled spore count per carrier by 0.48.

Purity—

Presence of contamination by other microorganisms— By examination of the spores on a suitable plate culture medium, there is no evidence of contamination with other microorganisms.

Disposal— Prior to destruction or discard, sterilize it by steam at 121° for not less than 30 minutes, or by not less than an equivalent method recommended by the manufacturer. This includes a strip used in test procedures for strips themselves. ■ 1S (USP39)

■ Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions

» ~~Liquid spore suspensions may be used to prepare biological indicators for moist heat, dry heat, and gaseous modes of sterilization. On the basis of the intended sterilization use, the suspension is prepared inoculated from a culture of viable spores derived from one of several sterilization resistant microorganisms. Cultures used for liquid spore suspensions include, among others, the following: *Clostridium sporogenes*, *Geobacillus stearothermophilus* (formerly *B. stearothermophilus*), *Bacillus atrophaeus* (formerly *B. subtilis*), *Bacillus subtilis*, or *Bacillus coagulans*. Each tube or container containing the spore suspension is individually packaged for use. The packaged biological indicator spore suspension has a particular labeled spore count of not less than 10^3 , and not more than 10^9 , spores per mL of suspension. The suspending medium or vehicle is identified according to chemical composition. It has a survival time and kill time appropriate to the labeled spore count, and to the decimal reduction value (the *D value*, in minutes), specified by the following:~~

~~*Survival time* (in minutes) = not less than (labeled *D value*) × (log of labeled spore count per mL from 1:100 dilution of original suspension – 2);~~
and

~~*Kill time* (in minutes) = not more than (labeled *D value*) × (log of labeled spore count per mL from 1 : 100 dilution of original suspension + 4).~~

Packaging and storage—~~Preserve in the original tube or container under the conditions recommended on the label, and protect the contents of the tube or container from light, toxic substances, and excessive heat. The materials of composition of the tube or container must not adversely affect the performance of the spore suspension.~~

Expiration date—~~The expiration date is determined on the basis of stability studies. The date of manufacture is the date on which the first determination of the total viable count was made.~~

Labeling—~~Label the spore suspension tube or container or package insert to state that it is a biological indicator spore suspension for use in label specified applications for moist heat, dry~~

heat, and/or gaseous sterilization. State the biological indicator *D value* obtained under defined exposures to stated sterilization conditions using the Survival Curve Method of *D value* analysis. State the *Survival time and kill time* for the biological indicator suspension under specified conditions on the label. The total viable spore count per mL of the suspension following heat shock treatment must also appear on the label. State in the labeling the strain and ATCC number of the microorganisms used in the spore suspension and instructions for spore recovery and for safe disposal of the suspension. Indicate in the labeling that the stated *D value* is reproducible only under the exact conditions determined by the manufacturer and that the user would not necessarily obtain the same results if different exposure conditions were used. State that the user should determine the suitability of the biological indicator spore suspension for the user's particular purpose and exposure conditions.

Identification—Identification for the biological indicator is of lesser importance than the more relevant concerns of population and resistance to the sterilization processes. The manufacturer should identify the species used.

D value—If the biological indicators are being used in moist heat or dry heat sterilization, proceed as directed for the relevant procedure in the section *D Value Determination under Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if the determined *D value* is within 20% of the labeled *D value* for the selected sterilizing conditions, and if the confidence limits of the estimate are within 10% of the determined *D value*. The *D value* determination method used should be that identified by the biological indicator manufacturer.

Survival time and kill time—Follow the procedure under *Survival Time and Kill Time* in the section *D Value Determination under Biological Indicators—Resistance Performance Tests* (55). The test is conducted using 1:100 dilution aliquots of the original suspension to inoculate carrier substrates that are most likely to be used by the purchaser of the spore suspensions for a given mode of sterilization. Following a total viable count analysis, the inoculated substrates are subjected to sterilization exposure conditions intended to indicate survival. The inoculated carriers must show evidence of growth among the exposed carriers. A second study is conducted to demonstrate the conditions necessary to result in total kill of the carriers. None of the carriers subjected to conditions designed to induce total kill should show growth. If for either the survival time test or the kill time test, not more than one carrier out of both groups fails the survival or kill requirements, continue the corresponding test with four additional groups, each consisting of 10 carriers, according to the procedure described. For biological indicators for use with moist heat or dry heat sterilization, if all of the additional specimens subjected to the specific sterilization process either meet the survival requirements for the survival time test or meet the kill requirement for the kill time test, whichever is applicable, the requirements are met.

Total viable spore count—Proceed as directed for *Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Liquid Spore Suspensions* in the section *Total Viable Spore Count* under *Biological Indicators—Resistance Performance Tests* (55). The requirements for this test are met if the total viable spore count within the suspension is within ± 1 log of the value stipulated by the manufacturer.

Purity—There is no evidence of contamination with other microorganisms following examination of spores recovered from the metal carriers using suitable plate culture medium.

~~**Shipment**—Spore suspensions must be shipped following EPA requirements for the shipment of biological and/or etiological agents.~~

~~**Disposal**—Spore suspensions that a user or manufacturer wishes to dispose of are first sterilized by moist heat by a process that achieves temperatures of approximately 121 °C for not less than 30 minutes. Alternative sterilization methods yielding equivalent or greater levels of lethality may be used. ■1S (USP39)~~

■ Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Nonpaper Carriers

~~» Biological indicators for moist heat, dry heat, and gaseous modes of sterilization may be nonpaper carriers inoculated with a culture of viable spores derived from one of several sterilization resistant microorganisms, based on the intended sterilization use. Cultures used for inoculation of carriers include, among others, *Clostridium sporogenes*, *Geobacillus stearothermophilus* (formerly *B. stearothermophilus*), *Bacillus atrophaeus* (formerly *B. subtilis*), or *Bacillus coagulans*. The carriers should be individually packaged for use either within the package or for use upon removal from the package as an unpackaged biological indicator. The packaged biological indicator on the carrier has a particular labeled spore count of not less than 10^3 and not more than 10^9 spores per carrier. It has a survival time and kill time appropriate to the labeled spore count and to the decimal reduction value (*D value*, in minutes), specified by:~~

~~*Survival time* (in minutes) = not less than (labeled *D value*) × (log of labeled spore count per carrier – 2), and~~

~~*Kill time* (in minutes) = not more than (labeled *D value*) × (log of labeled spore count per carrier + 4).~~

~~**Packaging and storage**—Preserve in the original package under the conditions recommended on the label, and protect the package from light, toxic substances, excessive heat, and high~~

relative humidity or moisture. The packaging or container materials do not adversely affect the performance of the article used as directed in the labeling.

Expiration date—The expiration date is determined on the basis of stability studies and is not more than 18 months from the date of manufacture. The date of manufacture is the date on which the first determination of the total viable count was made.

Labeling—Label the package or package insert to state that it is a biological indicator prepared on a carrier for use in label specified applications for moist heat, dry heat, and/or gaseous sterilization. State the biological indicator *D value* obtained under defined exposures to stated sterilization conditions using the Survival Curve method, Spearman-Kärber method, or Stumbo-Murphy-Cochran method of *D value* analysis. State the survival time and kill time for the biological indicator carrier under specified conditions on the label. The total viable spore count per carrier following heat shock treatment must also appear on the label or package insert. State in the labeling the strain and ATCC number of the spore suspension used to inoculate the carriers and instructions for spore recovery and for safe disposal of the carriers. Indicate in the labeling that the stated *D value* is reproducible only under the exact conditions determined by the manufacturer and that the user would not necessarily obtain the same results if different exposure conditions were used. State that the user should determine the suitability of the carrier biological indicator for the user's particular purpose and exposure conditions.

Identification—Identification for the biological indicator is of less importance than the more relevant concerns of population and resistance to the sterilization processes. The manufacturer should identify the species used.

D value—Proceed as directed in the relevant procedure for *D Value Determination under Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if the determined *D value* is within 20% of the labeled *D value* for the selected sterilizing conditions, and if the confidence limits of the estimate are within 10% of the determined *D value*. The *D value* determination method used should be that identified by the biological indicator manufacturer.

Survival time and kill time—Follow the procedure in the subsection *Survival Time and Kill Time* in the section *D Value Determination* under the chapter *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if all of the carriers subjected to sterilization exposure conditions intended to indicate survival show evidence of growth among the exposed carriers, while none of the carriers subjected to conditions designed to induce total kill show growth. If for either the survival test or the kill time test, not more than one carrier out of both groups fails the survival or kill requirements, continue the corresponding test with four additional groups, each consisting of 10 carriers, according to the procedure described. If all of the additional specimens subjected to the specific sterilization process either meet the survival requirements for the survival test time or meet the kill requirement for the kill test, whichever is applicable, the requirements are met.

Total viable spore count—Proceed as directed in the subsection *Biological Indicators for Moist Heat, Dry Heat, and Gaseous Modes of Sterilization, Nonpaper Carriers* in the section *Total Viable Spore Count* under the chapter *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if the average number of viable spores per carrier are within $-50%$ and $+300%$ of the labeled count per carrier or within a lesser range that may be

~~stated by the manufacturer.~~

~~**Purity**—There is no evidence of contamination with other microorganisms following examination of spores recovered from the carriers using a suitable plate culture medium.~~

~~**Disposal**—Prior to destruction or discarding the carriers, sterilize by moist heat sterilization to ensure that the carrier surface is exposed to 121 °C for not less than 30 minutes, or by an equivalent method recommended by the manufacturer. ■1S (USP39)~~

BRIEFING

Biological Indicator for Steam Sterilization, Paper Carrier, *USP 38* page 2438. This monograph is being proposed for deletion, and appropriate content from this monograph has been moved into *USP* general information chapter *Biological Indicators for Sterilization* (1229.5), which was proposed in *PF* 41(2) [Mar.–Apr. 2015]. No monograph or chapter is impacted by this omission.

■ **Biological Indicator for Steam Sterilization, Paper Carrier**

~~» Biological Indicator for Steam Sterilization, Paper Carrier, is a defined preparation of viable spores made from a culture derived from a specified strain of *Bacillus stearothermophilus*, on a suitable grade of paper carrier, individually packaged in a suitable container readily penetrable by steam, and characterized for predictable resistance to steam sterilization. The packaged Biological Indicator for Steam Sterilization, Paper Carrier, has a particular labeled spore count per carrier of not less than 10^4 and not more than 10^9 spores. When labeled for and subjected to steam sterilization conditions at a particular temperature, it has a survival time and kill time appropriate to the labeled spore count and to the decimal reduction value (*D value*, in minutes) of the preparation, specified by:~~

~~*Survival time* (in minutes) = not less than (labeled *D value*) × (log labeled spore count per carrier − 2); and~~

~~*Kill time* (in minutes) = not more than (labeled *D value*) × (log labeled spore count per carrier + 4).~~

~~**Packaging and storage**—Preserve in the original package under the conditions recommended on the label, and protect it from light, toxic substances, excessive heat, and moisture. The packaging and container materials do not adversely affect the performance of the article used as directed in the labeling.~~

Expiration date—The expiration date is determined on the basis of stability studies and is not less than 18 months from the date of manufacture, the date of manufacture being the date on which the first determination of the total viable spore count was made.

Labeling—Label it to state that it is a Biological Indicator for Steam Sterilization, Paper Carrier; to indicate its *D value*, the method used to determine such *D value*, i.e., by spore count or fraction negative procedure after graded exposures to the sterilization conditions; the survival time and kill time under specified sterilization conditions stated on the label; its particular total viable spore count with a statement that such count has been determined after preliminary heat treatment; and its recommended storage conditions. State in the labeling the size of the paper carrier, the strain and ATCC number from which the spores were derived, and instructions for spore recovery and for safe disposal of the indicator. Indicate in the labeling that the stated *D value* is reproducible only under the exact conditions under which it was determined; that the user would not necessarily obtain the same result and that the user should determine the suitability of the biological indicator for the particular use.

Identification—The biological indicator organism complies substantially with the morphological, cultural, and biochemical characteristics of the strain of *Bacillus stearothermophilus*, ATCC No. 7953 or 12980, whichever is stated in the labeling: under microscopic examination it consists of Gram positive rods with oval endospores in subterminally swollen cells; when incubated in nutrient broth for 17 hours and used to inoculate appropriate solid media, growth occurs when the inoculated media are incubated aerobically for 24 hours at 55 ° to 60 °, and similar inoculated media incubated concomitantly at 30 ° to 35 ° show no evidence of growth in the same period. When examined under conventional biochemical tests for microbial characterization, it shows a delayed weak positive catalase reaction, it does not utilize citrate, propionate or hippurate, it reduces nitrate, but it does not liquefy gelatin, and it gives a negative result with the Voges-Proskauer test. Organisms derived from ATCC strain No. 7953 show negative egg yolk and starch hydrolysis reactions, while those derived from ATCC strain No. 12980 show positive reactions in both tests.

Resistance performance tests—

D value— Proceed as directed for the relevant procedure for *D Value* under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if the determined *D value* is within 20% of the labeled *D value* for the selected sterilizing temperature, and if the confidence limits of the estimate are within 10% of the determined *D value*.

Survival time and kill time— Follow the procedure for *Survival Time and Kill Time* in the section *Steam Sterilization, Paper Carrier, under Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if all of the specimens subjected to the steam sterilization for the survival time show evidence of growth, while none of the specimens subjected to the steam sterilization for the kill time shows growth. If for either the survival time test or the kill time test, not more than 1 specimen out of both groups fails the survival requirement or the kill requirement (whichever is applicable), continue the corresponding test with 4 additional groups, each consisting of 20 specimens, according to the procedure described. If all of the additional specimens subjected to steam sterilization either meet the survival requirement for the survival time test or meet the kill requirement for the kill time test, whichever is applicable, the requirements of the test are met.

~~Total viable spore count— Proceed as directed for *Total Viable Spore Count* in the section *Steam Sterilization, Paper Carrier*, under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the tests are met if the log average number of viable spores per carrier is not less than 0.3 log of the labeled spore count per carrier and does not exceed the log labeled spore count per carrier by 0.48.~~

~~**Purity—**~~

~~*Presence of contamination by other microorganisms—* By examination of the spores on a suitable plate culture medium, there is no evidence of contamination with other microorganisms.~~

~~**Disposal—** Prior to destruction or discard, sterilize it by steam at 121° for not less than 30 minutes, or by not less than an equivalent method recommended by the manufacturer. This includes a test strip employed in any test procedures for the strips themselves. ■ 1S (USP39)~~

■ **Biological Indicator for Steam Sterilization, Self-Contained**

~~» Biological Indicator for Steam Sterilization, Self-Contained, is a Biological Indicator for Steam Sterilization, Paper Carrier individually packaged in a suitable container readily penetrable by steam and designed to hold an appropriate bacteriological culture medium, so as to enable the packaged carrier, after subjection to saturated steam sterilization conditions, to be incubated in the supplied medium in a self-contained system. The supplied medium may contain a suitable indicator as a convenience for determining by a color change whether or not spores have survived. The design of the self-contained system is such that, after exposure to the specified sterilization conditions and inoculation of the medium under closed conditions as stated in the labeling, there is no loss of medium and inoculum during subsequent transport and handling, if done according to the provided instructions. The materials of which the self-contained system are made are such that there is no retention or release of any substance that may cause inhibition of growth of surviving spores under the incubation~~

~~conditions stated in the labeling.~~

Packaging and storage—~~Preserve in the original package under the conditions recommended on the label, and protect from light, from substances that may adversely affect the contained microorganisms, from excessive heat, and from moisture.~~

Expiration date—~~The expiration date is determined on the basis of stability studies and is not less than 18 months from the date of manufacture, the date of manufacture being the date on which the first determination of the total viable spore count was made.~~

Labeling—~~Label it to state that it is a Biological Indicator for Steam Sterilization, Self-Contained; to indicate the *D value* of the self-contained system, the method used to determine such *D value* (i.e., by spore count or fraction negative procedure after graded exposures to the sterilization conditions); the survival time and kill time under the specified conditions stated on the label; its particular total viable spore count, with a statement that such count has been determined after preliminary heat treatment; and its recommended storage conditions. State on the labeling that the supplied bacteriological medium will meet requirements for growth-promoting ability, the strain and ATCC number from which the spores were derived, and the instructions for spore recovery and for safe disposal of the indicator unit. Also indicate in the labeling that the stated resistance characteristics are reproducible only under steam sterilization conditions at the stated temperature and only under the exact conditions under which it was determined, that the user would not necessarily obtain the same result, and that the user should determine the suitability of the biological indicator for the particular use.~~

Identification—~~It meets the requirements of the *Identification* test under *Biological Indicator for Steam Sterilization, Paper Carrier*.~~

Resistance performance tests—

D value—~~Proceed as directed for the relevant procedure for *D Value* under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if the determined *D value* is within 20% of the labeled *D value* for the selected sterilizing temperature and if the confidence limits of the estimate are within 10% of the determined *D value*.~~

Survival time and kill time—~~Follow the procedure for *Survival Time and Kill Time* in the section *Steam Sterilization, Self-Contained*, under *Biological Indicators—Resistance Performance Tests* (55). The requirements of the test are met if all of the specimens subjected to the steam sterilization for the survival time show evidence of growth, while none of the specimens subjected to the steam sterilization for the kill time shows growth. If for either the survival time or the kill time requirement, not more than 1 specimen out of both groups fails the test, whichever is applicable, continue the corresponding test with 4 additional groups, each consisting of 10 specimens, according to the procedure described above. If all of the additional specimens subjected to steam sterilization either meet the survival requirement for the survival time test or meet the kill requirement for the kill time test, whichever is applicable, the requirements of the test are met.~~

Total viable spore count—~~Proceed as directed for *Total Viable Spore Count* under *Biological Indicators—Resistance Performance Tests* (55) using the procedure applicable to *Biological Indicator for Steam Sterilization, Paper Carrier*. The requirements of the test are met if the average number of viable spores per carrier is not less than 0.3 log of the labeled spore count~~

per carrier and does not exceed the log-labeled spore count per carrier by 0.48.

Medium suitability—

Sterility— Incubate 10 self-contained biological indicator systems at 55° to 60°, or at the optimal recovery temperature specified by the manufacturer, for 48 hours, making sure that there is no contact between the individual spore strips and the supplied medium. Examine the incubated medium visually (for change in color indicator or turbidity) and microscopically (for absence of microbial growth).

Growth promotion of medium prior to sterilization treatment— Submerge 10 self-contained units in a water bath maintained at 95° to 100° for 15 minutes. Start timing when the temperature of the container contents reach 95°. Cool rapidly in an ice-water bath (0° to 4°). Remove the units from the ice-water bath, submerge each spore strip with the self-contained medium, incubate at 55° to 60°, or at the optimal recovery temperature specified by the manufacturer, and examine visually after 48 hours for growth (for turbidity or change in color), and microscopically (for microbial growth). All the specimens under test show growth. If one or more of the specimens do not show growth, repeat the test with 20 additional units. The additional units all show growth.

Growth promotion of medium after exposure to sterilization conditions— Expose the specified number of units for both the *Survival Time* and *Kill time* stated in the labeling, as described in the section *Biological Indicator for Steam Sterilization, Self-Contained* under *Biological Indicators—Resistance Performance Tests (55)*. Incubate the spore strips submerged in the self-contained medium according to the instructions of the manufacturer. At the end of the incubation period confirm the existence of growth in each of the specimens that were exposed for each *Survival time* and the absence of growth in each of the specimens that were exposed for each *Kill time* by visual inspection (turbidity or color indicator change) and by separate microscopic examination of each specimen and confirm, where applicable, correspondence of the labeled color to the appearance of growth in the supplied medium.

Ability of medium to support growth after exposure to the sterilization conditions— Take a stated number of units (e.g., 10) after they have been exposed for each *Kill time* stated in the labeling as directed in the preceding section. Aseptically remove and pool the medium from each unit. Prepare a suspension of the indicator microorganism as directed for *Total Viable Spore Counts* under *Biological Indicator for Steam Sterilization, Paper Carrier*. Prepare a dilution of that suspension so as to contain 100 to 1000 viable microorganisms in one mL. Inoculate the pooled medium with enough suspension to contain a total of 100 to 1000 microorganisms in a 10-mL aliquot of not more than the volume from 10 units of the pooled medium. Incubate the inoculated pooled medium as directed for *Total Viable Spore Count*. Clear evidence of growth is obtained within 7 days.

Disposal— Prior to destruction or discard, sterilize it by steam at 121° for not less than 30 minutes, or by not less than an equivalent method recommended by the manufacturer. This includes test strips employed in any test procedures for the strips themselves. ■ 1S (USP39)

BRIEFING

Bisectrizole, USP 38 page 2456. On the basis of comments received, the following revisions

to the monograph are proposed:

1. The mobile phase gradient *Table 1* in the *Assay* is revised to allow the bisoctrizole isomer peak to completely elute. The Machery-Nagel Nucleosil 100 C18 AB brand or YMC PACK ODS AM brand of L1 columns are found suitable. The particle size of 5- μm is specified.
2. The *Standard solution* is replaced with the *System suitability solution* for the resolution determination in the test for *Limit of Bisoctrizole Related Compound A and Bisoctrizole Isomer*.

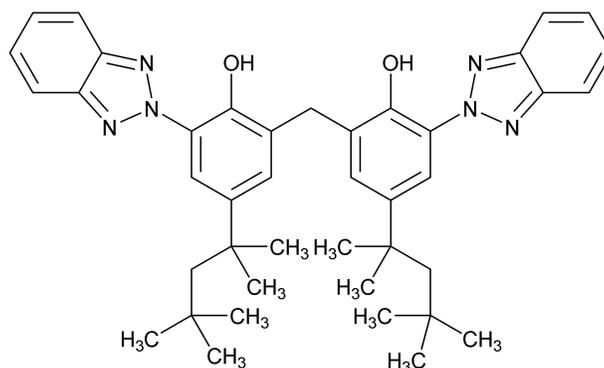

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers, and store at controlled room temperature.
- **USP Reference Standards** { 11 }
 - USP Bisotrizole RS
 - USP Bisotrizole Related Compound A RS
 - 2-(2*H*-Benzotriazol-2-yl)-4-(1,1,3,3-tetramethylbutyl) phenol.

$C_{20}H_{25}N_3$ 323.43

USP Bisotrizole Resolution Mixture RS

A mixture of approximately 1.5% of bisotrizole isomer [phenol, 2,2-methylenebis[6-(2*H*-benzotriazol-2-yl)-4-(1,1,3,3-tetramethylbutyl)]] in a matrix of bisotrizole.

BRIEFING

Bupivacaine Hydrochloride, *USP 38* page 2483. As part of USP monograph modernization efforts, it is proposed to make the following changes:

1. Revise the *Acceptance criteria* in the *Definition* and *Assay* from NLT 98.5% and NMT 101.5% to NLT 98.0% and NMT 102.0%, which are typical for chromatographic procedures.
2. Replace *Identification* test A using a hazardous solvent (chloroform) with the retention time agreement from the proposed *Assay*.
3. Replace the titration procedure in the *Assay* with a validated stability-indicating HPLC procedure. The proposed procedure is based on analyses performed with the YMC-Triart C18 brand of L1 column. The typical retention time for bupivacaine is about 13 min.
4. Replace the TLC procedure in the test for *Organic Impurities* with a validated HPLC procedure that uses the same chromatographic system as that proposed for the *Assay*.
5. A lower limit of USP Ropivacaine Related Compound A RS is proposed to harmonize with the *European Pharmacopoeia*.
6. Add USP Bupivacaine Related Compound A RS, USP Bupivacaine Related Compound B RS, and USP Ropivacaine Related Compound A RS to the *USP Reference Standards* section to support the proposed test for *Organic Impurities*.

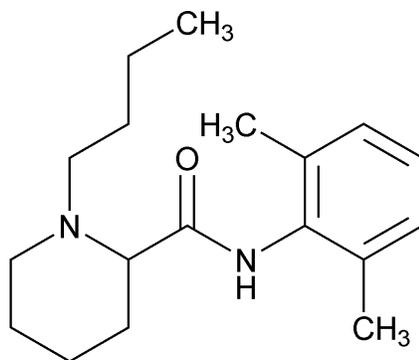

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

BRIEFING

Bupivacaine Hydrochloride Injection, USP 38 page 2484. As part of USP monograph modernization efforts, it is proposed to make the following changes:

1. Add a stability-indicating HPLC procedure to the test for *Organic Impurities*, because the present monograph is missing an impurity test. The HPLC procedure is based on analyses performed with the YMC Triart C18 brand of L1 column. The typical retention time for the bupivacaine peak in the *Organic Impurities* test is about 13 min.
2. A more selective, single HPLC procedure is used for both the *Assay* and *Organic Impurities* test.
3. Delete *Identification* test A because it is non-value added and replace it with UV spectrum matching from the proposed *Assay*.
4. Add USP Bupivacaine Related Compound A RS and USP Bupivacaine Related Compound B RS to the *USP Reference Standards* section to support the proposed test for *Organic Impurities*.
5. The limit for degradation products is based on the drug substance monograph. Manufacturers with different impurity profiles and limits are encouraged to provide this information to USP for consideration.
6. Add the storage temperature to the *Packaging and Storage* section.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

Bupivacaine Hydrochloride Injection**DEFINITION**

Bupivacaine Hydrochloride Injection is a sterile solution of Bupivacaine Hydrochloride in Water for Injection. It contains NLT 93.0% and NMT 107.0% of the labeled amount of bupivacaine hydrochloride ($C_{18}H_{28}N_2O \cdot HCl$).

IDENTIFICATION

Delete the following:

■ • A. Identification—Organic Nitrogenous Bases ~~(181)~~

Sample solution: 2 mg/mL of bupivacaine hydrochloride in 0.01 N hydrochloric acid, from Injection

Analysis: Proceed as directed in the chapter beginning with "Transfer the liquid to a separator".

Acceptance criteria: Meets the requirements ■_{1S} (USP39)

Add the following:

■ • A. The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■_{1S} (USP39)

• B. The retention time of the bupivacaine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

Change to read:

• Procedure

Buffer: 1.94 g/L of monobasic potassium phosphate and 2.48 g/L of dibasic potassium phosphate in water. Adjust, if necessary, with 1 N potassium hydroxide or 1 M phosphoric acid to a pH of 6.8.

Mobile phase: Acetonitrile and *Buffer* (65:35). Adjust, if necessary, with 1 M phosphoric acid to a pH of 7.7 ± 0.2 . Filter the solution through a membrane filter of 1 μ m or finer pore size, and degas.

Internal standard solution: 1.3 mg/mL of dibutyl phthalate in methanol

Standard solution: 0.5 mg/mL of USP Bupivacaine Hydrochloride RS, prepared as follows: In a 100 mL volumetric flask, dissolve 50 mg of USP Bupivacaine Hydrochloride RS in 10.0 mL of water, using sonication if necessary. Add 10 mL of *Internal standard solution*, and dilute with methanol to volume.

Sample solution: Nominally 0.5 mg/mL of bupivacaine hydrochloride, prepared as follows: In a 100 mL volumetric flask, transfer an amount of Injection equivalent to 50 mg of bupivacaine hydrochloride, add 10.0 mL of *Internal standard solution*, and dilute with methanol to volume.

BRIEFING

Bupivacaine Hydrochloride in Dextrose Injection, USP 38 page 2484. As part of USP monograph modernization efforts, it is proposed to make the following changes:

1. Add a stability-indicating HPLC procedure to the test for *Organic Impurities*, because the present monograph is missing an impurity test. The HPLC procedure is based on analyses performed with the YMC Triart C18 brand of L1 column. The typical retention time for the bupivacaine peak in the *Organic Impurities* test is about 13 min.
2. A more selective, single HPLC procedure is used for both the *Assay* and *Organic Impurities* test.
3. Add *Identification* test C based on UV spectrum matching from the proposed *Assay*.
4. Add USP Bupivacaine Related Compound A RS and USP Bupivacaine Related Compound B RS to the *USP Reference Standards* section to support the proposed test for *Organic Impurities*.
5. The limit for degradation products is based on the drug substance monograph. Manufacturers with different impurity profiles and limits are encouraged to provide this information to USP for consideration.
6. Add the storage temperature to the *Packaging and Storage* section.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

Bupivacaine Hydrochloride in Dextrose Injection

DEFINITION

Bupivacaine Hydrochloride in Dextrose Injection is a sterile solution of Bupivacaine Hydrochloride and Dextrose in Water for Injection. It contains NLT 93.0% and NMT 107.0% of the labeled amounts of bupivacaine hydrochloride ($C_{18}H_{28}N_2O \cdot HCl$) and dextrose ($C_6H_{12}O_6$). It contains no preservative.

IDENTIFICATION

- **A. Thin-Layer Chromatographic Identification Test** 〈 201 〉

Standard solution A: USP Bupivacaine Hydrochloride RS in water

Standard solution B: USP Dextrose RS in water

Standard solution C: USP Bupivacaine Hydrochloride RS in *Standard solution B* to obtain a solution with concentrations corresponding to the labeled concentrations of bupivacaine hydrochloride and dextrose in the Injection

Sample solution: Bupivacaine Hydrochloride in Dextrose Injection

Chromatographic system

Adsorbent: Chromatographic silica gel mixture; 0.25 mm

Application volume: See *Analysis*.

Developing solvent system: Butyl alcohol, dehydrated alcohol, glacial acetic acid, and water (6:1:1:2)

Spray reagents

Naphthalenediol reagent: Dissolve 20 mg of 1,3-naphthalenediol in 10 mL of dehydrated alcohol containing 0.2 mL of sulfuric acid.

Iodoplatinate reagent: Mix equal volumes of platinum chloride solution (3 in 1000) and potassium iodide solution (6 in 100).

Analysis: Separately apply 10 μ L each of *Standard solution A*, *Standard solution C*, and *Sample solution* to a portion of the chromatographic plate, and separately apply 1 μ L each of *Standard solution B* and *Sample solution* to the remaining portion of the plate. Dry the applications in a current of warm air, develop the chromatograms in the *Developing solvent system*, remove the plate from the developing chamber, and mark the solvent front. Dry the plate in warm circulating air, and examine the plate under short-wavelength UV light. *Acceptance criteria 1* should be met.

Spray the plate with *Naphthalenediol reagent*, heat at 90° for 5 min, and examine the plate. *Acceptance criteria 2* should be met.

Cool the plate, spray it with *Iodoplatinate reagent*, and examine the plate. *Acceptance criteria 3* should be met and also, bupivacaine appears as a blue-purple spot on a salmon-colored background, and the dextrose spots fade slightly.

Acceptance criteria

1: The R_F value of the principal spot from the *Sample solution* corresponds to those of *Standard solution A* and *Standard solution C*.

2: The R_F value of the principal blue-purple spot from the *Sample solution* corresponds to that from *Standard solution B*.

3: The R_F value of the bupivacaine spot from the *Sample solution* corresponds to those from *Standard solution A* and *Standard solution C*.

- **B.** The retention time of the bupivacaine peak of the *Sample solution* corresponds to that of

the *Standard solution*, as obtained in the Assay for *Bupivacaine Hydrochloride*.

Add the following:

- **C.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay. ■ 1S (USP39)

ASSAY

Change to read:

• **Bupivacaine Hydrochloride**

Solution A: 1.94 mg/mL of monobasic potassium phosphate and 2.48 mg/mL of dibasic potassium phosphate in water. [Note—Adjust, if necessary, with 1 N potassium hydroxide or 1 M phosphoric acid to a pH of 6.8.]

Mobile phase: Acetonitrile and *Solution A* (65:35). [Note—Adjust, if necessary, with 1 M phosphoric acid to a pH of 7.7 ± 0.2 . Pass the solution through a membrane filter of 1- μ m or finer porosity.]

Internal standard solution: 1.3 mg/mL of dibutyl phthalate in methanol

Standard solution: 0.5 mg/mL of USP Bupivacaine Hydrochloride RS prepared as follows. Dissolve 50 mg of USP Bupivacaine Hydrochloride RS in 10.0 mL of water, using sonication if necessary, in a 100-mL volumetric flask. Add 10 mL of *Internal standard solution*, and dilute with methanol to volume.

Sample solution: Nominally 0.5 mg/mL of bupivacaine hydrochloride from Injection as follows. Transfer an accurately measured volume of Injection equivalent to 50 mg of bupivacaine hydrochloride to a 100-mL volumetric flask, add 10.0 mL of *Internal standard solution*, and dilute with methanol to volume.

Chromatographic system

(See *Chromatography* ~~(621)~~, *System Suitability*.)

Mode: LC

Detector: UV 263 nm

Column: 4 mm \times 30 cm; packing L1

Flow rate: 2 mL/min

Injection size: 20 μ L

System suitability

Sample: *Standard solution*

[Note—The relative retention times for dibutyl phthalate and bupivacaine hydrochloride are about 1.2 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between bupivacaine and dibutyl phthalate

Relative standard deviation: NMT 1.0% for the ratios of the bupivacaine peak to the dibutyl phthalate peak (three replicate injections)

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of labeled amount of bupivacaine hydrochloride ($C_{18}H_{28}N_2O \cdot HCl$) in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100/L$$

~~R_S~~ peak response ratio of bupivacaine hydrochloride to the internal standard from the *Sample solution*

~~R_S~~ peak response ratio of bupivacaine hydrochloride to the internal standard from the *Standard solution*

~~C_S~~ concentration of USP Bupivacaine Hydrochloride RS, in the *Standard solution* (mg/mL)

~~C_S~~ nominal concentration of bupivacaine hydrochloride in the *Sample solution* (mg/mL)

L = label claim (mg/volume of Injection)

Acceptance criteria: ~~93.0%–107.0%~~

■ **Solution A:** 10 mM ammonium bicarbonate in water. Adjust with ammonium hydroxide to a pH of 9.0.

Solution B: Acetonitrile, methanol, and isopropyl alcohol (85:10:5)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.0	90	10
1.0	90	10
5.0	55	45
8.0	45	55
16.0	10	90
18.0	10	90
18.1	90	10
20.0	90	10

Diluent: Acetonitrile and water (20:80)

Standard solution: 0.2 mg/mL of USP Bupivacaine Hydrochloride RS in *Diluent*

Sample solution: Nominally 0.2 mg/mL of bupivacaine hydrochloride in *Diluent* from Injection prepared as follows. Transfer the contents of Injection to a volumetric flask of appropriate size, dilute with *Diluent* to volume, and mix.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm. For *Identification test C*, use a diode array detector in the range of 190–300 nm.

Column: 2.0-mm × 10-cm; 1.9- μ m packing L1

Column temperature: 45°

Flow rate: 0.25 mL/min

Injection volume: 2 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of bupivacaine hydrochloride ($C_{18}H_{28}N_2O \cdot HCl$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U

= peak response from the *Sample solution*

r_S

= peak response from the *Standard solution*

C_S

= concentration of USP Bupivacaine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U

= nominal concentration of bupivacaine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 93.0%–107.0% ■ 1S (USP39)

• Dextrose

Analysis: Determine the angular rotation of the Injection in a suitable polarimeter tube (see *Optical Rotation* 〈 781 〉).

Calculate the percentage of the labeled amount of dextrose ($C_6H_{12}O_6$) in the portion of Injection taken:

$$\text{Result} = \{[(A \times R)/F] \times 100\} \times (100/L)$$

A = 100 mm divided by the length of the polarimeter tube (mm)

R = observed rotation (degrees)

F = midpoint of the specific rotation range for anhydrous dextrose, 52.9°

L = label claim of dextrose (g/100 mL)

Acceptance criteria: 93.0%–107.0%

IMPURITIES

Add the following:

■ • Organic Impurities

Solution A, Solution B, Mobile phase, Diluent, and Chromatographic system: Proceed as directed in the Assay.

BRIEFING

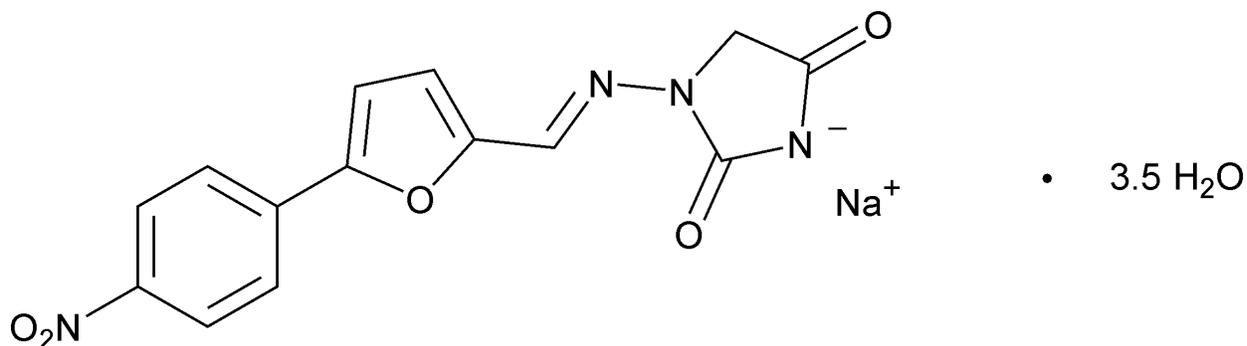

Dantrolene Sodium, *USP 38* page 2997. In preparation for the omission of the flame tests from general chapter *Identification Tests—General* 〈 191 〉, proposed in *PF 41(2)* [Mar.–Apr. 2015], it is proposed to replace the use of the flame test in *Identification* test *C* with the pyroantimonate precipitation test currently described in this general chapter and to add a second multi-step precipitation reaction as *Identification* test *D*. Proposed *Identification* test *C* is consistent with 2.3.1 *Identification reactions of ions and functional groups* in the *European Pharmacopoeia*. The preparation of the *Sample solution* within the proposed *Identification* test *C* as well as the test proposed as *Identification* test *D* are adopted from the *Dantrolene Sodium* monograph published in the 2014 *British Pharmacopoeia*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

2,4-Imidazolidinedione, 1-[[[5-(4-nitrophenyl)-2-furanyl]methylene]amino]-, sodium salt, hydrate (2:7);

1-[[5-(*p*-Nitrophenyl)furfurylidene]amino]hydantoin sodium salt hydrate [24868-20-0].

DEFINITION

Dantrolene Sodium contains NLT 90.0% and NMT 96.0% of dantrolene ($C_{14}H_{10}N_4O_5$), the free acid form of Dantrolene Sodium, calculated on the anhydrous basis.

IDENTIFICATION

- **A. Infrared Absorption** < 197K >
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

Change to read:

- **C. Identification Tests—General** < 191 >, *Sodium* : ~~Ignite about 200 mg; the residue meets the requirements of the flame test for sodium.~~

■ **Sample solution:** To 0.1 g of Dantrolene Sodium, add 20 mL of water and 2 drops of acetic acid, shake well, and pass the resulting solution through a suitable filter. Use 2 mL of the filtrate.

Analysis

Sample: *Sample solution*

Acceptance criteria: Meets the requirements ■ 1S (*USP39*)

Add the following:

■ • D.

Solution A: Dissolve 2.7 g of methoxyphenylacetic acid in 6 mL of tetramethylammonium hydroxide solution, and add 20 mL of dehydrated alcohol.

Solution B: 158 mg/mL of ammonium carbonate in water

Sample solution: To 0.1 g of Dantrolene Sodium, add 20 mL of water and 2 drops of acetic acid, shake well, and pass the resulting solution through a suitable filter. Use the filtrate.

Analysis

Sample: *Sample solution*

Part 1: To 0.5 mL of the *Sample solution* in a suitable container, add 1.5 mL of *Solution A*, and cool in ice water for 30 min.

Part 2: Transfer the container from *Part 1* to a water bath at 20°, and stir for 5 min.

Part 3: Add 1 mL of ammonia TS to the container from *Part 2*.

Part 4: Add 1 mL of *Solution B* to the container from *Part 3*.

Acceptance criteria: The requirements for *Part 1*, *Part 2*, *Part 3*, and *Part 4* must all be met.

Part 1: A voluminous, white, crystalline precipitate is formed.

Part 2: The precipitate does not disappear.

Part 3: The precipitate dissolves completely.

Part 4: No precipitate is formed.

BRIEFING

Dipyridamole, *USP 38* page 3156. As part of USP monograph modernization efforts, the following revisions are proposed:

1. Replace the current HPLC procedure in the *Organic Impurities* test, which does not have any specified impurity, with a new procedure developed for the Dipyridamole family. The proposed procedure is specific to all the specified impurities and is based on analyses performed with the Waters Acquity UPLC BEH C18 brand of L1 column. The typical retention time for dipyridamole is about 9.5 min.
2. Add proposed *Acceptance criteria* for specified and unspecified impurities to the *Organic Impurities* section.
3. Add USP Dipyridamole Related Compound A RS, USP Dipyridamole Related Compound B RS, USP Dipyridamole Related Compound C RS, USP Dipyridamole Related Compound D RS, USP Dipyridamole Related Compound E RS, and USP Dipyridamole Related Compound F RS to the *USP Reference Standards* section to support the proposed revisions.

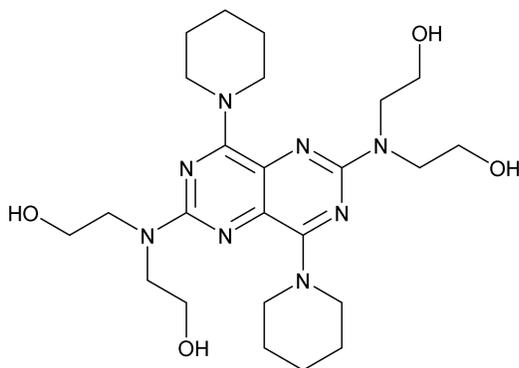

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM2: G. Hsu, S. Ramakrishna.)

2,2',2'',2'''-[(4,8-Dipiperidinopyrimido[5,4-*d*]pyrimidine-2,6-diyl)dinitrilo]tetraethanol [58-32-2].

DEFINITION

Dipyridamole contains NLT 98.0% and NMT 102.0% of dipyridamole ($C_{24}H_{40}N_8O_4$), calculated on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption** { 197K }
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• Procedure

Buffer: 0.77 g/L of ammonium acetate. Adjust with glacial acetic acid to a pH of 4.0.

Mobile phase: Methanol and *Buffer* (700:300)

Standard solution: 0.2 mg/mL of USP Dipyridamole RS in methanol

Sample solution: 0.2 mg/mL of Dipyridamole in methanol

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 288 nm

Column: 4.6-mm × 25-cm; 5- μ m packing L1

Flow rate: 1.2 mL/min

Injection volume: 10 μ L

Run time: NLT 1.7 times the retention time of dipyridamole

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 0.73%

Analysis**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of dipyridamole ($C_{24}H_{40}N_8O_4$) in the portion of Dipyridamole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of dipyridamole from the *Sample solution*

r_S peak response of dipyridamole from the *Standard solution*

C_S concentration of USP Dipyridamole RS in the *Standard solution* (mg/mL)

C_U concentration of Dipyridamole in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **Residue on Ignition** $\langle 281 \rangle$: NMT 0.1%

Delete the following:

- **Heavy Metals, Method II** $\langle 231 \rangle$: NMT 10 ppm (Official 1-Dec-2015)

Change to read:

- **Organic Impurities**

Mobile phase: ~~250 mg of dibasic sodium phosphate in 250 mL of water, and adjust with dilute phosphoric acid (1 in 3) to a pH of 4.6. Add 750 mL of methanol, and pass through a membrane filter of 0.5 μ m pore size.~~

Standard solution: ~~15 μ g/mL of USP Dipyridamole RS in Mobile phase~~

Sample solution A: ~~1 mg/mL of Dipyridamole in methanol~~

Sample solution B: ~~0.01 mg/mL of Dipyridamole, from Sample solution A, in methanol~~

Chromatographic system

(See *Chromatography* $\langle 621 \rangle$, *System Suitability*.)

Mode: ~~LC~~

Detector: ~~UV 288 nm~~

Column: ~~3.9 mm \times 30 cm; packing L1~~

Flow rate: ~~1.5 mL/min~~

Injection volume: ~~10 μ L~~

Run time: ~~NLT 10 min~~

System suitability

Sample: ~~Standard solution~~

Suitability requirements

Column efficiency: ~~NLT 1000 theoretical plates~~

Tailing factor: ~~NMT 2.0~~

Relative standard deviation: ~~NMT 2.0%~~

Analysis

Samples: ~~Sample solution A and Sample solution B~~

[Note ~~Inject Sample solution B into the chromatograph, adjusting the operating~~

parameters so that the response of the main peak (retention time about 6.5 min) obtained is about 5% full scale.]

Acceptance criteria: The sum of the responses of all secondary peaks from *Sample solution A* is NMT the response of the main peak from *Sample solution B* (1.0%).

■ **Solution A:** 10 mM ammonium formate. Adjust with formic acid to a pH of 5.0.

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.0	80	20
2.0	80	20
17.0	5	95
19.0	5	95
21.0	80	20
25.0	80	20

Standard solution: 0.5 µg/mL each of USP Dipyrindamole RS, USP Dipyrindamole Related Compound A RS, USP Dipyrindamole Related Compound B RS, USP Dipyrindamole Related Compound C RS, USP Dipyrindamole Related Compound D RS, USP Dipyrindamole Related Compound E RS, and USP Dipyrindamole Related Compound F RS in methanol

Sample solution: 500 µg/mL of Dipyrindamole in methanol

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 295 nm

Column: 2.1-mm × 15-cm; 1.7-µm packing L1

Column temperature: 45°

Flow rate: 0.3 mL/min

Injection volume: 2 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 4.0 between dipyrindamole related compound D and dipyrindamole

Relative standard deviation: NMT 2.8%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each specified impurity in the portion of Dipyrindamole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U

= peak response of each specified impurity from the *Sample solution*

r_S

= peak response of corresponding USP Reference Standard from the *Standard solution*

C_S

= concentration of corresponding USP Reference Standard in the *Standard solution* ($\mu\text{g/mL}$)

C_U

= concentration of Dipyridamole in the *Sample solution* ($\mu\text{g/mL}$)

Calculate the percentage of each unspecified impurity in the portion of Dipyridamole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U

= peak response of each unspecified impurity from the *Sample solution*

r_S

= peak response of dipyridamole from the *Standard solution*

C_S

= concentration of USP Dipyridamole RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U

= concentration of Dipyridamole in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: See *Table 2*. Disregard peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

BRIEFING

Dipyridamole Tablets, USP 38 page 3159. As part of USP monograph modernization efforts, it is proposed to make the following changes:

1. Add an orthogonal *Identification* test *B* based on the retention time agreement in the

Assay.

2. Revise the calculation in the *Uniformity of Dosage Units* section. Change the report unit from the quantity in mg to the percentage of the label claim.
3. Add the test for *Organic Impurities* to the monograph. The proposed procedure is based on analyses performed with the Waters Acquity UPLC BEH C18 brand of L1 column. The typical retention time for dipyridamole is 9.5 min.
4. Add proposed *Acceptance criteria* for specified and unspecified degradation products.
5. Add storage requirements to the *Packaging and Storage* section.
6. Add USP Dipyridamole Related Compound A RS, USP Dipyridamole Related Compound B RS, USP Dipyridamole Related Compound C RS, USP Dipyridamole Related Compound D RS, USP Dipyridamole Related Compound E RS, and USP Dipyridamole Related Compound F RS to the *USP Reference Standards* section to support the proposed addition of the *Organic Impurities* test.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Dipyridamole Tablets**DEFINITION**

Dipyridamole Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of dipyridamole ($C_{24}H_{40}N_8O_4$).

IDENTIFICATION**Change to read:**

-

■ **A.** ■ 1S (*USP39*)

Infrared Absorption { 197K }

Sample: Transfer an amount equivalent to 100 mg of dipyridamole from finely powdered Tablets to 10 mL of 0.1 N hydrochloric acid, triturate, and filter, collecting the filtrate in a beaker. Add 0.1 N sodium hydroxide until the solution is basic and a precipitate forms. Heat the mixture on a steam bath for 1 min, cool, and filter. Dry the residue at 105° for 1 h.

Acceptance criteria: Meet the requirements

Add the following:

■ • **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay. ■ 1S (*USP39*)

ASSAY

- **Procedure**

Mobile phase: Dissolve 250 mg of dibasic sodium phosphate in 250 mL of water, and adjust

with dilute phosphoric acid (1 in 3) to a pH of 4.6. Add 750 mL of methanol and pass through a suitable filter of 0.5- μ m pore size.

Standard solution: 15 μ g/mL of USP Dipyridamole RS in *Mobile phase*

Sample solution: Nominally 15 μ g/mL of dipyridamole prepared as follows. Transfer NLT 20 Tablets to a suitable volumetric flask. Add water equivalent to 10% of the final flask volume and sonicate for 15 min. Add methanol equivalent to 75% of the final flask volume and shake by mechanical means for 30 min. Dilute with methanol to volume and centrifuge to obtain a clear supernatant. Dilute a volume of the clear supernatant with *Mobile phase* to obtain a solution containing 15 μ g/mL of dipyridamole.

Chromatographic system

(See *Chromatography* \langle 621 \rangle , *System Suitability*.)

Mode: LC

Detector: UV 288 nm

BRIEFING

Eptacog Alfa. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods of analysis, is proposed.

1. The liquid chromatographic procedure in *Identification* test *B* for *Peptide Mapping* is based on analyses performed with the Machery–Nagel Nucleosil C18 brand of L1 column.
2. The liquid chromatographic procedures in the *Assay for Concentration of Eptacog Alfa* and in the *Impurities* test for *Dimer and Related Substances of Higher Molecular Mass* are based on analyses performed with the Waters Protein-Pak 300SW brand of L59 column. The typical retention time for eptacog alfa is about 17 min.
3. The liquid chromatographic procedure in the *Impurities* test for *Degraded Heavy Chain and Oxidized Forms* is based on analyses performed with the Interchim

Uptisphere WC4, 300 Å brand of L26 column. The typical retention time for eptacog alfa is about 26 min.

- The liquid chromatographic procedure in the *Impurities* test for *Gla-Domainless Eptacog Alfa (γ-Carboxylation)* is based on analyses performed with a precolumn packed with the Bio-Rad Chelex brand of chelating ion exchange resin for removal of calcium, and the Dionex DNAPac PA-100 brand of L## analytical column. The typical retention times for eptacog alfa and Gla-domainless eptacog alfa are about 14 and 10 min, respectively.
- The liquid chromatographic procedure in the *Specific Tests for Glycan Analysis* is based on analyses performed with the Dionex brand of L## guard and analytical columns, using CarboPac PA-100 4.0 mm × 5 cm and CarboPac PA-100 4.0 mm × 25 cm, respectively.

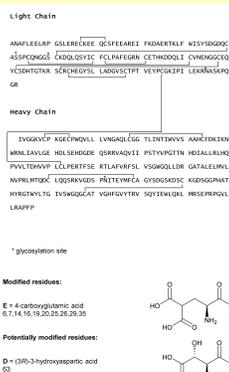

(BIO2: C. Li.)

Comment deadline: July 31, 2015

Add the following:

■ Eptacog Alfa

$C_{1982}H_{3054}N_{560}O_{618}S_{28}$ (The chemical formula includes the γ -carboxylations and modification of D (Asp) in position 63, and does not include the glycosylations.) $\approx 50,000$ (The molecular weight includes the glycosylation.) [102786–61–8].

DEFINITION

Eptacog Alfa is recombinant human coagulation factor VIIa, a recombinant form of plasma-derived activated coagulation factor VII. It is a two-chain molecule, obtained by proteolytic cleavage of the peptide bond between Arg¹⁵² and Ile¹⁵³ of single-chain coagulation factor VII. Eptacog Alfa consists of a 20 kDa light chain (N-terminal) and a 30 kDa heavy chain (C-terminal) connected by a disulfide bond.

Eptacog Alfa is produced in mammalian cells by a method based on recombinant DNA technology. It is distinguishable from the naturally occurring analogue in terms of its post-translational modifications, including its glycosylation pattern. The host cell-derived proteins (HCP) content is determined by a validated method and is below the limit approved by the competent authority. The host cell DNA content is determined by a validated method and is

below the limit approved by the competent authority. When prepared as a drug substance (eptacog alfa concentrated solution), it contains NLT 1.0 and NMT 1.7 mg/mL of eptacog alfa. It has a biological potency of NLT 44 and NMT 64 IU/ μ g of eptacog alfa. Formulation contains one or more suitable buffering and/or stabilizing agents.

[Note—Some tests refer to using the injection amount based on μ g of eptacog alfa because the concentration of eptacog alfa in the *Standard solution* or the *Sample solution* can vary. The injection volume can be approximated based on the expected protein concentration.]

IDENTIFICATION

- **A.** Meets the requirements in the *Assay for Potency*

- **B. Peptide Mapping**

Solution A: 0.65 mL/L of trifluoroacetic acid in water

Solution B: Acetonitrile, water, and trifluoroacetic acid (900: 100: 0.5)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
100	50	50
105	0	100
110	0	100
110.1	100	0
125	100	0

Diluent: 50 mM tris(hydroxymethyl)aminomethane and 5 mM calcium chloride prepared as follows. Dissolve 6.06 g of tris(hydroxymethyl)aminomethane and 0.74 g of calcium chloride in 1000 mL of water. Adjust with 37% hydrochloric acid to a pH of 7.5.

Enzyme solution diluent: 0.001 N hydrochloric acid and 2 mM calcium chloride prepared as follows. Dissolve 1 mL of 1 N hydrochloric acid and 0.3 g of calcium chloride in 1000 mL of water.

Enzyme solution: 1 mg/mL of trypsin suitable for peptide mapping in *Enzyme solution diluent*

Standard solution: 1.5 mg/mL of USP Coagulation Factor VIIa RS in *Diluent*. Desalt a volume of this solution by a suitable method. [Note—For example, use a suitable gel-filtration column¹ with *Diluent* as the elution buffer.] After desalting, the concentration should be about 1.0 mg/mL. Transfer 1 mL of the desalted solution to a polypropylene tube and add 10 μ L of the *Enzyme solution*. Cap the tube and mix gently by inversion. Incubate at $37 \pm 2^\circ$ for 24 ± 2 h. At 5.5 ± 0.5 h, add an additional 10 μ L of the *Enzyme solution*. After incubation, remove the sample from the incubator and place the solution at room temperature. Add 9 μ L of glacial acetic acid and mix by inversion. Keep the solution at -15° or below until chromatographic analysis.

Sample solution: About 1.5 mL of Eptacog Alfa in *Diluent*. Desalt and digest this solution as directed in the *Standard solution*.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 215 nm
Column: 4.0 mm × 25 cm; 5- μ m packing L1
Column temperature: 30 $^{\circ}$
Flow rate: 1.0 mL/min
Injection amount: 25 μ g

System suitability

Sample: *Standard solution*

Suitability requirements

Chromatogram similarity: The chromatogram of the *Standard solution* corresponds to that of the typical chromatogram provided with the USP Certificate for USP Coagulation Factor VIIa RS.

Analysis

Samples: *Standard solution* and *Sample solution*

Acceptance criteria: The chromatographic profile of the *Sample solution* corresponds to that of the *Standard solution*.

All major peaks identified in the chromatogram of the *Standard solution* are present in the chromatogram of the *Sample solution*.

No new major peaks are observed in the chromatogram of the *Sample solution* in comparison with the chromatogram of the *Standard solution*.

ASSAY**• Concentration of Eptacog Alfa**

Mobile phase: 0.2 M ammonium sulfate and 5% 2-propanol prepared as follows. Dissolve 26.4 g of ammonium sulfate in approximately 900 mL of water. Adjust first with phosphoric acid to a pH of 2.5 and then with triethylamine to a pH of 7.0. Add 50 mL of 2-propanol. Dilute with water to 1000 mL.

Standard solution: 1.5 mg/mL of USP Coagulation Factor VIIa RS in water

Sample solution: About 1.5 mg/mL of Eptacog Alfa in water

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 7.5 mm × 30 cm; 10- μ m packing L59

Autosampler temperature: 2 $^{\circ}$ –8 $^{\circ}$

Flow rate: 0.5 mL/min

Injection amount: About 30 μ g, *Sample solution*

System suitability

Sample: *Standard solution* injected at 10, 20, and 30 μ L

Suitability requirements

Tailing factor: NMT 1.3 for the monomer peak from the *Standard solution* injected at 20 μ L

Peak-to-valley ratio: NLT 1.1 for the dimer peak from the *Standard solution* injected at 20 μ L

Relative standard deviation: NMT 2.0% for the monomer peak from five replicate injections of 20 μ L of the *Standard solution*

Linearity: Inject 10, 20, and 30 μ L of the *Standard solution*. Plot the monomer peak response against the injected protein content (μ g) and perform a linear regression to

create a standard curve. The correlation coefficient calculated for the standard curve (r^2) is NLT 0.990.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration of eptacog alfa using the monomer peak response from the *Sample solution*, the standard curve, and the injection volume of the *Sample solution*.

Acceptance criteria: 1.0–1.7 mg/mL

● **Potency**

The principle of the test is to measure the ability of an eptacog alfa preparation to reduce the prolonged coagulation time of factor VII-deficient plasma. The biological activity is assessed by comparing the dose-response curve of the *Sample solution* to that of the *Standard solution*.

Use a suitable coagulation analyzer or carry out the assay with incubation tubes and reagents maintained at 37°.

Diluent: Use a suitable buffer for the coagulation test. [Note—For example, 0.05 M piperazine-1,4-bis(2-ethanesulfonic acid), 0.1 M sodium chloride, 2 mM sodium edetate, and 1% bovine albumin. Adjust to a pH of 7.2 prepared as follows. 15.12 g/L of piperazine-1,4-bis(2-ethanesulfonic acid), 5.73 g/L of sodium chloride, and 0.74 g/L of sodium edetate. Adjust with sodium hydroxide to a pH of 7.2 and add 10 g/L of bovine albumin.]

Standard solution: Prepare solutions of USP Coagulation Factor VIIa for Bioassay RS in *Diluent* at three different concentrations within the linear range. Prepare in duplicate and use the solutions immediately. [Note—An example of the linear range is 0.005–0.14 IU/mL.]

Sample solution: Prepare solutions of Eptacog Alfa in *Diluent* at three different concentrations within the linear range. Prepare in duplicate and use the solutions immediately. [Note—An example of the linear range is 0.005–0.14 IU/mL.]

Analysis

Samples: *Standard solution* and *Sample solution*

[Note—The volumes and sequences of the reagents given below may be adapted to the tissue factor solution and apparatus used.]

To 40 μ L of each *Standard solution* or *Sample solution*, add 40 μ L of factor VII-deficient plasma, incubate for an appropriate time at 37°, and add 80 μ L of tissue factor. [Note—Use a tissue factor that contains calcium and other suitable excipients.] Measure the coagulation time (the interval between the addition of tissue factor and the formation of a fibrin clot). Calculate the activity in IU/mL using an appropriate statistical method and validity test. For example, the parallel-line assay and the statistical tests for linearity, slope, and parallelism for the sample compared to the standard have to be passed at the 95% level. The confidence limits ($P = 0.95$) must be within 80%–125% of the estimated potency.

Divide the determined activity in IU/mL by the concentration of eptacog alfa and report the result in IU/ μ g.

Acceptance criteria: 44–64 IU/ μ g

IMPURITIES

● **Degraded Heavy Chain and Oxidized Forms**

Solution A: 0.1% Trifluoroacetic acid (v/v) in water

Solution B: Acetonitrile, water, and trifluoroacetic acid (800: 200: 0.9)

Mobile phase: See *Table 2*. [Note—The main peak should elute at approximately 26 min. The percentage of *Solution B* at 0 min and 30 min can be adjusted together so that the increase in the percentage of *Solution B* should always be 13% over 30 min.]

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	54	46
30	41	59
33	41	59
33.1	0	100
38	0	100

Standard solution: 1.5 mg/mL of USP Coagulation Factor VIIa RS in water

Sample solution: About 1.5 mg/mL of Eptacog Alfa in water

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 214 nm

Column: 4.0 mm × 25 cm; 5- μ m packing L26

Temperatures

Column: 60^o–70^o

Autosampler: 2^o–8^o

Flow rate: 1.0 mL/min

Injection amount: 30 μ g

System suitability

Sample: *Standard solution*

[Note—The retention time for eptacog alfa is about 26 min.]

Suitability requirements

The chromatogram from the *Standard solution* corresponds to the typical chromatogram provided in the USP Certificate for USP Coagulation Factor VIIa RS, with the 10 peaks being clearly visible. In the chromatogram from the *Standard solution*, identify 10 peaks according to the USP Certificate for USP Coagulation Factor VIIa RS and the descriptions provided in *Table 3*.

Table 3

Peak	Name	Typical Retention Time (min)
1	Degraded heavy chain form, amino acids 1–290	10
2	Degraded heavy chain form, amino acids 291–406	16
3–5	Oxidized forms, methionyl sulfoxide of eptacog alfa at Met ²⁹⁸ , Met ³⁰⁶ , and Met ³²⁷ , respectively	19–24

Peak	Name	Typical Retention Time (min)
6	Degraded heavy chain form, cleaved between Arg ³¹⁵ and Lys ³¹⁶	25
7	Eptacog alfa	26
8-10	Unknown	29-32

Resolution: NLT 0.9 between peaks 6 and 7

Analysis

Sample: *Sample solution*

Calculate the percentage of the degraded heavy chain and oxidized forms in the portion of Eptacog Alfa taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_{\bar{U}}$ peak response of the degraded heavy chain or oxidized forms from the *Sample solution*

$r_{\bar{T}}$ sum of all the peak responses from the *Sample solution*

Acceptance criteria

Sum of degraded heavy chain forms: NMT 11%

Sum of oxidized forms: NMT 2.2%

Gla-Domainless Eptacog Alfa (γ -Carboxylation)

Solution A: 10 mM tris(hydroxymethyl)aminomethane and 10 mM bis-tris propane prepared as follows. 1.2 g/L of tris(hydroxymethyl)aminomethane and 2.8 g/L of bis-tris propane in water. Adjust with glacial acetic acid to a pH of 9.4.

Solution B: 10 mM tris(hydroxymethyl)aminomethane, 10 mM bis-tris propane, and 1.4 M ammonium acetate, prepared as follows. 1.2 g/L of tris(hydroxymethyl)aminomethane, 2.8 g/L of bis-tris propane, and 107.9 g/L of ammonium acetate in water. Adjust with concentrated ammonia to a pH of 9.4.

Mobile phase: See Table 4.

Sample solution: About 1.5 mg/mL of Eptacog Alfa in water

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Columns

Precolumn: Chelating ion exchange resin for removal of calcium²

Analytical: 4.0 mm × 25 cm; packing L##

Temperatures

Column: 25°

Autosampler: 2°–8°

Flow rate: 1.0 mL/min

Injection amount: About 150 µg

System suitability

Sample: *Standard solution*

[Note—Gla-domainless eptacog alfa (Υ -carboxylation) is des(1-38)-eptacog alfa. The retention time for eptacog alfa is about 14 min. The relative retention time for Gla-domainless eptacog alfa (Υ -carboxylation) is about 0.7.]

Suitability requirements

Resolution: NLT 2.0 between the Gla-domainless eptacog alfa and eptacog alfa peaks

Analysis

Sample: *Sample solution*

Calculate the percentage of Gla-domainless eptacog alfa in the portion of Eptacog Alfa taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U peak response of Gla-domainless eptacog alfa from the *Sample solution*

r_T sum of the peak responses from the *Sample solution*

Acceptance criteria: NMT 5.9%

• **Dimer and Related Substances of Higher Molecular Mass**

Mobile phase, Standard solution, Sample solution, Chromatographic system, and

System suitability: Proceed as directed in the *Assay for Concentration of Eptacog Alfa*

Analysis

Sample: *Sample solution*

Calculate the percentage of dimer and related substances of higher molecular mass in the portion of Eptacog Alfa taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U sum of the peak responses with retention time less than that of the monomer from the *Sample solution*

r_T sum of the responses of all eptacog alfa-related peaks from the *Sample solution*

Acceptance criteria: NMT 1.9%

• **Non-Activated Factor VII (Single Chain)**

Sample buffer (reducing conditions): Concentrated LDS-PAGE sample buffer³ for reducing conditions containing dithiothreitol (DTT) as the reducing agent.⁴ [Note—For example, prepare by mixing 300 µL of water, 500 µL of LDS-PAGE sample buffer,³ and 200 µL of reducing agent.⁴]

Running buffer: MOPS–SDS buffer.⁵ [Note—For example, 50 mM 3-(*N*-morpholino)propanesulfonic acid, 50 mM tris(hydroxymethyl)aminomethane, 0.1% sodium dodecyl sulfate, and 1 mM EDTA. Adjust to a pH of 7.7.]

Molecular weight marker solution: Solution of molecular weight markers suitable for calibrating SDS-polyacrylamide gels in the range of 10–70 kDa

Standard solution: 800 µg/mL of USP Coagulation Factor VIIa RS in water. Mix equal

volumes of this solution and the *Sample buffer (reducing conditions)*.

Sample solution: About 800 µg/mL of Eptacog Alfa in water. Mix equal volumes of this solution and the *Sample buffer (reducing conditions)*.

Sample treatment: Boil the *Standard solution* and the *Sample solution* separately for 5 min or heat at $73 \pm 3^\circ$ for 10 min before applying to the gel.

