Acceptance criteria: 42%–52% average inhibition. Percent inhibition of each single *Sample assay solution* reading is between 41%–53%; % RSD of % average inhibition of the nine readings of the *Sample assay solution* is NMT 10%.

ASSAY

• Procedure

Buffer solution: Dissolve 13.6 g of sodium acetate trihydrate in 900 mL of water and adjust the pH to 6.5 ± 0.1 with glacial acetic acid. Dilute with water to 1000 mL and pass through a filter of 0.2- μm pore size.

Solution A: *Buffer solution* and water (1:1)

Solution B: Acetonitrile and *Buffer solution* (1:1)

Mobile phase: See *Table 3*.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	90	10
5	85	15
30	65	35
35	65	35
35.1	90	10
40	90	10

Standard solution A1: 1.5 mg/mL of USP Bivalirudin RS in water. Prepare in duplicate.

Standard solution A2: 0.16 mg/mL of USP [Asp⁹]-Bivalirudin RS in water. Prepare in duplicate.

System suitability solution: *Standard solution A1* and *Standard solution A2* (1:1)

Sample solutions: 1.5 mg/mL of Bivalirudin in water. Prepare in triplicate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm \times 25-cm; 5- μm packing *L1*

Temperatures

Column: 40°

Autosampler: 2°–8°

Flow rate: 1.2 mL/min

Injection volume: 40 μL

System suitability

Samples: *Standard solution A1 and System suitability solution*

Suitability requirements

Resolution: NLT 2.5 between bivalirudin and [Asp⁹]-bivalirudin peaks, *System suitability solution*

Column efficiency: NLT 15,000 theoretical plates, *Standard solution A1*

Relative standard deviation: NMT 1.5 for three replicate injections of each preparation, *Standard solution A1*

Analysis

Samples: *Standard solution A1 and Sample solutions*

Calculate the percentage of bivalirudin (C₉₈H₁₃₈N₂₄O₃₃) in the portion of Bivalirudin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of bivalirudin from the *Sample solutions*

r_S = mean peak response of bivalirudin from *Standard solution A1*

C_S = concentration of USP Bivalirudin RS in *Standard solution A1* (mg/mL)

C_U = concentration of Bivalirudin in the *Sample solutions* (mg/mL)

Take the percentage of bivalirudin for each *Sample solution*. Average the results to report the acceptance criteria.

Acceptance criteria: 96.0%–103.0% on the anhydrous and trifluoroacetic acid-free basis

● **Product-Related Substances and Impurities**

Procedure 1

[Note—Manufacturers should determine the suitability of their related substances method for their process-related and degradation impurities. For any impurity peak equal to or above the limit for unspecified impurity peaks, identification and appropriate qualification is required.]

Mobile phase and Chromatographic system: Proceed as directed in the *Assay*.

System suitability solution: Prepare a solution containing 2.5 mg/mL of USP Bivalirudin RS spiked with 0.05 mg/mL of USP [Asp⁹]-Bivalirudin RS in water.

Standard stock solution: 25 mg/mL of USP Bivalirudin RS in *Buffer solution*

Standard solution: Prepare a 2.5-mg/mL solution of USP Bivalirudin RS by diluting the *Standard stock solution* with water.

Sample solution: 2.5 mg/mL of Bivalirudin in water

Blank: Water

Chromatographic system: Proceed as directed in the *Assay*.

System suitability

Sample: *System suitability solution*

Suitability requirements

Retention time: The relative retention time for [Asp⁹]-bivalirudin compared to

bivalirudin is NMT 1.0.

Resolution: NLT 2.5 between [Asp⁹]-bivalirudin and bivalirudin

Column efficiency: NLT 12,000 theoretical plates

Analysis

Sample: *Sample solution*

Record the chromatograms and measure the response of each peak from the *Sample solution* using the drop-down integration method with respect to the baseline. Exclude from the integration the peaks present in the blank. Among all the integrated peaks, only those with a signal-to-noise ratio higher than 10 shall be used for the calculation. Calculate the percentage of each impurity in the portion of Bivalirudin taken:

$$\text{Result} = (r_i/r_T) \times 100$$

r_i = peak response of each impurity from the *Sample solution*

r_T = sum of all the peak responses from the *Sample solution*

Acceptance criteria

Individual impurities: See Table 4.

Table 4

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Fragment [1-11]	0.49	0.5
Fragment [2-20]	0.60	0.5
Total fragments ^a	0.44-0.65	1.8
[Asp ⁹]-bivalirudin	0.93	0.4
Bivalirudin	1.00	—
[des-Glu ¹³]-bivalirudin	1.31-1.34	0.4
Unspecified impurities	—	0.4
^a Peptide fragment peaks resulting from degradation.		

Procedure 2

[Note—Manufacturers should determine the suitability of their related substances method for their process-related and degradation impurities. For any impurity peak equal to or above the limit for unspecified impurity peaks, identification and appropriate qualification is required.]

Solution A: Acetonitrile and water (85:15)

Solution B: 0.04% Trifluoroacetic acid (v/v) in *Solution A*

Solution C: Acetonitrile and 0.04% trifluoroacetic acid (v/v)

Mobile phase: See Table 5.

Table 5

Time (min)	Solution B (%)	Solution C (%)
0	50	50
35	50	50

System suitability solution: Prepare a solution containing 3 mg/mL of USP Bivalirudin RS spiked with 0.015 mg/mL of USP [des-Glu¹³]-Bivalirudin RS in *Solution B*.

Standard solution: 3 mg/mL of USP Bivalirudin RS in *Solution B*

Sample solution: 3 mg/mL of Bivalirudin in *Solution B*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 207 nm

Column: 4.6-mm × 25-cm; 5-μm packing L3

Column temperature: 40°

Flow rate: 1.2 mL/min

Injection volume: 5 μL

System suitability

Sample: *System suitability solution*

[Note—See *Table 6* for relative retention times.]

Suitability requirements

Retention time: The bivalirudin peak elutes between 9.4 and 14.7 min.

Peak width: The bivalirudin peak width at half height should be NMT 0.45.

Peak-to-valley ratio: NLT 1.25 between [des-Glu¹³]-bivalirudin and bivalirudin

Analysis

Sample: *Sample solution*

Record the chromatograms and measure the response for each peak in the chromatogram of the *Sample solution*. Disregard any peak due to trifluoroacetic acid, the peaks at RRT 0.2, RRT 0.91, RRT 0.64, and any peak with an area less than 0.10% of that of Bivalirudin.

Calculate the percentage of each impurity in the portion of Bivalirudin taken:

$$\text{Result} = (r_i / r_T) \times 100$$

r_i = peak response of each impurity from the *Sample solution*

r_T = sum of all the peak responses from the *Sample solution*

Acceptance criteria

Individual impurities: See *Table 6*.

Table 6

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
[des-Gly ⁴]-bivalirudin	0.75	0.4
Bivalirudin	1.00	—
[Endo-Gly ⁵]-bivalirudin	1.36	0.5
Unspecified impurities	—	0.4

Total impurities: The sum of all impurities from *Procedure 1* and *Procedure 2* is NMT 2.5%.

OTHER COMPONENTS

- **Trifluoroacetic Acid (TFA) in Peptides** (503.1): Between 8.0% and 12.0%

SPECIFIC TESTS

- **Microbial Enumeration Tests** (61): The total aerobic microbial count does not exceed 100 cfu/g and the total combined yeast and mold count does not exceed 50 cfu/g.
- **Bacterial Endotoxins Test** (85): NMT 1 USP Endotoxins Unit/mg
- **Water Determination** (921), *Method Ic*: NMT 6.0%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in an airtight, closed container protected from light at a temperature between $-20 \pm 5^\circ$.
- **Labeling:** Label it to state the strength, in mg, of bivalirudin.
- **USP Reference Standards** (11)
 - USP Bivalirudin RS
 - USP [Asp⁹]-Bivalirudin RS
 - USP [des-Glu¹³]-Bivalirudin RS
 - USP Endotoxin RS

■ 2S (USP39)

¹ A suitable human alpha-thrombin is available from Sekisui Diagnostics, LLC.

BRIEFING

Bivalirudin for Injection. Because there is no existing *USP* monograph for this drug product, a new monograph based on validated methods of analysis is being proposed. The liquid chromatographic procedures in the *Assay* and the test for *Product-Related Substances and Impurities* are based on analyses performed with the Vydac C18 brand of *L1* column. The typical retention time for bivalirudin in the *Assay* and the test for *Product-Related Substances and Impurities* is about 24 min.

(BIO1: A. Szajek.)

Correspondence Number—C152088

Comment deadline: November 30, 2015

Add the following:

- **Bivalirudin for Injection**

DEFINITION

Bivalirudin for Injection is a sterile, lyophilized powder for reconstitution. Bivalirudin used in the manufacture of Bivalirudin for Injection complies with the compendial requirements stated in the *Bivalirudin* monograph. It contains the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of bivalirudin.

IDENTIFICATION

- **A.**

Standard solution and Sample solution: Proceed as directed in the *Assay*.

Identity sample solution: 0.75 mg/mL of USP Bivalirudin RS and 0.75 mg/mL of Bivalirudin in water

Acceptance criteria: The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. The major peaks of the *Identity sample solution* co-elute.

- **B. Bioidentity**

Thrombin inhibition activity

Buffer solution: 50 mM Tris-HCl and 120 mM sodium chloride in water. Adjust to a pH of 7.40 ± 0.04 . Add bovine serum albumin (BSA) to obtain a 100-mg/mL concentration and pass through a filter of 0.45- μ m pore size.

Human thrombin solution: 10 μ g/mL of human thrombin¹ in *Buffer solution*

Chromogenic substrate solution: 5 mM solution of *H*-d-cyclohexylalanyl-Ala-Arg-p-nitroanilide diacetate salt in water. Dilute with water to obtain a 50- μ M solution.

Diluted human thrombin solution: Dilute *Human thrombin solution* in *Buffer solution* to obtain a 0.5- μ g/mL solution. Thrombin from alternate sources must be standardized in the substrate reaction. Prepare six replicates by adding 910 μ L of *Buffer solution* to each sample tube followed by 30 μ L of *Chromogenic substrate solution*. Add 60 μ L of *Diluted human thrombin solution*, vortex, and begin the 20-min incubation. Determine the absorbance at 405 nm for each replicate.

Calculate the standardized volume (E_C) of *Diluted human thrombin solution* from the mean absorbance:

$$E_C = (0.45 \times 60 \mu\text{L}) / \text{mean absorbance}$$

Blank: Water

Standard solution: Prepare a 0.6-mg/mL solution of USP Bivalirudin RS in water. Dilute with *Buffer solution* to obtain a 5- μ g/mL solution.

Sample solution: Prepare a 0.6-mg/mL solution of Bivalirudin for Injection in water. Measure the absorbance of the 0.6-mg/mL solution at 275 nm, using *Blank* to auto-zero. Calculate the concentration of bivalirudin in the *Sample solution*:

$$C_{\text{bivalirudin}} (\text{mg/mL}) = A_{275} / 0.62$$

From this concentration, dilute with *Buffer solution* to obtain a 5- $\mu\text{g}/\text{mL}$ solution. Prepare in triplicate.

Stop solution: Glacial acetic acid

Preparation of Control assay solution, Sample assay solution, and Standard assay solution: In each sample tube, add the *Buffer solution*, (1000 μL - E_C - S_C) first, then 30 μL of *Chromogenic substrate solution* (S_C), then the bivalirudin (if using). Vortex and incubate for 10 min at 37° in a water bath. Add the appropriate volume of *Diluted human thrombin solution* to give a final concentration of 0.095 NIH Units/mL (E_C) and immediately after activate the chronometer. Vortex for a few seconds and heat to 37° for 20 min \pm 15 sec in a water bath. Stop the reaction by adding 100 μL of *Stop solution*. Measure the absorbance of the six solutions at 405 nm using *Blank* to auto-zero.

Prepare the solutions for the analysis as indicated in *Table 1*.

Table 1

	Blank	Control Assay Solution	Sample Assay Solution	Standard Assay Solution
Number of replicates	1	3	3	3
Total number of UV readings	1	3	9	3
Chromogenic substrate solution	30 μL	30 μL	30 μL	30 μL
Bivalirudin	100 μL (<i>Standard solution</i>)	0	100 μL (<i>Sample solution</i>)	100 μL (<i>Standard solution</i>)
Thrombin	0	E_C	E_C	E_C
Buffer solution	1000 μL – 30 μL – 100 μL	1000 μL – 30 μL – E_C	1000 μL – 30 μL – 100 μL – E_C	1000 μL – 30 μL – 100 μL – E_C

System suitability

Samples: *Control assay solution* and *Standard assay solution*

Suitability requirements

Mean absorbance: Between 0.428 and 0.473, *Control assay solution*

Relative standard deviation: NMT 5% for six replicates, *Control assay solution*

Percent average inhibition: 44%–50% for the three readings of *Standard assay solution*

Analysis

Samples: *Standard assay solution* and *Sample assay solution*. Prepare three independent preparations of *Sample assay solution* to obtain a 0.6-mg/mL concentration.

Calculations: Determine % thrombin inhibition for each of the nine sample readings of

the sample tested. The final inhibition % result is given by the average of these nine values.

$$\% \text{ Inhibition} = [1 - (r_U/r_S)] \times 100$$

r_U = absorbance response, *Sample assay solution*

r_S = average absorbance response of the six readings of *Control assay solution* preparations

Acceptance criteria: 42%–52% average inhibition. Percent inhibition of each single *Sample assay solution* reading is between 41%–53%; % RSD of % average inhibition of the nine readings of the *Sample assay solutions* is NMT 10%.

ASSAY

• Procedure

Buffer solution: Dissolve 8.2 g of sodium acetate in 900 mL of water, adjust with glacial acetic acid to a pH of 6.5 ± 0.1 . Dilute with water to 1000 mL and pass through a filter of 0.2- μm pore size.

Solution A: *Buffer solution* and water (1:1)

Solution B: Acetonitrile and *Buffer solution* (1:1)

Mobile phase: See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	90	10
5	85	15
30	65	35
35	65	35
35.1	90	10
40	90	10

Standard solution A1: 275 $\mu\text{g}/\text{mL}$ of USP Bivalirudin RS in water. Prepare in duplicate.

Standard solution A2: 300 $\mu\text{g}/\text{mL}$ of USP [Asp⁹]-Bivalirudin RS in water. Prepare in duplicate.

System suitability solution: Using *Standard solution A1* and *Standard solution A2*, prepare a solution with a concentration of 275 $\mu\text{g}/\text{mL}$ of USP Bivalirudin RS and 3 $\mu\text{g}/\text{mL}$ of USP [Asp⁹]-Bivalirudin RS.

Sample solution: Transfer the entire contents of a vial (250 mg) to a 100-mL volumetric flask. Dissolve in and dilute with water to volume. Dilute with water to 275 $\mu\text{g}/\text{mL}$. Prepare in triplicate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 25-cm; 5- μ m packing L1

Temperatures

Column: 40°

Autosampler: 2°–8°

Flow rate: 1.2 mL/min

Injection volume: 40 μ L

System suitability

Samples: *Standard solution A1* and *System suitability solution*

Suitability requirements

Resolution: NLT 2.5 between the bivalirudin peak and the [Asp⁹]-bivalirudin peak, *System suitability solution*

Column efficiency: NLT 12,000 theoretical plates, *Standard solution A1*

Relative standard deviation: NMT 1.0% for three replicate injections of each preparation of *Standard solution A1*

Analysis

Samples: *Standard solution A1* and *Sample solution*

Analyze a single injection each of *Standard solution A1* and *Sample solution*. Calculate the percentage of the labeled amount of bivalirudin (C₉₈H₁₃₈N₂₄O₃₃) in the portion of Bivalirudin for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = mean peak response from *Standard solution A1*

C_S = concentration of USP Bivalirudin RS in *Standard solution A1* (μ g/mL)

C_U = nominal concentration of bivalirudin in the *Sample solution* (μ g/mL)

Acceptance criteria: 90.0%–120.0%

● **Product-Related Substances and Impurities**

Buffer solution: Dissolve 27.2 g of sodium acetate trihydrate in 1800 mL of water, and adjust with glacial acetic acid to a pH of 6.5 \pm 0.1. Dilute with water to 2000 mL and pass through a filter of 0.2- μ m pore size.

Solution A: *Buffer solution* and water (1:1)

Solution B: Acetonitrile and *Buffer solution* (1:1)

Mobile phase: See *Table 3*.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	90	10
5	85	15
30	65	35
35	65	35
35.1	90	90
40	90	90

Standard stock solution: 5.0 mg/mL of USP Bivalirudin RS in water

Standard solution A1: 0.05 mg/mL of USP [Asp⁹]-Bivalirudin RS in water. Prepare in duplicate.

High load sample solution (S1): Transfer the entire contents of a vial (250 mg) to a 100-mL volumetric flask. Dissolve in and dilute with water to volume. Prepare in duplicate.

Low load sample solution (S2): Dilute 2.0 mL of *Sample solution S1* with water to 100 mL. Prepare in duplicate.

System suitability solution: *Standard stock solution* and *Standard solution A1* (1:1)

Blank: Water

Chromatographic system: Proceed as directed in the *Assay*.

System suitability

Samples: *Standard solution A1* and *System suitability solution*

Suitability requirements

Resolution: NLT 2.5 between the bivalirudin peak and the [Asp⁹]-bivalirudin peak, *System suitability solution*

Column efficiency: NLT 10,000 theoretical plates, *Standard solution A1*

Relative standard deviation: NMT 1.0% for three replicate injections of each preparation of *Standard solution A1*

Analysis

Sample: *Low load sample solution (S2)*, single injection

Record the chromatograms, and measure the response for each peak of the *Low load sample solution* using the drop-down method of integration with respect to the baseline. Exclude from the integration the peaks present in the blank. Among all the integrated peaks, only those with a signal-to-noise ratio higher than 10 shall be used for the calculation. Report the area of all peaks of the chromatogram of the *High load sample solution*. To calculate the corrected bivalirudin peak area for the *Low load sample solution*, report the area of the bivalirudin peak of the *Low load sample solution* chromatogram and multiply this value by the dilution factor (50).

For the *Low load sample solution*, calculate the corrected total area:

$$r_T = \text{total area}_{S1} - \text{bivalirudin peak area}_{S1} + \text{bivalirudin corrected peak area}_{S2}$$

r_T = corrected total peak area

total area_{S1} = total peak area from the *High load sample solution*

bivalirudin peak area_{S1} = bivalirudin peak area from the *High load sample solution*
 bivalirudin corrected peak area_{S2} = mean bivalirudin peak area from the *Low load sample solution*
 × dilution factor (50)

For the *High load sample solution*, calculate the percentage of each impurity in the portion of Bivalirudin for Injection taken by using the corrected total peak area:

$$\text{Result} = (r_i/r_T) \times 100$$

r_i = peak response of each impurity from the *High load sample solution*

r_T = corrected total peak area

Acceptance criteria

Individual impurities: See *Table 4*. NMT 1.0% of any individual impurity is found unless specified, and the sum of all impurities is NMT 5.0%.

Table 4

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Fragment [1-11]	0.49	0.7
Fragment [2-20]	0.60	0.7
Total fragments ^a	0.44-0.65	1.8
[Asp ⁹]-Bivalirudin	0.93	1.0
Bivalirudin	1.00	—
Unspecified impurities	—	1.0
Total impurities	—	5.0

^a Peptide fragment peaks resulting from degradation.

PERFORMANCE TESTS

- **Uniformity of Dosage Units** (905): Meets the requirements

SPECIFIC TESTS

- **Completeness of Solution** (641)

Sample solution: Reconstitute 1 vial of Bivalirudin for Injection with 5 mL of carbon dioxide-free water.

Acceptance criteria: After 3 min, the solution is clear and free from undissolved solids.

- **Constituted Solution:** At the time of use, it meets the requirements in *Injections and Implanted Drug Products (1)*, *Product Quality Tests Common to Parenteral Dosage Forms*, *Specific Tests*, *Completeness and clarity of solutions*.
- **Bacterial Endotoxins Test** (85): NMT 50.0 USP Endotoxin Units/mL
- **Sterility Tests** (71), *Test for Sterility of the Product to Be Examined*, *Membrane Filtration:* Meets the requirements

- **Water Determination** (921), *Method Ic*: NMT 4.0%
- **Particulate Matter in Injections** (788): Meets the requirements for small-volume injections
- **pH** (791)
Sample solution: Use the *Sample solution* prepared in the test for *Completeness of Solution*.
Acceptance criteria: 5.0–6.0
- **Other Requirements:** Meets the requirements in *Labeling* (7)

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in single-dose containers, preferably of Type I glass. Store at controlled room temperature.
 - **Labeling:** Label it to indicate its synthetic origin.
 - **USP Reference Standards** (11)
 - USP Bivalirudin RS
 - USP [Asp⁹]-Bivalirudin RS
 - USP Endotoxin RS
- 2S (USP39)

¹ A suitable human alpha-thrombin is available from Sekisui Diagnostics LLC.

BRIEFING

Castor Oil, *USP 38* page 2633. As part of the USP monograph modernization effort, and on the basis of comments and data received, it is proposed to make the following revisions:

1. Add a CAS number and chemical structure.
2. Update the monograph *Definition*.
3. Add an *Identification* test *A, Identity by Fatty Acid Composition*. The added procedure is based on a GC method of analysis performed with the Agilent DB-225 or Restek Rtx-225 brand of G7 column. The typical retention times for methyl palmitate, methyl stearate, methyl oleate, methyl *cis*-11-octadecenoate, methyl linoleate, methyl linolenate, methyl *cis*-11-eicosenoate, and methyl ricinoleate are 7.25, 11.51, 11.75, 11.94, 12.69, 13.98, 19.20, and 31.49 min, respectively.
4. Move the test for *Distinction from Most Other Fixed Oils* from *Specific Tests* to the *Identification* section as test *B*.
5. In the *Assay*, add a test for *Triglyceride Composition*, which is based on analyses performed using the Phenomenex Prodigy ODS-3 brand or Phenomenex Ultremex C18 brand of column that contains 5- μ m packing L1. The typical retention times for RRR, RRL, RRO, and RRS are 7.6, 12.2, 13.6, and 15.4 min, respectively.
6. Replace the specification for *Free Fatty Acids* with a specification for *Acid Value*, and modify the test for *Hydroxyl Value* as the specification for *Acid Value* is known.
7. Add a specification for *Peroxide Value*.
8. Delete the test for *Iodine Value*.
9. Add a specification for *Water Determination*.
10. Add a specification for *Unsaponifiable Matter*.
11. Update the *Packaging and Storage* section.

12. Add a *Labeling* section with a statement accommodating a special grade that is used in injectable dosage forms. The specific grade must meet the *Other Requirements* to be added under the *Additional Requirements* section.
13. Add a *USP Reference Standards* section including USP Castor Oil RS, USP Methyl Linoleate RS, USP Methyl Linolenate RS, USP Methyl Ricinoleate RS, USP Methyl Palmitate RS, and USP Methyl Stearate RS.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(EXC1: H. Wang.)

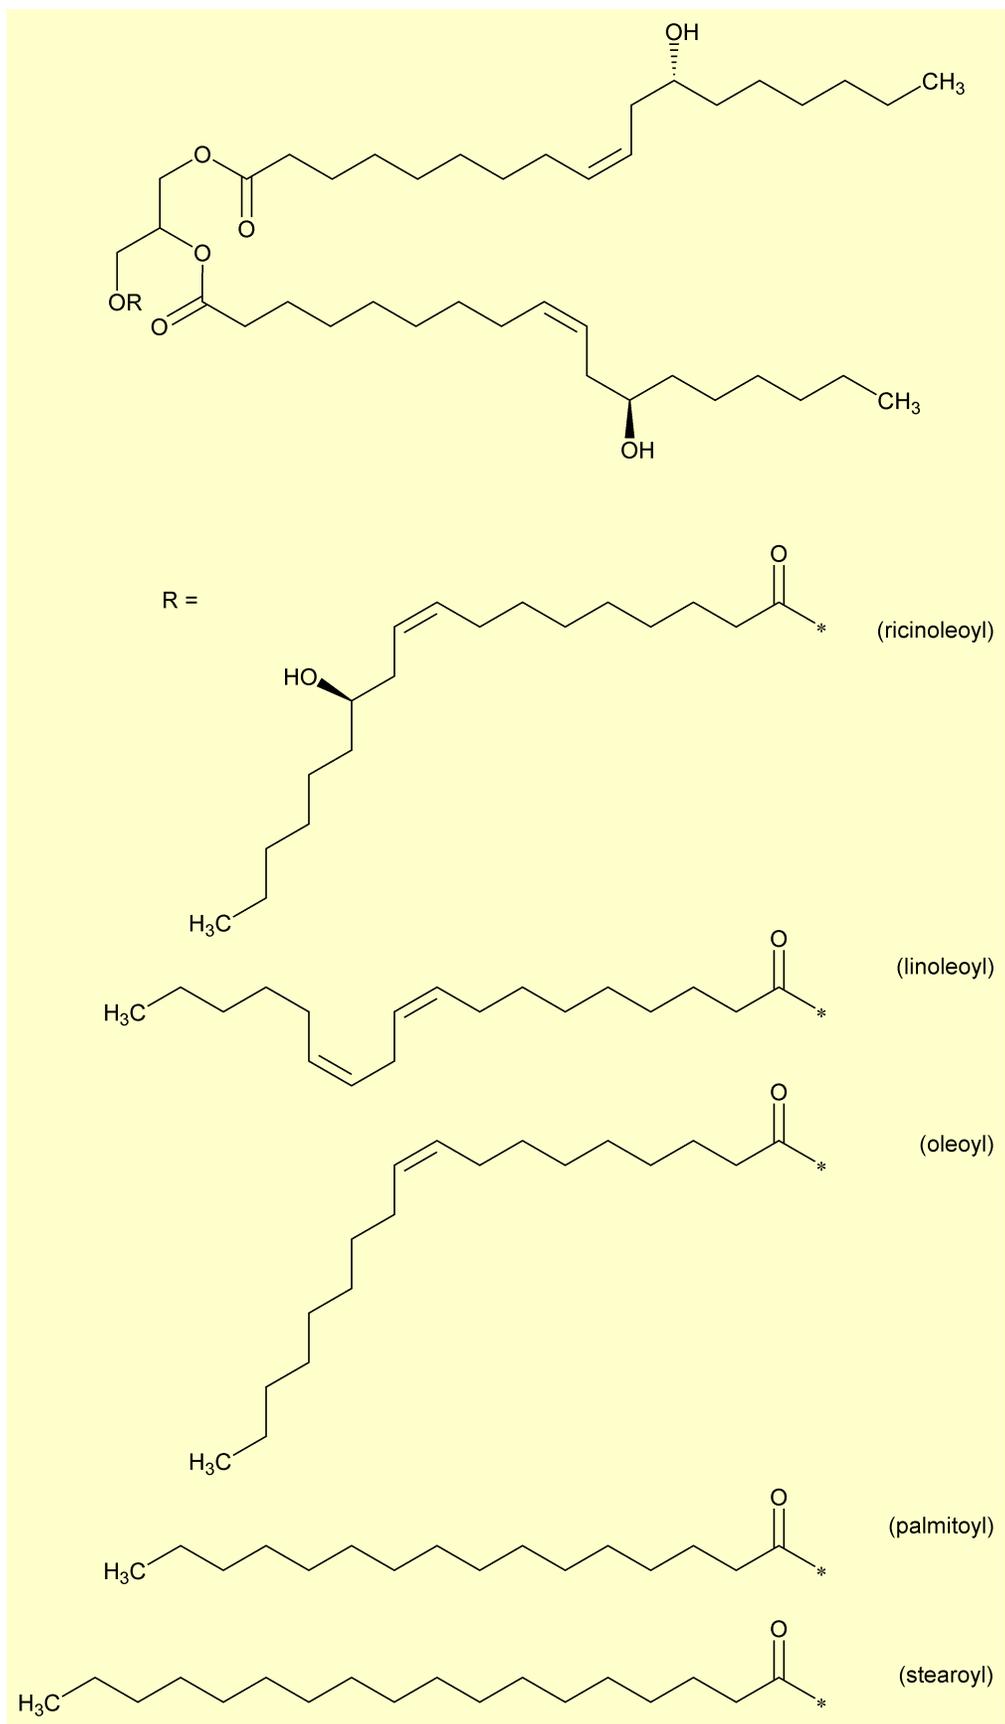

Correspondence Number—C109769

Comment deadline: November 30, 2015

Castor Oil

Add the following:

Triricinolein (glyceryl triricinoleate or triricinoleoyl-glycerol) predominates [8001-79-4].