Electrophoretic system

Mode: Polyacrylamide gel electrophoresis

Detector: Integrating densitometer

Staining: Coomassie⁶

Resolving gel: 12% Acrylamide; 1 mm thickness⁷

Application amount: 2.0–4.0 µg

System suitability

Samples: *Molecular weight marker solution*, *Standard solution*, and *Sample solution*

Suitability requirements

Molecular weight: The principal bands in the electropherogram from the *Sample solution* correspond to the position of the principle bands in the electropherogram from the *Standard solution*. [Note—The positions of the principle bands from the *Standard solution* and *Sample solution* correspond to 30 kDa for heavy chain and 20–25 kDa for light chain determined by comparison with the known molecular weight bands from the *Molecular weight marker solution*.]

Sensitivity: The band corresponding to non-activated single chain factor VII (molecular mass of 51 kDa) is visible in the electropherogram from the *Standard solution*.

Analysis

Sample: *Sample solution*

Calculate the percentage of non-activated single chain factor FVII (molecular mass of 51 kDa) in the portion of Eptacog Alfa taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_{\bar{U}}$ band response of the non-activated single chain factor VII from the *Sample solution*

$r_{\bar{T}}$ sum of the responses of all bands from the *Sample solution*

Acceptance criteria: NMT 3%

SPECIFIC TESTS

• Glycan Analysis

[Note—The procedure below can be substituted with a suitable procedure from *Oligosaccharide Analysis* (212).]

Solution A: 6 g/L of sodium hydroxide in degassed water

Solution B: 40.8 g/L of sodium acetate trihydrate and 6 g/L of sodium hydroxide in degassed water

Mobile phase: See *Table 5*.

Table 5

Time (min)	Solution A (%)	Solution B (%)
0	100	0

Time (min)	Solution A (%)	Solution B (%)
52	35	65
52.1	0	100
65	0	100
65.1	100	0
90	100	0

Buffer: 10 mM tris(hydroxymethyl)aminomethane prepared as follows. 1.21 g/L of tris(hydroxymethyl)aminomethane in water. Adjust with hydrochloric acid to a pH of 7.5.

Standard solution: 1.5 mg/mL of USP Coagulation Factor VIIa RS in water. Desalt a volume of this solution by a suitable method. [Note—For example, use a suitable gel-filtration column¹ with *Buffer* as the elution buffer.] After desalting, the concentration of the solution is about 1.0 mg/mL.

Sample solution: 1.5 mg/mL of Eptacog Alfa in water. Desalt a volume of this solution by a suitable method. [Note—For example, use a suitable centrifugal filter unit or gel-filtration column with *Buffer* as the elution buffer.] After desalting, the concentration of the solution is about 1.0 mg/mL.

Selective release of glycans: Transfer 500 μ L of the desalted *Sample solution* and 500 μ L of the desalted *Standard solution* to separate tubes and add 10 μ L of a 200-U/mL solution of peptide *N*-glycosidase F⁸ to each tube. Cap the tubes and incubate for 16–24 h at 37^o. Remove the protein fraction by adding 1.5 mL of ethanol (96%) prechilled at –20^o to the tubes. Mix and allow to stand at –20^o for 20–30 min. Centrifuge the tubes at 10,000 rpm for 10 min. Collect the supernatant and evaporate to dryness. [Note—For example, use a rotary evaporator.]

Labeling of glycans: Label the released glycans with 2-aminobenzamide (2-AB) using a suitable procedure.⁹ [Note—For example, add 5–15 μ L of 2-AB labeling solution to the dried glycan sample and mix well. Immediately incubate at 37^o for 16–24 h or at 65^o for 2 h. Allow to cool at room temperature for 10 min. Centrifuge briefly. Remove excess 2-AB using a suitable solid-phase exchange (SPE) cartridge.¹⁰]

BRIEFING

Eptacog Alfa for Injection. Because there is no existing *USP* monograph for this drug product, a new monograph, based on validated methods of analysis, is proposed.

1. The liquid chromatographic procedures in the *Assay for Content of Eptacog Alfa* and in the *Impurities* test for *Dimer and Related Substances of Higher Molecular Mass* are based on analyses performed with the Waters Protein–Pak 300SW brand of L59 column. The typical retention time for eptacog alfa is about 17 min.

- The liquid chromatographic procedure in the *Impurities* test for *Degraded Heavy Chain and Oxidized Forms* is based on analyses performed with the Interchim Uptisphere WC4, 300 Å brand of L26 column. The typical retention time for eptacog alfa is about 26 min.

(BIO2: C. Li.)

Correspondence Number—C149307

Comment deadline: July 31, 2015

Add the following:

■ Eptacog Alfa for Injection

DEFINITION

Eptacog Alfa for Injection is a sterile lyophilized preparation of recombinant human coagulation factor VIIa. It contains NLT 87% and NMT 113% of the labeled amount of eptacog alfa. It has a biological potency of NLT 44 and NMT 64 IU/μg of eptacog alfa. This formulation contains one or more suitable buffering and/or stabilizing agents. [Note—The tests refer to using the injection amount based on μg of eptacog alfa because the concentration of eptacog alfa in the *Standard solution* or the *Sample solution* can vary. The injection amount as μg of eptacog alfa is listed under certain tests. The injection volume can be approximated based on the expected protein concentration.]

IDENTIFICATION

- A.** Meets the requirements in the *Assay for Potency*

ASSAY

- Content of Eptacog Alfa**

Mobile phase: 0.2 M ammonium sulfate and 5% 2-propanol prepared as follows. Dissolve 26.4 g of ammonium sulfate in approximately 900 mL of water. Adjust first with phosphoric acid to a pH of 2.5 and then with triethylamine to a pH of 7.0. Add 50 mL of 2-propanol. Dilute with water to 1000 mL.

Standard solution: 1.5 mg/mL of USP Coagulation Factor VIIa RS in water

Sample solution: Dilute Eptacog Alfa for Injection with water to obtain a concentration of 1 mg/mL of eptacog alfa.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 7.5 mm × 30 cm; 10-μm packing L59

Autosampler temperature: 2°–8°

Flow rate: 0.5 mL/min

Injection amount: About 30 μg, *Sample solution*

System suitability

Sample: *Standard solution* injected at 10, 20, and 30 μL

Suitability requirements

Tailing factor: NMT 1.3 for the monomer peak from the *Standard solution* injected at 20

μL

Peak-to-valley ratio: NLT 1.1 for the dimer peak from the *Standard solution* injected at 20 μL

Relative standard deviation: NMT 2.0% for the monomer peak from five replicate injections of 20 μL of the *Standard solution*

Linearity: Inject 10, 20, and 30 μL of the *Standard solution*. Plot the monomer peak areas against the injected eptacog alfa and perform a linear regression to create a standard curve. The correlation coefficient calculated for the standard curve (r^2) is NLT 0.990.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration of eptacog alfa using the monomer peak area in the chromatogram from the *Sample solution*, the standard curve, and the injection volume of the *Sample solution*.

Calculate the percentage of the labeled amount of eptacog alfa in the portion of Eptacog Alfa for Injection taken:

$$\text{Result} = [(C_U \times V)/L] \times 100$$

C_U = nominal concentration of eptacog alfa in the *Sample solution* (mg/mL)

V = volume of *Sample solution* (mL)

L = label claim of eptacog alfa in Eptacog Alfa for Injection (mg)

Acceptance criteria: 87%–113%

• Potency

The principle of the test is to measure the ability of an eptacog alfa preparation to reduce the prolonged coagulation time of factor VII-deficient plasma. The biological activity is assessed by comparing the dose-response curve of the *Sample solution* to that of the *Standard solution*.

Use a suitable coagulation analyzer or carry out the assay with incubation tubes and reagents maintained at 37°.

Diluent: Use a suitable buffer for the coagulation test. [Note—For example, 0.05 M piperazine-1,4-bis(2-ethanesulfonic acid), 0.1 M sodium chloride, 2 mM sodium edetate, and 1% bovine albumin. Adjust to a pH of 7.2, prepared as follows. Mix 15.12 g/L of piperazine-1,4-bis(2-ethanesulfonic acid), 5.73 g/L of sodium chloride, and 0.74 g/L of sodium edetate. Adjust with sodium hydroxide to a pH of 7.2 and add 10 g/L of bovine albumin.]

Standard solution: Prepare solutions of USP Coagulation Factor VIIa for Bioassay RS in *Diluent* at three different concentrations within the linear range. Prepare in duplicate and use the solutions immediately. [Note—An example of the linear range is 0.005–0.14 IU/mL.]

Sample solution: Prepare solutions of Eptacog Alfa for Injection in *Diluent* at three different concentrations within the linear range. Prepare in duplicate and use the solutions immediately. [Note—An example of the linear range is 0.005–0.14 IU/mL.]

Analysis

Samples: *Standard solution* and *Sample solution*

[Note—The volumes and sequences of the reagents given below may be adapted to the

tissue factor solution and apparatus used.]

To 40 μL of each *Standard solution* or *Sample solution*, add 40 μL of factor VII-deficient plasma, incubate for an appropriate time at 37 $^{\circ}$, and add 80 μL of tissue factor. [Note—Use a tissue factor that contains calcium and other suitable excipients.] Measure the coagulation time (the interval between the addition of the tissue factor solution and the formation of a fibrin clot). Calculate the activity in IU/mL using an appropriate statistical method and validity test. For example, the parallel-line assay and the statistical tests for linearity, slope, and parallelism for the sample compared to the standard have to be passed at the 95% level. The confidence limits ($P = 0.95$) must be within 80%–125% of the estimated potency.

Divide the determined activity in IU by the determined content of eptacog alfa in μg , and report the result in IU/ μg .

Acceptance criteria: 44–64 IU/ μg

IMPURITIES

• Degraded Heavy Chain and Oxidized Forms

BRIEFING

Exemestane. Because there is no existing *USP* monograph for this drug substance, a new monograph based on validated methods of analysis is proposed.

1. The liquid chromatographic procedure used in the *Assay* is based on analysis performed with the Hypersil BDS C18 brand of L1 column. The typical retention time for exemestane is about 8.5 min.
2. The liquid chromatographic procedure used in the test for *Organic Impurities* is based on analysis performed with the Waters XTerra RP18 brand of L1 column. The typical retention time for exemestane is about 23.5 min.
3. The liquid chromatographic procedure used in the *Limit of Exemestane Related Compound D* test is based on analysis performed with the Daicel Chiralcel OJ brand of L80 column. The typical retention time for exemestane is about 17 min.

BRIEFING

Fluticasone Propionate Lotion. Because there is no existing *USP* monograph for this dosage form, a new monograph, based on validated methods of analysis, is proposed.

1. The HPLC procedure in the *Assay* is based on analyses performed with the Inertsil ODS-3V brand of L1 column manufactured by GL Sciences. The typical retention time for fluticasone propionate in the *Assay* is about 24 min.
2. The HPLC procedure in *Organic Impurities* is based on analyses performed with the Inertsil ODS-3V brand of L1 column manufactured by GL Sciences. The typical retention time for fluticasone propionate in *Organic Impurities* is about 39 min.

(SM4: D. Min.)

Correspondence Number—C130868

Comment deadline: July 31, 2015

Add the following:**■ Fluticasone Propionate Lotion****DEFINITION**

Fluticasone Propionate Lotion is fluticasone propionate in a suitable lotion base. It contains NLT 90.0% and NMT 110.0% of the labeled amount of fluticasone propionate ($C_{25}H_{31}F_3O_5S$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **Procedure**

Buffer: 1.15 g/L of monobasic ammonium phosphate in water. Adjust with phosphoric acid to a pH of 3.5. Pass the solution through a suitable filter of 0.45- μ m pore size.

Mobile phase: Acetonitrile, methanol, and *Buffer* (13:50:37)

Standard stock solution: 0.8 mg/mL of USP Fluticasone Propionate RS, prepared as follows. Transfer 40 mg of USP Fluticasone Propionate RS to a 50-mL volumetric flask. Add 10 mL of tetrahydrofuran and sonicate to dissolve. Dilute with methanol to volume.

Standard solution: 0.04 mg/mL of USP Fluticasone Propionate RS in methanol from *Standard stock solution*

Sample solution: Nominally 0.04 mg/mL of fluticasone propionate from Lotion, prepared as follows. Transfer a portion of Lotion to a suitable volumetric flask. Add tetrahydrofuran equivalent to about 20% of the flask volume and vortex until the Lotion is dispersed. Add methanol equivalent to 60% of the flask volume and sonicate for 10 min to dissolve. Dilute with methanol to volume. Pass a portion of the solution through a suitable filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: 239 nm. For *Identification test B*, use a diode array detector in the range of 200–400 nm.

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Column temperature: 45 $^{\circ}$

Flow rate: 1 mL/min

Injection volume: 20 μ L

Run time: 30 min

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Column efficiency: NLT 5000 theoretical plates

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of fluticasone propionate ($C_{25}H_{31}F_3O_5S$) in the portion of Lotion taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of fluticasone propionate from the *Sample solution*

r_S peak response of fluticasone propionate from the *Standard solution*

C_S concentration of USP Fluticasone Propionate RS in the *Standard solution* (mg/mL)

C_U nominal concentration of fluticasone propionate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **Minimum Fill** 〈 755 〉: Meets the requirements

IMPURITIES

- **Organic Impurities**

Solution A: Methanol, phosphoric acid, and water (30: 0.5: 970)

Solution B: Acetonitrile, methanol, and phosphoric acid (950: 50: 0.5)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	56	44
45	56	44
49	10	90
70	10	90
71	56	44
80	56	44

System suitability solution: 0.13 mg/mL of USP Fluticasone Propionate RS and 0.38 µg/mL of USP Fluticasone Propionate Related Compound D RS in methanol

Standard stock solution: 0.25 mg/mL of USP Fluticasone Propionate RS, prepared as follows. Transfer 25 mg of USP Fluticasone Propionate RS to a 100-mL volumetric flask. Add 25 mL of tetrahydrofuran and sonicate to dissolve. Dilute with methanol to volume.

Standard solution: 0.63 µg/mL of USP Fluticasone Propionate RS in methanol from *Standard stock solution*

Sample solution: Nominally 0.13 mg/mL of fluticasone propionate from Lotion, prepared as follows. Transfer a portion of Lotion, equivalent to 1.25 mg of fluticasone propionate, to a suitable volumetric flask. Add tetrahydrofuran equivalent to 20% of the flask volume and vortex until the Lotion is dispersed. Add methanol equivalent to 40% of the flask volume and sonicate for 10 min to dissolve. Dilute with methanol to volume. Pass a portion of the solution through a suitable filter of 0.45-µm pore size.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: 239 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 40 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—See *Table 2* for the relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between fluticasone propionate related compound D and fluticasone propionate, *System suitability solution*

Relative standard deviation: NMT 5.0 from six replicate injections, *Standard solution*

Analysis

Samples: *Standard solution and Sample solution*

Calculate the percentage of fluticasone propionate related compound C, fluticasone propionate related compound D, or any individual unspecified impurity in the portion of Lotion taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of fluticasone propionate related compound C, fluticasone propionate related compound D, or each unspecified impurity from the *Sample solution*

r_S = peak response of fluticasone propionate from the *Standard solution*

C_S = concentration of USP Fluticasone Propionate RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of fluticasone propionate in the *Sample solution* ($\mu\text{g/mL}$)

F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

BRIEFING

Furosemide, USP 38 page 3626. As part of the USP monograph modernization efforts, the following revisions are proposed:

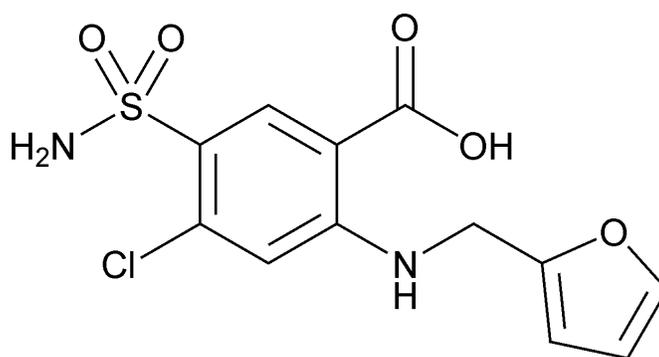

1. Revise the acceptance criteria in the *Definition* and the *Assay* from NLT 98.0% and NMT 101.0% to NLT 98.0% and NMT 102.0%, which is typical for chromatographic procedures.
2. Replace *Identification* test B, which uses ultraviolet absorptivities, with an HPLC procedure based on the retention time agreement for furosemide from the proposed *Assay* procedure.
3. Replace *Identification* test C, which uses a wet chemistry-based colorimetric procedure, with a spectroscopic procedure based on the UV spectrum match of the main peak from the proposed HPLC procedure for the *Assay* to complement the chromatographic procedure.
4. Replace the existing titration-based *Assay* procedure with a validated stability-indicating HPLC procedure. The proposed liquid chromatographic procedure is based on an analysis performed with the Waters Spherisorb ODS-1 brand of L1 column. The typical retention time for furosemide is about 23 min.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

BRIEFING

Gemfibrozil Tablets, *USP 38* page 3661 and *PF 40(4)* [July–Aug. 2014]. On the basis of comments received, it is proposed to revise the monograph as follows:

1. Revise the preparation of the *Standard stock solution* and the *Standard solution* in the *Dissolution* test to be consistent with the sponsor's FDA-approved drug product.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM2: S. Ramakrishna.)

Gemfibrozil Tablets

DEFINITION

Gemfibrozil Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of gemfibrozil (C₁₅H₂₂O₃).

IDENTIFICATION

Change to read:

● **Procedure**

■ **A.** ■ 2S (*USP38*)

Sample: 100 mg of gemfibrozil from a quantity of finely ground Tablets

Analysis: Shake the *Sample* with 10 mL of 0.1 N sodium hydroxide. Filter the mixture into a 50-mL centrifuge tube, and acidify the filtrate with 3 N sulfuric acid to obtain a copious precipitate. Centrifuge, and discard the clear solution. Wash the precipitate with small portions of water, and allow it to air-dry.

Acceptance criteria: The IR absorption spectrum of a potassium bromide dispersion of the precipitate, previously dried over silica gel for 4 h, exhibits maxima only at the same wavelengths as those of a similar preparation of USP Gemfibrozil RS.

Add the following:

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■ 2S (*USP38*)

ASSAY**Change to read:**● **Procedure**

Mobile phase: Add 10 mL of glacial acetic acid to 800 mL of methanol in a 1000-mL volumetric flask, and dilute with water to volume.

System suitability solution: 0.2 mg/mL of gemfibrozil

■ USP Gemfibrozil RS ■_{2S} (USP38)

and 0.05 mg/mL of 2,5-xylenol in *Mobile phase*

Standard stock solution: 1 mg/mL of USP Gemfibrozil RS in methanol

Standard solution: 0.2 mg/mL of USP Gemfibrozil RS from the *Standard stock solution* in *Mobile phase*

Sample stock solution: Nominally 1 mg/mL of gemfibrozil prepared as follows. Transfer the equivalent of 100 mg of gemfibrozil from NLT 20 finely powdered Tablets to a 100-mL volumetric flask. Add about 80 mL of methanol and shake to dissolve. Dilute with methanol to volume and filter.

Sample solution: Nominally 0.2 mg/mL of gemfibrozil from the *Sample stock solution* in *Mobile phase*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 276 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 0.8 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 8.0 between gemfibrozil and 2,5-xylenol, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of gemfibrozil (C₁₅H₂₂O₃) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Gemfibrozil RS in the *Standard solution* (mg/mL)

C_U nominal concentration of gemfibrozil in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Change to read:

- **Dissolution** 〈 711 〉

Medium: 0.2 M phosphate buffer prepared as follows. Dissolve 545 g of monobasic potassium phosphate in 5 L of water, add 131 g of sodium hydroxide, dilute with water to about 19.5 L, and mix well. Adjust with either 1 N phosphoric acid or 1 N sodium hydroxide to a pH of 7.5. Dilute with water to 20 L; 900 mL.

Apparatus 2: 50 rpm

Time: 30 min

Standard stock solution: 0.33 mg/mL

■ A known concentration ■ 1S (USP39)

of USP Gemfibrozil RS in *Medium* prepared as follows. Dissolve USP Gemfibrozil RS in an amount of methanol not to exceed 1% of the

■ total ■ 1S (USP39)

volume of the *Standard stock solution*. Dilute with *Medium* to volume.

Standard solution: Dilute the *Standard stock solution* with 1 N sodium hydroxide to obtain a concentration estimated to correspond to that of the filtered and diluted *Sample solution*.

■ A suitable concentration of USP Gemfibrozil RS from the *Standard stock solution*. ■ 1S (USP39)

Sample solution: Pass a portion of the solution under test through a suitable filter. Dilute with 1 N sodium hydroxide to a concentration similar to that of the *Standard solution*.

Instrumental conditions

Mode: UV

Analytical wavelength: 276 nm

Analysis: Calculate the percentage of the labeled amount of gemfibrozil (C₁₅H₂₂O₃) dissolved from UV absorbances of the *Sample solution* in comparison with those of the *Standard solution*.

Tolerances: NLT 80% (Q) of the labeled amount of gemfibrozil (C₁₅H₂₂O₃) is dissolved.

- **Uniformity of Dosage Units** 〈 905 〉: Meet the requirements

IMPURITIES**Add the following:**

- • **Organic Impurities**

Mobile phase, System suitability solution, and Standard stock solution: Proceed as directed in the *Assay*.

Standard solution: 0.05 mg/mL of USP Gemfibrozil RS from the *Standard stock solution* in *Mobile phase*

Sensitivity solution: 0.005 mg/mL of USP Gemfibrozil RS from the *Standard solution* in *Mobile phase*

Sample solution: Nominally 10 mg/mL of gemfibrozil prepared as follows. Transfer 500 mg of gemfibrozil from NLT 20 finely powdered Tablets to a 50-mL volumetric flask, and add about 40 mL of *Mobile phase*. Sonicate and shake for 20 min. Dilute with *Mobile phase* to volume and filter.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 276 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 10 µL

Run time: NLT 3 times the retention time of gemfibrozil

System suitability

Samples: *System suitability solution* and *Sensitivity solution*

Suitability requirements

Resolution: NLT 8.0 between gemfibrozil and 2,5-xyleneol, *System suitability solution*

Relative standard deviation: NMT 2.0% for the gemfibrozil peak, *System suitability solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of each impurity from the *Sample solution*

r_S peak response of gemfibrozil from the *Standard solution*

C_S concentration of USP Gemfibrozil RS in the *Standard solution* (mg/mL)

C_U nominal concentration of gemfibrozil in the *Sample solution* (mg/mL)

Acceptance criteria

Individual impurities: NMT 0.17%

Total impurities: NMT 1.0%

■ 2S (USP38)

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers.
- **USP Reference Standards** { 11 }
USP Gemfibrozil RS

BRIEFING

Interferon beta-1a. Because there is no existing *USP* monograph for this drug substance, a new monograph based on validated methods of analysis is proposed.

1. The liquid chromatographic procedure used in the *Assay* is based on analyses performed with the Vydac 214TP Alltech brand of L26 column. The typical retention time for interferon beta-1a is 4 min.
2. The liquid chromatographic procedure used in *Identification* test C for *Peptide Mapping* and in the *Impurities* test for *Oxidized Interferon beta-1a* is based on analyses performed with the Vydac 214TP52 Alltech brand of L26 column.
3. The liquid chromatographic procedure used in the *Specific Tests* for *Analysis of N-Linked Oligosaccharides* and *Quantitation of Biantennary Sialylation* is based on analyses performed with the Shodex NH2P-50 Asahipak brand of L82 column.

 [145258-61-3].

DEFINITION

Interferon beta-1a is a 166 amino acid glycoprotein containing a disulfide bond between Cys-31 and Cys-141 and a free cysteine at position 17. Single *N*-linked glycosylation occurs at Asn₈₀. The amino acid sequence, disulfide linkage, and carbohydrate distribution are similar to natural human fibroblast interferon. Interferon beta-1a is recombinantly produced in mammalian cells containing the human interferon DNA sequence and stored as a concentrated solution. Residual host cell proteins and host cell-derived or vector-derived DNA are measured by suitable validated methods with limits approved by the appropriate regulatory authority.

IDENTIFICATION**● A. Bioidentity**

Medium A: Dulbecco's Modified Eagle Medium containing 25 mM d-glucose,¹ as well as 10% heat-inactivated fetal bovine serum,² and 4 mM l-glutamine.³ Filter sterilize.

Medium B: Dulbecco's Modified Eagle Medium containing 25 mM d-glucose,⁴ as well as 2% heat-inactivated fetal bovine serum,⁵ and 4 mM l-glutamine.⁶ Filter sterilize.

NBB solution: An aqueous solution of 0.05% (w/v) naphthol blue black (NBB),⁷ 9% (v/v) glacial acetic acid, and 0.1 M sodium acetate.

Cell culture preparation: Prepare adherent cell cultures of human lung carcinoma cell line A549⁸ in *Medium A*, and incubate in a humidified incubator at 37° containing 5% carbon dioxide. Cells should be passaged by trypsinization about once a week and are fed four days later with *Medium A*. The day before the assay (20–24 h before assay set-up), seed assay plates by removing the media from the flasks and add sufficient volume of 37° of cell culture grade trypsin-EDTA solution⁹ to cover the flask surface. Add 2 mL of the trypsin-EDTA solution to each flask, [Note—These volumes are based on a T-150 tissue culture flask.¹⁰] rock the flasks, and then place in the 37° incubator again for 5–10 min. Remove the flasks, tap the flasks to dislodge the cells, then add 10 mL of 37° *Medium A* to each flask. Aseptically pool all trypsinized cell solutions into a suitable sterile container, dilute with *Medium A* to 1:2, and then count the cells. Adjust the cell density with

Medium A such that the final concentration is 2.5×10^5 cells/mL and mix well to ensure a single cell suspension. Seed 100 μ L of this suspension into each well of a 96-well tissue culture plate,¹¹ and incubate for 20–24 h.

Standard/Control stock solutions: Reconstitute USP Interferon beta-1a for Bioidentity RS with a suitable quantity of sterile, distilled water and then dilute further with *Medium A* to 1×10^4 Units/mL or 50,000 pg/mL. [Note—This stock may be aliquoted and frozen at -70° until day of assay performance.]

Test stock solutions: Dilute the interferon beta-1a test materials with *Medium A* to 50,000 pg/mL (10,000 Units/mL). [Note—If the *Standard/Control stock solutions* were frozen before use in the assay, then the *Test stock solutions* must also be aliquoted and frozen at -70° before evaluation in the method.]

Virus solution: Encephalomyocarditis (EMC) virus¹² is cultured in murine fibroblast L929 cells¹³ through a minimum of 4 passages. The supernatant of the virus cultures are frozen at -70° . Before qualification, the harvested virus supernatant is thawed, sonicated for 30 min, and centrifuged at $1920 \times g$ for 10 min. The centrifuged virus supernatant is pooled, aliquoted, and frozen at -70° for qualification. The virus is qualified by determining the TCID₅₀ of the virus on A549 cells. The working concentration of the virus is approximately TCID₅₀/mL = $10^{6.16}$ in *Medium B*.

Procedure: For each sample, two independent sets of interferon beta-1a *Test solutions* must be prepared for each assay plate (left block and right block are duplicate) and NLT 2 assay plates must be performed to generate an $n = 4$ for each sample (2 from each plate). On day of assay performance, dilute the 50,000 pg/mL *Standard stock solution*, the *Control stock solution*, and the *Sample stock solution* with *Medium B* to a concentration of 40 pg/mL. From this intermediate dilution, dilute 6 times serially, using 1.3-fold dilution steps, to obtain a concentration series of 30.77 pg/mL to 8.29 pg/mL. Remove the tissue culture plate containing cells from the incubator and visually inspect the plate to confirm the cells are confluent, and appear healthy and uncontaminated. Discard the media completely from the wells. Next, starting with the least concentrated solutions in row G and moving up, add 100 μ L of each concentration of *Standard solution*, *Control solution*, and *Test solution* to the appropriate well using the plate design in *Table 1*. Add 100 μ L *Medium B* to rows A and H. At a minimum, repeat this setup for a second plate of cells. Incubate the plate for 20–24 h at 37° in an incubator with 5% carbon dioxide (CO₂).

The next day, dilute the *Virus solution* with *Medium B* to the predetermined qualified dilution. Remove the plates from the incubator and completely remove the solutions in each well. Add 100 μ L of *Medium B* to all wells of row A in each plate. Add 100 μ L of *Virus solution* to all wells on the rest of the plates. Incubate the plates again for 28–30 hours at 37° in an incubator with 5% carbon dioxide (CO₂).

The next day, remove the plates from the incubator and completely remove the solutions in each well. Add 50 μ L of *NBB solution* to all wells of the plates. Incubate the plates at 37° in an incubator with 5% carbon dioxide (CO₂) for 60 ± 15 min. Remove the plates and shake out the *NBB solution* from all the wells. Add 100 μ L of phosphate buffered saline¹⁴ to every well then shake out this solution, blot the plates on a paper towel, and repeat this wash one more time. Next, add 100 μ L of 50 mM sodium hydroxide to every empty well.

Place the plates on a shaker for NLT 1 min and NMT 96 h. Read the absorbance from the plates at a wavelength of 620 nm using a suitable plate reader.

Legend	
Cells	= Negative control of cells with <i>Medium B</i> ; no interferon beta-1a, no virus.
TSA	= One dilution series of <i>Test solution</i> , with the following concentrations of interferon beta-1a added to the indicated well: #1: 30.77 pg/mL; #2: 23.67 pg/mL; #3: 18.21 pg/mL; #4: 14.01 pg/mL; #5: 10.77 pg/mL; #6: 8.29 pg/mL. TSB, TSC, TSD=3 additional independent dilution series of <i>Test solution</i> , prepared as in TSA.
St	= Dilution series of <i>Standard solution</i> (concentrations same as in TSA #1 through #6).
PC	= <i>Positive control solution</i> dilution series (concentrations same as in TSA #1 through #6).
VC	= <i>Medium B</i> and cells present, followed by virus, but no interferon beta-1a.

Calculations: Each independent half-plate block of samples, standards, and controls are evaluated separately. The relative potency of the *Test solutions* and the *Control solutions* are calculated relative to the *Standard solutions* in that block using parallel line analysis.

System suitability criteria: For each individual *Control solution* compared to the *Standard solution*, the statistical tests for regression and parallelism must pass at the 95% level. The percent relative confidence interval must be NMT 50%. For the plate to be acceptable, the signal-to-noise ratio of the mean cell control signal in row A to the mean virus control signal in row H must be NLT 2.0, and the relative potency of the *Control Solution* to the *Standard solution* in that block must be NLT 80% and NMT 133% of the expected relative potency. For each individual *Test solution* compared to the *Standard solution*, the statistical tests for regression and parallelism must pass at the 95% level. The percent relative confidence interval must be NMT 50%. If any block fails based on these criteria or the *System suitability criteria* then it must be repeated until a minimum of 4 relative potencies can be combined to calculate a mean relative potency. The 95% confidence interval for the calculated mean potency must be within 64%–156% of the observed potency.

Acceptance criteria: 80%–133%

- **B.** The retention time of the interferon beta-1a main peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. Peptide Mapping**
Solution A: 0.1% (w/v) trifluoroacetic acid in water. Degas.
Solution B: Prepare a 90% solution of acetonitrile in water. Add trifluoroacetic acid to 0.1% (w/v) and mix.
Mobile phase: See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	100	0
70	30	70
80	100	0

Buffer solution: 0.1 M solution of tris (hydroxymethyl) aminomethane (tris) and 0.25 M

sodium chloride. Adjust with hydrochloric acid to a pH of 8.5. Filter.

Enzyme solution: Prepare an aqueous solution of 0.8 mg/mL lysyl endopeptidase from *Achromobacter lyticus*.

Standard stock solution: 1.0 mg/mL of USP Interferon beta-1a RS in *Buffer solution*

Standard solutions: Prepare duplicate tubes containing 8.8 μL of 50 mM dithiothreitol in each. Add 40 μL of *Standard stock solution* and 40 μL of *Buffer solution* to each tube. Mix and incubate for 15–60 min. Add 4.0 μL of a 20 mM EDTA solution and 4.0 μL *Enzyme solution* and gently mix, making sure not to introduce air and that all sample is at the bottom of the tube. Cap the tube and incubate at $25 \pm 2^\circ$ for 20–28 h. Add 98 μL of 8 M guanidine hydrochloride solution and 16 μL of 50 mM dithiothreitol solution. Mix and perform chromatography, injecting samples NMT 22 h later. [Note—Samples can be stored at -70° if necessary but an additional 16 μL of 50 mM dithiothreitol solution must be added before analysis if this is performed.]

Sample stock solution: 0.2 mg/mL of interferon beta-1a in *Buffer solution*. [Note—If necessary, buffer exchange by suitable means into *Buffer solution* to prepare this solution before digestion.]

Sample solutions: Prepare duplicate tubes containing 8.8 μL of 50 mM dithiothreitol in each. Add 8 μL of *Sample stock solution* and 72 μL of *Buffer solution* to each tube. Mix and incubate for 15–60 min. Add 4.0 μL of a 20 mM EDTA solution and 4.0 μL of *Enzyme solution* and gently mix, making sure not to introduce air and that all sample is at the bottom of the tube. Cap the tube and incubate at $25 \pm 2^\circ$ for 20–28 h. Add 98 μL of 8 M guanidine hydrochloride solution and 16 μL of 50 mM dithiothreitol solution. Mix and perform chromatography, injecting samples NMT 22 h later. [Note—Samples can be stored at -70° if necessary but an additional 16 μL of 50 mM dithiothreitol solution must be added before analysis if this is performed.]

Blank solutions: Prepare duplicate tubes containing 8.8 μL of 50 mM dithiothreitol in each. Add 80 μL of *Buffer solution* to each tube. Mix and incubate for 15–60 min. Add 4.0 μL of a 20 mM EDTA solution and 4.0 μL of *Enzyme solution* and gently mix, making sure not to introduce air and that all sample is at the bottom of the tube. Cap the tube and incubate at $25 \pm 2^\circ$ for 20–28 h. Add 98 μL of 8 M guanidine hydrochloride solution and 16 μL of 50 mM dithiothreitol solution. Mix and perform chromatography, injecting samples NMT 22 h later. [Note—Samples can be stored at -70° if necessary but an additional 16 μL of 50 mM dithiothreitol solution must be added before analysis if this is performed.]

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 2.1-mm \times 25-cm; 5- μm packing L26

Temperatures

Column: 40°

Sample: 5°

Flow rate: 0.3 mL/min

Injection volume: 100 μL

System suitability

Samples: *Standard solutions* and *Blank solutions*

Suitability requirements

Resolution: NLT 2.0 between the AP6(ox) peak (representing amino acids 34–45 of interferon beta-1a) at half height and the AP5 peptide peak (representing amino acids 124–134 of interferon beta-1a) in the *Standard solution*. [Note—See also the chromatogram supplied with USP Interferon beta-1a RS.]

NLT 3.8 between the AP6 and AP5 peptide peaks

Interfering peaks: No significant peaks that coelute with the AP6 and AP6(ox) peaks in the *Blank solution*.

Analysis

Samples: *Standard solutions* and *Sample solutions*

[Note—Condition the chromatographic system by running a blank gradient program before injecting the digests.]

Acceptance criteria: The chromatographic profiles of the *Sample solutions* are similar to those of the *Standard solutions* and no extra peaks greater than 5% of the peak height of peptide AP9 (representing amino acids 137–166 of interferon beta-1a) are present.

ASSAY• **Procedure**

Solution A: 0.1% (w/v) trifluoroacetic acid. Degas solution before use.

Solution B: 90% (v/v) acetonitrile and 0.1% (w/v) trifluoroacetic acid. Degas solution before use.

Mobile phase: See *Table 3*.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	60	40
5	10	90
7	10	90
9	60	40

Buffer solution: Dissolve 1.58 g of sodium acetate trihydrate and 31.60 g of l-arginine HCl in 900 mL of water, then add 0.48 mL acetic acid, followed by more water to 1 L total. Mix, filter, and confirm that the pH is 4.8 ± 0.2 .

Sample additive: 10% (w/v) polyoxyethylene–polyoxypropylene block copolymer¹⁵

Blank solution: Add 5 μ L of *Sample additive* to 500 μ L of *Buffer solution*.

Standard solution: Dilute a suitable quantity of USP Interferon beta-1a RS in *Buffer solution* to prepare a 60 μ g/mL solution. Add 10 μ L of *Sample additive* to 1 mL of this protein solution and gently mix. Before use, centrifuge at $20,000 \times g$ for 30 min at 2° – 8° , then store at this temperature before injection.

Sample solution: Dilute a suitable quantity of Interferon beta-1a in *Buffer solution* to prepare a 60 μ g/mL solution. Add 10 μ L of *Sample additive* to 1 mL of the protein solution and gently mix. Before use, centrifuge at $20,000 \times g$ for 30 min at 2° – 8° , then store at this temperature before injection.

Chromatographic System

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 2.1-mm × 5-cm; 5-μm packing L26

Temperatures

Column: 40°

Sample: 5°

Flow rate: 0.5 mL/min

Injection volume: 100 μL

System suitability

Samples: *Standard solutions, Sample solutions, and Blank solution*

Suitability requirements

Precision: NMT 3% RSD for the main peak area of the first six *Standard solution* injections before the *Sample solutions*, and NMT 3% RSD for the main peak area of the two *Standard solution* injections after the *Sample solutions*. In addition, NMT 5% difference between the means of the first (first six injections) and second set (last two injections) of *Standard solution* injections where the percent difference is calculated by subtracting the mean of the second set from the first set, divided by the average of both sets, and multiplying by 100.

Tailing factor: 1.0–2.4 for the interferon beta-1a peak in each *Standard solution* injection, except the first injection

Interfering peaks: No significant peaks may be observed in the second *Blank solution*.

Analysis

Samples: *Standard solutions and Sample solutions*

[Note—Condition the chromatographic system by running a blank gradient program before injecting the solutions.] Inject two *Blank solutions*, then six *Standard solutions*, followed by duplicate injections of up to three *Sample solutions*, followed by two *Standard solution* injections.

Integrate each chromatogram's interferon beta-1a main peak area. Calculate the concentration, in μg/mL, of interferon beta-1a in the *Sample solution* taken:

$$\text{Result} = (r_U/r_S) \times C_S$$

r_U = peak area from each *Sample solution* injection

r_S = average peak area of bracketing *Standard solutions*

C_S = concentration of the *Standard solution* (μg/mL)

For the final result, average the *Sample solution* results.

Acceptance criteria: 90%–110%

IMPURITIES

• **Impurities with Molecular Masses Different from Those of Main Interferon beta-1a**

12% Resolving gel: Per 10 mL of solution, mix 4 mL of 30% acrylamide/bisacrylamide (29:1) solution, 3.3 mL of water, 2.5 mL of 1.5 M Tris-HCl buffer (pH 8.8), 0.1 mL of 100 g/L SDS solution, 0.1 mL of 100 g/L ammonium persulfate solution (APS), and 4 μL of tetramethylethylenediamine (TEMED). Pour into a suitable gel cassette, add a sufficient quantity of water-saturated isobutanol to cover the surface, and allow polymerization.¹⁶

Stacking gel: After polymerization of the *12% Resolving gel*, mix (per 5 mL of solution) 0.83

mL of 30% acrylamide/bisacrylamide (29:1) solution, 3.4 mL of water, 0.63 mL of 1.5 M Tris-HCl buffer (pH 8.8), 50 μ L of 100 g/L SDS solution, 50 μ L of 100 g/L APS, and 5 μ L of TEMED. Remove the isobutanol from the *12% Resolving gel* surface and then pour the stacking gel solution on top, insert a suitable gel comb without introducing air bubbles, and allow polymerization.

Buffer A: Prepare a stock solution of 151.4 g of tris, 721.0 g of glycine, and 50.0 g of sodium lauryl sulfate in 5 L of water. Immediately before use, dilute 10-fold with water. Confirm that the pH is 8.1–8.8.

Stock sample buffer: Mix 3.78 g of tris, 10 g sodium dodecyl sulfate (SDS), and 100 mg of bromophenol blue in water. Add 50.0 mL of glycerol and dilute with water to 200 mL. Add 25.0 mL of 2-mercaptoethanol. Adjust with hydrochloric acid to a pH of 6.8, and then dilute with water to 250 mL total volume.

Sample buffer: Mix equal volumes of *Stock sample buffer* with water.

Sample solution A: Concentrate the Interferon beta-1a sample with a suitable procedure to obtain a concentration of 1.5 mg/mL.

Sample solution B: Mix equal volumes of *Sample solution A* with *Stock sample buffer*.

Sample solution C: Dilute *Sample solution A* with water to obtain a concentration of 0.6 mg/mL. Mix equal volumes of this protein solution with *Stock sample buffer*.

Sample solution D: Mix 8 μ L of *Sample solution C* with 40 μ L of *Sample buffer*.

Sample solution E: Mix 15 μ L of *Sample solution D* with 35 μ L of *Sample buffer*.

Sample solution F: Mix 18 μ L of *Sample solution E* with 18 μ L of *Sample buffer*.

Sample solution G: Mix 12 μ L of *Sample solution F* with 12 μ L of *Sample buffer*.

Molecular weight markers: Mix an equal volume of a solution of relative molecular mass markers suitable for SDS-PAGE analysis in the range of 14–66 kDa¹⁷ with *Sample buffer*.

Staining solution: Dissolve 1.25 g/L of brilliant blue dye¹⁸ in a solution of glacial acetic acid, methanol, and water (1:4:5). Pass through a suitable filter.

Destaining solution: Mix glacial acetic acid, isopropanol, and water (1:1:8).

Analysis: Insert the prepared gel in a suitable electrophoresis chamber containing *Buffer A* and remove the comb. Rinse each well with *Buffer A* before loading samples. Boil all *Sample solutions* and *Molecular weight markers* for 3 min. Load 20 μ L of each *Sample solution (A through G)* and *Molecular weight marker* into individual wells of the gel. Perform the electrophoresis until the bromophenol blue dye front is near the bottom of the gel. Remove the gel from the cassette and immerse in *Staining solution* with gentle shaking at 33°–37° for 90 min. Discard the *Staining solution* and add a large excess of *Destaining solution*. Measure the distance traveled for each band in all lanes from the top of the resolving gel then divide that value by the distance traveled by the dye front to obtain the R_f for each band. Plot the logarithm of the molecular weights of each protein in the *Molecular weight markers* versus the R_f values. *Table 4* describes the apparent molecular weights of the main interferon beta-1a band as well as related substances.

Table 4

Name	Apparent Molecular Mass	Acceptance Criteria
Interferon beta-1a	23,000	—
Underglycosylated interferon beta-1a	21,000	NMT 5%
Deglycosylated interferon beta-1a	20,000	NMT 2%

System suitability requirements: The *Molecular weight markers* must be distributed across 80% of the gel, and there should be a linear relationship between the logarithm of their molecular weight and their R_F values. At least one band of approximate molecular weight of 23,000 Da (interferon beta-1a) must be present in the *Sample solution G* lane. A decrease in staining intensity is seen from *Sample solution B* through *Sample solution G*. No interferon beta-1a dimer should be visible in any of the *Sample solution* lanes (apparent molecular mass 46,000).

Acceptance criteria: Any band in *Sample solution C* that corresponds to underglycosylated interferon beta-1a must not be more intense than the interferon beta-1a band in *Sample solution E* (or 5%). Any band in *Sample solution B* that corresponds to deglycosylated interferon beta-1a must not be more intense than the interferon beta-1a band in *Sample solution E* (or 2%). Any other band (other than the two described) of lower molecular weight than interferon beta-1a must not be more intense than the interferon beta-1a band in *Sample solution F* (or 1%).

• **Oxidized Interferon beta-1a**

Mobile phase, Solution C, Enzyme solution, Standard solutions, Sample solutions, Blank solutions, Chromatographic system, and System suitability: Prepare as directed in *Identification test C, Peptide Mapping*.

Analysis: Using the results from the test for *Peptide Mapping*, locate the peaks due to the peptide fragment AP6 comprising amino acids 34–45 and its oxidized form using the *Standard solution* results and the chromatogram of oxidized interferon beta-1a digest supplied with the USP Interferon Beta-1a RS.

Calculate the percentage of oxidation of interferon beta-1a:

$$\frac{A_{34-45ox}}{A_{34-45} + A_{34-45ox}} \times 100$$

$A_{34-45ox}$ = area of the peak corresponding to the oxidized peptide fragment 34–45

A_{34-45} = area of the peak corresponding to the unoxidized peptide fragment 34–45

Acceptance criteria: NMT 6%

SPECIFIC TESTS

• **Analysis of N-Linked Oligosaccharides**

Solution A: Mix 2 mL of *Solution B* with 998 mL of water. Degas before use.

Solution B: Dissolve 19.3 g of ammonium acetate in 800 mL of water. Add 9 mL of acetic acid then dilute with water to 1000 mL. Degas before use.

Mobile phase: See *Table 5*. [Note—Additional time may be inserted after 73 min to flush the column with 100% *Solution B* at 0.75 mL/min to remove excess dye from the column. If this is necessary, the column must then be washed with 100% *Solution A* before the next sample injection.]

Table 5

Time (min)	Flow Rate (mL/min)	Solution A (%)	Solution B (%)
0	0.50	100	0
30	0.50	70	30
70	0.50	15	85
72	0.50	0	100
72.5	0.75	0	100
87	0.75	0	100
88.5	0.75	100	0
99.5	0.75	100	0
99.8	0.50	100	0
130	0.50	100	0
131	0.0	100	0

Enzyme solution: On the day of use, combine 1.0 mL of 50 mM ammonium bicarbonate with 144 μ L of 10% nonyl phenoxy polyethoxy ethanol and mix. Add 40 μ L of peptide *N*-glycosidase F¹⁹ (PNGase F) and mix.

Labeling reagent: Mix 0.3 mL of acetic acid with 0.7 mL of dimethyl sulfoxide in a 1.5 mL microfuge tube. In a fume hood, add 48 mg of anthranilic acid²⁰ (2-AA). Mix well, then add 63 mg of sodium cyanoborohydride. Mix well.

System suitability solution: Using separate vials for each glycan standard, transfer 40 μ g of NA2F complex *N*-linked glycan²¹ (BiNA0), 20 μ g of NGA2F complex *N*-linked glycan²² (BiNA0-2Gal), 60 μ g of A1F complex *N*-linked glycan²³ (BiNA1), and 80 μ g of A2F complex *N*-linked glycan²⁴ (BiNA2). Add 10 μ L of *Labeling reagent* to each tube. Mix by vortexing, then centrifuge briefly. Incubate for 3 ± 0.25 h at $45 \pm 2^\circ$. After cooling and briefly centrifuging, remove excess label on suitable cartridges²⁵ per the manufacturer's instructions. After the final acetonitrile wash, elute each labeled glycan from the cartridge using 3×0.5 mL water washes into fresh tubes. Evaporate to dryness. Reconstitute each labeled glycan standards with 100 μ L of water for every 10 μ g of starting glycan. Pool all the labeled standards, mix, and aliquot. Aliquots may be stored for up to 1 year at $-20 \pm 5^\circ$ C.

Standard solutions: Buffer exchange sufficient quantities of USP Interferon beta-1a RS by suitable methods to prepare two replicates each containing 200 μ g USP Interferon beta-1a RS in a volume of 150–300 μ L of 50 mM ammonium bicarbonate. Add 100 μ L of *Enzyme solution* and mix gently. Incubate 16–24 h at $37 \pm 2^\circ$. Recover the released glycans by reverse phase solid phase extraction using suitable cartridges²⁶ eluting with 0.5 mL of 10 % methanol. Evaporate each digest sample to dryness. Add 10 μ L of *Labeling reagent* to each tube. Mix by vortexing, then centrifuge briefly. Incubate for 3 ± 0.25 h at $45 \pm 2^\circ$. After cooling and briefly centrifuging, remove excess label on suitable cartridges²⁷ per the manufacturer's instructions. After the final acetonitrile wash, elute each labeled glycan from the cartridge using 3×0.5 mL water washes into fresh tubes. Evaporate to dryness. Before *Analysis*, reconstitute each labeled glycan sample with 50 μ L of water.

Sample solutions: Prepare two replicates for each sample. Buffer exchange by suitable methods 200 μ g of interferon beta 1a into a final volume of 150–300 μ L of 50 mM ammonium bicarbonate. Add 100 μ L of *Enzyme solution* and mix gently. Incubate 16–24 h

at $37 \pm 2^\circ\text{C}$. Recover the released glycans by reverse phase solid phase extraction using suitable cartridges²⁸ eluting with 0.5 mL of 10 % methanol. Evaporate each digest sample to dryness. Add 10 μL of *Labeling reagent* to each tube. Mix by vortexing, then centrifuge briefly. Incubate for 3 ± 0.25 h at $45 \pm 2^\circ$. After cooling and briefly centrifuging, remove excess label on suitable cartridges²⁹ per the manufacturer's instructions. After the final acetonitrile wash, elute each labeled glycan from the cartridge using 3×0.5 mL water washes into fresh tubes. Evaporate to dryness. Before *Analysis*, reconstitute each labeled glycan sample with 50 μL of water.

Blank solutions: Prepare two blanks containing 150 μL of 50 mM ammonium bicarbonate.

Add 100 μL of *Enzyme solution* and mix gently. Incubate 16–24 h at $37 \pm 2^\circ$. Perform reverse phase solid phase extraction using suitable cartridges³⁰ eluting with 0.5 mL of 10 % methanol. Evaporate each tube to dryness. Add 10 μL of *Labeling reagent* to each tube. Mix by vortexing, then centrifuge briefly. Incubate for 3 ± 0.25 h at $45 \pm 2^\circ$. After cooling and briefly centrifuging, remove excess label on suitable cartridges³¹ per the manufacturer's instructions. After the final acetonitrile wash, elute each blank from the cartridge using 3×0.5 mL water washes into fresh tubes. Evaporate to dryness. Before *Analysis*, add 50 μL of water to each tube.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: Fluorescence (350-nm excitation wavelength; 430-nm emission wavelength)

Column: 4.6-mm \times 15-cm; 5- μm packing L82

Temperatures

Column: $30 \pm 3^\circ$

Sample: $2^\circ - 8^\circ$

Flow rate: 0.5 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution*, *Standard solutions*, and *Blank solutions*

Suitability requirements

Chromatogram of the *Standard solutions* must be comparable to the example chromatogram supplied with the USP Interferon beta-1a RS.

Resolution: NLT 10 between the BiNA2 glycan and BiNA1 glycan in the *System suitability solution*.

Column efficiency: NLT 10,000 based on the BiNA2 glycan peak in the *System suitability solution*.

Interfering peaks: No significant peaks that interfere with glycan quantitation in the *Blank solution*.

Analysis

Samples: *Standard solutions*, *Sample solutions*, and *Blank solutions*

Separately inject samples in the following order. Water alone, *Blank solution*, *System suitability solution*, first *Standard solution*, *Sample solutions*, second *Standard solution*, second *Blank solution*. Record the chromatograms and identify the 5 expected peaks listed in *Table 6* (same nomenclature followed in the calculations below) by comparison to the

representative chromatogram with the USP Interferon beta-1a RS. Integrate the chromatograms over the range including the BiNA0 through the BiNA3 peaks. Calculate the antennary distribution of fully sialylated form of each glycan BiNA2, TriNA3, and TriLacNA3 for each replicate, and report the average of replicate results:

$$\% \text{ BiNA2} = \frac{\text{Area of BiNA2}}{\text{Area of BiNA2} + \text{Area of TriNA3} + \text{Area of TriLacNA3}} \times 100$$

$$\% \text{ TriNA3} = \frac{\text{Area of TriNA3}}{\text{Area of BiNA2} + \text{Area of TriNA3} + \text{Area of TriLacNA3}} \times 100$$

$$\% \text{ TriLacNA3} = \frac{\text{Area of TriLacNA3}}{\text{Area of BiNA2} + \text{Area of TriNA3} + \text{Area of TriLacNA3}} \times 100$$

Table 6

Structure	Glycoform	Description
BiNA1	2A1S1F	Biantennary complex type glycan with core fucose (Bi) and one sialic acid (neuraminic acid, NA1)
BiNA2	2A2S1F	Biantennary complex type glycan with core fucose and two sialic acids
TriLacNA3	3A3S1F1L	Triantennary complex type glycan with core fucose and lactosamine repeat in one antennae, and three sialic acids
TriNA3	3A3S1F	Triantennary complex type glycan with core fucose and three sialic acids
BiNA3	2A3S1F	Biantennary complex type glycan with core fucose and three sialic acids

Acceptance criteria: Replicate chromatograms of *Sample solutions* must be comparable to each other and to the *Standard solution* chromatogram in terms of presence/absence of peaks and relative response (*Standard solution, Sample solution*).

• **Quantitation of Biantennary Sialylation**

Solution A, Solution B, Mobile phase, Enzyme solution, Labeling reagent, System suitability solution, Sample solutions, Standard solutions, Blank solutions, Chromatographic system, and System suitability: Prepare as directed in *Analysis of N-Linked Oligosaccharides*.

Analysis

Samples: *Sample solutions, Standard solutions, and Blank solution*

Separately inject samples in the following order. Water alone, *Blank solution, System suitability solution, first Standard solution, Sample solutions, second Standard solution, second Blank solution*. Record the chromatograms and identify the biantennary peaks listed in *Table 6* and by comparison to the representative chromatogram with the USP Interferon beta-1a RS.

Calculate the percentage of sialylation of biantennary glycans for each replicate, and report the average of replicate results:

$$\% \text{ Biantennary sialylation} = + \frac{(\text{Area of BiNA1}) + ((\text{Area of BiNA2} + \text{Area of BiNA3}) \times 2)}{(\text{Area of BiNA0} + \text{Area of BiNA1} + \text{Area of BiNA2} + \text{Area of BiNA3}) \times 2} \times 100$$

Acceptance criteria: NLT 90%

• **Osmolality and Osmolarity** 〈 785 〉 : 261–319 mOsmol/kg

• **Bacterial Endotoxins Test** 〈 85 〉 : It contains NMT 21 USP Endotoxin Units/mL.

- **Microbial Enumeration Tests** 〈 61 〉 and **Tests for Specified Microorganisms** 〈 62 〉: The total aerobic microbial count is NMT 10 cfu/10 mL and the total combined yeasts and molds count is NMT 10 cfu/10 mL.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers, protected from light, at NMT -70° .
 - **Labeling:** The labeling states the interferon beta-1a content (mg/mL) and anti-viral activity (in Units/mL), and that the material is of recombinant origin.
 - **USP Reference Standards** 〈 11 〉
 - USP Interferon beta-1a RS
 - USP Interferon beta-1a for Bioidentity RS
- 1S (USP39)

BRIEFING

Interferon beta-1a Injection. Because there is no existing *USP* monograph for this drug product, a new monograph based on validated methods of analysis is proposed.

1. The liquid chromatographic procedure used in the *Assay* is based on analyses performed with the Vydac 214TP Alltech brand of L26 column. The typical retention time for interferon beta-1a is 4 min.
2. The liquid chromatographic procedure used in *Identification* test C for *Peptide Mapping* and in the *Impurities* test for *Oxidized Interferon beta-1a* is based on analyses performed with the Vydac 214TP52 Alltech brand of L26 column.
3. The liquid chromatographic procedure used in the *Specific Tests* for *Analysis of N-*

Linked Oligosaccharides and Quantitation of Biantennary Sialylation is based on analyses performed with the Shodex NH2P-50 Asahipak brand of L82 column.

Add the following:

■ Interferon beta-1a Injection

DEFINITION

Interferon beta-1a Injection is a sterile solution of Interferon beta-1a in a suitable solvent that may include suitable buffering and stabilizing agents.

IDENTIFICATION

• **A. Bioidentity**

Medium A: Dulbecco's Modified Eagle Medium containing 25 mM d-glucose,¹ as well as 10% heat-inactivated fetal bovine serum,² and 4 mM l-glutamine.³ Filter sterilize.

Medium B: Dulbecco's Modified Eagle Medium containing 25 mM d-glucose,⁴ as well as 2% heat-inactivated fetal bovine serum,⁵ and 4 mM l-glutamine.⁶ Filter sterilize.

NBB solution: An aqueous solution of 0.05% (w/v) naphthol blue black (NBB),⁷ 9% (v/v) glacial acetic acid, and 0.1 M sodium acetate.

Cell culture preparation: Prepare adherent cell cultures of human lung carcinoma cell line A549⁸ in *Medium A* and incubate in a humidified incubator at 37° containing 5% carbon dioxide. Cells should be passaged by trypsinization about once a week and are fed 4 days later with *Medium A*. The day before the assay (20–24 h before assay set-up), seed assay plates by removing the media from the flasks and add sufficient volume of 37° cell culture grade trypsin–EDTA solution⁹ to cover the flask surface. Add 2 mL of the trypsin–EDTA solution to each flask, [Note—These volumes are based on a T-150 tissue culture flask.¹⁰] rock the flasks, and then place in the 37° incubator again for 5–10 min. Remove the flasks, tap the flasks to dislodge the cells, then add 10 mL of 37° *Medium A* to each flask. Aseptically pool all trypsinized cell solutions into a suitable sterile container, dilute with *Medium A* to 1:2, and then count the cells. Adjust the cell density with *Medium A* such that the final concentration is 2.5×10^5 cells/mL and mix well to ensure a single cell suspension. Seed 100 µL of this suspension into each well of a 96-well tissue culture plate¹¹ and incubate for 20–24 h.

Standard/Control stock solutions: Reconstitute USP Interferon beta-1a for Bioidentity RS with a suitable quantity of sterile, distilled water and then dilute further with *Medium A* to 1×10^4 Units/mL or 50,000 pg/mL. [Note—This stock may be aliquoted and frozen at –70° until day of assay performance.]

Test stock solutions: Dilute the interferon beta-1a test materials with *Medium A* to 50,000 pg/mL (10,000 Units/mL). [Note—If the *Standard/Control stock solutions* were frozen before use in the assay then the *Test stock solutions* must also be aliquoted and frozen at –70° before evaluation in the method.]

Virus solution: Encephalomyocarditis (EMC) virus¹² is cultured in murine fibroblast L929 cells¹³ through a minimum of four passages. The supernatant of the virus cultures are frozen at -70° . Before qualification, the harvested virus supernatant is thawed, sonicated for 30 min, and centrifuged at $1920 \times g$ for 10 min. The centrifuged virus supernatant is pooled, aliquoted, and frozen at -70° for qualification. The virus is qualified by determining the TCID₅₀ of the virus on A549 cells. The virus is then diluted in *Medium B* to a working concentration (approximately TCID₅₀/mL = $10^{6.16}$).

Procedure: For each sample, two independent sets of interferon beta-1a *Test solutions* must be prepared for each assay plate (left block and right block are duplicate) and NLT 2 assay plates must be performed to generate an $n = 4$ for each sample (2 from each plate). On day of assay performance, dilute the 50,000 pg/mL *Standard stock solution*, the *Control stock solution*, and the *Test stock solution* with *Medium B* to a concentration of 40 pg/mL. From this intermediate dilution, dilute six times serially, using 1.3-fold dilution steps, to obtain a concentration series of 30.77 pg/mL to 8.29 pg/mL.

Remove the tissue culture plate containing cells from the incubator and visually inspect the plate to confirm the cells are confluent, and appear healthy and uncontaminated. Discard the media completely from the wells. Next, starting with the least concentrated solutions in row G and moving up, add 100 μ L of each concentration of *Standard solution*, *Control solution*, and *Test solution* to the appropriate well using the plate design in *Table 1*. Add 100 μ L of *Medium B* to rows A and H. At a minimum, repeat this setup for a second plate of cells. Incubate the plate for 20–24 h at 37° in an incubator with 5% carbon dioxide (CO₂).

The next day, dilute the *Virus solution* with *Medium B* to the predetermined qualified dilution. Remove the plates from the incubator and completely remove the solutions in each well. Add 100 μ L of *Medium B* to all wells of row A in each plate. Add 100 μ L of *Virus solution* to all wells on the rest of the plates. Incubate the plates again for 28–30 h at 37° in an incubator with 5% carbon dioxide (CO₂).

The next day, remove the plates from the incubator and completely remove the solutions in each well. Add 50 μ L of *NBB solution* to all wells of the plates. Incubate the plates at 37° in an incubator with 5% carbon dioxide (CO₂) for 60 ± 15 min. Remove the plates and shake out the *NBB solution* from all the wells. Add 100 μ L of phosphate buffered saline¹⁴ to every well then shake out this solution, blot the plates on a paper towel, and repeat this wash one more time. Next, add 100 μ L of 50 mM sodium hydroxide to every empty well. Place the plates on a shaker for NLT 1 min and NMT 96 h. Read the absorbance from the plates at a wavelength of 620 nm using a suitable plate reader.

Legend
 Cells = Negative control of cells with *Medium B*; no interferon beta-1a, no virus.
 TSA = One dilution series of *Test solution*, with the following concentrations of interferon beta-1a added to the indicated well: #1: 30.77 pg/mL; #2: 23.67 pg/mL; #3: 18.21 pg/mL; #4: 14.01 pg/mL; #5: 10.77 pg/mL; #6: 8.29 pg/mL. TSB, TSC, TSD=3 additional independent dilution series of *Test solution*, prepared as in TSA.
 St = Dilution series of *Standard solution* (concentrations same as in TSA #1 through #6).
 PC = *Positive control solution* dilution series (concentrations same as in TSA #1 through #6).
 VC= *Medium B* and cells present, followed by virus, but no interferon beta-1a.

Calculations: Each independent half-plate block of samples, standards, and controls are evaluated separately. The relative potency of the *Test solutions* and the *Control solutions* are calculated relative to the *Standard solutions* in that block using parallel line analysis.

System suitability criteria: For each individual *Control solution* compared to the *Standard solution*, the statistical tests for regression and parallelism must pass at the 95% level. The percent relative confidence interval must be NMT 50%. For the plate to be acceptable, the signal-to-noise ratio of the mean cell control signal in row A to the mean virus control signal in row H must be NLT 2.0, and the relative potency of the *Control solution* to the *Standard solution* in that block must be NLT 80% and NMT 133% of the expected relative potency. For each individual *Test solution* compared to the *Standard solution*, the statistical tests for regression and parallelism must pass at the 95% level. The percent relative confidence interval must be NMT 50%. If any block fails based on these criteria then it must be repeated until a minimum of 4 relative potencies can be combined to calculate a mean relative potency. The 95% confidence interval for the calculated mean potency must be within 64%–156% of the observed potency.

Acceptance criteria: 80%–133%

- **B.** The retention time of the interferon beta-1a main peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. Peptide Mapping**
Solution A: 0.1% (w/v) trifluoroacetic acid in water. Degas.
Solution B: Prepare a 90% solution of acetonitrile in water. Add trifluoroacetic acid to 0.1% (w/v) and mix.
Mobile phase: See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	100	0
70	30	70
80	100	0

Buffer solution: 0.1 M solution of tris(hydroxymethyl)aminomethane (tris) and 0.25 M sodium chloride. Adjust with hydrochloric acid to a pH of 8.5. Filter.

Enzyme solution: Prepare an aqueous solution of 0.8 mg/mL lysyl endopeptidase from *Achromobacter lyticus*.

Standard stock solution: 1.0 mg/mL of USP Interferon beta-1a RS in *Buffer solution*

Standard solutions: Prepare duplicate tubes containing 8.8 µL of 50 mM dithiothreitol in each. Add 40 µL of *Standard stock solution* and 40 µL of *Buffer solution* to each tube. Mix and incubate for 15–60 min. Add 4.0 µL of a 20 mM EDTA solution and 4.0 µL of *Enzyme*

solution and gently mix, making sure not to introduce air and that all sample is at the bottom of the tube. Cap the tube and incubate at $25 \pm 2^\circ$ for 20–28 h. Add 98 μL of 8 M guanidine hydrochloride solution and 16 μL of 50 mM dithiothreitol solution. Mix and perform chromatography, injecting samples NMT 22 h later. [Note—Samples can be stored at -70° if necessary but an additional 16 μL of 50 mM dithiothreitol solution must be added before analysis if this is performed.]

Sample stock solution: Combine a suitable number of containers and concentrate to obtain a solution of 0.2 mg/mL of interferon beta-1a in *Buffer solution*. [Note—If necessary, buffer exchange by suitable means into *Buffer solution* to prepare this solution before digestion.]

Sample solutions: Prepare duplicate tubes containing 8.8 μL of 50 mM dithiothreitol in each. Add 8 μL of *Sample stock solution* and 72 μL of *Buffer solution* to each tube. Mix and incubate for 15–60 min. Add 4.0 μL of a 20 mM EDTA solution and 4.0 μL of *Enzyme solution* and gently mix, making sure not to introduce air and that all sample is at the bottom of the tube. Cap the tube and incubate at $25 \pm 2^\circ$ for 20–28 h. Add 98 μL of 8 M guanidine hydrochloride solution and 16 μL of 50 mM dithiothreitol solution. Mix and perform chromatography, injecting samples NMT 22 h later. [Note—Samples can be stored at -70° if necessary but an additional 16 μL of 50 mM dithiothreitol solution must be added before analysis if this is performed.]