■ 2S (USP39)

DEFINITION

Change to read:

Castor Oil is the

■ refined ■ 2S (USP39)

fixed oil obtained from the seed of *Ricinus communis* L. (Fam. Euphorbiaceae).

■ Castor oil consists of NLT 90.0% of the triglyceride of ricinoleic acid. ■ 2S (USP39)

It contains no added substances.

IDENTIFICATION

Add the following:

■ ● A. Identity by Fatty Acid Composition

Diluent: *n*-Heptane

Standard solution 1: 0.2 mg/mL each of methyl palmitate, methyl stearate, methyl oleate, methyl linoleate, methyl linolenate, methyl *cis*-11-eicosenoate, and methyl ricinoleate from USP Methyl Palmitate RS, USP Methyl Stearate RS, USP Methyl Oleate RS, USP Methyl Linoleate RS, USP Methyl Linolenate RS, methyl *cis*-11-eicosenoate, and USP Methyl Ricinoleate RS in *Diluent*

Standard solution 2: 4 mg/mL each of methyl stearate and methyl ricinoleate from USP Methyl Stearate RS and USP Methyl Ricinoleate RS in *Diluent*

Sample solution: Transfer 140 mg of Castor Oil to a 10-mL screw-cap test tube, add 3.0 mL of *Diluent*, and mix well. Add 0.5 mL of 0.5 M sodium methoxide in methanol,¹ and mix with the sample. Allow the reaction to proceed at room temperature for 2 h. After 2 h, add 5 mL of water, and mix. Separate the organic layer (the upper layer), and remove the lower layer. Place an aliquot of the organic layer into an autosampler vial.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm × 15-m fused silica capillary bonded with a 0.25-μm layer of phase G7

Temperatures

Injection port: 240°

Detector: 250°

Column: See *Table 1* for oven program.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)	Total Time (min)
80	0	80	1	1
80	30	140	0	3
140	3	150	0	6.3
150	1	155	0	11.3
155	2	165	0	16.3
165	3	220	10	45

Column mode: See Table 2 for pressure program.

Table 2

Pressure (psi)	Pressure Ramp (psi/min)	Hold Time (min)	Total Time (min)
10	0	16	16
4	5	9 or 0 ^a	26.2 or 17.2
3	10	19 or 28	45

^a If considerable discrimination of late-eluting compounds is observed, the hold time can be adjusted from 9 to 0 min. Thus the total time should be 17.2 min. The next step of the hold time should be 28 min.

Carrier gas: Hydrogen

Injection volume: 0.5 µL

Injection type: Split ratio 60:1

Liner: Single taper, low-pressure drop liner with deactivated wool

Run time: 45 min

System suitability

Sample: Standard solution 1

[Note—See Table 3 for relative retention times.]

Table 3

Component	Relative Retention Time
Methyl palmitate (C16:0)	0.62
Methyl stearate (C18:0)	0.98
Methyl oleate (C18:1)	1.00
Methyl linoleate (C18:2)	1.08
Methyl linolenate (C18:3)	1.19
Methyl <i>cis</i> -11-eicosenoate (C20:1)	1.63
Methyl ricinoleate	2.68

Suitability requirements

Resolution: NLT 1.5 between the methyl stearate and methyl oleate peaks

Relative standard deviation: NMT 2.0% for the peak area ratio of methyl ricinoleate to methyl linoleate

Analysis

Samples: *Standard solution 1, Standard solution 2, and Sample solution*

The peak of methyl *cis*-11-octadecenoate, which is an isomer of methyl oleate, can be resolved from the methyl oleate peak with a resolution of about 1 and a relative retention time of 1.01 with respect to methyl oleate.

Calculate the relative response factor, F , for methyl ricinoleate:

$$F = (r_S/r_R) \times (C_R/C_S)$$

r_S = peak area of methyl stearate from *Standard solution 2*

r_R = peak area of methyl ricinoleate from *Standard solution 2*

C_R = concentration of USP Methyl Ricinoleate RS in *Standard solution 2* (mg/mL)

C_S = concentration of USP Methyl Stearate RS in *Standard solution 2* (mg/mL)

Correct the peak area of methyl ricinoleate in the *Sample solution* by multiplying by F . Calculate the percentage of each fatty acid component in the portion of sample taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area of each individual fatty acid methyl ester except for the uncorrected peak area of methyl ricinoleate (or corrected peak area of methyl ricinoleate) in the *Sample solution*

r_T = sum of all of the peak areas, excluding the solvent and methyl ricinoleate peaks and including the corrected peak area of methyl ricinoleate in the *Sample solution*

Acceptance criteria: Castor Oil exhibits the composition profile of fatty acids shown in *Table 4*.

Table 4

Component	Percentage (%)
Palmitic acid (C16:0)	≤2.0
Stearic acid (C18:0)	≤2.5
Oleic acid (C18:1)	2.5–6.0
Linoleic acid (C18:2)	2.5–7.0
Linolenic acid (C18:3)	≤1.0
<i>cis</i> -11-Eicosenoic acid (C20:1)	≤1.0
Ricinoleic acid	85.0–92.0
<i>cis</i> -11-Octadecenoic acid or any other unidentified fatty acid	≤1.0

■ 2S (USP39)

Add the following:

- ● **B. Distinction from Most Other Fixed Oils:** It is only slightly soluble in *solvent hexane* (distinction from most other fixed oils), but it yields a clear liquid with an equal volume of *alcohol* (foreign fixed oils). ■ 2S (USP39)

ASSAY**Add the following:****Triglyceride Composition**

[Note—The fatty acid radicals are designated as linoleic (L), oleic (O), palmitic (P), ricinoleic (R), and stearic (S), and the common abbreviations for triglycerides used are as follows: triricinolein (glyceryl triricinoleate or triricinoleoyl-glycerol) (RRR), diricinoleoyl-linoleoyl-glycerol (RRL), diricinoleoyl-oleoyl-glycerol (RRO), diricinoleoyl-palmitoyl-glycerol (RRP), and diricinoleoyl-stearoyl-glycerol (RRS).]

Solution A: *Methanol*

Solution B: *2-Propanol*

BRIEFING

Chlorhexidine Gluconate Topical Gel. Because there is no existing *USP* monograph for this dosage form, a new monograph, based on validated methods of analysis, is proposed. There has been an increasing use of chlorhexidine gluconate solution and gel for umbilical cord care in Nepal, Nigeria, and other countries. A 2012 UN Commission Report on Life-Saving Commodities for Women and Children listed this product as potentially saving 422,000 lives over five years,¹ and it subsequently was added to the 2013 World Health Organization (WHO) List of Essential Medicines for Children specifically for umbilical cord care.² Although the *USP-NF* currently includes monographs for the Chlorhexidine Gluconate drug substance and other dosage forms, it does not include a monograph for Chlorhexidine Gluconate Topical Gel because this product is not marketed in the U.S. USP developed this monograph as a result of its involvement with the Chlorhexidine Working Group, which comprises 18 global health organizations.

USP is consulting key global stakeholders to help define and implement a program to develop monographs for high-impact drugs legally marketed outside the U.S. The initiative targets critical medicines approved outside the U.S. for which no relevant standards exist and would be conducted in collaboration with the WHO, other pharmacopeias, and key stakeholders in ongoing consultation with the U.S. Food and Drug Administration. The proposed approach would use the existing *USP-NF* revision processes and resulting monographs would be published in *USP-NF* and designated to indicate their non-U.S. status. This could occur through a note within the monograph itself (see the proposed *Note* in the *Definition* section) or, alternatively, by placing these monographs in a separate section in *USP-NF*. USP welcomes and encourages comments and feedback on the proposed monograph and the broader concept for non-U.S. monographs presented here, including the need for a separate section within the compendia for these monographs to avoid confusion about their regulatory status in the U.S.

The chromatographic procedures in the *Assay* and the *Limit of p-Chloroaniline* test are based on analyses performed with the Phenomenex Luna C18 brand of L1 column. The typical retention time for chlorhexidine is about 8 min.

Comment deadline: November 30, 2015

Add the following:

▪ **Chlorhexidine Gluconate Topical Gel**

DEFINITION

Chlorhexidine Gluconate Topical Gel is prepared from Chlorhexidine Gluconate Solution. It contains NLT 90.0% and NMT 110.0% of the labeled amount of chlorhexidine gluconate ($C_{22}H_{30}Cl_2N_{10} \cdot 2C_6H_{12}O_7$). [Note—The U.S. Food and Drug Administration has not reviewed the safety and efficacy of Chlorhexidine Gluconate Topical Gel and it is not approved for marketing in the United States.]

IDENTIFICATION

• **A. Ultraviolet Absorption** (197U)

Wavelength range: 200–400 nm

Sample solution: Nominally 0.01 mg/mL of chlorhexidine gluconate from Topical Gel, prepared as follows. Transfer a suitable amount of Topical Gel to an appropriate volumetric flask and dilute with water to volume.

Acceptance criteria: The UV absorption spectrum of the *Sample solution* exhibits two maxima at 231 and 255 nm and two minima at 222 and 242 nm.

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

• **C. Thin-Layer Chromatographic Identification Test** (201)

Diluent: *Acetonitrile* and water (1:1)

Standard solution: 10 mg/mL of USP Potassium Gluconate RS in *Diluent*

Sample solution: Nominally 20 mg/mL of chlorhexidine gluconate from Topical Gel, prepared as follows. Transfer a suitable amount of Topical Gel, equivalent to 500 mg of chlorhexidine gluconate, to a 25-mL volumetric flask. Add a sufficient quantity of *Diluent*, sonicate with intermittent shaking for 30 min, and dilute with *Diluent* to volume. Centrifuge the solution for 5 min at 3000 rpm.

Chromatographic system

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 10 μ L

Developing solvent system: *Alcohol*, *ethyl acetate*, *ammonium hydroxide*, and water (5:1:1:3)

Spray reagent: Dissolve 2.5 g of *ammonium molybdate* in 50 mL of 2 N *sulfuric acid* in a 100-mL volumetric flask. Add 1.0 g of *ceric sulfate*, swirl to dissolve, and dilute with 2 N *sulfuric acid* to volume.

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatogram in a solvent system until the solvent front has moved 10 cm from the point of spotting. Remove the plate from the chamber and dry at 110° for 20 min. Allow to cool and spray with *Spray reagent*. Heat the plate at 110° for 10 min.

Acceptance criteria: The principal spot of the *Sample solution* corresponds in color, size, and R_f value to that of the *Standard solution*.

ASSAY

• Procedure

Buffer: Dissolve 27.6 g of *sodium dihydrogen phosphate* and 10 mL of *triethylamine* in 1.5 L of water. Adjust with *phosphoric acid* to a pH of 3.0 and dilute with water to 2000 mL.

Solution A: *Acetonitrile* and *Buffer* (30:70)

Solution B: *Acetonitrile*

Mobile phase: See *Table 1*.

0	100	0
9	100	0
10	45	55
15	45	55
16	100	0
21	100	0

Standard solution: 50 µg/mL of USP Chlorhexidine Acetate RS in *Solution A*

Sample stock solution: Nominally 0.4 mg/mL of chlorhexidine gluconate from Topical Gel, prepared as follows. Transfer a suitable amount of Topical Gel, equivalent to 40 mg of chlorhexidine gluconate, to a 100-mL volumetric flask. Add about 70 mL of *Solution A*, sonicate with intermittent shaking for 30 min, and dilute with *Solution A* to volume.

Sample solution: Nominally 80 µg/mL of chlorhexidine gluconate from the *Sample stock solution* with *Solution A*

BRIEFING

Chlorothiazide Oral Suspension, USP 38 page 2773. As part of the USP monograph modernization efforts, it is proposed to revise the monograph as follows:

1. Replace the UV-based *Assay* procedure with a stability-indicating HPLC procedure. The procedure has the same HPLC parameters as those proposed in the test for *Organic Impurities*. The liquid chromatographic procedure is validated using the Waters XBridge C18 brand of L1 column. The typical retention time for chlorothiazide is about 7.2 min.
2. Replace *Identification* test *A* based on UV spectrum match with a retention time agreement in the proposed *Assay*.
3. Add an orthogonal *Identification* test *B* based on UV spectrum match from the proposed chromatographic procedure in the *Assay*.
4. Add a stability-indicating HPLC procedure to the test for *Organic Impurities*.
5. Add a new USP Reference Standard used in the test for *Organic Impurities* to the *USP Reference Standards* section.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Chlorothiazide Oral Suspension

DEFINITION

Chlorothiazide Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of chlorothiazide ($C_7H_6ClN_3O_4S_2$).

IDENTIFICATION

Change to read:

- **A.** ~~The UV absorption spectrum of the solution of chlorothiazide prepared from Oral Suspension as directed in the Assay exhibits maxima and minima at the same wavelengths as that of a solution of USP Chlorothiazide RS, prepared as directed in the Assay, concomitantly measured.~~
 - The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay. ■ 2S (USP39)

Add the following:

- **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay. ■ 2S (USP39)

ASSAY

Change to read:

- **Procedure**

Standard solution: ~~10 µg/mL of USP Chlorothiazide RS in sodium hydroxide solution (1 in 250)~~

Sample stock solution: ~~Transfer an accurately measured volume of Oral Suspension, equivalent to about 250 mg of chlorothiazide, to a 250 mL volumetric flask. Dilute in sodium hydroxide solution (1 in 250) to volume, and mix. Transfer 10.0 mL of this solution to a 100 mL volumetric flask, add dilute hydrochloric acid (1 in 100) to volume, and mix. Transfer 50.0 mL of the resulting solution to a 125 mL separator, and wash with two 25 mL portions of chloroform, discarding the washings.~~

Sample solution: ~~Nominally 10 µg/mL of chlorothiazide from Oral Suspension prepared as follows. Transfer 10.0 mL of *Sample stock solution* to a 100 mL volumetric flask, and dilute with sodium hydroxide solution (1 in 250) to volume, and mix.~~

Spectrometric conditions

Mode: ~~UV~~

Analytical wavelength: ~~292 nm~~

Cell: ~~1 cm~~

Blank: ~~Sodium hydroxide solution (1 in 250)~~

Analysis

Samples: ~~Standard solution and Sample solution~~

~~Determine the absorbances of the Standard solution and the Sample solution at 292 nm.~~

~~Calculate the percentage of labeled amount of chlorothiazide ($C_7H_6ClN_3O_4S_2$) in the portion of Oral Suspension taken:~~

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

~~A_U = absorbance of the Sample solution~~

~~A_S = absorbance of the Standard solution~~

~~C_S = concentration of the Standard solution ($\mu\text{g/mL}$)~~

~~C_U = nominal concentration of chlorothiazide in the Sample solution ($\mu\text{g/mL}$)~~

▪ **Solution A:** 0.1% Formic acid in water

Solution B: Methanol

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)

Chlorothiazide Tablets

DEFINITION

Chlorothiazide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of chlorothiazide ($\text{C}_7\text{H}_6\text{ClN}_3\text{O}_4\text{S}_2$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

Change to read:

B. Identification Tests—General, Sulfite (191): Powder 1 Tablet, and fuse it with a pellet of sodium hydroxide: the ammonia fumes produced turn moistened red litmus paper blue, and the residue responds to the test.

- The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■ 2S (USP39)

ASSAY

Change to read:● **Procedure**

Mobile phase: Prepare a solution of 0.08 M monobasic sodium phosphate (adjusted with phosphoric acid to a pH of 2.9 ± 0.1) and methanol (95:5).

Standard solution: 0.5 mg/mL of USP Chlorothiazide RS prepared as follows. Transfer 25 mg of USP Chlorothiazide RS to a 50 mL volumetric flask, add 5 mL of 0.05 M monobasic sodium phosphate solution, followed by 10 mL of acetonitrile to the flask, and sonicate with occasional shaking for 3 min. Dilute with water to volume and filter.

Sample solution: Nominally 0.5 mg/mL of chlorothiazide from the Tablets prepared as follows. Transfer a portion of the powder, equivalent to 250 mg of chlorothiazide, from finely powdered Tablets (NLT 20) to a 500 mL volumetric flask. Add 50 mL of 0.05 M monobasic sodium phosphate solution, and shake by mechanical means for 15 min, followed by sonication for 2 min. Add 100 mL of acetonitrile, sonicate for 3 min, dilute with water to volume, and filter. [Note—Prepare fresh daily.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9 mm × 30 cm; packing L1, and fitted with a guard column

Flow rate: 2 mL/min

Injection volume: 15 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Capacity factor: NLT 4.3

Tailing factor: NMT 2.0

Column efficiency: NLT 1300 theoretical plates

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of chlorothiazide ($C_7H_6ClN_3O_4S_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Chlorothiazide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of chlorothiazide in the *Sample solution* (mg/mL)

■ **Solution A:** 0.1% *Formic acid* in water

Solution B: *Methanol*

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	94	6
4	94	6
14	80	20
18	40	60
25	40	60
26	94	6
30	94	6

Diluent: *Acetonitrile* and *Solution A* (30:70)

Standard solution: 0.1 mg/mL of USP Chlorothiazide RS in *Diluent*

Sample stock solution: 0.5 mg/mL of chlorothiazide in *Diluent* prepared as follows.

Transfer a suitable amount of finely powdered Tablets (NLT 20), equivalent to 25 mg of chlorothiazide, to a 50-mL volumetric flask. Add 40 mL of *Diluent* and sonicate. Dilute with *Diluent* to volume. Centrifuge and use the supernatant.

Sample solution: Nominally 0.1 mg/mL of chlorothiazide in *Diluent* from the *Sample stock solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 275 nm. For *Identification test B*, use a diode array detector in the range of 200–400 nm.

Column: 4.6-mm × 15-cm; 5-μm packing L1

Temperatures

Autosampler: 5°

Column: 30°

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of chlorothiazide (C₇H₆ClN₃O₄S₂) in the

portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of chlorothiazide from the *Sample solution*

r_S = peak response of chlorothiazide from the *Standard solution*

C_S = concentration of USP Chlorothiazide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of chlorothiazide in the *Sample solution* (mg/mL)

■ 2S (USP39)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• Dissolution (711)

Medium: 0.05 M pH 8.0 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*); 900 mL

Apparatus 2: 75 rpm

Time: 60 min

Standard solution: Known concentration of USP Chlorothiazide RS in *Medium*

Sample solution: Filtered portions of the solution under test, suitably diluted with *Medium* to a concentration that is similar to the *Standard solution*

Instrumental conditions

Mode: UV

Analytical wavelength: 294 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Tolerances: NLT 75% (Q) of the labeled amount of chlorothiazide ($C_7H_6ClN_3O_4S_2$) is dissolved.

• Uniformity of Dosage Units (905): Meet the requirements

IMPURITIES

Add the following:

■ • Organic Impurities

Solution A, Solution B, Mobile phase, Diluent, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 10 µg/mL of USP Benzothiadiazine Related Compound A RS and 2 µg/mL of USP Chlorothiazide RS in *Diluent*

Sample solution: Nominally 1 mg/mL of chlorothiazide in *Diluent* prepared as follows. Transfer a suitable amount of finely powdered Tablets (NLT 20) to an appropriate volumetric flask. Add *Diluent* to 80% of the final flask volume and sonicate. Dilute with *Diluent* to volume. Centrifuge and use the supernatant.

System suitability

Sample: *Standard solution*

[Note—See *Table 2* for relative retention times.]

Suitability requirements

Resolution: NLT 4.0 between the benzothiadiazine related compound A and chlorothiazide peaks

Relative standard deviation: NMT 5.0% for chlorothiazide

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of any individual unspecified degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each unspecified degradation product from the *Sample solution*

r_S = peak response of chlorothiazide from the *Standard solution*

C_S = concentration of USP Chlorothiazide RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of chlorothiazide in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: See *Table 2*. Disregard any peak below 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Benzothiadiazine related compound A ^a	0.7	—
Chlorothiazide	1.0	—
Any individual unspecified degradation product	—	0.2
Total degradation products	—	2.0

^a Not included in the total degradation products.

BRIEFING

Ciprofloxacin, *USP 38* page 2816; and *PF 40(3)* [May–June 2014]. The revision proposal in *PF 40(3)* is being cancelled and replaced with the following proposal based on the comments received:

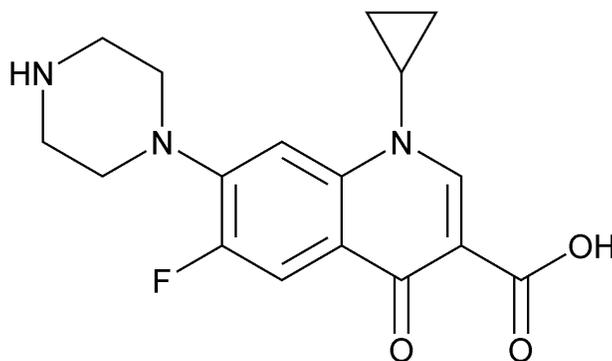

1. The nonselective TLC procedure in *Organic Impurities, Procedure 1* is replaced with a stability-indicating liquid chromatography procedure. The proposed HPLC procedure is based on the analysis performed with the YMC-Pack ODS-AQ brand of L1 column. The typical retention time for ciprofloxacin is about 9.5 min.
2. The *Organic Impurities, Procedure 2* is deleted as the proposed HPLC procedure is sufficient to monitor all the impurities.
3. The tests for *Chloride* and *Sulfate* are deleted, as they are not needed.
4. The *Column efficiency* criteria in the *Assay* is deleted as other system suitability criteria are sufficient.
5. In the *USP Reference Standards* section, chemical information is updated for the USP impurity Reference Standards that support the proposed test for *Organic Impurities*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(SHM1: S. Shivaprasad.)

Ciprofloxacin

$C_{17}H_{18}FN_3O_3$ 331.34

3-Quinolinecarboxylic acid, 1-cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-(1-piperazinyl)-; 1-Cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-(1-piperazinyl)-3-quinolinecarboxylic acid [85721-33-1].

DEFINITION

Ciprofloxacin contains NLT 98.0% and NMT 102.0% of ciprofloxacin ($C_{17}H_{18}FN_3O_3$), calculated on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

Change to read:

- **Procedure**

Buffer: 0.025 M phosphoric acid. Adjust with triethylamine to a pH of 3.0 ± 0.1 .

Mobile phase: Acetonitrile and *Buffer* (13:87)

Standard solution: 0.5 mg/mL of USP Ciprofloxacin RS prepared as follows. Transfer 12.5 mg of USP Ciprofloxacin RS to a 25-mL volumetric flask. Add 0.1 mL of 7% phosphoric acid, and dilute with *Mobile phase* to volume.

System suitability stock solution: 0.025 mg/mL of USP Ciprofloxacin Ethylenediamine Analog RS in *Mobile phase*

System suitability solution: Transfer 1.0 mL of the *System suitability stock solution* to a 10-mL volumetric flask, and dilute with *Standard solution* to volume.

Sample solution: Transfer 25 mg of Ciprofloxacin to a 50-mL volumetric flask. Add 0.2 mL of 7% phosphoric acid, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 278 nm

Column: 4.6-mm \times 25-cm; packing L1

Column temperature: $30 \pm 1^\circ$

Flow rate: 1.5 mL/min

Injection volume: 10 μ L

System suitability

Samples: *Standard solution* and *System suitability solution*

[Note—The relative retention times for ciprofloxacin ethylenediamine analog and ciprofloxacin are about 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 6 between ciprofloxacin ethylenediamine analog and ciprofloxacin, *System suitability solution*

Column efficiency: NLT 2500 theoretical plates from the ciprofloxacin peak, *Standard solution*

■ **2S (USP39)**

Tailing factor: NMT 2.5, *Standard solution*

Relative standard deviation: NMT 1.5%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of ciprofloxacin ($C_{17}H_{18}FN_3O_3$) in the portion of Ciprofloxacin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Ciprofloxacin RS in the *Standard solution* (mg/mL)

C_U = concentration of Ciprofloxacin in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **Residue on Ignition** (281): NMT 0.1%, except that where it is intended for use in preparing Ciprofloxacin for Oral Suspension, it is NMT 0.2%.

Delete the following:

● Chloride

Standard solution: 8.2 µg/mL of sodium chloride (5 µg/mL of chloride)

Sample solution: Add 30.0 mL of water to 0.5 g of Ciprofloxacin, shake for 5 min, and pass through chloride-free filter paper. Use the filtrate as the *Sample solution*.

Analysis

Samples: *Standard solution* and *Sample solution*

Transfer 15.0 mL of the *Sample solution* to a 50 mL color-comparison tube. Transfer 10.0 mL of the *Standard solution* to a second matched 50 mL color-comparison tube, add 5.0 mL of water, and mix. To each tube add 1 mL of 2 N nitric acid, mix, add 1 mL of silver nitrate TS, and mix.

Acceptance criteria: The turbidity exhibited by the *Sample solution* does not exceed that of the *Standard solution* (0.02%). ■ 2S (USP39)

Delete the following:

● Sulfate

Standard solution: 18.1 µg/mL of potassium sulfate in 30% alcohol (10 µg/mL of sulfate)

Sample solution: Dissolve 0.5 g of Ciprofloxacin in 5.0 mL of 2 N acetic acid and 15.0 mL of water.

Analysis

Samples: *Standard solution* and *Sample solution*

To each of two 50 mL matched color-comparison tubes transfer 1.50 mL of the *Standard solution*. To each tube add, successively and with continuous shaking, 1.0 mL of 250 mg/mL barium chloride solution, and allow to stand for 1 min. To one of the tubes transfer 15.0 mL of the *Standard solution* and 0.5 mL of 30% acetic acid, and mix. To the second tube add 15.0 mL of the *Sample solution* and 0.5 mL of 30% acetic acid, and mix.

Acceptance criteria: The turbidity exhibited in the tube containing the *Sample solution* does not exceed that of the tube containing the *Standard solution* (0.04%). ■ 2S (USP39)

Delete the following:

- **Heavy Metals** (231), *Method II*: NMT 20 ppm • (Official 1-Dec-2015)

Delete the following:

■ ● **Procedure 1: Limit of Fluoroquinolonic Acid**

Standard stock solution: Transfer 5.0 mg of USP Fluoroquinolonic Acid RS to a 50-mL volumetric flask containing 0.05 mL of 6 N ammonium hydroxide, and dilute with water to volume.

Standard solution: Dilute 2.0 mL of the *Standard stock solution* with water to 10.0 mL.

Sample solution: 10.0 mg/mL of Ciprofloxacin in 0.1 N acetic acid

Developing solvent system: Methylene chloride, methanol, acetonitrile, and ammonium hydroxide (4:4:1:2)

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of silica gel mixture

Application volume: 5 µL

Analysis

Samples: *Standard solution* and *Sample solution*

Place the plate in a suitable chamber in which is placed a beaker containing 50 mL of ammonium hydroxide. After 15 min, transfer the plate to a suitable chromatographic chamber, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the plate to air-dry for about 15 min. Examine the plate under short-wavelength UV light.

Acceptance criteria: Any spot from the *Sample solution*, at an R_f value corresponding to the principal spot from the *Standard solution*, is not greater in size or intensity than the principal spot from the *Standard solution* (0.2%). ■ 2S (USP39)

Delete the following:

■ ● **Procedure 2**

Solution A, Mobile phase, System suitability stock solution, System suitability solution, Standard solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Ciprofloxacin taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = response of each impurity peak

~~r_T = sum of the responses of all the peaks~~

~~Acceptance criteria~~

~~**Ciprofloxacin ethylenediamine analog or any other individual impurity peak:** NMT 0.2%~~

~~**Total impurities:** NMT 0.5%~~

■ 2S (USP39)

Add the following:

■ ● Organic Impurities

Buffer: Dilute 3.4 mL of phosphoric acid with water to 2000 mL. Adjust with triethylamine to a pH of 3.0 ± 0.1 .

Solution A: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Buffer (%)	Solution A (%)
0	87	13
10	87	13
11	50	50
16	50	50
16.1	87	13
20	87	13

Diluent: *Solution A* and *Buffer* (13:87)

System suitability solution: 7.5 µg/mL each of USP Ciprofloxacin Ethylenediamine Analog RS and USP Ciprofloxacin RS in *Diluent*

Standard stock solution: 0.1 mg/mL each of USP Fluoroquinolonic Acid RS and USP Ciprofloxacin RS prepared as follows. Add suitable amounts of USP Fluoroquinolonic Acid RS and USP Ciprofloxacin RS to a suitable volumetric flask. Add 0.1% of the flask volume of 6 M ammonium hydroxide and dilute with water to volume.

Standard solution: 0.7 µg/mL each of USP Fluoroquinolonic Acid RS and USP Ciprofloxacin RS from *Standard stock solution* in *Diluent*

Sample solution: 0.35 mg/mL of Ciprofloxacin prepared as follows. Transfer 35 mg of Ciprofloxacin to a 100-mL volumetric flask, add 0.2 mL of 7% phosphoric acid, and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 263 and 278 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 30 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for ciprofloxacin ethylenediamine analog and ciprofloxacin are 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 6.0 between ciprofloxacin ethylenediamine analog and ciprofloxacin at 278 nm, *System suitability solution*

Tailing factor: NMT 2.0 for the ciprofloxacin peak at 278 nm, *Standard solution*

Relative standard deviation: NMT 5.0% for ciprofloxacin at 278 nm; NMT 5.0% for fluoroquinolonic acid at 263 nm, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of fluoroquinolonic acid in the portion of Ciprofloxacin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of fluoroquinolonic acid at 263 nm from the *Sample solution*

r_S = peak response of fluoroquinolonic acid at 263 nm from the *Standard solution*

C_S = concentration of USP Fluoroquinolonic Acid RS in the *Standard solution* (mg/mL)

C_U = concentration of Ciprofloxacin in the *Sample solution* (mg/mL)

Calculate the percentage of the ciprofloxacin ethylenediamine analog and any individual unspecified impurity in the portion of Ciprofloxacin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity at 278 nm from the *Sample solution*

r_S = peak response of ciprofloxacin at 278 nm from the *Standard solution*

C_S = concentration of USP Ciprofloxacin RS in the *Standard solution* (mg/mL)

C_U = concentration of Ciprofloxacin in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*. Disregard peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Wavelength (nm)	Acceptance Criteria, NMT (%)
Ciprofloxacin ethylenediamine analog	0.70	278	0.2
Ciprofloxacin	1.00	278	—
Fluoroquinolonic acid	1.89	263	0.2
Any individual unspecified impurity	—	278	0.2
Total impurities ^a	—	—	0.5
^a Total impurities does not include the fluoroquinolonic acid impurity.			

■ 2S (USP39)

SPECIFIC TESTS● **Clarity of Solution**

Sample solution: Dissolve 0.25 g in 10 mL of 0.1 N hydrochloric acid.

Acceptance criteria: A clear to slightly opalescent solution is obtained.

- **Microbial Enumeration Tests** (61) and **Tests for Specified Microorganisms** (62): Where it is intended for use in preparing Ciprofloxacin for Oral Suspension, the total microbial count does not exceed 10^3 cfu/g, and the total combined molds and yeasts count does not exceed 10^2 cfu/g. It also meets the requirements for absence of *Salmonella* species and *Escherichia coli*.

● **Loss on Drying** (731)

Analysis: Dry under vacuum at 120° for 6 h.

Acceptance criteria: NMT 1.0%, except that where it is labeled as intended for use in preparing Ciprofloxacin for Oral Suspension, 10%–20%

- **Sterility Tests** (71), *Test for Sterility of the Product to Be Examined, Membrane Filtration:* Where the label states that it is sterile, it meets the requirements.
- **Bacterial Endotoxins Test** (85): Where the label states that it is sterile or where the label states that Ciprofloxacin must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.50 USP Endotoxin Units/mg of ciprofloxacin.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight, light-resistant containers. Store at 25°, excursion permitted between 15° and 30°, and avoid excessive heat.
- **Labeling:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms. Where it is intended for use in preparing Ciprofloxacin for Oral Suspension, it is so labeled.

C_S = concentration of USP Ciprofloxacin Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Ciprofloxacin Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

- **Residue on Ignition** (281): NMT 0.1%

Delete the following:

- ● **Chloride and Sulfate** (221), *Sulfate*: A 375-mg portion shows no more sulfate than corresponds to 0.15 mL of 0.020 N sulfuric acid (0.04%). ■ 2S (USP39)

Delete the following:

- ● **Heavy Metals** (231), *Method II*: NMT 20 ppm. (Official 1-Dec-2015)

Delete the following:

- ● **Procedure 1: Limit of Fluoroquinolonic Acid**

Standard solution: Transfer 5.0 mg of USP Fluoroquinolonic Acid RS to a 50-mL volumetric flask containing 0.05 mL of 6 N ammonium hydroxide, add water to volume, and mix. Transfer 2.0 mL of this solution to a 10.0-mL volumetric flask, and dilute with water to volume.

Sample solution: 10 mg/mL of Ciprofloxacin Hydrochloride in water

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of silica gel mixture

Application volume: 5 µL

Developing solvent system: Methylene chloride, methanol, acetonitrile, and ammonium hydroxide (4:4:1:2)

Analysis

Samples: *Standard solution* and *Sample solution*

Proceed as directed in the chapter. Place a beaker containing 50 mL of ammonium hydroxide in a suitable chamber, and then place the plate in the chamber. After 15 min, transfer the plate to a suitable chromatographic chamber, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the plate to air dry for about 15 min. Examine the plate under short-wavelength UV light.

Acceptance criteria: Any spot from the *Sample solution*, at an R_f value corresponding to the principal spot from the *Standard solution*, is not greater in size or intensity than the principal spot from the *Standard solution* (0.2%). ■ 2S (USP39)

Delete the following:

■ ● **Procedure 2**

Mobile phase, Standard solution, System suitability solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Ciprofloxacin Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each impurity

r_T = sum of the responses of all the peaks

Acceptance criteria

Individual impurities: NMT 0.2% for the ciprofloxacin ethylenediamine analog or any other individual impurity peak

Total impurities: NMT 0.5%

■ 2S (USP39)

Add the following:

■ ● **Organic Impurities**

Buffer: Dilute 3.4 mL of phosphoric acid with water to 2000 mL. Adjust with triethylamine to a pH of 3.0 ± 0.1 .

Solution A: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Buffer (%)	Solution A (%)
0	87	13
10	87	13
11	50	50
16	50	50
16.1	87	13
20	87	13

Diluent: *Solution A* and *Buffer* (13:87)

System suitability solution: 7.5 µg/mL each of USP Ciprofloxacin Ethylenediamine Analog RS and USP Ciprofloxacin Hydrochloride RS in *Diluent*

Standard stock solution: 0.1 mg/mL each of USP Fluoroquinolonic Acid RS and USP Ciprofloxacin Hydrochloride RS prepared as follows. Add suitable amounts of USP Fluoroquinolonic Acid RS and USP Ciprofloxacin Hydrochloride RS to a suitable volumetric flask. Add 0.1% of the flask volume of 6 M ammonium hydroxide and dilute with water to volume.

Standard solution: 0.7 µg/mL each of USP Fluoroquinolonic Acid RS and USP Ciprofloxacin Hydrochloride RS from *Standard stock solution* in *Diluent*

Sample solution: 0.35 mg/mL of Ciprofloxacin Hydrochloride in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 263 and 278 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 30 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for ciprofloxacin ethylenediamine analog and ciprofloxacin are 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 6.0 between ciprofloxacin ethylenediamine analog and ciprofloxacin at 278 nm, *System suitability solution*

Tailing factor: NMT 2.0 for the ciprofloxacin peak at 278 nm, *Standard solution*

Relative standard deviation: NMT 5.0% for ciprofloxacin at 278 nm; NMT 5.0% for fluoroquinolonic acid at 263 nm, *Standard solution*

Analysis

Samples: *Standard solution and Sample solution*

Calculate the percentage of fluoroquinolonic acid in the portion of Ciprofloxacin Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of fluoroquinolonic acid at 263 nm from the *Sample solution*

r_S = peak response of fluoroquinolonic acid at 263 nm from the *Standard solution*

C_S = concentration of USP Fluoroquinolonic Acid RS in the *Standard solution* (mg/mL)

C_U = concentration of Ciprofloxacin Hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of ciprofloxacin ethylenediamine analog and any individual unspecified impurity in the portion of Ciprofloxacin Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity at 278 nm from the *Sample solution*

r_S = peak response of ciprofloxacin at 278 nm from the *Standard solution*

C_S = concentration of USP Ciprofloxacin Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Ciprofloxacin Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 2. Disregard peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Wavelength (nm)	Acceptance Criteria, NMT (%)
Ciprofloxacin ethylenediamine analog	0.70	278	0.2
Ciprofloxacin	1.00	278	—
Fluoroquinolonic acid	1.89	263	0.2
Any individual unspecified impurity	—	278	0.2
Total impurities ^a	—	—	0.5
^a Total impurities does not include fluoroquinolonic acid impurity.

BRIEFING

Codeine Sulfate Tablets, *USP 38* page 2933. As part of the USP monograph modernization initiative, it is proposed to make the following changes:

1. Replace *Identification* test *A*, which is based on IR and uses a toxic solvent, chloroform, with the retention time agreement from the *Assay*.
2. Delete *Identification* test *B* for sulfate. The salt form is controlled in the drug substance monograph.
3. Add *Identification* test *B* for codeine, a second orthogonal procedure based on the UV (210–400 nm) spectrum of the codeine peak in the *Assay*.
4. In the *Assay*, it is proposed to delete the system suitability requirement for *Column efficiency* and *Signal-to-noise ratio*. *Tailing factor* and *Relative standard deviation* are sufficient for the system suitability requirements.
5. Update the molecular weights of codeine sulfate, trihydrate and anhydrous compounds, to be consistent with the *USAN* dictionary.
6. The *Sensitivity solution* and system suitability requirement for *Signal-to-noise ratio* was moved from the *Assay* to the *Organic Impurities* test because this requirement is applicable to the *Organic Impurities* test.
7. Delete the *Procedure for content uniformity* in the test for *Uniformity of Dosage Units* to allow flexibility.
8. Add the disregard limit to the *Organic Impurities* test based on the submission data.
9. Update the storage requirement in the *Packaging and Storage* section based on the information in the label insert for an approved drug product.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Codeine Sulfate Tablets

DEFINITION

Codeine Sulfate Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of codeine sulfate trihydrate $[(C_{18}H_{21}NO_3)_2 \cdot H_2SO_4 \cdot 3H_2O]$.

IDENTIFICATION**Delete the following:**

- ● **A. Infrared Absorption** ~~(197K)~~

Standard solution: 50 mg of USP Codeine Sulfate RS dissolved in 15 mL of water, then rendered alkaline with *ammonium hydroxide, 6 N* and extracted with several 10 mL portions of *chloroform*. Evaporate the combined *chloroform* extracts on a steam bath at 80° for 4 h to dryness.

Sample solution: Digest an equivalent to 50 mg of codeine sulfate, from finely powdered Tablets, with 15 mL of water and 5 mL of 2 N sulfuric acid for 1 h. Filter, if necessary, and wash any undissolved residue with a few mL of water. Render the filtrate alkaline with *ammonium hydroxide, 6 N*, extract with several small portions of *chloroform*. Evaporate the *chloroform* solution on a steam bath at 80° for 4 h to dryness.

Acceptance criteria: Meet the requirements ■ 2S (USP39)

Add the following:

- ● **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■ 2S (USP39)

Delete the following:

- ● **B. Identification Tests—General, Sulfate** ~~(191)~~ A filtered solution of Tablets meets the requirements. ■ 2S (USP39)

Add the following:

- ● **B.**

Standard solution and Sample solution: Proceed as directed in the *Assay*.

Analysis: Inject 2 µL each of the *Standard solution* and the *Sample solution* using the *Chromatographic system* in the *Assay*.

Acceptance criteria: The spectrum of the codeine peak of the *Sample solution* exhibits maxima and minima at the same wavelengths as those of the corresponding peaks of the *Standard solution*, as obtained in the *Assay*. ■ 2S (USP39)

ASSAY**Change to read:**

- **Procedure**

Solution A: *Acetonitrile* and 0.1% ammonium hydroxide (1.0 mL of concentrated *ammonium hydroxide* and 1000 mL of water) (1:19)

Solution B: *Acetonitrile* and 0.1% ammonium hydroxide (9:11)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
40	0	100
41	100	0
50	100	0

[Note—The *Standard solution* and *Sample solution*, for the degradation products, are stable for 4 days when stored at room temperature in amber vials.]

Diluent: 0.5% Phosphoric acid (5 mL of concentrated *phosphoric acid* and 1000 mL of water)

Standard solution: 1.2 mg/mL of USP Codeine Sulfate RS in *Diluent*

~~**Sensitivity solution:** 0.6 µg/mL of USP Codeine Sulfate RS from the *Standard solution* in *Diluent*~~

■ ■2S (USP39)

Sample solution: Nominally 1.2 mg/mL of codeine sulfate trihydrate in *Diluent*. [Note—~~Dissolve 20 Tablets in 80% of the flask volume of *Diluent*, and sonicate for 15–30 min with occasional swirling before diluting with *Diluent* to volume.~~]

■ Dissolve 20 Tablets in 80% of the flask volume of *Diluent* and sonicate for 15–30 min with occasional swirling before diluting with *Diluent* to volume. ■2S (USP39)

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 282 nm. For *Identification test B*, use a diode-array detector in the range of 210–400 nm.

Column: 4.6-mm × 15-cm; 3-µm packing *L1*

Column temperature: 40°

Flow rate: 1.2 mL/min

Injection volume: 40 µL

Comment deadline: November 30, 2015

Delete the following:

■ **Dolasetron Mesylate Injection**

» Dolasetron Mesylate Injection is a sterile solution, suitable for intravenous administration, containing Dolasetron Mesylate in a buffer solution. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dolasetron mesylate ($C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$).

Packaging and storage—Preserve in a single-dose container, protected from light. Store at controlled room temperature.

Labeling—Label it to indicate that it may be diluted with a suitable parenteral vehicle prior to intravenous infusion.

USP Reference standards (11)—

USP Dolasetron Mesylate RS

USP Endotoxin RS

Identification, Infrared Absorption (197K)—

Test specimen—Transfer a portion of Injection, equivalent to about 100 mg of dolasetron mesylate, to a 150-mL beaker. Add about 20 mL of water and 10 mL of a sodium hydroxide solution (1 in 10). Mix, and allow to stand at room temperature for 30 minutes. Pass through a filtering crucible with fritted disk having a medium porosity, using about 100 mL of water to aid in the transfer. Dry the precipitate in a vacuum oven at 105° for 4 hours. Prepare a 1.5% mixture of the dried powder with potassium bromide.

Bacterial endotoxins (85)—It contains not more than 2.7 USP Endotoxin Units per mg of dolasetron mesylate.

pH (791): between 3.2 and 3.8.

Particulate matter (788): meets the requirements for small-volume injections.

Other requirements—It meets the requirements under *Injections* (1).

Assay—

Mobile phase—Proceed as directed in the Assay under *Dolasetron Mesylate*.

System suitability preparation—Dissolve accurately weighed quantities of USP Dolasetron Mesylate RS and indole-3-carboxylic acid in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of about 0.1 mg per mL and 0.02 mg per mL, respectively.

Standard preparation—Dissolve an accurately weighed quantity of USP Dolasetron Mesylate RS in *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

Assay preparation—Using a “to contain” pipet, transfer 2.5 mL of Injection to a 50-mL

volumetric flask. Rinse the pipet with several portions of *Mobile phase*, and collect the rinses in the same flask. Dilute with *Mobile phase* to volume, and mix. Pipet 5.0 mL of this solution into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))— Prepare as directed in the *Assay* under *Dolasetron Mesylate*. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the resolution, R , between indole-3-carboxylic acid and dolasetron mesylate is not less than 4; and the tailing factor for the dolasetron mesylate peak is not more than 1.8. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%.

Procedure— Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of dolasetron mesylate ($C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$) in each mL of Injection taken by the formula:

$$200C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Dolasetron Mesylate RS in the *Standard preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively. ■ 2S (USP39)

BRIEFING

Dolasetron Mesylate Tablets, USP 38 page 3193. It is proposed to omit this monograph for the following reasons. No drug products formulated as defined under Dolasetron Mesylate Tablets are currently marketed in the United States. The drug product is currently not used in veterinary medicine in the United States.

(CHM3: R.S. Prasad, E. Gonikberg.)

Comment deadline: November 30, 2015

Delete the following:

■ **Dolasetron Mesylate Tablets**

» Dolasetron Mesylate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dolasetron mesylate ($C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$).

Packaging and storage— Preserve in well-closed containers, protected from light.

USP Reference standards (11)—

USP Dolasetron Mesylate RS

Identification, Infrared Absorption (197K)—

Test specimen— Transfer a quantity of powdered Tablets, equivalent to about 200 mg of dolasetron mesylate, to a capped tube. Add 10 mL of acetonitrile, and shake for about 5 minutes. Allow to settle, filter, and collect the filtrate in a glass vial. Evaporate the solvent at 85°. Add an additional 5 mL of acetonitrile to the vial, and evaporate at 85°. Then evaporate

to dryness in a vacuum oven at 80°. Mix about 2 mg of the crystals obtained with about 300 mg of potassium bromide.

Dissolution (711)—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Procedure— Determine the amount of $C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 284 nm on filtered portions of the solution under test, suitably diluted with *Medium*, in comparison with a Standard solution having a known concentration of USP Dolasetron Mesylate RS in the same *Medium*.

Tolerances— Not less than 80% (*Q*) of the labeled amount of $C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Mobile phase— Proceed as directed in the *Assay* under *Dolasetron Mesylate*.

System suitability preparation— Dissolve accurately weighed quantities of USP Dolasetron Mesylate RS and indole-3-carboxylic acid in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having known concentrations of about 0.1 mg and 0.05 mg per mL, respectively.

Standard preparation— Dissolve an accurately weighed quantity of USP Dolasetron Mesylate RS in *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

Assay preparation— Transfer 10 Tablets to a 500 mL volumetric flask, add about 400 mL of *Mobile phase*, and stir vigorously with a magnetic stirrer for at least 40 minutes to dissolve. Dilute with *Mobile phase* to volume, mix, and allow the insoluble excipients to settle. Quantitatively dilute a portion of the supernatant with *Mobile phase* to obtain a solution having a concentration of about 0.1 mg of dolasetron mesylate per mL.

Chromatographic system (see *Chromatography* (621))— Prepare as directed in the *Assay* under *Dolasetron Mesylate*. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between indole-3-carboxylic acid and dolasetron mesylate is not less than 4; and the tailing factor for the dolasetron mesylate peak is not more than 1.8. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%.

Procedure— Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of dolasetron mesylate ($C_{19}H_{20}N_2O_3 \cdot CH_4O_3S \cdot H_2O$) in each Tablet taken by the formula:

$$(TC/D)(r_U/r_S)$$

in which *T* is the labeled quantity, in mg, of dolasetron mesylate in the Tablet; *C* is the concentration, in mg per mL, of USP Dolasetron Mesylate RS in the *Standard preparation*; *D* is

~~the concentration, in mg per mL, of dolasetron mesylate in the Assay preparation, based on the labeled quantity per Tablet and the extent of dilution; and r_U and r_S are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.~~ ■ 2S (USP39)

BRIEFING

Doxycycline for Oral Suspension, USP 38 page 3221. As part of USP monograph modernization efforts, it is proposed to make the following revisions:

1. Replace the TLC *Identification* procedure, *Identification—Tetracyclines* (193), with a more specific FTIR procedure.
2. Add a second *Identification* test based on retention time using the HPLC procedure in the *Assay*.
3. A validated stability-indicating HPLC procedure for the *Organic Impurities* test is added. The proposed procedure uses the Acquity UPLC BEH C8 brand of L7 column manufactured by Waters where doxycycline elutes at about 3 min. A guard-column of the same brand of stationary phase was used in the validation.
4. Replace the *Assay* procedure with one that uses a new chromatographic method, which will also be used in the *Organic Impurities* test.
5. Acceptance limits for 4-epidoxycycline and any other unspecified impurity are proposed. Manufacturers with different limits are encouraged to submit their approved specifications to USP.
6. A *Dissolution* test is added. The analytical procedure uses the PRP-1 styrene divinyl benzene polymer brand of L21 column manufactured by Hamilton where doxycycline elutes at about 7.7 min.
7. Reference Standards are added to the *USP Reference Standards* section to support the revised procedures. USP Doxycycline Monohydrate RS is introduced as the Reference Standard for *Identification* test A. USP Doxycycline Related Compound A RS and USP Methacycline Hydrochloride RS are introduced in the *Assay* and the *Organic Impurities* test for system suitability evaluation and peak identification.
8. The test for *Water Determination* is deleted because the acceptance criterion for water is formulation specific.
9. The *Packaging and Storage* section is updated to include storage conditions consistent with the product label.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

Comment deadline: November 30, 2015

Doxycycline for Oral Suspension

DEFINITION

Doxycycline for Oral Suspension contains the equivalent of NLT 90.0% and NMT 125.0% of the labeled amount of doxycycline (C₂₂H₂₄N₂O₈) when constituted as directed. It contains one or

more suitable buffers, colors, diluents, flavors, and preservatives.

IDENTIFICATION

Delete the following:

■ ● ~~A.~~

Test solution: Nominally 1 mg/mL of doxycycline in methanol from Doxycycline for Oral Suspension. Shake, allow to settle, and use the clear supernatant.

Analysis: Proceed as directed in *Identification—Tetracyclines* (193), Method II.

Acceptance criteria: Meets the requirements ■2S (USP39)

Add the following:

■ ● **A. Infrared Absorption** (197A)

Standard: Transfer about 25 mg of USP Doxycycline Monohydrate RS to a suitable flask. Add 25 mL of *acetonitrile* and mix for approximately 5 min with a magnetic stir bar. Pass through a suitable filter, evaporate the solvent, and dry under vacuum.

Sample: Place an amount of Doxycycline for Oral Suspension, equivalent to about 25 mg of doxycycline, in a suitable flask. Add 25 mL of *acetonitrile* and mix for approximately 5 min with a magnetic stir bar. Pass through a suitable filter and evaporate the acetonitrile under vacuum.

Analysis: Examine the spectra of the *Standard* and the *Sample* in the range between 4000 and 650 cm^{-1} .

Acceptance criteria: The *Sample* exhibits bands at about 1685, 1610, 1585, 1531, 1000, 958, 935, and 620 cm^{-1} , similar to the *Standard*. ■2S (USP39)

Add the following:

- ● **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■2S (USP39)

ASSAY

Change to read:

● **Procedure**

Throughout the following sections, protect the *Standard solution* and the *Sample solution* from light.

Mobile phase: Transfer 2.72 g of monobasic potassium phosphate, 0.74 g of sodium hydroxide, 0.50 g of tetrabutylammonium hydrogen sulfate, and 0.40 g of edetate disodium to a 1000 mL volumetric flask. Add 850 mL of water, and stir to dissolve. Add 60 g of tertiary butyl alcohol with the aid of water, dilute with water to volume, and adjust with 1 N sodium hydroxide to a pH of 8.0 ± 0.1 . Pass this solution through a filter of 0.5 μm or finer pore size, and degas before using. Decreasing the proportion of tertiary butyl alcohol results in a longer retention time of doxycycline and improved separation of doxycycline from the related compounds.

Diluent: 0.01 N hydrochloric acid

System suitability stock solution: 6 mg/mL of doxycycline from USP Doxycycline Hyclate

RS in Diluent

System suitability solution: Transfer 5 mL of *System suitability stock solution* to a 25-mL volumetric flask, heat on a steam bath for 60 min, and evaporate to dryness on a hot plate, taking care not to char the residue. Dissolve the residue in 0.01 N hydrochloric acid, and dilute with *Diluent* to volume. Pass a portion of this solution through a filter of 0.5 μm or finer pore size, and use the filtrate. This solution contains a mixture of 4-epidoxycycline, 6-epidoxycycline, and doxycycline. When stored in a refrigerator, this solution may be used for 14 days.

Standard solution: 1.2 mg/mL of USP Doxycycline Hyclate *RS in Diluent*. Sonicate as needed to dissolve.