Blank solutions: Prepare duplicate tubes containing 8.8 μL of 50 mM dithiothreitol in each. Add 80 μL of *Buffer solution* to each tube. Mix and incubate for 15–60 min. Add 4.0 μL of a 20 mM EDTA solution and 4.0 μL of *Enzyme solution* and gently mix making sure not to introduce air and that all sample is at the bottom of the tube. Cap the tube and incubate at $25 \pm 2^\circ$ for 20–28 h. Add 98 μL of 8 M guanidine hydrochloride solution and 16 μL of 50 mM dithiothreitol solution. Mix and perform chromatography, injecting samples NMT 22 h later. [Note—Samples can be stored at -70° if necessary but an additional 16 μL of 50 mM dithiothreitol solution must be added before analysis if this is performed.]

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 2.1-mm \times 25-cm; 5- μm packing L26

Temperatures

Column: 40°

Sample: 5°

Flow rate: 0.3 mL/min

Injection volume: 100 μL

System suitability

Samples: *Standard solutions* and *Blank solutions*

Suitability requirements

Resolution: NLT 2.0 between the AP6(ox) peak (representing amino acids 34–45 of interferon beta-1a) at half height and the AP5 peptide peak (representing amino acids 124–134 of interferon beta-1a) in the *Standard solution*. [Note—See also the chromatogram supplied with USP Interferon beta-1a RS.]

NLT 3.8 between the AP6 and AP5 peptide peaks.

Interfering peaks: No significant peaks that coelute with the AP6 and AP6(ox) peaks in the *Blank solution*

Analysis

Samples: *Standard solutions* and *Sample solutions*

[Note—Condition the chromatographic system by running a blank gradient program before injecting the digests.]

Acceptance criteria: The chromatographic profiles of the *Sample solutions* are similar to those of the *Standard solutions* and no extra peaks greater than 5% of the peak height of peptide AP9 (representing amino acids 137–166 of interferon beta-1a) are present.

ASSAY

• Procedure

Solution A: 0.1% (w/v) trifluoroacetic acid. Degas solution before use.

Solution B: 90% (v/v) acetonitrile and 0.1% (w/v) trifluoroacetic acid. Degas solution before use.

Mobile phase: See *Table 3*.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	60	40
5	10	90
7	10	90
9	60	40

Buffer solution: Dissolve 1.58 g of sodium acetate trihydrate and 31.60 g of L-arginine HCl in 900 mL of water, then add 0.48 mL of acetic acid, followed by more water to 1 L total. Mix, filter, and confirm that the pH is 4.8 ± 0.2 .

Sample additive: 10% (w/v) polyoxyethylene-polyoxypropylene block copolymer¹⁵

Standard solution: Dilute a suitable quantity of USP Interferon beta-1a RS in *Buffer solution* to prepare a 60 µg/mL solution. Add 10 µL of *Sample additive* to 1 mL of this protein solution and gently mix. Before use, centrifuge at $20,000 \times g$ for 30 min at 2° – 8° , then store at this temperature before injection.

Sample solution: Dilute a suitable quantity of containers in *Buffer solution* to obtain a 60 µg/mL interferon beta-1a solution. Add 10 µL of *Sample additive* per 1 mL of protein solution and gently mix. Before use, centrifuge at $20,000 \times g$ for 30 min at 2° – 8° , then store at this temperature before injection.

Blank solution: Add 5 µL of *Sample additive* to 500 µL of *Buffer solution*.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 2.1-mm \times 5-cm; 5-µm packing L26

Temperatures

Column: 40°

Sample: 5°

Flow rate: 0.5 mL/min

Injection volume: 100 μ L

System suitability

Samples: *Standard solution*, *Sample solution*, and *Blank solution*

Suitability requirements

Precision: NMT 3% RSD for the main peak area of the first six *Standard solution* injections before the *Sample solutions*, and NMT 3% RSD for the main peak area of the two *Standard solution* injections after the *Sample solution*. In addition, NMT 5% difference between the means of the first (first six injections) and second set (last two injections) of *Standard solution* injections where the percent difference is calculated by subtracting the mean of the second set from the first set, divided by the average of both sets, and multiplying by 100.

Tailing factor: 1.0–2.4 for the interferon beta-1a peak in each *Standard solution* injection, except the first injection

Interfering peaks: No significant peaks may be observed in the second *Blank solution*.

Analysis

Samples: *Standard solution* and *Sample solution*

[Note—Condition the chromatographic system by running a blank gradient program before injecting the solutions.]

Inject two *Blank solutions*, then six *Standard solutions*, followed by duplicate injections of up to three *Sample solutions*, followed by two *Standard solution* injections. Integrate each chromatogram's interferon beta-1a main peak area. Calculate the concentration, in μ g/mL, of interferon beta-1a in the *Sample solution* taken:

$$\text{Result} = (r_U/r_S) \times C_S$$

r_U peak area from each *Sample solution* injection

r_S average peak area of bracketing *Standard solutions*

C_S concentration of the *Standard solution* (μ g/mL)

For the final result, average the *Sample solution* results.

Acceptance criteria: 90%–115%

IMPURITIES

• **Impurities with Molecular Masses Different from Those of Main Interferon beta-1a**

12% Resolving gel: Per 10 mL of solution, mix 4 mL of 30% acrylamide/bisacrylamide (29:1) solution, 3.3 mL of water, 2.5 mL of 1.5 M tris-HCl buffer (pH 8.8), 0.1 mL of 100 g/L SDS solution, 0.1 mL of 100 g/L ammonium persulfate solution (APS), and 4 μ L of tetramethylethylenediamine (TEMED). Pour into a suitable gel cassette, add a sufficient quantity of water-saturated isobutanol to cover the surface, and allow polymerization.¹⁶

Stacking gel: After polymerization of the *12% Resolving gel*, prepare (per 5 mL of solution): 0.83 mL 30% acrylamide/bisacrylamide (29:1) solution, 3.4 mL water, 0.63 mL of 1.5 M tris-HCl buffer (pH 8.8), 50 μ L of 100 g/L SDS solution, 50 μ L of 100 g/L APS, and 5 μ L TEMED. Remove the isobutanol from the *12% Resolving gel* surface and then pour the *Stacking gel* solution on top, insert a suitable gel comb without introducing air bubbles, and allow polymerization.

Buffer A: Prepare a stock solution of 151.4 g of tris, 721.0 g of glycine, and 50.0 g of

sodium lauryl sulfate, in 5 L water. Immediately before use, dilute 10-fold with water. Confirm that the pH is 8.1–8.8.

Stock sample buffer: Mix 3.78 g of tris, 10 g of sodium dodecyl sulfate (SDS), and 100 mg of bromophenol blue in water. Add 50.0 mL of glycerol and dilute with water to 200 mL. Add 25.0 mL of 2-mercaptoethanol. Adjust with hydrochloric acid to a pH of 6.8, and then dilute with water to 250 mL total volume.

Sample buffer: Mix equal volumes of *Stock sample buffer* with water.

Sample solution A: Concentrate a suitable number of containers with a suitable procedure to obtain an interferon beta-1a concentration of 1.5 mg/mL.

Sample solution B: Mix equal volumes of *Sample solution A* with *Stock sample buffer*.

Sample solution C: Dilute *Sample solution A* with water to obtain a concentration of 0.6 mg/mL. Mix equal volumes of this protein solution with *Stock sample buffer*.

Sample solution D: Mix 8 μL of *Sample solution C* with 40 μL of *Sample buffer*.

Sample solution E: Mix 15 μL of *Sample solution D* with 35 μL of *Sample buffer*.

Sample solution F: Mix 18 μL of *Sample solution E* with 18 μL of *Sample buffer*.

Sample solution G: Mix 12 μL of *Sample solution F* with 12 μL of *Sample buffer*.

Molecular weight markers: Mix an equal volume of a solution of relative molecular mass markers suitable for SDS-PAGE analysis in the range of 14–66 kDa¹⁷ with *Sample buffer*.

Staining solution: Dissolve 1.25 g/L of brilliant blue dye¹⁸ in a solution of glacial acetic acid, methanol, and water (1:4:5). Filter.

Destaining solution: Mix glacial acetic acid, isopropanol, and water (1:1:8).

Analysis

Insert the prepared gel in a suitable electrophoresis chamber containing *Buffer A* and remove the comb. Rinse each well with *Buffer A* before loading samples. Boil all *Sample solutions* and *Molecular weight markers* for 3 min. Load 20 μL of each *Sample solution* (A through G) and *Molecular weight marker* into individual wells of the gel. Perform the electrophoresis until the bromophenol blue dye front is near the bottom of the gel. Remove the gel from the cassette and immerse in *Staining solution* with gentle shaking at 33°–37° for 90 min. Discard the *Staining solution* and add a large excess of *Destaining solution*. Measure the distance traveled for each band in all lanes from the top of the resolving gel then divide that value by the distance traveled by the dye front to obtain the R_F for each band. Plot the logarithm of the molecular weights of each protein in the *Molecular weight markers* versus the R_F values. *Table 4* describes the apparent molecular weights of the main interferon beta-1a band as well as related substances.

Table 4

Name	Apparent Molecular Mass	Acceptance Criteria
Interferon beta-1a	23,000	—
Underglycosylated interferon beta-1a	21,000	NMT 5%
Deglycosylated interferon beta-1a	20,000	NMT 2%

System suitability requirements: The *Molecular weight markers* must be distributed across 80% of the gel, and there should be a linear relationship between the logarithm of their molecular weight and their R_F values. At least one band of approximate molecular weight of 23,000 Da (interferon beta-1a) must be present in the *Sample solution G* lane. A

decrease in staining intensity is seen from *Sample solution B* through *Sample solution G*. No interferon beta-1a dimer should be visible in any of the *Sample solution* lanes (apparent molecular mass 46,000).

Acceptance criteria: Any band in *Sample solution C* that corresponds to underglycosylated interferon beta-1a must not be more intense than the interferon beta-1a band in *Sample solution E* (or 5%). Any band in *Sample solution B* that corresponds to deglycosylated interferon beta-1a must not be more intense than the interferon beta-1a band in *Sample solution E* (or 2%). Any other band (other than the two described) of lower molecular weight than interferon beta-1a must not be more intense than the interferon beta-1a band in *Sample solution F* (or 1%).

- **Oxidized Interferon beta-1a**

Mobile phase, Solution C, Enzyme solution, Standard solutions, Sample solutions, Blank solutions, Chromatographic system, and System suitability: Prepare as directed in *Identification test C, Peptide Mapping*.

Analysis

Using the results from the test for *Peptide Mapping*, locate the peaks due to the peptide fragment AP6 comprising amino acids 34–45 and its oxidized form using the *Standard solution* results and the chromatogram of oxidized interferon beta-1a digest supplied with the USP Interferon beta-1a RS.

Calculate the percentage of oxidation of interferon beta-1a:

$$\frac{A_{34-45ox}}{A_{34-45} + A_{34-45ox}} \times 100$$

$A_{34-45ox}$ = area of the peak corresponding to the oxidized peptide fragment 34–45

A_{34-45} = area of the peak corresponding to the unoxidized peptide fragment 34–45

Acceptance criteria: NMT 11%

SPECIFIC TESTS

- **Analysis of N-Linked Oligosaccharides**

Solution A: Mix 2 mL of *Solution B* with 998 mL water. Degas before use.

Solution B: Dissolve 19.3 g of ammonium acetate in 800 mL water. Add 9 mL of acetic acid then dilute with water to 1000 mL. Degas before use.

Mobile phase: See *Table 5*.

[Note—Additional time may be inserted after 73 min to flush the column with 100% *Solution B* at 0.75 mL/min to remove excess dye from the column. If this is necessary, the column must then be washed with 100% *Solution A* before the next sample injection.]

Table 5

Time (min)	Flow Rate (mL/min)	Solution A (%)	Solution B (%)
0	0.50	100	0
30	0.50	70	30
70	0.50	15	85
72	0.50	0	100
72.5	0.75	0	100
87	0.75	0	100
88.5	0.75	100	0
99.5	0.75	100	0
99.8	0.50	100	0
130	0.50	100	0
131	0.0	100	0

Enzyme solution: On the day of use, combine 1.0 mL of 50 mM ammonium bicarbonate with 144 μ L of 10% nonyl phenoxy polyethoxy ethanol and mix. Add 40 μ L of peptide *N*-glycosidase F¹⁹ (PNGase F) and mix.

Labeling reagent: Mix 0.3 mL of acetic acid with 0.7 mL of dimethyl sulfoxide in a 1.5 mL microfuge tube. In a fume hood, add 48 mg of anthranilic acid²⁰ (2-AA). Mix well, then add 63 mg of sodium cyanoborohydride. Mix well.

System suitability solution: Using separate vials for each glycan standard, transfer 40 μ g of NA2F complex *N*-linked glycan²¹ (BiNA0), 20 μ g of NGA2F complex *N*-linked glycan²² (BiNA0-2Gal), 60 μ g of A1F complex *N*-linked glycan²³ (BiNA1), and 80 μ g of A2F complex *N*-linked glycan²⁴ (BiNA2). Add 10 μ L of *Labeling reagent* to each tube. Mix by vortexing, then centrifuge briefly. Incubate for 3 ± 0.25 h at $45 \pm 2^\circ$. After cooling and briefly centrifuging, remove excess label on suitable cartridges²⁵ per the manufacturer's instructions. After the final acetonitrile wash, elute each labeled glycan from the cartridge using 3×0.5 mL water washes into fresh tubes. Evaporate to dryness. Reconstitute each labeled glycan standards with 100 μ L of water for every 10 μ g of starting glycan. Pool all the labeled standard, mix, and aliquot. Aliquots may be stored for up to 1 year at $-20 \pm 5^\circ$.

Standard solutions: Buffer exchange sufficient quantities of USP Interferon beta-1a RS by suitable methods to prepare two replicates each containing 200 μ g USP Interferon beta-1a RS in a volume of 150–300 μ L of 50 mM ammonium bicarbonate. Add 100 μ L of *Enzyme solution* and mix gently. Incubate 16–24 h at $37 \pm 2^\circ$. Recover the released glycans by reverse-phase solid-phase extraction using suitable cartridges²⁶ eluting with 0.5 mL of 10% methanol. Evaporate each digest sample to dryness. Add 10 μ L of *Labeling reagent* to each tube. Mix by vortexing, then centrifuge briefly. Incubate for 3 ± 0.25 h at $45 \pm 2^\circ$. After cooling and briefly centrifuging, remove excess label on suitable cartridges²⁷ per the manufacturer's instructions. After the final acetonitrile wash, elute each labeled glycan from the cartridge using 3×0.5 mL water washes into fresh tubes. Evaporate to dryness. Before *Analysis*, reconstitute each labeled glycan sample with 50 μ L of water.

Sample solutions: Prepare two replicates for each sample. Buffer exchange by suitable methods sufficient containers to produce 200 μ g of interferon beta-1a in a final volume of

150–300 μL of 50 mM ammonium bicarbonate. Add 100 μL of *Enzyme solution* and mix gently. Incubate 16–24 h at $37 \pm 2^\circ\text{C}$. Recover the released glycans by reverse-phase solid-phase extraction using suitable cartridges²⁸ eluting with 0.5 mL of 10 % methanol. Evaporate each digest sample to dryness. Add 10 μL of *Labeling reagent* to each tube. Mix by vortexing, then centrifuge briefly. Incubate for 3 ± 0.25 h at $45 \pm 2^\circ$. After cooling and briefly centrifuging, remove excess label on suitable cartridges²⁹ per the manufacturer's instructions. After the final acetonitrile wash, elute each labeled glycan from the cartridge using 3×0.5 mL water washes into fresh tubes. Evaporate to dryness. Before *Analysis*, reconstitute each labeled glycan sample with 50 μL of water.

Blank solutions: Prepare two blanks containing 150 μL of 50 mM ammonium bicarbonate.

Add 100 μL of *Enzyme solution* and mix gently. Incubate 16–24 h at $37 \pm 2^\circ$. Perform reverse-phase-solid phase extraction using suitable cartridges³⁰ eluting with 0.5 mL of 10% methanol. Evaporate each tube to dryness. Add 10 μL of *Labeling reagent* to each tube. Mix by vortexing, then centrifuge briefly. Incubate for 3 ± 0.25 h at $45 \pm 2^\circ$. After cooling and briefly centrifuging, remove excess label on suitable cartridges³¹ per the manufacturer's instructions. After the final acetonitrile wash, elute each blank from the cartridge using 3×0.5 mL water washes into fresh tubes. Evaporate to dryness. Before *Analysis*, add 50 μL of water to each tube.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: Fluorescence (350-nm excitation wavelength; 430-nm emission wavelength)

Column: 4.6-mm \times 15-cm; 5- μm packing L82

Temperatures

Column: $30 \pm 3^\circ$

Sample: 2° – 8°

Flow rate: 0.5 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution*, *Standard solutions*, and *Blank solutions*

Suitability requirements

Chromatogram of the *Standard solutions* must be comparable to the example chromatogram supplied with the USP Interferon beta-1a RS.

Resolution: NLT 10 between the BiNA2 glycan and BiNA1 glycan in the *System suitability solution*.

Column efficiency: NLT 10,000 based on the BiNA2 glycan peak in the *System suitability solution*

Interfering peaks: No significant peaks that interfere with glycan quantitation in the *Blank solution*

Analysis

Samples: *Standard solutions*, *Sample solutions*, and *Blank solutions*

Separately inject samples in the following order. Water alone, *Blank solution*, *System suitability solution*, first *Standard solution*, *Sample solutions*, second *Standard solution*, second *Blank solution*. Record the chromatograms and identify the five expected peaks

listed in *Table 6* (same nomenclature followed in the calculations below) by comparison to the representative chromatogram with the USP Interferon beta-1a RS. Integrate the chromatograms over the range including the BiNA0 through the BiNA3 peaks. Calculate the antennary distribution of fully sialylated form of each glycan BiNA2, TriNA3, and TriLacNA3 for each replicate, and report the average of replicate results:

$$\% \text{ BiNA2} = \frac{\text{Area of BiNA2}}{\text{Area of BiNA2} + \text{Area of TriNA3} + \text{Area of TriLacNA3}} \times 100$$

$$\% \text{ TriNA3} = \frac{\text{Area of TriNA3}}{\text{Area of BiNA2} + \text{Area of TriNA3} + \text{Area of TriLacNA3}} \times 100$$

$$\% \text{ TriLacNA3} = \frac{\text{Area of TriLacNA3}}{\text{Area of BiNA2} + \text{Area of TriNA3} + \text{Area of TriLacNA3}} \times 100$$

Table 6

Structure	Glycoform	Description
BiNA1	2A1S1F	Biantennary complex type glycan with core fucose (Bi) and one sialic acid (neuraminic acid, NA1)
BiNA2	2A2S1F	Biantennary complex type glycan with core fucose and two sialic acids
TriLacNA3	3A3S1F1L	Triantennary complex type glycan with core fucose and lactosamine repeat in one antennae, and three sialic acids
TriNA3	3A3S1F	Triantennary complex type glycan with core fucose and three sialic acids
BiNA3	2A3S1F	Biantennary complex type glycan with core fucose and three sialic acids

Acceptance criteria: Replicate chromatograms of *Sample solutions* must be comparable to each other and to the *Standard solution* chromatogram in terms of presence/absence of peaks and relative response (*Standard solution, Sample solution*).

- **Quantitation of Biantennary Sialylation**

Solution A, Solution B, Mobile phase, Enzyme solution, Labeling reagent, System suitability solution, Standard solutions, Sample solutions, Blank solutions, Chromatographic system, and System suitability: Prepare as directed in *Analysis of N-Linked Oligosaccharides*.

Analysis

Samples: *Standard solutions, Sample solutions, and Blank solutions*

Separately inject samples in the following order. Water alone, *Blank solution, System suitability solution, first Standard solution, Sample solutions, second Standard solution, second Blank solution*. Record the chromatograms and identify the biantennary peaks listed in *Table 6* and by comparison to the representative chromatogram with the USP Interferon beta-1a RS.

Calculate the percentage of sialylation of biantennary glycans for each replicate, and report the average of replicate results in the portion of Injection taken:

$$\% \text{ Biantennary sialylation} = \frac{(\text{Area of BiNA1}) + ((\text{Area of BiNA2} + \text{Area of BiNA3}) \times 2)}{(\text{Area of BiNA0} + \text{Area of BiNA1} + \text{Area of BiNA2} + \text{Area of BiNA3}) \times 2} \times 100$$

Acceptance criteria: NLT 90%

- **Bacterial Endotoxins Test** 〈 85 〉: NMT 96 USP Endotoxin Units/mL
- **Sterility Tests** 〈 71 〉: Meets the requirements
- **Osmolality and Osmolarity** 〈 785 〉: 261–319 mOsmol/kg
- **pH** 〈 791 〉: 4.5–5.1
- **Subvisible Particulate Matter in Therapeutic Protein Injections** 〈 787 〉: Meets the requirements for small-volume injections
- **Injections and Implanted Drug Products** 〈 1 〉: Meets the requirements

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in Type 1 glass, single-use syringes, protected from light, at 2°–8°.
 - **Labeling:** The syringe labeling states the interferon beta-1a content (µg/mL).
 - **USP Reference Standards** 〈 11 〉

BRIEFING

Iophendylate, *USP 38* page 3916. It is proposed to omit this monograph from *USP* for the following reasons:

- This drug substance is not used in any dosage form for human use in the United States.
- This drug substance is currently not used in veterinary medicine in the United

States.

(SM4: R. Ravichandran.) Correspondence Number—C135179

*Comment deadline: July 31, 2015***Delete the following:****Iophendylate**~~Benzenedecanoic acid, iodo-*p*-methyl-, ethyl ester.~~~~Ethyl 10-(iodophenyl)undecanoate [[1320-11-2]].~~

» ~~Iophendylate is a mixture of isomers of ethyl iodophenylundecanoate, consisting chiefly of ethyl 10-(iodophenyl)undecanoate. It contains NLT 98.0 percent and NMT 102.0 percent of ethyl 10-(iodophenyl)undecanoate ($C_{19}H_{29}IO_2$).~~

Packaging and storage—~~Preserve in tight, light-resistant containers. Store at 25°; excursions permitted between 15° and 30°.~~

Identification—~~Place about 1 mL of Iophendylate, 15 mL of water, and 7 g of potassium dichromate in a round-bottom, 50-mL flask. Carefully add 10 mL of sulfuric acid, moderating the ensuing vigorous reaction by cooling the flask with tap water. When the reaction has subsided, reflux the mixture for 2 h. Pour the cooled contents of the flask into 25 mL of water, filter the mixture with suction, and wash the precipitate with a small quantity of cold water. Crystallize the precipitate from 10 mL of diluted alcohol, and sublime the solid so obtained: the sublimate of *p*-iodobenzoic acid melts between 268° and 272°.~~

Specific gravity ~~(841)~~: between 1.248 and 1.257

Refractive index ~~(831)~~: between 1.524 and 1.526

Residue on ignition ~~(281)~~: NMT 0.1%

Free acids—~~Transfer about 4 g, accurately weighed, to a small flask, and add 20 mL of alcohol. Swirl to dissolve the test specimen, add 5 drops of phenolphthalein TS, and titrate with 0.050 N alcoholic potassium hydroxide to a pink color that persists for 30 s: NMT 0.60 mL of 0.050 N alcoholic potassium hydroxide is required for neutralization, correction being made for the amount of 0.050 N alcoholic potassium hydroxide consumed by a blank (0.3% as~~

iodophenylundecanoic acid).

Free iodine—Determine its absorbance in a 4-cm cell, at 485 nm, with a suitable spectrophotometer, using water as the blank: the absorbance is not greater than 0.16 (7.5 ppm).

Saponification value—Transfer about 1 g, accurately weighed, to a 250-mL flask, add 25.0 mL of 0.5-N alcoholic potassium hydroxide VS, and reflux the mixture on a steam bath for 1 h. Cool, add 25 mL of water and 0.7 mL of phenolphthalein TS, and titrate with 0.5-N hydrochloric acid VS. The saponification value (see *Fats and Fixed Oils* ~~(401)~~) is between 132 and 142.

Assay—Dissolve about 50 mg of Iophendylate, accurately weighed, in 5 mL of toluene contained in a 125-mL separator fitted with a suitable, inert plastic stopcock. Add 15 mL of sodium biphenyl, and shake vigorously for 2 min. Extract gently with three 10-mL portions of 5-M phosphoric acid, combining the lower phases in a 125-mL iodine flask. Add 1-N sodium hypochlorite dropwise to the combined extracts until the solution turns brown, and then add an additional 0.5 mL. Shake intermittently for 3 min, add 5 mL of freshly prepared, saturated phenol solution, mix, and allow to stand for 1 min, accurately timed. Add 1 g of potassium iodide, shake for 30 s, and titrate rapidly with 0.1-N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Each mL of 0.1-N sodium thiosulfate is equivalent to 6.939 mg of ethyl 10-(iodophenyl)undecanoate ($C_{19}H_{29}IO_2$). ■ 1S (USP39)

BRIEFING

Iophendylate Injection, USP 38 page 3917. It is proposed to omit this monograph from USP for the following reasons:

- This dosage form is not used for human use in the United States.
- This drug substance is currently not used in veterinary medicine in the United States.

Comment deadline: July 31, 2015

Delete the following:

■ Iophendylate Injection

» Iophendylate Injection is sterile Iophendylate.

Packaging and storage—Preserve in single-dose containers, preferably of Type I glass, protected from light.

USP Reference standards ~~(11)~~—

USP Endotoxin RS

Bacterial endotoxins ~~(85)~~—It contains NMT 0.9 USP Endotoxin Unit per mg of iophendylate.

Other requirements—It conforms to the Definition, responds to the *Identification* test, and meets the requirements for *Specific gravity*, *Refractive index*, *Residue on ignition*, *Free acids*, *Free iodine*, *Saponification value*, and *Assay* under *Iophendylate*. It also meets the requirements under *Injections* ~~(1)~~. ■ 1S (USP39)

BRIEFING

Levamisole Hydrochloride, *USP 38* page 4058. As part of USP monograph modernization efforts, the following revisions are proposed:

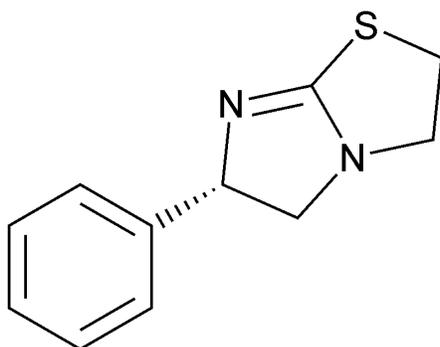

1. *Identification* test *A* is revised to reference *Infrared Absorption* 〈197〉 and to provide multiple analysis options to allow for more flexibility for the users.
2. *Identification* test *B* is revised to replace the TLC procedure with retention time agreement based on the proposed test for *Organic Impurities*.
3. The TLC procedure for *Organic Impurities* is replaced with a liquid chromatographic procedure adapted from the *European Pharmacopoeia* monograph. The LC procedure is based on analyses performed with the Hypersil BDS brand of L1 column. The typical retention time for levamisole is about 3 min.
4. The tests for *Melting Range or Temperature* and *Light Absorption* are proposed for omission.
5. A new Reference Standard, USP Levamisole System Suitability Mixture RS, used in the proposed test for *Organic Impurities*, is added to the *USP Reference Standards* section.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Levamisole Hydrochloride

• HCl

$C_{11}H_{12}N_2S \cdot HCl$ 240.75

Imidazo[2,1-*b*]thiazole, 2,3,5,6-tetrahydro-6-phenyl-, monohydrochloride, (*S*)-;

(-)-2,3,5,6-Tetrahydro-6-phenylimidazo[2,1-*b*]thiazole monohydrochloride [16595-80-5].

DEFINITION

Levamisole Hydrochloride contains NLT 98.5% and NMT 101.0% of levamisole hydrochloride ($C_{11}H_{12}N_2S \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

(See ~~Chromatography <621>~~, ~~Thin-Layer Chromatography~~.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 μ L

Developing solvent system: Toluene, acetone, and ammonium hydroxide (60:40:1)

Analysis

Samples: ~~Identification Standard solution, Sample solution, Identification sample solution, and Diluted sample solution~~[~~Note—Identification Standard solution and Identification solution are used in Identification B.~~]

Proceed as directed for ~~Chromatography <621>~~, ~~Thin-Layer Chromatography~~. Allow the spots to dry, and develop the chromatogram in the ~~Developing solvent system~~, until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber, and dry it at 105° for 15 min. Locate the spots on the plate by examination under short-wavelength UV light.

Acceptance criteria

Individual impurities: Any spot from ~~Sample solution~~, other than the one corresponding to levamisole, does not exceed, in size or intensity, the principal spot from the ~~Diluted sample solution~~, corresponding to NMT 0.5% of any individual impurity. Expose the plate to iodine vapor in a closed chamber for 15 min, and locate the spots on the plate. Any spot from the ~~Sample solution~~, other than the one corresponding to levamisole, does not exceed, in size or intensity, the principal spot from the ~~Diluted sample solution~~, corresponding to NMT 0.5% of any individual impurity.

Total impurities: NMT 1.0%

- [Note—Protect all analytical solutions from light, maintain them at NMT 25°, and inject them within 2 h of preparation.]

Solution A: 5 g/L of monobasic ammonium phosphate prepared as follows. Dissolve a suitable quantity of monobasic ammonium phosphate in 90% of the total volume of water, adjust with 1 N sodium hydroxide to a pH of 6.5, and dilute with water to volume.

Solution B: Acetonitrile

Mobile phase: See *Table 1*. Return to original conditions, and equilibrate the system for at least 4 min.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
8	30	70
10	30	70

System suitability solution: 10 mg/mL of USP Levamisole System Suitability Mixture RS prepared as follows. Transfer a suitable quantity of USP Levamisole System Suitability Mixture RS to an appropriate volumetric flask. Dissolve in methanol and then add 10% of the total flask volume of ammonium hydroxide. Dilute with methanol to volume.

Standard solution: 0.02 mg/mL of USP Levamisole Hydrochloride RS in methanol

Sample solution: 10 mg/mL of Levamisole Hydrochloride prepared as follows. Transfer a suitable quantity of Levamisole Hydrochloride to an appropriate volumetric flask. Dissolve

in methanol and then add 10% of the total flask volume of ammonium hydroxide. Dilute with methanol to volume.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 10-cm; 3-μm packing L1

Flow rate: 1.5 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between mercaptoethylthiazolidinone derivative and didehydro levamisole, *System suitability solution*

Tailing factor: NMT 3.5, *Standard solution*

Analysis

Samples: *System suitability solution*, *Standard solution*, and *Sample solution*

Chromatograph the *System suitability solution*, and identify the components on the basis of their relative retention times, given in *Table 2*.

Calculate the percentage of each impurity in the portion of Levamisole Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) 100$$

r_U

= peak response of each impurity from the *Sample solution*

r_S

= peak response of levamisole from the *Standard solution*

C_S

= concentration of USP Levamisole Hydrochloride RS in the *Standard solution* (mg/mL)

C_U

= concentration of Levamisole Hydrochloride in the *Sample solution* (mg/mL)

F

= relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*. The reporting level for impurities is 0.05%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Thiazolidinone derivative ^a	0.9	0.50	0.2
Levamisole	1.0	—	—
Styrylthiazolidin-2-imine ^b	1.4	0.59	0.2
Mercaptoethylthiazolidinone derivative ^c	1.5	0.34	0.2
Didehydro levamisole (EP, impurity D) ^d	1.6	0.77	0.2
Thiazolidinone disulfide derivative ^e	2.0	0.37	0.2
Any other individual impurity	—	1.0	0.10
Total impurities	—	—	0.3
a 3-(2-Amino-2-phenylethyl)thiazolidin-2-one.			

^b (E)-3-Styrylthiazolidin-2-imine.

^c 1-(2-Mercaptoethyl)-4-phenylimidazolidin-2-one.

^d 6-Phenyl-2,3-dihydroimidazo[2,1-*b*]thiazole.

^e 1,1'-Bis(4-phenylimidazolidin-2-one-1-ylethyl)disulfide.

BRIEFING

Levetiracetam, USP 38 page 4060. It is proposed to revise the monograph as follows:

1. Revise *Identification* test *B* to use the *Identification solution* with a lower concentration to match the concentration of the *System suitability solution*. The *Sample solution* concentration in the current monograph is 200-fold higher than the concentration of levetiracetam in the *System suitability solution* leading to difficulties in identification based on retention time.
2. Introduce an *Identification solution* in the test for *Limit of Levetiracetam R-Enantiomer* to facilitate *Identification* test *B*.

3. Rename "Organic Impurities, Procedure 1: Limit of Levetiracetam Related Compound B" as "Limit of Levetiracetam Related Compound B" to eliminate potential confusion regarding the applicability of the flexible monograph approach.
4. Rename "Organic Impurities, Procedure 2" as "Organic Impurities" to eliminate potential confusion regarding the applicability of the flexible monograph approach.

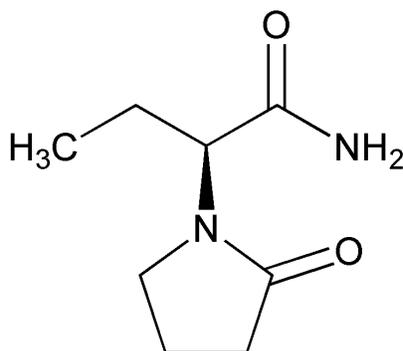

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Levetiracetam

$C_8H_{14}N_2O_2$ 170.21

1-Pyrrolidineacetamide, α -ethyl-2-oxo-, (α S)-;

(-)-(S)- α -Ethyl-2-oxo-1-pyrrolidineacetamide [102767-28-2].

DEFINITION

Levetiracetam contains NLT 98.0% and NMT 102.0% of levetiracetam ($C_8H_{14}N_2O_2$), calculated on the anhydrous and solvent-free basis.

IDENTIFICATION

- **A. Infrared Absorption** < 197K >

Change to read:

- **B.** The retention time of the major peak for levetiracetam from the Sample solution of the *Identification solution* ■ 1S (*USP39*)

corresponds to that of the levetiracetam S-enantiomer from the *System suitability solution*, as obtained in the test for *Limit of Levetiracetam R-Enantiomer*.

ASSAY

- **Procedure**

Buffer: 2.7 g/L of monobasic potassium phosphate in water. Adjust with 2% aqueous potassium hydroxide (w/v) to a pH of 5.5.

Solution A: Acetonitrile and *Buffer* (1:19)

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
3	100	0
20	71	29

System suitability solution: 0.2 mg/mL of USP Levetiracetam RS and 0.08 mg/mL of USP Levetiracetam Related Compound A RS in *Solution A*. Prepare by first dissolving the required amount of USP Levetiracetam RS in a suitable volumetric flask. Add 10% of the flask volume of 0.1 N potassium hydroxide. Let the mixture react at room temperature for about 15 min, and then neutralize by adding 0.1 N hydrochloric acid at 10% of the flask volume. Add the required amount of USP Levetiracetam Related Compound A RS, sonicate to dissolve, dilute with *Solution A* to volume, and mix. [Note—Levetiracetam related compound A is included for peak identification purposes.]

Standard solution: 0.1 mg/mL of USP Levetiracetam RS in *Solution A*

Sample solution: 0.1 mg/mL of Levetiracetam in *Solution A*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 4.6-mm × 15-cm; packing L1

BRIEFING

Lithium Carbonate, USP 38 page 4115. As part of USP monograph modernization efforts, the following changes are proposed:

1. The current *Identification* test B uses a flame test for lithium ion. It is replaced with the retention time agreement of lithium ion from the proposed ion chromatographic procedure in the *Assay*.
2. The current titration procedure in the *Assay* is replaced with an ion chromatographic procedure, which is validated using an IonPac CS16 brand of L84 cation-exchange column manufactured by ThermoScientific-Dionex. Under the chromatographic conditions, lithium ions elute at a retention time of about 10 min. The current *Acceptance criteria* is changed from NLT 99.0% to 98.0%–102.0% of lithium carbonate (Li₂CO₃) to be consistent with the chromatographic procedure. The *Definition* has been changed to reflect the revised *Acceptance criteria*.

3. The current time consuming test for *Calcium* and the flame photometric test for *Sodium* are replaced with the ion chromatographic procedure, which is the same as proposed in the *Assay*. Under the chromatographic conditions, sodium and calcium ions elute at retention times of about 16 and 22 min, respectively.
4. Add USP Lithium Carbonate RS to the *USP Reference Standards* section to support the proposed revisions to the *Assay* and the *Calcium and Sodium* test.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Acceptance criteria: 98.0%–102.0% on the dried basis ■1S (USP39)

IMPURITIES

● Aluminum and Iron

Sample solution: Dissolve 500 mg of Lithium Carbonate in 10 mL of water by the dropwise addition, with agitation, of hydrochloric acid.

Analysis: Boil the *Sample solution*, then cool it. To 5 mL of the solution add 6 N ammonium hydroxide until the reaction is alkaline.

Acceptance criteria: No turbidity or precipitate is observed.

Delete the following:

- ● **Calcium**

Sample solution: Suspend 5.0 g of Lithium Carbonate in 50 mL of water, and add a slight excess of 3 N hydrochloric acid. Boil the clear solution to expel carbon dioxide, add 5 mL of ammonium oxalate TS, render alkaline with 6 N ammonium hydroxide, and allow to stand for 4 h. Pass through a filtering crucible, and wash with warm water until the last washing yields no turbidity with calcium chloride TS. Place the crucible in a beaker, cover the crucible with water, add 3 mL of sulfuric acid, and heat to 70 °.

Analysis: Titrate the *Sample solution* with 0.10 N potassium permanganate to a pale pink color that persists for 30 s.

Acceptance criteria: NMT

▲3.8▲*USP38*

mL of 0.10 N potassium permanganate is consumed (0.15%). ■1S (*USP39*)

Delete the following:

- ● **Sodium**

Standard stock solution: 500 µg/mL of sodium prepared as follows. Dissolve 1.271 g of sodium chloride, previously dried at 130 ° to constant weight, in water in a 1000 mL volumetric flask. Dilute with water to volume.

Sample stock solution: 100 mg/mL of Lithium Carbonate prepared as follows. Suspend 20.0 g of Lithium Carbonate in 100 mL of water, cautiously add 50.0 mL of hydrochloric acid, transfer to a 200 mL volumetric flask, and dilute with water to volume.

Standard solution: Transfer 1 mL of *Standard stock solution* and 5 mL of *Sample stock solution* to a 100 mL volumetric flask, and dilute with water.

Sample solution: 5 mg/mL of Lithium Carbonate from *Sample stock solution* diluted with water

Instrumental conditions

Mode: Flame photometry

Analytical wavelengths: 580 and 589 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Set the flame photometer for maximum emission at 589 nm, using the *Standard solution*. Measure the emission intensities of the *Sample solution* at 580 and 589 nm.

Acceptance criteria: The difference between the intensities observed at 580 and 589 nm for the *Sample solution* does not exceed the difference between the intensities observed at 589 nm for the *Sample solution* and the *Standard solution*, respectively (0.1%).

■1S (*USP39*)

BRIEFING

Medroxyprogesterone Acetate Injectable Suspension, *USP 38* page 4221. As part of USP monograph modernization efforts, it is proposed to make the following changes:

1. Replace the current HPLC procedure in the *Assay* with a stability-indicating UHPLC method. The proposed liquid chromatographic procedure is based on analyses using the Zorbax Eclipse Plus C18 brand of L1 column. The typical retention time for medroxyprogesterone acetate is about 15.6 min.
2. Add *Identification* test *B* using a retention time agreement based on the proposed UHPLC procedure in the *Assay*.
3. Add a UHPLC procedure for the *Organic Impurities* test that is consistent with the proposed *Assay* method.
4. Update the *Packaging and Storage* section to be consistent with approved manufacturers' package inserts.
5. Add the new USP Reference Standard, USP Medroxyprogesterone Acetate Related Compound B RS, introduced by the proposed UHPLC procedure for the *Assay* and the test for *Organic Impurities*, to the *USP Reference Standards* section. Add existing USP Reference Standards, USP Medroxyprogesterone Acetate Related Compound A RS and USP Megestrol Acetate RS, to the *USP Reference Standards* section.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Medroxyprogesterone Acetate Injectable Suspension

DEFINITION

Medroxyprogesterone Acetate Injectable Suspension is a sterile suspension of Medroxyprogesterone Acetate in a suitable aqueous medium. It contains NLT 90.0% and NMT 110.0% of the labeled amount of medroxyprogesterone acetate ($C_{24}H_{34}O_4$).

IDENTIFICATION

• A. Infrared Absorption (197K)

Sample: Transfer a portion of Injectable Suspension, equivalent to 50 mg of medroxyprogesterone acetate, to a centrifuge tube. Centrifuge, decant the supernatant, and wash the solids with two 15-mL portions of water, discarding the water washings. Dissolve the solids in 10 mL of chloroform, transfer to a small beaker, evaporate the chloroform on a steam bath, and dry the residue at 105° for 3 h.

Acceptance criteria: Meets the requirements

Add the following:

- B. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■1S (*USP39*)

ASSAY

Change to read:

• Procedure

~~**Mobile phase:** 700 mL of butyl chloride, 300 mL of hexane, both previously saturated with water, and 80 mL of acetonitrile. The acetonitrile concentration may be varied to meet *System suitability* requirements and to provide elution times of about 12 and 15 min for progesterone and medroxyprogesterone acetate, respectively. Pass the solution through a membrane filter of 1 µm or less pore size.~~

~~**Internal standard solution:** 0.25 mg/mL of progesterone in *Mobile phase*~~

~~**Standard solution:** 0.4 mg/mL of USP Medroxyprogesterone Acetate RS in *Internal standard solution*~~

~~**Sample solution:** Nominally 0.4 mg/mL of medroxyprogesterone acetate in *Internal standard solution*, prepared as follows. Transfer a volume of Injectable Suspension, equivalent to 50 mg of medroxyprogesterone acetate, to a suitable container. Transfer 25 mL of chloroform into the container, shake for 20 min, and centrifuge. Transfer 4 mL of the chloroform layer into a suitable container, and evaporate to dryness. Dissolve the residue in 20 mL of *Internal standard solution*.~~

~~**Chromatographic system**~~

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 2-mm × 25-cm; 5-µm packing L3

Flow rate: The *Mobile phase* is maintained at a flow rate capable of giving the required resolution and suitable elution times.

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 5.0 between progesterone and medroxyprogesterone acetate

Relative standard deviation: NMT 2.0%

■ **Solution A:** Acetonitrile, tetrahydrofuran, and water (150:50:800). Pass through a suitable filter of 0.2-µm pore size.

Solution B: Acetonitrile, tetrahydrofuran, and water (400:400:200). Pass through a suitable filter of 0.2-µm pore size.

Diluent: Acetonitrile and water (70:30)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.0	90	10
5.0	90	10
18.0	45	55
18.01	90	10
22.0	90	10

System suitability stock solution: 0.2 mg/mL each of USP Medroxyprogesterone Acetate RS and USP Megestrol Acetate RS prepared as follows. Add portions of each Reference Standard to a suitable volumetric flask. Add *Diluent* equivalent to 70% of the flask volume and sonicate if necessary. Dilute with *Diluent* to volume.

System suitability solution: 0.05 mg/mL each of USP Medroxyprogesterone Acetate RS and USP Megestrol Acetate RS in *Diluent* prepared from *System suitability stock solution*

Standard solution: 0.1 mg/mL of USP Medroxyprogesterone Acetate RS in *Diluent*. Sonicate to dissolve as needed. Pass through a suitable filter of 0.2-µm pore size.

Sample stock solution: Nominally 10.0 mg/mL of medroxyprogesterone acetate prepared as follows. Transfer a portion of Injectable Suspension to a suitable volumetric flask and add 70% of the flask volume of *Diluent*. Sonicate for about 10 min and dilute with *Diluent* to volume.

Sample solution: Nominally 0.1 mg/mL of medroxyprogesterone acetate in *Diluent* from *Sample stock solution*. Pass through a suitable filter of 0.2-µm pore size.

[Note—Several hours of stirring are required.] Dilute with water to volume.**Standard stock solution:** 70 mg of USP Medroxyprogesterone Acetate RS in 140 mL of *Sodium lauryl sulfate stock solution*. Dilute with water to 250 mL. [Note—It may be necessary to sonicate the solution to mix in the Reference Standard before diluting with water.] Prepare the *Standard stock solution* fresh daily.**Standard solution:** Transfer a 20-mL aliquot of *Standard stock solution* to a 1-L volumetric flask. Add 40 mL of *Sodium lauryl sulfate stock solution* and dilute with water to volume. This solution is stable for up to 7 days.**Sample solution:** Withdraw 15 mL of the solution under test and filter, discarding the first 5 mL of the filtrate.**Chromatographic system**(See *Chromatography* 〈 621 〉, *System Suitability*.)**Mode:** LC**Detector:** UV 254 nm**Column:** 4-mm × 8-cm; packing L7**Flow rate:** 1.5 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.2

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of medroxyprogesterone acetate ($\text{C}_{24}\text{H}_{34}\text{O}_4$) dissolved using the responses from the *Standard solution* and *Sample solution*.

Tolerances: NLT 50% (Q) of the labeled amount of medroxyprogesterone acetate ($\text{C}_{24}\text{H}_{34}\text{O}_4$) is dissolved.

• **Uniformity of Dosage Units** 〈 905 〉

Procedure for content uniformity

Diluent: Alcohol and water (3:1)

Standard solution: 15 $\mu\text{g}/\text{mL}$ of USP Medroxyprogesterone Acetate RS in *Diluent*

Sample solution: Nominally 15 $\mu\text{g}/\text{mL}$ of medroxyprogesterone acetate in *Diluent* prepared as follows. Transfer 1 Tablet to a volumetric flask, dilute with *Diluent* to volume, and shake for 15 min. Filter and quantitatively dilute a portion of the filtrate as needed.

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: Maximum at about 242 nm

Cell: 1 cm

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of medroxyprogesterone acetate ($\text{C}_{24}\text{H}_{34}\text{O}_4$) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

$A_{\bar{U}}$ absorbance of the *Sample solution*

$A_{\bar{S}}$ absorbance of the *Standard solution*

$C_{\bar{S}}$ concentration of USP Medroxyprogesterone Acetate RS in the *Standard solution* ($\mu\text{g}/\text{mL}$)

$C_{\bar{U}}$ nominal concentration of medroxyprogesterone acetate in the *Sample solution* ($\mu\text{g}/\text{mL}$)

Acceptance criteria: Meet the requirements

IMPURITIES

Add the following:

■ • **Organic Impurities**

Solution A, Solution B, Diluent, and Mobile phase: Proceed as directed in the *Assay*.

Standard stock solution: 0.2 mg/mL each of USP Medroxyprogesterone Acetate RS, USP Megestrol Acetate RS, and USP Medroxyprogesterone Acetate Related Compound B RS,

and 0.1 mg/mL of USP Medroxyprogesterone Acetate Related Compound A RS prepared as follows. Add portions of each Reference Standard to a suitable volumetric flask. Add *Diluent* equivalent to 70% of the flask volume and sonicate if necessary. Dilute with *Diluent* to volume.

Standard solution: 0.05 mg/mL each of USP Medroxyprogesterone Acetate RS, USP Megestrol Acetate RS, and USP Medroxyprogesterone Acetate Related Compound B RS, and 0.025 mg/mL of USP Medroxyprogesterone Acetate Related Compound A RS, in *Diluent* prepared from *Standard stock solution*. Pass through a suitable filter of 0.2- μ m pore size.

Sample solution: Nominally 5.0 mg/mL of medroxyprogesterone acetate prepared as follows. Add a portion from NLT 20 finely powdered Tablets to a suitable volumetric flask and add *Diluent* equivalent to 75% of the flask volume. Sonicate for about 10 min, then dilute with *Diluent* to volume. Pass through a suitable filter of 0.2- μ m pore size.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector

UV 266 nm: For megestrol acetate, medroxyprogesterone acetate, and medroxyprogesterone related compound B

UV 282 nm: For medroxyprogesterone acetate related compound A

Column: 3.0-mm \times 15-cm; 1.8- μ m packing L1

Column temperature: 55 $^{\circ}$

Flow rate: 0.7 mL/min

Injection volume: 4.0 μ L

System suitability

Sample: *Standard solution*

[Note—The relative retention times are listed in *Table 2*.]

Suitability requirements

Resolution: NLT 6.0 between megestrol acetate and medroxyprogesterone acetate peaks

Relative standard deviation: NMT 4.5% for the medroxyprogesterone acetate, megestrol acetate, and medroxyprogesterone acetate related compound B peaks; NMT 5.0% for the medroxyprogesterone acetate related compound A peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of megestrol acetate and medroxyprogesterone acetate related compound B in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of megestrol acetate or medroxyprogesterone acetate related compound B at 266 nm from the *Sample solution*

r_S peak response of each corresponding Reference Standard at 266 nm from the *Standard solution*

C_S concentration of each corresponding Reference Standard in the *Standard solution* (mg/mL)

C_U nominal concentration of medroxyprogesterone acetate in the *Sample solution* (mg/mL)

Calculate the percentage of medroxyprogesterone acetate related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of medroxyprogesterone acetate related compound A at 282 nm from the *Sample solution*

r_S peak response of each corresponding Reference Standard at 282 nm from the *Standard solution*

C_S concentration of each corresponding Reference Standard in the *Standard solution* (mg/mL)

C_U nominal concentration of medroxyprogesterone acetate in the *Sample solution* (mg/mL)

Calculate the percentage of any individual unspecified degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of any degradation product from the *Sample solution*

r_S peak response of medroxyprogesterone acetate from the *Standard solution*

C_S concentration of USP Medroxyprogesterone Acetate RS in the *Standard solution* (mg/mL)

C_U nominal concentration of medroxyprogesterone acetate in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*. Disregard any impurity peaks less than 0.05%.

BRIEFING

Mesna, USP 38 page 4273. In preparation for the omission of the flame tests from general chapter *Identification Tests—General* 〈 191 〉, proposed in PF 41(2) [Mar.–Apr. 2015], it is proposed to replace the use of the flame test in *Identification* test B with the pyroantimonate precipitation test currently described in the general chapter. This test is also consistent with test A in section 2.3.1—*Identification Reactions of Ions and Functional Groups* in the *European Pharmacopoeia*, and is employed in the EP monograph for *Mesna*. In addition, it is proposed to make the following changes on the basis of comments received:

1. Delete the third chemical name for Mesna.
2. Revise the *Diluent* used in the preparation of *Sulfate standard solution* in the test for *Limit of Sulfate* to address the solubility issue. The proposed *Diluent* is consistent with that in the EP monograph for *Mesna*.
3. Add *Sample solution* to the pH test. The proposed *Sample solution* is consistent with that in the EP monograph for *Mesna*.
4. Definitions of the concentration of *Sample solution* in the test for *Organic Impurities* are clarified by removing “nominal.”
5. The relative response factor for individual unspecified impurities is clarified.
6. Update all chemical names for impurities to be consistent with USAN naming convention, and include the appropriate acronyms. The molecular weights for mesna

related compound A and mesna related compound B are also updated.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

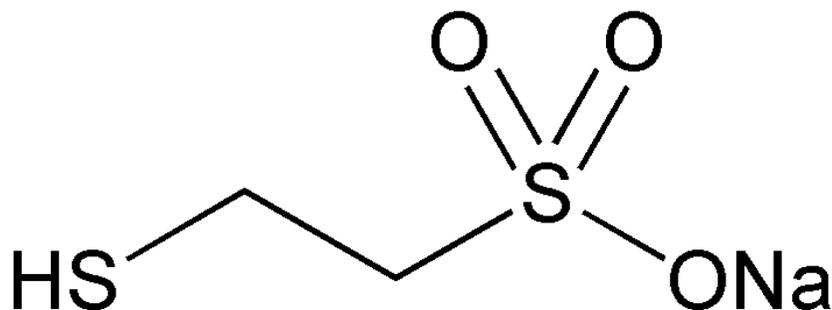

(SM2: H. Cai.)

Correspondence Number—C149855

Comment deadline: July 31, 2015

Mesna

Change to read:

$C_2H_5NaO_3S_2$ 164.18

Ethanesulfonic acid, 2-mercapto-, monosodium salt;

Sodium 2-mercaptoethanesulfonate

Sodium 2-sulphanylethanesulfonate

■ ■ 1S (USP39)

[19767-45-4].

DEFINITION

Mesna contains NLT 96.0% and NMT 102.0% of mesna ($C_2H_5NaO_3S_2$), calculated on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption** 〈 197K 〉

Delete the following:

- ● **B. Identification Tests—General, Sodium** 〈 191 〉: A solution meets the requirements of the flame test. ■ 1S (USP39)

Add the following:

- ● **B. Identification Tests—General** 〈 191 〉, *Sodium*
Acceptance criteria: Meet the requirements ■ 1S (USP39)

ASSAY● **Procedure**

Sample solution: 120 mg of Mesna in 10 mL of water

Analysis: To the *Sample solution* add 10 mL of 1 M sulfuric acid and 10 mL of 0.1 N iodine VS. Titrate with 0.1 N sodium thiosulfate VS, adding 1 mL of starch TS near the endpoint.

Perform a blank determination, and make any necessary corrections (see *Titrimetry* { 541 }). Each mL of sodium thiosulfate is equivalent to 16.42 mg of mesna ($C_2H_5NaO_3S_2$).

Acceptance criteria: 96.0%–102.0% on the dried basis

IMPURITIES● **Limit of Chloride**

Chloride standard solution: 8.24 $\mu\text{g/mL}$ of sodium chloride in water

Sample solution: 200 mg/mL of Mesna in carbon dioxide-free water

Analysis: To 1 mL of the *Sample solution* and 15 mL of water add 1 mL of 2 M nitric acid.

Add the resulting solution to 1 mL of silver nitrate solution (17 g in 1000 mL), and allow to stand for 5 min, protected from light. To 10 mL of the *Chloride standard solution* add 5 mL of water and 1 mL of 2 M nitric acid. To this solution add 1 mL of silver nitrate solution (17 g in 1000 mL) and allow to stand for 5 min, protected from light. When viewed against a dark background, the *Sample solution* is not more turbid than the *Chloride standard solution*.

Acceptance criteria: NMT 250 ppm

Change to read:● **Limit of Sulfate**

~~**Sulfate standard solution:** 1.81 mg/mL of potassium sulfate in alcohol. Immediately before use, dilute with alcohol to 100 times its volume, and mix.~~

■ **Diluent:** 30% (v/v) ethanol in water

Sulfate standard stock solution: 1.81 mg/mL of potassium sulfate in *Diluent*

Sulfate standard solution: 0.0181 mg/mL of potassium sulfate in *Diluent*, prepared immediately before use from *Sulfate standard stock solution* ■ 1S (USP39)

Sample solution: Add 5.0 mL of the *Sample solution* prepared as directed in the test for *Limit of Chloride* to a 30-mL volumetric flask, and dilute with water to volume.

Analysis: Add 3 mL of a 250-g/L solution of barium chloride to 4.5 mL of *Sulfate standard solution*. Shake and allow to stand for 1 min. To 2.5 mL of this solution add 15 mL of the *Sample solution* and 0.5 mL of acetic acid. Use 15 mL of this mixture for comparison with 15 mL of the *Sulfate standard solution*, prepared in the same manner, but using the *Sulfate standard solution* instead of the *Sample solution*. After 5 min, any opalescence in the *Sample solution* is not more intense than that in the *Sulfate standard solution*.

Acceptance criteria: NMT 300 ppm

Delete the following:

●● **Heavy Metals, Method I** { 231 } : 10 ppm ● (Official 1-Dec-2015)

Change to read:● **Organic Impurities**

Mobile phase: In a 1000-mL volumetric flask dissolve 2.94 g of potassium dihydrogen

phosphate, 2.94 g of dipotassium hydrogen phosphate, and 2.6 g of tetrabutylammonium hydrogen sulfate in about 600 mL of water. Adjust with phosphoric acid to a pH of 2.3, add 335 mL of methanol, and dilute with water to volume.

System suitability solution: 0.18 mg/mL and 0.004 mg/mL of USP Mesna RS and USP Mesna Related Compound A RS, respectively, in *Mobile phase*

Standard solution 1: 8 µg/mL and 120 µg/mL of USP Mesna Related Compound A RS and USP Mesna Related Compound B RS, respectively, in *Mobile phase*

Standard solution 2: 12 µg/mL of USP Mesna RS in *Mobile phase*

Sample solution: 4 mg/mL of Mesna in *Mobile phase*

BRIEFING

Methylprednisolone Sodium Succinate, *USP 38* page 4356. In preparation for the omission of the flame tests from *Identification Tests—General* 〈191〉, proposed in *PF 41(2)* [Mar.—Apr. 2015], it is proposed to delete the reference to 〈191〉 in *Identification* test *C* and include a complete description of the flame test in the monograph. Manufacturers are encouraged to submit a replacement wet chemistry or an instrumental procedure for consideration by the Expert Committee.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM4: M. Koleck.)

Correspondence Number—C154900

Comment deadline: July 31, 2015

Methylprednisolone Sodium Succinate

$C_{26}H_{33}NaO_8$ 496.53

Pregna-1,4-diene-3,20-dione, 21-(3-carboxy-1-oxopropoxy)-11,17-dihydroxy-6-methyl-, monosodium salt, (6 α ,11 β)-;

11 β ,17,21-Trihydroxy-6 α -methylpregna-1,4-diene-3,20-dione 21-(sodium succinate) [2375-03-3].

DEFINITION

Methylprednisolone Sodium Succinate contains NLT 97.0% and NMT 103.0% of methylprednisolone sodium succinate ($C_{26}H_{33}NaO_8$), calculated on the dried basis.

IDENTIFICATION

● **A. Infrared Absorption**

Sample: 100 mg of Methylprednisolone Sodium Succinate

Analysis: Transfer the *Sample* to a separator, dissolve in 10 mL of water, add 1 mL of 3 N hydrochloric acid, and extract immediately with 50 mL of chloroform. Filter the chloroform extract through cotton, evaporate on a steam bath to dryness, and dry under vacuum at 60° for 3 h.

Acceptance criteria: The IR absorption spectrum of a mineral oil dispersion of the residue so obtained exhibits maxima only at the same wavelengths as those of a similar preparation of USP Methylprednisolone Hemisuccinate RS.

● **B. Ultraviolet Absorption** 〈197U〉

Standard solution: 20 μ g/mL of USP Methylprednisolone Hemisuccinate RS in methanol

Sample solution: 20 μ g/mL of Methylprednisolone Sodium Succinate in methanol

Analytical wavelength: 243 nm

Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.

Delete the following:

- **C. Identification Tests—General, Sodium** 〈191〉: Meets the requirements of the flame test ■1S (*USP39*)

Add the following:

- C. The sample imparts an intense yellow color to a nonluminous flame. ■1S (USP39)

ASSAY● **Procedure**

Solution A: 5 mg/mL of blue tetrazolium in alcohol

Solution B: Alcohol and tetramethylammonium hydroxide TS (9:1)

Standard solution: Proceed as directed for *Assay for Steroids* (351), *Standard Preparation*, preparing 12.5 µg/mL of USP Methylprednisolone Hemisuccinate RS in alcohol.

Sample solution: 12.5 µg/mL of Methylprednisolone Sodium Succinate in alcohol

Blank: Alcohol

Instrumental conditions

Mode: Vis

Analytical wavelength: 525 nm

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Pipet 20.0 mL of the *Blank*, *Standard solution*, and *Sample solution* into three different glass-stoppered, 50-mL conical flasks. Add 2.0 mL of *Solution A*, and mix. To each flask add 4.0 mL of *Solution B*. Mix, and allow to stand in the dark for 90 min. Add 1.0 mL of glacial acetic acid, and mix. Without delay, determine the absorbances of the *Standard solution* and the *Sample solution* against the *Blank*.

Calculate the percentage of methylprednisolone sodium succinate (C₂₆H₃₃NaO₈) in the portion of Methylprednisolone Sodium Succinate taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Methylprednisolone Hemisuccinate RS in the *Standard solution* (µg/mL)

C_U = concentration of Methylprednisolone Sodium Succinate in the *Sample solution* (µg/mL)

M_{r1} = molecular weight of methylprednisolone sodium succinate, 496.53

M_{r2} = molecular weight of methylprednisolone hemisuccinate, 474.54

Acceptance criteria: 97.0%–103.0% on the dried basis

OTHER COMPONENTS● **Sodium Content**

Sample solution: Dissolve, with gentle heating, about 1 g of Methylprednisolone Sodium Succinate in 75 mL of glacial acetic acid. Add 20 mL of dioxane, then add 1 drop of crystal violet TS.

Titrimetric system

Mode: Direct

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Visual

Analysis: Titrate with *Titrant* to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of *Titrant* is equivalent to 2.299 mg of sodium (Na).

Acceptance criteria: 4.49%–4.77% on the dried basis

SPECIFIC TESTS

- **Optical Rotation** 〈 781S 〉, *Specific Rotation*

Sample solution: 10 mg/mL of Methylprednisolone Sodium Succinate in alcohol

Acceptance criteria: +96° to +104°

- **Loss on Drying** 〈 731 〉

Analysis: Dry at 105° for 3 h.

Acceptance criteria: NMT 3.0%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight, light-resistant containers.

- **USP Reference Standards** 〈 11 〉

USP Methylprednisolone Hemisuccinate RS

BRIEFING

Metoprolol Succinate, *USP 38* page 4370. As part of the USP monograph modernization effort, it is proposed to make the following changes:

1. Replace the existing *Organic Impurities, Procedure 1* by TLC with a hydrophilic interaction chromatograph (HILIC) method coupled with a charged aerosol detector (CAD) for the organic impurities without UV chromophore. The HILIC procedure is based on analysis performed with the Halo Penta-HILIC brand of L## column manufactured by Advanced Materials Technologies. The typical retention time for the metoprolol peak in the test is 2.3 min.
2. Add the required *A* designation to the existing *Identification* test by FT-IR. Add *Identification* test *B* based on the retention time agreement in the *Assay*.
3. Delete the test for *Clarity and Color of Solution* as it is non-value added.
4. Two new Reference Standards are added to the *USP Reference Standards* section to support the proposed revision in *Impurities*.

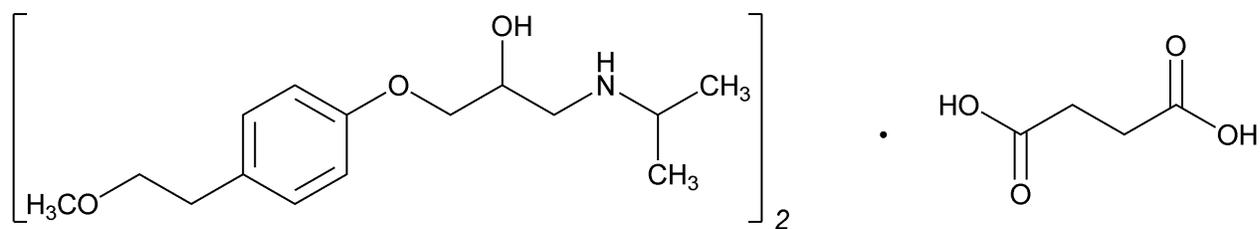

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Metoprolol Succinate

$(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_4$ 652.82

2-Propanol, 1-[4-(2-methoxyethyl)phenoxy]-3-[(1-methylethyl)amino]-, (\pm)-, butanedioate (2:1) (salt); (\pm)-1-(Isopropylamino)-3-[*p*-(2-methoxyethyl)phenoxy]-2-propanol succinate (2:1) (salt) [98418-47-4].

DEFINITION

Metoprolol Succinate contains NLT 98.0% and NMT 102.0% of metoprolol succinate [$(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_4$], calculated on the dried basis.

ASSAY

• Procedure

Solution A: 1.3 mg/mL of sodium dodecyl sulfate in aqueous phosphoric acid, 0.1% (w/v)

Mobile phase: Acetonitrile and *Solution A* (40:60)

System suitability solution: 5 μ g/mL each of USP Metoprolol Succinate RS, USP Metoprolol Related Compound A RS, USP Metoprolol Related Compound B RS, USP Metoprolol Related Compound C RS, and USP Metoprolol Related Compound D RS in *Mobile phase*

Standard solution: 0.08 mg/mL of USP Metoprolol Succinate RS in *Mobile phase*

Sample stock solution: 0.8 mg/mL of Metoprolol Succinate in *Mobile phase*

Sample solution: 0.08 mg/mL of Metoprolol Succinate from the *Sample stock solution* in *Mobile phase*

Chromatographic system

(See *Chromatography* \langle 621 \rangle , *System Suitability*.)

Mode: LC

Detector: UV 223 nm

Column: 4-mm \times 12.5-cm; 4- μ m packing L7

Column temperature: 30°

Flow rate: 0.9 mL/min

Injection volume: 10 µL

Run time: NLT 1.5 times the retention time of the metoprolol peak

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for metoprolol related compound C, metoprolol related compound B, metoprolol related compound A, and metoprolol are 0.6, 0.7, 0.8, and 1.0, respectively. The relative retention times for the two diastereomers of metoprolol related compound D are 5.0 and 5.2.]