Sample solution: Nominally 1 mg/mL of doxycycline in *Diluent*, prepared as follows: Constitute Doxycycline for Oral Suspension as directed in the labeling. Transfer a suitable aliquot of the constituted suspension, freshly mixed and free from air bubbles, to a suitable volumetric flask, add 50% of the final volume of 0.1 N hydrochloric acid, and shake by mechanical means for 15 min. Dilute with *Diluent* to volume. Pass through filter paper, discarding the first 10 mL of the filtrate, then pass through a filter of 0.5 μm or finer pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6 mm \times 25 cm; packing L21

Column temperature: 60 \pm 1 $^{\circ}$

Flow rate: 1 mL/min

Injection volume: 20 μL

Run time: 1.7 times the retention time of doxycycline

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for 4-epidoxycycline (the main degradation product), 6-epidoxycycline, and doxycycline are about 0.4, 0.7, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.0 between the 4-epidoxycycline peak and the doxycycline peak; *System suitability solution*

Tailing factor: NMT 2.0 for doxycycline, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of doxycycline ($\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8$) in the portion of Doxycycline for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

f_U = peak response from the *Sample solution*

f_S = peak response from the *Standard solution*

C_S = concentration of USP Doxycycline Hyclate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of doxycycline from the *Sample solution* (mg/mL)

P = potency of doxycycline in USP Doxycycline Hyclate RS ($\mu\text{g}/\text{mg}$)

F = unit conversion factor, 0.001 mg/ μg

Acceptance criteria: 90.0%–125.0%

- Protect solutions containing doxycycline from light.

Solution A: Transfer 3.1 g of *monobasic potassium phosphate*, 0.5 g of *edetate disodium*, and 0.5 mL of *triethylamine* to a 1000-mL volumetric flask. Add about 850 mL of water and mix. Dilute with water to volume and adjust with 1 N *sodium hydroxide* to a pH of 8.5 \pm 0.2.

Solution B: Methanol

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.0	90	10
2.0	90	10
4.0	60	40
6.0	90	10
9.0	90	10

Diluent: 0.01 N hydrochloric acid

System suitability stock solution 1: 1 mg/mL each of USP Doxycycline Related Compound A RS and USP Methacycline Hydrochloride RS in *Diluent*

System suitability stock solution 2: 1.2 mg/mL of USP Doxycycline Hyclate RS in *Diluent*

System suitability solution: Transfer 5 mL of *System suitability stock solution 2* to a 25-mL volumetric flask, heat on a steam bath for 60 min, and evaporate to dryness on a hot plate, taking care not to char the residue. Dissolve the residue in *Diluent*, add 0.5 mL of *System suitability stock solution 1*, and dilute with *Diluent* to volume. Pass the solution through a suitable filter and use the filtrate. This solution contains a mixture of 4-epidoxycycline, doxycycline related compound A, methacycline, and doxycycline. When stored in a refrigerator, this solution may be used for 14 days.

Standard solution: 0.3 mg/mL of USP Doxycycline Hyclate RS in *Diluent*. Sonicate as needed to dissolve.

Sample solution: Nominally 0.25 mg/mL of doxycycline in *Diluent*, prepared as follows. Constitute Doxycycline for Oral Suspension as directed in the labeling. Transfer an accurately measured portion of the constituted suspension, freshly mixed and free from air bubbles, equivalent to about 25 mg of doxycycline, to a suitable volumetric flask. Add 50% of the final volume of *Diluent*, shake by mechanical means for about 15 min and dilute with *Diluent* to volume. Pass a portion of this solution through a suitable filter of

0.2- μm pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 350 nm

Column: 2.1-mm \times 5-cm; 1.7- μm packing L7. [Note—A 1.7- μm guard-column with packing L7 was used during method validation.]

Column temperature: 60°

Flow rate: 0.6 mL/min

Injection volume: 5 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—See *Table 2* for the relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between methacycline and 4-epidoxycycline; NLT 1.5 between 4-epidoxycycline and doxycycline related compound A; NLT 1.5 between doxycycline related compound A and doxycycline, *System suitability solution*

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of doxycycline ($\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8$) in the portion of Doxycycline for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Doxycycline Hyclate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of doxycycline in the *Sample solution* (mg/mL)

P = potency of doxycycline in USP Doxycycline Hyclate RS ($\mu\text{g}/\text{mg}$)

F = conversion factor, 0.001 mg/ μg

Acceptance criteria: 90.0%–125.0% \blacksquare 2S (*USP39*)

PERFORMANCE TESTS

- **Deliverable Volume** (698): Meets the requirements
- **Uniformity of Dosage Units** (905)

For single-unit containers

Acceptance criteria: Meets the requirements

Add the following:

■ ● **Dissolution** (711)

Protect solutions containing doxycycline from light.

Medium: 0.01 N hydrochloric acid; 900 mL

Apparatus 2: 25 rpm

Time: 10 min

Solution A: Transfer 1.36 g of *monobasic potassium phosphate*, 0.37 g of *sodium hydroxide*, 0.25 g of *tetrabutylammonium hydrogen sulfate*, and 0.2 g of *edetate disodium* to a 1000-mL volumetric flask. Add about 850 mL of water and mix. Add 0.75 g of *tert-butyl alcohol* and dilute with water to volume. Adjust with 1 N *sodium hydroxide* to a pH of 8.0 ± 0.05 .

Solution B: *Acetonitrile* and water (80:20)

Mobile phase: See Table 2.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0.0	100	0
13.0	100	0
15.0	20	80
21.0	20	80

Return to original conditions and equilibrate the system.

Standard solution: 32 µg/mL of USP Doxycycline Hyclate RS in *Medium*

Sample solution: Reconstitute the suspension according to the label instructions for three separate containers. Transfer and combine the contents of the three containers into a separate suitable flask. Determine the density of the suspension. Using suitable syringes, measure portions of the reconstituted suspension containing nominally 25 mg of doxycycline. With the paddles lowered, gently empty the contents of each syringe into each vessel containing *Medium*. Start the paddle rotation. At the specified time, sample per *Dissolution* (711) and pass a portion through a suitable filter of 0.45-µm pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 355 nm

Column: 4.6-mm × 250-cm; 5-µm packing *L21*

Run time: 30 min

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage (*Q*) of the labeled amount of doxycycline ($C_{22}H_{24}N_2O_8$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times D \times (d/W) \times V \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of doxycycline in the *Standard solution* (mg/mL)

L = label claim of Doxycycline for Oral Suspension (mg/5 mL)

D = dilution factor, necessary only if the *Sample solution* requires dilution (mL/mL)

d = density of the *Sample solution* (g/mL)

W = weight of Doxycycline for Oral Suspension taken (g)

V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (*Q*) of the labeled amount of doxycycline ($C_{22}H_{24}N_2O_8$) is dissolved.

■ 2S (USP39)

IMPURITIES

Add the following:

■ ● **Organic Impurities**

Mobile phase, Diluent, System suitability solution, and Chromatographic system:

Proceed as directed in the *Assay*.

Standard solution: 1.5 µg/mL of USP Doxycycline Hyclate RS in *Diluent*

Sample solution: Constitute Doxycycline for Oral Suspension as directed in the labeling.

Nominally, a 0.25-mg/mL solution of doxycycline in *Diluent* is prepared as follows. Transfer an accurately measured portion of the constituted suspension, freshly mixed and free from air bubbles, equivalent to about 25 mg of doxycycline, to a 100-mL volumetric flask. Add 50 mL of *Diluent* and shake by mechanical means for about 15 min. Dilute with *Diluent* to volume. Pass a portion of this solution through a suitable filter of 0.2-µm pore size.

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.5 between methacycline and 4-epidoxycycline; NLT 1.5 between 4-epidoxycycline and doxycycline related compound A; NLT 1.5 between doxycycline related compound A and doxycycline, *System suitability solution*

Relative standard deviation: NMT 5.0% for the doxycycline peak, *Standard solution*

Analysis**Samples:** *Standard solution and Sample solution*

Calculate the percentage of each impurity in the portion of Doxycycline for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of doxycycline from the *Standard solution*

C_S = concentration of USP Doxycycline Hyclate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of doxycycline in the *Sample solution* (mg/mL)

P = potency of doxycycline in USP Doxycycline Hyclate RS ($\mu\text{g}/\text{mg}$)

F = conversion factor, 0.001 mg/ μg

Acceptance criteria: See *Table 3*. Disregard any impurity peaks less than 0.2%.

BRIEFING

Epoetin. Because there is no existing *USP* monograph for this drug substance, a new monograph based on validated methods is being proposed. The liquid chromatographic procedure in the test for *Peptide Mapping* is based on analyses performed with the Agilent Zorbax SB-C8 brand of L7 column. The liquid chromatographic procedure in the test for *Limit of High Molecular Weight Proteins* is based on analyses performed with the Tosoh TSKgel G3000SW xl brand of L20 column. The liquid chromatographic procedure in the test for *N-Glycan Profiling* is based on analyses performed with the Dionex CarboPac PA1 brand of L46 guard column and the Dionex CarboPac PA1 brand of L46 column. The Nomenclature, Safety and Labeling Expert Committee in consultation with Biologics and Biotechnology Expert Committee 1 propose the title "Epoetin" because the monograph tests can apply to human recombinant erythropoietin with the same amino acid sequence and expressed in mammalian cell lines. Based on extensive discussion, the Biologics and Biotechnology Expert Committee 1 proposes the test for *N-Glycan Profiling* be included under *Specific Tests*.

C₈₀₉H₁₃₀₁N₂₂₉O₂₄₀S₅ 18,236.06 Da (amino acid sequence)

DEFINITION

Epoetin is the recombinant form of human erythropoietin. It is a 165 amino acid glycoprotein manufactured using recombinant DNA technology. The presence of the impurities, host cell DNA, and host cell protein in Epoetin is process-specific, and is controlled through the purification process. The impurity levels are determined by validated methods and limits approved by the competent regulatory authority. It has a potency of NLT 140,000 and NMT 200,000 International Units (IU) per absorbance unit (AU) at 280 nm.

IDENTIFICATION

- **A. Erythropoietin Bioassays** (124): Meets the requirements
- **B. Peptide Mapping**

Solution A: Trifluoroacetic acid and water (1.5: 1000)

Solution B: Acetonitrile, trifluoroacetic acid, and water (900: 1.2: 100)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
30.0	78	22
110.0	58	42
130.0	35	65
130.1	10	90
140.0	10	90
140.1	90	10

Phosphate buffer saline: 137 mM sodium chloride, 2.7 mM potassium chloride, 8.1 mM disodium hydrogen phosphate, and 1.47 mM potassium dihydrogen phosphate

Buffer A: 20 mM sodium citrate and 100 mM sodium chloride, pH 6.9, prepared as follows. Dissolve 5.80 g of sodium citrate dihydrate, 0.057 g of citric acid, and 5.84 g of sodium chloride in 800 mL of water, and mix. Adjust with hydrochloric acid to a pH of 6.9 and dilute with water to 1 L. Pass through a nylon filter of 0.2- μ m pore size.

Digest stop solution: 8 M guanidine hydrochloride

Digest buffer stock: 1.0 M *tris*(hydroxymethyl) aminomethane solution. Adjust with hydrochloric acid to a pH of 7.3.

Lys-C stock solution: Dissolve Lysyl Endopeptidase (Lys-C), containing approximately 4.5 AU/mg, in *Digest buffer stock* to a final concentration of 2 mg/mL. Expiry of reconstituted Lys-C is 2 years at $-70 \pm 10^\circ$, and 1 day at $5 \pm 3^\circ$.

Lys-C digest solution: Add 20 μ L of *Lys-C stock solution* to 180 μ L of *Digest buffer stock*. Expiry is 1 day stored on ice or at $5 \pm 3^\circ$.

Standard solution: 100 μ g of USP Erythropoietin RS in 50 μ L of water. Buffer exchange by a suitable method into *Buffer A*. Add 5 μ L of *Lys-C digest solution* to 50 μ L of buffer exchanged USP Erythropoietin RS. Incubate at 37° for 30 min. Add 50 μ L of *Digest stop solution* and mix.

Sample solution: 100 μ g of Epoetin in 50 μ L of *Phosphate buffer saline*. Add 5 μ L of *Lys-C*

digest solution. Incubate at 37° for 30 min. Add 50 µL of *Digest stop solution* and mix.

Blank solution: 50 µL of *Phosphate buffered saline*. Add 5 µL of *Lys-C digest solution*. Incubate at 37° for 30 min. Add 50 µL of *Digest stop solution* and mix.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 214 nm

Column: 3.0-mm × 25-cm; 5-µm packing L7

Column temperature: 30°

Flow rate: 0.2 mL/min

Injection volume: 50 µL

System suitability

Sample: *Standard solution*

Suitability requirements: 10 major peaks must be present as illustrated in the typical chromatogram provided with the USP certificate for USP Erythropoietin RS. The absolute difference between the retention times of peaks 5, 8, and 9 must be ±1.2 min for three replicate *Standard solution* injections. The ratio of relative heights % (RRH%) for each peak 8 and peak 9 in the *Standard solution* injections must be within 94%–106%.

Signal-to-noise ratio: NLT 3 for peak 6

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank solution*

Follow each injection of *Standard solution* with a *Blank solution* injection. Inject *Standard solution* before and after all *Sample solution* injections. Record the retention time and response (peak height) of each of the 10 major peaks for both the *Standard solution* and *Sample solution*.

Calculate the relative peak height (RH%) of peak 8 and peak 9 as compared to peak 5 for both the *Standard solution* and *Sample solution* taken:

$$\text{Result} = (r_U/r_S) \times 100$$

r_U = peak height of peak 8 or 9

r_S = peak height of peak 5

Calculate the ratio of relative peak height (RRH%) for peak 8 and peak 9:

$$\text{Result} = (RH_x/RH_S) \times 100$$

RH_x = RH% of peak 8 or 9 for the *Standard solution*

RH_S = RH% of peak 8 or 9 for the *Sample solution*

Acceptance criteria: The chromatographic profile of the *Sample solution* is similar to that of the *Standard solution*. The absolute difference between the retention times of peaks 5, 8, and 9 in the *Sample solution* must be within 1.2 min when compared to the initial *Standard solution*. The RRH% for each peak 8 and peak 9 in the *Sample solution* must be

within 94%–106% when compared to the initial *Standard solution*. There must be no new peaks > peak 6 in height in the *Sample solution* that are not present in the *Standard solution*.

ASSAY

• Erythropoietin Bioassays (124)

Acceptance criteria: Meets the requirements. It has a potency of NLT 140,000 and NMT 200,000 IU per absorbance unit at 280 nm.

IMPURITIES

• Limit of High Molecular Weight Proteins

Mobile phase: 20 mM sodium citrate and 100 mM sodium chloride, pH 6.9, prepared as follows. Dissolve 5.80 g of sodium citrate dihydrate, 0.057 g of citric acid, and 5.84 g of sodium chloride in 800 mL of water and mix. Adjust with hydrochloric acid to a pH of 6.9 and dilute with water to 1 L. Pass through a nylon filter of 0.2- μ m pore size.

System suitability solution: 2 mg/mL of USP Erythropoietin RS. Heat at 80° for 30 min, and use immediately.

Sample solution: 2 mg/mL of Epoetin

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 7.8-mm \times 30-cm; packing L20

Temperatures

Autosampler: 2–8°

Column: 25°

Flow rate: 1.0 mL/min

Injection volume: 40 μ L

Run time: 30 min

System suitability

Sample: *System suitability solution*

[Note—The relative retention time for the aggregate is approximately 0.7.]

Suitability requirements: The monomer retention time must be within 8–10 min for *System suitability solution* injections. The relative retention times for the dimer and monomer are about 0.9 and 1.0, respectively.

Relative standard deviation: The precision of the monomer peak area must be <2%.

Analysis

Sample: *Sample solution*

[Note—Condition the *Chromatographic system* with the *Standard solution*. Inject the *Standard solution* initially in duplicate before, and in a single bracket after, all *Sample solutions* injected.]

Record the chromatogram, and measure the areas of the main peak and of the peaks eluting near the main peak, excluding the solvent peaks.

Acceptance criteria: The total impurities (aggregates and dimer) should be NMT 0.1%.

SPECIFIC TESTS

• N-Glycan Profiling

Solution A: Water. Degas before use.

Solution B: Dissolve 41.0 g of anhydrous sodium acetate in 900 mL of water. Transfer the solution to a 1-L volumetric flask, and dilute with water to volume. Pass the solution through a nylon membrane filter of NMT 0.45- μ m pore size, and degas before use.

Solution C: To 900 mL of water add 26 mL of 50% (w/w) sodium hydroxide solution. Dilute the solution with water to a final volume of 1000 mL. Pass the solution through an alkaline-resistant nylon membrane filter of NMT 0.45- μ m pore size, and degas before use.

Mobile phase: See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)	Solution C (%)
0	80	10	10
15	80	10	10
70	60	30	10
94	0	90	10
99	0	90	10
105	0	10	90
110	0	10	90
111	80	10	10
130	80	10	10

2-AB labeling solution: Add 150 μ L of glacial acetic acid to 350 μ L of dimethyl sulfoxide (DMSO) and mix. Add 110 μ L of the acetic acid–DMSO mixture to a tube containing 5 mg of 2-aminobenzamide acid (2-AB) labeling dye and mix. Transfer the complete acetic-acid/DMSO/2-AB mixture to a tube containing 6 mg of sodium cyanoborohydride and mix. Use immediately and protect from light.

Buffer A: 20 mM sodium citrate, 100 mM sodium chloride, pH 6.9. Dissolve 5.80 g of sodium citrate dihydrate, 0.057 g of citric acid, and 5.84 g of sodium chloride in 800 mL of water and mix. Adjust with hydrochloric acid to a pH of 6.9 and dilute with water to 1 L. Pass through a nylon filter of 0.2- μ m pore size.

0.5 M DTT: Add 77 mg of dithiothreitol to 1 mL of water and mix. Use immediately.

Enzyme reaction buffer: 0.5 M sodium phosphate, pH 7.5

Standard solution: Reconstitute 100 μ g of USP Erythropoietin RS in 50 μ L of water. If necessary, buffer exchange by a suitable method into *Buffer A*. Transfer the entire contents to a 1.5-mL polypropylene tube (or equivalent). Add 12.0 μ L of *Enzyme reaction buffer*, 2.5 μ L of 0.5 M DTT, and 38.5 IUB milliunits of Peptide-N-Glycosidase F (PNGase F). Dilute with water to a final volume of 100 μ L, mix, and briefly centrifuge. Incubate at 37° for 30 min. Briefly centrifuge the sample, then freeze on dry ice for at least 5 min.

After the sample is frozen, uncap the tube and place it in the centrifugal evaporator and operate under vacuum without heat for approximately 70–80 min or until completely dry. Add 5.0 μL of 2-AB labeling solution, vortex, briefly centrifuge, and incubate at 60° for 3 h. Following incubation, add 120 μL of water, vortex, and centrifuge the sample. Remove excess 2-AB using a microcentrifuge column filled with an appropriate amount of G-10 gel filtration stationary phase for desalting a 75–150- μL sample. To prepare the resin, add 0.5 mL of water to the microcentrifuge column and swell for 15 min. Centrifuge at maximum speed for 5–10 s. Repeat wash and remove residual water. Apply labeled glycans, place the column in the microcentrifuge and spin at 200 $\times g$ for 1 min. Apply the flow through to a second column and repeat centrifugation. Transfer the repeat flow through to an HPLC vial for analysis.

Sample solution: Proceed as directed in the *Standard solution* using 100 μg of Epoetin.

Blank: Water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Fluorescence (330- and 420-nm emission wavelength)

Columns

Guard: 4.0-mm \times 5-cm; 10- μm packing L46

Analytical: 4.0-mm \times 25-cm; 10- μm packing L46

Temperatures

Column: 25°

Autosampler: 4°

Flow rate: 0.5 mL/min

Injection volume: 25 μL

System suitability

Samples: *Standard solution* and *Blank*

Suitability requirements: The % interference of the *Blank* injection must be <1% of the total peak area of the initial *Standard solution*. The *Standard solution* chromatogram must be consistent with the typical chromatogram provided with the USP certificate for USP Erythropoietin RS, including the presence of peaks 1–7. [Note—Peak 6 may exhibit splitting or shouldering but must be consistent for all *Standard solution* injections within a run.]

Relative standard deviation: Precision of total integrated peak area must be NMT 1.5%, *Standard solution*.

Analysis

Sample: *Sample solution*

Calculate the peak area response of each of the three peak groups, bi-sialylated (2 N), tri-sialylated (3 N), and tetra-sialylated (4 N), using the following formula: [Note—Refer to the typical chromatogram provided with the USP certificate for USP Erythropoietin RS.]

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = total peak response for each of the three peak groups, bi-sialylated (2 N), tri-sialylated (3 N), and tetra-sialylated (4 N)

r_T = sum of the total peak responses for the three peak groups, bi-sialylated (2 N), tri-sialylated (3 N), and tetra-sialylated (4 N)

Acceptance criteria: The *N*-glycan percentages must be within the following ranges.

2 N: 4.5%–6.0%

3 N: 18%–25%

4 N: 69%–77%

● **Isoform Distribution**

Cathode solution: Measure 0.31 g of L-histidine and dilute with water to a final volume of 10 mL.

Anode solution: 0.2 N sulfuric acid

Initiator: Measure 0.072 g of potassium persulfate and dilute with water to a final volume of 10 mL.

Gel: Prepare a single horizontal gel using plate dimensions of 265-mm × 128-mm × 3-mm with a gel of 0.5-mm thickness prepared as follows. Combine 9.0 g of urea, 5.9 mL of acrylamide (30%), 2.4 mL of bis-acrylamide (2%), 450 μL of 3-10 ampholyte, and 1.1 mL of 3-5 ampholyte. Dilute with water to 28 mL, mix thoroughly, and pass the solution through a filter of 0.45-μm pore size. Add 2 mL of *Initiator* and mix by inversion. Transfer the solution to the gel cassette assembly.

Fixing solution: Prepare a solution containing 200 mL of 60% (w/v) of a mixture containing trichloroacetic acid and 17.5% 5-sulfosalicylic acid, 100 mL of glacial acetic acid, 400 mL of absolute methanol, and 300 mL of water.

Gel wash solution: Prepare a solution containing 400 mL of absolute methanol and 100 mL of glacial acetic acid. Dilute with water to 1 L.

Stain solution: Dissolve 1.25 g of Coomassie Brilliant Blue R-250 in 1 L of *Gel wash solution*. Pass through a filter of 0.45-μm pore size.

Destain solution: Prepare a solution containing 75 mL of absolute methanol and 100 mL of glacial acetic acid. Dilute with water to 1 L.

Standard stock solution: 2 μg/μL of USP Erythropoietin RS in water

Standard solution A: 0.13 μg/mL of USP Erythropoietin RS, prepared by diluting *Standard stock solution* in water

Standard solution B: 1.3 μg/mL of USP Erythropoietin RS, prepared by diluting *Standard stock solution* in water

Sample solution: 20 μg of Epoetin in 15 μL of water

Electrophoretic system

Mode: Horizontal electrophoretic system with integrated cooling apparatus capable of maintaining 2°–8°

Temperature: Cool to 2°–8° before applying voltage and maintain the temperature during electrophoresis.

Prefocusing: Prefocus the gel for 20–40 min at a constant 10 watts (maximum of 3,000

V and 50 mAmps).

Loading profile: Load 15 µL of *Standard solution A*, *Standard solution B*, and *Sample solution* onto separate lanes of the gel at the cathode site.

Focusing: Focus the gel for 2.5 h at a constant 10 watts (maximum of 3,000 V and 50 mAmps).

Staining: Incubate the gel in *Fixing solution* two times for 15 min each. Decant and incubate the gel in *Gel wash solution* for at least 30 min. Decant and incubate the gel in *Stain solution* for 15–60 min. Decant and rinse the gel with *Destain*. Decant and incubate the gel in *Destain* until the background is clear and *Standard solution A* is still visible.

System suitability

Samples: *Standard solution A* and *Standard solution B*

There is no artifact of staining that obscures visualization of protein lanes and the location and intensity of bands are appropriate in *Standard solution A* and *Standard solution B*. Isoforms 10, 11, 12, and 13 are present in *Standard solution A* and *Standard solution B*. No bands are present below Isoform 9 in *Standard solution B*. Refer to the typical image provided with the USP certificate for USP Erythropoietin RS.

Analysis

Sample: *Sample solution*

Scan the gel with a densitometer.

Using data from the densitometric scan, calculate the relative percentage of each individual isoform in the portion of the *Sample solution* taken:

$$\text{Result} = (I/T) \times 100$$

I = individual band intensity

T = total band intensity in the *Sample solution*

Acceptance criteria: Isoforms 10–13 must be present at the following percentages.

Isoform 13: NLT 13%

Isoforms 12 + 13: 46%–72%

Isoforms 10 + 11: NLT 52%

Isoforms 10–13: NLT 91%

Isoforms 9 and 14 may be present in the *Sample solution*. No isoform below isoform 9 is observed and any minor band present in the *Sample solution* must also be present at the same location in *Standard solution B*. Refer to the typical image provided with the USP certificate for USP Erythropoietin RS.

● Protein Content

Sample solution: Epoetin, undiluted

Blank: Use an appropriate buffer solution consistent with the Epoetin under test.

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: 280 nm

Cell: Quartz cuvette

Analysis

Samples: *Sample solution* and *Blank*

Calculate the protein concentration, in mg/mL, of the sample taken:

$$\text{Result} = (A/e) \times l$$

A = absorbance at 280 nm, corrected with the *Blank*

e = extinction coefficient, 0.74 mL/mg·cm⁻¹

l = path length (cm)

- **Sterility Tests** (71): Meets the requirements
- **Bacterial Endotoxins Test** (85): It contains NMT 2.5 USP Endotoxin Units/mL.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in fluorinated ethylene propylene (FEP) or equivalent containers between 2° and 8°. Protect from light.
 - **Labeling:** Label it to indicate that the material is of recombinant DNA origin.
 - **USP Reference Standards** (11)
 - USP Endotoxin RS
 - USP Erythropoietin RS
- 2S (USP39)

BRIEFING

Exenatide. Because there is no existing *USP* monograph for this drug substance, a new monograph based on validated methods of analyses is being proposed. The liquid chromatographic procedure in the *Assay* is based on analyses performed with the XBridge 130 C18 brand of L1 column. The liquid chromatographic procedures in the test for *Product-Related Substances and Impurities, Procedures 1* and *2* are based on analyses performed with the XBridge 130 C18 brand of L1 column and YMC ODS AQ brand of L1 column. The typical retention time for exenatide in the *Assay* and the test for *Product-Related Substances and Impurities* are 14–20 min and 24–27 min, respectively. The liquid chromatographic procedure in *Process-Related Impurities, Limit of Phosphate* is based on analyses performed with the Dionex IonPac AS17-C brand of L83 column.

(BIO1: A. Szajek.)

Add the following:

■ Exenatide

HGEGTFTSDL SKQMEEEAVR LFIEWLKNGG PSSGAPPPS —NH₂

C₁₈₄H₂₈₂N₅₀O₆₀S 4186.57

L-Histidyl-glycyl-L-glutamyl-glycyl-L-threonyl-L-phenylalanyl-L-threonyl-L-seryl-L-aspartyl-L-leucyl-L-seryl-L-lysyl-L-glutamyl-L-methionyl-L-glutamyl-L-glutamyl-L-alanyl-L-valyl-L-arginyl-L-leucyl-L-phenylalanyl-L-isoleucyl-L-glutamyl-L-tryptophyl-L-leucyl-L-lysyl-L-asparaginyl-glycyl-glycyl-L-prolyl-L-seryl-L-seryl-glycyl-L-alanyl-L-prolyl-L-prolyl-L-prolyl-L-serinamide [141758-74-9].