Suitability requirements

Resolution: NLT 2.5 between metoprolol related compound A and metoprolol related compound B; NLT 1.5 between metoprolol related compound B and metoprolol related compound C, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of metoprolol succinate [(C₁₅H₂₅NO₃)₂·C₄H₆O₄] in the portion of Metoprolol Succinate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Metoprolol Succinate RS in the *Standard solution* (mg/mL)

C_U = concentration of Metoprolol Succinate in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **Residue on Ignition** (281): NMT 0.1%

Delete the following:

- **Heavy Metals, Method I** (231): NMT 10 ppm • (Official 1-Dec-2015)

Delete the following:

- **Organic Impurities, Procedure 1**

Sample solution: 50 mg/mL of Metoprolol Succinate in methanol

Standard solution: 0.1 mg/mL of Metoprolol Succinate from *Sample solution* in methanol

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 µL

Developing solvent system: Ethyl acetate and methanol (80:20)

Analysis

Samples: *Standard solution* and *Sample solution*

Proceed as directed in the chapter. Place two 50 mL beakers, each containing 30 mL of ammonium hydroxide, on the bottom of a chromatographic chamber that is lined with filter paper and contains the *Developing solvent system*, and allow to equilibrate for 1 h. Position the plate in the chromatographic chamber, and develop the chromatogram until the solvent front has moved about two thirds of the length of the plate. Remove the plate from the chamber, mark the solvent front, and dry the plate for 3 h in a current of warm air. Place the plate in a chamber containing iodine vapor, and allow to react for at least 15 h. Compare the intensities of the brown spots appearing on the chromatogram.

Acceptance criteria: Any secondary spot obtained from the *Sample solution* is not more intense than the corresponding spot obtained from the *Standard solution*. NMT 0.2%.

■ 1S (USP39)

Add the following:**■ • Content of Metoprolol Related Compound H and Metoprolol Related Compound I**

Buffer: 6.31 g/L of ammonium formate in water. Adjust with formic acid to a pH of 3.2.

Pass the solution through a suitable filter of 0.22- μ m pore size.

Mobile phase: Acetonitrile and *Buffer* (85:15)

Diluent: Acetonitrile and water (85:15)

System suitability solution: 0.1 mg/mL of USP Metoprolol Succinate RS and 0.01 mg/mL each of USP Metoprolol Related Compound H RS and USP Metoprolol Related Compound I RS in *Diluent*

Standard solution: 2 μ g/mL each of USP Metoprolol Related Compound H RS and USP Metoprolol Related Compound I RS in *Diluent*

Sample solution: 2 mg/mL of Metoprolol Succinate in *Diluent*

[Note—Sonication may be needed to aid dissolution.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Charged aerosol

Nitrogen pressure: 35 psi

Range: 100 pA

Column: 4.6-mm \times 15-cm; 5- μ m packing L##

Flow rate: 0.8 mL/min

Injection volume: 10 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 2.0 between metoprolol related compound H and metoprolol related compound I, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of metoprolol related compound H and metoprolol related compound I in the portion of Metoprolol Succinate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of the corresponding impurity from the *Sample solution*

r_S peak response of the corresponding impurity from the *Standard solution*

C_S concentration of the corresponding USP Impurity RS in the *Standard solution* (mg/mL)

BRIEFING

Metoprolol Succinate Extended-Release Tablets, *USP 38* page 4371. As part of the USP monograph modernization effort, it is proposed to revise the monograph as follows:

1. Add the test for *Organic Impurities* to the monograph. The proposed HPLC procedure in the test for *Organic Impurities* was validated using the Agilent Zorbax StableBond C8 brand of L7 column in which metoprolol elutes at about 8 min.
2. Add *Identification* test C by retention time agreement in the *Assay*.
3. Add the pore size of the HPLC column used in the test for *Uniformity of Dosage Units* based on the original submission document.
4. Add three new Reference Standards to the *USP Reference Standards* section to support the proposed test for *Organic Impurities*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM2: D. Min.)

Comment deadline: July 31, 2015

Metoprolol Succinate Extended-Release Tablets

DEFINITION

Metoprolol Succinate Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of metoprolol succinate [$(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_4$].

IDENTIFICATION

● A. Infrared Absorption { 197K }

Sample solution: Equivalent to 200 mg of metoprolol succinate from 1 or more Tablets in a stoppered centrifuge tube. Add 40 mL of pH 6.8 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*) and 40 mL of methylene chloride, and shake

for 5 min. Centrifuge, filter, and use the aqueous phase as the *Sample solution*.

Sample: Transfer 3 mL of the *Sample solution* to a separator. Add 2 mL of ammonium hydroxide, and extract with 20 mL of methylene chloride. Filter the methylene chloride phase. Grind 1 mL of the filtrate with 300 mg of potassium bromide, dry in a current of warm air, and prepare a disk.

Acceptance criteria: The IR spectrum of the *Sample* exhibits maxima only at the same wavelengths as those obtained from a similar preparation of USP Metoprolol Succinate RS (presence of metoprolol).

• **B. Infrared Absorption** 〈 197K 〉

Sample: Transfer 5 mL of the *Sample solution* prepared in *Identification* test A to a glass-stoppered test tube. Add 2 mL of 5 N hydrochloric acid, and extract with 5 mL of ether. Filter the ether phase. Grind 2 mL of the filtrate with 300 mg of potassium bromide, dry in a current of warm air, and prepare a disk.

Acceptance criteria: The IR spectrum of the *Sample* exhibits maxima only at the same wavelengths as those obtained from a similar preparation of succinic acid (presence of succinate).

Add the following:

- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■1S (USP39)

ASSAY

• **Procedure**

Analysis: Determine the mean percentage value of the labeled amount of metoprolol succinate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_4]$ from the Tablets analyzed in the test for *Uniformity of Dosage Units*.

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **Dissolution** 〈 711 〉

Test 1

Medium: pH 6.8 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*); 500 mL

Apparatus 2: 50 rpm

Times: 1, 4, 8, and 20 h

Buffer, Mobile phase, and Standard solution: Proceed as directed in the test for *Uniformity of Dosage Units*.

Analysis: Proceed as directed in the test for *Uniformity of Dosage Units*, except use 5.0 mL of a filtered portion of the solution under test as the *Sample solution*, and use *Medium* as the blank, in comparison with a *Standard solution* with a known concentration of USP Metoprolol Succinate RS in the same *Medium*.

Acceptance criteria: See *Table 1*.

Table 1

Time (h)	Amount Dissolved (%)
1	NMT 25

Time (h)	Amount Dissolved (%)
4	20–40
8	40–60
20	NLT 80

The percentages of the labeled amount of metoprolol succinate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_4]$ dissolved at the times specified conform to *Dissolution* $\langle 711 \rangle$, *Acceptance Table 2*.

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

Medium: Simulated gastric fluid without enzyme, pH 1.2; 500 mL

Apparatus 2: 75 rpm

Times: 1, 4, 8, and 20 h

Buffer: 1 M monobasic sodium phosphate, 1 M phosphoric acid, and water (50:8:942). If necessary, adjust with 1 M monobasic sodium phosphate or 1 M phosphoric acid to a pH of 3.0.

Mobile phase: Acetonitrile and *Buffer* (250:750)

Standard solution: Prepare a solution of USP Metoprolol Succinate RS in *Medium* as directed in *Table 2*.

Table 2

Tablet Strength (mg as metoprolol succinate)	Concentration (mg/mL)
200	0.380
100	0.190
50	0.095
25	0.048

Sample solution: Pass the solution under test through a suitable filter.

Chromatographic system

(See *Chromatography* $\langle 621 \rangle$, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.0-mm \times 12.5-cm; 4- μ m packing L7

Flow rate: 1 mL/min

Injection volume: See *Table 3*.

Table 3

Tablet Strength (mg as metoprolol succinate)	Volume (μ L)
25	40
50	20
100	10
200	5

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 1500 theoretical plates

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i), in mg/mL, of metoprolol succinate dissolved in *Medium* at each time point (i):

$$\text{Result} = (r_U/r_S) \times C_S$$

r_U peak response of metoprolol from the *Sample solution*

r_S peak response of metoprolol from the *Standard solution*

C_S concentration of USP Metoprolol Succinate RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of metoprolol succinate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_4]$ dissolved (Q_i), at each time point (i):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_S)] + (C_1 \times V_S)\} \times (1/L) \times 100$$

$$\text{Result}_3 = (\{C_3 \times [V - (2 \times V_S)]\} + [(C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

$$\text{Result}_4 = (\{C_4 \times [V - (3 \times V_S)]\} + [(C_3 + C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

C_i concentration of metoprolol succinate in the portion of sample withdrawn at time point (i) (mg/mL)

V = volume of *Medium*, 500 mL

L = label claim (mg/Tablet)

V_S volume of the *Sample solution* withdrawn from the *Medium* (mL)

Tolerances: See *Table 4*.

Table 4

Time Point (i)	Time (h)	Amount Dissolved (%)
1	1	NMT 20
2	4	20–40
3	8	55–85
4	20	NLT 80

The percentages of the labeled amount of metoprolol succinate $[(C_{15}H_{25}NO_3)_2 \cdot C_4H_6O_4]$ dissolved at the times specified conform to *Dissolution* { 711 }, *Acceptance Table 2*.

Oxcarbazepine Tablets

DEFINITION

Oxcarbazepine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of oxcarbazepine ($C_{15}H_{12}N_2O_2$).

IDENTIFICATION

- **A. Infrared Absorption** { 197K }

Sample: Weigh about 840 mg of crushed Tablet powder, and add to a 50-mL volumetric flask. Add 45 mL of chloroform, and shake the flask for 30 min on a mechanical shaker. Add chloroform to volume, centrifuge, and collect the supernatant in a Petri dish.

Evaporate the supernatant on a water bath at 60°. Dry the residue, and crush the residue thoroughly with potassium bromide in the ratio of 1:100.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **Procedure**

Buffer: 6.8 g/L of monobasic potassium phosphate in water. Add 2 mL of triethylamine. Adjust with phosphoric acid to a pH of 6.0.

Diluent: Methanol and water (80:20)

Mobile phase: Methanol, acetonitrile, and *Buffer* (22:16:62)

Standard stock solution: 0.5 mg/mL of USP Oxcarbazepine RS in *Diluent*. Sonication may be used to aid in dissolution.

Standard solution: 0.1 mg/mL of USP Oxcarbazepine RS in *Mobile phase* from the *Standard stock solution*

Sample stock solution: Nominally equivalent to 1.2 mg/mL of oxcarbazepine from a portion of finely powdered (NLT 20) Tablets, prepared as follows. Transfer a weighed quantity of powdered Tablets, equivalent to 600 mg of oxcarbazepine, to a 500-mL volumetric flask. Add *Diluent* to fill 50% of the final volume. Sonicate for 15 min with intermittent swirling, cool to room temperature, and dilute with *Diluent* to volume. Pass this solution through a suitable 2- μ m glass filter, and discard the first portion of the filtrate.

Sample solution: 0.1 mg/mL of oxcarbazepine in *Mobile phase* from a portion of the filtrate obtained from the *Sample stock solution*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1.5 mL/min

Injection volume: 10 µL

Temperatures

Sample: 5°

Column: 50°

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of oxcarbazepine (C₁₅H₁₂N₂O₂) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Oxcarbazepine RS in the *Standard solution* (mg/mL)

C_U nominal concentration of oxcarbazepine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Change to read:

• **Dissolution** 〈 711 〉

Test 1

Medium

For Tablets labeled to contain 150 mg: 0.3% (w/v) sodium dodecyl sulfate in water; 900 mL, deaerated

For Tablets labeled to contain 300 mg: 0.6% (w/v) sodium dodecyl sulfate in water; 900 mL, deaerated

For Tablets labeled to contain 600 mg: 1.0% (w/v) sodium dodecyl sulfate in water; 900 mL, deaerated

Apparatus 2: 60 rpm

Times: 30 and 60 min

Standard stock solution: 0.35 mg/mL of USP Oxcarbazepine RS in methanol

Standard solution: Dilute the *Standard stock solution* with the corresponding *Medium* according to the Tablet strength, to obtain a final concentration of $(L/900)$ µg/mL, where L is the label claim in mg/Tablet.

■ to obtain a final concentration of 0.0175 mg/mL of USP Oxcarbazepine RS. ■ 1S (USP39)

Sample solution: Use portions of the solution under test passed through a suitable filter of

0.45- μm pore size. The volume of the solution under test withdrawn must be replaced by the same volume of corresponding *Medium*. Dilute with the appropriate *Medium* if necessary, according to the Tablet strength, to obtain a final concentration similar to that of the *Standard solution*.

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: 256 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of oxcarbazepine ($\text{C}_{15}\text{H}_{12}\text{N}_2\text{O}_2$) dissolved at 30 min (Q_{30}):

$$Q_{30} = (A_U/A_S) \times (C_S/L) \times D \times V \times 100$$

Calculate the percentage of oxcarbazepine ($\text{C}_{15}\text{H}_{12}\text{N}_2\text{O}_2$) dissolved at 60 min (Q_{60}):

$$Q_{60} = [(A_U/A_S) \times (C_S/L) \times D \times V \times 100] + [Q_{30} \times (V_S/V)]$$

$A_{\bar{U}}$ absorbance of the *Sample solution*

$A_{\bar{S}}$ absorbance of the *Standard solution*

$C_{\bar{S}}$ concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

D = dilution factor of the *Sample solution*

V = volume of *Medium*, 900 mL

V_S = volume of the solution under test withdrawn (mL)

Tolerances: NLT 70% (Q) of the labeled amount of oxcarbazepine is dissolved in 30 min, and NLT 80% (Q) of the labeled amount of oxcarbazepine is dissolved in 60 min.

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

Medium

For Tablets labeled to contain 150 mg: 0.3% (w/v) sodium dodecyl sulfate in water; 900 mL, deaerated

For Tablets labeled to contain 300 mg: 0.6% (w/v) sodium dodecyl sulfate in water; 900 mL, deaerated

For Tablets labeled to contain 600 mg: 1.0% (w/v) sodium dodecyl sulfate in water; 900 mL, deaerated

Apparatus 2: 60 rpm

Times: 30 and 60 min

Standard stock solution: 3.3 mg/mL of USP Oxcarbazepine RS in methanol. [Note—This solution is stable for 22 h at 10 $^{\circ}$.]

Standard solution: Dilute the *Standard stock solution* with the corresponding *Medium*, according to the Tablet strength, to obtain a final concentration of ($L/900$)

•mg/mL, where L is the label claim in mg/Tablet. •(ERR 1-Jun-2014)

Sample solution: Use portions of the solution under test passed through a suitable filter of 0.45- μm pore size. The volume of the solution under test withdrawn must be replaced by the same volume of corresponding *Medium*.

Instrumental conditions**Mode:** UV-Vis**Analytical wavelength:** 304 nm**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of oxcarbazepine ($C_{15}H_{12}N_2O_2$) dissolved at 30 min (Q_{30}):

BRIEFING

Oxtriphylline Delayed-Release Tablets, *USP* 38 page 4696. It is proposed to omit the monograph for the following reasons. No drug products formulated as defined under Oxtriphylline Delayed-Release Tablets are currently marketed in the United States. The drug product is currently not used in veterinary medicine in the United States.

(SM4 : M. Koleck.) Correspondence Number—C127643

Comment deadline: July 31, 2015

Delete the following:

■ Oxtriphylline Delayed-Release Tablets

~~» Oxtriphylline Delayed-Release Tablets contain an amount of oxtriphylline equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous theophylline ($C_7H_8N_4O_2$).~~

~~**Packaging and storage**—Preserve in tight containers.~~

~~**Labeling**—Label the Tablets to state both the content of oxtriphylline and the content of anhydrous theophylline. The label indicates that the Tablets are enteric-coated.~~

~~**USP Reference standards** ~~(11)~~—
 USP Oxtriphylline RS~~

~~**Identification**—~~

~~**A:** The retention time exhibited by theophylline in the chromatogram of the *Assay preparation* corresponds to that of theophylline in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.~~

~~**B:** Transfer a quantity of finely ground Tablets, equivalent to about 100 mg of oxtriphylline, to a suitable test tube, add 10 mL of methanol, shake on a vortex mixer for several minutes, and filter to obtain the test solution. Apply 10 μ L of the test solution and 10 μ L of a Standard solution of *USP Oxtriphylline RS* in methanol containing 10 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* ~~(621)~~) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the applications to dry, and develop the chromatogram in a solvent system consisting of a mixture of chloroform, alcohol, and formic acid (88:10:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Observe the plate under short-wavelength UV light: the principal spot obtained from the test solution corresponds in color, size, and R_f value to that obtained from the Standard solution.~~

~~**Disintegration** ~~(701)~~—Test Tablets as directed for *Enteric-Coated Tablets* (see *Disintegration* ~~(701)~~): the tablets do not disintegrate after 30 minutes of agitation in simulated gastric fluid TS; continue agitation in simulated gastric fluid TS for an additional 30 minutes: the tablets may disintegrate during this period; if all of the tablets have not~~

disintegrated, place the basket in simulated intestinal fluid TS, and operate the apparatus: all of the tablets disintegrate within 90 minutes (2.5 hours total disintegration time).

Uniformity of dosage units ~~(905)~~: meet the requirements

Assay

Mobile phase— Dissolve 6.8 g of monobasic potassium phosphate in water to make 1000 mL, and adjust with 0.1 N potassium hydroxide to a pH of 5.8 ± 0.1 . Prepare a filtered and degassed mixture of this solution and methanol (4:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* ~~(621)~~).

Standard preparation— Dissolve an accurately weighed quantity of *USP Oxtriphylline RS* in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.1 mg per mL.

Assay preparation— Place 10 Tablets in a 1000-mL volumetric flask, and add about 700 mL of water. Heat on a steam bath, with occasional shaking, until the Tablets have disintegrated. Cool to room temperature, dilute with water to volume, mix, and filter. Transfer an accurately measured volume of this specimen solution, equivalent to about 20 mg of Oxtriphylline, to a 200-mL volumetric flask, dilute with water to volume, and mix.

System suitability preparation— Dissolve suitable quantities of *USP Oxtriphylline RS* and theobromine in water to obtain a solution containing about 0.6 mg and 0.3 mg per mL, respectively. Dilute this solution quantitatively, and stepwise if necessary, with water to obtain a solution containing about 60 µg of *USP Oxtriphylline RS* per mL and about 30 µg of theobromine per mL.

Chromatographic system (see *Chromatography* ~~(621)~~)—The liquid chromatograph is equipped with a 275-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation* and the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the resolution, R , between the theobromine and theophylline peaks is not less than 3.0, and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%. The relative retention times are about 0.7 for theobromine and 1.0 for theophylline.

Procedure— Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. [Note—The major peaks recorded in the chromatograms represent the theophylline moiety of oxtriphylline.] Calculate the quantity, in mg, of $C_7H_8N_4O_2$ per Tablet taken by the formula:

$$(180.17 / 283.33)(20C / V)(r_U / r_S)$$

in which 180.17 and 283.33 are the molecular weights of anhydrous theophylline and oxtriphylline, respectively, C is the concentration, in µg per mL, of *USP Oxtriphylline RS* in the *Standard preparation*, V is the volume, in mL, of specimen solution taken for the *Assay preparation*, and r_U and r_S are the theophylline peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. ■1S (USP39)

BRIEFING

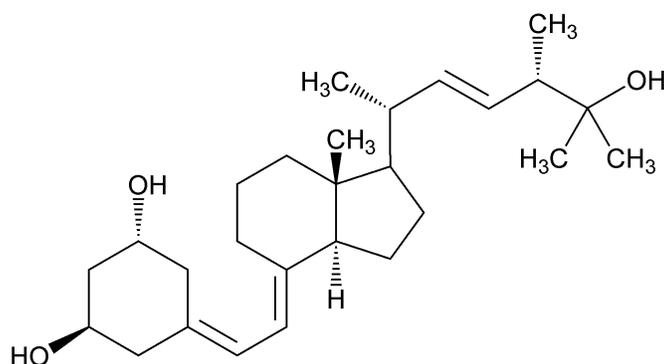

Paricalcitol, *USP 38* page 4761. The currently official monograph contains a test for *Organic Impurities* but does not list specified impurities. As a part of USP's modernization process, the monograph is revised to update the analytical procedure and to include acceptance criteria for specified impurities. The liquid chromatographic procedure in the test for *Organic Impurities* is based on analyses performed with the Halo C18 brand of L1 column. The typical retention time for paricalcitol is about 12 min.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

^a Determine the retention time of the paricalcitol peak using the *Standard solution*. Adjust the start of the gradient to be 1.0 ± 0.1 min prior to the retention time of paricalcitol and accordingly adjust the remaining gradient times.

System suitability stock solution: Prepare a 50- $\mu\text{g}/\text{mL}$ solution of paricalcitol from USP Paricalcitol Solution RS in dehydrated alcohol. Using a colorless glass container, expose the solution to ultraviolet light at 254 nm. Paricalcitol undergoes partial degradation to 7Z-paricalcitol. A degradation of at least 0.2% of paricalcitol to 7Z-paricalcitol [(7Z,22E)-19-nor-9,10-secoergosta-5,7,22-triene-1 α ,3 β ,25-triol] must be obtained, based on the corresponding peaks. If it is not obtained, expose the solution to ultraviolet light again.

System suitability solution: *System suitability stock solution* and water (1:1)

Standard stock solution: 5 $\mu\text{g}/\text{mL}$ of paricalcitol from USP Paricalcitol Solution RS in *Diluent*

Standard solution: 0.15 $\mu\text{g}/\text{mL}$ of paricalcitol from *Standard stock solution* in *Diluent*

Sensitivity solution: 0.05 $\mu\text{g}/\text{mL}$ of paricalcitol from *Standard solution* in *Diluent*

Sample stock solution: 200 $\mu\text{g}/\text{mL}$ of Paricalcitol in dehydrated alcohol

Sample solution: 100 $\mu\text{g}/\text{mL}$ of Paricalcitol from *Sample stock solution* in water

Chromatographic system

(See *Chromatography* $\langle 621 \rangle$, *System Suitability*.)

Mode: LC

Detector: UV 252 nm

Column: 4.6-mm \times 10-cm; 2.7- μm packing L1

Column temperature: 30 $^{\circ}$

Flow rate: 0.9 mL/min

Injection volume: 25 μL

System suitability

Samples: *System suitability solution*, *Standard solution*, and *Sensitivity solution*

[Note—The relative retention times for paricalcitol and 7Z-paricalcitol are 1.0 and 1.06, respectively.]

Suitability requirements

Resolution: NLT 1.5 between paricalcitol and 7Z-paricalcitol, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Paricalcitol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U

= peak response of each impurity from the *Sample solution*

r_S

= peak response of paricalcitol from the *Standard solution*

C_S

= concentration of paricalcitol in the *Standard solution* ($\mu\text{g/mL}$)

C_U

= concentration of Paricalcitol in the *Sample solution* ($\mu\text{g/mL}$)

F

= relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*. Disregard peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Paricalcitol	1.0	—	—
22Z-Paricalcitol ^a	1.23	0.64	0.15
Any other individual impurity	—	1.0	0.1
Total impurities	—	—	0.5
^a (7E,22Z)-19-Nor-9,10-secoergosta-5,7,22-triene-1 α ,3 β ,25-triol.			

■ 1S (USP39)

SPECIFIC TESTS

• Loss on Drying

(See *Thermal Analysis* < 891 > .)

Sample: 8 mg of Paricalcitol

Analysis: Determine the percentage of volatile substances by thermogravimetric analysis

on an appropriately calibrated instrument. Heat at a rate of 5^o/min between ambient

temperature and 150^o in an atmosphere of nitrogen at a flow rate of 40 mL/min. Determine the accumulated loss in weight from the thermogram.

Acceptance criteria: NMT 2.0%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight, light-resistant containers, and store under argon in a freezer.

- **USP Reference Standards** 〈 11 〉

- USP Paricalcitol RS

- USP Paricalcitol Solution RS

BRIEFING

Paricalcitol Capsules. Because there is no existing *USP* monograph for this dosage form, a new monograph, based on validated methods of analysis, is proposed.

1. The liquid chromatographic procedure in the *Assay* is based on analyses performed using the Waters Symmetry C18 brand of L1 column. The Sulpeco LC-18 DB and Alltech Altima C18 brands of L1 column are also suitable for this procedure. The typical retention time for paricalcitol is about 7.5 min. An internal standard is employed to compensate for displacement and dilution effects.
2. The liquid chromatographic procedure in the test for *Organic Impurities* is based on analyses performed using the Waters Symmetry C18 brand of L1 column. The Alltech Altima C18 brand of L1 column is also suitable for this procedure. The typical retention time for paricalcitol is about 35 min. An internal standard is employed because the sample preparation includes an extraction procedure.
3. Degradation solutions A and B described in the proposal are similar to the ones in the currently official *Paricalcitol Injection* monograph. The same specified unidentified degradation products (related compounds A–I) are formed. Because the analytical procedures in the two monographs are different, the relative retention times of the components differ but the elution order remains the same. Related compounds E and F, which are degradation products and are listed in the *Paricalcitol Injection* monograph, are not observed in the Capsules procedure and are therefore not included in *Table 4*.

Comment deadline: July 31, 2015

Add the following:

■ **Paricalcitol Capsules**

DEFINITION

Paricalcitol Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of paricalcitol ($C_{27}H_{44}O_3$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **Procedure**

[Note—Protect paricalcitol solutions from light.]

Solution A: Acetonitrile, isopropyl alcohol, and water (50:15:35)

Solution B: Acetonitrile and isopropyl alcohol (50:50)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
20	100	0
21	0	100
29	0	100
30	100	0
35	100	0

Internal standard solution: 0.75 µg/mL of triphenylene in acetonitrile

Standard stock solution: 10 µg/mL of paricalcitol from USP Paricalcitol Solution RS in acetonitrile

Standard solution: 0.5 µg/mL of paricalcitol from *Standard stock solution* and 0.15 µg/mL of triphenylene from *Internal standard solution* in acetonitrile

Sample solution: Nominally 0.5 µg/mL of paricalcitol from Capsules and 0.15 µg/mL of triphenylene from *Internal standard solution*. Prepare as follows. Transfer 10 Capsules to a suitable container. Transfer the volume of acetonitrile specified in *Table 2* to a separate beaker. Cut each Capsule to allow the oil to flow freely from the shell. Rinse any tools used to open the shells by pouring in portions of acetonitrile from the beaker into the sample container. When the rinsing is complete, add the remainder of the acetonitrile to the sample container and add the volume of *Internal standard solution* specified in *Table 2*. [Note—To facilitate cutting the Capsules open, soften them in a suitable microwave oven for NMT 10 s; taking care not to melt the Capsules. A microwave oven of 600–825 watts was found to be suitable for this procedure.]

Table 2

Capsule Strength (µg/Capsule)	Volume of Acetonitrile (mL)	Volume of Internal Standard Solution (mL)	Internal Standard Correction Factor (F)
1	16.0	4.0	1
2	32.0	8.0	1
4	65.0	15.0	0.9375

[Note—The relative retention times for paricalcitol and triphenylene are 1.0 and 2.0, respectively.]

Suitability requirements**Resolution:** NLT 4.0 between paricalcitol and triphenylene**Tailing factor:** NMT 2.0 for the paricalcitol peak**Relative standard deviation:** NMT 2.0% for the peak response ratios of paricalcitol to triphenylene**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of paricalcitol ($C_{27}H_{44}O_3$) in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times F \times 100$$

 $R_{\bar{U}}$ peak response ratio of paricalcitol to triphenylene from the *Sample solution* $R_{\bar{S}}$ peak response ratio of paricalcitol to triphenylene from the *Standard solution* $C_{\bar{S}}$ concentration of paricalcitol from USP Paricalcitol Solution RS in the *Standard solution* ($\mu\text{g/mL}$) $C_{\bar{U}}$ nominal concentration of paricalcitol in the *Sample solution* ($\mu\text{g/mL}$) F = internal standard correction factor (see *Table 2*)**Acceptance criteria:** 90.0%–110.0%**PERFORMANCE TESTS**

- **Disintegration** { 701 }

Apparatus: Basket-rack assembly with disks**Time:** 15 min

- **Uniformity of Dosage Units** { 905 } : Meet the requirements

IMPURITIES

- **Organic Impurities**

[Note—Unless otherwise specified, protect paricalcitol solutions from light.]

Solution A: Water**Solution B:** Acetonitrile**Solution C:** Acetonitrile and isopropyl alcohol (50:50)**Mobile phase:** See *Table 3*.**Table 3**

Time (min)	Solution A (%)	Solution B (%)	Solution C (%)
0	85	15	0
55	5	95	0
56	0	0	100
60	0	0	100
61	85	15	0
70	85	15	0

Diluent: Acetonitrile and water (50:50)**Degradation stock solution:** Dilute 1 mL of USP Paricalcitol Solution RS with *Diluent* to 5

mL.

Degradation solution A: Transfer 1 mL of the *Degradation stock solution* and 0.1 mL of 30% hydrogen peroxide into a suitable container, and allow to stand at room temperature for 1 h. Dilute with *Diluent* to 10 mL, and mix. This solution contains paricalcitol and related compounds A and B.

Degradation solution B: Mix 1 mL of the *Degradation stock solution* and 1 mL of 0.1 N hydrochloric acid, and heat at 70° for 1 h. Cool to room temperature, dilute with *Diluent* to 10 mL, and mix. This solution contains paricalcitol and related compounds C, D, G, H and I.

Internal standard solution: 0.08 µg/mL of calcitriol from USP Calcitriol Solution RS in acetonitrile

Standard solution: 0.01 µg/mL of paricalcitol from USP Paricalcitol Solution RS and 0.016 µg/mL of calcitriol from *Internal standard solution* in *Diluent*

Sample solution: Nominally 1.9 µg/mL of paricalcitol from Capsules. Prepare as follows. Remove the contents of a suitable number of Capsules using a syringe or cut the Capsules open with scissors and transfer the contents to a suitable container. Transfer a portion of mixed Capsule contents containing nominally 1.9 mg of paricalcitol to a 10-mL volumetric flask. Add acetonitrile to obtain a total mass of 5 g. Transfer 2.0 mL of *Internal standard solution* to the flask and dilute with water to volume. Mix using a vortex mixer. Centrifuge for 5 min at approximately 3000 rpm. Continue centrifuging for 5 min intervals until the top layer is clear, then transfer the supernatant to a suitable chromatographic vial within 2 min.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 252 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1.5 mL/min

Injection volume: 300 µL

Run time: 55 min

System suitability

Sample: *Standard solution*

[Note—The relative retention times for paricalcitol and calcitriol are 1.0 and 1.03, respectively. See *Table 4* for all other relative retention times.]

Suitability requirements

Relative standard deviation: NMT 7.0% for the peak response ratio of paricalcitol to calcitriol

Analysis

Samples: *Degradation solution A*, *Degradation solution B*, *Standard solution*, and *Sample solution*

Identify the impurities in the *Sample solution* on the basis of the relative retention times of the components of *Degradation solution A* and *Degradation solution B* in *Table 4*.

Table 4

Name ^a	Degradation Solution	Relative Retention Time
Related compound A	A	0.74
Related compound B	A	0.84
Related compound C	B	0.91
Related compound D	B	0.97
7Z-Paricalcitol ^b	—	1.01
Related compound G	B	1.47
Related compound H	B	1.50
Related compound I	B	1.51
Total impurities	—	—

^a Related compounds A, B, C, D, G, H, and I are specified unidentified degradation products. No information is available about chemical structures or chemical names for these impurities.

^b (7Z,22E)-19-Nor-9,10-secoergosta-5,7,22-triene-1 α ,3 β ,25-triol.

Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of each impurity to calcitriol from the *Sample solution*

R_S = peak response ratio of paricalcitol to calcitriol from the *Standard solution*

C_S = concentration of paricalcitol from USP Paricalcitol Solution RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of paricalcitol in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria

Any individual impurity: NMT 2.0%

Total impurities: NMT 3.0%

BRIEFING

Penicillin G Potassium, USP 38 page 4785. The following revisions are proposed:

1. An *Identification* test based on the chromatographic retention time in the *Assay* is added to strengthen the monograph.
2. In preparation for the omission of flame tests from *Identification Tests—General* \langle

191), proposed in PF 41(2) [Mar.–Apr. 2015], it is proposed to replace the flame test for potassium with *Test a* for potassium from 2.3.1 *Identification Reactions of Ions and Functional Groups* in the *European Pharmacopoeia*. This is consistent with *Identification test D* in the *European Pharmacopoeia* monograph for *Benzylpenicillin Potassium*.

3. The *Assay* is revised to delete the column efficiency requirement. The remaining requirements are adequate to evaluate the system suitability.
4. The requirement in *Sterility Tests* is revised to make it more flexible.
5. The *USP Reference Standards* section is updated to add a Reference Standard that is used for the *Bacterial Endotoxins Test*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

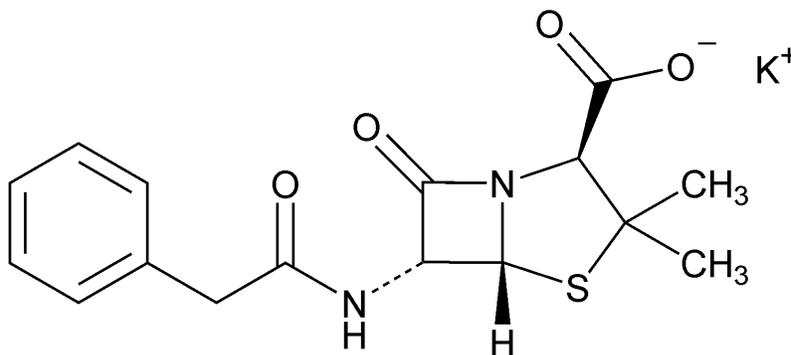

Interested parties are encouraged to submit validated procedures and approved acceptance criteria along with supporting data to further improve this monograph and other monographs containing Penicillin G Potassium.

USP Penicillin V Potassium RS

BRIEFING

Sildenafil Tablets. Because there is no existing *USP* monograph for this dosage form, a new monograph based on validated methods of analysis is being proposed. The liquid chromatographic procedure for the *Assay* and the test for *Organic Impurities* are based on analyses performed with the Waters Symmetry C18 brand of L1 column. The typical retention time for sildenafil is about 6.5 min.

(SM4: M. Koleck.)

Correspondence Number—C118327; C138606

Comment deadline: July 31, 2015

Add the following:

■ **Sildenafil Tablets**

DEFINITION

Sildenafil Tablets contain sildenafil citrate equivalent to NLT 90% and NMT 110% of the labeled amount of sildenafil ($C_{22}H_{30}N_6O_4S$).

IDENTIFICATION

● **A. Infrared Absorption** 〈 197K〉

Solution A: Ammonium hydroxide and water (10:90)

Standard solution: 1.4 mg/mL of USP Sildenafil Citrate RS in *Solution A*

Sample solution: Grind 1 Tablet and add a sufficient amount of *Solution A* to obtain nominally 1 mg/mL of sildenafil. Sonicate for 2 min, shake well, and centrifuge. Use the supernatant.

Analysis: For each of the *Standard solution* and the *Sample solution*, prewash a 6-cc C18 solid phase extraction cartridge with 10 mL of methanol followed by 10 mL of *Solution A*, discarding both washings. Apply 5 mL each of the *Standard solution* and the *Sample solution* to separate prewashed cartridges and draw each solution through the cartridge. Wash each cartridge with 10 mL of water and allow the cartridge to dry under vacuum. Elute the sildenafil from each cartridge with 5 mL of methanol, collecting the eluant in a suitable container. Add about 200 mg of potassium bromide to each container, mix well, and evaporate to dryness. To about 70 mg of each dried mixture, add about 140 mg of potassium bromide and mix.

Acceptance criteria: Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

● **Procedure**

Buffer: Dilute 7 mL of triethylamine with water to 1 L. Adjust with phosphoric acid to a pH of 3.0.

Mobile phase: *Buffer*, methanol, and acetonitrile (58:25:17)

Diluent: Acetonitrile and water (90:10)

Standard solution: 0.028 mg/mL of USP Sildenafil Citrate RS in *Mobile phase*

Sample stock solution: Disperse 1 Tablet in 5 mL of *Diluent* with the aid of sonication. Dilute with *Mobile phase* to 250.0 mL. Sonicate, if necessary. Centrifuge and use the supernatant.

Sample solution: Nominally 0.02 mg/mL of sildenafil prepared by diluting a suitable portion of the *Sample stock solution* with *Mobile phase*

Chromatographic system

(See *Chromatography* 〈 621〉, *System Suitability*.)

Mode: LC

Detector: UV 290 nm

Column: 3.9-mm × 15-cm; 5-µm packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 20 µL

Run time: NLT 1.5 times the retention time of sildenafil

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.3

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of sildenafil ($C_{22}H_{30}N_6O_4S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of sildenafil from the *Sample solution*

r_S = peak response of sildenafil from the *Standard solution*

C_S = concentration of USP Sildenafil Citrate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of sildenafil in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of sildenafil, 474.58

M_{r2} = molecular weight of sildenafil citrate, 666.70

Acceptance criteria: 90%–110%

PERFORMANCE TESTS

• Dissolution (711)

Medium: 0.01 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 15 min

Standard solution: 0.03 mg/mL of USP Sildenafil Citrate RS in *Medium*

Sample solution: A filtered portion of the solution under test, suitably diluted with *Medium*, if necessary

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: Maximum at about 290 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of sildenafil ($C_{22}H_{30}N_6O_4S$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times D \times V \times (1/L) \times (M_{r1}/M_{r2}) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Sildenafil Citrate RS in the *Standard solution* (mg/mL)

D = dilution factor for the *Sample solution*, if needed

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

M_{r1} molecular weight of sildenafil, 474.58

M_{r2} molecular weight of sildenafil citrate, 666.70

Tolerances: NLT 80% (Q) of the labeled amount of sildenafil ($C_{22}H_{30}N_6O_4S$) is dissolved.

- **Uniformity of Dosage Units** { 905 } : Meet the requirements

IMPURITIES

- **Organic Impurities**

Buffer, Mobile phase, Diluent, and Chromatographic system: Proceed as directed in the *Assay*, except for *Run time*.

Run time: NLT 3 times the retention time of sildenafil

System suitability solution: A mixture of sildenafil and sildenafil *N*-oxide in *Mobile phase*, prepared as follows. Dissolve 70 mg of USP Sildenafil Citrate RS in 1 mL of a solution of hydrogen peroxide and formic acid (2:1), allow to stand for NMT 10 min, and then dilute with *Mobile phase* to 250.0 mL.

Standard solution: 0.0014 mg/mL of USP Sildenafil Citrate RS in *Mobile phase*

Sensitivity solution: 0.00035 mg/mL of USP Sildenafil Citrate RS in *Mobile phase* from the *Standard solution*

Sample stock solution: Transfer 5 Tablets to a 250-mL volumetric flask and disperse in 25 mL of *Diluent* with the aid of sonication. Dilute with *Mobile phase* to volume. Sonicate, if necessary. Centrifuge and use the supernatant.

Sample solution: Nominally 0.5 mg/mL of sildenafil prepared by diluting a suitable portion of the *Sample stock solution* with *Mobile phase*

System suitability

Samples: *System suitability solution*, *Standard solution*, and *Sensitivity solution*

[Note—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 2.6 between sildenafil *N*-oxide and sildenafil, *System suitability solution*

Tailing factor: NMT 1.3, *Standard solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of any individual degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of any individual degradation product from the *Sample solution*

r_S = peak response of sildenafil from the *Standard solution*

C_S = concentration of USP Sildenafil Citrate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of sildenafil in the *Sample solution* (mg/mL)

M_{r1} molecular weight of sildenafil, 474.58

M_r molecular weight of sildenafil citrate, 666.70

Acceptance criteria: See *Table 1*. Disregard any peak less than 0.05%.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Sildenafil	1.0	—
Sildenafil <i>N</i> -oxide ^a	1.2	0.20
Any individual degradation product	—	0.20
Total degradation products	—	0.50

^a 1- {[3-(6,7-Dihydro-1-methyl-7-oxo-3-propyl-1*H*-pyrazolo[4,3-*d*]pyrimidin-5-yl)-4-ethoxyphenyl]sulfonyl}-4-methylpiperazine *N*⁴-oxide.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers. Store at controlled room temperature.
- **USP Reference Standards** { 11 }
USP Sildenafil Citrate RS
- 1S (USP39)

BRIEFING

Sodium Chloride and Dextrose Tablets, *USP 38* page 5317. It is proposed to omit this monograph for the following reasons. No drug products formulated as defined under Sodium Chloride and Dextrose Tablets are currently marketed in the United States. The drug product is currently not used in veterinary medicine in the United States.

(SM4: M. Koleck.) Correspondence Number—C157333

Comment deadline: July 31, 2015

Delete the following:

■ **Sodium Chloride and Dextrose Tablets**

» ~~Sodium Chloride and Dextrose Tablets contain not less than 92.5 percent and not more than 107.5 percent of the labeled amount of sodium chloride (NaCl) and of dextrose (C₆H₁₂O₆·H₂O).~~

~~**Packaging and storage**—Preserve in well-closed containers.~~

~~**Identification**—~~

~~**A:** A filtered solution of Tablets responds to the flame test for *Sodium* {191} and to the test for *Chloride* {191}.~~

~~**B:** Add a few drops of the filtered solution tablets to 5 mL of hot alkaline cupric tartrate TS: a copious red precipitate of cuprous oxide is formed.~~

Change to read:

Somatropin is a protein hormone consisting of 191 amino acid residues, and its structure corresponds to the major component of the growth hormone extracted from human pituitary glands. It is produced as a lyophilized powder or bulk solution by methods based on recombinant DNA technology. ~~When prepared as a lyophilized powder, it contains NLT 910 µg of somatropin/mg, calculated on the anhydrous basis. When prepared as a bulk solution, it contains NLT 910 µg of somatropin/mg of total protein.~~

■ ■ 1S (USP39)

The presence of host-cell DNA and host-cell protein impurities in Somatropin is process specific—the limits of these impurities are determined by validated methods. Manufacturers must demonstrate a correlation between the Assay and a validated and approved growth-promotion-based bioassay. It may contain excipients.

[Note—One mg of anhydrous Somatropin is equivalent to 3.0 USP Somatropin Units.]

IDENTIFICATION

- **A.** The retention time of the somatropin peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Chromatographic Purity*, except that a *Standard solution* is also chromatographed and prepared by reconstituting a vial of USP Somatropin RS with *Diluent* to obtain a known concentration of about 2 mg/mL.
- **B. Peptide Mapping**

Solution A: Trifluoroacetic acid and water (1:999). Filter, and degas.

Solution B: Water, trifluoroacetic acid, and acetonitrile (100:1:899)

Solution C: 0.05 M solution of tris(hydroxymethyl)aminomethane (Tris). Adjust with hydrochloric acid to a pH of 7.5.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
20	80	20
40	75	25
65	50	50
70	20	80
71	100	0
86	100	0

Trypsin solution: 1 mg/mL of trypsin in *Solution C*. Store in a freezer, if necessary.

Standard stock solution: 2.0 mg/mL of USP Somatropin RS in *Solution C*

Standard solution: To 1 mL of the *Standard stock solution* add 30 µL of *Trypsin solution*.

Cap the tube, and place it in a water bath at 37° for 4 h. [Note—If this solution is not injected immediately, store it in a freezer.]

Sample stock solution: 2.0 mg/mL of Somatropin in *Solution C*

Sample solution: To 1 mL of the *Sample stock solution* add 30 µL of *Trypsin solution*. Cap the tube, and place it in a water bath at 37° for 4 h. [Note—If this solution is not injected immediately, store it in a freezer.]

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 214 nm

Column: 4.6-mm × 25-cm; packing L7

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 100 µL

Analysis

Samples: *Standard solution* and *Sample solution*, separately injected

[Note—Condition the chromatographic system by running a blank gradient program before injecting the digests.]

Acceptance criteria: The chromatographic profile of the *Sample solution* is similar to that of the *Standard solution*.

- **C. Somatropin Bioidentity Tests** { 126 } : Meets the requirements

[Note—The bioidentity test may be performed either on the Somatropin bulk drug substance or on the finished pharmaceutical product.]

ASSAY

- **Somatropin Content**

Buffer solution: Dissolve 5.18 g of dibasic sodium phosphate and 3.65 g of monobasic sodium phosphate in 950 mL of water. Adjust with phosphoric acid or sodium hydroxide solution to a pH of 7.0. Dilute with water to 1000 mL.

Mobile phase: Isopropyl alcohol and *Buffer solution* (3:97). Filter, and degas.

Diluent: *Buffer solution* and water (1: 1.5)

System suitability solution: Place 1 vial of USP Somatropin RS in an oven at 50° for 12–24 h. Remove from the oven, and dissolve the contents of the vial in *Diluent* to obtain a solution with a known concentration of about 1 mg/mL and a dimer content of 1%–2%.

Standard solution: Known concentration of about 1 mg/mL of USP Somatropin RS in *Diluent*

Sample solution: About 1 mg/mL of accurately weighed Somatropin in *Diluent*, or by diluting a bulk solution of Somatropin with *Diluent*. [Note—If necessary, the amount of protein in solution can be determined by the test for *Total Protein Content*.]

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 214 nm

Column: 7.8-mm × 30-cm; packing L33

Column temperature: Ambient

Flow rate: 0.6 mL/min

Injection volume: 20 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NMT 0.4 for the ratio of the valley height, between the dimer and the monomer, and the dimer peak height

Tailing factor: NMT 1.7 for the monomer (major) peak

Analysis

Samples: *Standard solution* and *Sample solution*, separately injected

Record the chromatograms for NLT twice the retention time of the somatropin monomer (major) peak, and measure the peak responses for the monomer.

Calculate the concentration, in mg/mL, of somatropin in the *Sample solution* taken:

$$\text{Result} = (r_U/r_S) \times C_S$$

r_U peak response of the monomer from the *Sample solution*

r_S peak response of the monomer from the *Standard solution*

C_S concentration of USP Somatropin RS in the *Standard solution* (mg/mL)

Acceptance criteria: NLT 910 µg of somatropin/mg on the anhydrous basis. When prepared as a bulk solution, it contains NLT 910 µg of somatropin/mg of total protein.

IMPURITIES

Change to read:

• Chromatographic Purity

Diluent: 0.05 M Tris in water. Adjust with hydrochloric acid to a pH of 7.5.

Mobile phase: *n*-Propyl alcohol and degassed *Diluent* (29:71). Filter.

System suitability solution: 2.0 mg/mL of Somatropin in *Diluent*. Pass through a filter to sterilize or add sodium azide to a final concentration of 0.01%, and allow to stand at room temperature for 24 h. [Note—Use within 48 h of preparation, or store the solution in a refrigerator until ready to use.]

Sample solution: 2.0 mg/mL of Somatropin in *Diluent*, prepared immediately before use

■ 1S (USP39)

[Note—Maintain the solutions between 2° and 8°, and use within 24 h. If an automatic injector is used, maintain the temperature between 2° and 8°.]

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; packing L26

Column temperature: 45°

Flow rate: 0.5 mL/min

Injection volume: 20 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 1.0 between somatropin and its adjacent peak

Tailing factor: 0.9–1.8 for the somatropin (major) peak

Analysis

Sample: *Sample solution*

Calculate the percentage of impurities in the portion of Somatropin taken:

$$\text{Result} = [A_U / (A_U + A_S)] \times 100$$

A_U sum of all the peak responses other than the somatropin (major) peak and disregarding any peak due to the solvent

A_S peak response of somatropin

Acceptance criteria: NMT 6.0% of total impurities

- **Limit of High Molecular Weight Proteins**

Buffer solution, Mobile phase, Diluent, System suitability solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Analysis

Samples: *System suitability solution* and *Sample solution*

Measure the areas of the main peak and of the peaks eluting before the main peak, excluding the solvent peaks.

Calculate the percentage of high molecular weight proteins in the portion of Somatropin taken:

$$\text{Result} = [A_H / (A_H + A_M)] \times 100$$

A_H sum of the areas of the high molecular weight peaks

A_M peak area of the monomer from the *Sample solution*

Acceptance criteria: NMT 4% of high molecular weight proteins

SPECIFIC TESTS

- **Total Protein Content**

(See *Ultraviolet-Visible Spectroscopy* 〈 857 〉.)

Buffer solution: 0.025 M solution of monobasic potassium phosphate in water. Adjust with sodium hydroxide to a pH of 7.0.

Sample solution: Dissolve a weighed quantity of Somatropin in *Buffer solution* to obtain a solution with an absorbance value between 0.5 and 1.0 at the wavelength of maximum absorbance at 280 nm.

Analysis: Determine the absorbance of the *Sample solution* using a spectrophotometric cell of path length 1 cm, at the wavelength of maximum absorbance around 280 nm and at 320 nm, using *Buffer solution* as the blank.

Calculate the protein content, in mg, in the portion of Somatropin taken:

$$\text{Result} = (A_{max} - A_{320}) \times (V/0.82)$$

A_{max} absorbance value of the *Sample solution* at the wavelength of maximum absorbance

A_{320} absorbance value of the *Sample solution* at 320 nm

V = volume of the *Sample solution*

- **Microbial Enumeration Tests** 〈 61 〉 and **Tests for Specified Microorganisms** 〈 62 〉: The total aerobic microbial count is NMT 3×10^2 cfu/g, the test being performed on 0.2–0.3 g of powder, accurately weighed.

- **Water Determination** 〈 921 〉, *Method 1c*: NMT 10%, when prepared as a lyophilized powder

- **Bacterial Endotoxins Test** 〈 85 〉: NMT 10 USP Endotoxin Units/mg of Somatropin

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers, and store between -10° and -25° .
- **Labeling:** The labeling states that the material is of recombinant DNA origin.
- **USP Reference Standards** 〈 11 〉
 - USP Endotoxin RS
 - USP Somatropin RS

BRIEFING

Somatropin for Injection, *USP 38* page 5340. It is proposed to clarify the instructions for the preparation and storage of the *Sample solution* in the test for *Chromatographic Purity*. Additionally, redundant acceptance criteria were deleted from the *Definition* since they are already present in the *Somatropin Content* test.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Delete the following:

■ Succinylcholine Chloride for Injection

» ~~Succinylcholine Chloride for Injection is Succinylcholine Chloride suitable for parenteral use.~~

~~**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1):~~

~~**USP Reference standards** (11)—~~

- ~~USP Endotoxin RS~~
- ~~USP Succinylcholine Chloride RS~~
- ~~USP Succinylmonocholine Chloride RS~~

~~**Completeness of solution** (641)—A 500 mg portion dissolves in 10 mL of carbon dioxide-free water to yield a clear and colorless solution.~~

~~**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1):~~

~~**Bacterial endotoxins** (85)—It contains not more than 2.0 USP Endotoxin Units per mg of succinylcholine chloride.~~

Chromatographic purity—

Standard solution— Transfer 20 mg each of choline chloride and *USP Succinylmonocholine Chloride RS*, accurately weighed, to a 50 mL volumetric flask, dissolve in 40 mL of methanol, dilute with methanol to volume, and mix.

Test solution— Prepare, immediately prior to use, a solution of succinylcholine chloride in methanol having a concentration of about 50 mg per mL.

Procedure— Separately apply 2 μ L of the *Test solution* and 5 μ L of the *Standard solution* to a suitable high performance 10 \times 10 cm thin layer chromatographic plate (see *Chromatography* ~~(621)~~) coated with a 0.10 mm layer of chromatographic cellulose. Allow the spots to dry, and immediately place the plate, its coated surface toward the nearer wall, in the dry trough of a twin trough chromatographic chamber whose other trough contains a solvent system consisting of the upper layer of a mixture of butyl alcohol, water, and 96% formic acid (65:35:15) that has been shaken and allowed to stand for 24 hours until the phases have separated. Equilibrate the chromatographic chamber for 30 minutes, and tilt the chamber to introduce the developing solvent into the trough containing the plate. Develop the chromatogram until the solvent front has moved about three fourths of the length of the plate, remove the plate from the developing chamber, quickly and thoroughly evaporate the solvent with the aid of a current of air, and dry at 105^o for 15 minutes. [Note—During the drying, support the plate in such a manner that only the upper and lower edges of the plate, outside the chromatographic zone, are in direct contact with any heated surface.] Spray the plate with potassium iodoplatinate TS, dry at 105^o for about 2 minutes, and allow to cool to room temperature: any spots from the *Test solution* are not greater in size or intensity than the spots, occurring at the respective *R_f* values (approximately 0.6 for succinylmonocholine chloride, and 0.5 for choline chloride), produced by 5 μ L of the *Standard solution*, corresponding to 0.8% of each compound. Estimate the size and intensities of any other spots detected by comparison with the spot produced by succinylmonocholine chloride in the *Standard solution*. The total of any such spots detected is not more than 2.0%.

Other requirements— It conforms to the Definition, responds to the *Identification* tests, and meets the requirements for *Water*, *Residue on ignition*, *Chloride content*, and *Assay* under *Succinylcholine Chloride*. It meets also the requirements for *Sterility Tests* ~~(71)~~, *Uniformity of Dosage Units* ~~(905)~~, and *Labeling* under *Injections* ~~(1)~~. ■ 1S (USP39)

BRIEFING

Temozolomide, *USP 38* page 5480. On the basis of comments received, it is proposed to revise the *Definition* and make the following changes in the test for *Organic Impurities* based on the *Related substance* of *Temozolomide* in *Pharmeuropa*.

1. USP Dacarbazine Related Compound A RS is deleted. Aminoimidazolecarboxamide is given as a nickname for dacarbazine related compound A free base. Aminoimidazolecarboxamide is calculated using a relative response factor and a footnote is added to *Table 1* for its relative retention time.
2. The resolution is determined between temozolomide acid and temozolomide peaks.
3. Two peaks for aminoimidazolecarboxamide may be observed. A footnote in *Table 1* is

revised to indicate that two peaks may be observed and to use the sum of the peak areas for calculation.

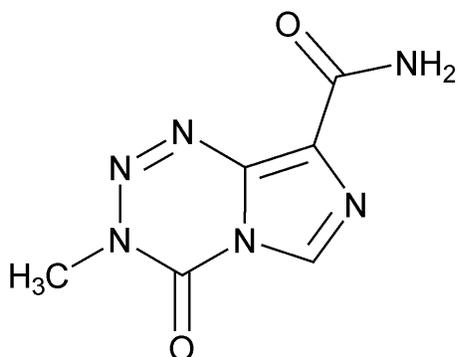

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM3: F. Mao.)

BRIEFING

Theophylline, *USP 38* page 5524. As a part of USP monograph modernization efforts, the following revisions are proposed:

1. Replace the current HPLC procedure in the *Assay* that uses an internal standard with the same UHPLC procedure that is proposed in the test for *Organic Impurities*. The liquid chromatographic procedure is performed using the Acquity BEH C18 brand of L1 column. The typical retention time of theophylline is about 4 min.
2. Add a stability-indicating UHPLC procedure in the test for *Organic Impurities* using the same chromatographic system as the *Assay*.
3. Revise *Identification* test *B* to match the proposed *Assay* method by removing the reference to the internal standard.
4. Delete the tests for *Melting Range or Temperature* and *Acidity* because these tests are nonspecific and provide no additional value to the monograph.
5. Add five new Reference Standards used in the *Assay* and the test for *Organic Impurities* to the *USP Reference Standards* section.

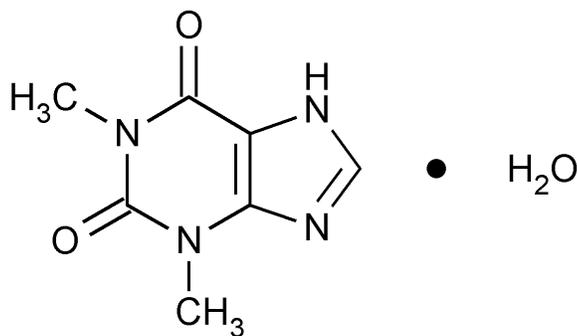

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

BRIEFING

Sterile Purified Water, *USP 38* page 5807. In *PF 38(3)* [May–June 2012], four sterile water monographs, including *Sterile Purified Water*, were proposed to be updated. At the time, an *Oxidizable Substances* test was required. The change was to allow a *Total Organic Carbon* test as an alternative to the *Oxidizable Substances* test. The change became official in the *First Supplement to USP 36*. In the briefing of the same *PF* article, it was proposed to delete the *Oxidizable Substances* test in 18–24 months. This revision proposal deletes the option of the *Oxidizable Substances* test, and retains the *Total Organic Carbon* test that is specific to sterile waters.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Sterile Purified Water

[Note—For microbiological guidance, see *Water for Pharmaceutical Purposes* 〈 1231 〉.]

H₂O 18.02**DEFINITION**

Sterile Purified Water is Purified Water sterilized and suitably packaged. It contains no antimicrobial agents. [Note—Do not use Sterile Purified Water in preparations intended for parenteral administration. For such purposes use Water for Injection, Bacteriostatic Water for Injection, or Sterile Water for Injection.]

SPECIFIC TESTS**Delete the following:**

- **Oxidizable Substances**

Sample: 100 mL

Analysis: Add 10 mL of 2 N sulfuric acid, and heat to a boil. For Sterile Purified Water in containers having a fill volume of less than 50 mL, add 0.4 mL of 0.02 M potassium permanganate, and boil for 5 min; where the fill volume is 50 mL or more, add 0.2 mL of 0.02 M potassium permanganate, and boil for 5 min. If a precipitate forms, cool in an ice bath to room temperature, and pass through a sintered glass filter.

Acceptance criteria: The pink color does not completely disappear. Alternatively, perform the test for *Total Organic Carbon* $\langle 643 \rangle$, *Sterile Water*. ■ 1S (USP39)

BRIEFING

Sterile Water for Injection, *USP 38* page 5806. In *PF 38(3)* [May–June 2012], four sterile water monographs, including *Sterile Water for Injection*, were proposed to be updated. At the time, an *Oxidizable Substances* test was required. The change was to allow a *Total Organic Carbon* test as an alternative to the *Oxidizable Substances* test. The change became official in the *First Supplement to USP 36*. In the briefing of the same *PF* article, it was proposed to delete the *Oxidizable Substances* test in 18–24 months. This revision proposal deletes the option of the *Oxidizable Substances* test, and retains the *Total Organic Carbon* test that is specific to sterile waters.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Stage 4 Harmonization

This section contains monographs or chapters undergoing harmonization by the Pharmacopoeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization consists of several steps (**Stages 1** through **7**, as defined below). Stage 4 drafts are available for comments. Below are descriptions of the developmental Stages as defined by the United States Pharmacopeia, the European Pharmacopoeia, and the Japanese Pharmacopoeia.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

STIMULI TO THE REVISION PROCESS

Stimuli articles do not necessarily reflect the policies of the USPC or the USP Council of Experts

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of Expert Committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues.

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* section. Readers interested in submitting comments should see *Instructions to Authors*.

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP-NF* revision will be considered for publication in *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously in any language or medium and that they are not simultaneously under consideration by any other publication. All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication they will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention (USPC) and may not be subsequently published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

Style and Usage—*Stimuli* articles generally follow the current *Chicago Manual of Style* except in scientific usage (numbers, abbreviations, etc.). For the latter, authors should use the current *AMA Manual of Style* or the current *ACS Style Guide*. Authors may usefully consult a current edition of *Pharmacopeial Forum*.

References—Consult the current *AMA Manual of Style*, which is generally consistent with the National Library of Medicine's *Recommended Formats for Bibliographic Citation*. A current edition of *Pharmacopeial Forum* will offer examples of reference formats.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Disclosure of Potential Conflicts of Interest—Maintaining independence and impartiality are critical to the integrity and credibility of USP's public health mission. Accordingly, authors are expected to conform to the Conflict of Interest provisions of the USP Code of Ethics (see link below), including as part of their manuscript submission disclosure of all financial and personal relationships that may potentially influence, or be perceived to influence, their article. USP staff are available to provide additional guidance to authors on the range of disclosure that would be appropriate. Although USP *Stimuli* articles are not the type of source likely to be relied on as a basis for governmental actions (e.g., not a vehicle for reports of human clinical research), USP nevertheless supports the overall policies of the International Committee of Medical Journal Editors (ICMJE) regarding Uniform Requirements for Manuscripts Submitted to Biomedical Journals and Ethical Considerations in the Conduct and Reporting of Research (links below).

USP Code of Ethics:

<http://www.usp.org/aboutUSP/governance/policies/codeOfEthics.html>

ICMJE Uniform Requirements:

http://www.icmje.org/urm_main.html

ICMJE Conflicts of Interest:

<http://www.icmje.org/conflicts-of-interest/>

Contact Person—USP will designate a Scientific Liaison in the Documentary Standards Division as the corresponding author. This ensures that USP receives all comments generated by the *Stimuli* article. Authors should contact the Scientific Liaison if they would like to receive copies of comments generated by their *Stimuli* articles.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

Determination of Thermodynamic Solubility of Active Pharmaceutical Ingredients for Veterinary Species: A New USP General Chapter

Mike Apley,^a G. Bryan Crist,^a Vivek Fellner,^b Mario A. Gonzalez,^{a,c} Robert P. Hunter,^a Marilyn N. Martinez,^a Janis R. Messenheimer,^a Sanja Modric,^a Mark G. Papich,^a Alan F. Parr,^{a,c} Jim E. Riviere,^a Margareth R. C. Marques^{d,e}

ABSTRACT This *Stimuli* article discusses the approach for the development of a new general chapter on solubility determination for veterinary drug products. Possible procedures are discussed, with emphasis on the shake-flask method. Recommendations are included on the test conditions for products to treat dogs and cattle. The Expert Panel welcomes comments from the public and stakeholders.

INTRODUCTION

The United States Pharmacopeia (USP) held the workshop "Solubility Criteria for Veterinary Products" on November 7–8, 2012, at USP headquarters (1). One of the workshop outcomes was a decision by participants that the content of the new general chapter would focus on species-appropriate descriptions of conditions for testing in vitro drug solubility. Determining the solubility of drug candidates is important in pharmaceutical research, both for the discovery phase and the development phase (2,3). In the early stages of drug research, solubility—together with other physicochemical parameters (lipophilicity, ionization, and permeability)—is used to screen drug candidates. This information is needed to support formulation development, including product optimization and salt selection. During the later phases of product development, solubility considerations are useful in planning for challenges that may be encountered when addressing formulation modifications and the associated bioequivalence issues.

BACKGROUND

In the pharmaceutical literature, two commonly used solubility terms are: 1) kinetic solubility, the concentration of a compound at the time when an induced precipitate first appears in the solution; and 2) equilibrium (or thermodynamic) solubility, the concentration of a compound in a saturated solution when an excess of solid is present, and the solution and solid are at equilibrium. A third term, intrinsic solubility, refers to the equilibrium solubility of the free acid or base form of an ionizable compound at a pH where it is fully un-ionized (2). Aqueous equilibrium solubility is the partitioning of a compound between its pure phase and water. At equilibrium, there is a dynamic, balanced process of dissolution of the solid into solution and recrystallization of the drug from solution. The molar aqueous solubility (S_W) can be empirically correlated to activity and crystal lattice energy via the general solubility equation (GSE) proposed by Yalkowsky (4,5):

$$\log S_W = -0.01(MP-25) - \log K_{OW} + 0.5$$

MP = melting point

K_{OW} = octanol-water partition coefficient

There are multiple computational tools for prediction of aqueous solubility including ACD Labs, COSMO-RS, QikPro, and others (6)

As a physicochemical property, solubility is influenced by: temperature; pressure; purity of materials; composition of buffer solutions and properties of the compound, such as polymorphism; aggregation; and the formation of supersaturated solutions. The effect of pH on the solubility of ionizable compounds is a well-known and an extensively examined phenomenon (2,7). For poorly soluble compounds, determining the solubility in the presence of various solubilizing agents presents a special set of challenges (7).

When solubility is measured, the value obtained is also influenced by several experimental factors, including: stirring time, sedimentation time, composition of the aqueous buffer, temperature, amount of solid excess, and the technique used for phase-separation (2).

EXPERIMENTAL METHODS

Saturation Shake-Flask Method

The shake-flask method is based on the phase solubility technique that was developed 40 years ago and is still considered by most to be the most reliable and widely used method for solubility measurement today (2,3,8-10).

The sample is typically prepared by adding an excess of solid to the solubility medium, which is in a stoppered flask or vial. The amount of medium in the flask or vial does not need to be measured accurately. Although it is important to ensure that the amount of added material is sufficient to produce a suspension, it is also important to avoid adding an amount of material that will significantly alter the properties of the solubility medium, including its pH (7,8). The pH of the suspension should be verified after the addition of the compound and at the end of the experiment (3). It is generally agreed that saturation or equilibrium has been reached when multiple samples, assayed after different equilibration time periods, yield the same result for apparent solubility.

The time to reach equilibrium can vary as a function of the type of agitation used, the active ingredient properties, the amount of material used, and the equilibration method used. With an agitation rate that is adequate to prevent particle agglomeration and to ensure particle contact with the diluent, samples generally reach equilibrium quickly (often within 24 h). However, for poorly soluble compounds, the equilibrium time may be prolonged, well beyond 24 h, because of a poor dissolution rate that is further depressed as the equilibrium process advances and the concentration in solution gets closer to the limit of drug solubility. One way to expedite the process is to increase the effective surface area for dissolution. This can be achieved by either vortexing or sonicating the samples prior to equilibrium evaluation.