DEFINITION

Exenatide is a 39 amino acid synthetic peptide agonist for glucagon-like peptide-1 (GLP-1) receptor. Exenatide contains NLT 95% and NMT 105% of exenatide ($C_{184}H_{282}N_{50}O_{60}S$), calculated on the anhydrous, acetic acid-free basis. Exenatide is a white to off-white powder. [Note—Exenatide is very hygroscopic. Protect from exposure to moisture.]

IDENTIFICATION

- **A. HPLC:** *Solution A, Solution B, Mobile phase, System suitability solution, Standard solutions, Sample solutions, Chromatographic system, and System suitability.* Proceed as directed in the Assay.

Identity sample solution: Mix equal volumes of the *Standard solution* and the *Sample solution*.

Analysis

Samples: *Standard solution, Sample solution, and Identity sample solution*

Examine the chromatograms of the *Standard solution, Sample solution, and Identity sample solution*.

Acceptance criteria: The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, and the major peak from the *Identity sample solution* elutes as a single peak.

- **B. Amino Acid Analysis**

For further discussion of the theory and applications, see *Biotechnology-Derived Articles—Amino Acid Analysis* (1052), which may be a helpful, but not mandatory, resource. Standardize the instrument with a mixture containing equal molar per volume amounts (except for L-cystine which is half the molar amount) of glycine and the L-form of the following amino acids: alanine, arginine, aspartic acid, cystine, glutamic acid, histidine, isoleucine, leucine, lysine, methionine, norleucine, phenylalanine, proline, serine, threonine, tyrosine, tryptophan, valine, and tryptophan.

Hydrolysis solution: 6 N hydrochloric acid containing 4% of phenol

Sample solution: Accurately weigh out between 0.4 and 1.0 mg of Exenatide Acetate in glass ampuls. Add a minimum of 1.0 mL of *Hydrolysis solution*, freeze the sample ampul, and flame seal under vacuum. Hydrolyze at 110° for about 22 h. After hydrolysis, dry the test sample under vacuum to remove any residual acid. To the ampul add 2 mL of a buffer solution that is suitable for the amino acid analyzer, and pass through a filter of 0.45- μ m pore size.

Procedure: Prepare a co-injection of the *Standard solution* and the test sample. Inject a suitable volume into the amino acid analyzer, and record and measure the responses for each amino acid peak in the *Standard solution*. Express the content of each amino acid in

nmoles.

Calculate the mean nmol of the amino acids:

Result = (nmol found in the *Analysis* for Ala, Arg, Asx, Glx, Gly, His, Ile, Leu, Lys, Phe, Pro, Val)/30

Divide the nmol of each amino acid by the *Result* to determine the amino acid ratios that must meet the *Acceptance criteria*.

Acceptance criteria: See *Table 1*.

Table 1

Name	Acceptance Criteria (amino acid ratio)
Asparagine, threonine, phenylalanine, lysine, alanine	1.5–2.5
Serine	4.2–5.5
Glutamine	5.2–6.8
Proline	3.5–4.5
Glycine	4.5–5.5
Valine	0.5–1.5
Methionine, isoleucine, histidine, arginine	0.5–1.5
Leucine	2.5–3.5
Tryptophan	0.5–1.5

- **C.** The average mass by *Mass Spectrometry* (736) is 4186.6 ± 1.0 mass units.

ASSAY

- **Procedure**

Solution A: 10 mM ammonium hydrogen carbonate, pH 9.5

Solution B: Acetonitrile and *Solution A* (90:10)

Mobile phase: See *Table 2*.

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 15-cm; 3.5-μm packing L1

Temperatures

Column: 60°

Autosampler: 10°

Flow rate: 0.8 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solutions*

Suitability requirements

Mean peak area: Maximum difference between the mean peak area of the two *Standard solutions* is ± 2%.

Resolution: NLT 1.0 between the [Glu¹³]-exenatide and [Met(O)¹⁴]-exenatide peaks, *System suitability solution*

Retention time: 14–20 min for the exenatide peak, *Standard solutions*

Relative standard deviation: NMT 2.0% for the exenatide peak area and retention time from three replicate injections of the two *Standard solutions*

Analysis

Sample: *Sample solutions*

Calculate the percentage of exenatide (C₁₈₄H₂₈₂N₅₀O₆₀S) in the portion of Exenatide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of exenatide from the *Sample solutions*

r_S = peak response of exenatide from the *Standard solutions*

C_S = concentration of USP Exenatide RS in the *Standard solutions* (mg/mL)

C_U = concentration of Exenatide in the *Sample solutions* (mg/mL), calculated on the anhydrous, acetic acid-free basis

Acceptance criteria: 95%–105% of exenatide on the anhydrous, acetic acid-free basis

PRODUCT RELATED SUBSTANCES IMPURITIES

• Procedure 1: Exenatide Related Substances and Impurities

[Note—Manufacturers should determine the suitability of their related substances method for their process-related and degradation impurities. For any impurity peak above the limit for unspecified impurity peaks, identification and appropriate qualification is required.]

Mobile phase, System suitability solution, Standard solutions, Sample solutions, and Chromatographic system: Proceed as directed in the *Assay*.

Acceptance criteria

Individual impurities: See *Table 3*.

Table 3

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
[Glu ¹³]exenatide	0.65–0.68	0.50
Sum of [Asp ²⁸]-exenatide and [Met(O) ¹⁴]-exenatide	0.68–0.76	0.50
Exenatide	1.00	—
Impurity A	1.19–1.20	0.50
Unspecified impurities	—	0.50

Total impurities: NMT 3.0% from *Procedure 1*

● **Procedure 2: N-Acetyl His¹-Exenatide**

[Note—Manufacturers should determine the suitability of their related substances method for their process-related and degradation impurities. For any impurity peak above the limit for unspecified impurity peaks, identification and appropriate qualification is required.]

Solution A: 0.1 M sodium perchlorate, pH 2.7

Solution B: Acetonitrile

Mobile phase: See *Table 4*.

Table 4

Time (min)	Solution A (%)	Solution B (%)
0	63	37
40	59	41
60	39	61

System suitability solution: 1.0 mg/mL of USP Exenatide RS and 0.005 mg/mL of USP [N-Acetyl-His¹]-Exenatide RS

Standard solution: 1.0 mg/mL of USP Exenatide RS in water

Sample solution: 1.0 mg/mL of Exenatide in water

Chromatographic system

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.0 between the main exenatide peak and the [*N*-acetyl-His¹]-exenatide impurity peak, *System suitability solution*

Retention time variability: NMT $\pm 5\%$ of mean for the exenatide peak, *Standard solution*

Relative standard deviation: NMT 2.0% for the exenatide peak from three replicate injections, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Exenatide Acetate taken, disregarding any peak with an area less than 0.05% of the main peak:

$$\text{Result} = (r_I/r_T) \times 100$$

r_I = peak area of each individual impurity from the *Sample solution*, other than the solvent peak and the main exenatide acetate peak

r_T = sum of the areas of all the peaks from the *Sample solution*, excluding that of the solvent peak

Acceptance criteria

Individual impurities: See *Table 5*.

Table 5

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Exenatide	1.00	—
[<i>N</i> -Acetyl-His ¹]-exenatide	1.10–1.12	1.0
Unspecified impurities	—	0.50

Total impurities: NMT 3.0% from *Procedure 2*

Procedure 3: Limit of d-His¹ Exenatide

Standard solution: 100 mg of l-amino acids and 0.5 mg of corresponding d-enantiomers are dissolved in 500 mL water. An aliquot of 700 μ L is dried in a SpeedVac and derivatized as described in the *Sample solution*.

Sample solution: Hydrolyze 1 mg of the sample in 350 μ L of 6 N deuterium chloride (DCI) in heavy water (D₂O) at 110° for 8 h. After removal of excess reagent by a stream of nitrogen, the sample is esterified with 250 μ L of 4 M deuteriochloric acid-ethyl alcohol at 110° for 20 min. After cooling to about 40°, open the vial and evaporate the reagent with a gentle stream of nitrogen at moderate temperature. Dissolve the residue in 250 μ L of trifluoroacetic anhydride in trifluoroacetic acid ethyl ester (1:2). Tightly close the vials

and heat to 130° for 10 min. After cooling to room temperature, remove the excess reagent by a stream of nitrogen. Add 50 µL of isobutyl chloroformate to the sample and heat the closed vial to 110° for 10 min. After removal of the excess reagent under a nitrogen stream, dissolve the residue in 250 µL of dichloromethane.

System suitability solution: About 100 µg of each d, l-amino acid is derivatized as described in *Sample solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC-MS (see *Mass Spectrometry* (736))

Detector: Mass

Column: 20-m × 0.28-mm Chirasil Val, 0.28 µm; liquid phase Chirasil Val or equivalent chiral capillary column¹

Temperatures

Oven: 155°, 3 min isotherm, 4°/min to 190°, 5 min

Injection port: 220°

Carrier gas: Hydrogen

Flow rate: 26 mL/min

Injection volume: 1.0 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 1.0 for enantiomers of the analyte and for any additional peak next to the analyte, *System suitability solution*

Tailing factor: NMT 2.0 for the representative enantiomer, *System suitability solution*

Relative standard deviation: NMT ±0.1% from the calculated content of d-Ala, d-Pro, d-Asp, d-Glu, d-Lys, and d-Arg, *Standard solution*

Analysis

Sample: *Sample solution*

Calculate the percentage of d-His-exenatide impurity in the portion of Exenatide taken:

$$\text{Result} = [A_D / (A_D + A_L)] \times 100$$

A_D = peak response of d-His from the *Sample solution*

A_L = peak response of l-His from the *Sample solution*

Acceptance criteria: NMT 1.0%

PROCESS RELATED IMPURITIES

● **Procedure 4: Limit of Phosphate**

[Note—Limit of phosphate should be performed if phosphate is used in manufacture.]

Solution A: 50 mM potassium hydroxide in water

Solution B: Water

Mobile phase: See Table 6.

Table 6

Time (min)	Solution A (%)	Solution B (%)
0	2	98
3	2	98
20	50	50
21	100	0

Diluent: 1 mM sodium hydroxide in water

Standard solution: 2 µg/mL of phosphate in *Diluent*

Sample solution: 2 mg/mL of Exenatide in *Diluent*

System suitability solution: *Standard solution* and *Sample solution* (1:1)

Chromatographic system

(See *Ion Chromatography* (1065).)

Mode: IC

Detector: Conductivity

Column: 2-mm × 25-cm; 10.5-µm packing L83

Temperatures

Column: 30°

Sample: 15°

Suppressor: Anion self-regenerating suppressor

Suppressant: Autosuppression

Flow rate: 0.25 mL/min

Injection volume: 25 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Tailing factor: NMT 3%, *Standard solution*

Relative standard deviation: NMT 10%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

The peak area responses for the phosphate ion peak in the chromatograms obtained with the *Standard solution* shows a peak corresponding to phosphate ion at a retention time of 15–21 min. The identity of the phosphate peak in the exenatide sample is confirmed by the *System suitability solution* showing one single peak. The phosphate content in exenatide is >0.1%, if the mean peak area of the *Sample solution* is higher than the mean peak area of the *Standard solution*. The phosphate content in exenatide is ≤0.1%, if the mean peak area of the *Sample solution* is equal to or smaller than the mean peak area for

the *Standard solution*.

Acceptance criteria: NMT 0.1%

- **Procedure 5, Trifluoroacetic Acid (TFA) in Peptides** <503.1>: The exenatide shall contain NMT 0.25% trifluoroacetic acid.

OTHER COMPONENTS

- **Acetic Acid In Peptides** <503>: NMT 5.0%

SPECIFIC TESTS

- **Bacterial Endotoxins Test** <85>: It contains NMT 10 USP Endotoxin Units/mg of exenatide.
- **Microbial Enumeration Tests** <61> and **Tests for Specified Microorganisms** <62>: The total aerobic microbial count is less than 200 cfu/g and the total combined yeasts and molds count does not exceed 200 cfu/g.
- **Water Determination** <921>, *Method Ic*: NMT 7.0%

ADDITIONAL REQUIREMENTS

BRIEFING

Frovatriptan Tablets. Because there is no existing monograph for this drug product, a new monograph based on validated methods of analysis is proposed.

The liquid chromatographic system used in the *Assay* and the *Dissolution* test was validated using the Inertsil C8-3 brand of *L7* column. The typical retention time for frovatriptan is about 5.5 min. The liquid chromatographic system used in the proposed test for *Organic Impurities* was validated using the Inertsil C8-3 brand of *L7* column. The typical retention time for frovatriptan is 24 min.

This monograph is contingent on FDA approval of a product that meets the proposed monograph.

► **Frovatriptan Tablets**

DEFINITION

Frovatriptan Tablets contain frovatriptan succinate equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of frovatriptan (C₁₄H₁₇N₃O).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV spectrum of the frovatriptan peak of the *Sample solution* exhibits maxima and minima at the same wavelengths as the frovatriptan peak of the *Standard solution*, as obtained in the *Assay*.

ASSAY**• Procedure**

Solution A: Add 2.0 mL of *phosphoric acid* per L of water.

Buffer: 3.9 g/L of *ammonium acetate* in water. Add 2.0 mL of *triethylamine* per L and adjust with *glacial acetic acid* to a pH of 6.8.

Mobile phase: *Chromatographic methanol* and *Buffer* (20:80)

Diluent: *Chromatographic acetonitrile* and *chromatographic methanol* (50:50)

Standard stock solution: 0.3 mg/mL of USP Frovatriptan Succinate RS prepared as follows. Transfer a suitable quantity of USP Frovatriptan Succinate RS to an appropriate volumetric flask. Add 50% of the total flask volume of *Solution A*. Sonicate to promote dissolution. Dilute with *Diluent* to volume.

Standard solution: 0.06 mg/mL of USP Frovatriptan Succinate RS (equivalent to 0.04 mg/mL of frovatriptan) from *Standard stock solution* in *Mobile phase*

Sample stock solution: Nominally 0.2 mg/mL of frovatriptan from Tablets prepared as follows. Transfer NLT 20 Tablets to an appropriate volumetric flask. Add 50% of the final flask volume of *Solution A* and sonicate for 15 min with intermittent shaking. Add 30% of the final flask volume of *Diluent*, and sonicate for 15 min. Allow to cool to room temperature and dilute with *Diluent* to volume.

Sample solution: Nominally 0.04 mg/mL of frovatriptan from *Sample stock solution* in *Mobile phase* passed through a suitable filter. Use the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 245 nm. For *Identification* test B, use a diode array detector in the range of 210–300 nm.

Column: 4.6-mm × 25-cm; 5-µm packing L7

Column temperature: 30°

Flow rate: 1.2 mL/min

Injection volume: 10 µL

Run time: NLT 1.5 times the retention time of frovatriptan

System suitability**Sample:** *Standard solution***Suitability requirements****Tailing factor:** NMT 2.0**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of frovatriptan ($C_{14}H_{17}N_3O$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

 r_U = peak response from the *Sample solution* r_S = peak response from the *Standard solution* C_S = concentration of USP Frovatriptan Succinate RS in the *Standard solution* (mg/mL) C_U = nominal concentration of frovatriptan in the *Sample solution* (mg/mL) M_{r1} = molecular weight of frovatriptan, 243.30 M_{r2} = molecular weight of anhydrous frovatriptan succinate, 361.40**Acceptance criteria:** 90.0%–110.0%**PERFORMANCE TESTS****• Dissolution** (711)**Medium:** pH 5.5 phosphate buffer (6.8 g/L of *monobasic potassium phosphate* adjusted with sodium hydroxide solution to a pH of 5.5); 900 mL**Apparatus 2:** 50 rpm**Time:** 20 min**Buffer:** 3.9 g/L of *ammonium acetate* in water. Add 2.0 mL of *triethylamine* per 1 L and adjust with *glacial acetic acid* to a pH of 6.8.**Mobile phase:** *Chromatographic methanol* and *Buffer* (20:80)**Standard stock solution:** 0.4 mg/mL of USP Frovatriptan Succinate RS prepared as follows. Transfer a suitable amount of USP Frovatriptan Succinate RS to an appropriate volumetric flask. Add 20% of the final flask volume of *chromatographic methanol*. Sonicate to promote dissolution and then dilute with *Medium* to volume.**Standard solution:** ($L/900$) mg/mL of USP Frovatriptan Succinate RS from *Standard stock solution* in *Medium*, where L is the label claim of frovatriptan in mg/Tablet**Sample solution:** Pass a portion of solution under test through a suitable filter and use the filtrate.**Chromatographic system**(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 245 nm

Column: 4.6-mm × 25.0-cm; 5-μm packing L7

Column temperature: 30°

Flow rate: 1.2 mL/min

Injection volume: 50 μL

Run time: NLT 1.5 times the retention time of frovatriptan

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of frovatriptan (C₁₄H₁₇N₃O) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times (M_{r1}/M_{r2}) \times V \times (1/L) \times 100$$

r_U = peak response of frovatriptan from the *Sample solution*

r_S = peak response of frovatriptan from the *Standard solution*

C_S = concentration of USP Frovatriptan Succinate RS in the *Standard solution* (mg/mL)

M_{r1} = molecular weight of frovatriptan, 243.30

M_{r2} = molecular weight of anhydrous frovatriptan succinate, 361.40

V = volume of *Medium*, 900 mL

L = label claim of frovatriptan (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of frovatriptan (C₁₄H₁₇N₃O)

- **Uniformity of Dosage Units** (905): Meets the requirements

IMPURITIES

- **Organic Impurities**

Solution A: 3.9 g/L of *ammonium acetate* in water

Solution B: *Chromatographic methanol*

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	92	8
15	92	8
30	88	12
50	80	20
60	80	20
65	92	8
70	92	8

Diluent: *Chromatographic methanol* and *Solution A* (10:90)

System suitability solution: 0.1 mg/mL of USP Frovatriptan Succinate RS and 0.1 µg/mL of USP Frovatriptan Related Compound A RS in *Diluent*. Sonication may be used to aid in dissolution.

Standard solution: 0.8 µg/mL of USP Frovatriptan Succinate RS (equivalent to 0.5 µg/mL of frovatriptan) in *Diluent*. Sonication may be used to aid in dissolution.

Sensitivity solution: 0.08 µg/mL of USP Frovatriptan Succinate RS (equivalent to 0.05 µg/mL of frovatriptan) from *Standard solution* in *Diluent*

Sample solution: Nominally 100 µg/mL of frovatriptan from Tablets prepared as follows. Transfer NLT 10 Tablets into an appropriate volumetric flask. Add 40% of the final flask volume of *Diluent* and sonicate for 20 min. Allow to cool to room temperature and then dilute with *Diluent* to volume. Pass the resulting solution through a suitable filter. Use the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 245 nm

Column: 4.6-mm × 25-cm; 5-µm packing *L7*

Column temperature: 30°

Flow rate: 1.2 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution*, *Standard solution*, and *Sensitivity solution*

Suitability requirements

Resolution: NLT 2.0 between frovatriptan related compound A and frovatriptan, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each degradation product from the *Sample solution*

r_S = peak response of frovatriptan from *Standard solution*

C_S = concentration of USP Frovatriptan Succinate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of frovatriptan in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of frovatriptan, 243.30

M_{r2} = molecular weight of anhydrous frovatriptan succinate, 361.40

Acceptance criteria: See *Table 2*. Disregard peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Frovatriptan related compound A ^a	0.86	—
Frovatriptan	1.0	—
Any individual, unspecified degradation product	—	0.26
Total degradation products	—	1.0

^a This is a process impurity that is included in the table for identification purposes only. It is controlled in the drug substance and is not to be reported or included in the total degradation products for the drug product.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers. Store at controlled room temperature.
- **USP Reference Standards** <11>
 - USP Frovatriptan Succinate RS
 - USP Frovatriptan Related Compound A RS
 - (R)-3-Amino-2,3,4,9-tetrahydro-1H-carbazole-6-carboxamide.
 - C₁₃H₁₅N₃O 229.28

◀(TBD)

BRIEFING

Frovatriptan Succinate. Because there is no existing monograph for this drug substance, a new monograph based upon the Authorized Pending Monograph (posted December 27, 2013) is being proposed. On the basis of comments received, the chemical formula for frovatriptan succinate in the *Definition* and the calculation description in the *Assay* are for the anhydrous form of frovatriptan succinate.

The isocratic liquid chromatographic procedure in the *Assay* was validated with the Inertsil C8-3 brand of *L7* column. The typical retention time for the frovatriptan peak is about 6.7 min. The gradient liquid chromatographic procedure in the test for *Organic Impurities* was validated with the Inertsil C8-3 brand of *L7* column. The typical retention time for the frovatriptan peak is about 11.7 min. The liquid chromatographic procedure in the test for the *Limit of d-Camphor Sulfonic Acid* was validated with the Zorbax SB C8 brand of *L7* column. The typical retention time for the d-camphor sulfonic acid peak is about 6.7 min. The liquid chromatographic

procedure in the test for *Enantiomeric Purity* was validated with the Chiralpak AS-H brand of L90 column. The typical retention time for the frovatriptan peak is about 7.9 min.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style. This monograph is contingent on FDA approval of a product that meets the proposed monograph.

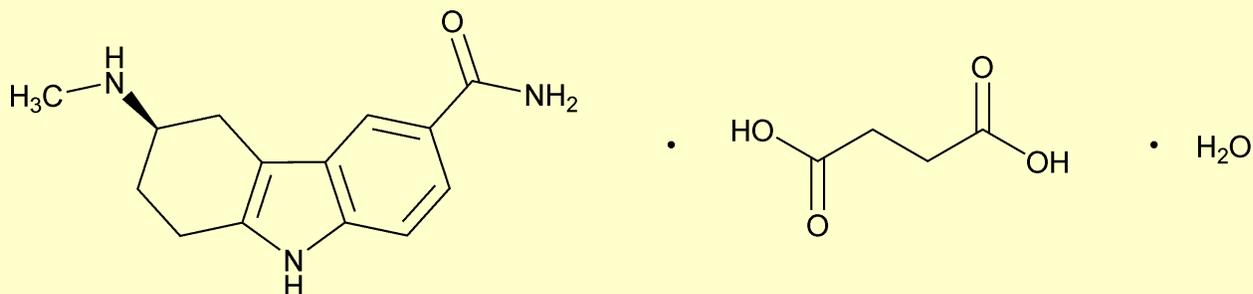

(CHM4: H. Joyce.)

Comment deadline: November 30, 2015

Add the following:

►Frovatriptan Succinate

$C_{14}H_{17}N_3O \cdot C_4H_6O_4 \cdot H_2O$ 379.41

(+)-(R)-2,3,4,9-Tetrahydro-3-(methylamino)-1H-carbazole-6-carboxamide butanedioate (1:1), monohydrate;

(+)-(R)-5,6,7,8-Tetrahydro-6-(methylamino)carbazole-3-carboxamide succinate (1:1), monohydrate [158930-17-7].

DEFINITION

Frovatriptan Succinate contains NLT 98.0% and NMT 102.0% of frovatriptan succinate ($C_{14}H_{17}N_3O \cdot C_4H_6O_4$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. Infrared Absorption** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• Procedure

Solution A: 3.9 g/L of *ammonium acetate* in water

Solution B: *Chromatographic acetonitrile* and *chromatographic methanol* (50:50)

Mobile phase: *Solution A* and *Solution B* (85:15)

Diluent: *Chromatographic acetonitrile*, *chromatographic methanol*, and water (5:5:90)

Standard solution: 50 µg/mL of USP Frovatriptan Succinate RS in *Diluent*. Sonication may

be used to aid in dissolution.

Sample solution: 50 µg/mL of Frovatriptan Succinate in *Diluent*. Sonication may be used to aid in dissolution.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 245 nm

Column: 4.6-mm × 25.0-cm; 5-µm packing *L7*

Flow rate: 1 mL/min

Injection volume: 10 µL

Run time: 2.2 times the retention time of frovatriptan

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of frovatriptan succinate ($C_{14}H_{17}N_3O \cdot C_4H_6O_4$) in the portion of Frovatriptan Succinate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Frovatriptan Succinate RS in the *Standard solution* (µg/mL)

C_U = concentration of Frovatriptan Succinate in the *Sample solution* (µg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

- **Residue on Ignition** (281): NMT 0.20%
- **Limit of Palladium**

Diluent: *Nitric acid* and water (20:80)

Standard solutions: Prepare five solutions having known concentrations ranging from 1.0 to 6.25 µg/mL of palladium, from a commercially available palladium atomic absorption standard in *Diluent*.

Sample solution: Transfer 2.5 g of Frovatriptan Succinate into a crucible that was previously ignited at $800 \pm 50^\circ$ for 30 min, cooled, and tared. Add 1 mL of *sulfuric acid*, and heat gently to thoroughly char the Frovatriptan Succinate. After cooling, moisten the residue with a small amount of sulfuric acid. Heat gently until white fumes are no longer evolved. Ignite at $800 \pm 50^\circ$ until the residue is completely incinerated. Ensure that fumes

are not produced during the ignition. Cool in a desiccator over silica gel. Dissolve the residue in 1 mL of *nitric acid*, and dilute with water to 5 mL.

Blank: *Diluent*

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrometry

Analytical wavelength: 247.6 nm

Lamp: Hollow cathode

Flame: Air-acetylene

System suitability

Samples: *Standard solutions* and *Blank*

Construct a calibration curve using the corrected absorbance values of the *Standard solutions*.

Suitability requirements

Correlation coefficient: NLT 0.99

Analysis

Samples: *Sample solution* and *Blank*

Using linear regression, calculate the slope (*S*) and the intercept (*I*) from the calibration curve.

Calculate the amount of palladium in the portion of Frovatriptan Succinate taken to prepare the *Sample solution*:

$$\text{Result} = [(A_U - I) \times (1/S) \times V] / W$$

A_U = corrected absorbance of palladium from the *Sample solution* (μg/mL)

I = intercept from the linear regression

S = slope from the linear regression

V = volume of the *Sample solution* (mL)

W = initial weight of Frovatriptan Succinate in the *Sample solution* (g)

Acceptance criteria: NMT 5 ppm

Limit of d-Camphor Sulfonic Acid

Solution A: To each L of a 2.5-g/L solution of *octanesulfonic acid sodium salt* add 2 mL of *triethylamine*, and adjust with *perchloric acid* to a pH of 2.0.

Solution B: *Chromatographic acetonitrile*

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
8	90	10
25	75	25
30	75	25
31	90	10
40	90	10

[Note—The gradient was established on an HPLC system with a dwell volume of approximately 0.9 mL.]

Standard solution: 20 µg/mL of USP d-Camphor Sulfonic Acid RS in water. Sonication may be used to aid in dissolution.

Sensitivity solution: 4 µg/mL of USP d-Camphor Sulfonic Acid RS from the *Standard solution* in water

Sample solution: 4 mg/mL of Frovatriptan Succinate in water. Sonication may be used to aid in dissolution.

Chromatographic system

Samples: *Standard solution* and *Sensitivity solution*

Suitability requirements

Relative standard deviation: NMT 5.0%, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of d-camphor sulfonic acid in the portion of Frovatriptan Succinate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of d-camphor sulfonic acid from the *Sample solution*

r_S = peak response of d-camphor sulfonic acid from the *Standard solution*

C_S = concentration of USP d-Camphor Sulfonic Acid RS in the *Standard solution* (µg/mL)

C_U = concentration of Frovatriptan Succinate in the *Sample solution* (µg/mL)

Acceptance criteria: NMT 0.10%

- **Organic Impurities**

Solution A: 3.9 g/L of ammonium acetate in water

Solution B: *Chromatographic acetonitrile* and *Chromatographic methanol* (50:50)

Diluent: *Chromatographic acetonitrile*, *Chromatographic methanol*, and water (5:5:90)

System suitability stock solution A: 0.1 mg/mL of USP Frovatriptan Related Compound A RS, prepared as follows. Dissolve the Reference Standard first in *Solution B* using 10% of the final flask volume, then dilute with *Diluent* to volume.

System suitability stock solution B: 0.015 mg/mL of USP Frovatriptan Related Compound A RS from *System suitability stock solution A* in *Diluent*

System suitability solution: 0.5 mg/mL of USP Frovatriptan Succinate RS and 0.75 µg/mL of USP Frovatriptan Related Compound A RS from *System suitability stock solution B*, prepared as follows. Transfer a suitable amount of USP Frovatriptan Succinate RS to an appropriate volumetric flask. Add 5% of the final flask volume of *System suitability stock solution B* and 50% of the final flask volume of *Diluent*. Sonication may be used to aid in dissolution. Dilute with *Diluent* to the final flask volume.

Standard solution: 0.5 µg/mL of USP Frovatriptan Succinate RS in *Diluent*. Sonication may be used to aid in dissolution.

Sample solution: 0.5 mg/mL of Frovatriptan Succinate in *Diluent*. Sonication may be used to aid in dissolution.

Mobile phase: See *Table 2*.

BRIEFING**Guaifenesin**, *USP 38* page 3725. The following revisions are being proposed:

1. Revise *Identification* test A to allow for the use of either *Infrared Absorption* (197K) or (197A).
2. Delete *Identification* test C, which is a reaction of the pseudoalkaloid, guaifenesin, with a Marquis reagent. The test is nonspecific and is non-value added. Conformance with both of the remaining tests by IR absorption and UV absorption is adequate for identification.
3. Delete the *Melting Range or Temperature* test. The remaining tests adequately ensure the purity of the material.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

 USP Guaifenesin RS

BRIEFING

Hydroxyprogesterone Caproate Injection, USP 38 page 3810. As part of USP monograph modernization efforts, it is proposed to make the following changes.

1. Replace *Identification* test B, which is based on TLC and uses a toxic solvent, chloroform, with a retention time agreement in the proposed *Assay*.
2. Replace the nonspecific UV procedure in the *Assay* with a stability-indicating HPLC method. This procedure was validated using the Waters Symmetry C18 brand of L1 column. The retention time for hydroxyprogesterone caproate in the analysis is about 15 min.
3. Add a test for *Organic Impurities* to the monograph based on the proposed HPLC procedure in the *Assay*. The procedure was validated using the same chromatographic parameters as were used in the *Assay*.
4. Add an additional storage requirement to the *Packaging and Storage* section based on the information for an approved drug product.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

(CHM5: P. Pabba, D. Min.)

Comment deadline: November 30, 2015

Hydroxyprogesterone Caproate Injection

DEFINITION

Hydroxyprogesterone Caproate Injection is a sterile solution of Hydroxyprogesterone Caproate in a suitable vegetable oil. It contains NLT 90.0% and NMT 110.0% of the labeled amount of hydroxyprogesterone caproate ($C_{27}H_{40}O_4$).

IDENTIFICATION

• A.

Sample solution: Transfer a volume of Injection, equivalent to 125 mg of hydroxyprogesterone caproate, to a 60-mL separator containing 10 mL of solvent hexane, 8 mL of methanol, and 2 mL of water. Insert the stopper, shake for 2 min, and allow the phases to separate. The lower layer is the *Sample solution*.

Analysis: To 3 mL of the *Sample solution* add sulfuric acid dropwise until a color develops, then add 3 mL of methanol.

Acceptance criteria: A purple color develops and the solution, when viewed under long-wavelength UV light, exhibits a pale yellow fluorescence.

Delete the following:

■ • B. Thin-Layer Chromatography

Standard solution: 400 µg/mL of USP Hydroxyprogesterone Caproate RS in chloroform

Sample solution: Evaporate 4 mL of the *Sample solution* prepared in the *Assay* to dryness and dissolve the residue in 0.5 mL of chloroform.

Chromatographic system

(See *Chromatographic system* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 µL

Developing solvent system: Chloroform and ethyl acetate (3:1)

Spray reagent: Sulfuric acid and alcohol (1:3)

Analysis: Apply the *Sample solution* and the *Standard solution* 2 cm apart on a line 2.5 cm from the bottom edge of a thin-layer chromatographic plate. Place the plate in a chamber that contains and that has been equilibrated with the *Developing solvent system*. Develop the plate until the solvent front has moved to 10 cm above the points of application. Remove the plate, mark the solvent front, and dry. Spray the plate with the *Spray reagent*, and heat in an oven at 105° for 5 min.

Acceptance criteria: The R_f value of the principal yellowish green spot of the *Sample solution* corresponds to that of the *Standard solution*. ■ 2S (USP39)

Add the following:

- ● **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■ 2S (USP39)

ASSAY**Change to read:**● **Procedure**

Isoniazid reagent: Dissolve 375 mg of isoniazid and 0.47 mL of hydrochloric acid in 500 mL of methanol.

Standard solution: 50 µg/mL of USP Hydroxyprogesterone Caproate RS in methanol

Sample solution: Nominally 50 µg/mL of hydroxyprogesterone caproate from an appropriate volume of Injection diluted with methanol

Spectrometric conditions

Mode: UV-Vis

Analytical wavelength: 380 nm

Blank: Methanol and *Isoniazid reagent* (5:10)

Analysis: Pipet 5 mL of *Sample solution* into a glass stoppered, 50 mL conical flask. Pipet 5 mL of *Standard solution* into a similar flask. To each flask add 10.0 mL of *Isoniazid reagent*, mix, and allow to stand in a water bath at 30° for 45 min.

Determine the absorbances of the *Sample solution* and the *Standard solution*. Calculate the percentage of hydroxyprogesterone caproate ($C_{27}H_{40}O_4$) in the portion of Injection taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Hydroxyprogesterone Caproate RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of hydroxyprogesterone caproate the *Sample solution* (µg/mL)

- **Mobile phase:** Methanol and water (80:20)

Standard solution: 0.05 mg/mL of USP Hydroxyprogesterone Caproate RS in methanol

Sample solution: Nominally 0.05 mg/mL of hydroxyprogesterone caproate from an appropriate volume of Injection in methanol

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 242 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1.0 mL/min

Injection volume: 20 μL

Run time: Twice the retention time of hydroxyprogesterone caproate

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 4000 theoretical plates

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of hydroxyprogesterone caproate ($\text{C}_{27}\text{H}_{40}\text{O}_4$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Hydroxyprogesterone Caproate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of hydroxyprogesterone caproate in the *Sample solution* (mg/mL)

■ 2S (USP39)

Acceptance criteria: 90.0%–110.0%

IMPURITIES

Add the following:

■ ● Organic Impurities

Mobile phase and Chromatographic system: Proceed as directed in the Assay.

Standard solution: 0.5 $\mu\text{g/mL}$ of USP Hydroxyprogesterone Caproate RS in methanol

Sample stock solution: Transfer 2.0 mL of Injection, equivalent to 500 mg of hydroxyprogesterone caproate, to a 100-mL volumetric flask and dilute with methanol to volume.

Sample solution: Nominally 0.25 mg/mL of hydroxyprogesterone caproate prepared as follows. Transfer an appropriate amount of *Sample stock solution* to a suitable volumetric flask and dilute with methanol to volume.

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Signal-to-noise ratio: NLT 10

Analysis

Samples: *Standard solution and Sample solution*

Calculate the percentage of hydroxyprogesterone or any individual unspecified degradation product in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each corresponding degradation product from the *Sample solution*

r_S = peak response of hydroxyprogesterone caproate from the *Standard solution*

C_S = concentration of USP Hydroxyprogesterone Caproate RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of hydroxyprogesterone caproate in the *Sample solution* (µg/mL)

F = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*. Disregard any peak less than 0.05%.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Hydroxyprogesterone ^a	0.4	1.3	1.0
Hydroxyprogesterone caproate	1.0	—	—
Individual unspecified degradation product	—	1.0	0.2
Total impurities	—	—	2.0

^a 17-Hydroxypregn-4-ene-3,20-dione.

USP Hydroxyprogesterone Caproate RS

BRIEFING

Imipramine Pamoate Capsules. The previous proposal of the new monograph, which appeared as an *In-Process Revision* in PF 39(6) [Nov.–Dec. 2013], is canceled and is now being re-proposed with changes based on comments received.

1. *Identification* test *B* based on spectral agreement using the test for *Organic Impurities*

has been added.

2. A statement has been added to the *Sample stock solution* preparation within the *Assay* to indicate that the solution must be allowed to stand for 5 min before use.
3. A two-tiered approach has been added to *Dissolution Test 1* to address possible cross-linking.
4. *Dissolution Test 2* is added to accommodate the drug product, which was approved with different dissolution conditions and tolerances.
5. The requirement for using low-actinic glassware is replaced with a more flexible light protection statement in the test for *Organic Impurities*.
6. The composition of *Solution A* has been modified slightly to reflect the sponsor's solution description within the liquid chromatographic test for *Organic Impurities* and to reflect additional validation data.
7. A *Labeling* section was added to support the inclusion of *Dissolution Test 2*.

The liquid chromatographic test procedure in the *Assay* is based on analyses performed with the XTerra RP18 brand of L1 column manufactured by Waters Corporation. The typical retention time for imipramine in the *Assay* procedure is about 27 min.

The liquid chromatographic test procedure in *Dissolution Test 1* is based on analyses performed with the XTerra RP18 brand of L1 column manufactured by Waters Corporation. The typical retention time for imipramine in *Dissolution Test 1* is about 9.3 min.

The liquid chromatographic test procedure in the *Organic Impurities* is based on analyses performed with the XTerra RP18 brand of L1 column manufactured by Waters Corporation. The typical retention times for imipramine are 24–25 min.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Add the following:

■ Imipramine Pamoate Capsules

DEFINITION

Imipramine Pamoate Capsules contain imipramine pamoate $[(C_{19}H_{24}N_2)_2 \cdot C_{23}H_{16}O_6]$ equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of imipramine hydrochloride $(C_{19}H_{24}N_2 \cdot HCl)$.

IDENTIFICATION

- **A.** The retention time of the imipramine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV spectrum of the imipramine peak of the *Sample solution* corresponds to that of the *System suitability solution*, as obtained in the test for *Organic Impurities*.

ASSAY

- Procedure**

Buffer: 5.2 g/L of *dibasic potassium phosphate* in water

Solution A: *Chromatographic acetonitrile* and *Buffer* (15:85). Adjust with *phosphoric acid* to a pH of 8.0.

Solution B: *Chromatographic acetonitrile* and *Buffer* (38:62). Adjust with *phosphoric acid* to a pH of 8.0.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
10	70	30
20	35	65
30	35	65
31	90	10
35	90	10

Diluent: *Chromatographic acetonitrile* and water (75:25)

Standard stock solution: 0.75 mg/mL of USP *Imipramine Pamoate RS* in *Diluent*

Standard solution: 0.23 mg/mL of USP *Imipramine Pamoate RS* (equivalent to 0.15 mg/mL of *imipramine hydrochloride*) from the *Standard stock solution* in *Solution A*. Pass a portion through a suitable filter of 0.45- μ m pore size. Use the filtrate.

Sample stock solution: Transfer the contents of *Capsules (NLT 5)* into a suitable volumetric flask, and add the corresponding capsule shells. Add 10% of the final flask volume of *acetonitrile*, and sonicate for 10 min with intermittent shaking. Add 80% of the final flask volume of *Diluent*, and sonicate for 15 min with intermittent shaking. Allow to cool to room temperature, and dilute with *Diluent* to volume. Allow to stand for 5 min.

Sample solution: Nominally 0.23 mg/mL of *imipramine pamoate* (equivalent to 0.15 mg/mL of *imipramine hydrochloride*) from the *Sample stock solution* in *Solution A*. Pass a portion of the resulting solution through a suitable filter of 0.45- μ m pore size. Use the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 269 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Autosampler temperature: 10°

Flow rate: 1.5 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

[Note—The relative retention times for *pamoic acid* and *imipramine* are 0.3 and 1.0,

respectively.]

Suitability requirements

Resolution: NLT 2.0 between pamoic acid and imipramine

Tailing factor: NMT 2.0 for imipramine

Relative standard deviation: NMT 2.0% for imipramine

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of imipramine hydrochloride ($C_{19}H_{24}N_2 \cdot HCl$) in the portion of Imipramine Pamoate Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times [M \times (M_{r1}/M_{r2})] \times 100$$

r_U = peak area of imipramine from the *Sample solution*

r_S = peak area of imipramine from the *Standard solution*

C_S = concentration of USP Imipramine Pamoate RS in the *Standard solution* (mg/mL)

C_U = equivalent concentration of imipramine hydrochloride in the *Sample solution* (mg/mL)

M = number of moles of imipramine hydrochloride equivalent to each mole of imipramine pamoate, 2

M_{r1} = molecular weight of imipramine hydrochloride, 316.87

M_{r2} = molecular weight of imipramine pamoate, 949.18

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• Dissolution (711)

Test 1

Tier 1

Medium 1: 0.1 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 30 and 90 min

Tier 2

Medium 2: 0.1 N hydrochloric acid with 0.3% purified pepsin; 900 mL

Apparatus 1: 100 rpm

Time: 30 and 90 min

Buffer: 4.4 g/L of *dibasic potassium phosphate* in water

Mobile phase: *Acetonitrile*, *triethylamine*, and *Buffer* (400:5:600). Adjust with *phosphoric acid* to a pH of 8.0.

Diluent A: *Acetonitrile* and water (75:25)

Diluent B: 20.4 g/L of *monobasic potassium phosphate* and 3 g/L of *sodium hydroxide*. Adjust with 1 N *sodium hydroxide* or 1 N *phosphoric acid* to a pH of 7.4.

Standard stock solution: 0.63 mg/mL of USP Imipramine Pamoate RS in *Diluent A*

Standard solution: 0.038 mg/mL of USP Imipramine Pamoate RS from the *Standard stock solution* prepared as follows. Transfer a suitable volume of the *Standard stock solution* to an appropriate flask that already contains 60% of the final flask volume of *Diluent B* and 30% of the final flask volume of *Medium*. Dilute with *Diluent B* to volume.

Sample stock solution: Centrifuge a portion of the solution under test. Use the supernatant. Replace the portion of solution removed from the vessel with the same volume of fresh *Medium 1* or *Medium 2* at 37°. [Note—The use of a centrifuge speed of 5000 rpm for 10 min may be suitable.]

Sample solution: Nominally equivalent to about 0.025 mg/mL of imipramine hydrochloride prepared from the *Sample stock solution* in *Diluent B* in a suitable volumetric flask

Dissolution procedure: Perform the test using the conditions under *Tier 1*. In the presence of cross-linking, repeat the test with a new set of Capsules using the conditions under *Tier 2*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 252 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Temperatures

Autosampler: 10°

Column: 30°

Flow rate: 1.2 mL/min

Injection volume: 50 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of imipramine hydrochloride ($C_{19}H_{24}N_2 \cdot HCl$) dissolved at each time point (i):

$$\text{Result}_i = (r_i/r_S) \times C_S \times [M \times (M_{r1}/M_{r2})] \times V \times (1/L) \times 100$$

r_i = peak area of imipramine from the *Sample solution* at each time point

r_S = peak area of imipramine from the *Standard solution*

C_S = concentration of USP Imipramine Pamoate RS in the *Standard solution* (mg/mL)

M = number of moles of imipramine hydrochloride equivalent to each mole of imipramine pamoate, 2

M_{r1} = molecular weight of imipramine hydrochloride, 316.87

M_{r2} = molecular weight of imipramine pamoate, 949.18

V = volume of *Medium 1* or *Medium 2*, 900 mL

L = label claim (mg/Capsule)

Tolerances: See *Table 2*.

Table 2

Time Point (<i>i</i>)	Time (min)	Amount Dissolved NLT (%)
1	30	40
2	90	75

The percentage of imipramine pamoate dissolved equivalent to the labeled amount of imipramine hydrochloride ($C_{19}H_{24}N_2 \cdot HCl$) dissolved at the times specified conforms to *Dissolution* (711), *Acceptance Table 1*.

Test 2: If the product complies with this test, the labeling indicates that the product meets *USP Dissolution Test 2*.

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Times: 30 and 150 min

Standard solution: A solution containing USP Imipramine Pamoate RS at the concentrations listed in *Table 3* prepared as follows. Transfer a suitable quantity of USP Imipramine Pamoate RS to an appropriate volumetric flask. Add 5% of the final flask volume of *methanol* and sonicate for 5 min. Add 75% of the final flask volume of *Medium* that has been heated to NLT 60° and stir for 30 min. Allow to cool to room temperature. Dilute with *Medium* to volume and mix. Pass through a suitable filter and use the filtrate.

Table 3

Labeled Amount of Imipramine Hydrochloride (mg/Capsule)	Concentration of USP Imipramine Pamoate RS (mg/mL)	Equivalent Concentration of Imipramine Hydrochloride (mg/mL)
75	0.12	0.08
100	0.17	0.11
125	0.21	0.14
150	0.26	0.17

Sample solution: Pass a portion of the solution under test through a suitable filter. Use the filtrate.

Instrumental conditions

Mode: UV-Vis

Wavelength: 251 nm

Cell: 0.2 cm

Analysis**Samples:** *Standard solution* and *Sample solutions*

Calculate the percentage of the labeled amount of imipramine hydrochloride ($C_{19}H_{24}N_2 \cdot HCl$) dissolved at each time point (i):

$$\text{Result}_i = (A_i/A_S) \times C_S \times [M \times (M_{r1}/M_{r2})] \times V \times (1/L) \times 100$$

A_i = absorbance of imipramine from the *Sample solution* at each time point

A_S = absorbance of imipramine from the *Standard solution*

C_S = concentration of USP Imipramine Pamoate RS in the *Standard solution* (mg/mL)

M = number of moles of imipramine hydrochloride equivalent to each mole of imipramine pamoate, 2

M_{r1} = molecular weight of imipramine hydrochloride, 316.87

M_{r2} = molecular weight of imipramine pamoate, 949.18

V = volume of *Medium*, 900 mL

L = label claim (mg/Capsule)

Tolerances: See *Table 4*.**Table 4**

Time Point (i)	Time (min)	Amount Dissolved NLT (%)
1	30	25
2	150	80

The percentage of imipramine pamoate dissolved equivalent to the labeled amount of imipramine hydrochloride ($C_{19}H_{24}N_2 \cdot HCl$) dissolved at the times specified conforms to *Dissolution (711), Acceptance Table 1*.

- **Uniformity of Dosage Units (905):** Meet the requirements

IMPURITIES

- **Organic Impurities**

Protect solutions containing imipramine from light.

Buffer: 5.2 g/L of *dibasic potassium phosphate* in water

Solution A: *Chromatographic acetonitrile* and *Buffer* (3:100). Adjust with *phosphoric acid* to a pH of 7.2.

Solution B: *Methanol* and *chromatographic acetonitrile* (70:30)

Mobile phase: See *Table 5*.

Table 5

Time (min)	Solution A (%)	Solution B (%)
0	62	38
12	62	38
25	50	50
65	20	80
70	20	80
75	62	38
95	62	38

System suitability solution: 1.5 mg/mL of USP Imipramine Pamoate RS (equivalent to 1 mg/mL of imipramine hydrochloride), and 0.001 mg/mL each of USP Desipramine Hydrochloride RS and USP Depramine RS in *Solution B*. Pass a portion through a suitable membrane filter of 0.2- μ m pore size, and use the filtrate.

Standard solution: 0.015 mg/mL of USP Imipramine Pamoate RS (equivalent to 0.010 mg/mL of imipramine hydrochloride) in *Solution B*. Pass a portion through a suitable membrane filter of 0.2- μ m pore size, and use the filtrate.

Sample solution: Nominally 1.5 mg/mL of imipramine pamoate (equivalent to 1.0 mg/mL of imipramine hydrochloride) from NLT 20 Capsules prepared as follows. Transfer a portion of the contents of the Capsules equivalent to 50 mg of imipramine hydrochloride to a 50-mL volumetric flask. Add 30 mL of *Solution B*, and sonicate for 10 min in a cool water bath with intermittent shaking. Dilute with *Solution B* to volume. Pass a portion through a suitable membrane filter of 0.2- μ m pore size, and use the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm. For *Identification* test B, a diode-array detector may be used in the wavelength range of 200–300 nm.

Column: 4.6-mm \times 15-cm; 3.5- μ m packing L1

Temperatures

Autosampler: 10°

Column: 45°

Flow rate: 1 mL/min

Injection volume: 10 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

BRIEFING

Insulin Injection, *USP 38* page 3871. On the basis of comments received, it is proposed to revise the monograph as follows:

1. In the *Definition* and *Assay*, *Acceptance criteria*, change “USP Insulin Units” to “USP Insulin Units/mL” to align with the potency specification in the *Assay* calculation. Clarify the components contributing to the potency in the *Definition*.
2. Replace the test for *Limit of High Molecular Weight Proteins* with the test for *Physicochemical Analytical Procedures for Insulins* (121.1), *Limit of High Molecular Weight Proteins*, but retain the specific instructions for the *Sample solution* and *Acceptance criteria*.
3. In the *USP Reference Standards* section, remove USP Insulin RS because the reference material is no longer available. The *System suitability solution* and concentration of the *Standard solution* in the formula of the *Assay* have been modified to specify use of USP Insulin Beef RS and USP Insulin Pork RS in lieu of USP Insulin RS.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Insulin Injection

DEFINITION

Change to read:

Insulin Injection is an isotonic, sterile solution of Insulin. Its potency

■, based on the sum of the insulin and desamido insulin components, ■ 2S (USP39) is NLT 95.0% and NMT 105.0% of the potency stated on the label, expressed in ~~USP Insulin Units~~

■ USP Insulin Units/mL. ■ 2S (USP39)

IDENTIFICATION

- **A.** The retention time of the insulin peak of *Sample solution A* or *Sample solution B* corresponds to that of the appropriate species of the *Identification solution*, as obtained in the *Assay*. [Note—It may be necessary to inject a mixture of *Sample solution* and *Identification solution*.]

ASSAY

Change to read:

- **Procedure**

Solution A: Dissolve 28.4 g of *anhydrous sodium sulfate* in 1000 mL of water. Pipet 2.7 mL of *phosphoric acid* into the solution, and adjust with *ethanolamine* to a pH of 2.3, if necessary.

Mobile phase: *Acetonitrile* and *Solution A* (26:74). [Note—The *acetonitrile* is warmed to NLT 20° to avoid precipitation.]

System suitability solution: 1.5 mg/mL of insulin

- of the appropriate species, either insulin beef or insulin pork, ■_{2S} (USP39) in 0.01 N *hydrochloric acid*.

- For insulin of mixed species, prepare a solution containing 1.3 mg/mL of insulin beef and 0.25 mg/mL of insulin pork in 0.01 N *hydrochloric acid*. ■_{2S} (USP39)

Allow to stand at room temperature for NLT 3 days to obtain a solution containing NLT 5% of A-21 desamido insulin.

Identification solution: 0.6 mg/mL of USP Insulin Beef RS and 0.6 mg/mL of USP Insulin Pork RS in 0.01 N *hydrochloric acid*

Standard solution: 1.5 mg/mL of USP Insulin RS of the appropriate species, either USP Insulin Beef RS or USP Insulin Pork RS, in 0.01 N *hydrochloric acid*. For insulin of mixed species, prepare a solution containing 1.3 mg/mL of USP Insulin Beef RS and 0.25 mg/mL of USP Insulin Pork RS in 0.01 N *hydrochloric acid*.

Sample solution A (for Insulin Injection labeled as containing 40 USP Insulin Units/mL):

Add 2.5 µL of 9.6 N *hydrochloric acid* for each mL of an accurately measured volume of Injection. Allow the suspension, if present, to clarify, and mix.

Sample solution B (for Insulin Injection labeled as containing 100 USP Insulin Units/mL):

Add 2.5 µL of 9.6 N *hydrochloric acid* for each mL of an accurately measured volume of Injection. Allow the suspension, if present, to clarify, and mix. [Note—Pooling several package units may be necessary to obtain sufficient volume of the sample.] Pipet 2 mL of this solution into a 5-mL volumetric flask, dilute with 0.01 N *hydrochloric acid* to volume, and mix.

[Note—The *Identification solution*, *Standard solution*, and *Sample solutions* may be stored at room temperature for up to 12 h or in a refrigerator for up to 48 h.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 214 nm

Column: 4.6-mm × 15-cm; packing *L1*

Column temperature: 40°

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between insulin and A-21 desamido insulin, *System suitability solution*

Tailing factor: NMT 1.8 for the insulin peak, *System suitability solution*

Relative standard deviation: NMT 1.6%, *Standard solution*

Analysis

Samples: *Identification solution, Standard solution, and either Sample solution A or Sample solution B*

Measure the peak responses for insulin and A-21 desamido insulin using the chromatogram of the *Identification solution* to identify the insulin peaks.

For Insulin Injection prepared from a single species, calculate the potency, in USP Insulin Units/mL, of the portion of Injection taken:

$$\text{Result} = (\Sigma r_U / \Sigma r_S) \times C_S \times D$$

Σr_U = sum of the peak responses of insulin and A-21 desamido insulin from the *Sample solution*

Σr_S = sum of the peak responses of insulin and A-21 desamido insulin from the *Standard solution*

C_S = concentration of USP Insulin RS

▪ of the appropriate species, either USP Insulin Beef RS or USP Insulin Pork RS, ■ 2S (USP39) in the *Standard solution* (USP Insulin Units/mL)

D = dilution factor used to prepare the *Sample solution*

For Insulin Injection prepared from a mixture of insulin beef and insulin pork, calculate the total potency as the sum of the potencies of insulin beef and insulin pork, determined separately, as directed above.

Acceptance criteria: 95.0%–105.0% of the potency stated on the label, expressed in USP Insulin

Units/mL ■ 2S (USP39)

OTHER COMPONENTS

- **Zinc Determination (591):** 10–40 µg for every 100 USP Insulin Units of the appropriate species

PRODUCT RELATED SUBSTANCES IMPURITIES

Delete the following:

● **Limit of High Molecular Weight Proteins**

Solution A: 1 mg/mL of L-arginine in water

Mobile phase: ~~Solution A, acetonitrile, and glacial acetic acid (65:20:15)~~

Resolution solution: 4 mg/mL of insulin containing NLT 0.4% of high molecular weight proteins in 0.01N hydrochloric acid. Store in a refrigerator, and use within 7 days.