Other challenges in determining the solubility of poorly soluble compounds are their poor wettability and their tendency to float. Potential remedies include the use of small glass microspheres to de-aggregate the particles with agitation or sonication, or adding a quantity of surfactant that is below the critical micelle concentration to serve as a wetting agent. If the addition of surfactant causes too much foaming, a small amount (just 1 or 2 drops) of an appropriate defoaming agent, such as *n*-octanol, can be added.

Filtration and centrifugation are both commonly used to separate the saturated solution from the solute phase. However, filter sorption can be a significant source of error. Generally, filter sorption is most critical for hydrophobic and poorly soluble compounds, and as expected filter

sorption is directly proportional to filter surface area (7).

High performance liquid chromatography (HPLC) is the most commonly used analytical tool for the analysis of saturated solutions. The advantage of HPLC over the spectrophotometric method is that HPLC can detect impurities and any instability (7,8).

pH–Solubility Profile

For drugs with ionizable functional groups, determining solubility as a function of pH is very important. Typically, there are two ways to control pH. One approach is to use buffers. Because multiple buffer systems are needed to control the entire pH range, the solubility results may be complicated by salt formation with the buffer species. This can be detected by examining the residual solid from solubility determinations.

Another way to control pH is through the use of a pH-stat, where pH is controlled by titrating with acidic and/or basic solutions. Ionic equilibrium can be monitored continuously by measuring the solution pH. Equilibrium has been reached, it is generally assumed, when the pH no longer changes over a period of time.

Solubility of Salts

Use of the equilibrium method for determining the solubility of pharmaceutical salts may be challenging for certain compounds, such as those with poor intrinsic solubility. Theoretically, after an excess amount of solid salt is equilibrated in water, the solution concentration at equilibrium should represent the solubility of the salt. However, this is only true if the pH of the saturated solution is below pH of maximum solubility (11). For compounds with low intrinsic solubility and weak basicity or acidity, their salts may convert to the un-ionized form in the solubility medium. In such cases, the measured solubility is only the solubility of the un-ionized form at those particular pH values.

When determining the solubility of salts in simulated gastric fluid, or in pH 1 or pH 2 hydrochloric acid solutions, the salt may convert to the hydrochloride salt, depending on the relative solubility of the salts. If the simulated gastric fluid contains sodium chloride, the common ion effect of the chloride ion may significantly depress the solubility of the hydrochloride salt (7).

Potentiometric Titration

The potentiometric acid–base titration for the solubility measurements is based on a characteristic shift in the middle of the titration curve that is caused by precipitation. For the titration, accurate volumes of a standardized acid or base are added to a solution containing an ionizable substance and 0.15 M potassium chloride (KCl), which is included to increase the accuracy of the measurements. Sparging (a technique that involves bubbling a chemically inert gas, such as nitrogen, argon, or helium, through a liquid) with argon prevents CO₂ from the atmosphere from influencing the pH value. A glass electrode is used to monitor the pH value continuously. The potentiometric titration curve is obtained by plotting the pH value against the consumed volume of acid/base (8).

Turbidimetry

Turbidimetry involves the dissolution of a compound in an organic solvent, typically dimethyl sulfoxide (DMSO). The resulting solution is added to a pH 7 buffered solution in 1-min intervals. Further aliquots of the solution are added after the first detection of turbidity by light

scattering. Subsequently, the volume added can be plotted against the turbidity. The solubility is then estimated by back-extrapolation to the point where precipitation began. This method can be used to measure as many as 50–300 samples/day. The drawbacks include the use of DMSO, which can increase the solubility to an unknown and unpredictable extent, and the short duration of the experiment, which leads to a kinetic rather than thermodynamic estimate of the solubility. Because DMSO dilutions readily form a supersaturated solution, the kinetic measurement can easily overestimate the equilibrium (thermodynamic) solubility (8).

Miniaturization, High-Throughput, and Automation in Solubility Measurement

Solubility is not only important in pre-formulation studies. It is also important in lead selection and optimization during drug development. Thus, it is desirable to have methods that can determine equilibrium solubility with as little compound as possible and with the necessary high-throughput characteristics that will enable the method to be used in support of lead optimization (7).

To this end, Glomme et al. (8) developed a miniaturized version of the shake-flask method. The procedure is almost identical to the traditional shake-flask method but Glomme's small scaled version allows for the use of very small solvent volumes (e.g., 0.5–2 mL, depending upon the equipment used).

There are also several computer programs that will support the numerical estimation of compound solubility based upon the chemical structure of the compound. Although some error in the estimations may exist, the accuracy of the calculated values is generally adequate to support further synthesis plans (8).

Systems that automate all the steps to measure equilibrium solubility have also been developed and are commercially available (7).

TEST CONDITIONS

The test conditions (media composition, temperature, and others) will be defined by animal species. Initially, the *USP* general chapter will address the conditions used for dogs and cattle, and later it will be expanded by adding other animal species through future revisions of the chapter.

Dogs

Media composition: Buffer solutions prepared according to USP–NF instructions in the section *Reagents, Indicators and Solutions; Buffer Solutions*.

pH: 1.2, 4.6, and 6.8

Temperature: 39°

Time: Time to equilibrium (or saturation) or at least 24 h

Cattle

Media composition and pH: Hydrochloric acid, pH 2.5; acetate buffer, pH 3.5; phosphate

buffer containing 40 mM acetic acid, 35 mM propionic acid, and 15 mM butyric acid, pH 5.0; phosphate buffer with no surfactant, pH 6.8; phosphate buffer containing 70 mM acetic acid, 15 mM propionic acid, and 10 mM butyric acid, pH 6.8

Temperature: 39^o

Time: Time to equilibrium (or saturation) or at least 24 h

The following conditions are suggested when preparing the bovine solubility medium (12):

A. Preparation of short chain fatty acid (SCFA) stock solution (see *Table 1*).

Table 1

SCFA	mL/L	Density (g/mL)	MW ^a (g/mole)	Concentration (mM)
Acetic acid (Ac)	6	1.0491	60.05	104.8
Propionic acid (Pr)	4	0.9920	74.08	53.6
Butyric acid (Bu)	2	0.9640	88.10	21.9

^a MW, molecular weight.

B. Dilution of stock solution used to obtain SCFA concentration for specific pH (see *Table 2*)

Table 2

	DF ^a	Concentration SCFA (mM)
pH 6.8	—	—
Ac ^b	1.5	70
Pr	3.6	15
Bu	2.19	10
pH 5.0	—	—
Ac	2.62	40
Pr	1.53	35
Bu	1.46	15

^a DF: Dilution factor of the stock solution used to obtain the desired SCFA concentration.

^b Ac, Acetic acid; Pr, Propionic acid; Bu, Butyric acid.

Performance Test for Parenteral Dosage Forms

Vinod P Shah, James DeMuth, Desmond G Hunt^a

ABSTRACT

Procedures and acceptance criteria for testing parenteral drug products are divided into two categories: 1) those that assess product quality attributes, e.g., identification, sterility, and particulate matter, and are contained in general chapter *Injections and Implanted Drug Products* (1); and 2) those that assess product performance, e.g., in vitro release of the drug substance from the drug product. A product performance test, i.e., drug release test, should be carried out using appropriate test parameters and procedures. This *Stimuli* article addresses performance tests for parenteral drug products and the various methodologies.

INTRODUCTION

Parenteral drug products include solutions, suspensions, emulsions, sterile powders for solutions or suspensions (including liposomes), implants (including microparticles), and products that consist of both a drug and a device, such as drug-eluting stents. Two categories of tests, product quality and product performance, are performed on such drug products. These tests provide assurances of batch-to-batch quality, reproducibility, reliability, and performance. Product quality tests are performed to assess attributes, such as assay, identification, and content uniformity, and are part of the compendial requirements (see general chapter *Injections and Implanted Drug Products* (1)). Product performance tests are conducted to assess drug release from the dosage form.

Parenteral drug products such as solutions, suspensions, and emulsions are relatively simple in comparison to microsphere and liposome preparations. For the less complex products, a simple drug-release test performed with Apparatus 2 (paddle method) can be used. However, the use of Apparatus 4 (the flow-through cell) may be a preferred method for coarse suspensions or emulsions. Dialysis sac and reversed dialysis sac methods can also be used for emulsions. Parenteral products, such as microspheres and liposomes, are complex in nature, which complicates the development and validation of assays for in vitro drug release. Methodologies can be developed, validated, and standardized, but because of the complexity of the various types of parenteral drug products, a single method for determining drug release is not currently feasible, although a significant amount of research is being conducted in this regard. An American Association of Pharmaceutical Scientists workshop report recommended the use of Apparatus 4 for evaluating the release profile of novel systems, such as nanoparticles and liposomes (1).

In the development of dissolution/drug-release tests or the selection of the drug-release medium, apparatus, procedure, or analytical method, consult general information chapter *The Dissolution Procedure: Development and Validation* (1092). In developing the performance test specifications, one should consider the mechanism of drug release as well as the drug's mechanism of action (2). In vitro release (IVR) is a key performance attribute used to evaluate and demonstrate product performance; IVR is used for process and product control. Long-

acting drug products are typically designed to release the drug over an extended period of time. Accelerated methods are necessary to assist in the evaluation of these drug products, without affecting the drug-release mechanism (3,4).

PERFORMANCE TEST METHODS FOR PARENTERAL DOSAGE FORMS

For most parenteral drug products, the performance test includes drug release from the formulation. The performance test may include the dialysis sac, reverse dialysis sac, manual shaker bath (sample and separate), paddle method (Apparatus 2), flow-through system (Apparatus 4), or other methods for testing in vitro release. Standardized methods such as Apparatus 2 and 4 are preferred to allow data comparison between laboratories.

In Vitro Drug-Release Testing Using the Dialysis Sac Method

The dialysis sac method involves placing the formulation (e.g., liposomes) into a dialysis sac or tube. This dialysis sac is then placed in a large volume of release medium (receiver chamber). The receiver chamber is stirred to ensure mixing of the released drug. However, the inside of the dialysis sac is not stirred, and this can result in aggregation problems as well as data that cannot be reproduced. The drug released from the formulation diffuses through the dialysis sac membrane, and the drug concentration is determined by taking samples from the release medium at appropriate time intervals. The temperature of the entire chamber is maintained at $37 \pm 2^{\circ}$ using a water bath (5).

SELECTION OF MEMBRANE

Cellulose ester, regenerated cellulose, and polyvinylidene difluoride are the most commonly used membranes for the dialysis sac. The membrane should have appropriate molecular weight so that drug diffusion through the membrane is not a rate-limiting step.

CONDITIONING OF MEMBRANE

The dialysis membrane should be conditioned through soaking in the release medium for an appropriate length of time. This helps remove any extractable substance from the membrane that could potentially interfere with the analysis.

SAMPLE INTRODUCTION

The formulation can be introduced to the dialysis sac using a syringe or fine-tip pipet. The formulation can be placed in the dialysis sac directly or can be mixed with a small volume of release medium.

AGITATION

Agitation can be achieved using a shaker water bath or a magnetic stirrer. Appropriate control of hydrodynamics is important for reproducible results.

TEMPERATURE

The temperature of the entire chamber is usually maintained at 37° . The temperature should be calibrated using a certified thermometer and held at $37 \pm 0.5^{\circ}$ throughout the test.

VOLUME FOR DRUG-RELEASE TESTING

When selecting the volume of the medium outside of the dialysis sac, the analyst should take into account the solubility of the active pharmaceutical ingredient (API) and sink conditions. Replenishing the medium at various stages of the test may be necessary to achieve sink conditions. When drug release is rapid, it may be impossible to maintain sink conditions within the dialysis sac, and as a result, the dialysis sac becomes a rate-limiting membrane (6,7).

SAMPLING PARAMETERS

Sampling time points should be chosen to adequately describe any initial burst release and provide an adequate number of data points to create a drug release profile. Sampling should occur within ± 2 min for time points up to 12 h; within ± 5 min for time points between 12 and 24 h; and within ± 30 min for later time points. It is important that the medium is mixed adequately during sampling so that a representative sample is obtained. The medium may be replenished after sampling.

MEDIUM FOR DRUG-RELEASE TESTING

The medium should be chosen with consideration of the physical and chemical characteristics of the drug substance and dosage unit. See chapter (1092) for further guidance. The medium should be degassed using an appropriate technique unless the use of surfactants is necessary. A specified volume of medium should be transferred accurately to the receiver chamber. Media should be stirred throughout the test.

ANALYSIS AND CALCULATIONS

The assay for a dissolution sample is HPLC, although other methods, such as spectrophotometry, may be used if feasible. On-line fiber optic UV probes are useful for fast-releasing formulations because complete characterization of the release profile is possible (more data points can be collected in short time intervals).

A cumulative release profile can be obtained by analyzing samples at appropriate time points; the concentration ($\mu\text{g/mL}$ or mg/mL) of the analyte is determined at each time point using appropriate analytical methods. The concentration is then multiplied by the total volume of the dissolution medium, thereby determining the total amount released during different time intervals. This allows determination of the cumulative amount released. Calculations should account for all dissolution medium adjustment and replenishments.

In Vitro Drug Release Using the Reverse Dialysis Sac Method

The reverse dialysis sac method involves placing the formulation directly into an appropriate volume of release medium in a suitable chamber. Two or more dialysis sacs are placed in the release medium. At appropriate time intervals, one dialysis sac is removed, and the drug concentration is analyzed to calculate the percentage of release. This approach helps to maintain sink conditions because the formulation is diluted in the large volume of release medium outside the dialysis sacs (5,6,8). In addition, there are no problems of aggregation of the delivery system due to lack of direct stirring within the dialysis sacs [as can occur in standard (i.e., not reverse) dialysis methods].

In Vitro Drug Release Using Apparatus 2

The use of Apparatus 2 may be an effective way to perform in vitro drug-release testing for some parenteral formulations. Depending on the hydrophobic/hydrophilic nature of the drug product and its molecular weight, floating and/or aggregation of the formulation may occur. When aggregation occurs, it is justified to use another apparatus to perform the in vitro release testing. Modifications to the medium during a run are more challenging with Apparatus 2 than with Apparatus 4, and for this reason Apparatus 2 may not be a viable method. Typically, standard 1-L dissolution vessels are used with standard medium volumes (500–1000 mL). The temperature of each vessel is maintained at $37 \pm 2^{\circ}$. A set of six vessels is used for each test.

SAMPLE INTRODUCTION

The dosage form is introduced into the medium using typical sample handling tools such as pipets, spatulas, or weighing boats. Other means of introduction should be well specified, repeatable, and reproducible.

AGITATION

Rotation speeds of 50–100 rpm should be used, although the use of other rotation speeds may be warranted.

SINK CONDITIONS

Replenishing medium at various stages of the test may be required to achieve sink conditions. Changing the medium volume at various stages may also be necessary. The exact manner for doing these should be specified.

SAMPLING PARAMETERS

Sampling time points should be chosen to adequately describe any initial burst release and provide an adequate number of data points for the drug-release profile. Sampling should occur within ± 2 min for time points up to 12 h; it should occur within ± 5 min for time points between 12 and 24 h; and it should occur within ± 30 min for later time points. An accurately determined volume is withdrawn from each vessel, preferably with the paddles still rotating. The medium may be replenished after sampling.

DISSOLUTION MEDIUM

The medium is chosen by considering the physical and chemical data for the drug substance and dosage unit. See chapter [1092](#) for further guidance. The effect of deaeration should be determined. If deaeration affects the dissolution rate, the medium should be degassed using an appropriate technique. Evaporative loss of medium should be minimized. Replenishment of evaporated medium may be necessary for tests of long duration.

ANALYSIS AND CALCULATIONS

The usual assay for a dissolution sample is HPLC, although other methods, such as spectrophotometry, may be used if feasible. When performing calculations, the analyst should take into consideration all of the dissolution medium adjustments and replenishments.

In Vitro Drug Release Using Apparatus 4

The use of the flow-through cell, Apparatus 4, may be an effective procedure for performing in vitro drug-release testing of some parenteral formulations that are not clear solutions. Typically, the standard tablet cells, 12.0 and 22.6 mm, are used without the tablet clip present, and the unit is operated in the closed-system configuration. The use of other cell designs is allowable. Dissolution medium composition should be selected on the basis of the physical and chemical properties of the drug substance or its API. The flow rate through the cell can also depend on the application. The temperature of the cells is usually maintained at $37 \pm 2^{\circ}$. A set of six cells is used for each test.

SAMPLE PREPARATION IN THE CELLS

The standard cell is initially fitted with a 5-mm bead to stop back-flow. One approach can be to add glass beads (typically 1-mm borosilicate glass) to fill the cell up to the intersection of the conical part and the cylindrical part of the cell. Then, an accurately weighed portion of pharmaceutical product to be investigated (e.g., suspension) is added to the cell. Depending on the product and the possibility of aggregation, it may be necessary to disperse the dosage form, typically with more glass beads. The use of additional glass beads to disperse the product also helps to prevent channeling of the fluid through areas of the product (as can occur in a suspension bed), because this can result in non-wetting of portions of the product and a subsequent lack of reproducibility of the data. For nanoparticulate systems, the use of a dialysis sac adapter may be considered. This allows dispersion of the nanoparticulates within the dialysis sac, together with a volume of media as in the "normal" dialysis method discussed above. The media flows around the dialysis sac, which is a preferred dialysis method for nanoparticulates, because it uses a standardized apparatus. Nanoparticulates cannot be suspended directly in the USP Apparatus 4 flow-through cell, because they would either pass through or block the filter material, resulting in sample loss from the flow-through cells and/or system back-pressure and hence failure (7).

FILTER MATERIAL

The filter head for the flow-through cell should be fitted with an appropriate filter material. The filter material should be durable enough so as to not physically degrade over the duration of the test. Typical filter materials, such as glass fiber filters, polyvinylidene fluoride, polytetrafluoroethylene, and regenerated cellulose can be considered. Filter studies for drug adsorption should be performed before testing. If the filter pore size is too small, unacceptable back-pressure can result in the system.

FLOW RATE

The flow rate may influence the drug-release results (for diffusion controlled systems). For this reason, the effect of flow rate on drug release should be examined. Typical flow rates include 4, 8, and 16 mL/min, although other flow rates may be used.

VOLUME FOR DRUG-RELEASE TESTING

The volume of medium used in a closed-loop configuration can vary from as low as 20 mL to several liters. When operating the system in a closed-loop setting, the volume of the medium

should be selected with consideration of the solubility of the API and sink conditions. The volume of medium can be adjusted during the same test to achieve a proper concentration. Replacement of medium at various stages of the test may be required to achieve sink conditions. Media replacement may also be conducted as part of the test; an example is changing the media to mimic environmental changes that can occur in vivo (e.g., cellular uptake of liposomes or other nanoparticles) (8).

SAMPLING PARAMETERS

Sampling time points should be chosen to adequately describe any initial burst release and provide an adequate number of data points for creating the drug-release profile. Sampling should occur within ± 2 min for time points up to 12 h; within ± 5 min for time points between 12 and 24 h; and within ± 30 min for later time points. An accurately determined volume is withdrawn from each media bottle, preferably with the pump still running. It is important that the medium is mixed adequately during sampling so that a representative sample can be obtained. The medium may be replenished after sampling.

MEDIUM FOR DRUG-RELEASE TESTING

When choosing the medium, the analyst should consider the physical and chemical characteristics of the drug substance and dosage unit. See chapter [1092](#) for further guidance. The medium should be degassed using an appropriate technique, unless the use of surfactants is necessary. A specified volume of medium should be accurately transferred to each of the six bottles. Media should be stirred throughout the test. Typically, the medium is not heated before or during the test.

ANALYSIS AND CALCULATIONS

The assay for a dissolution sample is HPLC, although other methods (such as spectrophotometry) may be used if appropriate. Fiber optic UV probes can be used with USP Apparatus 4. On-line fiber optic UV probes enable complete characterization of the initial burst release phase, because more data points can be collected in short time intervals. The release profile can be monitored using fiber optic UV analysis without any interference from the formulation (e.g., microspheres), because the formulation is isolated from the media in USP Apparatus 4.

Typically, release testing of microsphere formulations is performed in a closed-system configuration with USP Apparatus 4. An open system is not practical when long-term testing is required, as with some microsphere products. A cumulative release profile can be obtained in a closed-system configuration by analyzing samples at appropriate time intervals. The change in concentration ($\mu\text{g/mL}$ or mg/mL) determined for each time interval (using an appropriate analytical method), multiplied by the total volume of the dissolution medium, gives the total amount released at different time intervals. The cumulative amount released can be determined in this manner. Calculations should take into account all dissolution medium adjustments and replenishments.

PERFORMANCE TEST FOR SPECIFIC TYPES OF DOSAGE FORMS

A. Emulsions and Suspensions

For emulsions or suspensions, use either the paddle method (Apparatus 2) or the flow-thru

method (Apparatus 4). See chapter < 1092 > for further guidance.

B. Microspheres

The in vitro drug-release test should characterize the mechanism of release and should differentiate between the different release phases of the product.

Sample, separate, and dialysis sac methods have been used conventionally for performance testing of microspheres. However, these methods have the disadvantages of microsphere loss during sampling and aggregation because of improper agitation.

The flow-through cell (USP Apparatus 4) may be used for release testing of microsphere formulations. The microspheres dispersed with the glass beads are packed in the flow-through cells. This modification of the flow-through cell is useful in minimizing aggregation of microspheres and separating them from the release media (9,10).

The standard tablet cells, 12.0 and 22.6 mm, may be used without the tablet clip, and the unit is operated in the closed-system configuration or the open configuration. Appropriate flow rates can be selected, depending on the formulation and application. The temperature of the cells is usually maintained at $37 \pm 2^\circ\text{C}$. For accelerated testing, higher temperatures can be used. A set of six cells is used for each test.

C. Nanoparticles/Nanocrystals

Dissolution of nanoparticle suspensions can be measured by using sampling-separation technique or by monitoring changes in the light-scattering device (11).

D. Liposomes

Membrane dialysis methods, such as dialysis sac and reverse dialysis sac, are conventionally used for performance testing of liposomes. These methods are needed for separating liposomes from the release media. However, these methods are not based on compendial dissolution/release apparatuses. The procedure and apparatus used for dialysis sac and reverse dialysis sac methods vary among laboratories, and results from different laboratories may not be comparable. Therefore, a dialysis method based on a compendial dissolution/release apparatus may be more appropriate for performance testing of liposomes.

USP Apparatus 4, using a flow-through cell fitted with a dialysis adapter, may be used for performance testing of liposome formulations. An adapter has been designed for the 22.6-mm diameter flow-through cell. A dialysis membrane is placed over the adapter, and this assembly is then placed over the conical part of the flow-through cell. The method has been shown to be superior to dialysis and reverse dialysis sac methods for liposomes containing the hydrophobic drug dexamethasone in terms of reproducibility and discriminatory ability (7).

The flow-through cell (USP Apparatus 4), fitted with a dialysis adapter, may be used for performance testing of liposome formulations. However, if placed directly in the flow-through cell, the liposomes (nanometer size range) may either block the filter or pass through it. The dialysis adapter may be used with 12- or 22.6-mm diameter flow-through cells. Flow-through cell size may be selected based upon the drug concentration in the formulation and the volume of formulation to be used for release testing. Higher volumes can be used with the 22.6-mm diameter flow-through cell.

The dialysis adapter framework consists of a circular top and bottom supported by three wires of a suitable material (such as peek, metal, or others). The circular top has an opening for

sample introduction, and this opening can be closed with a leak-proof screw. A dialysis membrane/bag is placed over this adapter frame and sealed with "O" rings. This assembly is then placed over the conical part of the flow-through cell. This method offers several advantages: 1) uniform and adequate agitation outside the dialysis bag; 2) uniform temperature in the sample cell per USP requirements; and 3) low variation among the replicates (7). The standard tablet cells, 12.0 and 22.6 mm, may be used without the tablet clip present, and the unit may be operated in the open- or closed-system configuration. Appropriate flow rates can be selected, depending on the formulation and application. The temperature of the cells is usually maintained at $37 \pm 2^\circ$. A set of six cells may be used for each test.

E. Implants

The flow-through cell (USP Apparatus 4) may be used for release testing of implant formulations (12). The implants may be held in the flow-through cell with a special holder. The standard tablet cells, 12.0 and 22.6 mm, may be used without the tablet clip when the unit is operated in the closed-system configuration or in the open configuration. Appropriate flow rates can be selected, depending on the formulation and application. The temperature of the cells is usually maintained at $37 \pm 2^\circ$. For accelerated testing, higher temperatures can be used. A set of six cells is used for each test.

F. Drug-Eluting Stents

USP Apparatus 4 and 7 with stent holders may be used for performance testing of drug-eluting stents. Small volumes of release media can be used with both of these systems (about 15 and 4 mL for USP Apparatus 4 and 7, respectively).

Small-volume dissolution apparatuses, with volumes of 1–4 mL, have been used to measure drug release from medical devices, such as drug-eluting stents. The instrument features a magnetically driven reciprocation mechanism and heater jackets to determine the rate of drug release from stents.

G. In Situ Forming Gels

In situ forming gels are very challenging because of problems associated with gelling in vitro; a suitable depot must be formed without emulsification or sample dispersion occurring. USP Apparatus 2 and 4 have been used. Most in vitro release tests have been performed using variants of the sample-and-separate methodology. In addition, the dialysis method has also been used to evaluate in situ depot-forming formulations. When performing an in vitro release test, the pregelled formulation is usually held in a special retainer to achieve a defined geometry or area of formulation–buffer interface. Alternatively, the already formed formulation can be placed into the release medium using a syringe (13).

Please address comments on *Pharmacopeial Forum* content to
USP Executive Secretariat
12601 Twinbrook Parkway
Rockville, MD 20852

execsec@usp.org

ISSN: 1542-1945

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI)*, in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences*.

The United States Pharmacopeial Convention comprises representatives from colleges and national and state organizations of medicine and pharmacy. It publishes the *U.S. Pharmacopeia* and *National Formulary*, the legally recognized compendia of standards for drugs and products of other health care technologies. The *USP* and *NF* include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling. **Pharmacopeial Forum's Public Review and Comment Process**

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum (PF)*, for the development of official standards in the *United States Pharmacopeia* and the *National Formulary (USP-NF)*.

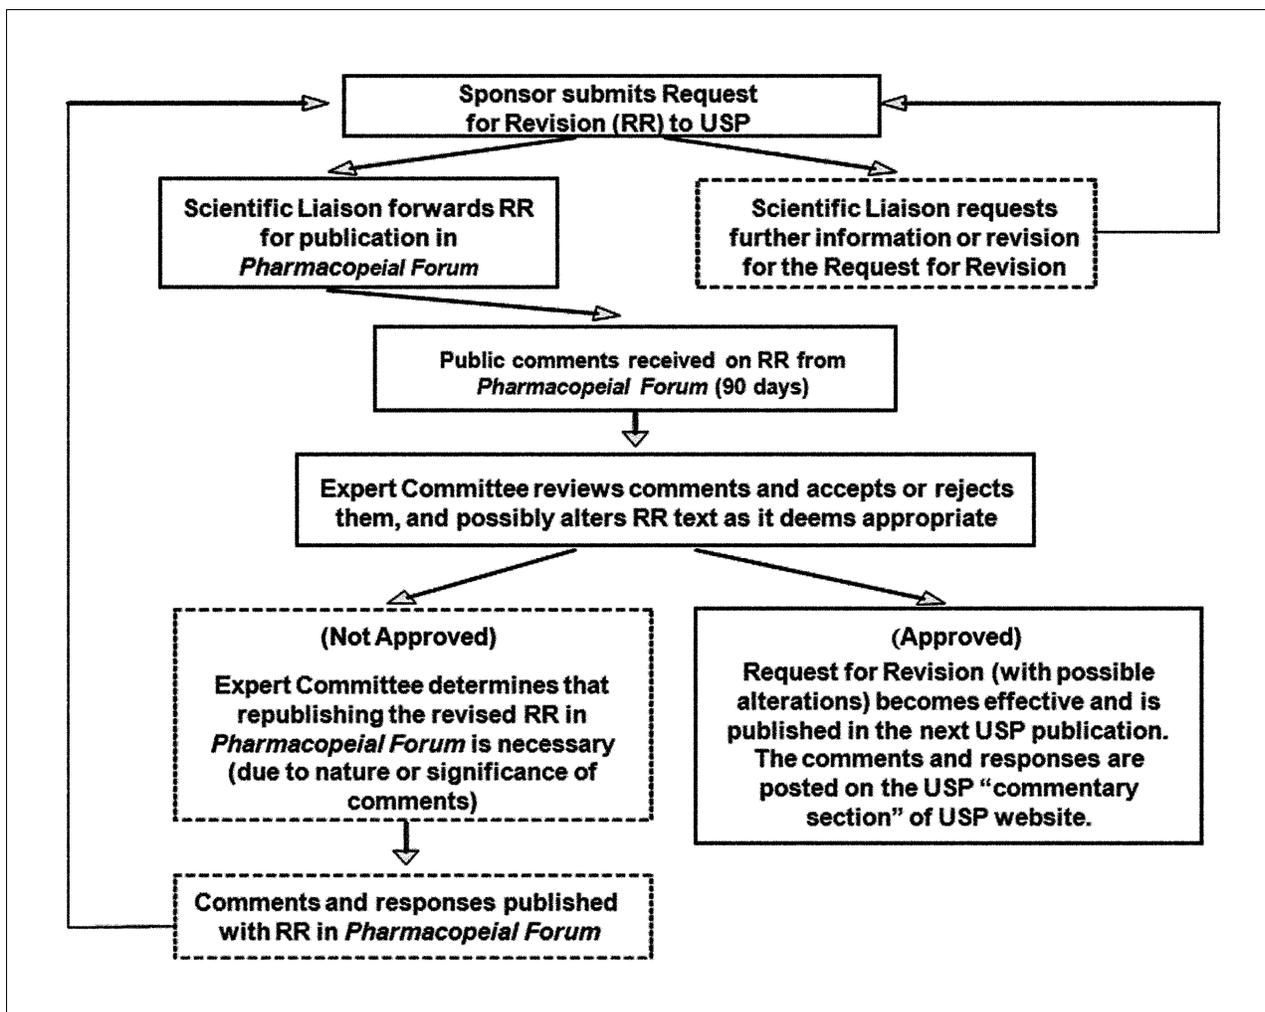

USP publishes *PF* on a bimonthly basis to provide an opportunity to review and comment on new or revised standards.

There are two types of proposed revisions in *PF*:

1. **Proposed Revisions**—New or revised standards targeted for adoption through USP's Standard Revision Process. USP's Revision Process calls for publication of a proposed revision in *PF* for a 90-day notice and comment period. After the comment period and subsequent review of comments and approval by the relevant USP Expert Committee, the official standard is published in the next available *USP-NF* or *Supplement*. If comments received are significant, or if the Expert Committee's consideration of comments results in significant additional changes, the Expert Committee may determine that republishing in *PF* is necessary prior to the revision becoming official. See the *In-Process Revision* section for current proposed revisions.
2. **Proposed Interim Revision Announcements**—New or revised standards that become official through an accelerated process in accordance with USP's Guideline on Accelerated Revisions (available on the USP Web site). *Interim Revision Announcements (IRAs)* allow for a revision to become official prior to the next *USP-NF* or *Supplement*. *IRAs* are first presented for a 90-day public comment period in the *Proposed Interim Revision Announcement* section of the *PF*. Note that final *IRAs*, as well as *Errata*, and *Revision Bulletins*, which also are defined in the Accelerated Revision Guideline, appear only on the USP Web site.

USP welcomes comments and data on proposed revisions. A summary of comments received, along with USP's responses, will be published in the *Revisions and Commentary* section of the USP website (<http://www.usp.org/USPNF/revisions/>).

The chart below shows the public review and comment process and its relationship to standards development.

Questions on the process should be addressed to the USP Executive Secretariat, United States Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE PF

The various sections of *PF* are briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a *Request for Revision* is available in the *Guideline for Submitting Requests for Revision to the USP–NF* on the USP Web site (www.usp.org/USPNF/submitMonograph/subGuide.html). Note that the Expert Committee listing and the Scientific Staff Directory also are located on the USP Web site (see below for links).

Proposed and Adopted Revisions to the USP–NF

Proposed Interim Revision Announcements

This section includes proposals for *Interim Revision Announcements (IRAs)* that will be published as official *USP* or *NF* standards. There is a 90-day comment period for these proposals (see <http://www.usp.org/USPNF/pf/pfRedesign.html> for the *PF* comment schedule). Readers should review material in this section and provide comments to the Scientific Liaison using the contact information appearing at the end of each proposed *IRA*. Information on how to comment can be found under the "Participation" section of www.usp.org. It is important to send comments promptly so that the Expert Committee members can consider reader's input as they are deciding whether to advance standards to official status. The approved official text will be published under *IRAs* in the "New Official Text" section of USP's Web site.

Each proposal is preceded by a Briefing that indicates the proposed revisions.

Symbols—New text is enclosed in symbols and set off from the current official text as shown in the following example:

◆new text◆

Where the symbols appear together with no enclosed text, such as

◆◆

, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the date the proposal, if approved, will become official as an *IRA*. For example, ◆(IRA 1-Apr-2011)

BRIEFING

Methocarbamol, *USP 38* page 4313 and the *Revision Bulletin* posted on the USP website with an official date of May 1, 2015. The monograph does not have individual limits for the specified impurities although they are listed with specific relative retention times. It is interpreted that these specified impurities are controlled at any individual unspecified impurity limit. This interpretation results in the total impurities in the drug substance being more than the total degradation products limit in the *Methocarbamol Tablets* monograph. Per International Conference on Harmonization guidelines the impurities in the drug substance should be either equal to or less than the limits in the dosage form but never more than the dosage form. USP has received a request from a manufacturer to revise the monograph with their approved limits. To address these inconsistencies, it is proposed to revise the monograph as follows:

1. Specify the acceptance criteria for the limit of guaifenesin to NMT 0.15%.
2. Specify the acceptance criteria for the limit of methocarbamol isomer and methocarbamol dioxolone to NMT 0.05%.
3. Revise the acceptance criteria for the total impurities from NMT 2.0% to NMT 1.0%.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

The comment period for this revision ends September 30, 2015. In the absence of significant adverse comments, it is proposed to implement this revision via an *Interim Revision Announcement* to the *Second Supplement to USP 39–NF 34*, with an official date of January 1, 2016.

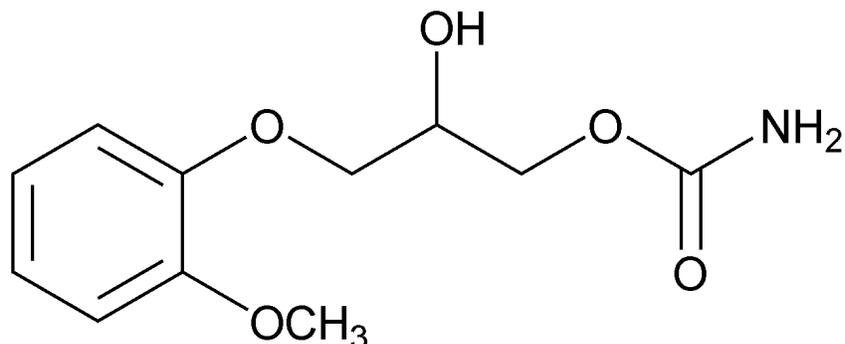

Interested parties are encouraged to submit comments to Ravi Ravichandran, Ph.D., Principal Scientific Liaison to the Monograph Development committee (301-816-8330 or rr@usp.org).

Protamine Sulfate Injection**DEFINITION****Change to read:**

Protamine Sulfate Injection is a sterile, isotonic solution of Protamine Sulfate.

▲Protamine Sulfate used in the manufacture of Protamine Sulfate Injection complies with the compendial requirements stated in the *Protamine Sulfate* monograph. ▲*USP38*

Each mg of Protamine Sulfate, used in the manufacture of the Injection, neutralizes NLT 100 USP Heparin Units, calculated on the dried basis. It contains NLT 90.0% and NMT 120.0% of the labeled amount of protamine sulfate.

IDENTIFICATION**Add the following:**

- ▲● **A.** The retention times of the four major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*. ▲*USP38*

Change to read:

- ▲● **B.** ▲*USP38*

Identification Tests—General 〈 191 〉, *Sulfate*: Meets the requirements

ASSAY

Change to read:

- **Procedure**

▲ **Solution A:** 0.3 M sodium phosphate, pH 1.8. Pass the solution through a membrane filter of 0.45- μ m pore size, and degas before use.

Solution B: *Solution A* and acetonitrile (93.5: 6.5)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	85	15
15	55	45
25	55	45
30	85	15

[Note—Initial gradient composition may be adjusted as appropriate to obtain sufficient resolution. The end of the gradient can be increased to re-equilibrate the column for the next injection.]

Standard solution: 0.5 mg/mL of USP Protamine Sulfate RS in 0.01 M hydrochloric acid

Sample solution: 0.5 mg/mL of protamine sulfate in 0.01 M hydrochloric acid

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 214 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Column temperature: 55 $^{\circ}$

Flow rate: 1 mL/min

Injection volume: 100 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Retention time: The chromatogram of the *Standard solution* must show four major peaks (in increasing elution order: protamine peptides 1, 2, 3, and 4), with protamine peptide 4 eluting no later than 15 min. [Note—See the standard chromatogram provided with USP Protamine Sulfate RS.]

Resolution: The resolution between protamine peptides 1 and 2, calculated by the tangent method, is NLT 2.0.

Relative standard deviation: NMT 2.0% for the total integrated areas of the six

chromatograms of the *Standard solution*, using vertical drop-down integration

Analysis

Samples: *Standard solution* and *Sample solution*

Separately inject equal volumes (about 100 µL) of the *Standard solution* (at least six injections) and the *Sample solution* into the chromatograph. Record the chromatograms for approximately 30 min, and measure the responses for all the peaks observed using a full scale comparable to the height of the largest peak and using vertical drop-down integration.

Calculate the percentage of the labeled amount of protamine sulfate in the portion of Injection taken:

$$\text{Result} = \Sigma[(r_U/r_S) \times (C_S/C_U)] \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Protamine Sulfate RS in the *Standard solution* (mg/mL)

C_U nominal concentration of protamine sulfate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–120.0%▲*USP38*

SPECIFIC TESTS

- **Bacterial Endotoxins Test** 〈 85 〉: It contains NMT 7.0 USP Endotoxin Units/mg of protamine sulfate.

Add the following:

- **pH** 〈 791 〉: 6.0–7.0 •(IRA 1-Jan-2016)

Add the following:

- ▲● **Particulate Matter in Injections** 〈 788 〉: Meets the requirements for small-volume injections ▲*USP38*

- **Other Requirements:** It meets the requirements in *Injections* 〈 1 〉.

ADDITIONAL REQUIREMENTS

In-Process Revision

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) proposed revisions placed directly under *In-Process Revision*, or (2) modifications of revisions previously proposed under *In-Process Revision*. Readers should review material in this section and provide comments to the Scientific Liaison using the contact information appearing at the end of each proposal. Information on how to comment can be found under the "Participation" section of www.usp.org. It is important to send comments promptly, using the comment deadline listed after each title.

Briefings Each Proposal is preceded by a Briefing in the following format:

Briefing
<p>Name of Item, citations of the most recent <i>USP</i> publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Expert Committee acronym (the name of the Scientific Liaison who handled the particular monograph or general chapter, and the <i>USP</i> tracking correspondence number, as shown in the example below:</p>
<p>(Expert Committee Acronym: Liaison Name.)</p>
<p>Correspondence Number—CXXXXX</p>

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed out. All *USP-NF* revisions use the following symbols that indicate the final destination of the official text:

◆ new text ◆

if slated for an *IRA*;

▲ new text ▲

if slated for *USP-NF*;

■ new text ■

if slated for a *Supplement* to *USP-NF*. The same symbols indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as

◆ ◆

, or

■ ■

, or

▲ ▲

, it means that text has been deleted and no new text was proposed to replace it.

In all revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA*, *Supplement*, or the *USP* or *NF* as the publication where the revision will appear if approved. For example, ■

2S (USP 34) indicates that the proposed revision is slated for the *Second Supplement to USP 34*, and ▲
 USP35 and ▲NF30 indicates that the revisions are proposed for *USP 35* and *NF 30*, respectively.

Official Title Changes Where the specification "**Monograph title change**" is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

BRIEFING

⟨ 1130 ⟩ **Nucleic Acid-Based Techniques—Approaches for Detecting Trace Nucleic Acids (Residual DNA Testing)**, *USP 38* page 1267 and *PF 40(2)* [Mar.–Apr. 2014]. During manufacture of biopharmaceuticals produced by cells, it is important to reduce, as much as possible, the quantity of residual host cell DNA, thereby maximizing product purity, safety, and quality. This revision proposal modernizes the official chapter to reflect current methodology and expectations for residual DNA procedures, and also addresses public comments received during a previous revision proposal published in *PF 40(2)* and canceled. Specifically, additional options for polymerase chain reaction-based methods are introduced in addition to hybridization and methods based on the use of DNA binding proteins. The chapter also proposes a wider acceptance range of 50%–150% for sample recovery, based on current methods approved by regulators. The chapter is also referenced by the following official *USP–NF* chapters:

- *Gene Therapy Products* ⟨ 1047 ⟩
- *Growth Factors and Cytokines Used in Cell Therapy Manufacturing* ⟨ 92 ⟩
- *Nucleic Acid-Based Techniques—General* ⟨ 1125 ⟩
- *Nucleic Acid-Based Techniques—Extraction, Detection, and Sequencing* ⟨ 1126 ⟩
- *Nucleic Acid-Based Techniques—Microarray* ⟨ 1128 ⟩
- *Vaccines for Human Use—Polysaccharide and Glycoconjugate Vaccines* ⟨ 1234 ⟩
- *Vaccines for Human Use—General Considerations* ⟨ 1235 ⟩
- *Vaccines for Human Use—Bacterial Vaccines* ⟨ 1238 ⟩

These links will remain as written when this chapter becomes official.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style.

⟨ 1130 ⟩ NUCLEIC ACID-BASED TECHNIQUES—APPROACHES FOR DETECTING TRACE NUCLEIC ACIDS (RESIDUAL DNA TESTING)

Change to read:

INTRODUCTION

The basic principles of nucleic acid amplification technologies (NAT) and definitions of the various techniques are covered in *Nucleic Acid-Based Techniques—General* ⟨ 1125 ⟩. This

chapter covers the analytical procedure used to quantify residual DNA in biopharmaceuticals.

Quantification of residual DNA impurities in biopharmaceuticals is based on safety concerns. The cells used to produce biopharmaceuticals can be sources of a range of complex, heterogeneous, and potentially unsafe impurities, and host cell DNA is among these. Much of the safety concern associated with residual DNA in biopharmaceuticals lies in the possibility that host cell DNA, particularly continuous cell-line DNA, may result in tumors or adverse reactions. Cells used to produce biopharmaceuticals may possibly carry viruses or harbor harmful nucleic acid, and the residual DNA in a given biopharmaceutical product may be infectious. Although animal testing has shown that extraneous DNA can cause tumors or infections, no reports to date have demonstrated this risk in humans. Therefore, some regulatory agencies have allowed a target of 100 pg or less of residual DNA per dose in biopharmaceuticals, and levels up to 10 ng of residual DNA per dose may be considered, depending on the source of the residual DNA and the product's route of administration.

One can address residual DNA in biopharmaceutical processes in two ways: by validating clearance during process validation or by monitoring residual DNA levels by routine testing of the drug substance. The level of concern regarding residual DNA can be tied to the potential source of the residual DNA (e.g., infectious viral DNA) and the route of administration, so the residual DNA specification and procedure for monitoring DNA clearance for a given product should be developed in consultation with regulatory agencies. Regardless of whether routine testing of a drug product is used to determine residual DNA content or whether DNA clearance is demonstrated by process validation, analytical procedures for the quantification of residual DNA are required. The analytical procedures used to determine the residual DNA content of biopharmaceuticals can include hybridization, instrumentation based on DNA-binding protein, quantitative PCR (q-PCR), or other DNA amplification methods. The expectation is that the analytical procedure used to quantify residual DNA in biopharmaceuticals has a detection limit approximating 10 pg per dose. The assays based on hybridization, DNA-binding protein, and q-PCR are typically the techniques of choice because they can meet the sensitivity expectation.

■ Process characterization and the theoretical safety concerns with process-related impurities highlight the need for residual DNA testing in biopharmaceutical products. The ability of a manufacturing process to remove residual DNA from a biopharmaceutical product is an indicator of the quality and consistency of the process. Additionally, the cells used to produce a biopharmaceutical can be sources of a range of complex, heterogeneous, and potentially unsafe impurities, with host cell DNA among these impurities. Historically, the safety concern associated with residual DNA in biopharmaceuticals lies in the possibility that host cell DNA, particularly continuous cell-line DNA, may result in tumors or adverse reactions. Cells used to produce biopharmaceuticals may also carry viruses or harbor harmful nucleic acid. Although animal testing has shown that extraneous DNA can cause tumors or infections, no reports to date have demonstrated this risk in humans. Residual DNA content, up to 10 ng of residual DNA per parental dose, may be considered for DNA originating from mammalian cell cultures, but the residual DNA content may vary depending on the source of the residual DNA and the route of administration of the product. One can address residual DNA in biopharmaceutical processes in two ways: 1) by validating clearance during process validation; and/or 2) by monitoring residual DNA levels through routine testing of the drug substance. The level of concern regarding residual DNA can be tied to its source and the route of administration, so the residual DNA specification and procedure for monitoring DNA clearance for a given product should be developed in consultation with regulatory agencies. Regardless of whether routine testing of a

drug substance is used to determine residual DNA content or whether DNA clearance is demonstrated by process validation, analytical procedures for the quantification of residual DNA are required. DNA amplification techniques, such as quantitative PCR (qPCR), are used most often for residual DNA testing because of their superior sensitivity and unique advantages (e.g., high specificity). The expectation is that the analytical procedure used to quantify residual DNA in biopharmaceuticals has a detection limit well below the DNA level allowed by regulators for biopharmaceuticals (often 10 ng/dose). Assays based on hybridization, DNA-binding protein, and qPCR are typically the techniques of choice because they can meet the sensitivity expectation.

SAMPLE PRETREATMENT

Analysis of residual DNA requires accurate quantification of pg levels of DNA in mg (or larger) quantities of product. The sample itself, whether it is a protein or other chemical entity, can create sample matrix effects that must be overcome in order to yield a useful assay. Protein samples may require only digestion with proteinase (e.g., Proteinase K, Pronase) to allow the analytical method to quantitatively recover the residual DNA. Treating the sample with a detergent may be required to dissociate the residual DNA from the sample matrix. Traditionally, extraction methods based on phenol and chloroform, followed by ethanol precipitation, have been applied to the purification of DNA in molecular biology research. The phenol/chloroform extraction technique may be a useful pretreatment for residual DNA samples prior to analysis. Because of the typically low levels of residual DNA present in samples, quantitative DNA recovery with ethanol precipitation may be difficult. For this reason, a carrier molecule (e.g., glycogen) may be necessary to aid in DNA recovery if this technique is used.

A commercial kit is available¹ and has been used successfully for pretreatment of residual DNA samples. The commercial kit uses a chaotrope (sodium iodide) and a detergent (sodium *N*-lauroyl sarcosinate) to disrupt the association of the DNA with the sample. The DNA is then co-precipitated using glycogen as the carrier molecule in the presence of isopropanol.

Each of these pretreatment techniques may yield acceptable results, or analysts may combine the techniques to obtain acceptable recovery of the residual DNA from the sample. Sample extraction is an extra handling step that may cause the incomplete recovery of the residual DNA or may introduce environmental DNA into the sample, so great care must be taken during any sample manipulations. Addition of DNA spiked samples in the residual DNA assay is a common practice. A recovery of 80% to 120% of the spiked DNA is an acceptance criterion often applied to residual DNA assays to ensure that the assay yields acceptable results. When sample characteristics (e.g., matrix effects, sample preparation method) make achieving a recovery acceptance criterion of 80–120% impractical, then correcting the observed DNA concentration by the load recovery percentage is also an acceptable approach. During the qualification of a residual DNA assay, some scientists treat the samples with DNase I to degrade the DNA in the sample in order to demonstrate that the assay response was due to DNA and not some other sample component.

■ Analysis of residual DNA requires accurate quantification of picogram levels of DNA in mg (or

larger) quantities of product, which may be in a variety of matrices. In certain circumstances, the sample can be analyzed neat in the analytical procedure with acceptable recovery and precision. When the product or other sample components interfere with the assay sample, dilution may be all that is required to overcome the interference, so long as the specified DNA content of the sample remains within the useful range of the analytical procedure. When sample dilution is not effective in reducing assay interference, it may be necessary to use more extensive sample pretreatment procedures, such as proteolytic digestion, chemical dissociation, or extractions. It may be necessary to use a combination of different pretreatment steps to remove interference to an acceptable level. Extensive sample manipulation can lead to losses of DNA or introduction of environmental DNA, and should be a consideration when using one or more sample pretreatment steps. Contamination with environmental DNA may only be a concern when using a residual DNA procedure that is not sequence specific.

Protein samples may only require digestion with proteinase (e.g., Proteinase K, Pronase) to allow the analytical method to quantitatively recover the residual DNA. It may also be possible that the DNA is bound to the sample components, and chemical dissociation (e.g., detergents) may disrupt the binding, allowing sufficient recovery in the residual DNA assay. Residual DNA test procedures often use protein reagents and the use of a chemical dissociation reagent. These materials must be used at a sufficiently low level or removed so that the analysis is not compromised.

It may be necessary to extract the DNA from the sample to remove the inhibitory substances that are causing the reduced DNA recovery. Extraction procedures are typically based on precipitating the DNA from the sample or DNA-specific binding to a matrix (e.g., magnetic beads). Historically, extraction methods based on phenol and chloroform, followed by ethanol precipitation, have been applied to the purification of DNA in molecular biology research. The phenol/chloroform extraction technique may be a useful pretreatment for residual DNA samples before analysis, but the phenol/chloroform extraction technique might not be the best choice for the low levels of DNA typically found in biopharmaceutical samples. Because of these low levels, quantitative DNA recovery with ethanol precipitation may be difficult. For this reason, a carrier molecule (e.g., glycogen) may be necessary to aid in DNA recovery if the phenol/chloroform extraction technique is used. Commercial kits are available and have been used successfully for pretreatment of residual DNA samples for improved recovery in the residual DNA assay. For example, some kits use a chaotrope (sodium iodide) and a detergent (sodium *N*-lauroyl sarcosinate) to disrupt the association of the DNA with the sample. The DNA is then co-precipitated using glycogen as the carrier molecule in the presence of isopropanol. Extraction of DNA from the sample, based on binding to a solid matrix, can be found in various formats. One of the most popular formats uses magnetic beads, where the beads are added to a sample with a binding solution to capture the sample DNA on the beads. The beads are then captured and held in the sample tube using a magnetic stand while the supernatant containing the interfering substances is removed and discarded. The beads are washed repeatedly using a magnetic stand and a wash solution. Finally, the DNA is eluted from the beads for the assay using an elution buffer, with the beads being removed from the sample preparation using the magnetic stand.

The sample manipulation involved with pretreatment may reduce the recovery of the residual DNA or introduce environmental DNA into the sample. Great care must be taken during any sample manipulations to avoid DNA losses or contamination. The addition of target DNA-spiked samples in the residual DNA assay is a common practice. The target DNA-spiked sample should not be confused with the internal positive control (IPC), which is typically a non-target DNA

added after the sample pretreatment step to detect the presence of PCR inhibitors and to evaluate DNA amplification during the analysis. The IPC may also be introduced before the extraction to improve the control of this step. A recovery of 50%–150% of the spiked target DNA is often applied to residual DNA assays to ensure that the assay yields acceptable results. When sample characteristics (e.g., matrix effects or sample preparation method) make achieving a recovery acceptance criterion of 50%–150% impractical, then correcting the observed DNA concentration by using the load recovery percentage is also an acceptable approach. ■2S (USP39)

HYBRIDIZATION-BASED RESIDUAL DNA ASSAY

The first residual DNA assays were based on DNA hybridization, wherein a DNA probe created from host cell DNA detects and quantifies the amount of complementary DNA present in the product under assay. Double-stranded host cell DNA consists of two complementary strands of DNA that are held together by hydrogen bonding. The double-stranded DNA in the test sample is denatured to single strands and immobilized to a membrane, typically a nitrocellulose or nylon membrane. The sample is probed using host cell DNA that has been denatured and labeled. The host cell DNA probe is not a specific sequence but is prepared by a random labeling procedure during which a radioactive or fluorescent label is introduced into the host cell DNA to produce the probe. When the denatured, labeled DNA probe is brought into contact with the membrane-immobilized DNA, the probe will bind to complementary sequences of the host cell DNA. If the probe is radioactive, the membrane is placed against autoradiography film for a sufficient length of time, the film is developed, and a dark spot will be observed where the test DNA was immobilized. If the probe has a fluorescent label, the intensity of the spots is determined using a phosphor- or fluorescence-imaging system. The intensity of the spot is proportional to the amount of probe that was hybridized to the test DNA and therefore is proportional to the amount of residual DNA in the sample. The intensity of the spot can be compared visually with the intensity of spots that correspond to a standard curve yielding semiquantitative results (i.e., visual quantitation), or the intensity can be determined using an instrument (e.g., densitometer) to create a quantitative value that is compared with the values obtained from the standard curve.

DNA-BINDING PROTEIN-BASED RESIDUAL DNA ASSAY

Instrumentation is commercially available for the quantitation of residual DNA in biopharmaceuticals. The instrumentation requires reagents that use DNA-binding protein and antibodies targeted for DNA in a four-step analytical procedure.

1. The first step requires that the DNA be denatured into single-stranded DNA by sample heating. The denatured DNA is mixed with a single reagent that contains DNA-binding protein that is conjugated with streptavidin and a monoclonal anti-DNA antibody that is conjugated to urease. The DNA-binding protein and the monoclonal antibody are specific for single-stranded DNA but do not have any sequence specificity. This liquid phase facilitates the formation of reaction complexes that contain DNA, streptavidin, and urease.

2. During the second step, the sample is filtered through a biotinylated membrane that binds to the streptavidin and captures the complexes on the membrane, which is washed to remove any reagents that are not bound to the membrane.
3. During the third step, the membrane is inserted into a sensor on the instrument, where the urease in the DNA complex reacts with a urea solution in the sensor, producing ammonia and a change in pH that is detected using a light-addressable potentiometric sensor (LAPS). The change in pH directly correlates with the amount of DNA in the sample.
4. In the fourth step, the raw data from the instrument are analyzed using the appropriate software to determine the residual DNA content of the sample.

~~A DNA primer~~

~~pair of DNA primers~~ ■ 2S (USP39)

~~is also added to the reaction. During the amplification reaction, DNA polymerase I attaches where the DNA primer binds to the single-stranded sample (template) DNA and moves along the sample DNA, synthesizing new complementary DNA. While following the template DNA, DNA polymerase I cleaves any complementary DNA in the path. If DNA polymerase I encounters the labeled DNA probe it will cleave the reporter dye from the probe. The reporter dye is released into solution and, in the absence of the quencher dye, can be quantitated as a fluorescent measurement. Repeating the reaction cycle results in an amplification of the fluorescent signal. The number of cycles required for the fluorescent measurement to exceed a threshold value correlates to the amount of starting residual DNA in the sample. By comparing with a standard curve the fluorescence obtained from a sample, analysts can quantify the residual DNA in the sample.~~

Alternative Detection Strategies

A number of innovative detection strategies have been developed and commercialized beyond that described above. A few of the most common are as follows:

1. Intercalating cyanine dyes fluoresce after binding to double-stranded DNA. The amount of dye incorporated is proportional to the amount of target amplicon generated. These dyes are inexpensive and easy to use. The disadvantage of this technique is the lack of a specific probe to confer sequence specificity beyond that afforded by the primers, and the dye will also bind somewhat to single-stranded DNA and RNA molecules. Consequently, primer dimers or nonspecific products may affect the quantification. However, it is possible to check for the specificity of the system by running a melting curve at the end of the PCR run, based on the principle that every product has a different dissociation temperature and depending on the size and base content.
2. Other sensitive probes exist that contain a stem-loop structure with a fluorophore and a quencher at their 5' and 3' ends, respectively. The stem is usually six bases long, mainly consisting of cytosines and guanines, and holds the probe in the hairpin configuration. The "stem" sequence keeps the fluorophore and the quencher in close proximity, but only in the absence of a sequence complementary to the "loop" sequence. In the presence of a complementary sequence, the probe unfolds and hybridizes to the target, leading to separation between the fluorophore and the quencher, and the probe fluoresces. The amount of signal is proportional to the amount of target amplicon sequence. The increase in fluorescence that occurs is reversible, because there is no cleavage of the probe. It is also possible to design the stem structure to add specificity to this type of probe. However, these probes are often expensive, and the signal can be weak due to the limited possible physical separation between the fluorophore and the quencher.
3. Another variety of the second example above uses a single-stranded nucleic acid sequence containing the specific PCR primers, the specific probe with a stem-loop tail separating a fluorophore and a quencher, and a blocking group. The stem-loop tail is separated from the PCR primer sequence by a "PCR blocker", a chemical modification that prevents the polymerase from copying the stem-loop sequence of the primer. After extension of the primer during PCR amplification, the specific probe sequence is able to bind to its complement within the same strand of DNA. This hybridization event opens the hairpin loop so that fluorescence is no longer quenched, and an increase in signal is observed. Covalent attachment of the probe to the target amplicon ensures that each probe has a target in close proximity. Enzymatic cleavage is not required, nor a separate probe hybridization step, thereby reducing the time needed for signaling. This can result in stronger signals and lower background with faster cycling; however, these probes can be quite expensive and complicated to design.
4. Fluorogenic minor groove binder probes are short linear probes that have a minor groove binder with a non-fluorescent quencher on the 5' end and a fluorophore on the 3' end. The minor groove binder prevents the exonuclease activity of the DNA polymerase from cleaving the probe. Quenching occurs when the random coiling of the probe in the free

form brings the quencher and the fluorophore close together. The probe is elongated when bound to its target and quenching is decreased, leading to an increase in fluorescent signal proportional to the amount of accumulated amplicon. These probes are also expensive and can produce a low signal-to-noise ratio.

Quantitative Multiplex PCR-Based Residual DNA Assay

An evolution of qPCR is quantitative multiplex PCR, where several pairs of primers and the corresponding probes are introduced in the reaction medium to simultaneously detect multiple targets. Benefits include higher throughput and better control of false-negative results, whereas disadvantages come from amplification and detection interferences, as outlined in *Nucleic Acid-based Techniques—Amplification* (1127). One of the applications of this technique is a duplex qPCR, where the introduction of an exogenous DNA, called IPC, enhances confidence in the accuracy of the analysis when appropriately amplified. Multiplex qPCR is not used as often as single-target qPCR to assay host cell residual DNA in biopharmaceuticals.

■

PRACTICAL APPLICATIONS OF RESIDUAL DNA TESTING

Analysts choosing hybridization, DNA-binding protein, or q-PCR techniques for residual DNA analysis should consider how the assay will be used, the structure of the DNA available (e.g., fragment length), and regulatory issues. The cost of analysis can be significant and should be considered when evaluating an assay format. Traditionally, hybridization assays were performed using ^{32}P -labeled DNA and autoradiography. Because ^{32}P decays quickly, probes prepared with ^{32}P have a limited shelf life, and the precautions necessary for handling radioactive material can be cumbersome.

These issues with ^{32}P labeling may make fluorescence labeling of the hybridization probe a more desirable option. If the hybridization assay is assessed visually, this represents a semiquantitative assay, but if the intensity of the spots is determined using a densitometer or other image system, the results can be quantitative. DNA-binding protein assays and q-PCR give quantitative results. Quantitative assays are typically preferred instead of semiquantitative assays because the results are considered more accurate and precise, which allows better process monitoring and control.

Due to sample interference, a sample pretreatment step is often required to obtain accurate and reproducible results. Pretreatment steps can influence the recovery of DNA, so it is often necessary to design the assay with a spike-recovery control and an acceptance criterion to ensure assay performance. Commercial sources of host cell and vector DNA are typically not available to prepare in-house controls. In-house controls are usually prepared in the laboratory and quantified by UV spectroscopy, using standard techniques employed in molecular biology, to determine the DNA content and purity. Additionally, it is a good practice to evaluate in-house residual DNA controls by agarose gel electrophoresis to demonstrate that the DNA is of a proper size for the assay employed and has not degraded.

The hybridization assay uses genomic and/or vector DNA, labeled randomly throughout the

DNA, as the hybridization probe reagent. For this reason the hybridization assay is specific for the source of DNA but is not specific for a given sequence. A synthesized probe, specific for a specific sequence, can be prepared and used in the hybridization assay if this level of specificity is desirable. The DNA-binding protein residual DNA assay is not sequence-specific and hence not specific for the host DNA. Therefore, laboratory personnel should avoid contaminating samples for this assay with environmental DNA before denaturing the DNA; otherwise the DNA result may be falsely elevated. The q-PCR probe is sequence-specific, which creates some special challenges for development of a q-PCR residual DNA assay. The q-PCR-specific sequence must be a stable sequence within a highly conserved region of DNA. The recovery of the probe target sequence must consistently represent the recovery of all the residual DNA. As a guideline, for a DNA fragment to be detected by hybridization, q-PCR, and DNA-binding protein assays, it must have no fewer than 50, 150, and 600 base pairs, respectively. A bioprocess typically may have operations that shear DNA into smaller fragments, and this must be taken into consideration when selecting an assay. Procedures exist to determine whether the DNA fragments in a sample are too small for adequate residual DNA recovery with a given assay. As noted, residual DNA assays are extremely sensitive. Detection limits as low as <1, 3, and 6 pg of DNA per sample have been reported for q-PCR, DNA-binding protein, and hybridization assays, respectively.

Although safety concerns regarding residual DNA impurities are not as prominent as they once were, the levels of residual DNA in any bioprocess remain a key quality attribute and help define the process. ■ 2S (USP39)

■

RESIDUAL DNA TESTING POINTS TO CONSIDER

When developing a residual DNA assay, one should consider how the assay will be used, the structure of the DNA available (e.g., fragment length), and regulatory issues. The cost of analysis can be significant and should be considered when evaluating an assay format. In addition, environmental, health, and safety aspects should be considered. Traditionally, hybridization assays were performed using phosphorus (^{32}P)-labeled DNA and autoradiography. Because ^{32}P decays quickly, probes prepared with ^{32}P have a limited shelf life, and the precautions necessary for handling radioactive material can be cumbersome. These issues with ^{32}P labeling may make fluorescence labeling of the hybridization probe a more desirable option. If the hybridization assay is assessed visually, this process represents a semiquantitative assay, but if the intensity of the spots is determined using a densitometer or other imaging system, the results may be quantitative. DNA-binding protein assays and qPCR give quantitative results. Quantitative assays are typically preferred instead of semiquantitative assays (e.g., older hybridization-based methods), because the results are considered more accurate and precise, which allows better process monitoring and control. Because of sample matrix interference, a sample pretreatment step is often required to obtain accurate and reproducible results. Pretreatment steps can influence the recovery of DNA, so it is usually necessary to design the assay with a spike-recovery control and an acceptance criterion to ensure assay performance.

In-house controls are usually prepared in the laboratory and qualified by ultraviolet spectroscopy, using standard techniques employed in molecular biology, to determine the DNA content and purity. The hybridization assay uses genomic and/or vector DNA, labeled randomly throughout the DNA, as the hybridization probe reagent. For this reason, the hybridization assay is specific for the source of DNA but is not specific for a given sequence. A synthesized probe, specific for a specific sequence, can be prepared and used in the hybridization assay if this level of specificity is desirable. The DNA-binding protein residual DNA assay is not sequence specific and hence not specific for the host DNA. Therefore, laboratory personnel should avoid contaminating samples for this assay with environmental DNA before denaturing the DNA; otherwise, the DNA result may be falsely elevated. The qPCR probe has the advantage of being sequence specific, but this creates some special challenges for development of a qPCR residual DNA assay. The qPCR-specific sequence must be a stable sequence within a suitable region of DNA. The recovery of the target sequence must consistently represent the recovery of all the residual DNA. Biopharmaceutical manufacturing processes typically may have operations that shear DNA into smaller fragments, and this must be taken into consideration when selecting an assay. Procedures exist to determine whether the DNA fragments in a sample are too small for adequate residual DNA recovery with a given assay. When bridging from one DNA assay technique to another, a thorough understanding of the DNA analyte is critical. Some assays can detect both single-stranded and double-stranded DNA, whereas some can only detect double-stranded DNA (e.g., some fluorescent dye-binding assays). There are assays that are not sequence specific, and those assays that are sequence specific can be influenced by the copy number of the target sequence present in the DNA. There are assays that require two or more antibody molecules to bind to the DNA fragment (e.g., DNA-binding protein-based residual DNA assay), and if the DNA fragments are too small and present in sufficient quantity, they can saturate the reagents and inhibit the assay (hook effect). Although safety concerns regarding residual DNA impurities are not as prominent as they once were, the levels of residual DNA in any bioprocess remain a key quality attribute and help define the process. ■2S (USP39)

BRIEFING

Northern Schisandra Fruit Dry Extract. Because there is no existing *USP* monograph for

this dietary supplement, a new monograph is being proposed. The liquid chromatographic procedure in the test for *Content of Lignans* is based on analyses performed with the Acquity UPLC® HSS T3 brand of L1 column with 1.8- μ m packing. The typical retention times observed for schisandrin, schisandrol B, deoxyschisandrin, and γ -schisandrin are about 1.00, 1.29, 2.90, and 3.31 min, respectively.

(DS: C. Okunji.)

Correspondence Number—C158696

Comment deadline: September 30, 2015

Add the following:

■ Northern Schisandra Fruit Dry Extract

DEFINITION

Northern Schisandra Fruit Dry Extract consists of dried ripe fruits of *Schisandra chinensis* (Turcz.) Baill. (Fam. Schisandraceae) collected in the fall, by extraction with hydroalcoholic mixtures. It contains NLT 90.0% and NMT 110.0% of the labeled amount of schisandrin on the dried basis; NLT 90.0% and NMT 110.0% of the labeled amount of total lignans, calculated as the sum of schisandrin, schisandrol B, deoxyschisandrin (schisandrin A), and γ -schisandrin (schisandrin B).

IDENTIFICATION

• **A. Thin-Layer Chromatography**

Standard solution A: 0.5 mg/mL of USP Schisandrin RS in methanol

Standard solution B: Sonicate 100 mg/mL of USP *Schisandra chinensis* Fruit Dry Extract RS in methanol for 10 min. Centrifuge and use the supernatant.

Sample solution: Sonicate about 250 mg (adjust the amount properly, if necessary) of Northern Schisandra Fruit Dry Extract in 5 mL of alcohol for 10 min. Centrifuge, and use the supernatant.

Chromatographic system

(See *HPTLC for Articles of Botanical Origin* (203).)

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 μ m (HPTLC plates)

Application volume: 3 μ L, as 8-mm bands

Relative humidity: Condition the plate to a relative humidity of about 33% using a suitable device.

Developing solvent system: Toluene, ethyl acetate, and glacial acetic acid (23:6:1)

Developing distance: 6 cm

Derivatization reagent: 10% Sulfuric acid in ethanol. [Note—Slowly add sulfuric acid to ice-cold ethanol.]

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the *Samples* as bands to a suitable HPTLC plate, and dry in air. Develop the chromatograms in a saturated chamber, remove the plate from the chamber, air-dry, and examine under UV light at 254 nm. Then treat the plate with *Derivatization reagent*, heat

at 120° for 7 min, and examine under UV light at 366 nm.

System suitability: Under UV light at 254 nm, *Standard solution B* exhibits an intense band corresponding in R_F to the band of schisandrin in *Standard solution A*. *Standard solution B* also exhibits a band due to schisandrin A in the middle of the chromatogram, and four or five bands between the positions of the bands of schisandrin and schisandrin A. In the upper-half section, *Standard solution B* exhibits an intense band corresponding to schisandrin B.

Acceptance criteria: Under UV light at 254 nm, the *Sample solution* exhibits an intense band at an R_F corresponding to the band due to schisandrin [distinction from Southern Schisandra (*Schisandra sphenanthera*) fruit] in *Standard solution A*. The *Sample solution* exhibits additional bands corresponding in R_F to similar bands in *Standard solution B*, including a band due to schisandrin A in the middle of the chromatogram; four or five bands between the positions of the bands of schisandrin A and schisandrin; and two or three bands in the upper-half section, the most intense band at an R_F corresponding to the band of schisandrin B. Under UV light at 366 nm after derivatization, the chromatogram of the *Sample solution* does not exhibit an intense blue fluorescent band (distinction from *Schisandra sphenanthera* fruit) in the upper-third of the chromatogram.

• B. HPLC

Analysis: Proceed as directed in *Content of Lignans*.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits the most intense peak with a retention time corresponding to schisandrin in *Standard solution A*, and the peaks for schisandrol B, deoxyschisandrin, and γ -schisandrin corresponding to the retention times for the same lignans in *Standard solution B*. There is no principal peak due to schisantherin A at a relative retention time of about 2.1 relative to schisandrin (distinction from *Schisandra sphenanthera* fruit).

COMPOSITION

• Content of Lignans

Solution A: Water

Solution B: Acetonitrile and methanol (1:1) (v/v)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	47	53
30	20	80

Standard solution A: 0.06 mg/mL of USP Schisandrin RS in methanol

Standard solution B: 10 mg/mL of USP *Schisandra chinensis* Fruit Dry Extract RS in methanol. Sonicate and pass through a polytetrafluoroethylene filter of 0.2- μ m pore size, and discard the first portion of the filtrate before injection.

Sample solution: Accurately transfer an amount, equivalent to 4 mg of total lignans according to the labeled content, of Northern Schisandra Fruit Dry Extract, to a 50-mL centrifuge tube. Add 10.0 mL of methanol, and sonicate for 10 min (140 W, 42 kHz). Centrifuge, and transfer the supernatant to a 25-mL volumetric flask. Repeat the extraction one more time. Combine the extracts in the 25-mL volumetric flask and dilute with methanol to volume. Mix, pass through a polytetrafluoroethylene filter of 0.2- μ m pore

size before injection, and discard the first portion of the filtrate.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: UPLC

Detector: UV 251 nm

Column: 2.1-mm × 15-cm; 1.8-μm packing L1

Column temperature: 35°

Flow rate: 0.3 mL/min

Injection volume: 3 μL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram of *Standard solution B* is similar to the reference chromatogram provided with the lot of USP *Schisandra chinensis* Fruit Dry Extract RS being used.

Resolution: NLT 1.5 between the schisandrol B peak and its following peak, *Standard solution B*

Tailing factor: NMT 2.0 for the schisandrin peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for the schisandrin peak, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using the chromatogram of *Standard solution A*, *Standard solution B*, and the reference chromatogram provided with the lot of USP *Schisandra chinensis* Fruit Dry Extract RS being used, identify the retention times of the peaks corresponding to schisandrin, schisandrol B, schisandrin A, and schisandrin B in the *Sample solution*.

[Note—The approximate relative retention times of the analytes are provided in *Table 2*.]

Table 2

Analyte	Approximate Relative Retention Time	Conversion Factor
Schisandrin	1.00	1.00
Schisandrol B	1.29	1.21
Schisandrin A	2.90	1.00
Schisandrin B	3.31	1.23

Separately calculate the percentages of schisandrin, schisandrol B, schisandrin A, and schisandrin B in the portion of Northern Schisandra Fruit Dry Extract taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of schisandrin from *Standard solution A*

C_S = concentration of USP Schisandrin RS in *Standard solution A* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Northern Schisandra Fruit Dry Extract taken to prepare the *Sample solution* (mg)

F = conversion factor for analytes (see *Table 2*)

Calculate the percentage of the labeled amount of schisandrin in the portion of Northern Schisandra Fruit Dry Extract taken:

$$\text{Result} = (P/L) \times 100$$

P = content of schisandrin as determined above (%)

L = labeled amount of schisandrin (%)

Acceptance criteria: 90.0%–110.0% on the dried basis of schisandrin

Calculate the percentage of the labeled amount of total lignans as the sum of schisandrin, schisandrol B, schisandrin A, and schisandrin B in the portion of Northern Schisandra Fruit Dry Extract taken:

$$\text{Result} = (P/L) \times 100$$

P = content of total lignans as determined above (%)

L = labeled amount of total lignans (%)

Acceptance criteria: 90.0%–110.0% on the dried basis of total lignans

CONTAMINANTS

- **Articles of Botanical Origin** 〈 561 〉, *Pesticide Residue Analysis*: Meets the requirements
- **Microbial Enumeration Tests** 〈 2021 〉: The total aerobic bacterial count does not exceed 10^5 cfu/g, the total combined molds and yeasts count does not exceed 10^3 cfu/g, and the bile-tolerant Gram-negative bacteria does not exceed 10^3 cfu/g.
- **Absence of Specified Microorganisms** 〈 2022 〉, *Test Procedures, Test for Absence of Salmonella Species* and *Test Procedures, Test for Absence of Escherichia coli*: Meets the requirements
- **Articles of Botanical Origin** 〈 561 〉, *Test for Aflatoxins*: Meets the requirements

SPECIFIC TESTS

- **Loss on Drying** 〈 731 〉
Sample: 2 g of Northern Schisandra Fruit Dry Extract
Analysis: Dry the *Sample* at 105° for 5 h.
Acceptance criteria: NMT 8%
- **Articles of Botanical Origin** 〈 561 〉, *Total Ash*
Sample: 2 g of Northern Schisandra Fruit Dry Extract
Acceptance criteria: NMT 5%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers, protected from light and moisture, and store at controlled room temperature.
- **Labeling:** The label states the Latin binomial following the official name.
- **USP Reference Standards** 〈 11 〉
 USP *Schisandra chinensis* Fruit Dry Extract RS
 USP Schisandrin RS

■ 2S (USP39)

BRIEFING

Chlorobutanol, *NF 33* page 6610. As part of the USP monograph modernization effort and on the basis of a request to accommodate certain grades of chlorobutanol used in injectable dosage forms that are not currently included in the monograph, it is proposed to make the following revisions:

1. Add a *Bacterial Endotoxins Test* to the *Specific Tests* section.
2. In the *Labeling* section, add a statement to accommodate a special chlorobutanol grade that is used in injectable dosage forms.
3. Add USP Endotoxin RS to the *USP Reference Standards* section.

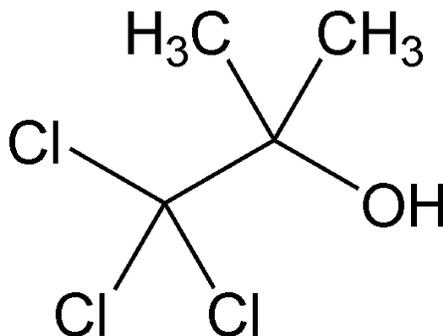

Additionally, minor editorial changes have been made to update the monograph to current USP style.

BRIEFING

Eucalyptus Oil, PF 39(4) [Jul.–Aug. 2013]. A new monograph proposal was presented in PF 39(4). The test for *Content of Aroma Substances* is based on a GC method of analysis performed using the Supelco Wax 10 brand of G16 column.

On the basis of comments and data received, it is proposed to make the following revisions to the PF proposal in PF 39(4):

1. Add the title for *Identification* test B.
2. In the test for *Content of Aroma Substances*, the typical retention times for (+)- α -pinene, β -pinene, sabinene, (R)-(-)- α -phellandrene, (R)-(+)-limonene, eucalyptol, and camphor are 10.21, 12.75, 13.10, 14.46, 15.51, 15.85, and 24.99 min, respectively. In addition to the seven previously proposed aroma substances that were specified in PF 39(4), five additional aroma substances have been identified and are included: β -myrcene, γ -terpinene, *p*-cymene, terpinen-4-ol, and α -terpineol. β -Myrcene elutes before (R)-(-)- α -phellandrene and after sabinene; γ -terpinene and *p*-cymene elute between eucalyptol and camphor; terpinen-4-ol and α -terpineol elute after camphor. The typical retention times for β -myrcene, γ -terpinene, *p*-cymene, terpinen-4-ol, and α -terpineol are 14.27, 16.96, 17.75, 26.63, and 28.85 min, respectively. Subsequently, replace the previous *Table 2* with one providing the updated relative retention times and add a new *Table 3* to provide the relative retention times for the five additional aroma substances. Correspondingly, add the calculation for the five additional aroma substances.
3. In the *Acceptance criteria* for *Content of Aroma Substances*, change the previous *Table 3* to *Table 4*, increase the lower limits of the *Acceptance criteria* for (+)- α -pinene and (R)-(+)-limonene, and decrease the upper limit of the *Acceptance criteria* for eucalyptol. Additionally, add the *Acceptance criteria* for γ -terpinene, *p*-cymene, and new total percentage of the 12 identified aroma substances.
4. Due to the proposed change for the upper limit of the *Acceptance criteria* for eucalyptol, update the *Definition*.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

■ 2S (NF34)

IMPURITIES

• Test for Aldehyde

Alcoholic hydroxylamine solution: Dissolve 3.5 g of hydroxylamine hydrochloride in 95 mL of 60% alcohol (v/v) and add 0.5 mL of a 2-mg/mL solution of methyl orange in 60%

alcohol (v/v) and sufficient 0.5 M potassium hydroxide in 60% alcohol (v/v) to give a pure yellow color. Dilute with 60% alcohol (v/v) to 100 mL.

Analysis: In a ground-glass-stoppered tube 25-mm in diameter and 150-mm long, add 10 mL of Eucalyptus Oil. Then add 5 mL of toluene and 4 mL of *Alcoholic hydroxylamine solution*. Shake vigorously, and titrate immediately with 0.5 M potassium hydroxide in 60% alcohol (v/v) until the red color changes to yellow. Continue the titration with shaking; the endpoint is reached when the pure yellow color of the indicator is permanent in the lower layer after shaking vigorously for 2 min and allowing separation to take place. The reaction is complete in about 15 min.

Repeat the titration using a further 10 mL of Eucalyptus Oil and, as a reference solution for the endpoint, the titrated liquid from the first determination, to which has been added 0.5 mL of 0.5 M potassium hydroxide in 60% alcohol (v/v).

Acceptance criteria: NMT 2.0 mL of 0.5 M potassium hydroxide in 60% alcohol (v/v) is required in the second titration.

SPECIFIC TESTS

- **Specific Gravity** $\langle 841 \rangle$: 0.906–0.927, at 20°
- **Refractive Index** $\langle 831 \rangle$: 1.450–1.470, at 20°
- **Optical Rotation** $\langle 781 \rangle$: 0°–10°, at 20°

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers. Do not store above 25°.
- **USP Reference Standards** $\langle 11 \rangle$
 - USP Camphor RS
 - USP Eucalyptol RS
 - USP Eucalyptus Oil RS

■ 2S (NF34)

BRIEFING

Albuterol Sulfate, *USP 38* page 2071. The FDA has requested this monograph be moved up in prioritization for modernization. The impurities specifications and analytical procedures from multiple sponsors and the corresponding monograph from the *European Pharmacopoeia* were considered, but these procedures were not specific enough to separate and to quantify all of the identified impurities. Thus, USP laboratories developed and validated suitable procedures that could be proposed for use as the test for *Organic Impurities* and the *Assay*. It is proposed to revise the monograph as follows:

1. Remove *Identification* test *B* based on the UV spectral agreement and reletter the remaining *Identification* tests, as needed, which are sufficient to identify albuterol sulfate.
2. Replace the nonspecific TLC procedure in the test for *Organic Impurities* with a specific LC procedure that was validated using the Waters Acquity UPLC BEH-C18 brand of L1 column. The typical retention time of albuterol is about 3 min. The gradient was established on an LC system with a dwell volume of 350–400 μ L.
3. The *Acceptance criteria* proposed in the test for *Organic Impurities* reflect the limits provided by several manufacturers who have approved applications for drug products

containing Albuterol Sulfate or the corresponding monograph published in the *European Pharmacopoeia*. Manufacturers are strongly encouraged to contact USP during the public comment period and provide supporting documentation if their approved specifications are different from those proposed in this revision.

4. Replace the current *Assay* with an LC procedure, which is similar to the proposed test for *Organic Impurities*. This procedure was validated using the Waters Acquity UPLC BEH-C18 brand of L1 column. The typical retention time for albuterol is about 3 min.
5. Revise the *Definition* to support the proposed *Assay*.
6. Add USP Albuterol Related Compound B RS, USP Albuterol Related Compound C RS, USP Levalbuterol Related Compound C RS, USP Levalbuterol Related Compound E RS, and USP Levalbuterol Related Compound H RS to the *USP Reference Standards* section to support the proposed revisions to the *Assay* and test for *Organic Impurities*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

BRIEFING

Alprazolam Extended-Release Tablets, *USP 38* page 2100 and *PF 41(2)* [Mar.–Apr. 2015]. The revision proposal for this monograph, which appeared in *PF 41(2)*, is being further modernized as part of the USP monograph modernization efforts; it is proposed to revise the monograph as follows:

1. Add *Identification* test *B* based on the UV spectral agreement of the major peak from the *Assay*.
2. Revise the *Assay* to add the use of a diode array detector to support the proposed *Identification* test *B*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Alprazolam Extended-Release Tablets

DEFINITION

Alprazolam Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

Add the following:

C_U = nominal concentration of alprazolam in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Change to read:

• **Dissolution** 〈 711 〉

Test 1

Medium: pH 6.0 phosphate buffer (8.0 g/L of monobasic potassium phosphate and 2.0 g/L of dibasic potassium phosphate in water; adjust with phosphoric acid or potassium hydroxide to a pH of 6.0 ± 0.1); 500 mL

Apparatus 1: 100 rpm

Times: 1, 4, 8, and 12 h

Mobile phase: Acetonitrile, tetrahydrofuran, and *Medium* (7:1:12)

Standard stock solution: 0.5 mg/mL of USP Alprazolam RS in acetonitrile

Standard solution: ($L/500$) mg/mL of USP Alprazolam RS in *Medium* from the *Standard stock solution*, where L is the label claim in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 10-cm; 5- μ m packing L7

Flow rate: 1 mL/min

Injection volume: 100 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Column efficiency: NLT 3000 theoretical plates

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 500 mL

Tolerances: See *Table 1*.

Table 1

Time (h)	Amount Dissolved		
	0.5-mg Tablet	2-mg Tablet	3-mg Tablet
1	NMT 25%	NMT 20%	NMT 20%
4	40%–60%	30%–55%	30%–55%
8	70%–90%	65%–90%	65%–90%
12	NLT 85%	NLT 85%	NLT 85%

The percentages of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$) released at the times specified conform to *Dissolution* $\langle 711 \rangle$, *Acceptance Table 2*.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: pH 6.0 phosphate buffer (8.0 g/L of monobasic potassium phosphate and 2.0 g/L of dibasic potassium phosphate in water; adjust with phosphoric acid or potassium hydroxide to a pH of 6.0 ± 0.1); 500 mL

Apparatus 1: 100 rpm

Times: 1, 4, 8, and 16 h

Mobile phase: Acetonitrile, tetrahydrofuran, and *Medium* (35:5:60)

Standard stock solution: 0.05 mg/mL of USP Alprazolam RS in methanol

Standard solution: ($L/500$) mg/mL of USP Alprazolam RS in *Medium* from the *Standard stock solution*, where L is the label claim in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter.

Chromatographic system

(See *Chromatography* $\langle 621 \rangle$, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 7.5-cm; 5- μ m packing L7

Flow rate: 1.3 mL/min

Injection volume: 80 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of alprazolam ($C_{17}H_{13}ClN_4$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (r_U/r_S) \times C_S$$

r_U peak response of alprazolam from the *Sample solution* at each time point

r_S peak response of alprazolam from the *Standard solution*

C_S concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$) dissolved at

each time point (*i*):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_S)] + (C_1 \times V_S)\} \times (1/L) \times 100$$

$$\text{Result}_3 = (\{C_3 \times [V - (2 \times V_S)]\} + [(C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

$$\text{Result}_4 = (\{C_4 \times [V - (3 \times V_S)]\} + [(C_3 + C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

C_T = concentration of alprazolam in the *Sample solution* at the specified time point (mg/mL)

V = volume of *Medium*, 500 mL

L = label claim (mg/Tablet)

V_S = volume of the *Sample solution* withdrawn at each time point and replaced with *Medium* (mL)

Tolerances: See *Table 2*.

Table 2

Time Point (<i>i</i>)	Time (h)	Amount Dissolved			
		0.5-mg Tablet	1-mg Tablet	2-mg Tablet	3-mg Tablet
1	1	NMT 25%	NMT 25%	NMT 20%	NMT 20%
2	4	45%–60%	40%–55%	30%–50%	25%–45%

4	16	NLT 85%	NLT 85%	NLT 85%	NLT 80%

The percentages of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$) released at the times specified conform to *Dissolution* { 711 }, *Acceptance Table 2*.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium: pH 6.0 phosphate buffer (8.0 g/L of monobasic potassium phosphate and 2.0 g/L of dibasic potassium phosphate in water; adjust with phosphoric acid or potassium hydroxide to a pH of 6.0 ± 0.1); 500 mL, deaerated

Apparatus 1: 100 rpm

Times: 1, 4, and 8 h for Tablets labeled to contain 0.5 mg or 1 mg; 1, 4, 8, and 16 h for Tablets labeled to contain 2 mg or 3 mg

Mobile phase: Acetonitrile and *Medium* (40:60)

Standard stock solution: 0.5 mg/mL of USP Alprazolam RS in methanol

Standard solution: ($L/500$) mg/mL of USP Alprazolam RS in *Medium* from the *Standard stock solution*, where L is the label claim in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter of 1- μ m pore size.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 10-cm; 3- μ m or 5- μ m packing L7

Flow rate: 1 mL/min

Injection volume: 100 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of alprazolam ($C_{17}H_{13}ClN_4$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (r_U/r_S) \times C_S$$

r_U = peak response of alprazolam from the *Sample solution* at each time point

r_S = peak response of alprazolam from the *Standard solution*

C_S = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$) dissolved at each time point (i):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_S)] + (C_1 \times V_S)\} \times (1/L) \times 100$$

$$\text{Result}_3 = (\{C_3 \times [V - (2 \times V_S)]\} + [(C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

$$\text{Result}_4 = (\{C_4 \times [V - (3 \times V_S)]\} + [(C_3 + C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

C_U = concentration of alprazolam in the *Sample solution* at the specified time point (mg/mL)

V = volume of *Medium*, 500 mL

L = label claim (mg/Tablet)

V_S = volume of the *Sample solution* withdrawn at each time point and replaced with *Medium* (mL)

Tolerances: See *Table 3*.

Table 3

Time Point (i)	Time (h)	Amount Dissolved			
		0.5-mg Tablet	1-mg Tablet	2-mg Tablet	3-mg Tablet
1	1	15%–35%	10%–30%	10%–30%	5%–25%
2	4	50%–75%	45%–65%	30%–55%	25%–50%
3	8	NLT 75%	NLT 70%	60%–80%	50%–75%
4	16	—	—	NLT 85%	NLT 80%

The percentages of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$) released at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

Test 4: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

Medium: pH 6.0 phosphate buffer (8.0 g/L of monobasic potassium phosphate and 2.0

g/L of dibasic potassium phosphate in water; adjust with phosphoric acid or potassium hydroxide to a pH of 6.0); 500 mL

Apparatus 1 (20-mesh basket): 100 rpm

Times: 1, 4, 8, and 16 h

Mobile phase: Acetonitrile and *Medium* (32:68)

Standard stock solution: 0.4 mg/mL of USP Alprazolam RS in methanol

Standard solution: ($L/500$) mg/mL of USP Alprazolam RS in *Medium* from the *Standard stock solution*, where L is the label claim in mg/Tablet. Pass through a suitable filter of 0.45- μ m pore size, and use the filtrate.

Sample solution: At the end of specified time intervals, withdraw a known volume (V_S) of the solution from the dissolution vessel, and replace an equal volume of fresh *Medium* into the dissolution vessel. Pass the withdrawn sample through a suitable filter of 0.45- μ m pore size, and use the filtrate.

Chromatographic system

(See *Chromatography* $\langle 621 \rangle$, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Flow rate: 1.5 mL/min

Injection volume: 100 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of alprazolam ($C_{17}H_{13}N_4$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (r_U/r_S) \times C_S$$

r_U = peak response of alprazolam from the *Sample solution* at each time point

r_S = peak response of alprazolam from the *Standard solution*

C_S = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of alprazolam ($C_{17}H_{13}N_4$) dissolved at each time point (i):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times V) + (C_1 \times V_S)] \times (1/L) \times 100$$

$$\text{Result}_3 = \{[C_3 \times V] + [(C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{[C_4 \times V] + [(C_3 + C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

C_i = concentration of alprazolam in the *Sample solution* at the specified time point (mg/mL)

V = volume of *Medium*, 500 mL

L = label claim (mg/Tablet)

V_5 volume of the *Sample solution* withdrawn at each time point and replaced with *Medium* (mL)

Tolerances: See *Table 4*.

Table 4

Time Point (i)	Time (h)	Amount Dissolved			
		0.5-mg Tablet	1-mg Tablet	2-mg Tablet	3-mg Tablet
1	1	NMT 40%	NMT 35%	NMT 35%	NMT 35%
2	4	50%–75%	45%–65%	35%–55%	30%–55%
3	8	NLT 75%	70%–90%	55%–75%	50%–70%
4	16	NLT 85%	NLT 85%	NLT 85%	NLT 75%

The percentages of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$) released at the times specified conform to *Dissolution* $\langle 711 \rangle$, *Acceptance Table 2*.

- **Test 5:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.

Medium: pH 6.0 phosphate buffer (8.0 g/L of monobasic potassium phosphate and 2.0 g/L of dibasic potassium phosphate in water; adjust with phosphoric acid to a pH of 6.0); 500 mL

Apparatus 1: 100 rpm

Times: 1, 4, 8, and 16 h

Mobile phase: Acetonitrile, water, and phosphoric acid (350:650:1)

Standard stock solution: 0.5 mg/mL of USP Alprazolam RS in methanol

Standard solution: ($L/500$) mg/mL of USP Alprazolam RS in *Medium* from the *Standard stock solution*, where L is the label claim in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size, and use the filtrate.

Chromatographic system

(See *Chromatography* $\langle 621 \rangle$, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L7

Column temperature: 30 $^{\circ}$

Flow rate: 1 mL/min

Injection volume: 50 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of alprazolam ($C_{17}H_{13}ClN_4$) in the sample withdrawn

from the vessel at each time point (i):

$$\text{Result}_i = (r_U/r_S) \times C_S$$

r_U peak response of alprazolam from the *Sample solution* at each time point

r_S peak response of alprazolam from the *Standard solution*

C_S concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$) dissolved at each time point (i):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_S)] + (C_1 \times V_S)\} \times (1/L) \times 100$$

$$\text{Result}_3 = (\{C_3 \times [V - (2 \times V_S)]\} + [(C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

$$\text{Result}_4 = (\{C_4 \times [V - (3 \times V_S)]\} + [(C_3 + C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

C_i concentration of alprazolam in the *Sample solution* at the specified time point (mg/mL)

V = volume of *Medium*, 500 mL

L = label claim (mg/Tablet)

V_S volume of the *Sample solution* withdrawn at each time point (mL)

Tolerances: See *Table 5*.

Table 5

Time Point (i)	Time (h)	Amount Dissolved
1	1	NMT 25%
2	4	40%–65%
3	8	65%–95%
4	16	NLT 85%

The percentages of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$) released at the times specified conform to *Dissolution* $\langle 711 \rangle$, *Acceptance Table 2*.

*(RB 1-Apr-2014)

IMPURITIES

Change to read:

- **Organic Impurities**

Buffer: 5.4 g/L of monobasic potassium phosphate (KH_2PO_4) in water. Adjust with phosphoric acid to a pH of 3.4.

Solution A: Acetonitrile, methanol, and *Buffer* (27:10:63)

Solution B: Acetonitrile, methanol, and *Buffer* (7:3:10)

Mobile phase: See *Table 6*.

Table 6

Time (min)	Solution A (%)	Solution B (%)
0	95	5
22	95	5
25	15	85
60	15	85
60.1	95	5
70	95	5

System suitability solution: 1 µg/mL each of USP Chlordiazepoxide Related Compound A RS, USP Alprazolam Related Compound A RS, and USP Nordazepam RS; and 0.4 µg/mL of USP Alprazolam RS in methanol

Standard solution: 0.4 µg/mL of USP Alprazolam RS in methanol

Sample solution: From NLT 20 Tablets ground to a fine powder, transfer an amount of powder to a suitable flask to obtain a nominal concentration of 0.2 mg/mL of alprazolam in methanol. [Note—Sonicate for 15 min to dissolve the contents.] Filter a portion, and discard the first 1 mL of filtrate.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 25-cm; 5-µm packing L7

Flow rate: 1.5 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times are listed in *Table 7*.]

Suitability requirements

Resolution: NLT 1.5 between nordazepam and alprazolam; NLT 1.5 between chlordiazepoxide related compound A and alprazolam related compound A, *System suitability solution*

Tailing factor: NMT 2.0 for the alprazolam peak, *System suitability solution*

Relative standard deviation: NMT 5%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of the impurity from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of alprazolam in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 7*)

Acceptance criteria: See *Table 7*.

USP Nordazepam RS **BRIEFING**

Alprazolam Orally Disintegrating Tablets, USP 38 page 2104. As part of the USP monograph modernization efforts, it is proposed to revise the monograph as follows:

1. Add an *Identification* test *B* based on the UV spectral agreement for the main peak from the *Assay*.
2. Revise the *Assay* to add the use of a diode array detector to support the proposed *Identification* test *B*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM4: D. Min.)

Correspondence Number—C153797

Comment deadline: September 30, 2015

Alprazolam Orally Disintegrating Tablets**DEFINITION**

Alprazolam Orally Disintegrating Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of alprazolam (C₁₇H₁₃ClN₄).

IDENTIFICATION**Change to read:**

-

■ A.**■ 2S (USP39)**

The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

Add the following:

- **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. **■ 2S (USP39)**

ASSAY**Change to read:**

- **Procedure**

Buffer: 6.8 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 3.5.

Diluent: Acetonitrile and water (60:40)

Mobile phase: Acetonitrile, methanol, and *Buffer* (35:10:55)

Standard solution: 10 µg/mL of USP Alprazolam RS in *Diluent*

Sample solution: Nominally 10 µg/mL of alprazolam from Tablets prepared as follow.

Transfer 10 Tablets into a suitable volumetric flask. Add *Diluent* to volume and pass through a suitable filter. [Note—Sonicate with intermittent shaking to help dissolve, if

necessary.]

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 221 nm.

■ For *Identification* test B, use a diode array detector in the range of 200–400 nm.

■ 2S (USP39)

Column: 4.6-mm × 15-cm; 5-μm packing L7

Column temperature: 30°

Flow rate: 1.5 mL/min

Injection volume: 30 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alprazolam (C₁₇H₁₃ClN₄) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Alprazolam RS in the *Standard solution* (μg/mL)

C_U nominal concentration of alprazolam in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• Disintegration { 701 }

Test 1

Time: NMT 60 s

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Disintegration Test 2*.

Time: NMT 30 s

• Dissolution { 711 }

Test 1

Medium: pH 6.0 phosphate buffer (8 g/L of monobasic potassium phosphate and 2 g/L of dibasic potassium phosphate in water. Adjust with phosphoric acid or diluted potassium hydroxide to a pH of 6.0 ± 0.1); 900 mL

Apparatus 2: 50 rpm

Time: 10 min

Mobile phase, Chromatographic system, and System suitability: Proceed as directed

in the *Assay*, except use an *Injection volume* of 100 μL .

Standard stock solution: 50 $\mu\text{g}/\text{mL}$ of USP Alprazolam RS in methanol. [Note—Sonicate to help dissolve, if necessary.]

Standard solution: $(L/1000)$ $\mu\text{g}/\text{mL}$ of USP Alprazolam RS in *Medium* from the *Standard stock solution*, where L is the label claim in $\mu\text{g}/\text{Tablet}$

Sample solution: Pass a portion of the solution under test through a nylon membrane filter of 0.45- μm pore size, discarding the first few mL.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alprazolam ($\text{C}_{17}\text{H}_{13}\text{ClN}_4$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of alprazolam ($\text{C}_{17}\text{H}_{13}\text{ClN}_4$) is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: pH 6.0 phosphate buffer (8 g/L of monobasic potassium phosphate and 2 g/L of dibasic potassium phosphate in water. Adjust with phosphoric acid or potassium hydroxide to a pH of 6.0 ± 0.1); 500 mL

Apparatus 2: 50 rpm

Time: 10 min

Buffer: 1.36 g/L of monobasic potassium phosphate. Adjust with dilute sodium hydroxide to a pH of 6.0.

Mobile phase: Acetonitrile and *Buffer* (35:65)

Standard stock solution: 50 $\mu\text{g}/\text{mL}$ of USP Alprazolam RS in methanol. [Note—Sonicate to help dissolve, if necessary.]

Standard solution: $(L/500)$ $\mu\text{g}/\text{mL}$ of USP Alprazolam RS in *Medium* from the *Standard stock solution*, where L is the label claim in $\mu\text{g}/\text{Tablet}$

Sample solution: Pass a 5-mL aliquot of the solution under test through a suitable filter of 0.45- μm pore size, discarding the first 3 mL.

Chromatographic system

(See *Chromatography* $\langle 621 \rangle$, *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm \times 7.5-cm; 5- μm packing L7

Flow rate: 1.5 mL/min

Injection volume: 40 μL

Run time: 3 times the retention time of alprazolam

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alprazolam (C₁₇H₁₃ClN₄) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Alprazolam RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 500 mL

L = label claim (mg/Tablet)

Tolerances: NLT 70% (Q) of the labeled amount of alprazolam (C₁₇H₁₃ClN₄) is dissolved.

- **Uniformity of Dosage Units** { 905 } : Meet the requirements

IMPURITIES

- **Organic Impurities**

Diluent: Prepare as directed in the *Assay*.

Buffer: 6.8 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 3.0.

Solution A: Acetonitrile, methanol, and *Buffer* (25:20:55)

Solution B: Acetonitrile, methanol, and *Buffer* (40:5:55)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
12	100	0
15	0	100
60	0	100
65	100	0
70	100	0

Standard solution: 0.6 µg/mL of USP Alprazolam RS in *Diluent*

Sample solution: 200 µg/mL of alprazolam in *Diluent*. Prepare using 10 Tablets, and pass through a suitable filter.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 240 nm

Column: 4.6-mm × 15-cm; 5-µm packing L7

Column temperature: 30°

Flow rate: 1.2 mL/min

Injection volume: 25 µL

System suitability

Sample: *Standard solution*

Suitability requirements**Theoretical plates:** NLT 2000**Tailing factor:** NMT 1.5**Relative standard deviation:** NMT 6.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

 r_U peak response of each impurity from the *Sample solution* r_S peak response of alprazolam from the *Standard solution* C_S concentration of USP Alprazolam RS in the *Standard solution* ($\mu\text{g/mL}$) C_U nominal concentration of alprazolam in the *Sample solution* ($\mu\text{g/mL}$) F = relative response factor (see *Table 2*)**Acceptance criteria:** See *Table 2*. Disregard any peaks less than 0.05%.**Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Alprazolam related compound A ^{a,b}	0.8	—	—
Alprazolam	1.0	—	—
2-Amino-5-chlorobenzophenone	2.9	1.9	0.5
Any other unknown impurity	—	1.0	0.5
Total impurities	—	—	2.0

^a 2-(2-Acetylhydrazino)-7-chloro-5-phenyl-3H-1,4-benzodiazepine.

^b Disregard the peak due to alprazolam related compound A, because it is a process impurity in alprazolam.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers, and store at controlled room temperature.
- **Labeling:** When more than one *Disintegration* test is given, the labeling states the *Disintegration* test used only if *Test 1* is not used. When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

USP Alprazolam RS

BRIEFING

Aminobenzoate Potassium, *USP 38* page 2174; and *PF 41(2)* [Mar.–Apr. 2015]. In preparation for the omission of the flame tests from *Identification Tests—General* { 191 }, proposed in *PF 41(2)*, it is proposed to delete the reference to { 191 } under *Identification* test *C* and include a complete description of the flame test in the monograph. Manufacturers are encouraged to submit a replacement wet-chemistry or an instrumental procedure for the

Expert Committee's consideration.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

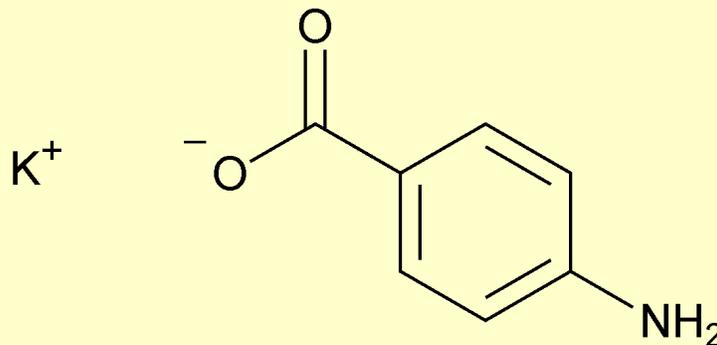

(SM2: H. Cai.)

Correspondence Number—C157466

Comment deadline: September 30, 2015

Aminobenzoate Potassium

Add the following:

$C_7H_6KNO_2$ 175.23

Benzoic acid, 4-amino-, potassium salt;
Potassium 4-aminobenzoate [138-84-1]. ■1S (*USP39*)

DEFINITION

Change to read:

Aminobenzoate Potassium contains NLT 98.5%

■98.0% ■1S (*USP39*)

and NMT 101.0%

■102.0% ■1S (*USP39*)

of aminobenzoate potassium ($C_7H_6KNO_2$), calculated on the dried basis.

IDENTIFICATION

Delete the following:

- ~~A. Ultraviolet Absorption (197U)~~

~~**Solution:** 10 µg/mL in 0.001 N sodium hydroxide~~

~~**Acceptance criteria:** Meets the requirements.~~

■1S (*USP39*)

Add the following:

- **A. Infrared Absorption (197K)** ■1S (*USP39*)

Delete the following:■● ~~B.~~~~**Sample:** 400 mg~~~~**Analysis:** Dissolve the *Sample* in 10 mL of water, add 1 mL of 3 N hydrochloric acid, filter, and wash the precipitate with two 5 mL portions of cold water. Recrystallize the precipitate from alcohol, and dry at 110° for 1 h.~~~~**Acceptance criteria:** The resulting *p*-aminobenzoic acid melts between 186° and 189°.~~~~■1S (USP39)~~**Add the following:**

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■1S (USP39)

Delete the following:

- ~~**C. Identification Tests—General, Potassium** (191):~~ A solution (1 in 100) meets the requirements of the flame test. ■2S (USP39)

Add the following:■● **C.****Sample solution:** A solution (1 in 100)

Acceptance criteria: The *Sample solution* imparts a violet color to a nonluminous flame. Since the presence of small quantities of sodium masks the color, screen out the yellow color produced by sodium by viewing through a blue filter that blocks emission at 589 nm (sodium) but is transparent to emission at 404 nm (potassium). [Note—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.]

■2S (USP39)

BRIEFING

Aminobenzoate Potassium Capsules, *USP 38* page 2175. As part of the USP monograph modernization effort, the following revisions are proposed:

1. Add *Identification* test *B* based on the retention time agreement of aminobenzoic acid in the proposed HPLC method.
2. Replace the existing UV procedure in the *Assay* with a validated stability-indicating HPLC procedure. The proposed liquid chromatographic procedure is based on analyses performed with the Eclipse XBD-Phenyl brand of L11 column. The typical retention time for aminobenzoic acid is about 6.0 min.
3. Add a test for *Organic Impurities* based on the proposed HPLC procedure in the *Assay*. This method monitors impurities that are consistent with those found in aminobenzoic acid.
4. Add a new Reference Standard and an existing Reference Standard, introduced by the proposed HPLC procedure, to the *USP Reference Standards* section: USP 4-Nitrobenzoic Acid RS and USP Benzocaine RS.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Aminobenzoate Potassium Capsules

DEFINITION

Aminobenzoate Potassium Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of aminobenzoate potassium (C₇H₆KNO₂).

IDENTIFICATION

● **A.**

Sample: 1 g of the Capsule contents

Analysis: Dissolve the *Sample* in 25 mL of water, add 5 mL of 3 N hydrochloric acid, and wash the precipitate with two 5-mL portions of cold water. Recrystallize from alcohol the precipitate so obtained, and dry at 110° for 1 h.

Acceptance criteria: The *p*-aminobenzoic acid melts between 186° and 189°.

Add the following:

- ● **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the

Standard solution, as obtained in the Assay. ■2S (USP39)

ASSAY

Change to read:

● Procedure

~~**Standard solution:** 5 µg/mL of USP Aminobenzoate Potassium RS in water~~

~~**Sample solution:** Nominally 5 µg/mL of aminobenzoate potassium prepared as follows. Remove as completely as possible, and combine, the contents of NLT 20 Capsules. Transfer a portion of the combined contents, equivalent to 100 mg of aminobenzoate potassium, to a 200 mL volumetric flask. Add 150 mL of water, shake by mechanical means for 30 min, dilute with water to volume, and filter. Pipet 2 mL of the filtrate into a 200 mL volumetric flask, and dilute with water to volume.~~

~~Spectrometric conditions-~~

~~**Mode:** UV~~

~~**Analytical wavelength:** maximum absorbance at about 270 nm~~

~~**Blank:** Water~~

~~Analysis-~~

~~**Samples:** *Standard solution* and *Sample solution*~~

~~Concomitantly determine the absorbances of the *Standard solution* and *Sample solution* and calculate the percentage of the labeled amount of aminobenzoate potassium ($C_7H_6KNO_2$) in the portion of Capsule taken:~~

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

~~A_U absorbance of the *Sample solution*~~

~~A_S absorbance of the *Standard solution*~~

~~C_S concentration of USP Aminobenzoate Potassium RS in the *Standard solution* (µg/mL)~~

~~C_U nominal concentration of aminobenzoate potassium in the *Sample solution* (µg/mL)~~

~~**Acceptance criteria:** 90.0%–110.0%~~

■**Solution A:** 1.5% Acetic acid prepared as follows. Mix 690 mL of water with 10 mL of acetic acid and pass through a filter of 0.45-µm pore size.

Mobile phase: Methanol and *Solution A* (15:85)

Standard solution: 0.1 mg/mL of USP Aminobenzoate Potassium RS in *Mobile phase*

Sample solution: Nominally 0.1 mg/mL of aminobenzoate potassium prepared as follows. Remove as completely as possible, and combine the contents of NLT 10 Capsules. Transfer a portion of the combined contents, equivalent to 10 mg of aminobenzoate potassium to a 100-mL volumetric flask, dissolve in 70 mL of *Mobile phase*, sonicate for 3–4 min, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: 280 nm

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of aminobenzoate potassium ($\text{C}_7\text{H}_6\text{KNO}_2$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U

= peak response from the *Sample solution*

r_S

= peak response from the *Standard solution*

C_S

= concentration of USP Aminobenzoate Potassium RS in the *Standard solution* (mg/mL)

C_U

= nominal concentration of aminobenzoate potassium in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110% $\pm 2S$ (USP39)

PERFORMANCE TESTS

● **Dissolution** { 711 }

Medium: Water; 900 mL

Apparatus 1: 100 rpm

Time: 45 min

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum absorbance at about 270 nm

Standard solution: A known concentration of USP Aminobenzoate Potassium RS in *Medium*

Sample solution: Filter portions of the solution under test, and dilute with *Medium*, if necessary, in comparison with the *Standard solution* concentration.

Analysis: Calculate the percentage of the labeled amount of aminobenzoate potassium ($\text{C}_7\text{H}_6\text{KNO}_2$) dissolved.

Tolerances: NLT 75% (Q) of the labeled amount of aminobenzoate potassium ($\text{C}_7\text{H}_6\text{KNO}_2$) is dissolved.

● **Uniformity of Dosage Units** { 905 } : Meet the requirements

IMPURITIES**Add the following:****Organic Impurities**

Solution A, Mobile phase, and Chromatographic system: Prepare as directed in the Assay.

Standard solution: 1 µg/mL each of USP Aminobenzoate Potassium RS, USP 4-Nitrobenzoic Acid RS, and USP Benzocaine RS in *Mobile phase*

Sensitivity solution: 0.1 µg/mL of USP Aminobenzoate Potassium RS in *Mobile phase* from *Standard solution*

Sample solution: Nominally 1 mg/mL of aminobenzoate potassium in *Mobile phase* prepared as follows. Remove as completely as possible, and combine, the contents of NLT 10 Capsules. Transfer a portion of the combined contents, equivalent to 10 mg of aminobenzoate potassium, to a 10-mL volumetric flask. Dissolve in 7 mL of *Mobile phase*, sonicate for 3–4 min, and dilute with *Mobile phase* to volume.

BRIEFING

Aminobenzoate Sodium, *USP 38* page 2176 and *PF 41(2)* [Mar.–Apr. 2015]. In preparation for the omission of the flame tests from *Identification Tests—General* 〈 191 〉, proposed in *PF 41(2)*, it is proposed to delete the reference to 〈 191 〉 under *Identification* test C and include a complete description of the flame test in the monograph. Manufacturers are encouraged to submit a replacement wet-chemistry or an instrumental procedure for the Expert Committee's consideration.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

10.1	85	15
13	85	15

Diluent: Methanol and water (85:15)

System suitability solution: 1 mg/mL of USP Aminobenzoate Sodium RS, 0.01 mg/mL of USP 4-Nitrobenzoic Acid RS, and 0.01 mg/mL of USP Benzocaine RS in *Diluent* prepared as follows. Transfer 1 mL each of 0.1 mg/mL of USP 4-Nitrobenzoic Acid RS in methanol and 0.1 mg/mL of USP Benzocaine RS in *Diluent* to a 10-mL volumetric flask containing the appropriate amount of USP Aminobenzoate Sodium RS, and dilute with *Diluent* to volume.

Standard solution: 1 µg/mL each of USP Aminobenzoate Sodium RS, USP 4-Nitrobenzoic Acid RS, and USP Benzocaine RS in *Diluent*

Sample solution: 1 mg/mL of Aminobenzoate Sodium in *Diluent*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.0-mm × 15-cm; 3.5-µm packing L11

Flow rate: 0.4 mL/min

Injection volume: 5 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.5 between benzocaine and 4-nitrobenzoic acid, *System suitability solution*

Relative standard deviation: NMT 3% for the aminobenzoate sodium, 4-nitrobenzoic acid, and benzocaine peaks, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of 4-nitrobenzoic acid or benzocaine in the portion of Aminobenzoate Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of 4-nitrobenzoic acid or benzocaine from the *Sample solution*

r_S peak response of 4-nitrobenzoic acid or benzocaine from the *Standard solution*

C_S concentration of USP 4-Nitrobenzoic Acid RS or USP Benzocaine RS in the *Standard solution* (mg/mL)

C_U concentration of Aminobenzoate Sodium in the *Sample solution* (mg/mL)

Calculate the percentage of any individual unspecified impurity in the portion of Aminobenzoate Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_{\bar{f}}$ peak response of any unspecified impurity from the *Sample solution*

$r_{\bar{s}}$ peak response of aminobenzoate from the *Standard solution*

$C_{\bar{s}}$ concentration of USP Aminobenzoate Sodium RS in the *Standard solution* (mg/mL)

$C_{\bar{f}}$ concentration of Aminobenzoate Sodium in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 3.

Table 3

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Aminobenzoic acid	1.0	—
Benzocaine	2.0	0.2
4-Nitrobenzoic acid	2.1	0.2
Any individual unspecified impurity	—	0.10

Gamma-Aminobutyric Acid Capsules. Because there is no existing *USP* monograph for this dosage form, a new monograph is being proposed. The liquid chromatographic procedure in the test for *Strength* is based on analyses performed with the Waters XBridge Amide brand of L68 column. Typical retention times for gamma-aminobutyric acid and monosodium glutamate are 7.2 and 8.7 min, respectively.

(DS: N. Davydova.)

Correspondence Number—C135188

Comment deadline: September 30, 2015

Add the following:

■ **Gamma-Aminobutyric Acid Capsules**

DEFINITION

Gamma-Aminobutyric Acid Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of gamma-aminobutyric acid (C₄H₉NO₂).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Strength*.

STRENGTH

● **Procedure**

Buffer solution: 20 mM monobasic sodium phosphate. Adjust with 1 N sodium hydroxide to a pH of 5.5.

Mobile phase: Acetonitrile and *Buffer solution* (78:22)

Diluent: Acetonitrile and water (60:40)

System suitability solution: 1 mg/mL of USP Gamma-Aminobutyric Acid RS and 0.1 mg/mL of monosodium glutamate in *Diluent*

Standard solution: 1 mg/mL of USP Gamma-Aminobutyric Acid RS in *Diluent*

Sample solution: Accurately weigh the contents of NLT 20 Capsules and mix. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of gamma-aminobutyric acid, to a 50-mL volumetric flask. Add about 40 mL of *Diluent* and sonicate for about 10 min. Cool the mixture to room temperature, dilute with *Diluent* to volume, and pass through a nylon membrane filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography* 〈621〉, *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.6-mm \times 15-cm; 3.5- μ m packing L68

Column temperature: 35^o

Flow rate: 1.5 mL/min

Injection volume: 20 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for gamma-aminobutyric acid and monosodium

glutamate are 1.0 and 1.2, respectively.]

Suitability requirements

Resolution: NLT 2.0 between gamma-aminobutyric acid and monosodium glutamate, *System suitability solution*

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of gamma-aminobutyric acid ($C_4H_9NO_2$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Gamma-Aminobutyric Acid RS in the *Standard solution* (mg/mL)

C_U nominal concentration of gamma-aminobutyric acid in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **Disintegration and Dissolution** $\langle 2040 \rangle$: Meet the requirements for *Disintegration*

BRIEFING

Diatrizoate Sodium, *USP 38* page 3070. On the basis of comments received, it is proposed to revise the monograph as follows:

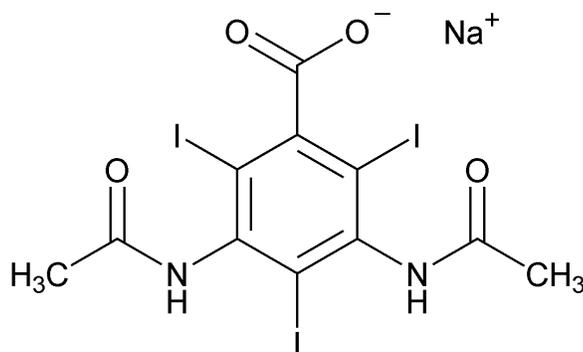

1. Delete *Identification* test *B* because it generates iodine vapors, which are a potential safety hazard because iodine vapors can irritate the nose and eyes.
2. Delete the reference to *Identification Tests—General* { 191 }, *Sodium* in *Identification* test *C* and include a complete description of each flame test in the monograph.
3. Include a calculation formula in the *Assay*.
4. Rename the test for *Organic Impurities, Procedure: Free Aromatic Amine* as *Limit of Free Aromatic Amine*. Reformat the procedure to make it easier to follow and perform.
5. Rename the *Iodine and Iodide* test as *Limit of Iodine and Iodide*. Reformat the procedure to make it easier to follow and perform.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

ASSAY

Change to read:

- **Procedure**

Sample solution: Transfer 300 mg of Diatrizoate Sodium to a glass-stoppered, 125-mL conical flask, add 30 mL of 1.25 N sodium hydroxide and 500 mg of powdered zinc, connect the flask to a reflux condenser, and reflux the mixture for 1 h. Cool the flask to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and filter the mixture. Rinse the flask and filter thoroughly, adding the rinsings to the filtrate. Add 5 mL of glacial acetic acid and 1 mL of tetrabromophenolphthalein ethyl ester TS.

■ **Titrimetric system**

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.05 N silver nitrate VS

Endpoint detection: Visual

Analysis: Titrate the *Sample solution* with the *Titrant* until the yellow precipitate just turns green.

Calculate the percentage of diatrizoate sodium ($C_{11}H_8I_3N_2NaO_4$) in the portion of Diatrizoate Sodium taken:

$$\text{Result} = [(V \times N \times F)/W] \times 100$$

V

= sample *Titrant* volume (mL)

 N

= *Titrant* normality (mEq/mL)

 F

= equivalent weight of diatrizoate sodium, 212 mg/mEq

 W

= weight of Diatrizoate Sodium (mg)

■ 2S (USP39)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

Delete the following:

●● Heavy Metals 〈 231 〉

Standard solution: To 2.0 mL of *Standard Lead Solution* (20 µg of Pb) in a 50-mL color-comparison tube, add 5 mL of 1 N sodium hydroxide, and dilute with water to 40 mL.

Sample solution: Dissolve 1.0 g of Diatrizoate Sodium in 20 mL of water and 5 mL of 1 N sodium hydroxide, transfer the solution to a 50-mL color-comparison tube, and dilute with water to 40 mL.

Analysis: To each of the tubes containing the *Standard solution* and the *Sample solution*, add 10 mL of sodium sulfide TS, allow to stand for 5 min, and view downward over a white surface.

Acceptance criteria: The color of the solution from the *Sample solution* is not darker than that of the solution from the *Standard solution* (0.002%). •(Official 1-Dec-2015)

Delete the following:

●● Organic Impurities

● Procedure: Free Aromatic Amine

Sample solution: Transfer 1.0 g to a 50-mL volumetric flask, and add 5 mL of water and 10 mL of 0.1 N sodium hydroxide.

Standard stock solution: Dissolve a suitable quantity of USP Diatrizoic Acid Related Compound A RS in 0.1 N sodium hydroxide. Use 0.2 mL of 0.1 N sodium hydroxide for each 5.0 mg of Standard, and dilute with water to obtain 500 µg/mL.

Standard solution: Transfer 4 mL of water, 10 mL of 0.1 N sodium hydroxide, and 1.0 mL of a *Standard stock solution* to a 50-mL volumetric flask.

Blank: Transfer 5 mL of water and 10 mL of 0.1 N sodium hydroxide to a 50-mL volumetric flask.

Analysis: Treat each flask as follows. Add 25 mL of dimethyl sulfoxide, insert the stopper, and mix by swirling gently. Chill in an ice bath in the dark for 5 min.

[Note—In conducting the following steps, keep the flasks in the ice bath and in the dark as

~~much as possible until all of the reagents have been added. }~~

~~Slowly add 2 mL of hydrochloric acid and allow to stand for 5 min. Add 2 mL of sodium nitrite solution (1 in 50), and allow to stand for 5 min. Add 1 mL of sulfamic acid solution (2 in 25), shake, and allow to stand for 5 min.~~

~~[Note—Considerable pressure is produced.]~~

~~Add 2 mL of a solution (1 in 1000) of *N*-(1-naphthyl)ethylenediamine dihydrochloride in dilute propylene glycol (7 in 10). Remove the flasks from the ice bath and from storage in the dark, and allow to stand in a water bath at 22°–25° for 10 min. Shake gently and occasionally during this period, releasing the pressure by loosening the stopper. Dilute with water to volume.~~

Spectrometric conditions

~~(See *Spectrophotometry and Light Scattering* (851).)~~

~~**Mode:** UV-Vis~~

~~**Analytical wavelength:** About 465 nm~~

~~**Cell:** 1 cm~~

~~**Analysis:** Within 5 min from the time of diluting the solutions in all three flasks to 50 mL, concomitantly determine the absorbances of the solutions.~~

~~**Acceptance criteria:** The absorbance of the *Sample solution* is NMT that of the *Standard solution* (0.05%).~~

■ 2S (USP39)

Add the following:

■ • **Limit of Free Aromatic Amine**

Solution A: 1 mg/mL of *N*-(1-naphthyl)ethylenediamine dihydrochloride in a mixture of propylene glycol and water (70:30)

Standard stock solution: 0.5 mg/mL of USP Diatrizoic Acid Related Compound A RS in 0.1 N sodium hydroxide

Standard solution: Transfer 4 mL of water, 10 mL of 0.1 N sodium hydroxide, and 1.0 mL of *Standard stock solution* to a 50-mL volumetric flask.

Sample solution: Transfer 1.0 g of Diatrizoate Sodium to a 50-mL volumetric flask, and add 5 mL of water and 10 mL of 0.1 N sodium hydroxide.

Blank solution: Transfer 5 mL of water and 10 mL of 0.1 N sodium hydroxide to a 50-mL volumetric flask.

Instrumental conditions

Mode: Vis

Analytical wavelength: 465 nm

Cell: 1 cm

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank solution*

Treat the *Samples* as follows. Add 25 mL of dimethylsulfoxide. Place the flask in an ice bath for 5 min. Add 2 mL of hydrochloric acid, and allow to stand in the ice bath for 5 min. Add 2.0 mL of sodium nitrite solution (20 mg/mL), and allow to stand in the ice bath for 5 min. Remove the flask from the ice bath, add 1.0 mL of sulfamic acid solution (80 mg/mL), and allow to stand in the ice bath for 5 min. [**Caution**—Considerable pressure is

produced.] Add 2.0 mL of *Solution A*. Remove the flasks from the ice bath and allow to stand in a water bath at room temperature. Shake occasionally, releasing the pressure by loosening the stopper. Dilute with water to volume. Within 5 min, measure the absorbances of the *Standard solution* and *Sample solution* against the blank.

Acceptance criteria: The absorbance of the *Sample solution* is NMT that of the *Standard solution* (NMT 0.05% of free aromatic amine). ■2S (USP39)

Add the following:

- **C.**
Sample solution: Dissolve 60 mg of Diclofenac Sodium in 0.5 mL of methanol and add 0.5 mL of water.
Analysis: To 0.5 mL of the *Sample solution* add 1.5 mL of methoxyphenylacetic TS and

cool in ice water for 30 min. A voluminous, white, crystalline precipitate is formed. Place the mixture of precipitate in a water bath at 20° and stir for 5 min. The precipitate does not disappear. Add 1 mL of ammonia TS. The precipitate dissolves completely. Add 1 mL of 158 g/L of ammonium carbonate in water.

Acceptance criteria: No precipitate is formed. ■2S (USP39)

ASSAY

● Procedure

Sample solution: Dissolve about 450 mg of Diclofenac Sodium in 25 mL of glacial acetic acid.

Titrimetric system

Titrant: 0.1 N perchloric acid VS

Analysis: Titrate with *Titrant*, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 31.81 mg of diclofenac sodium (C₁₄H₁₀Cl₂NNaO₂).

Acceptance criteria: 99.0%–101.0% on the dried basis

IMPURITIES

Delete the following:

●● Heavy Metals, Method II { 231 }

Analysis: To prepare the *Sample solution*, use a 100-mL borosilicate glass beaker or a quartz crucible. If the residue is not completely white after the ignition at 500°–600°, add enough hydrogen peroxide to dissolve it, heat gently until dry, and ignite for 1 h. Repeat the hydrogen peroxide treatment and ignition until the residue is completely white. Proceed as directed for the *Test preparation* in the chapter, beginning with "Cool, add 4 mL of 6 N hydrochloric acid..."

Acceptance criteria: NMT 10 ppm (Official 1-Dec-2015)

● Organic Impurities

Solution A: 0.01 M phosphoric acid and 0.01 M monobasic sodium phosphate (1:1). If necessary, adjust with additional portions of the appropriate components to a pH of 2.5 ± 0.2.

Mobile phase: Methanol and *Solution A* (70:30)

Diluent: Methanol and water (70:30)

System suitability solution: 20 µg/mL of diethyl phthalate, 7.5 µg/mL of USP Diclofenac Related Compound A RS, and 0.75 mg/mL of USP Diclofenac Sodium RS in *Diluent*

Standard stock solution: 0.75 mg/mL of USP Diclofenac Related Compound A RS in methanol

Standard solution: 1.5 µg/mL of USP Diclofenac Related Compound A RS in *Diluent* from *Standard stock solution*

Sample solution: 0.75 mg/mL of Diclofenac Sodium in *Diluent*

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L7 (end-capped)

Flow rate: 1 mL/min

Injection volume: 10 µL

Run time: 2.5 times the retention time of diclofenac

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for diethyl phthalate, diclofenac related compound A, and diclofenac are 0.5, 0.6, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.2 between diethyl phthalate and diclofenac related compound A; NLT 6.5 between diclofenac related compound A and diclofenac, *System suitability solution*

Relative standard deviation: NMT 5%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of diclofenac related compound A in the portion of Diclofenac Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of diclofenac related compound A from the *Sample solution*

r_S = peak response of diclofenac related compound A from the *Standard solution*

C_S = concentration of USP Diclofenac Related Compound A RS in the *Standard solution* (mg/mL)

C_U = concentration of Diclofenac Sodium in the *Sample solution* (mg/mL)

Calculate the percentage of each other impurity in the portion of Diclofenac Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of diclofenac related compound A from the *Standard solution*

C_S = concentration of USP Diclofenac Related Compound A RS in the *Standard solution* (mg/mL)

C_U = concentration of Diclofenac Sodium in the *Sample solution* (mg/mL)

Acceptance criteria

Diclofenac related compound A: NMT 0.2%

Each other individual impurity: NMT 0.2%

Total impurities: NMT 0.5%

SPECIFIC TESTS

- **Color of Solution:** A solution (1 of 20) of Diclofenac Sodium in methanol is colorless to faintly yellow, and the absorbance of the solution, determined in a 1-cm cell at 440 nm, is NMT 0.050, methanol being used as the blank.
- **Clarity of Solution:** The solution prepared as directed under *Color of Solution* is not

significantly less clear than an equal volume of methanol contained in a similar vessel and examined similarly.

- **pH** 〈 791 〉

Sample solution: A solution (1 of 100)

Acceptance criteria: 7.0–8.5

- **Loss on Drying** 〈 731 〉

Analysis: Dry at 105°–110° for 3 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight, light-resistant containers.

- **USP Reference Standards** 〈 11 〉

USP Diclofenac Sodium RS

USP Diclofenac Related Compound A RS

N-(2,6-Dichlorophenyl)indolin-2-one.

C₁₄H₉Cl₂NO 278.14

BRIEFING

Doxapram Hydrochloride, *USP 38* page 3207. As part of USP monograph modernization efforts, it is proposed to revise the monograph as follows:

1. Replace the TLC test for *Organic Impurities* with a stability-indicating HPLC procedure that is capable of identifying and separating doxapram chloroethyl analog and doxapram related compound B. Add the corresponding limits based on the current USP specification. The liquid chromatographic procedure was validated using the Waters Xselect CSH C18 brand of L1 column. The typical retention time for doxapram is about 5.5 min.
2. Replace the current titration *Assay* with a chromatographic procedure using the same parameters as in the proposed test for *Organic Impurities*.
3. Revise the acceptance criteria in the *Definition* and the *Assay* from "NLT 98.0% and NMT 100.5%" to "NLT 98.0% and NMT 102.0%," which are typical for chromatographic procedures.
4. Replace the current *Identification* test *B*, based on UV absorption, with retention time agreement as in the proposed *Assay*.
5. Add *Identification* test *C* for chloride counter ion determination.
6. Add USP Doxapram Related Compound B RS to the *USP Reference Standards* section to support the proposed test for *Organic Impurities*.

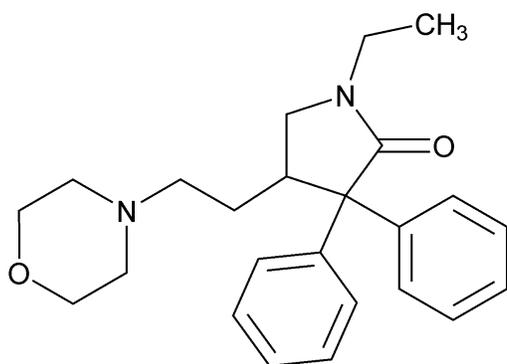

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

BRIEFING

Doxapram Hydrochloride Injection, *USP 38* page 3208. As part of USP monograph modernization efforts, it is proposed to revise the monograph as follows:

1. Add a stability-indicating HPLC procedure for the *Organic Impurities* test. The HPLC procedure was validated using the Waters Xselect CSH C18 brand of L1 column. The typical retention time for doxapram is about 5.5 min. The *Acceptance criteria* are consistent with the *Doxapram Hydrochloride* revision proposal, appearing elsewhere in this issue of *PF*. Manufacturers are encouraged to submit their approved specifications to USP if they are different from those proposed in this revision.
2. Replace the current HPLC procedure in the *Assay*, which uses an internal standard, with a chromatographic procedure that uses the same parameters as in the proposed test for *Organic Impurities*.
3. Revise the current *Identification* test *A* based on the proposed *Assay*.
4. Replace the current *Identification* test *B*, based on the UV spectrum from the sample extraction using chloroform, with the UV spectral agreement for the main peak from the proposed *Assay*.
5. Include a storage requirement in the *Packaging and Storage* section based on the approved storage conditions for drug products containing doxapram hydrochloride.
6. Add USP Doxapram Related Compound B RS to the *USP Reference Standards* section to support the proposed test for *Organic Impurities*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Doxapram Hydrochloride Injection**DEFINITION**

Doxapram Hydrochloride Injection is a sterile solution of Doxapram Hydrochloride in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of doxapram hydrochloride monohydrate (C₂₄H₃₀N₂O₂·HCl·H₂O).

IDENTIFICATION

Change to read:

- **A.** The retention time of the major peak of doxapram from
 ■ 2S (USP39)

the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

Change to read:

- **B.**

Standard solution: Transfer 50 mg of USP Doxapram Hydrochloride RS to a separator containing 5 mL of water. Add 1 mL of a saturated solution of sodium chloride to the separator, insert the stopper, and mix. Add 5 mL of 2.5 N sodium hydroxide, and extract with three 15 mL portions of chloroform. Pass each extract through a pledget of glass wool, combine the filtrates in a 50 mL volumetric flask, and dilute with chloroform to volume. Evaporate about 5 mL of this solution to dryness. Dissolve the residue in 0.01 N sulfuric acid, and dilute with 0.01 N sulfuric acid to 100 mL.