[Note—Insulin containing NLT 0.4% of high molecular weight proteins may be prepared by allowing insulin to stand at room temperature for about 5 days.]

Sample solution: Quantitatively add 4 µL of 6 N hydrochloric acid to each mL of an accurately measured volume of Injection, and mix.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV-276 nm

Column: 7.8 mm × 30 cm; packing L20

Flow rate: 0.5 mL/min

Injection volume: 100 µL

System suitability

Sample: *Resolution solution*

Suitability requirements

Retention times: 13–17 min for the polymeric insulin complexes, about 17.5 min for the covalent insulin dimer, and 18–22 min for the insulin monomer, with salts eluting after the insulin monomer

Peak-to-valley ratio: The ratio of the height of the covalent insulin dimer peak to the height of the valley between the covalent insulin dimer peak and the insulin monomer peak is NLT 2.0

Analysis

Sample: *Sample solution*

Disregard any peaks having retention times greater than that of the insulin monomer. Calculate the percentage of high molecular weight proteins in the portion of insulin taken:

$$\text{Result} = 100 \times \sum r_H / (\sum r_H + r_M)$$

$\sum r_H$ = sum of the responses of all peaks having retention times less than that of the insulin monomer

r_M = peak response of the insulin monomer

Acceptance criteria: NMT 2.0% ■ 2S (USP39)

Add the following:

- ● **Physicochemical Analytical Procedures for Insulins** (121.1), *Limit of High Molecular Weight Proteins*

Proceed as directed in *Limit of High Molecular Weight Proteins*, except prepare the following *Sample solution*. It meets the requirements.

Sample solution: Quantitatively add 4 µL of 6 N *hydrochloric acid* to each mL of an accurately measured volume of Injection, and mix.

Acceptance criteria: NMT 2.0% ■ 2S (USP39)

SPECIFIC TESTS

- **pH** (791): 7.0–7.8
- **Particulate Matter in Injections** (788): Meets the requirements for small-volume injections

- **Bacterial Endotoxins Test** (85): NMT 80 USP Endotoxin Units/100 USP Insulin Units
- **Sterility Tests** (71), *Test for Sterility of the Product to Be Examined, Membrane Filtration*: Meets the requirements
- **Injections** (1): Meets the requirements

ADDITIONAL REQUIREMENTS

- **Packaging and Storage**: Preserve in the unopened, multiple-dose container provided by the manufacturer. Do not repackage. Store in a refrigerator, protect from sunlight, and avoid freezing.
- **Labeling**: Label it to indicate the one or more animal species to which it is related, as porcine, bovine, or a mixture of porcine and bovine. If the Insulin Injection is made from insulin that is purified, label it as such. Label it to state that it is to be stored in a refrigerator and that freezing is to be avoided. The label states the potency in USP Insulin Units/mL.

Isophane Insulin Suspension

DEFINITION

Isophane Insulin Suspension is a sterile suspension of zinc–insulin crystals and Protamine Sulfate in buffered Water for Injection, combined in a manner such that the solid phase of the suspension consists of crystals composed of insulin, protamine, and zinc. The Protamine Sulfate is prepared from the sperm or from the mature testes of fish belonging to the genus *Oncorhynchus* Suckley, or *Salmo* Linné (Fam. Salmonidae). Its potency, based on the sum of its insulin and desamido insulin components, is NLT 95.0% and NMT 105.0% of the potency stated on the label, expressed in USP Insulin Units/mL.

IDENTIFICATION

- **A.** The retention time of the insulin peak of *Sample solution A* or *Sample solution B* corresponds to that of the appropriate species of the *Identification solution*, as obtained in the *Assay*. Insulin Zinc Suspension

Insulin zinc [8049-62-5].

DEFINITION

Insulin Zinc Suspension is a sterile suspension of Insulin in buffered Water for Injection,

modified by the addition of a suitable zinc salt in a manner such that the solid phase of the suspension consists of a mixture of crystalline and amorphous insulin in a ratio of approximately 7 parts of crystals to 3 parts of amorphous material. Its potency, based on the sum of its insulin and desamido insulin components, is NLT 95.0% and NMT 105.0% of the potency stated on the label, expressed in USP Insulin Units/mL.

IDENTIFICATION

- **A.** The retention time of the insulin peak of *Sample solution A* or *Sample solution B* corresponds to that of the appropriate species of the *Identification solution*, as obtained in the *Assay*. [Note—It may be necessary to inject a mixture of *Sample solution* and *Identification solution*.]

ASSAY

Change to read:

- **Procedure**

Solution A: Dissolve 28.4 g of *anhydrous sodium sulfate* in 1000 mL of water. Pipet 2.7 mL of *phosphoric acid* into the solution, and adjust with *ethanolamine* to a pH of 2.3, if necessary.

BRIEFING

Extended Insulin Zinc Suspension, *USP 38* page 3886. On the basis of comments received, it is proposed to revise the monograph as follows:

1. Replace the test for *Limit of High Molecular Proteins* with the test for *Physicochemical Analytical Procedures for Insulins* <121.1>, *Limit of High Molecular Weight Proteins*, but retain the specific instructions for the *Sample solution* and *Acceptance criteria*.
2. The *Assay* in the currently official monograph instructs the user to "Proceed as directed in the *Assay* under *Insulin Injection*." The *Insulin Injection* monograph indicates, "Note —The *Identification solution*, *Standard solution*, and *Sample solutions* may be stored at room temperature for up to 12 hours or in a refrigerator for up to 48 hours." Stability of the *Standard solution* and *Sample solutions* is specific to the *Insulin Injection* monograph, and as such is not included in the *Extended Insulin Zinc Suspension* monograph.
3. Modify the *System suitability solution* and the concentration of the *Standard solution* in the formula of the *Assay* to specify the use of USP Insulin Beef RS and USP Insulin Pork RS for added clarity.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Extended Insulin Zinc Suspension

DEFINITION

Extended Insulin Zinc Suspension is a sterile suspension of Insulin in buffered Water for Injection, modified by the addition of a suitable zinc salt in a manner such that the solid phase of the suspension is predominantly crystalline. Its potency, based on the sum of its insulin and desamido insulin components, is NLT 95.0% and NMT 105.0% of the potency stated on the label, expressed in USP Insulin Units/mL.

IDENTIFICATION

- **A.** The retention time of the insulin peak of *Sample solution A* or *Sample solution B* corresponds to that of the appropriate species of the *Identification solution*, as obtained in the *Assay*. [Note—It may be necessary to inject a mixture of *Sample solution* and *Identification solution*.]

ASSAY**Change to read:****Procedure**

Solution A: Dissolve 28.4 g of *anhydrous sodium sulfate* in 1000 mL of water. Pipet 2.7 mL of *phosphoric acid* into the solution, and adjust with *ethanolamine* to a pH of 2.3, if necessary.

Mobile phase: *Acetonitrile* and *Solution A* (26:74). [Note—The *acetonitrile* is warmed to NLT 20° to avoid precipitation.]

System suitability solution: 1.5 mg/mL of insulin

- of the appropriate species, either insulin beef or insulin pork, ■ 2S (USP39) in 0.01 N *hydrochloric acid*.

- For insulin of mixed species, prepare a solution containing 1.3 mg/mL of insulin beef and 0.25 mg/mL of insulin pork in 0.01 N *hydrochloric acid*. ■ 2S (USP39)

Allow to stand at room temperature for NLT 3 days to obtain a solution containing NLT 5% of A-21 desamido insulin.

Identification solution: 0.6 mg/mL of USP Insulin Beef RS and 0.6 mg/mL of USP Insulin Pork RS in 0.01 N *hydrochloric acid*. [Note—The *Identification solution*, *Standard solution*, and *Sample solution*

- ■ 2S (USP39)

may be stored at room temperature for up to 12 h or in a refrigerator for up to 48 h.]

Standard solution: 1.5 mg/mL of USP Insulin RS of the appropriate species, either USP Insulin Beef RS or USP Insulin Pork RS, in 0.01 N *hydrochloric acid*. For insulin of mixed species, prepare a solution containing 1.3 mg/mL of USP Insulin Beef RS and 0.25 mg/mL of USP Insulin Pork RS in 0.01 N *hydrochloric acid*.

Sample solution A (for Extended Insulin Zinc Suspension labeled as containing 40 USP Insulin Units/mL): Add 2.5 µL of 9.6 N *hydrochloric acid* for each mL of an accurately measured volume of Suspension. Allow the suspension to clarify, and mix.

Sample solution B (for Extended Insulin Zinc Suspension labeled as containing 100 USP Insulin Units/mL): Add 2.5 µL of 9.6 N *hydrochloric acid* for each mL of an accurately measured volume of Suspension. Allow the suspension to clarify, and mix. [Note—Pooling several package units may be necessary to obtain sufficient volume of the sample.] Pipet 2 mL of this solution into a 5-mL volumetric flask, dilute with 0.01 N *hydrochloric acid* to volume, and mix.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 214 nm

Column: 4.6-mm × 15-cm; packing L1

Column temperature: 40°

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between insulin and A-21 desamido insulin, *System suitability solution*

Tailing factor: NMT 1.8 for the insulin peak, *System suitability solution*

Relative standard deviation: NMT 1.6%, *Standard solution*

Analysis

Samples: *Identification solution*, *Standard solution*, and either *Sample solution A* or *Sample solution B*

Measure the peak responses for insulin and A-21 desamido insulin using the chromatogram of the *Identification solution* to identify the insulin peaks.

For Extended Insulin Zinc Suspension prepared from a single species, calculate the potency, in USP Insulin Units/mL, of the portion of Suspension taken:

$$\text{Result} = (\Sigma r_U / \Sigma r_S) \times C_S \times D$$

Σr_U = sum of the peak responses of insulin and A-21 desamido insulin from the *Sample solution*

Σr_S = sum of the peak responses of insulin and A-21 desamido insulin from the *Standard solution*

C_S = concentration of USP Insulin RS

▪ of the appropriate species, either USP Insulin Beef RS or USP Insulin Pork RS, ■ 2S (USP39)

in the *Standard solution* (USP Insulin Units/mL)

D = dilution factor used to prepare the *Sample solution*

For Extended Insulin Zinc Suspension prepared from a mixture of insulin beef and insulin pork, calculate the total potency as the sum of the potencies of insulin beef and insulin pork, determined separately, as directed above.

Acceptance criteria: 95.0%–105.0% of the potency stated on the label, expressed in USP Insulin Units/mL

OTHER COMPONENTS

- **Zinc Determination** (591): 0.12–0.25 mg for every 100 USP Insulin Units
- **Zinc in the Supernatant**

Analysis: Centrifuge a portion of Suspension sufficient for the test and determine the zinc content of the clear supernatant as directed in *Zinc Determination* (591).

Acceptance criteria: Concentration of zinc (mg/mL) is 20%–65% of the zinc concentration of the Suspension.

PRODUCT RELATED SUBSTANCES IMPURITIES**Delete the following:****Limit of High Molecular Weight Proteins****Solution A:** 1 mg/mL of L-arginine in water**Mobile phase:** *Solution A*, acetonitrile, and glacial acetic acid (65:20:15)**Resolution solution:** 4 mg/mL of insulin containing NLT 0.4% of high molecular weight proteins in 0.01 N hydrochloric acid. Store in a refrigerator, and use within 7 days.

[Note—Insulin containing NLT 0.4% of high molecular weight proteins may be prepared by allowing insulin to stand at room temperature for about 5 days.]

Sample solution: Quantitatively add 4 µL of 6 N hydrochloric acid to each mL of an accurately measured volume of Suspension, and mix.**Chromatographic system**(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV-276 nm**Column:** 7.8 mm × 30 cm; packing L20**Flow rate:** 0.5 mL/min**Injection volume:** 100 µL**System suitability****Sample:** *Resolution solution***Suitability requirements****Retention times:** 13–17 min for the polymeric insulin complexes, about 17.5 min for the covalent insulin dimer, and 18–22 min for the insulin monomer, with salts eluting after the insulin monomer**Peak-to-valley ratio:** The ratio of the height of the covalent insulin dimer peak to the height of the valley between the covalent insulin dimer peak and the insulin monomer peak is NLT 2.0**Analysis****Sample:** *Sample solution*

Disregard any peaks having retention times greater than that of the insulin monomer. Calculate the percentage of high molecular weight proteins in the portion of insulin taken:

$$\text{Result} = 100 \times \Sigma r_H / (\Sigma r_H + r_M)$$

 Σr_H = sum of the responses of all peaks having retention times less than that of the insulin monomer r_M = peak response of the insulin monomer**Acceptance criteria:** NMT 1.5% ■ 2S (USP39)**Add the following:**

- ● **Physicochemical Analytical Procedures for Insulins** (121.1), *Limit of High Molecular Weight Proteins*
Proceed as directed in *Limit of High Molecular Weight Proteins*, except prepare the following *Sample solution*. It meets the requirements.
Sample solution: Quantitatively add 4 μL of 6 N *hydrochloric acid* to each mL of an accurately measured volume of Suspension, and mix.
Acceptance criteria: NMT 1.5% ■_{2S} (USP39)

SPECIFIC TESTS

● **Insulin Not Extracted by Buffered Acetone Solution**

Sample solution: Centrifuge a quantity of Suspension representing 1000 USP Insulin Units, and discard the supernatant. Suspend the residue in 8.4 mL of water, quickly add 16.6 mL of *buffered acetone TS*, shake or stir vigorously, and centrifuge within 3 min after the addition of the *buffered acetone TS*. Discard the supernatant, repeat the treatment with water and *buffered acetone TS*, centrifuge, and discard the supernatant. Dissolve the crystalline residue in 5 mL of dilute *hydrochloric acid* (1 in 100), transfer to a 25-mL flask, and dilute with water to volume.

Analysis: Use an appropriate method to determine the insulin concentration.

Acceptance criteria: The insulin concentration is NLT 90% of the insulin content of an equal amount of the Suspension.

● **Insulin in the Supernatant**

Sample solution: Centrifuge 10 mL of the Suspension at 1500 $\times g$ for 10 min. Use the supernatant.

Analysis: Determine the insulin content of the *Sample solution* by a suitable method.

Acceptance criteria: NMT 1.0 USP Insulin Unit/mL

BRIEFING

Levonorgestrel, USP 38 page 4086. As part of the USP monograph modernization effort, the following changes are proposed:

1. The nonspecific UV-Vis procedure for the Assay is replaced with a specific liquid chromatographic procedure that is based on validated methods of analysis performed

with the Purospher STAR RP-18e brand of L1 column. The typical retention time for levonorgestrel is about 13 min.

2. *Identification* test C, based on a retention time match in the *Assay*, is added to strengthen the monograph.
3. A reference to *Titrimetry* (541) and a formula to calculate the amount of ethynyl group are added in the test for *Limit of Ethynyl Group*.
4. The TLC test for *Organic Impurities* is replaced with a stability-indicating liquid chromatographic procedure. This procedure was validated using the Ascentis Express C18 brand of L1 column. The typical retention time for levonorgestrel is about 12 min.

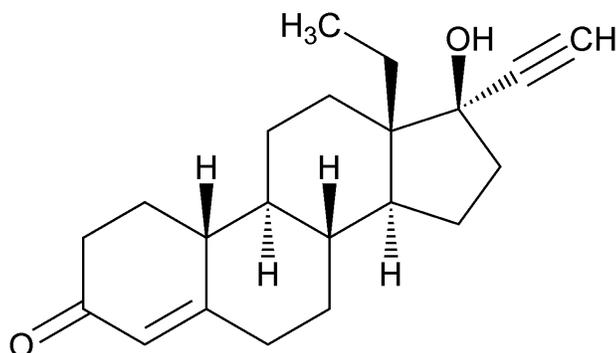

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(CHM5: M. Koleck.)

Standard solution D: 0.05 mg/mL of USP Levonorgestrel RS from *Standard solution A* in chloroform

Standard solution E: 0.02 mg/mL of USP Levonorgestrel RS from *Standard solution A* in chloroform

Standard solution F: 0.01 mg/mL of USP Levonorgestrel RS from *Standard solution A* in chloroform [Note—The *Standard solutions B–F* correspond to 2.0% (*Standard solution B*), 1.0% (*Standard solution C*), 0.5% (*Standard solution D*), 0.2% (*Standard solution E*), and 0.1% (*Standard solution F*), respectively, of the *Sample solution* concentration.]

Sample solution: 10.0 mg/mL of Levonorgestrel in chloroform

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Spray reagent: 0.1 g/mL of phosphomolybdic acid in alcohol. Stir the mixture for NLT 30 min and filter before use.

Application volume: 10 μ L

Developing solvent system: Chloroform and alcohol (96:4)

Analysis

Samples: *Standard solutions A–F* and *Sample solution*

[Note—Apply at equidistant points along a line 2.5 cm from one edge of a 20 × 20-cm, thin-layer chromatographic plate, previously activated by heating at 100° for 15 min.]

Place the plate in a suitable developing chamber that contains and has been equilibrated with *Developing solvent system*, seal the chamber, and allow the chromatogram to develop until the solvent front has moved 15 cm above the line of application. Remove the plate, allow the solvent to evaporate, then spray uniformly with *Spray reagent*, and heat it at 105° for 10–15 min. The lane of the *Sample solution* exhibits its principal spot at the same R_f as the principal spot of *Standard solution A*. If spots other than the principal spot are observed in the lane of the *Sample solution*, estimate the concentration of each by comparison with the *Standard solutions A–F*.

Acceptance criteria: ~~The sum of the impurities in the Sample solution does not exceed 2.0%, and no single impurity is greater than 0.5%.~~

▪ **Diluent:** Methanol and water (90:10)

Solution A: Acetonitrile and water (35:65)

Solution B: Acetonitrile and water (90:10)

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
28	100	0
40	60	40
50	35	65
60	0	100
70	0	100
71	100	0
80	100	0

Sensitivity solution: 0.5 µg/mL of USP Levonorgestrel RS in Diluent

Standard solution: 5 µg/mL of USP Levonorgestrel RS in Diluent

Sample solution: 1 mg/mL of Levonorgestrel in Diluent

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 10-cm; 2.7-µm packing L1

Autosampler temperature: 10°

Flow rate: 1.2 mL/min

Injection volume: 25 µL

System suitability

Samples: Sensitivity solution and Standard solution

Suitability requirements

Tailing factor: NMT 1.5, Standard solution

Relative standard deviation: NMT 5.0%, Standard solution

Signal-to-noise ratio: NLT 10, Sensitivity solution

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of any individual unspecified impurity in the portion of Levonorgestrel taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of levonorgestrel from the *Standard solution*

C_S = concentration of USP Levonorgestrel RS in the *Standard solution* (mg/mL)

C_U = concentration of Levonorgestrel in the *Sample solution* (mg/mL)

F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*. Disregard peaks that are less than 0.05%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

■ 2S (USP39)

SPECIFIC TESTS

- **Melting Range or Temperature** (741): 232°–239°, but the range between beginning and end of melting does not exceed 4°
- **Optical Rotation** (781S), *Specific Rotation*
Sample solution: 20 mg/mL of Levonorgestrel in *chloroform*
Acceptance criteria: –30° to –35°
- **Loss on Drying** (731)
Analysis: Dry at 105° for 5 h.
Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed, light-resistant containers.
- **USP Reference Standards** (11)
 USP Levonorgestrel RS

Mannitol, page 7428 of the *First Supplement to USP 38*. On the basis of comments received, it is proposed to make the following changes to this **STAGE 6** harmonization document. See also *Notices of Stage 6 Harmonized Text, Mannitol*, posted on the USP website, with an official date of Aug. 1, 2015.

1. *Reducing Sugars*. Add the preparation procedure for *Ferric sulfate solution*.
2. *Melting Range or Temperature*. Clarify the requirement by adding "Melting point".

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

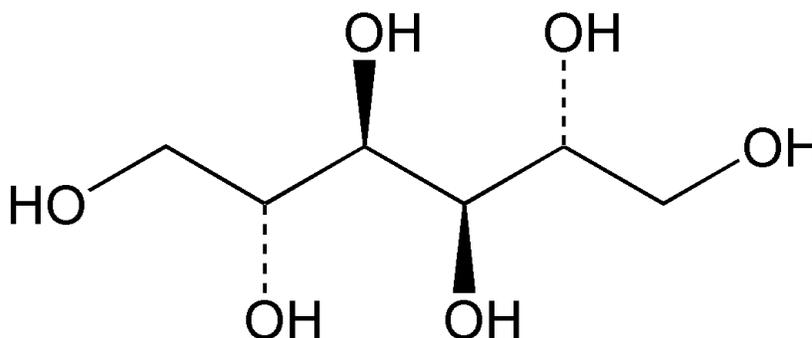

(EXC2: J. Liu.)

Correspondence Number—C160183

Comment deadline: November 30, 2015

Mannitol

Portions of the monograph text that are national *USP* text, and are not part of the harmonized text, are marked with symbols (♦) to specify this fact.

$C_6H_{14}O_6$ 182.17

d-Mannitol [69-65-8].

DEFINITION

Change to read:

Mannitol contains NLT 97.0% and NMT 102.0% of mannitol ($C_6H_{14}O_6$), calculated on the **dried** basis.

IDENTIFICATION

• **A. Infrared Absorption** (197K)

If the spectra shows differences, proceed as directed.

Standard solution: Dissolve 25 mg of USP Mannitol RS in a glass vial with 0.25 mL of distilled water without heating. The solution is clear. Evaporate to dryness by one of the following methods. Heat in a microwave oven with a power range of 600–700 W for 20 min, or heat in an oven at 100° for 1 h, then gradually apply vacuum until a dry residue is

obtained. Non-sticky, white, or slightly yellowish powders are obtained.

Sample solution: Dissolve 25 mg of Mannitol in a glass vial with 0.25 mL of distilled water without heating. The solution is clear. Evaporate to dryness by one of the following methods. Heat in a microwave oven with a power range of 600–700 W for 20 min, or heat in an oven at 100° for 1 h, then gradually apply vacuum until a dry residue is obtained. Non-sticky, white, or slightly yellowish powders are obtained.

Analysis: Record new spectra using the residues from the *Standard solution* and the *Sample solution*.

ASSAY

Change to read:

• Procedure

Mobile phase: Degassed water

System suitability solution A: 25.0 mg/mL each of sorbitol and USP Mannitol RS

System suitability solution B: 1.0 mg/mL each of maltitol and isomalt

Disregard limit: NMT 0.05%; any peak NMT the area of the principal peak obtained with *Standard solution C*

Sorbitol: NMT 2.0%; NMT the area of the principal peak obtained with *Standard solution B*

Sum of isomalt and maltitol: NMT 2.0%; NMT the area of the principal peak obtained with *Standard solution B*

Unspecified impurities: NMT 0.10% for each impurity; NMT twice the area of the principal peak obtained with *Standard solution C*

Total impurities: 2.0%; NMT the area of the principal peak obtained with *Standard solution B*

Change to read:● **Reducing Sugars**

■ **Ferric sulfate solution:** Dissolve 50 g of *ferric sulfate* in an excess of water, add 200 mL of *sulfuric acid*, and dilute with water to 1000 mL. ■_{2S} (USP39)

Copper sulfate solution: 69.2 mg/mL of *copper sulfate* ($\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$) ■ in water ■_{1S} (USP38)

Sodium potassium tartrate solution: Dissolve 173 g of *sodium potassium tartrate* ($\text{C}_4\text{H}_4\text{KNaO}_6 \cdot 4\text{H}_2\text{O}$) and 50 g of *sodium hydroxide* in 400 mL of water. Heat to boiling, allow to cool, and dilute with carbon dioxide-free water to 500 mL. ■ ■_{1S} (USP38)

Cupri-tartaric solution: Mix equal volumes of *Copper sulfate solution* ■ and *Sodium potassium tartrate solution* ■_{1S} (USP38) immediately before use.

Sample: 7.0 g

Analysis: To the *Sample* add 13 mL of water. Boil gently with 40 mL of *Cupri-tartaric solution* for 3 min, and allow to stand for about 2 min. A precipitate is formed. Pass through a sintered-glass filter (10–16 μm) coated with diatomaceous earth or a sintered-glass filter (5–10 μm). Wash the precipitate with hot water (at about 50°–60°) until the washing is no longer alkaline, and pass the washings through the filter described above. Discard all the filtrate at this step. Immediately dissolve the precipitate in 20 mL of *ferric sulfate solution*

■ *Ferric sulfate solution*, ■_{2S} (USP39)

pass through the filter described above in a clean flask, and wash the filter with 15–20 mL of water. Combine the washings and the filtrate, heat to 80°, and titrate with 0.02 M *potassium permanganate VS*.

Acceptance criteria: NMT 0.1%, expressed as glucose; NMT 3.2 mL of 0.02 M *potassium permanganate VS* is required to change the color of the solution. The green color turns to pink, and the color persists at least 10 s.

Change to read:● **Nickel**

Sample solution: Suspend 10.0 g of Mannitol in 30 mL of dilute acetic acid [115–125 g/L of acetic acid ($\text{C}_2\text{H}_4\text{O}_2$)], add water, and shake to dissolve. Dilute with water to 100.0 mL. Add 2.0 mL of a *saturated solution of ammonium pyrrolidinedithiocarbamate* ($\text{C}_5\text{H}_{12}\text{N}_2\text{S}_2$) (about 10 g/L) and 10.0 mL of water-saturated *methyl isobutyl ketone* ($\text{C}_6\text{H}_{12}\text{O}$, 4-methyl-2-pentanone), and then shake for 30 s protected from bright light. Allow the layers to separate, and use the methyl isobutyl ketone layer.

Blank solution: Treat water-saturated *methyl isobutyl ketone* as described for preparation of the *Sample solution*, omitting the mannitol.

Standard solutions: Prepare three reference solutions in the same manner as the *Sample solution* but adding 0.5, 1.0, and 1.5 mL, respectively, of *nickel standard solution TS* [10 ppm nickel (Ni)] in addition to the 10.0 g of the substance to be examined.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 232.0 nm

Lamp: Nickel hollow-cathode

Flame: Air-acetylene

Analysis

Samples: *Sample solution* and *Standard solutions*

Set the zero of the instrument using the blank. Record the average of the steady readings for each of the *Standard solutions* and the *Sample solution*. Between each measurement rinse with water, and ascertain that the reading returns to zero with the blank. \blacksquare 1S (USP38) Plot the absorbances of the *Standard solutions* and the *Sample solution* versus the added quantity of nickel. Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of nickel in the *Sample solution*.

Acceptance criteria: NMT 1 $\mu\text{g/g}$

SPECIFIC TESTS

Change to read:

- **Melting Range or Temperature** (741), *Class I*

\blacksquare **Melting point:** 165°–170° \blacksquare 2S (USP39)

- **Appearance of Solution**

Hydrazine sulfate solution: 10.0 mg/mL of *hydrazine sulfate*. Allow to stand for 4–6 h.

Methenamine solution: 2.5 g of *methenamine* in 25 mL of water, in a ground-glass-stoppered flask

Primary opalescent suspension: To the *Methenamine solution*, add 25.0 mL of the *Hydrazine sulfate solution*. Mix, and allow to stand for 24 h. This suspension is stable for two months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.