Sample solution: Transfer a volume of Injection, equivalent to 50 mg of doxapram hydrochloride monohydrate, to a separator containing 5 mL of water. Add 1 mL of a saturated solution of sodium chloride to the separator, insert the stopper, and mix. Add 5 mL of 2.5 N sodium hydroxide, and extract with three 15 mL portions of chloroform. Pass each extract through a pledget of glass wool, combine the filtrates in a 50 mL volumetric flask, and dilute with chloroform to volume. Evaporate about 5 mL of this solution to dryness. Dissolve the residue in 0.01 N sulfuric acid, and dilute with 0.01 N sulfuric acid to 100 mL.

Acceptance criteria: The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as that of the *Standard solution*.

- The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay. ■ 2S (USP39)

ASSAY**Change to read:**

- **Procedure**

Buffer: 2.8 g/L of monobasic potassium phosphate in water. Adjust with 50% phosphoric acid or 1 N potassium hydroxide to a pH of 3.0 ± 0.1 .

Mobile phase: Acetonitrile and *Buffer* (35:65)

Internal standard solution: 1.5 mg/mL of diphenhydramine hydrochloride in water

Standard stock solution: 2 mg/mL of USP Doxapram Hydrochloride RS in water

Standard solution: 0.2 mg/mL of doxapram hydrochloride from *Standard stock solution* prepared as follows. Transfer 5.0 mL each of *Standard stock solution* and *Internal standard solution* to a 50 mL volumetric flask, and dilute with water to volume.

Sample stock solution: Nominally 2 mg/mL of doxapram hydrochloride monohydrate from Injection in water.

Sample solution: Nominally 0.2 mg/mL of doxapram hydrochloride monohydrate from *Sample stock solution* prepared as follows. Transfer 5.0 mL each of *Sample stock solution* and *Internal standard solution* to a 50 mL volumetric flask, and dilute with water to volume.

USP Endotoxin RS

BRIEFING

Doxycycline Hyclate Capsules, USP 38 page 3226. As part of USP monograph modernization efforts, it is proposed to make the following revisions:

1. Replace the TLC *Identification* procedure, *Identification—Tetracyclines* { 193 }, with a more specific FTIR procedure.
2. Add a second *Identification* test based on retention time using the HPLC procedure in the *Assay*.
3. A validated stability-indicating HPLC procedure for the *Organic Impurities* test is added. The proposed procedure uses the Acquity UPLC BEH C8 brand of L7 column manufactured by Waters, where doxycycline elutes at about 3 min. A guard-column of the same brand of stationary phase was used in the validation.
4. Replace the *Assay* procedure with one that uses a new chromatographic system, which will also be used in the *Organic Impurities* test.
5. Acceptance limits for 4-epidoxycycline and any other unspecified impurity are proposed to strengthen the monograph. Manufacturers with different limits are encouraged to submit their approved specifications to USP.
6. USP Reference Standards are added to the *USP Reference Standards* section to support the revised procedures. USP Doxycycline Monohydrate RS is introduced as the Reference Standard for *Identification* test A. USP Doxycycline Related Compound A RS and USP Methacycline Hydrochloride RS are introduced in the *Assay* and the *Organic Impurities* tests for system suitability evaluation and peak identification.
7. The test for *Water Determination* is deleted because the acceptance criterion for water is formulation specific.
8. The *Packaging and Storage* section is updated to include storage conditions consistent with the product label.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

Doxycycline Hyclate Capsules**DEFINITION**

Doxycycline Hyclate Capsules contain the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of doxycycline ($C_{22}H_{24}N_2O_8$).

IDENTIFICATION

Change to read:

- **A.**

- **Infrared Absorption** $\langle 197A \rangle$ ■_{2S} (USP39)

~~**Test solution:** Nominally 1 mg/mL of doxycycline in methanol prepared from Capsule contents. Pass through a filter, and use the filtrate.~~

~~**Analysis:** Proceed as directed in *Identification—Tetracyclines* $\langle 193 \rangle$, *Method II*.~~

~~**Acceptance criteria:** Meet the requirements~~

- **Standard:** Transfer about 25 mg of USP Doxycycline Monohydrate RS to a suitable container. Add 25 mL of acetonitrile and mix for approximately 5 min with a magnetic stir bar. Pass through a suitable filter, evaporate the solvent, and dry under vacuum.

- **Sample:** Place about 2 g of Capsules contents in a suitable flask. Add 25 mL of acetonitrile and mix for approximately 5 min with a magnetic stir bar. Pass through a suitable filter and evaporate the acetonitrile under vacuum.

- **Analysis:** Examine the spectra of the *Standard* and the *Sample* in the range between 4000 and 650 cm^{-1} .

- **Acceptance criteria:** The *Sample* exhibits bands at about 1685, 1610, 1585, 1531, 1000, 958, 935, and 620 cm^{-1} , similar to the *Standard*. ■_{2S} (USP39)

Add the following:

- • **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■_{2S} (USP39)

ASSAY

Change to read:

- **Procedure**

~~Throughout the following sections, protect the *Standard solution* and the *Sample solution* from light.~~

~~**Mobile phase:** Transfer 2.72 g of monobasic potassium phosphate, 0.74 g of sodium hydroxide, 0.50 g of tetrabutylammonium hydrogen sulfate, and 0.40 g of edetate disodium to a 1000 mL volumetric flask. Add 850 mL of water, and stir to dissolve. Add 60 g of tertiary butyl alcohol with the aid of water, dilute with water to volume, and adjust with 1 N sodium hydroxide to a pH of 8.0 ± 0.1 . Pass this solution through a filter of 0.5 μm or finer pore size, and degas before using. Decreasing the proportion of tertiary butyl alcohol results in a longer retention time of doxycycline and improved separation of doxycycline from the related compounds.~~

~~**Diluent:** 0.01 N hydrochloric acid~~

~~**System suitability stock solution:** 6 mg/mL of doxycycline from USP Doxycycline Hyclate RS in *Diluent*~~

System suitability solution: Transfer 5 mL of *System suitability stock solution* to a 25-mL volumetric flask, heat on a steam bath for 60 min, and evaporate to dryness on a hot plate, taking care not to char the residue. Dissolve the residue in 0.01 N hydrochloric acid, and dilute with *Diluent* to volume. Pass a portion of this solution through a filter of 0.5- μ m or finer pore size, and use the filtrate. This solution contains a mixture of 4-epidoxycycline, 6-epidoxycycline, and doxycycline. When stored in a refrigerator, this solution may be used for 14 days.

Standard solution: 1.2 mg/mL of USP Doxycycline Hyclate RS in *Diluent*. Sonicate as needed to dissolve.

Sample solution: Nominally 1 mg/mL of doxycycline in *Diluent*, prepared as follows: Remove as completely as possible the contents of NLT 20 Capsules. Mix the combined contents, and transfer a suitable portion of the powder to a suitable volumetric flask; add 75% of the final volume of *Diluent*, sonicate for 5 min, shake for 15 min, and dilute with *Diluent* to volume. Pass through a membrane filter of 0.5- μ m or finer pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6 mm \times 25 cm; packing L21

Column temperature: 60 \pm 1 $^{\circ}$

Flow rate: 1 mL/min

Injection volume: 20 μ L

Run time: 1.7 times the retention time of doxycycline

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for 4-epidoxycycline (the main degradation product), 6-epidoxycycline, and doxycycline are about 0.4, 0.7, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.0 between the 4-epidoxycycline peak and the doxycycline peak; *System suitability solution*

Tailing factor: NMT 2.0 for doxycycline, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of doxycycline ($C_{22}H_{24}N_2O_8$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Doxycycline Hyclate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of doxycycline in the *Sample solution* (mg/mL)

P = potency of doxycycline in USP Doxycycline Hyclate RS (μ g/mg)

F = unit conversion factor, 0.001 mg/ μ g

Acceptance criteria: ~~90.0%–120.0%~~

- Protect solutions containing doxycycline from light.

Solution A: Transfer 3.1 g of *monobasic potassium phosphate*, 0.5 g of *edetate disodium*, and 0.5 mL of *triethylamine* to a 1000-mL volumetric flask. Add about 850 mL of water and mix. Dilute with water to volume and adjust with *1 N sodium hydroxide* to a pH of 8.5 ± 0.2 .

Solution B: Methanol

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.0	90	10
2.0	90	10
4.0	60	40
6.0	90	10
9.0	90	10

Diluent: 0.01 N hydrochloric acid

System suitability stock solution 1: 1 mg/mL each of USP Doxycycline Related Compound A RS and USP Methacycline Hydrochloride RS in *Diluent*

System suitability stock solution 2: 1.2 mg/mL of USP Doxycycline Hyclate RS in *Diluent*

System suitability solution: Transfer 5 mL of *System suitability stock solution 2* to a 25-mL volumetric flask, heat on a steam bath for 60 min, and evaporate to dryness on a hot plate, taking care not to char the residue. Dissolve the residue in *Diluent*, add 0.5 mL of *System suitability stock solution 1*, and dilute with *Diluent* to volume. Pass the solution through a suitable filter and use the filtrate.

This solution contains a mixture of 4-epidoxycycline, doxycycline related compound A, methacycline, and doxycycline. When stored in a refrigerator, this solution may be used for 14 days.

Standard solution: 0.3 mg/mL of USP Doxycycline Hyclate RS in *Diluent*. Sonicate as needed to dissolve.

Sample solution: Nominally 0.25 mg/mL of doxycycline in *Diluent*, prepared as follows. Empty as completely as possible the contents of NLT 20 Capsules. Mix the combined contents and transfer a suitable portion of the powder to a suitable volumetric flask. Add 75% of the final volume of *Diluent*, sonicate for about 5 min, shake for about 15 min, and dilute with *Diluent* to volume. Pass a portion of this solution through a suitable filter of 0.2- μm pore size.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 350 nm

Column: 2.1-mm \times 5-cm; 1.7- μm packing L7. [Note—A 1.7- μm guard column with packing L7 was used during method validation.]

Column temperature: 60 $^{\circ}$

Flow rate: 0.6 mL/min

Injection volume: 5 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—See *Table 2* for relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between methacycline and 4-epidoxycycline; NLT 1.5 between 4-epidoxycycline and doxycycline related compound A; NLT 1.5 between doxycycline related compound A and doxycycline, *System suitability solution*

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of doxycycline ($C_{22}H_{24}N_2O_8$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U

= peak response from the *Sample solution*

r_S

= peak response from the *Standard solution*

C_S

= concentration of USP Doxycycline Hyclate RS in the *Standard solution* (mg/mL)

C_U

= nominal concentration of doxycycline in the *Sample solution* (mg/mL)

P

= potency of doxycycline in USP Doxycycline Hyclate RS (μ g/mg)

F

= conversion factor, 0.001 mg/ μ g

Acceptance criteria: 90.0%–120.0% \pm 2S (USP39)

PERFORMANCE TESTS

Change to read:

- **Dissolution** { 711 }

Medium: Water; 900 mL

Apparatus 2: 75 rpm, the distance between the blade and the inside bottom of the vessel

being maintained at 4.5 ± 0.5 cm during the test

Time: 30 min

Standard solution: USP Doxycycline Hyclate RS in *Medium*

Sample solution: Sample per *Dissolution* 〈 711 〉. Dilute with *Medium* to a concentration that is similar to the *Standard solution*.

Instrumental conditions

Mode: UV

Analytical wavelength: 276 nm

■ **Analysis**

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of doxycycline ($C_{22}H_{24}N_2O_8$) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

A_U

= absorbance of the *Sample solution*

A_S

= absorbance of the *Standard solution*

C_S

= concentration of doxycycline in the *Standard solution* (mg/mL)

L

= label claim (mg/Capsule)

V

= volume of *Medium*, 900 mL

■ **2S (USP39)**

Tolerances: NLT 80% (Q) of the labeled amount of doxycycline ($C_{22}H_{24}N_2O_8$) is dissolved.

- **Uniformity of Dosage Units** 〈 905 〉: Meet the requirements

IMPURITIES

Add the following:

■ • **Organic Impurities**

Mobile phase, Diluent, System suitability solution, Sample solution, and

Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 1.5 $\mu\text{g/mL}$ of USP Doxycycline Hyclate RS in *Diluent*

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.5 between methacycline and 4-epidoxycycline; NLT 1.5 between 4-epidoxycycline and doxycycline related compound A; NLT 1.5 between doxycycline related compound A and doxycycline, *System suitability solution*

Relative standard deviation: NMT 5.0% for the doxycycline peak, *Standard solution*

Analysis

Samples: *Sample solution* and *Standard solution*

Calculate the percentage of each impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U peak response of each impurity from the *Sample solution*

r_S peak response of doxycycline from the *Standard solution*

C_S concentration of USP Doxycycline Hyclate RS in the *Standard solution* (mg/mL)

C_U nominal concentration of doxycycline in the *Sample solution* (mg/mL)

P = potency of doxycycline in USP Doxycycline Hyclate RS ($\mu\text{g}/\text{mg}$)

F = conversion factor, 0.001 mg/ μg

Acceptance criteria: See *Table 2*. Disregard any impurity peaks less than 0.2%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Methacycline ^{a,b}	0.64	—
4-Epidoxycycline ^c	0.79	0.5
Doxycycline related compound A (6-epidoxycycline) ^{a,d}	0.88	—
Doxycycline	1.0	—
Any individual unspecified impurity	—	0.5
Total impurities	—	2.0

^a Process impurities are controlled in the drug substance and are not to be reported here. They are not included in total impurities.

■ 2S (USP39)

BRIEFING

Doxycycline Hyclate Tablets, USP 38 page 3232. As part of USP monograph modernization efforts, it is proposed to make the following revisions:

1. Replace the TLC *Identification* procedure, *Identification—Tetracyclines* 〈 193 〉, with a more specific FTIR procedure.
2. Add a second *Identification* test based on retention time using the HPLC procedure in the *Assay*.
3. A validated stability-indicating HPLC procedure for the *Organic Impurities* test is added. The proposed procedure uses the Acquity UPLC BEH C8 brand of L7 column manufactured by Waters, where doxycycline elutes at about 3 min. A guard-column of the same brand of stationary phase was used in the validation.
4. Replace the *Assay* procedure with one that uses a new chromatographic system which will also be used in the *Organic Impurities* test.
5. Acceptance limits for 4-epidoxycycline and any other unspecified impurity are proposed to strengthen the monograph. The proposed limits are consistent with limits in the drug substance monograph. Manufacturers with different limits are encouraged to submit their approved specifications to USP.
6. *Dissolution Test 1* is revised to include a calculation and to remove notation on the use of low actinic glassware for protection from light. A statement is added to require that solutions be protected from light.
7. *Dissolution Test 2* is revised to remove the specific filter pore size in the *Sample solution* preparation. A suitable filter is to be used.
8. USP Reference Standards are added to the *USP Reference Standards* section to support the revised procedures. USP Doxycycline Monohydrate RS is introduced as the Reference Standard for *Identification* test A. USP Doxycycline Related Compound A RS and USP Methacycline Hydrochloride RS are introduced in the *Assay* and the *Organic Impurities* tests for system suitability evaluation and peak identification.
9. The test for *Water Determination* is deleted because the acceptance criterion for water is formulation specific.

10. The *Packaging and Storage* section is updated to include storage conditions consistent with the product label.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Doxycycline Hyclate Tablets

DEFINITION

Doxycycline Hyclate Tablets contain the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of doxycycline ($C_{22}H_{24}N_2O_8$).

IDENTIFICATION

Change to read:

- **A.**

■ **Infrared Absorption** (197A) ■_{2S} (USP39)

~~**Sample solution:** Shake a suitable quantity of finely ground Tablets with methanol to obtain a solution containing the equivalent of 1 mg/mL of doxycycline, and filter. Use the filtrate as the *Sample solution*.~~

~~**Analysis:** Proceed as directed under *Identification—Tetracyclines* (193), *Method II*.~~

~~**Acceptance criteria:** Meet the requirements~~

■ **Standard:**

Transfer about 25 mg of USP Doxycycline Monohydrate RS to a suitable flask. Add 25 mL of acetonitrile and mix for approximately 5 min with a magnetic stir bar. Pass through a suitable filter, evaporate the solvent, and dry under vacuum.

Sample: Place about 2 g of finely powdered Tablets in a suitable flask. Add 25 mL of acetonitrile and mix for approximately 5 min with a magnetic stir bar. Pass through a suitable filter and evaporate the acetonitrile under vacuum.

Analysis: Examine the spectra of the *Standard* and the *Sample* in the range between 4000 and 650 cm^{-1} .

Acceptance criteria: The *Sample* exhibits bands at about 1685, 1610, 1585, 1531, 1000, 958, 935, and 620 cm^{-1} , similar to the *Standard*. ■_{2S} (USP39)

Add the following:

- • **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■_{2S} (USP39)

ASSAY

Change to read:

- **Procedure**

Throughout the following sections, protect the *Standard solution* and the *Sample solution* from light.

Mobile phase: Transfer 2.72 g of monobasic potassium phosphate, 0.74 g of sodium hydroxide, 0.50 g of tetrabutylammonium hydrogen sulfate, and 0.40 g of edetate disodium to a 1000-mL volumetric flask. Add 850 mL of water, and stir to dissolve. Add 60 g of tertiary butyl alcohol with the aid of water, dilute with water to volume, and adjust with 1 N sodium hydroxide to a pH of 8.0 ± 0.1 . Decreasing the proportion of tertiary butyl alcohol results in a longer retention time of doxycycline and improved separation of doxycycline from the related compounds.

Diluent: 0.01 N hydrochloric acid

System suitability solution: Prepare 6 mg/mL of doxycycline from USP Doxycycline Hyclate RS in *Diluent*. Transfer 5 mL of this solution to a 25-mL volumetric flask, heat on a steam bath for 60 min, and evaporate to dryness on a hot plate, taking care not to char the residue. Dissolve the residue in 0.01 N hydrochloric acid, dilute with *Diluent* to volume, and filter. This solution contains a mixture of 4-epidoxycycline, 6-epidoxycycline, and doxycycline. When stored in a refrigerator, this solution may be used for 14 days.

Standard solution: 1.2 mg/mL of USP Doxycycline Hyclate RS in *Diluent*. [Note—Sonicate as necessary to dissolve.]

Sample solution: Nominally 1 mg/mL of doxycycline in *Diluent*, prepared as follows. Transfer nominally equivalent to 100 mg of doxycycline, from finely powdered Tablets (NLT 20), to a 100-mL volumetric flask, add 75 mL of *Diluent*, sonicate for 5 min, shake for 15 min, dilute with *Diluent* to volume, and mix. Pass through a suitable filter.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6 mm × 25 cm; packing L21

Column temperature: $60 \pm 1^\circ$

Flow rate: 1 mL/min

Injection volume: 20 μ L

Run time: 1.7 times the retention time of doxycycline

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for 4-epidoxycycline (the main degradation product), 6-epidoxycycline, and doxycycline are about 0.4, 0.7, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.0 between the 4-epidoxycycline peak and the doxycycline peak; *System suitability solution*

Tailing factor: NMT 2.0 for doxycycline, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of doxycycline ($C_{22}H_{24}N_2O_8$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

~~r_U~~ = peak response from the *Sample solution*

~~r_S~~ = peak response from the *Standard solution*

~~C_S~~ = concentration of USP Doxycycline Hyclate RS in the *Standard solution* (mg/mL)

~~C_U~~ = nominal concentration of doxycycline in the *Sample solution* (mg/mL)

~~P~~ = potency of doxycycline in USP Doxycycline Hyclate RS ($\mu\text{g}/\text{mg}$)

~~F~~ = unit conversion factor, 0.001 mg/ μg

Acceptance criteria: ~~90.0%–120.0%~~

- Protect solutions containing doxycycline from light.

Solution A: Transfer 3.1 g of *monobasic potassium phosphate*, 0.5 g of *edetate disodium*, and 0.5 mL of *triethylamine* to a 1000-mL volumetric flask. Add about 850 mL of water and mix. Dilute with water to volume and adjust with *1 N sodium hydroxide* to a pH of 8.5 \pm 0.2.

Solution B: Methanol

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.0	90	10
2.0	90	10
4.0	60	40
6.0	90	10
9.0	90	10

Diluent: 0.01 N hydrochloric acid

System suitability stock solution 1: 1 mg/mL each of USP Doxycycline Related Compound A RS and USP Methacycline Hydrochloride RS in *Diluent*

System suitability stock solution 2: 1.2 mg/mL of USP Doxycycline Hyclate RS in *Diluent*

System suitability solution: Transfer 5 mL of *System suitability stock solution 2* to a 25-mL volumetric flask, heat on a steam bath for 60 min, and evaporate to dryness on a hot plate, taking care not to char the residue. Dissolve the residue in *Diluent*, add 0.5 mL of *System suitability stock solution 1*, and dilute with *Diluent* to volume. Pass the solution through a suitable filter and use the filtrate.

This solution contains a mixture of 4-epidoxycycline, doxycycline related compound A, methacycline, and doxycycline. When stored in a refrigerator, this solution may be used for 14 days.

Standard solution: 0.3 mg/mL of USP Doxycycline Hyclate RS in *Diluent*. Sonicate as needed to dissolve.

Sample solution: Nominally 0.25 mg/mL of doxycycline in *Diluent*, prepared as follows. Transfer a suitable portion of NLT 20 finely powdered Tablets to a suitable volumetric flask. Add 50% of the final volume of *Diluent*, sonicate for about 5 min, shake for about 15 min, and dilute with *Diluent* to volume. Pass a portion of this solution through a suitable filter of 0.2- μm pore size.

Chromatographic system

(See *Chromatography* { 621 }, *System Suitability*.)

Mode: LC

Detector: UV 350 nm

Column: 2.1-mm × 5-cm; 1.7-μm packing L7. [Note—A 1.7-μm guard column with packing L7 was used during method validation.]

Column temperature: 60°

Flow rate: 0.6 mL/min

Injection volume: 5 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—See *Table 2* for relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between methacycline and 4-epidoxycycline; NLT 1.5 between 4-epidoxycycline and doxycycline related compound A; NLT 1.5 between doxycycline related compound A and doxycycline, *System suitability solution*

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of doxycycline (C₂₂H₂₄N₂O₈) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U

= peak response from the *Sample solution*

r_S

= peak response from the *Standard solution*

C_S

= concentration of USP Doxycycline Hyclate RS in the *Standard solution* (mg/mL)

C_U

= nominal concentration of doxycycline in the *Sample solution* (mg/mL)

P

= potency of doxycycline in USP Doxycycline Hyclate RS (μg/mg)

F

= conversion factor, 0.001 mg/μg

Acceptance criteria: 90.0%–120.0% ■_{2S} (USP39)

PERFORMANCE TESTS**Change to read:**

- **Dissolution** 〈 711 〉 [~~Note—Use low-actinic glassware to prepare the solutions.~~]

- Protect solutions containing doxycycline from light.

- 2S (USP39)

Test 1

Medium: Water; 900 mL

Apparatus 2: 75 rpm, the distance between the blade and the inside bottom of the vessel being maintained at 4.5 ± 0.5 cm during the test

Time: 90 min

Standard solution: USP Doxycycline Hyclate RS in *Medium*

Sample solution: Dilute with *Medium*, if necessary, to a concentration that is similar to the *Standard solution*.

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* 〈 851 〉.)

Mode: UV-Vis

Analytical wavelength: 276 nm

Analysis

Samples: *Standard solution* and *Sample solution*

- Calculate the percentage of the labeled amount of doxycycline ($C_{22}H_{24}N_2O_8$) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

A_U

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of doxycycline ($C_{22}H_{24}N_2O_8$) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

A_U absorbance of the *Sample solution*

A_S absorbance of the *Standard solution*

C_S concentration of doxycycline in the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 900 mL

Tolerances: NLT 85% (Q) of the labeled amount of doxycycline is dissolved.

- **Uniformity of Dosage Units** { 905 } : Meet the requirements

IMPURITIES

Add the following:

■ • Organic Impurities

Mobile phase, Diluent, System suitability solution, Sample solution, and

Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 1.5 µg/mL of USP Doxycycline Hyclate RS in *Diluent*

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.5 between methacycline and 4-epidoxycycline; NLT 1.5 between 4-epidoxycycline and doxycycline related compound A; NLT 1.5 between doxycycline related compound A and doxycycline, *System suitability solution*

Relative standard deviation: NMT 5.0% for the doxycycline peak, *Standard solution*

Analysis

Samples: *Sample solution* and *Standard solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of doxycycline from the *Standard solution*

C_S = concentration of USP Doxycycline Hyclate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of doxycycline in the *Sample solution* (mg/mL)

P = potency of doxycycline in USP Doxycycline Hyclate RS ($\mu\text{g}/\text{mg}$)

F = conversion factor, 0.001 mg/ μg

Acceptance criteria: See *Table 2*. Disregard any impurity peaks less than 0.2%.

Table 2

BRIEFING

Multiple Electrolytes Injection Type 1, *USP 38* page 3273. It is proposed to make the following revisions to the monograph:

1. In preparation for the omission of the flame tests from *Identification Tests—General* { 191 }, proposed in *PF 41(2)* [Mar.–Apr. 2015], it is proposed to delete the reference to *Sodium* and *Potassium* in *Identification* test *A* and include a complete description of each flame test in the monograph. Manufacturers are encouraged to submit a replacement wet chemistry or an instrumental procedure for consideration by the Expert Committee.
2. An equation is added to calculate the amount of chloride in the *Assay for Chloride*.
3. Concentration units for the *Standard solution* and *Sample solution* are revised to mEq/mL in the *Assay for Phosphate* to eliminate the need for the molecular weight correction term in the equation for the calculation of the amount of phosphate.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Comment deadline: September 30, 2015

Multiple Electrolytes Injection Type 1

DEFINITION

Multiple Electrolytes Injection Type 1 is a sterile solution of suitable salts in Water for Injection to provide sodium, potassium, magnesium, and chloride ions. In addition, the salts provide ions of acetate, acetate and gluconate, or acetate, gluconate, and phosphate. It contains NLT 90.0% and NMT 110.0% of the labeled amounts of sodium (Na), potassium (K), magnesium (Mg), chloride (Cl), acetate (C₂H₃O₂), gluconate (C₆H₁₁O₇), and phosphate (PO₄). It may contain Hydrochloric Acid or Sodium Hydroxide used to adjust the pH. It contains no antimicrobial agents.

IDENTIFICATION**Change to read:**

- **A. Identification Tests—General** < 191 >, ~~**Sodium**~~ < 191 >, ~~**Potassium**~~ < 191 >

- **2S** (USP39)

Magnesium and **Chloride**: Meets the requirements of the flame tests for ~~*Sodium*~~ and ~~*Potassium*~~, and for the tests for ~~*Magnesium*~~ and ~~*Chloride*~~

- **2S** (USP39)

Add the following:

- **B. Sodium:** The sample imparts an intense yellow color to a nonluminous flame. ■ **2S** (USP39)

Add the following:

- **C. Potassium:** The sample imparts a violet color to a nonluminous flame. Because the presence of small quantities of sodium masks the color, screen out the yellow color produced by sodium by viewing through a blue filter that blocks the emission at 589 nm (sodium), but is transparent to emission at 404 nm (potassium). [Note—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.]

- **2S** (USP39)

Change to read:

- **B**

- ~~M_{r2} = molecular weight of monobasic potassium phosphate, 136.09~~
 ■
 ■ 2S (USP39)

Acceptance criteria: 90.0%–110.0%

● **Potassium and Sodium**

Internal standard solution: 1.04 mg/mL of lithium nitrate prepared as follows. Transfer 1.04 g of lithium nitrate to a 1000-mL volumetric flask. Add a suitable nonionic surfactant, and then dilute with water to volume.

Potassium stock solution: 74.56 mg/mL of potassium chloride (1 mEq/mL of potassium) prepared as follows. Transfer 18.64 g of potassium chloride, previously dried at 105° for 2 h, to a 250-mL volumetric flask, and dilute with water to volume.

Sodium stock solution: 58.44 mg/mL of sodium chloride (1 mEq/mL of sodium) prepared as follows. Transfer 14.61 g of sodium chloride, previously dried at 105° for 2 h, to a 250-mL volumetric flask, and dilute with water to volume.

Standard stock solution: 0.0391J mg/mL of potassium (K) from *Potassium stock solution* and 0.02299J' mg/mL of sodium (Na) from *Sodium stock solution* prepared as follows. Transfer 0.1J mL of *Potassium stock solution* and 0.1J' mL of *Sodium stock solution* to a 100-mL volumetric flask, where J and J' are the labeled amounts, in mEq/L, of potassium and sodium, respectively, in the Injection. Dilute with water to volume.

Standard solution: Dilute 5.0 mL of the *Standard stock solution* with *Internal standard solution* to 500.0 mL.

Sample solution: Dilute 5.0 mL of Injection with *Internal standard solution* to 500.0 mL.

Instrumental conditions

Mode: Flame photometer

Analytical wavelengths

Potassium: Maximum at 766 nm

Sodium: Maximum at 589 nm

Lithium: Maximum at 671 nm

Blank: *Internal standard solution*

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Use the *Blank* to zero the instrument. Concomitantly determine the flame emission readings for the *Standard solution* and *Sample solution*.

Calculate the percentage of the labeled amount of potassium (K) in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_{\bar{U}}$ emission reading ratio of potassium to lithium from the *Sample solution*

$R_{\bar{S}}$ emission reading ratio of potassium to lithium from the *Standard solution*

$C_{\bar{S}}$ concentration of potassium (K) in the *Standard solution* (mg/mL)

$C_{\bar{U}}$ nominal concentration of potassium (K) in the *Sample solution* (mg/mL)

[Note—Each mg of potassium (K) is equivalent to 0.02558 mEq of potassium (K).]

Calculate the percentage of the labeled amount of sodium (Na) in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U emission reading ratio of sodium to lithium from the *Sample solution*

R_S emission reading ratio of sodium to lithium from the *Standard solution*

C_S concentration of sodium (Na) in the *Standard solution* (mg/mL)

C_U nominal concentration of sodium (Na) in the *Sample solution* (mg/mL)

[Note—Each mg of sodium (Na) is equivalent to 0.04350 mEq of sodium (Na).]

Acceptance criteria

Potassium: 90.0%–110.0%

Sodium: 90.0%–110.0%

SPECIFIC TESTS

- **Bacterial Endotoxins Test** 〈 85 〉: NMT 0.5 USP Endotoxin Units/mL
- **pH** 〈 791 〉: 4.0–8.0
- **Other Requirements:** It meets the requirements in *Injections* 〈 1 〉.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in single-dose glass or plastic containers. Glass containers of Type I or Type II glass are preferable.
- **Labeling:** The label states the content of each electrolyte in terms of milliequivalents (mEq) in a given volume. The label states the total osmolar concentration in mOsmol/L. When the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol/mL.

Multiple Electrolytes Injection Type 2

DEFINITION

Multiple Electrolytes Injection Type 2 is a sterile solution of suitable salts in Water for Injection to provide sodium, potassium, calcium, magnesium, and chloride ions. In addition, the salts provide ions of either acetate and citrate, or acetate and lactate. It contains NLT 90.0% and NMT 110.0% of the labeled amounts of sodium (Na), potassium (K), magnesium (Mg), calcium (Ca), chloride (Cl), acetate (C₂H₃O₂), citrate (C₆H₅O₇), and lactate (C₃H₅O₃). It may contain Hydrochloric Acid or Sodium Hydroxide used to adjust the pH. It contains no antimicrobial agents.

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Use the *Blank* to zero the instrument. Concomitantly determine the flame emission readings for the *Standard solution* and *Sample solution*.

Calculate the percentage of the labeled amount of potassium (K) in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_{\overline{K}}$ emission reading ratio of potassium to lithium from the *Sample solution*

$R_{\overline{S}}$ emission reading ratio of potassium to lithium from the *Standard solution*

$C_{\overline{S}}$ concentration of potassium (K) in the *Standard solution* (mg/mL)

$C_{\overline{U}}$ nominal concentration of potassium (K) in the *Sample solution* (mg/mL)

[Note—Each mg of potassium (K) is equivalent to 0.02558 mEq of potassium (K).]

Calculate the percentage of the labeled amount of sodium (Na) in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_{\overline{Na}}$ emission reading ratio of sodium to lithium from the *Sample solution*

$R_{\overline{S}}$ emission reading ratio of sodium to lithium from the *Standard solution*

C_s concentration of sodium (Na) in the *Standard solution* (mg/mL)

C_f nominal concentration of sodium (Na) in the *Sample solution* (mg/mL)

[Note—Each mg of sodium (Na) is equivalent to 0.04350 mEq of sodium (Na).]

Acceptance criteria

Potassium: 90.0%–110.0%

Sodium: 90.0%–110.0%

SPECIFIC TESTS

- **Bacterial Endotoxins Test** $\langle 85 \rangle$: NMT 0.5 USP Endotoxin Units/mL
- **pH** $\langle 791 \rangle$: 4.0–8.0
- **Other Requirements:** It meets the requirements in *Injections* $\langle 1 \rangle$.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in single-dose glass or plastic containers. Glass containers of Type I or Type II glass are preferable.
- **Labeling:** The label states the content of each electrolyte in terms of milliequivalents (mEq) in a given volume. The label states the total osmolar concentration in mOsmol/L. When the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol/mL.
- **USP Reference Standards** $\langle 11 \rangle$
 - USP Citric Acid RS
 - USP Endotoxin RS
 - USP Sodium Lactate RS

BRIEFING

Multiple Electrolytes and Dextrose Injection Type 1, *USP 38* page 3276. It is proposed to make the following revisions to the monograph:

1. In preparation for the omission of the flame tests from *Identification Tests—General* $\langle 191 \rangle$, proposed in *PF 41(2)* [Mar.–Apr. 2015], it is proposed to delete the references to *Sodium* and *Potassium* in *Identification test B* and include a complete description of each flame test in the monograph. Manufacturers are encouraged to submit a replacement wet chemistry or an instrumental procedure for consideration by the Expert Committee.
2. An equation is added to calculate the amount of chloride in the *Assay for Chloride*.
3. Concentration units for the *Standard solution* and *Sample solution* are revised to mEq/mL in the *Assay for Phosphate* to eliminate the need for the molecular weight correction term in the equation for the calculation of the amount of phosphate.
4. An equation is added to calculate the amount of sulfate in the *Assay for Sulfate*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Comment deadline: September 30, 2015

Multiple Electrolytes and Dextrose Injection Type 1

DEFINITION

Multiple Electrolytes and Dextrose Injection Type 1 is a sterile solution of Dextrose and suitable salts in Water for Injection to provide sodium, potassium, magnesium, and chloride ions. In addition, the salts provide ions of acetate, or acetate and gluconate, or acetate and phosphate, or phosphate and lactate, or phosphate and sulfate. It contains NLT 90.0% and NMT 110.0% of the labeled amounts of sodium (Na), potassium (K), magnesium (Mg), acetate ($C_2H_3O_2$), gluconate ($C_6H_{11}O_7$), phosphate (PO_4), lactate ($C_3H_5O_3$), and sulfate (SO_4); NLT 90.0% and NMT 120.0% of the labeled amount of chloride (Cl); and NLT 90.0% and NMT 105.0% of the labeled amount of dextrose ($C_6H_{12}O_6 \cdot H_2O$). It may contain Hydrochloric Acid or Sodium Hydroxide used to adjust the pH. It contains no antimicrobial agents.

IDENTIFICATION

- **A.**

Sample solution: Nominally 50 mg/mL of dextrose from a suitable volume of Injection

Analysis: Add a few drops of the *Sample solution* to 5 mL of hot alkaline cupric tartrate TS.

Acceptance criteria: A copious red precipitate of cuprous oxide is formed.

Change to read:

- **B. Identification Tests—General** ~~(191)~~, ~~**Sodium**~~ ~~(191)~~, ~~**Potassium**~~ ~~(191)~~,

- **2S** (USP39)

Magnesium and **Chloride**: Meets the requirements of the flame tests for ~~Sodium~~ and ~~Potassium~~, and of the tests for ~~Magnesium~~ and ~~Chloride~~

- **2S** (USP39)

Add the following:

- **C. Sodium:** The sample imparts an intense yellow color to a nonluminous flame. ■ **2S** (USP39)

Add the following:

- **D. Potassium:** The sample imparts a violet color to a nonluminous flame. Because the presence of small quantities of sodium masks the color, screen out the yellow color produced by sodium by viewing through a blue filter that blocks the emission at 589 nm (sodium), but is transparent to emission at 404 nm (potassium). [Note—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.]

● **Potassium and Sodium**

Internal standard solution: 1.04 mg/mL of lithium nitrate prepared as follows. Transfer 1.04 g of lithium nitrate to a 1000-mL volumetric flask. Add a suitable nonionic surfactant, and then dilute with water to volume.

Potassium stock solution: 74.56 mg/mL of potassium chloride (1 mEq/mL of potassium) prepared as follows. Transfer 18.64 g of potassium chloride, previously dried at 105° for 2 h, to a 250-mL volumetric flask, and dilute with water to volume.

Sodium stock solution: 58.44 mg/mL of sodium chloride (1 mEq/mL of sodium) prepared as follows. Transfer 14.61 g of sodium chloride, previously dried at 105° for 2 h, to a 250-mL volumetric flask, and dilute with water to volume.

Standard stock solution: 0.0391J mg/mL of potassium (K) from *Potassium stock solution* and 0.02299J' mg/mL of sodium (Na) from *Sodium stock solution* prepared as follows. Transfer 0.1J mL of *Potassium stock solution* and 0.1J' mL of *Sodium stock solution* to a 100-mL volumetric flask, where J and J' are the labeled amounts, in mEq/L, of potassium and sodium, respectively, in the Injection. Dilute with water to volume.

Standard solution: Dilute 5.0 mL of *Standard stock solution* with *Internal standard solution* to 500.0 mL.

Sample solution: Dilute 5.0 mL of Injection with *Internal standard solution* to 500.0 mL.

Instrumental conditions

Mode: Flame photometer

Analytical wavelengths

Potassium: Maximum at 766 nm

Sodium: Maximum at 589 nm

Lithium: Maximum at 671 nm

Blank: *Internal standard solution*

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Use the *Blank* to zero the instrument. Concomitantly determine the flame emission readings for the *Standard solution* and *Sample solution*.

Calculate the percentage of the labeled amount of potassium (K) in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_{\overline{K}}$ emission reading ratio of potassium to lithium from the *Sample solution*

$R_{\bar{S}}$ emission reading ratio of potassium to lithium from the *Standard solution*

$C_{\bar{S}}$ concentration of potassium (K) in the *Standard solution* (mg/mL)

$C_{\bar{I}}$ nominal concentration of potassium (K) in the *Sample solution* (mg/mL)

[Note—Each mg of potassium (K) is equivalent to 0.02558 mEq of potassium (K).]

Calculate the percentage of the labeled amount of sodium (Na) in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_{\bar{I}}$ emission reading ratio of sodium to lithium from the *Sample solution*

$R_{\bar{S}}$ emission reading ratio of sodium to lithium from the *Standard solution*

$C_{\bar{S}}$ concentration of sodium (Na) in the *Standard solution* (mg/mL)

$C_{\bar{I}}$ nominal concentration of sodium (Na) in the *Sample solution* (mg/mL)

[Note—Each mg of sodium (Na) is equivalent to 0.04350 mEq of sodium (Na).]

Acceptance criteria

 - USP Sodium Lactate RS

BRIEFING

Multiple Electrolytes and Dextrose Injection Type 2, *USP 38* page 3278. It is proposed to make the following revisions to the monograph.

1. In preparation for the omission of the flame tests from *Identification Tests—General* 〈 191 〉, proposed in *PF 41(2)* [Mar.–Apr. 2015], it is proposed to delete the references to *Sodium* and *Potassium* in *Identification test B* and include a complete description of each flame test in the monograph. Manufacturers are encouraged to submit a replacement wet chemistry or an instrumental procedure for consideration by the Expert Committee.
2. An equation is added to calculate the amount of chloride in the *Assay for Chloride*.
3. An equation is added to calculate the amount of sulfate in the *Assay for Sulfate*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SM4: M. Koleck.)

Correspondence Number—C156775

Comment deadline: September 30, 2015

Multiple Electrolytes and Dextrose Injection Type 2**DEFINITION**

Multiple Electrolytes and Dextrose Injection Type 2 is a sterile solution of Dextrose and suitable salts in Water for Injection to provide sodium, potassium, magnesium, calcium, and chloride ions. In addition, the salts provide ions of acetate, or acetate and citrate, or acetate and lactate, or gluconate and sulfate. It contains NLT 90.0% and NMT 110.0% of the labeled amounts of sodium (Na), potassium (K), magnesium (Mg), calcium (Ca), acetate (C₂H₃O₂), citrate (C₆H₅O₇), lactate (C₃H₅O₃), gluconate (C₆H₁₁O₇), and sulfate (SO₄); NLT 90.0% and NMT 120.0% of the labeled amount of chloride (Cl); and NLT 90.0% and NMT 105.0% of the labeled amount of dextrose (C₆H₁₂O₆·H₂O). It may contain Hydrochloric Acid or Sodium Hydroxide used to adjust the pH. It contains no antimicrobial agents.

IDENTIFICATION

• A.

Sample solution: Nominally 50 mg/mL of dextrose from a suitable volume of Injection

Analysis: Add a few drops of the *Sample solution* to 5 mL of hot alkaline cupric tartrate TS.

Acceptance criteria: A copious red precipitate of cuprous oxide is formed.

ASSAY

- **Acetate** (if present)

Mobile phase: 0.05 N sulfuric acid

Standard solution: 1.2 mg/mL of sodium acetate trihydrate (0.0088 mEq/mL of acetate) in water

Sample solution: Nominally 0.0088 mEq/mL of acetate from a volume of Injection in water

Chromatographic system

(See *Chromatography* $\langle 621 \rangle$, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Columns

Guard: 4.6-mm \times 3-cm; packing L17

Analytical: 7.8-mm \times 30-cm; packing L17

Column temperature: 60 $^{\circ}$

Flow rate: 0.8 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of acetate ($C_2H_3O_2$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of acetate from the *Sample solution*

r_S = peak response of acetate from the *Standard solution*

C_S = concentration of acetate in the *Standard solution* (mEq/mL)

C_U = nominal concentration of acetate in the *Sample solution* (mEq/mL)

Acceptance criteria: 90.0%–110.0%

Change to read:

- **Calcium**

[Note—Concentrations of the *Standard solutions* and the *Sample solution* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

Solution A: 88.45 g/L of lanthanum chloride prepared as follows. Transfer a suitable quantity of lanthanum chloride to an appropriate volumetric flask. Add 50% of the final flask volume of water. Carefully add 25% of the final flask volume of hydrochloric acid. Mix, and allow to cool. Dilute with water to volume.

Solution B: Mix 678 mL of hydrochloric acid with water to make 3000 mL.

Standard stock solution: 1000 $\mu\text{g/mL}$ of calcium prepared as follows. Transfer 499.5 mg of primary standard calcium carbonate to a 200-mL volumetric flask, and add 10 mL of water. Carefully add 5 mL of *Solution B*, and swirl to dissolve the calcium carbonate. Dilute with water to volume.

Standard solutions: 10.0, 15.0, and 20.0 $\mu\text{g/mL}$ of calcium prepared as follows. To three separate 100-mL volumetric flasks, each containing 5.0 mL of *Solution A*, add 1.0, 1.5, and 2.0 mL, respectively, of *Standard stock solution*. Dilute the contents of each flask with *Solution B* to volume.

Sample solution: Transfer a volume of Injection, equivalent to 20 mg (1 mEq)

■ ■ 2S (USP39)

of calcium, to a 1000-mL volumetric flask containing 50.0 mL of *Solution A*. Dilute with *Solution B* to volume.

Blank: 5.0 mL of *Solution A* diluted with *Solution B* to 100.0 mL

Instrumental conditions

(See *Spectrophotometry and Light Scattering* { 851 } .)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Calcium emission line at 422.7 nm

Lamp: Calcium hollow-cathode

Flame: Air-acetylene

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*

Plot the absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of calcium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration (C), in $\mu\text{g/mL}$, of calcium in the *Sample solution*.

Calculate the percentage of the labeled amount of calcium (Ca) in the portion of Injection taken:

$$\text{Result} = (C/C_U) \times 100$$

C = concentration of Calcium in the *Sample solution* ($\mu\text{g/mL}$), interpolated from the graph obtained

C_U = nominal concentration of Calcium in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–110.0%

Change to read:

• **Chloride**

Sample solution: Transfer a volume of Injection, equivalent to 55 mg of chloride (1.55 mEq), to a suitable conical flask, and add water, if necessary, to bring the volume to 10 mL. Add 10 mL of glacial acetic acid, 75 mL of methanol, and 0.5 mL of eosin Y TS.

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N silver nitrate VS

Endpoint detection: Visual

Analysis

Sample: *Sample solution*

Titrate, with shaking, with *Titrant* to a pink endpoint.

Each mL of *Titrant* is equivalent to 3.545 mg (0.1 mEq) of chloride (Cl).

■ Calculate the percentage of the labeled amount of chloride (Cl) in the portion of Injection taken:

$$\text{Result} = V \times N \times (F/W) \times 100$$

V

= Titrant volume consumed by the *Sample solution* (mL)

N

= actual normality of the *Titrant* (mEq/mL)

F

= equivalency factor, 35.45 mg/mEq

W

= nominal amount of chloride in the *Sample solution* (mg)

■ 2S (USP39)

Acceptance criteria: 90.0%–120.0%

• **Dextrose**

Sample solution: Transfer a volume of Injection containing 2–5 g of dextrose to a 100-mL volumetric flask. Add 0.2 mL of 6 N ammonium hydroxide, and dilute with water to volume.

Analysis

Sample: *Sample solution*

Determine the angular rotation in a polarimeter tube (see *Optical Rotation* { 781 }.)
Calculate the percentage of the labeled amount of dextrose ($C_6H_{12}O_6 \cdot H_2O$) in the portion of Injection taken:

$$\text{Result} = [(100 \times a)/(l \times \alpha)] \times (1/C_U) \times (M_{r1}/M_{r2}) \times 100$$

a = observed angular rotation of the *Sample solution*, in degrees

l = length of the polarimeter tube, in decimeters

α = midpoint of the specific rotation range for anhydrous dextrose, 52.9°

C_U = nominal concentration of dextrose in the *Sample solution*, g/100 mL

M_{r1} = molecular weight of dextrose monohydrate, 198.17

M_{r2} = molecular weight of anhydrous dextrose, 180.16

Acceptance criteria: 90.0%–105.0%

- **Citrate** (if present)

Mobile phase and Chromatographic system: Proceed as directed in the *Assay for Citric Acid/Citrate and Phosphate* { 345 }.

Standard solution: 0.3 mEq/L of citrate ($C_6H_5O_7$) from USP Citric Acid RS in freshly prepared 1 mM sodium hydroxide

Sample solution: Nominally 0.3 mEq/L of citrate in 1 mM sodium hydroxide from a volume of Injection diluted with freshly prepared sodium hydroxide

Analysis

Samples: *Standard solution* and *Sample solution*

Proceed as directed in { 345 }.

Calculate the percentage of the labeled amount of citrate ($C_6H_5O_7$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of citrate from the *Sample solution*

r_S = peak response of citrate from the *Standard solution*

C_S = concentration of citrate in the *Standard solution* (mEq/L)

C_U = nominal concentration of citrate in the *Sample solution* (mEq/L)

Acceptance criteria: 90.0%–110.0%

Change to read:

- **Gluconate** (if present)

Mobile phase: Dissolve 7.0 g of calcium acetate in 1900 mL of water, and adjust with glacial acetic acid to a pH of 4.5 ± 0.1 . Dilute with water to 2000 mL, mix, pass through a filter of 0.5- μm pore size or finer, and degas. Maintain the *Mobile phase* at $70 \pm 2^\circ$ at all times.

System suitability solution: 5 mg/mL each of USP Sodium Lactate RS and USP Potassium Gluconate RS in water

Standard solution: 4.6 mg/mL of USP Potassium Gluconate RS

■(0.02 mEq/mL of gluconate) ■_{2S} (USP39)

in water

Sample solution: Nominally 0.023 mEq/mL of gluconate from a volume of Injection in water

C = concentration of magnesium (Mg) in the *Sample solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of magnesium (Mg) in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–110.0%

• **Potassium and Sodium**

Internal standard solution: 1.04 mg/mL of lithium nitrate prepared as follows. Transfer 1.04 g of lithium nitrate to a 1000-mL volumetric flask. Add a suitable nonionic surfactant, and then dilute with water to volume.

Potassium stock solution: 74.56 mg/mL of potassium chloride (1 mEq/mL of potassium) prepared as follows. Transfer 18.64 g of potassium chloride, previously dried at 105° for 2 h, to a 250-mL volumetric flask, and dilute with water to volume.

Sodium stock solution: 58.44 mg/mL of sodium chloride (1 mEq/mL of sodium) prepared as follows. Transfer 14.61 g of sodium chloride, previously dried at 105° for 2 h, to a 250-mL volumetric flask, and dilute with water to volume.

Standard stock solution: 0.0391J mg/mL of potassium (K) from *Potassium stock solution* and 0.02299J' mg/mL of sodium (Na) from *Sodium stock solution* prepared as follows. Transfer 0.1J mL of *Potassium stock solution* and 0.1J' mL of *Sodium stock solution* to a 100-mL volumetric flask, where J and J' are the labeled amounts, in mEq/L, of potassium and sodium, respectively, in the Injection. Dilute with water to volume.

Standard solution: Dilute 5.0 mL of *Standard stock solution* with *Internal standard solution* to 500.0 mL.

Sample solution: Dilute 5.0 mL of Injection with *Internal standard solution* to 500.0 mL.

Instrumental conditions

Mode: Flame photometer

Analytical wavelengths

Potassium: Maximum at 766 nm

Sodium: Maximum at 589 nm

Lithium: Maximum at 671 nm

Blank: *Internal standard solution*

Analysis

Samples: *Standard solution, Sample solution, and Blank*

Use the *Blank* to zero the instrument. Concomitantly determine the flame emission readings for the *Standard solution* and *Sample solution*.

Calculate the percentage of the labeled amount of potassium (K) in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_{\bar{U}}$ emission reading ratio of potassium to lithium from the *Sample solution*

$R_{\bar{S}}$ emission reading ratio of potassium to lithium from the *Standard solution*

$C_{\bar{S}}$ concentration of potassium (K) in the *Standard solution* (mg/mL)

$C_{\bar{U}}$ nominal concentration of potassium (K) in the *Sample solution* (mg/mL)

[Note—Each mg of potassium (K) is equivalent to 0.02558 mEq of potassium (K).]

Calculate the percentage of the labeled amount of sodium (Na) in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_{\bar{U}}$ emission reading ratio of sodium to lithium from the *Sample solution*

$R_{\bar{S}}$ emission reading ratio of sodium to lithium from the *Standard solution*

$C_{\bar{S}}$ concentration of sodium (Na) in the *Standard solution* (mg/mL)

$C_{\bar{U}}$ nominal concentration of sodium (Na) in the *Sample solution* (mg/mL)

[Note—Each mg of sodium (Na) is equivalent to 0.04350 mEq of sodium (Na).]

Acceptance criteria

Potassium: 90.0%–110.0%

Sodium: 90.0%–110.0%

Change to read:

- **Sulfate** (if present)

Sample solution: Equivalent to 120 mg (1.25 mEq) of sulfate, from a volume of Injection.

Dilute, if necessary, to 200 mL, and add 1 mL of hydrochloric acid.

Analysis

Sample: *Sample solution*

Heat the *Sample solution* to boiling, and gradually add, in small portions and while constantly stirring, an excess of hot barium chloride TS (about 8 mL). Heat the mixture on a steam bath for 1 h, collect the precipitate of barium sulfate on a tared filtering crucible, wash until free from chloride, dry, ignite, and weigh. ~~The weight of the barium sulfate, multiplied by 0.4116, represents its equivalent of sulfate (SO₄). Each mg of barium sulfate represents 0.004285 mEq of sulfate (SO₄).~~

Calculate the percentage of the labeled amount of sulfate (SO₄) in the portion of Injection taken:

$$\text{Result} = \{[W \times (M_{r1}/M_{r2}) \times (1/M_{r1})]/(L \times V)\} \times 100$$

W

= weight of barium sulfate after ignition (mg)

M_{r1}

= molecular weight of sulfate, 96.06

M_{r2}

= molecular weight of barium sulfate, 233.43

L

= label claim of sulfate in the Injection (mEq/mL)

V

= volume of Injection in the *Sample solution* (mL)

BRIEFING

Multiple Electrolytes and Dextrose Injection Type 3, *USP 38* page 3279. It is proposed to make the following revisions to the monograph.

1. In preparation for the omission of the flame tests from *Identification Tests—General* 〈 191 〉, proposed in *PF 41(2)* [Mar.–Apr. 2015], it is proposed to delete the references to *Sodium* and *Potassium* in *Identification test B* and include a complete

description of each flame test in the monograph. Manufacturers are encouraged to submit a replacement wet chemistry or an instrumental procedure for consideration by the Expert Committee.

2. An equation is added to calculate the amount of ammonium in the *Assay for Ammonium*.
3. An equation is added to calculate the amount of chloride in the *Assay for Chloride*.
4. Concentration units for the *Standard solution* and *Sample solution* are revised to mEq/mL in the *Assay for Phosphate* to eliminate the need for the molecular weight correction term in the equation for the calculation of the amount of phosphate.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Multiple Electrolytes and Dextrose Injection Type 3

DEFINITION

Multiple Electrolytes and Dextrose Injection Type 3 is a sterile solution of Dextrose and suitable salts in Water for Injection to provide sodium, potassium, and chloride ions. In addition, the salts provide ions of ammonium, or acetate and phosphate, or phosphate and lactate. It contains NLT 90.0% and NMT 110.0% of the labeled amounts of sodium (Na), potassium (K), ammonium (NH₄), acetate (C₂H₃O₂), phosphate (PO₄), and lactate (C₃H₅O₃); NLT 90.0% and NMT 120.0% of the labeled amount of chloride (Cl); and NLT 90.0% and NMT 105.0% of the labeled amount of dextrose (C₆H₁₂O₆·H₂O). It may contain Hydrochloric Acid or Sodium Hydroxide used to adjust the pH. It contains no antimicrobial agents.

IDENTIFICATION

• **A.**

Sample solution: Nominally 50 mg/mL of dextrose from a suitable volume of Injection

Analysis: Add a few drops of the *Sample solution* to 5 mL of hot alkaline cupric tartrate TS.

Acceptance criteria: A copious red precipitate of cuprous oxide is formed.

Change to read:

• **B. Identification Tests—General** < 191 >, ~~**Sodium**~~ < 191 >, ~~**Potassium**~~ < 191 >,

■ 2S (USP39)

Chloride and **Ammonium**: Meets the requirements of the flame tests for ~~*Sodium*~~ and ~~*Potassium*~~, and of the tests for ~~*Chloride*~~ and ~~*Ammonium*~~

■ 2S (USP39)

Add the following:

• **C. Sodium:** The sample imparts an intense yellow color to a nonluminous flame. ■ 2S (USP39)

Add the following:

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of acetate ($C_2H_3O_2$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of acetate from the *Sample solution*

r_S peak response of acetate from the *Standard solution*

C_S concentration of acetate in the *Standard solution* (mEq/mL)

C_U nominal concentration of acetate in the *Sample solution* (mEq/mL)

Acceptance criteria: 90.0%–110.0%

Change to read:

- **Ammonium** (if present)

Sample solution: Transfer a volume of Injection, equivalent to 63 mg (3.5 mEq) of ammonium, to a 500-mL Kjeldahl flask. Dilute with water to 200 mL, and add 50 mL of sodium hydroxide solution (2 in 5).

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N sulfuric acid VS

Endpoint detection: Visual

Analysis

Sample: *Sample solution*

Immediately connect the flask containing the *Sample solution* by means of a distillation trap to a well-cooled condenser, the delivery tube of which dips into 40 mL of boric acid solution (1 in 25) contained in a suitable receiver. Heat to boiling, and distill about 200 mL. Cool the liquid in the receiver, if necessary, then add methyl red TS, and titrate with *Titrant*. Perform a blank determination, and make any necessary correction. ~~Each mL of *Titrant* is equivalent to 1.804 mg (0.1 mEq) of ammonium (NH_4).~~

Calculate the percentage of the labeled amount of ammonium (NH_4) in the portion of Injection taken:

$$\text{Result} = (V_S - V_B) \times N \times (F/W) \times 100$$

V_S

= *Titrant* volume consumed by the *Sample solution* (mL)

V_B

= *Titrant* volume consumed by the blank (mL)

N

= actual normality of the *Titrant* (mEq/mL)

F

= equivalency factor, 18.04 mg/mEq

W

= nominal amount of ammonium in the *Sample solution* (mg)

■ 2S (USP39)

Acceptance criteria: 90.0%–110.0%

Change to read:

• **Chloride**

Sample solution: Transfer a volume of Injection, equivalent to 55 mg of chloride (1.55 mEq), to a suitable conical flask and add water, if necessary, to bring the volume to about 10 mL. Add 10 mL of glacial acetic acid, 75 mL of methanol, and 0.5 mL of eosin Y TS.

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N silver nitrate VS

Endpoint detection: Visual

Analysis

Sample: *Sample solution*

Titrate, with shaking, with *Titrant* to a pink endpoint.

Each mL of *Titrant* is equivalent to 3.545 mg (0.1 mEq) of chloride (Cl).

■ Calculate the percentage of the labeled amount of chloride (Cl) in the portion of Injection taken:

$$\text{Result} = V \times N \times (F/W) \times 100$$

V

= *Titrant* volume consumed by the *Sample solution* (mL)

N

= actual normality of the *Titrant* (mEq/mL)

F

= equivalency factor, 35.45 mg/mEq

W

= nominal amount of chloride in the *Sample solution* (mg)

■ 2S (USP39)

Acceptance criteria: 90.0%–120.0%

• **Dextrose**

Sample solution: Transfer a volume of Injection containing 2–5 g of dextrose to a 100-mL volumetric flask. Add 0.2 mL of 6 N ammonium hydroxide, and dilute with water to volume.

Analysis**Sample:** *Sample solution*

Determine the angular rotation in a polarimeter tube (see *Optical Rotation* 〈 781 〉). Calculate the percentage of the labeled amount of dextrose ($C_6H_{12}O_6 \cdot H_2O$) in the portion of Injection taken:

$$\text{Result} = [(100 \times a)/(l \times \alpha)] \times (1/C_U) \times (M_{r1}/M_{r2}) \times 100$$

a = observed angular rotation of the *Sample solution*, in degrees

l = length of the polarimeter tube, in decimeters

α = midpoint of the specific rotation range for anhydrous dextrose, 52.9°

C_U = nominal concentration of dextrose in the *Sample solution*, g/100 mL

M_{r1} = molecular weight of dextrose monohydrate, 198.17

M_{r2} = molecular weight of anhydrous dextrose, 180.16

Acceptance criteria: 90.0%–105.0%

Change to read:

- **Lactate** (if present)

Mobile phase: Formic acid, dicyclohexylamine, and water (1:1:998)

System suitability solution: 3 mg/mL each of anhydrous sodium acetate and USP Sodium Lactate RS in water

Standard solution: 2 mg/mL of USP Sodium Lactate RS

■(0.018 mEq/mL of lactate)■_{2S} (USP39)

in water

Sample solution

For Injections containing >20 mEq/L of lactate: Nominally 0.02 mEq/mL of lactate from Injection in water

For Injections containing ≤20 mEq/L of lactate: Use the undiluted Injection.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 10-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 20 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2 between acetate and lactate, *System suitability solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of lactate ($C_3H_5O_3$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of lactate from the *Sample solution*

r_S peak response of lactate from the *Standard solution*

C_S concentration of lactate in the *Standard solution* (mEq/mL)

C_U nominal concentration of lactate in the *Sample solution* (mEq/mL)

Acceptance criteria: 90.0%–110.0%

Change to read:

• **Phosphate** (if present)

Solution A: 50 g/L of ammonium molybdate prepared as follows. Transfer a suitable amount of ammonium molybdate to an appropriate volumetric flask. Add 60% of the final flask volume of water, and swirl to dissolve. Add 15% of the flask volume of sulfuric acid, and swirl. Allow to cool, and dilute with water to volume.

Solution B: Dissolve 0.5 g of hydroquinone in 100 mL of water, and add 1 drop of sulfuric acid. Prepare this solution fresh daily.

Solution C: Dissolve 1 g of sodium sulfite in water to make 5 mL. Prepare this solution fresh daily.

Standard solution: 0.11 mg/mL of monobasic potassium phosphate

■ (0.0008 mEq/mL of phosphate) ■ 2S (USP39)

in water

Sample solution: ~~Transfer a volume of Injection equivalent to 4 mg (0.126 mEq) of phosphate to a 50 mL volumetric flask, and dilute with water to volume.~~

■ Nominally 0.0008 mEq/mL of phosphate from a volume of Injection ■ 2S (USP39)

Blank: Water

Instrumental conditions

Mode: Vis

Analytical wavelength: 640 nm

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Use water to zero the instrument. Transfer 2 mL each of the *Standard solution*, the *Sample solution*, and the *Blank* to separate test tubes. To each test tube add 1 mL of *Solution A*, and allow to stand for 3 min. Add 1 mL of *Solution B*. Add 1 mL of *Solution C*, and allow to stand for 30 min.

Calculate the percentage of the labeled amount of phosphate (PO_4) in the portion of the Injection taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

■ $\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$ ■ 2S (USP39)

A_U = absorbance of the *Sample solution*, corrected for any absorbance of the solution from the *Blank*

A_S = absorbance of the *Standard solution*, corrected for any absorbance of the solution from the *Blank*

C_S = concentration of phosphate in the *Standard solution* (~~mg~~
 ■ mEq/ ■ 2S (USP39)
 mL)

C_U = nominal concentration of phosphate (PO_4) in the *Sample solution* (~~mg~~
 ■ mEq/ ■ 2S (USP39)
 mL)

M_{r1} = molecular weight of phosphate, 94.97
 ■

M_{r2} = molecular weight of monobasic potassium phosphate, 136.09 ■ 2S (USP39)

Acceptance criteria: 90.0%–110.0%

● **Potassium and Sodium**

Internal standard solution: 1.04 mg/mL of lithium nitrate prepared as follows. Transfer 1.04 g of lithium nitrate to a 1000-mL volumetric flask, add a suitable nonionic surfactant, then dilute with water to volume.

Potassium stock solution: 74.56 mg/mL of potassium chloride (1 mEq/mL of potassium) prepared as follows. Transfer 18.64 g of potassium chloride, previously dried at 105° for 2 h, to a 250-mL volumetric flask, and dilute with water to volume.

Sodium stock solution: 58.44 mg/mL of sodium chloride (1 mEq/mL of sodium) prepared as follows. Transfer 14.61 g of sodium chloride, previously dried at 105° for 2 h, to a 250-mL volumetric flask, and dilute with water to volume.

Standard stock solution: 0.0391J mg/mL of potassium (K) from *Potassium stock solution* and 0.02299J' mg/mL of sodium (Na) from *Sodium stock solution* prepared as follows. Transfer 0.1J mL of *Potassium stock solution* and 0.1J' mL of *Sodium stock solution* to a 100-mL volumetric flask, where J and J' are the labeled amounts, in mEq/L, of potassium and sodium, respectively, in the Injection. Dilute with water to volume.

Standard solution: Dilute 5.0 mL of *Standard stock solution* with *Internal standard solution* to 500.0 mL.

Sample solution: Dilute 5.0 mL of Injection with *Internal standard solution* to 500.0 mL.

Instrumental conditions

Mode: Flame photometer

Analytical wavelengths

Potassium: Maximum at 766 nm

Sodium: Maximum at 589 nm

Lithium: Maximum at 671 nm

Blank: *Internal standard solution*

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Use the *Blank* to zero the instrument. Concomitantly determine the flame emission readings for the *Standard solution* and *Sample solution*.

Calculate the percentage of the labeled amount of potassium (K) in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_{\bar{K}}$ emission reading ratio of potassium to lithium from the *Sample solution*

$R_{\bar{S}}$ emission reading ratio of potassium to lithium from the *Standard solution*

$C_{\bar{S}}$ concentration of potassium (K) in the *Standard solution* (mg/mL)

$C_{\bar{K}}$ nominal concentration of potassium (K) in the *Sample solution* (mg/mL)

[Note—Each mg of potassium (K) is equivalent to 0.02558 mEq of potassium (K).]

Calculate the percentage of the labeled amount of sodium (Na) in the portion of Injection taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_{\bar{Na}}$ emission reading ratio of sodium to lithium from the *Sample solution*

$R_{\bar{S}}$ emission reading ratio of sodium to lithium from the *Standard solution*

$C_{\bar{S}}$ concentration of sodium (Na) in the *Standard solution* (mg/mL)

$C_{\bar{Na}}$ nominal concentration of sodium (Na) in the *Sample solution* (mg/mL)

[Note—Each mg of sodium (Na) is equivalent to 0.04350 mEq of sodium (Na).]

Acceptance criteria

Potassium: 90.0%–110.0%

Sodium: 90.0%–110.0%

SPECIFIC TESTS

- **Bacterial Endotoxins Test** 〈 85 〉: NMT 0.5 USP Endotoxin Units/mL
- **pH** 〈 791 〉: 4.0–6.5
- **Other Requirements:** It meets the requirements in *Injections* 〈 1 〉.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.
- **Labeling:** The label states the content of each electrolyte in terms of milliequivalents (mEq) in a given volume. The label states the total osmolar concentration in mOsmol/L. When the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol/mL.

BRIEFING

Multiple Electrolytes and Dextrose Injection Type 4, *USP 38* page 3281. It is proposed to omit this monograph for the following reasons. No drug products formulated as defined under Multiple Electrolytes and Dextrose Injection Type 4 are currently marketed in the United States. The drug product is currently not used in veterinary medicine in the United States.

(SM4: M. Koleck.) Correspondence Number—C157334

Comment deadline: September 30, 2015

Delete the following:**Multiple Electrolytes and Dextrose Injection Type 4**

» Multiple Electrolytes and Dextrose Injection Type 4 is a sterile solution of Dextrose and suitable salts in Water for Injection to provide sodium, magnesium, calcium, chloride, gluconate, and sulfate ions. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of sodium (Na), magnesium (Mg), calcium (Ca), gluconate ($C_6H_{11}O_7$), and sulfate (SO_4), not less than 90.0 percent and not more than 120.0 percent of the labeled amount of chloride (Cl), and not less than 90.0 percent and not more than 105.0 percent of the labeled amount of dextrose ($C_6H_{12}O_6 \cdot H_2O$). It may contain Hydrochloric Acid or Sodium Hydroxide used to adjust the pH. It contains no antimicrobial agents.

Packaging and storage—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

Labeling—The label states the content of each electrolyte in terms of milliequivalents in a given volume. The label states the total osmolar concentration in mOsmol per L. When the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol per mL.

USP Reference standards ~~(11)~~—

USP Endotoxin RS

USP Potassium Gluconate RS

Identification—

A: It responds to the *Identification* test under *Dextrose*.

B: It responds to the flame test for *Sodium* ~~(191)~~, to the tests for *Magnesium* ~~(191)~~ and *Chloride* ~~(191)~~, to the oxalate test for *Calcium* ~~(191)~~, and to the barium chloride test for *Sulfate* ~~(191)~~.

C: The retention time of the gluconate peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* obtained as directed in the *Assay for gluconate*.

Bacterial endotoxins ~~(85)~~—It contains not more than 0.5 USP Endotoxin Unit per mL.

pH ~~(791)~~: between 4.2 and 5.2.

Other requirements—It meets the requirements under *Injections* ~~(1)~~.

Assay for sodium—

Internal standard solution—Transfer 1.04 g of lithium nitrate to a 1000-mL volumetric flask, add a suitable nonionic surfactant, dilute with water to volume, and mix.

Standard preparation— Transfer 7.31 g of sodium chloride, previously dried at 105 ° for 2 hours and accurately weighed, to a 250 mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100 mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 500 mL volumetric flask, dilute with *Internal standard solution* to volume, and mix. Each mL of this solution contains 0.0292 mg of sodium chloride, equivalent to 0.0115 mg (0.0005 mEq) of sodium (Na).

Assay preparation— Dilute an accurately measured volume of Injection quantitatively with *Internal standard solution* to obtain a solution containing about 0.0115 mg (0.0005 mEq) of sodium per mL.

Procedure— Using a flame photometer, adjusted to read zero with *Internal standard solution*, concomitantly determine the flame emission readings for the *Standard preparation* and the *Assay preparation* at the wavelengths of maximum emission for sodium and lithium (589 nm and 671 nm, respectively). Calculate the quantity, in mg, of sodium (Na) in each mL of the Injection taken by the formula:

$$(22.99 / 58.44)(C)(L / D)(R_{U,589} / R_{U,671})(R_{S,671} / R_{S,589})$$

in which 22.99 is the atomic weight of sodium, 58.44 is the molecular weight of sodium chloride, *C* is the concentration, in mg per mL, of sodium chloride in the *Standard preparation*, *L* is the labeled quantity, in mg, of sodium in each mL of the Injection, *D* is the concentration, in mg per mL, of sodium in the *Assay preparation*, based on the volume of Injection taken and the extent of dilution, and $R_{U,589}$ and $R_{U,671}$ are the emission readings at the wavelengths identified by the subscript numbers obtained for the *Assay preparation*, and $R_{S,589}$ and $R_{S,671}$ are the emission readings at the wavelengths identified by the subscript numbers obtained from the *Standard preparation*. Each mg of sodium is equivalent to 0.0435 of mEq of sodium.

Assay for magnesium— [Note—Concentrations of the *Standard preparations* and the *Assay preparation* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

Lanthanum chloride solution, *Dilute hydrochloric acid*, *Blank solution*, *Magnesium stock solution*, and *Standard preparations*—Prepare as directed in the *Assay for magnesium* under *Multiple Electrolytes Injection Type 1*.

Assay preparation— Transfer an accurately measured volume of Injection, equivalent to about 20 mg (1.65 mEq) of magnesium, to a 1000 mL volumetric flask containing 50.0 mL of *Lanthanum chloride solution*. Dilute the contents of the flask with *Dilute hydrochloric acid* to volume, and mix.

Procedure— Proceed as directed for *Procedure* in the *Assay for magnesium* under *Multiple Electrolytes Injection Type 1*. Calculate the quantity, in µg, of magnesium (Mg) in each mL of Injection taken by the formula:

$$1000(C / V)$$

in which the terms are as defined therein.

Assay for calcium— [Note—Concentrations of the *Standard preparations* and the *Assay preparation* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

Lanthanum chloride solution, *Dilute hydrochloric acid*, and *Blank solution*— Prepare as directed

~~in the Assay for magnesium under Multiple Electrolytes Injection Type 1.~~

~~Calcium stock solution and Standard preparations— Prepare as directed in the Assay for calcium under Multiple Electrolytes Injection Type 2.~~

~~Assay preparation— Transfer an accurately measured volume of Injection, equivalent to about 20 mg (1 mEq) of calcium, to a 1000 mL volumetric flask containing 50.0 mL of Lanthanum chloride solution. Dilute the contents of the flask with Dilute hydrochloric acid to volume, and mix.~~

~~Procedure— Proceed as directed for Procedure in the Assay for calcium under Multiple Electrolytes Injection Type 2. Calculate the quantity, in µg, of calcium in each mL of Injection taken by the formula:~~

$$1000(C/V)$$

~~in which the terms are as defined therein.~~

~~**Assay for chloride**— Using the Injection, proceed as directed in the Assay for chloride under Multiple Electrolytes Injection Type 1.~~

Assay for gluconate—

~~Mobile phase, Standard preparation, Resolution solution, and Chromatographic system— Prepare as directed in the Assay for gluconate under Multiple Electrolytes and Dextrose Injection Type 1.~~

~~Assay preparation— Dilute an accurately measured volume of Injection quantitatively with water to obtain a solution containing about 0.023 mEq of gluconate per mL.~~

~~Procedure— Proceed as directed for Procedure in the Assay for gluconate under Multiple Electrolytes and Dextrose Injection Type 1. Calculate the quantity, in mEq per liter, of gluconate ($C_6H_{11}O_7$) in the Injection taken by the formula:~~

$$(C / 234.25)(L / D)(r_U / r_S)$$

~~in which the terms are as defined therein.~~

~~**Assay for sulfate**— Using the Injection, proceed as directed in the Assay for sulfate under Multiple Electrolytes and Dextrose Injection Type 1.~~

~~**Assay for dextrose**— Using the Injection, proceed as directed in the Assay for dextrose under Multiple Electrolytes and Dextrose Injection Type 1. ■ 2S (USP39)~~

BRIEFING

Multiple Electrolytes and Invert Sugar Injection Type 1, USP 38 page 3282. It is proposed to omit this monograph for the following reasons. No drug products formulated as defined under Multiple Electrolytes and Invert Sugar Injection Type 1 are currently marketed in the United States. The drug product is currently not used in veterinary medicine in the United States.

(SM4: M. Koleck.) Correspondence Number—C157330

Comment deadline: September 30, 2015

Delete the following:**■ Multiple Electrolytes and Invert Sugar Injection Type 1**

» Multiple Electrolytes and Invert Sugar Injection Type 1 is a sterile solution of a mixture of equal amounts of Dextrose and Fructose, or an equivalent solution produced by the hydrolysis of Sucrose, and suitable salts in Water for Injection to provide sodium, potassium, magnesium, chloride, phosphate, and lactate ions. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of sodium (Na), potassium (K), magnesium (Mg), phosphate (PO_4), lactate ($\text{C}_3\text{H}_5\text{O}_3$), and invert sugar ($\text{C}_6\text{H}_{12}\text{O}_6$), and not less than 90.0 percent and not more than 120.0 percent of the labeled amount of chloride (Cl). It may contain Hydrochloric Acid or Sodium Hydroxide used to adjust the pH. It contains no antimicrobial agents.

Packaging and storage—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

Labeling—The label states the content of each electrolyte in terms of milliequivalents in a given volume. The label states the total osmolar concentration in mOsmol per L. When the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol per mL.

USP Reference standards ~~(11)~~—

USP Sodium Lactate RS

Identification—

A: It responds to the *Identification* test under *Invert Sugar Injection*.

B: It responds to the flame tests for *Sodium* ~~(191)~~ and *Potassium* ~~(191)~~, and to the tests for *Magnesium* ~~(191)~~ and *Chloride* ~~(191)~~.

C: Add 5 mL of the Injection and 1 mL of ammonium molybdate TS to a test tube, and mix: a yellow precipitate, which is soluble in 6-N ammonium hydroxide, is formed (*presence of phosphate*).

D: The retention time of the lactate peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* obtained as directed in the *Assay for lactate*.

Pyrogen—It meets the requirements of the *Pyrogen Test* ~~(151)~~. [Note—Dilute, with Water for Injection, Injection containing more than 10% of invert sugar to give a concentration of 10% invert sugar.]

pH ~~(791)~~: between 3.0 and 6.0.

Completeness of inversion—

Mobile phase, Standard preparation, and Chromatographic system— Prepare as directed in the

~~test for Completeness of inversion under Invert Sugar Injection.~~

~~Test preparation—~~ Transfer an accurately measured volume of Injection, equivalent to about 2.5 g of invert sugar, to a 100 mL volumetric flask, dilute with water to volume, and mix.

~~Procedure—~~ Proceed as directed for *Procedure* in the test for *Completeness of inversion under Invert Sugar Injection*. Calculate the quantity, in mg, of sucrose in the volume of the Injection taken by the formula:

$$100C(r_U/r_S)$$

in which the terms are as defined therein. Not more than 1.5% of the quantity of invert sugar in the volume of the Injection taken, based on the labeled amount, is found.

Other requirements—It meets the requirements under *Injections* ~~(1)~~.

Assay for potassium and sodium—

~~Internal standard solution, Potassium stock solution, Sodium stock solution, Stock standard preparation, and Standard preparation—~~ Prepare as directed in the *Assay for potassium and sodium under Potassium Chloride in Sodium Chloride Injection*.

~~Assay preparation—~~ Transfer 5.0 mL of Injection to a 500 mL volumetric flask, dilute with *Internal standard solution* to volume, and mix.

~~Procedure—~~ Proceed as directed for *Procedure* in the *Assay for potassium and sodium under Potassium Chloride in Sodium Chloride Injection*. Calculate the quantity, in mg, of potassium (K) in each mL of the Injection taken by the formula:

$$C(R_{U,766} + R_{U,671})(R_{S,671} + R_{S,766})$$

in which the terms are as defined therein. Each mg of potassium is equivalent to 0.02558 mEq of potassium. Calculate the quantity, in mg, of sodium (Na) in each mL of the Injection taken by the formula:

$$C(R_{U,589} + R_{U,671})(R_{S,671} + R_{S,589})$$

in which the terms are as defined therein. Each mg of sodium is equivalent to 0.04350 mEq of sodium.

Assay for magnesium— [Note—Concentrations of the *Standard preparations* and the *Assay preparation* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

~~Lanthanum chloride solution, Dilute hydrochloric acid, Blank solution, Magnesium stock solution, and Standard preparations—~~ Prepare as directed in the *Assay for magnesium under Multiple Electrolytes Injection Type 1*.

~~Assay preparation—~~ Transfer an accurately measured volume of Injection, equivalent to about 20 mg (1.65 mEq) of magnesium, to a 1000 mL volumetric flask containing 50.0 mL of *Lanthanum chloride solution*. Dilute the contents of the flask with *Dilute hydrochloric acid* to volume, and mix.

~~Procedure—~~ Proceed as directed for *Procedure* in the *Assay for magnesium under Multiple Electrolytes Injection Type 1*. Calculate the quantity, in µg, of magnesium (Mg) in each mL of the Injection taken by the formula:

$$1000(C/V)$$

in which the terms are as defined therein.

Assay for chloride—Using the Injection, proceed as directed in the *Assay for chloride* under *Multiple Electrolytes Injection Type 1*.

Assay for phosphate—

Ammonium molybdate solution, Hydroquinone solution, Sodium sulfite solution, Standard preparation, and Blank— Prepare as directed in the *Assay for phosphate* under *Multiple Electrolytes Injection Type 1*.

Assay preparation— Transfer an accurately measured volume of Injection, equivalent to about 4 mg (0.126 mEq) of phosphate, to a 50-mL volumetric flask, dilute with water to volume, and mix.

Procedure— Proceed as directed for *Procedure* in the *Assay for phosphate* under *Multiple Electrolytes Injection Type 1*. Calculate the quantity, in mg, of phosphate (PO_4) in each mL of the Injection taken by the formula:

$$50(94.97 / 136.09)(C/V)(A_U / A_S)$$

in which the terms are as defined therein.

Assay for lactate—

Mobile phase, Resolution solution, Standard preparation, and Chromatographic system— Prepare as directed in the *Assay for lactate* under *Multiple Electrolytes Injection Type 2*.

Assay preparation— Where the labeled quantity of lactate is greater than 20 mEq per liter, dilute an accurately measured volume of Injection quantitatively with water to obtain a solution containing about 0.02 mEq of lactate per mL. Where the labeled quantity of lactate is 20 mEq or less per liter, use the undiluted Injection as the *Assay preparation*.

Procedure— Proceed as directed for *Procedure* in the *Assay for lactate* under *Multiple Electrolytes Injection Type 2*. Calculate the quantity, in mEq per liter, of lactate ($\text{C}_3\text{H}_5\text{O}_3$) in the Injection taken by the formula:

$$(C / 112.06)(L / D)(r_U / r_S)$$

in which the terms are as defined therein.

Assay for invert sugar—Tare a clean, medium porosity filtering crucible containing several carborundum boiling chips or glass beads. Transfer 50.0 mL of freshly mixed alkaline cupric tartrate TS to a 400-mL beaker. To the beaker add the boiling chips or glass beads from the tared crucible, 48 mL of water, and 2.0 mL of Injection that has been diluted quantitatively with water, if necessary, to a 5.0% concentration of invert sugar. Heat the beaker and contents over a burner that has been adjusted to cause boiling of the solution to start in 3.5 to 4 minutes. Boil the solution for 2.0 minutes, accurately timed, and filter immediately through the tared crucible, taking care to transfer all of the boiling chips or glass beads to the crucible. Wash the precipitate with hot water and 10 mL of alcohol. Dry the crucible and contents at 110° to constant weight, and make any necessary correction. The corrected weight of the precipitate so obtained is not less than 193.6 mg and not more than 234.5 mg, corresponding to between 90.0 and 110.0 mg of invert sugar ($\text{C}_6\text{H}_{12}\text{O}_6$). ■ 2S (USP39)

BRIEFING

Multiple Electrolytes and Invert Sugar Injection Type 2, *USP 38* page 3283. It is proposed to omit this monograph for the following reasons. No drug products formulated as defined under Multiple Electrolytes and Invert Sugar Injection Type 2 are currently marketed in the United States. The drug product is currently not used in veterinary medicine in the United States.

Multiple Electrolytes and Invert Sugar Injection Type 2

» ~~Multiple Electrolytes and Invert Sugar Injection Type 2 is a sterile solution of a mixture of equal amounts of Dextrose and Fructose, or an equivalent solution produced by the hydrolysis of Sucrose, and suitable salts in Water for Injection to provide sodium, potassium, magnesium, calcium, chloride, and lactate ions. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of sodium (Na), potassium (K), magnesium (Mg), calcium (Ca), lactate ($C_3H_5O_3$), and invert sugar ($C_6H_{12}O_6$), and not less than 90.0 percent and not more than 120.0 percent of the labeled amount of chloride (Cl). It may contain Hydrochloric Acid or Sodium Hydroxide used to adjust the pH. It contains no antimicrobial agents.~~

Packaging and storage—~~Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.~~

Labeling—~~The label states the content of each electrolyte in terms of milliequivalents in a given volume. The label states the total osmolar concentration in mOsmol per L. When the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol per mL.~~

USP Reference standards ~~(11)~~—

USP Sodium Lactate RS

Identification—

A: ~~It responds to the *Identification* test under *Invert Sugar Injection*.~~

B: ~~It responds to the flame tests for *Sodium* (191) and *Potassium* (191), to the tests for *Magnesium* (191) and *Chloride* (191), and to the oxalate test for *Calcium* (191).~~

C: ~~The retention time of the lactate peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* obtained as directed in the *Assay for lactate*.~~

Pyrogen—~~It meets the requirements of the *Pyrogen Test* (151). [Note—Dilute, with Water for Injection, Injection containing more than 10% of invert sugar to give a concentration of~~

~~±0% invert sugar.]~~

~~pH (791):~~ between 4.5 and 6.0.

~~Completeness of inversion~~

~~Mobile phase, Standard preparation, and Chromatographic system~~— Prepare as directed in the test for *Completeness of inversion* under *Invert Sugar Injection*.

~~Test preparation~~— Transfer an accurately measured volume of Injection, equivalent to about 2.5 g of invert sugar, to a 100-mL volumetric flask, dilute with water to volume, and mix.

~~Procedure~~— Proceed as directed for *Procedure* in the test for *Completeness of inversion* under *Invert Sugar Injection*. Calculate the quantity, in mg, of sucrose in the volume of Injection taken by the formula:

$$100C(r_U/r_S)$$

in which the terms are as defined therein. Not more than 1.5% of the quantity of invert sugar in the volume of Injection taken, based on the labeled amount, is found.

~~Other requirements~~— It meets the requirements under *Injections* (1).

~~Assay for potassium and sodium~~

~~Internal standard solution, Potassium stock solution, Sodium stock solution, Stock standard preparation, and Standard preparation~~— Prepare as directed in the *Assay for potassium and sodium* under *Potassium Chloride in Sodium Chloride Injection*.

~~Assay preparation~~— Transfer 5.0 mL of Injection to a 500-mL volumetric flask, dilute with *Internal standard solution* to volume, and mix.

~~Procedure~~— Proceed as directed for *Procedure* in the *Assay for potassium and sodium* under *Potassium Chloride in Sodium Chloride Injection*. Calculate the quantity, in mg, of potassium (K) in each mL of the Injection taken by the formula:

$$C(R_{U,766}/R_{U,671})(R_{S,671}/R_{S,766})$$

in which the terms are as defined therein. Each mg of potassium is equivalent to 0.02558 mEq of potassium. Calculate the quantity, in mg, of sodium (Na) in each mL of the Injection taken by the formula:

$$C(R_{U,589}/R_{U,671})(R_{S,671}/R_{S,589})$$

in which the terms are as defined therein. Each mg of sodium is equivalent to 0.04350 mEq of sodium.

~~Assay for magnesium~~— [Note—Concentrations of the *Standard preparations* and the *Assay preparation* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

~~Lanthanum chloride solution, Dilute hydrochloric acid, Blank solution, Magnesium stock solution, and Standard preparations~~— Prepare as directed in the *Assay for magnesium* under *Multiple Electrolytes Injection Type 1*.

~~Assay preparation~~— Transfer an accurately measured volume of Injection, equivalent to about 20 mg (1.65 mEq) of magnesium, to a 1000-mL volumetric flask containing 50.0 mL of

~~Lanthanum chloride solution.~~ Dilute the contents of the flask with ~~Dilute hydrochloric acid~~ to volume, and mix.

~~Procedure~~— Proceed as directed for ~~Procedure~~ in the ~~Assay for magnesium~~ under ~~Multiple Electrolytes Injection Type 1~~. Calculate the quantity, in µg, of magnesium (Mg) in each mL of the Injection taken by the formula:

$$1000(C/V)$$

in which the terms are as defined therein.

Assay for calcium— [Note—Concentrations of the ~~Standard preparations~~ and the ~~Assay preparation~~ may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

~~Lanthanum chloride solution, Dilute hydrochloric acid, and Blank solution~~— Prepare as directed in the ~~Assay for magnesium~~ under ~~Multiple Electrolytes Injection Type 1~~.

~~Calcium stock solution and Standard preparations~~— Prepare as directed in the ~~Assay for calcium~~ under ~~Multiple Electrolytes Injection Type 2~~.

~~Assay preparation~~— Transfer an accurately measured volume of Injection, equivalent to about 20 mg (1 mEq) of calcium, to a 1000 mL volumetric flask containing 50.0 mL of ~~Lanthanum chloride solution~~. Dilute the contents of the flask with ~~Dilute hydrochloric acid~~ to volume, and mix.

~~Procedure~~— Proceed as directed for ~~Procedure~~ in the ~~Assay for calcium~~ under ~~Multiple Electrolytes Injection Type 2~~. Calculate the quantity, in µg, of calcium in each mL of the Injection taken by the formula:

$$1000(C/V)$$

in which the terms are as defined therein.

Assay for chloride— Using the Injection, proceed as directed in the ~~Assay for chloride~~ under ~~Multiple Electrolytes Injection Type 1~~.

Assay for lactate—

~~Mobile phase, Resolution solution, Standard preparation, and Chromatographic system~~— Prepare as directed in the ~~Assay for lactate~~ under ~~Multiple Electrolytes Injection Type 2~~.

~~Assay preparation~~— Where the labeled quantity of lactate is greater than 20 mEq per liter, dilute an accurately measured volume of Injection quantitatively with water to obtain a solution containing about 0.02 mEq of lactate per mL. BRIEFING

Febantel. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on the *European Pharmacopoeia* monograph, is proposed. The HPLC procedure in the Assay and the test for *Organic Impurities* is based on analyses performed with the Nova-Pak C-18 or LiChrospher 100 RP-18 brands of L1 column. The typical retention

time for febantel is about 32 min.

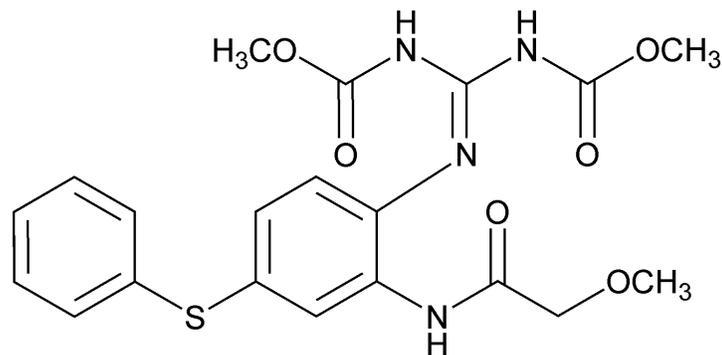

(SM3: M. Puderbaugh.)

Correspondence Number—C132963

Comment deadline: September 30, 2015

Add the following:

■ **Febantel**

C₂₀H₂₂N₄O₆S 446.48

Carbamic acid, [[2-[(methoxyacetyl)amino]-4-(phenylthio)phenyl]carbonimidoyl]bis-, dimethyl ester;

Dimethyl {[2-(2-methoxyacetamido)-4-(phenylthio)phenyl]imidocarbonyl}dicarbamate [58306-30-2].

DEFINITION

Febantel contains NLT 97.5% and NMT 102.0% of febantel (C₂₀H₂₂N₄O₆S), calculated on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption** (197K): If a difference appears in the IR spectra of the analyte and the standard, dissolve equal portions of the test specimen and the Reference Standard in equal volumes of acetone and evaporate the solutions to dryness. Repeat the test on the residues.
- **B.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **Procedure**

Buffer: 6.8 g/L of monobasic potassium phosphate in water

Mobile phase: Acetonitrile and *Buffer* (35:65)

Diluent: Acetonitrile and tetrahydrofuran (50:50)

Standard solution: 0.5 mg/mL of USP Febantel RS in *Diluent*

Sample solution: 0.5 mg/mL of Febantel in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC
Detector: UV 280 nm
Column: 4.0-mm × 15-cm; 5-μm packing L1
Flow rate: 1.0 mL/min
Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of febantel (C₂₀H₂₂N₄O₆S) in the portion of Febantel taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Febantel RS in the *Standard solution* (mg/mL)

C_U = concentration of Febantel in the *Sample solution* (mg/mL)

Acceptance criteria: 97.5%–102.0% on the dried basis

IMPURITIES

- **Residue on Ignition** (281): NMT 0.1%
- **Organic Impurities**

Buffer, Mobile phase, Diluent, and Chromatographic system: Proceed as directed in the *Assay*.

System suitability solution: 0.01 mg/mL each of USP Febantel Related Compound A RS, USP Febantel Related Compound B RS, and USP Fenbendazole RS in *Diluent*

Standard solution: 0.01 mg/mL of USP Febantel RS in *Diluent*

Sample solution: 10.0 mg/mL of Febantel in *Diluent*

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 3.0 between febantel related compound A and febantel related compound B; NLT 4.0 between febantel related compound B and fenbendazole

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Febantel taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of febantel from the *Standard solution*

C_S = concentration of USP Febantel RS in the *Standard solution* (mg/mL)

$C_{\bar{F}}$ concentration of Febantel in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 1*. The reporting level for impurities is 0.05%.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Febantel related compound A	0.19	0.1
Febantel related compound B	0.29	0.1
Fenbendazole	0.39	0.1
Febantel	1.00	—
Any other individual impurity	—	0.20
Total impurities	—	0.5

SPECIFIC TESTS

- **Loss on Drying** 〈 731 〉

Sample: 1.0 g

Analysis: Dry the *Sample* at 105° for 2 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers. Store at room temperature.
- **Labeling:** Label it to indicate that it is for veterinary use only.
- **USP Reference Standards** 〈 11 〉

USP Febantel RS

USP Febantel Related Compound A RS

Methyl [[2-[(methoxyacetyl)amino]-4-(phenylthio)phenyl]carbamimidoyl]carbamate.

C₁₈H₂₀N₄O₄S 388.44

USP Febantel Related Compound B RS

2-(Methoxymethyl)-5-(phenylthio)-1*H*-benzimidazole.

C₁₅H₁₄N₂OS 270.35

USP Fenbendazole RS

Methyl 5-(phenylthio)-2-benzimidazolecarbamate.

Comment deadline: September 30, 2015

Delete the following:

■ **Iopanoic Acid**

$C_{11}H_{12}I_3NO_2$ 570.93

Benzenepropanoic acid, 3-amino-~~α~~-ethyl-2,4,6-triiodo-, (±)-.
(±)-3-Amino-~~α~~-ethyl-2,4,6-triiodohydrocinnamic acid [[96-83-3]].

» Iopanoic Acid contains an amount of iodine equivalent to not less than 97.0 percent and not more than 101.0 percent of $C_{11}H_{12}I_3NO_2$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers.

Identification—Mix about 100 mg with 500 mg of sodium carbonate in a crucible, and heat until thoroughly charred. Cool, add 5 mL of hot water, heat on a steam bath for 5 minutes, and filter: the solution responds to the tests for *Iodide* ~~(191)~~.

Melting range ~~(741)~~: between 152° and 158°, with decomposition.

Loss on drying ~~(731)~~—Dry it at 105° for 1 hour: it loses not more than 1.0% of its weight.

Residue on ignition ~~(281)~~: not more than 0.1%.

Free iodine—Shake about 200 mg with 2 mL of water and 2 mL of chloroform for 1 minute: the chloroform layer shows no violet color.

Halide ions—Place about 500 mg in a glass-stoppered, 50-mL cylinder, add 10 mL of 2-N nitric acid and 15 mL of water, shake for 5 minutes, and filter through paper: 10 mL of the filtrate shows no greater turbidity than corresponds to 0.05 mL of 0.020-N hydrochloric acid (see *Chloride and Sulfate* ~~(221)~~).

Delete the following:

• **Heavy metals, Method II** ~~(231)~~: 0.002%. • (Official 1-Dec-2015)

Assay—

Transfer about 250 mg of Iopanoic Acid, accurately weighed, to a glass-stoppered, 250-mL conical flask. Add 30 mL of 1.25-N sodium hydroxide and 500 mg of powdered zinc, and reflux the mixture for 30 minutes. Cool to room temperature, wash the condenser with 20 mL of water, and filter the mixture. Wash the flask and the filter with small portions of water, adding the washings to the filtrate. Add to the filtrate 5 mL of glacial acetic acid and 1 mL of tetrabromophenolphthalein ethyl ester TS, and titrate with 0.05-N silver nitrate VS until the color of the yellow precipitate just changes to green. Each mL of 0.05-N silver nitrate is equivalent to 9.516 mg of $C_{11}H_{12}I_3NO_2$. ■ 2S (USP39)

Iopanoic Acid Tablets, *USP 38* page 3916. It is proposed to omit this monograph for the following reasons.

This dosage form is not used for human use in the United States.

This dosage form is currently not used in veterinary medicine in the United States.

■ Iopanoic Acid Tablets

» ~~Iopanoic Acid Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of $C_{11}H_{12}I_3NO_2$.~~

Packaging and storage—~~Preserve in tight, light-resistant containers.~~

Identification—~~Triturate a quantity of finely powdered Tablets, equivalent to about 1 g of iopanoic acid, with two 10-mL portions of solvent hexane, and decant and discard the liquid. Allow the residue to dry spontaneously, triturate with 15 mL of acetone, and filter. Repeat the trituration with another 15-mL portion of acetone, evaporate the combined filtrates on a steam bath to a volume of not more than 1 mL, add, with constant stirring, 20 mL of water, filter, wash the precipitate with two 5-mL portions of water, and dry at 105° for 2 hours: the iopanoic acid so obtained melts between 150° and 158°, with decomposition, and responds to the *Identification* test under *Iopanoic Acid*.~~

Disintegration ~~(701)~~: 30 minutes.

Uniformity of dosage units ~~(905)~~: meet the requirements.

Halide ions—~~A portion of the powdered Tablets prepared for the *Assay*, equivalent to about 500 mg of iopanoic acid, meets the requirements of the test for *Halide ions* under *Iopanoic Acid*.~~

Assay—~~Weigh and finely powder not fewer than 20 Tablets. Weigh accurately a portion of the powder, equivalent to about 1 g of iopanoic acid, and triturate with 10 mL of solvent hexane. Allow the mixture to settle, decant the hexane through a small filter, repeat the trituration with 10 mL of solvent hexane, filter through the same filter, and discard the filtrates. Warm the residue with 10 mL of neutralized alcohol at 70°, filter through the same filter, and wash the undissolved residue with four 10-mL portions of neutralized alcohol at 70°, passing the washings through the same filter. Cool the combined filtrate and washings to room temperature, add 3 to 5 drops of thymol blue TS, and titrate with 0.1 N sodium hydroxide VS. Each mL of 0.1 N sodium hydroxide is equivalent to 57.09 mg of $C_{11}H_{12}I_3NO_2$.~~ ■ 2S (*USP39*)

• **Heavy metals, Method II** ~~(231)~~: 0.003%. • (Official 1-Dec-2015)

Assay—

Transfer about 300 mg of Ipodate Sodium, accurately weighed, to a 250 mL flask, add 30 mL of

~~1.25 N sodium hydroxide and 0.5 g of powdered zinc, and reflux the mixture for 60 minutes. Cool, wash the condenser with 20 mL of water, and filter the mixture. Wash the flask and the filter with small portions of water, adding the washings to the filtrate. Add to the filtrate 5 mL of glacial acetic acid and 3 mL of a mixture of 2 drops of nitric acid in 5 mL of water, then add 3 drops of eosin Y TS, and titrate with 0.05 N silver nitrate VS until the entire mixture changes to a permanent pink color. Each mL of 0.05 N silver nitrate is equivalent to 10.33 mg of $C_{12}H_{12}I_3N_2NaO_2 \cdot 2S$ (USP39)~~

BRIEFING

Ipodate Sodium Capsules, USP 38 page 3932. It is proposed to omit this monograph for the following reasons. This dosage form is not for human use in the United States. This dosage form is currently not used in veterinary medicine in the United States.

■ Ipodate Sodium Capsules

~~» Ipodate Sodium Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{12}H_{12}I_3N_2NaO_2$.~~

~~**Packaging and storage**—Preserve in tight containers.~~

~~**Identification**~~

~~**A:** Transfer a portion of the contents of Capsules, equivalent to about 2 g of ipodate sodium, to a 250 mL separator, add 100 mL of water and 50 mL of solvent hexane, and shake. Transfer the aqueous layer to a beaker, add 5 mL of 3 N hydrochloric acid, and mix. Filter (retain the filtrate), and wash the precipitate with several portions of water. Dry the precipitate in vacuum at 60° for 4 hours. A 1 in 100,000 solution of the residue so obtained, in a 1 in 100 mixture of 2 N hydrochloric acid in methanol, exhibits an UV absorbance maximum at 242 ± 2 nm.~~

~~**B:** The residue obtained in *Identification* test A responds to *Identification* test C under *Ipodate Sodium*.~~

~~**C:** The filtrate obtained in *Identification* test A responds to the flame test for *Sodium* (191).~~

~~**Uniformity of dosage units** (905): meet the requirements.~~

~~**Assay**—Place a number of Capsules, equivalent to about 5 g of ipodate sodium, in a 400 mL beaker, add 200 mL of 1 N sodium hydroxide and 50 mL of solvent hexane, and stir by mechanical means until the capsules have completely disintegrated. Transfer the mixture to a 500 mL separator, wash the beaker with a total of 25 mL of 1 N sodium hydroxide in divided portions, and add the washings to the separator. Allow the layers to separate, and transfer the aqueous layer to a 500 mL volumetric flask. Wash the solvent hexane layer with two 50 mL portions of 1 N sodium hydroxide, add the washings to the volumetric flask, dilute with 1 N sodium hydroxide to volume, and mix. Pipet 25 mL of the solution, which may be milky in appearance, into a 250 mL conical flask, add 500 mg of powdered zinc, and proceed as~~

directed in the ~~Assay under Ipodate Sodium~~, beginning with “and reflux the mixture for 60 minutes.” ■ 2S (USP39)

BRIEFING

Lisinopril, USP 38 page 4111. As a part of USP monograph modernization efforts, the following changes are proposed:

- A new stability-indicating test for *Organic Impurities* is added. The liquid chromatographic procedure is validated using the Lichrosorb RP 8 brand of L7 column. Alternatively, the Zorbax C8 brand of L7 column could be used. The typical retention time for lisinopril is about 8.5 min under the specified conditions.
- The system suitability requirement for the *Relative standard deviation* in the *Assay* is revised to be consistent with *Chromatography* (621), *System Suitability*.
- The system suitability requirement for the *Column efficiency* in the *Assay* is deleted as the other suitability requirements can adequately establish the suitability of the system.

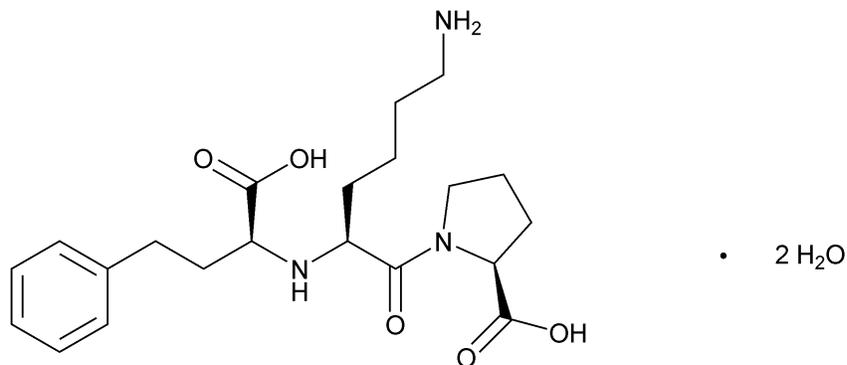

Additionally, minor editorial changes have been made to update the monograph to current USP style.

Lisinopril

C₂₁H₃₁N₃O₅·2H₂O 441.52

L-Proline, 1-[N²-(1-carboxy-3-phenylpropyl)-L-lysyl]-, dihydrate, (S)-;

1-[N²-[(S)-1-Carboxy-3-phenylpropyl]-L-lysyl]-L-proline dihydrate [83915-83-7].

DEFINITION

Lisinopril contains NLT 98.0% and NMT 102.0% of lisinopril (C₂₁H₃₁N₃O₅), calculated on the anhydrous basis.

IDENTIFICATION

- **A. Infrared Absorption** (197M)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the

Standard solution, as obtained in the Assay.

ASSAY

Change to read:

● Procedure

Solution A: 2.76 g/L of monobasic sodium phosphate in water prepared as follows. Dissolve 2.76 g of monobasic sodium phosphate in about 900 mL of water in a 1000-mL volumetric flask. Adjust with 1 N sodium hydroxide to a pH of 5.0 and dilute with water to volume.

Mobile phase: Acetonitrile and *Solution A* (4:96)

Standard solution: 0.3 mg/mL of USP Lisinopril RS in water

Sample solution: 0.3 mg/mL of Lisinopril in water

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 25-cm; 5-μm packing L7

Column temperature: 50°

Flow rate: 1 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: ~~NLT 180 theoretical plates~~

■ 2S (USP39)

Tailing factor: NMT 1.7

Relative standard deviation: NMT ~~±.0%~~

■ 0.73% ■ 2S (USP39)

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of lisinopril (C₂₁H₃₁N₃O₅) in the portion of Lisinopril taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of lisinopril from the *Sample solution*

r_S = peak response of lisinopril from the *Standard solution*

C_S = concentration of USP Lisinopril RS in the *Standard solution* (mg/mL)

C_U = concentration of Lisinopril in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

- **USP Reference Standards** (11)

USP Lisinopril RS **BRIEFING**

Mangafodipir Trisodium, USP 38 page 4195. It is proposed to omit this monograph for the following reasons:

- This drug substance is not used in any dosage form for human use in the United States.
- This drug substance is currently not used in veterinary medicine in the United States.

(SM4: R. Ravichandran.) Correspondence Number—C135177

Comment deadline: September 30, 2015**Delete the following:****■ Mangafodipir Trisodium**

Trisodium trihydrogen (OC-6-13) [[N,N'-1,2-ethanediylbis[N-[[3-hydroxy-2-methyl-5-[(phosphonooxy)methyl]-4-pyridinyl]methyl]glycinato]](8-)] manganate(6-).

Trisodium trihydrogen (OC-6-13) [[N,N'-ethylenebis[N-[[3-hydroxy-5-(hydroxymethyl)-2-methyl-4-pyridyl]methyl]glycine]-5,5'-bis(phosphato)](8-)] manganate(6-) [[140678-14-4]].

» Mangafodipir Trisodium contains not less than 97.0 percent and not more than 103.0 percent of $\text{C}_{22}\text{H}_{27}\text{MnN}_4\text{Na}_3\text{O}_{14}\text{P}_2$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers. Store in a cold place.

USP Reference standards (11)—

USP Endotoxin RS

USP Mangafodipir Related Compound A RS

Manganese(II) dipyridoxal monophosphate sodium salt.

USP Mangafodipir Related Compound B RS

~~Manganese(II) dipyridoxal diphosphate mono-overalkylated sodium salt.
USP Mangafodipir Related Compound C RS
Manganese(II) dipyridoxal diphosphate sodium salt.
USP Mangafodipir Trisodium RS
Manganese(II) dipyridoxal diphosphate.~~

Identification—

A: ~~Infrared Absorption (197K):~~

B: It meets the requirements of the tests for ~~Sodium (191)~~ and ~~Manganese (191)~~.

Microbial enumeration tests (61) and Tests for specified microorganisms (62)—The total aerobic microbial count is not more than 500 cfu per g.

Bacterial endotoxins (85): not more than 0.13 USP Endotoxin Unit per mg.

pH (791): between 5.5 and 7.0, in a solution (1 in 100).

Water, Method I (921): not more than 20%.

Limit of residual solvents—

Internal standard solution— Transfer 600 μL of methyl ethyl ketone to a 100-mL volumetric flask, dilute with water to volume, and mix to obtain a solution having a concentration of about 5 mg per mL. Transfer 2 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix to obtain a solution having a known concentration of about 0.1 mg per mL.

Standard stock solution— Transfer about 1 g of dehydrated alcohol and 1 g of acetone, both accurately weighed, to a 100-mL volumetric flask, and dilute with water to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix to obtain a solution having a known concentration of about 1 mg each of alcohol and acetone per mL.

Standard solutions— Transfer 10.0 mL of *Internal standard solution* to each of four 100-mL volumetric flasks. Separately add 0 mL, 1.0 mL, 5.0 mL, and 10.0 mL of *Standard stock solution* to the volumetric flasks, and dilute each with water to volume to obtain solutions having known concentrations of 0.0 μg per mL and about 10 μg per mL, 50 μg per mL, and 100 μg per mL each of alcohol and acetone, respectively. Add 7.0 mL of each *Standard solution* to separate headspace sample vials, and cap.

Test solution— Transfer about 1 g of Mangafodipir Trisodium, accurately weighed, to a sample vial, add 7.0 mL of the *Standard solution* having a concentration of 0.0 μg per mL, cap, and swirl to dissolve.

Chromatographic system (see Chromatography (621))— The gas chromatograph is equipped with a flame ionization detector, a 0.32-mm \times 30-m fused silica column coated with 1.8- μm G43 stationary phase. The carrier gas is helium, flowing at a rate of 1.5 mL per minute. The temperatures of the injection port and the oven are maintained at 150 $^{\circ}$ and 50 $^{\circ}$, respectively. The bath temperature for the headspace sample vials is maintained at 90 $^{\circ}$, the valve/loop temperature is maintained at 130 $^{\circ}$, and the sample thermostating time is 15 minutes.

Chromatograph the *Standard solutions*, and record the peak responses as directed for *Procedure*: the resolution, R , between alcohol and acetone is not less than 5; and the relative standard deviation for replicate injections of the *Standard solution* having a concentration of 100 µg per mL, determined from the peak response ratios of the analyte to the internal standard, is not more than 2.0%. Calculate the peak response ratios of the analyte to the internal standard, and plot the results. Determine the linear regression equation of the standards by the mean square method, and record the linear regression equation and the correlation coefficient. A suitable system is one that yields a line having a correlation coefficient of not less than 0.990.

Procedure— Separately inject equal volumes (about 1 mL) of the gaseous headspace of each of the *Standard solutions* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentages (w/w) of alcohol and acetone in the portion of Mangafodipir-Trisodium taken by the formula:

$$(7/10,000)(C/W)$$

in which C is the concentration, in µg per mL, of alcohol or acetone in the *Test solution*, as determined from the relevant standard response line; and W is the weight, in g, of Mangafodipir-Trisodium taken: not more than 0.1% of alcohol is found; and not more than 0.01% of acetone is found, both calculated on the anhydrous basis.

Limit of free manganese and free fodipir—

Ascorbic acid solution— Dissolve 0.5 g of ascorbic acid in 10 mL of water.

Manganese solution— Transfer about 3.6 g of manganese chloride, accurately weighed, to a 1000 mL volumetric flask, dissolve in and dilute with 0.1 N hydrochloric acid to volume, and mix. Transfer 100.0 mL of this solution to a 500 mL volumetric flask, dilute with water to volume, and mix.

Edetate titrant solution— Transfer about 37 g of edetate disodium, accurately weighed, to a 1000 mL volumetric flask, dilute with water to volume, and mix. Transfer 36 mL of this solution to a 1000 mL volumetric flask, dilute with water to volume, and mix to obtain a solution having a concentration of 0.0036 moles per L.

standardization of 0.0036 M edetate titrant solution— Accurately weigh about 200 mg of chelometric standard calcium carbonate, previously dried at 110 ° for 2 hours and cooled in a desiccator, transfer to a 100 mL volumetric flask, and add 10 mL of water and about 4 mL of diluted hydrochloric acid. Swirl the flask to dissolve, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a beaker while stirring, preferably with a magnetic stirrer; and add about 15 mL of sodium hydroxide TS and enough hydroxynaphthol blue indicator to achieve a percent transmission of about 95%, using a suitable autotitrator at a wavelength of 620 nm, calibrated to 100% transmission with water. Add 20.0 mL of *Edetate titrant solution*, and continue to titrate until 3 mL of titrant have been added beyond the sharp break point, as determined from the titration curve obtained by plotting relative transmittance versus volume, in mL, of titrant added. Determine the endpoint volume from the titration curve. The final titration volume is the sum of the endpoint volume and the 20.0 mL of *Edetate titrant solution* initially added. Calculate the molarity of the *Edetate titrant solution* by the formula:

$$(5/100.09)(W)/(100V)$$

in which 100.09 is the molecular weight of calcium carbonate; W is the weight, in mg, of the

calcium carbonate taken; and V is the final titration volume, in mL, of *Edetate titrant solution*.

Procedure— Transfer about 1 g of Mangafodipir Trisodium, accurately weighed, to a suitable beaker, add about 100 mL of water, 1.0 mL of *Ascorbic acid solution*, 10 mL of ammonia–ammonium chloride buffer TS, 0.1 mL of eriochrome black TS, and 1.0 mL of *Manganese solution*, and record the color. If the color is yellow to green, add additional 1.0 mL increments of *Manganese solution* until the color is red. Record the volume added. Titrate with the *Edetate titrant solution*, determining the endpoint photometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Calculate the percentage of free manganese in the portion of Mangafodipir Trisodium taken by the formula:

$$5.49V(M/W)$$

in which V is the volume, in mL, of the *Edetate titrant solution*; M is the molarity of the *Edetate titrant solution*; and W is the weight, in g, of Mangafodipir Trisodium taken. Calculate the percentage of free fodipir in the portion of Mangafodipir Trisodium taken by the formula:

$$63.85V(M/W)$$

in which V , M , and W are as defined herein: not more than 0.03% of free manganese is found; and not more than 0.5% of free fodipir is found, both calculated on the anhydrous basis.

Related compounds—

Ascorbic acid solution— Dissolve 0.4 g of ascorbic acid in 100 mL of water.

Phosphate buffer— Prepare as directed in the *Assay*.

Mobile phase— Prepare as directed in the *Assay*. [Note—Increasing the proportion of acetonitrile will decrease the retention times.]

System suitability stock solution— Prepare as directed for *Standard stock preparation* in the *Assay*.

System suitability solution 1— Prepare a solution of USP Mangafodipir Trisodium RS having a known concentration of about 4.0 mg per mL. Transfer 5.0 mL of this solution to a 50 mL volumetric flask, add 5.0 mL of *System suitability stock solution*, 5.0 mL of *Phosphate buffer*, and 5.0 mL of *Ascorbic acid solution*. Dilute with nitrogen-purged water to volume, and mix to obtain a solution having a concentration of about 0.4 mg of USP Mangafodipir Trisodium RS, and about 0.01 mg each of USP Mangafodipir Related Compound A RS and USP Mangafodipir Related Compound B RS per mL. [Note—Store in a refrigerator and under nitrogen to avoid excessive exposure to heat, air, and light.]

System suitability solution 2— Transfer about 10 mg of USP Mangafodipir Related Compound C RS to a 100 mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 50 mL volumetric flask, and add 5.0 mL of *Phosphate buffer*.

Test solution— Transfer an accurately weighed quantity of Mangafodipir Trisodium, equivalent to about 100 mg of mangafodipir trisodium, to a 50 mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a second 50 mL volumetric flask, add 5.0 mL of *Phosphate buffer*, dilute with water to volume, and mix. [Note—Store in a refrigerator and under nitrogen to avoid excessive exposure to heat, air, and light.]

Chromatographic system (see *Chromatography* (621))— Prepare as directed in the *Assay*. Chromatograph *System suitability solution 2*, and record the peak responses as directed for

Procedure: note the elution time to identify the mangafodipir related compound C peak, if present, in the chromatogram of *System suitability solution 1*. Chromatograph *System suitability solution 1*, and record the peak responses as directed for *Procedure*: the retention time for mangafodipir is between 18 and 30 minutes. The peak area for mangafodipir related compound C is less than 0.1%. [Note—If the peak area is more than 0.1% of the total of all peak areas, prepare fresh quantities of *Ascorbic acid solution* and *System suitability solution 1*, and repeat the test. If the peak area of mangafodipir related compound C is still greater than 0.1%, repeat the test using another column. A contaminated column can result in oxidation of Mn(II) to Mn(III), forming related compound C.] The tailing factor for the mangafodipir peak is not more than 2.3; the column efficiency is not less than 1000 theoretical plates; the resolution, R_s , between mangafodipir related compound B and mangafodipir is not less than 1.5; and the relative standard deviation for replicate injections is not more than 10% for each peak. [Note—If the resolution is less than 1.5, adjust the *Mobile phase* by increasing the concentration of tetrabutylammonium hydrogen sulfate.]

Procedure— Inject about 10 μL of the *Test solution* into the chromatograph, record the chromatogram, and measure the areas for all the major peaks. The relative retention times for ascorbic acid, mangafodipir related compound A, Mn(II) 5-methyl dipyridoxal monophosphate (Mn(II) 5-methyl DPMP) if present, mangafodipir related compound C, mangafodipir related compound B, and mangafodipir are about 0.1, 0.3, 0.4, 0.6, 0.8, and 1.0, respectively. Calculate the percentages of mangafodipir related compound A, mangafodipir related compound B, mangafodipir related compound C, and Mn(II) 5-methyl DPMP in the portion of Mangafodipir Trisodium taken by the formula:

$$100(r_f/r_s)$$

in which r_f is the peak area of each impurity; and r_s is the sum of the areas of all of the peaks: not more than 0.5% each of mangafodipir related compound A and mangafodipir related compound B is found; not more than 0.6% of mangafodipir related compound C is found; not more than 0.3% of Mn(II) 5-methyl DPMP is found; not more than 0.3% of any other impurity is found; not more than a total of 0.5% of other impurities is found; and not more than a total of 2.0% of impurities is found.

Assay—

Phosphate buffer— Transfer about 26.8 g of dibasic sodium phosphate to a 1000-mL volumetric flask, add 900 mL of water, and adjust with 1 N sodium hydroxide or 1 N hydrochloric acid to a pH of about 8.0. Dilute with water to volume, filter, and degas.

Mobile phase— Transfer about 0.61 g of boric acid and 9.2 g of tetrabutylammonium hydrogen sulfate to a 1000-mL volumetric flask, add 640 mL water, and mix. Adjust with 3 N sodium hydroxide to a pH of about 9.3, add 250 mL of acetonitrile, dilute with water to volume, and mix. Adjust with 3 N hydrochloric acid or 3 N sodium hydroxide to a pH of about 10.5, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard stock preparation— Transfer about 10 mg each of USP Mangafodipir Related Compound A RS and USP Mangafodipir Related Compound B RS, both accurately weighed, to a 100-mL volumetric flask, dilute with water to volume, and mix.

Standard preparation— Transfer about 100 mg of USP Mangafodipir Trisodium RS to a 50-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a

50-mL volumetric flask, add 5.0 mL of *Standard stock preparation* and 5.0 mL of *Phosphate buffer*, dilute with water to volume, and mix. [Note—Store in a refrigerator and under nitrogen to avoid exposure to excessive heat, air, or light.]

Assay preparation— Transfer an accurately measured quantity of Mangafodipir Trisodium, equivalent to about 100 mg of mangafodipir trisodium, to a 50-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, add 5.0 mL of *Phosphate buffer*, dilute with water to volume, and mix. [Note—Store in a refrigerator and under nitrogen to avoid exposure to excessive heat, air, or light.]

Chromatographic system (see *Chromatography* ~~(621)~~)— The liquid chromatograph is equipped with a 310-nm detector and a 4.6-mm × 15-cm column that contains 5- μ m packing L21. The chromatograph is maintained at about 20°. The flow rate is 0.8 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, R_s , between mangafodipir related compound A and mangafodipir related compound B is not less than 1.5; the column efficiency is not less than 1000 theoretical plates; and the tailing factor is not more than 2.3.

Procedure— Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{22}H_{27}MnN_4Na_3O_{14}P_2$ in the portion of Mangafodipir Trisodium taken by the formula:

$$25,000(C/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Mangafodipir Trisodium RS in the *Standard preparation*; W is the weight, in mg, of the Mangafodipir Trisodium taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. ■ 2S (USP39)

~~in which C is the concentration, in mg per mL, of USP Mangafodipir Trisodium RS in the~~

~~Standard preparation; V is the volume, in mL, of Injection taken to prepare the Assay preparation; and r_U and r_S are the mangafodipir peak responses obtained from the Assay preparation and the Standard preparation, respectively.~~ ■2S (USP39)

BRIEFING

Methotrexate Injection, USP 38 page 4320. As part of USP monograph modernization efforts, it is proposed to make the following changes:

1. Replace the current Assay HPLC procedure with the Assay method used in the current *Methotrexate* monograph. The proposed liquid chromatographic procedure is based on analysis using the Kromasil C18 brand of L1 column. The typical retention time for methotrexate is about 12 min.
2. Add *Identification* test B using a retention time agreement based on the proposed method for the Assay.
3. Add a stability-indicating HPLC procedure for the *Organic Impurities* test with the same HPLC parameters as used in the proposed Assay method.
4. Update the *Packaging and Storage* section to be consistent with approved manufacturers' package inserts.
5. Add the following existing USP Reference Standards to the *USP Reference Standards* section to support the proposed procedures in the Assay and the test for *Organic Impurities*: USP Methotrexate Related Compound B RS, USP Methotrexate Related Compound C RS, and USP Methotrexate Related Compound E RS.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

Methotrexate Injection

DEFINITION

Methotrexate Injection is a sterile solution of Methotrexate in Water for Injection prepared with the aid of Sodium Hydroxide. It contains NLT 90.0% and NMT 110.0% of the labeled amount of methotrexate ($C_{20}H_{22}N_8O_5$).

IDENTIFICATION

● **A. Infrared Absorption** 〈197K〉

Sample: Dilute, if necessary, a volume of Injection, equivalent to about 25 mg of methotrexate, with water to obtain a solution with a concentration of about 2.5 mg/mL. Adjust with 0.1 N hydrochloric acid to a pH of 4.0. Place the slurry in a 50-mL centrifuge tube, and centrifuge. Decant the supernatant, add 25 mL of acetone, shake, and pass through a solvent-resistant membrane filter of 0.45- μ m pore size. Air-dry the filtered precipitate.

Acceptance criteria: Meets the requirements

~~Add the following:~~

then dilute with *Solution A* to volume.

Sample solution: Nominally 0.2 mg/mL of methotrexate from Injection prepared as follows. Transfer a sufficient amount of Injection to an appropriate volumetric flask. Add about 5% of the flask volume of DMSO and sonicate for 2 min at ambient temperature, then add 30% of the flask volume of *Solution A* and sonicate. Dilute with *Solution A* to volume.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

■ 2S (USP39)

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methotrexate ($C_{20}H_{22}N_8O_5$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Methotrexate RS in the *Standard solution* (μg/mL)

C_U nominal concentration of methotrexate in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES

Add the following:

■ • Organic Impurities

Solution A, Solution B, Mobile phase, Sample solution, and Chromatographic system:

Proceed as directed in the *Assay*.

Standard solution: 0.2 μg/mL each of USP Methotrexate RS, USP Methotrexate Related Compound B RS, USP Methotrexate Related Compound C RS, and USP Methotrexate Related Compound E RS in *Solution A* prepared as follows. Add a sufficient amount of each Reference Standard to a suitable volumetric flask and add DMSO equivalent to 5% of the flask volume. Sonicate to achieve dissolution, then dilute with *Solution A* to volume. Sonicate if necessary to aid dissolution.

Sample solution: Nominally 0.2 mg/mL of methotrexate from Injection prepared as directed

in the Assay

System suitability

Sample: *Standard solution*

[Note—See *Table 2* for relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between methotrexate related compound B and methotrexate related compound C

Relative standard deviation: NMT 5.0% each for methotrexate, methotrexate related compound B, methotrexate related compound C, and methotrexate related compound E

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of methotrexate related compound B and methotrexate related compound C in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each corresponding impurity from the *Sample solution*

r_S = peak response of each corresponding Reference Standard from the *Standard solution*

C_S = concentration of each corresponding Reference Standard in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of methotrexate in the *Sample solution* ($\mu\text{g/mL}$)

Calculate the percentage of methotrexate related compound E free acid in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Methotrexate Related Compound E RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of methotrexate in the *Sample solution* ($\mu\text{g/mL}$)

M_{r1} = molecular weight of methotrexate related compound E free acid, 325.33

M_{r2} = molecular weight of USP Methotrexate Related Compound E RS, 343.56

[Note—USP Methotrexate Related Compound E RS is 4-[(2,4-Diaminopteridin-6-yl)methyl] (methyl)amino}benzoic acid, hemihydrochloride.]

Calculate the percentage of any individual unspecified degradation product in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each unspecified degradation product from the *Sample solution*

r_S = peak response of methotrexate from the *Standard solution*

C_S = concentration of USP Methotrexate RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of methotrexate in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: See *Table 2*. Disregard any unspecified degradation product peaks less than 0.1%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Methotrexate related compound B	0.67	0.3
Methotrexate related compound C	0.73	3.0
Methotrexate	1.0	—
Methotrexate related compound E free acid ^a	1.41	0.3
Any individual unspecified degradation product	—	0.2
Total unspecified degradation products	—	1.0

^a 4-{{[(2,4-Diaminopteridin-6-yl)methyl](methyl)amino}benzoic acid.

Methotrexate Tablets

DEFINITION

Methotrexate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of methotrexate (C₂₀H₂₂N₈O₅).

IDENTIFICATION

● **A. Ultraviolet Absorption** (197U)

Standard solution: 25 µg/mL of USP Methotrexate RS in dilute hydrochloric acid (1 in 100)

Sample solution: Dissolve 1 Tablet in 100 mL of dilute hydrochloric acid (1 in 100), and filter the solution.

Acceptance criteria: The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as those of the *Standard solution*.

Add the following:

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■2S (USP39)

ASSAY

Change to read:

- **Procedure**

Buffer: 0.2 M dibasic sodium phosphate and 0.1 M citric acid (63:37), adjusted if necessary with 0.1 M citric acid or 0.2 M dibasic sodium phosphate to a pH of 6.0

Mobile phase: Acetonitrile and *Buffer* (10:90)

System suitability solution: 0.1 mg/mL each of USP Methotrexate RS and folic acid in *Mobile phase*

Standard solution: 100 µg/mL of USP Methotrexate RS in *Mobile phase*

Sample solution: Nominally 100 µg/mL of methotrexate from Tablets prepared as follows. Powder NLT 20 Tablets. Dissolve the powder using a mechanical shaker or ultrasonic bath.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 302 nm

Column: 4.6 mm × 25 cm; packing L1

Flow rate: 1.2 mL/min

Injection volume: 10 µL

System suitability

Sample: *System suitability solution*

[Note—The relative retention times for folic acid and methotrexate are 0.35 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 8.0 between the folic acid and methotrexate peaks

Relative standard deviation: NMT 2.5% for the methotrexate peak

■ **Buffer:** 3.4 mg/mL of anhydrous monobasic sodium phosphate in water. Adjust with 1 N sodium hydroxide to a pH of 6.0.

Solution A: Acetonitrile and *Buffer* (5:95)

Solution B: Acetonitrile and *Buffer* (50:50)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.0	100	0
30	50	50
34	50	50
35	100	0
40	100	0

Standard solution: 0.2 mg/mL of USP Methotrexate RS in *Solution A* prepared as follows. Add a sufficient amount of USP Methotrexate RS to a suitable volumetric flask and add DMSO equivalent to 5% of the flask volume. Sonicate to achieve dissolution, then dilute with *Solution A* to volume.

Sample solution: Nominally 0.2 mg/mL of methotrexate from NLT 20 Tablets prepared as follows. Powder the Tablets and transfer a sufficient quantity to an appropriate volumetric flask. Add about 1% of the flask volume of DMSO and sonicate for 2 min at ambient temperature, then add 75% of the flask volume of *Solution A* and sonicate for

an additional 30 min at ambient temperature. Cool, then dilute with *Solution A* to volume. Centrifuge at 3000 rpm and use the clear upper layer for analysis.

Chromatographic system

(See *Chromatography* 〈 621 〉, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

■ 2S (USP39)

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methotrexate ($C_{20}H_{22}N_8O_5$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response from the *Sample solution*

r_S peak response from the *Standard solution*

C_S concentration of USP Methotrexate RS in the *Standard solution* (μg/mL)

C_U nominal concentration of methotrexate in the *Sample solution* (μg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

● Dissolution 〈 711 〉

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Standard solution: USP Methotrexate RS in *Medium*

Detector: UV 306 nm (maximum absorbance)

Analysis: Determine the amount of methotrexate ($C_{20}H_{22}N_8O_5$) dissolved from UV absorbances on filtered portions of the solution under test, suitably diluted with *Medium*, in comparison with a *Standard solution*.

Tolerances: NLT 75% (Q) of the labeled amount of methotrexate ($C_{20}H_{22}N_8O_5$) is dissolved.

● Uniformity of Dosage Units 〈 905 〉: Meet the requirements

IMPURITIES

Add the following:**Organic Impurities**

Solution A, Solution B, Mobile phase, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 0.2 µg/mL each of USP Methotrexate RS, USP Methotrexate Related Compound B RS, USP Methotrexate Related Compound C RS, and USP Methotrexate Related Compound E RS in *Solution A* prepared as follows. Add a sufficient amount of each Reference Standard to a suitable volumetric flask and add DMSO equivalent to 5% of the flask volume. Sonicate to achieve dissolution, then dilute with *Solution A* to volume. Sonicate if necessary to aid dissolution.

Sample solution: Nominally 0.2 mg/mL of methotrexate from Tablets prepared as directed in the *Assay*

System suitability

Sample: *Standard solution*

[Note—See *Table 2* for relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between methotrexate related compound B and methotrexate related compound C

Relative standard deviation: NMT 2.5% each for methotrexate, methotrexate related compound B, methotrexate related compound C, and methotrexate related compound E

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of methotrexate related compound B and methotrexate related compound C in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each corresponding impurity from the *Sample solution*

r_S = peak response of each corresponding Reference Standard from the *Standard solution*

C_S = concentration of each corresponding Reference Standard in the *Standard solution* (µg/mL)

C_U = nominal concentration of methotrexate in the *Sample solution* (µg/mL)

Calculate the percentage of methotrexate related compound E free acid in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Methotrexate Related Compound E RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of methotrexate in the *Sample solution* (µg/mL)

M_{r1} = molecular weight of methotrexate related compound E free acid, 325.33

M_{r2} = molecular weight of USP Methotrexate Related Compound E RS, 343.56

[Note—USP Methotrexate Related Compound E RS is 4- {[(2,4-Diaminopteridin-6-yl)methyl] (methyl)amino}benzoic acid, hemihydrochloride.]

Calculate the percentage of any individual unspecified degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U peak response of each unspecified degradation product from the *Sample solution*

r_S peak response of methotrexate from the *Standard solution*

C_S concentration of USP Methotrexate RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U nominal concentration of methotrexate in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: See *Table 2*. Disregard any unspecified degradation product peaks less than 0.1%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

■ 2S (USP39)

BRIEFING

Methylene Blue, *USP 38* page 4341. On the basis of comments received, it is proposed to modernize the monograph as follows:

1. The chemical information is revised to include different hydrated forms of the drug substance.
2. The acceptance criteria in the *Definition* and *Assay* are revised from 98.0%–103.0% to 97.0%–103.0%.
3. An orthogonal *Identification* test *B* is added based on the retention time agreement from the proposed *Assay*.
4. *Identification* test *C* is included to test for the chloride counter ion.
5. The UV spectrophotometric *Assay* is replaced with a stability-indicating liquid chromatographic procedure. The liquid chromatographic procedure is validated using the XBridge phenyl column with L11 packing. The typical retention time for methylene blue under the conditions specified is about 11 min.
6. A liquid chromatographic *Organic Impurities* test is included. The proposed procedure is validated using the XBridge phenyl column with L11 packing. The typical retention time for methylene blue under the conditions specified is about 11 min.
7. The tests for *Arsenic* and *Copper or Zinc* are revised to be consistent with the FDA-approved procedures and specifications.
8. The *Loss on Drying* test conditions and *Acceptance criteria* are revised to accommodate the different hydrated forms.
9. The *Bacterial Endotoxins Test* and *Microbial Enumeration Tests* are included to be consistent with the FDA-approved procedures and specifications.
10. New Reference Standards are added to the *USP Reference Standards* section in support of the proposed revisions.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.