Opalescence standard: Dilute 15.0 mL of the *Primary opalescent suspension* with water to 1000.0 mL. This suspension is freshly prepared and may be stored for up to 24 h.

Reference suspension: To 5.0 mL of *Opalescence standard* add 95.0 mL of water. Mix, and shake before use.

Standard solution: Pipet 3.0 mL of *ferric chloride CS*, 3.0 mL of *cobaltous chloride CS*, and 2.4 mL of *cupric sulfate CS* into a 1-L volumetric flask. Dilute with 1% (w/v) *hydrochloric acid* to volume.

Sample solution: 100.0 mg/mL of Mannitol

Analysis: Compare the color, clarity, and opalescence of equal volumes of the *Reference suspension*, *Standard solution*, and *Sample solution*.

Acceptance criteria: The *Sample solution* is clear and colorless; its clarity is the same as that of water, or its opalescence is not more pronounced than that of the *Reference suspension*, and it is not more intensely colored than the *Standard solution*.

- **Loss on Drying** (731)

Sample: 1.000 g

Analysis: Dry the *Sample* at 105° for 4 h.

Acceptance criteria: NMT 0.5%

- **Conductivity**

Sample: 20.0 g

Analysis: Dissolve the *Sample* in *carbon dioxide-free water* prepared from distilled water by heating to 40°–50°, and dilute with the same solvent to 100 mL. After cooling, measure the conductivity of the solution while gently stirring with a magnetic stirrer.

Acceptance criteria: NMT 20 µS/cm at 25°

- **Microbial Enumeration Tests** (61) and **Tests for Specified Microorganisms** (62): The total aerobic microbial count (TAMC) is NMT 10³ cfu/g, and the total combined molds and yeasts count is NMT 10² cfu/g. It meets the requirements of the test for absence of *Escherichia coli*.

If intended for use in the manufacture of parenteral dosage forms, the TAMC is NMT 10² cfu/g.

- **Bacterial Endotoxins Test** (85): If intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins, less than 4 IU/g for parenteral dosage forms with a concentration of 100 g/L or less of mannitol, and less than 2.5 IU/g for parenteral dosage forms with a concentration of more than 100 g/L of mannitol

ADDITIONAL REQUIREMENTS

- **↑Packaging and Storage:** Preserve in well-closed containers.↓
- **Labeling**
The label states, where applicable, the maximum concentration of bacterial endotoxins.
The label states, where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

Flow rate: 0.3 mL/min

Injection volume: 5 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of methylnaltrexone bromide ($C_{21}H_{26}BrNO_4$) in the portion of Methylnaltrexone Bromide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Methylnaltrexone Bromide RS in the *Standard solution* (mg/mL)

C_U = concentration of Methylnaltrexone Bromide in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

- **Residue on Ignition** (281): NMT 0.1%

- **Organic Impurities**

Protect solutions containing methylnaltrexone from light.

Solution A, Solution B, Mobile phase, Diluent, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 1.4 $\mu\text{g/mL}$ of USP Methylnaltrexone Bromide RS in *Diluent*

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5%

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Methylnaltrexone Bromide taken:

$$\text{Result} = (r_U/r_S) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of methylnaltrexone from the *Sample solution*

F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*. The reporting threshold is 0.05%.

^e (17RS)-17-(Cyclopropylmethyl)-4,5a-epoxy-14-hydroxy-17-methyl-3-methoxy-6-oxomorphinanum bromide.

SPECIFIC TESTS

- **pH** (791)

Sample solution: 75 mg/mL in water; heat gently, if necessary, to dissolve. Allow the solution to cool to $25 \pm 2^\circ$ before measuring the pH.

Acceptance criteria: 4.3–5.3

- **Water Determination** (921), *Method Ic*: NMT 1.0%

- **Optical Rotation** (781S), *Specific Rotation*

Sample solution: 10 mg/mL in water

Acceptance criteria: -160° to -166° , measured at 20°

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers; store below 40° .

- **Labeling:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

- **USP Reference Standards** (11)

USP Methylnaltrexone Bromide RS

■ 2S (USP39)

BRIEFING

Metronidazole Extended-Release Tablets. Because there is no existing *USP* monograph for this dosage form, a new monograph, based on validated methods of analysis, is proposed. The liquid chromatographic procedures in the *Assay* and the test for *Organic Impurities* are based on analyses performed with the Inertsil ODS 3V brand of *L1* column. In the *Assay*, the typical retention time for metronidazole is about 6 min. In the test for *Organic Impurities*, the typical retention times for tinidazole related compound A and metronidazole are about 11 and 14 min, respectively.

(CHM1: S. Ramachandran, S. Shivaprasad.)
Correspondence Number—C151124

Comment deadline: November 30, 2015

Add the following:

■ **Metronidazole Extended-Release Tablets**

DEFINITION

Metronidazole Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of metronidazole ($C_6H_9N_3O_3$).

IDENTIFICATION

● **A. Ultraviolet Absorption** (197U)

Diluent: *Methanol* and *sulfuric acid* (350:1)

Standard stock solution: 15 mg/mL of USP Metronidazole RS in *dilute hydrochloric acid* (1 in 100). Sonicate to dissolve and pass through a suitable filter.

Standard solution: 18.8 μ g/mL of USP Metronidazole RS in *Diluent* from *Standard stock solution*

Sample stock solution: Nominally 15 mg/mL of metronidazole prepared as follows. Finely powder NLT 5 Tablets and transfer an amount equivalent to 300 mg of metronidazole into a 20-mL volumetric flask. Add about 15 mL of *dilute hydrochloric acid* (1 in 100) and shake mechanically for 30 min. Dilute with *dilute hydrochloric acid* (1 in 100) to volume and shake well. Pass through a suitable filter.

Sample solution: Nominally equivalent to 18.8 μ g/mL of metronidazole in *Diluent* from *Sample stock solution*.

Wavelength range: 200–400 nm

Acceptance criteria: Meet the requirement

● **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

● **Procedure**

Buffer: 1.4 g/L of *monobasic potassium phosphate* in water

Mobile phase: *Methanol* and *Buffer* (30:70)

Standard solution: 0.1 mg/mL of USP Metronidazole RS in *Mobile phase*

Sample stock solution: Nominally 2.0 mg/mL of metronidazole from NLT 20 finely powdered Tablets in *Mobile phase*, prepared as follows. Transfer a suitable amount of the powder to a suitable volumetric flask. Add 60% of the flask volume with *Mobile phase*, and shake by mechanical means for 30 min, dilute with *Mobile phase* to volume. Allow the solution to stand until the insoluble material settles.

Sample solution: Nominally 0.1 mg/mL of metronidazole in *Mobile phase* from the *Sample stock solution* supernatant. Pass the solution through a suitable filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 315 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing *L1*

Temperatures

Column: 30°

Autosampler: 15°

Flow rate: 1 mL/min

Injection volume: 10 μ L

Run time: 15 min

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of metronidazole ($C_6H_9N_3O_3$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of metronidazole from the *Sample solution*

r_S = peak response of metronidazole from the *Standard solution*

C_S = concentration of USP Metronidazole RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of metronidazole in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• Dissolution (711)

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Times: 2, 6, 10, and 16 h

Standard solution: 16.65 µg/mL of USP Metronidazole RS in *Medium*

Sample solution: At the times specified, withdraw 10 mL of the solution under test and pass through a suitable filter of 0.45-µm pore size. Replace the aliquots withdrawn for analysis with equal volumes of fresh portions of *Medium* maintained at 37°. Dilute with *Medium* to a concentration similar to that of the *Standard solution*.

Blank: *Medium*

Instrumental conditions

Mode: UV

Analytical wavelength: 320 nm

Cell: 1 cm

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration (C_i) of metronidazole ($C_6H_9N_3O_3$) in the sample withdrawn from the vessel at each time point (i).

$$\text{Result} = (A_U/A_S) \times C_S \times D$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Metronidazole RS in the *Standard solution* (mg/mL)

D = dilution factor, if needed

Calculate the percentage of the labeled amount (Q_i) of metronidazole ($C_6H_9N_3O_3$) dissolved at each time point (i).

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times V) + (C_1 \times V_S)] \times (1/L) \times 100$$

$$\text{Result}_3 = \{[C_3 \times V] + [(C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{(C_4 \times V) + [(C_3 + C_2 + C_1) \times V_S]\} \times (1/L) \times 100$$

C_i = concentration of metronidazole in the portion of sample withdrawn at the specified time point (mg/mL)

V = volume of the *Medium*, 900 mL

L = label claim (mg/Tablet)

V_S = volume of the *Sample solution* withdrawn at each time point and replaced with *Medium* (mL)

Tolerances: See *Table 1*.

Table 1

Time Point (i)	Time (h)	Amount Dissolved (%)
1	2	20–35
2	6	45–60
3	10	60–75
4	16	NLT 75

The percentages (Q) of the labeled amount of metronidazole ($C_6H_9N_3O_3$) released at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

- **Uniformity of Dosage Units** (905): Meet the requirements

IMPURITIES

- **Organic Impurities**

Buffer: Dissolve 1.5 g of *monobasic potassium phosphate* in 900 mL of water, adjust with *phosphoric acid* to a pH of 3.2, and dilute with water to 1000 mL.

Diluent: *Acetonitrile* and *Buffer* (45:55)

Mobile phase: See *Table 2*.

Table 2

Time (min)	Buffer (%)	Acetonitrile (%)
0	95	5
5	95	5
25	50	50
30	95	5
35	95	5

System suitability solution: 0.5 mg/mL of USP Metronidazole RS and 2.5 μ g/mL of USP Tinidazole Related Compound A RS in *Diluent*. Sonicate, if necessary, to dissolve.

Standard solution: 0.75 μ g/mL of USP Metronidazole RS in *Diluent*

Sample solution: Nominally 0.5 mg/mL of metronidazole from NLT 20 finely powdered Tablets in *Diluent*, prepared as follows. Transfer a suitable amount of the powder to a suitable volumetric flask. Add *Diluent* equivalent to 70% of the flask volume, sonicate for 15 min with intermittent shaking, and dilute with *Diluent* to volume. Allow the solution to stand until the insoluble material settles, and pass the supernatant through a suitable filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 315 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing *L1*

Autosampler temperature: 20°

Flow rate: 1 mL/min

Injection volume: 10 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between tinidazole related compound A and metronidazole, *System suitability solution*

Relative standard deviation: NMT 5.0% for metronidazole, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each individual degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each individual degradation product from the *Sample solution*

r_S = peak response of metronidazole from the *Standard solution*

C_S = concentration of USP Metronidazole RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of metronidazole in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 3*. Disregard any impurity peaks less than 0.05%.

Table 3

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Tinidazole related compound A	0.79	0.15
Metronidazole	1.0	—
Any individual unspecified degradation product	—	0.10
Total degradation products	—	0.50

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers. Store at controlled room temperature.
- **USP Reference Standards** <11>
 - USP Metronidazole RS
 - USP Tinidazole Related Compound A RS
 - 2-Methyl-5-nitroimidazole.
 - $C_4H_5N_3O_2$ 127.10

■ 2S (USP39)

BRIEFING

Miconazole, *USP 38* page 4393. As part of the USP monograph modernization effort, it is proposed to make the following changes:

1. Revise the test method in *Identification* test A to allow the flexibility for the test.

2. Replace the UV-based *Identification* test *B* with a retention time agreement in the proposed *Assay*.
3. Replace the titration procedure for *Assay* with a stability-indicating liquid chromatographic procedure. The HPLC procedure is based on analyses performed with the Phenomenex Kinetex Phenyl-Hexyl brand of *L11* column. The typical retention time for the miconazole peak is about 24 min.
4. Replace the TLC procedure in the test for *Organic Impurities* with an HPLC procedure similar to that proposed in the *Assay*.
5. Add the new Reference Standards used in the *Assay* and *Organic Impurities* tests to the *USP Reference Standards* section.

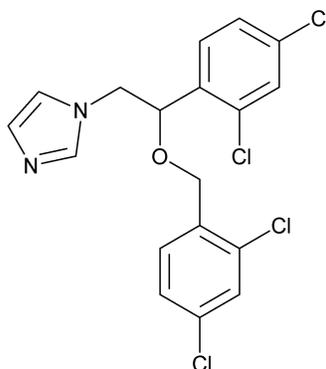

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(CHM6: R.-H. Yeh.)

Weigh an appropriate amount of each of the Reference Standards into a suitable volumetric flask, and dissolve in 25% of the final flask volume of *methanol*, then dilute with *Diluent* to volume.

Standard solution: 1.0 µg/mL each of USP Miconazole RS, USP Econazole Nitrate RS, USP Miconazole Related Compound C RS, USP Miconazole Related Compound F RS, and USP Miconazole Related Compound I RS in *Diluent* from *Standard stock solution*

Sample solution: 0.5 mg/mL of Miconazole in *Diluent* from *Sample stock solution*

System suitability

Sample: *Standard solution*

[Note—See *Table 2* for relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between miconazole related compound C and miconazole related compound I; NLT 1.5 between miconazole related compound I and econazole; NLT 1.5 between miconazole related compound F and miconazole

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of miconazole related compound C, miconazole related compound F, or miconazole related compound I in the portion of Miconazole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of miconazole related compound C, miconazole related compound F, or miconazole related compound I from the *Sample solution*

r_S = peak response of miconazole related compound C, miconazole related compound F, or miconazole related compound I from the *Standard solution*

C_S = concentration of USP Miconazole Related Compound C RS, USP Miconazole Related Compound F RS, or USP Miconazole Related Compound I RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = concentration of Miconazole in the *Sample solution* ($\mu\text{g/mL}$)

Calculate the percentage of econazole in the portion of Miconazole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of econazole from the *Sample solution*

r_S = peak response of econazole from the *Standard solution*

C_S = concentration of USP Econazole Nitrate RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = concentration of Miconazole in the *Sample solution* ($\mu\text{g/mL}$)

M_{r1} = molecular weight of econazole free base, 381.68

M_{r2} = molecular weight of econazole nitrate, 444.70

Calculate the percentage of any other individual specified or unspecified impurity in the portion of Miconazole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any other individual specified or unspecified impurity from the *Sample solution*

r_S = peak response of miconazole from the *Standard solution*

C_S = concentration of USP Miconazole RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = concentration of Miconazole in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: See *Table 2*. Disregard limit: 0.05%.

BRIEFING

Mupirocin Calcium, USP 38 page 4460. In preparation for the omission of the flame tests from *Identification Tests—General* (191) proposed in PF 41(2) [Mar.–Apr. 2015], it is proposed to replace the flame test for calcium with the oxalate precipitation test in the chapter. This is similar to the test for calcium in the *Japanese Pharmacopoeia* monograph for *Mupirocin Calcium Hydrate*. *Identification test A* is revised to remove the redundant requirement to use an undried sample. Because the label for USP Mupirocin Calcium RS states “Do not dry”, *Spectrophotometric Identification Tests* (197) indicates that the sample should also be undried. Additionally, minor editorial changes have been made to update the monograph to current USP style.

Nonanoic acid, 9-[[3-Methyl-1-oxo-4-[tetrahydro-3,4-dihydroxy-5-[[3-(2-hydroxy-1-methylpropyl)oxiranyl]methyl]-2*H*-pyran-2-yl]-2-butenyl]oxy-, calcium salt (2:1), dihydrate, [2*S*-[2*α*(*E*),3*β*,4*β*,5*α*[2*R**,3*R**(1*R**,2*R**)]]]-; (*αE*,2*S*,3*R*,4*R*,5*S*)-5-[(2*S*,3*S*,4*S*,5*S*)-2,3-Epoxy-5-hydroxy-4-methylhexyl]tetrahydro-3,4-dihydroxy-*β*-methyl-2*H*-pyran-2-crotonic acid, ester with 9-hydroxynonanoic acid, calcium salt (2:1), dihydrate [115074-43-6].

DEFINITION

Mupirocin Calcium contains the equivalent of NLT 865 µg/mg and NMT 936 µg/mg of mupirocin (C₂₆H₄₄O₉).

IDENTIFICATION**Change to read:**

- **A. Infrared Absorption** (197M)

Sample: Do not dry or

■ 2S (USP39)

grind extensively.

Acceptance criteria: Meets the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

Change to read:

- **C. Identification Tests—General** (191), *Calcium*: ~~When moistened with hydrochloric acid, it meets the requirements of the flame test.~~
 - Meets the requirements ■ 2S (USP39)

ASSAY

• **Procedure**

Solution A: 7.7 g/L of *ammonium acetate* in water, adjusted with *glacial acetic acid* to a pH of 5.7 before diluting to the final volume

Mobile phase: *Tetrahydrofuran* and *Solution A* (32:68)

Standard solution: 125 µg/mL of USP Mupirocin Lithium RS prepared as follows. Transfer a suitable amount of USP Mupirocin Lithium RS to a suitable volumetric flask, dissolve in *methanol*, using 2.5% of the final volume, and dilute with *Solution A* to volume.

System suitability solution: Adjust 10 mL of the *Standard solution* with 6 N *hydrochloric acid* to a pH of 2.0, and allow to stand for 20 h.

Sample solution: Transfer 25 mg of Mupirocin Calcium to a 200-mL volumetric flask, dissolve in 5 mL of *methanol*, and dilute with *Solution A* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 25-cm; 5-µm packing L7

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 7.0 between the second of the two peaks corresponding to mupirocin rearrangement products and the peak corresponding to mupirocin, *System suitability solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the quantity, in µg/mg, of mupirocin (C₂₆H₄₄O₉) in the portion of Mupirocin Calcium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

r_U = peak area of mupirocin from the *Sample solution*

r_S = peak area of mupirocin from the *Standard solution*

C_S = concentration of USP Mupirocin Lithium RS in the *Standard solution* (mg/mL)

C_U = concentration of Mupirocin Calcium in the *Sample solution* (mg/mL)

P = potency of mupirocin in USP Mupirocin Lithium RS ($\mu\text{g}/\text{mg}$)

Acceptance criteria: 865–936 $\mu\text{g}/\text{mg}$

IMPURITIES

• Chloride and Sulfate (221), Chloride

Analysis: Dissolve 50 mg in a mixture of 1 mL of 2 N nitric acid and 15 mL of methanol. Add 1 mL of silver nitrate TS.

Acceptance criteria: The turbidity does not exceed that produced by 0.70 mL of 0.020 N hydrochloric acid (0.5%).

• Organic Impurities

Solution A: Prepare as directed in the Assay.

Solution B: 13.6 g/L of sodium acetate in water, adjusted with glacial acetic acid to a pH of 4.0 before diluting to the final volume

Mobile phase: Tetrahydrofuran and Solution A (30:70)

Diluent: Methanol and Solution B (1:1)

Standard solution: 125 $\mu\text{g}/\text{mL}$ of USP Mupirocin Lithium RS in Diluent

System suitability solution: Adjust 10 mL of the Standard solution with 6 N hydrochloric acid to a pH of 2.0, allow to stand for 20 h, and adjust with 5 N sodium hydroxide to a pH of 4.0.

Sample solution: 5 mg/mL of Mupirocin Calcium in Diluent

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 240 nm

Column: 4.6-mm \times 25-cm; 5- μm packing L7

Flow rate: 1 mL/min

Injection volume: 20 μL

System suitability

Samples: Standard solution and System suitability solution

[Note—The relative retention times for two mupirocin rearrangement products and mupirocin in the System suitability solution are 0.63, 0.67, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 7.0 between the mupirocin rearrangement product, with a relative retention time of about 0.67, and mupirocin, System suitability solution

Column efficiency: NLT 3000 theoretical plates for the mupirocin peak, Standard solution

Tailing factor: NMT 2 for the mupirocin peak, *Standard solution*

Relative standard deviation: NMT 5% for the mupirocin peak, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each related compound in the portion of Mupirocin Calcium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak area of any impurity from the *Sample solution*

r_S = peak area of mupirocin from the *Standard solution*

C_S = concentration of USP Mupirocin Lithium RS in the *Standard solution* (mg/mL)

C_U = concentration of Mupirocin Calcium in the *Sample solution* (mg/mL)

P = potency of mupirocin in USP Mupirocin Lithium RS ($\mu\text{g}/\text{mg}$)

F = conversion factor, 0.001 mg/ μg

Acceptance criteria: See *Table 1*. Disregard any peak with an area less than 0.05 times the area of the mupirocin peak in the *Standard solution*.

Table 1

Name	Relative Retention Time	Acceptance Criteria NMT (%)
Pseudomonic acid D ^a	0.75	2.5
Mupirocin	1.0	—
Any other unspecified impurity	—	1
Total impurities	—	4.5
^a (E)-9-{{(E)-4-[(2S,3R,4R,5S)-3,4-Dihydroxy-5-{{(2S,3S)-3-[(2S,3S)-3-hydroxybutan-2-yl]oxiran-2-yl}methyl)tetrahydro-2H-pyran-2-yl]-3-methylbut-2-enoyloxy}non-4-enoic acid.		

SPECIFIC TESTS

- **Optical Rotation** (781S), *Specific Rotation*
Sample solution: 50 mg/mL in *methanol*
Acceptance criteria: -16° to -20°
- **Water Determination** (921), *Method I*: 3.0%–4.5%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers. Store at 25° , excursions permitted between 15° and 30° .
- **USP Reference Standards** (11)
 USP Mupirocin Calcium RS
 USP Mupirocin Lithium RS

BRIEFING

Nebivolol Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph, based on validated test methods, is proposed.

1. The proposed liquid chromatographic procedures in the *Assay* and the *Dissolution* test were validated using the Hypersil BDS C18 brand of L1 column. The test for *Organic Impurities* was validated using the Sunfire C18 brand of L1 column. Another suitable column for the *Assay* and the test for *Organic Impurities* is the Eclipse plus C-18 brand of L1 column. The typical retention times for nebivolol are about 5.5 and 9 min, respectively, based on the conditions specified in the *Assay* and in the test for *Organic Impurities*.

This monograph is contingent on FDA approval of a product that meets the proposed monograph.

(CHM2: S. Ramakrishna.)

Correspondence Number—C109140

Comment deadline: November 30, 2015

Add the following:

► **Nebivolol Tablets**

DEFINITION

Nebivolol Tablets contain an amount of nebivolol hydrochloride equivalent to NLT 95.0% and NMT 105.0% of the labeled amount of nebivolol ($C_{22}H_{25}F_2NO_4$) free base.

IDENTIFICATION

- **A.** The UV absorption spectra of the major peak of the *Sample solution* exhibit maxima and minima at the same wavelengths as those of the corresponding peak of the *Standard solution*, as obtained in the *Assay*.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **Procedure**

Dilute phosphoric acid: Dilute 1.0 mL of phosphoric acid with water to 1 L.

Buffer: Dissolve 2.72 g of monobasic potassium phosphate in 1 L of water and add 2.0 mL of triethylamine. Adjust with *Dilute phosphoric acid* to a pH of 3.0.

Mobile phase: Acetonitrile, methanol, and *Buffer* (25:30:45)

Diluent: Acetonitrile and *Dilute phosphoric acid* (55:45)

Standard stock solution: 0.55 mg/mL of USP Nebivolol Hydrochloride RS in *Diluent*. Initially fill with *Diluent* to about 70% of the total volume and sonicate. Further dilute with *Diluent* to volume.

Standard solution: 0.044 mg/mL of USP Nebivolol Hydrochloride RS in *Diluent* from the *Standard stock solution*

Sample stock solution: Nominally equivalent to 0.4 mg/mL of nebivolol in *Diluent*, prepared from a sufficient number of Tablets as follows. To an appropriate number of Tablets (NLT 10) in a suitable volumetric flask, add water to fill 10% of the volume of the flask, let stand for 10 min, and sonicate to disperse. Add *Diluent* to fill 80% of the total volume and sonicate for 30 min with intermittent shaking. Allow to cool to room temperature and dilute with *Diluent* to volume. Centrifuge the sample solution at 3500 rpm for 10 min in a stoppered centrifuge tube.

Sample solution: Nominally equivalent to 0.044 mg/mL of nebivolol in *Diluent* from the *Sample stock solution*. Pass through a suitable filter of 0.45- μ m pore size, discarding the first few mL of filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector

Assay: UV 281 nm

Identification A: Diode array, UV 200–400 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Autosampler temperature: 10°

Flow rate: 1 mL/min

Injection volume: 20 μ L

Run time: NLT 1.8 times the retention time of the nebivolol peak

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of nebivolol ($C_{22}H_{25}F_2NO_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of nebivolol from the *Sample solution*

r_S = peak response of nebivolol from the *Standard solution*

C_S = concentration of USP Nebivolol Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of nebivolol in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of nebivolol, 405.44

M_{r2} = molecular weight of nebivolol hydrochloride, 441.90

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

- **Dissolution** (711)

Medium: 0.01 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Buffer: Proceed as directed in the *Assay*.

Mobile phase: Acetonitrile and *Buffer* (45:55)

Diluent: Acetonitrile and water (50:50)

Standard stock solution 1: 0.6 mg/mL of USP Nebivolol Hydrochloride RS in *Diluent*.

Initially add *Diluent* to fill about 70% of the total volume, sonicate to dissolve, and dilute with *Diluent* to volume.

Standard stock solution 2: 0.06 mg/mL of USP Nebivolol Hydrochloride RS in *Medium* from *Standard stock solution 1*

Standard solution: Prepare solutions with concentrations shown in *Table 1* using *Medium* from *Standard stock solution 2*.

Table 1

Tablet Strength (mg)	Concentration (µg/mL)
2.5	3
5	6
10	12
20	24

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size, and discard the first 5 mL of the filtrate.

Chromatographic system: Proceed as directed in the *Assay* except for the *Run time*.

Run time: NLT 1.5 times the retention time of the nebivolol peak

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of nebivolol (C₂₂H₂₅F₂NO₄) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of nebivolol from the *Sample solution*

r_S = peak response of nebivolol from the *Standard solution*

C_S = concentration of USP Nebivolol Hydrochloride RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

M_{r1} = molecular weight of nebivolol, 405.44

M_{r2} = molecular weight of nebivolol hydrochloride, 441.90

Tolerances: NLT 80% (Q) of the labeled amount of nebivolol ($C_{22}H_{25}F_2NO_4$) is dissolved.

- **Uniformity of Dosage Units** (905): Meet the requirements

IMPURITIES

- **Organic Impurities**

Buffer: Dissolve 3.4 g of tetrabutylammonium hydrogen sulfate and 2.72 g of potassium dihydrogen phosphate in 1000 mL of water, and add 0.3 mL of diethylamine.

Solution A: Acetonitrile and *Buffer* (25:75)

Solution B: Acetonitrile and water (90:10)

Mobile phase: See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	100	0
20	100	0
50	80	20
60	80	20
65	100	0
70	100	0

Dilute phosphoric acid: Dilute 1.0 mL of phosphoric acid with water to 1 L.

Diluent: Acetonitrile and *Dilute phosphoric acid* (30:70)

Standard stock solution: 0.44 mg/mL of USP Nebivolol Hydrochloride RS in *Diluent*. Add *Diluent* to fill about 70% of the total volume, sonicate to dissolve, and dilute with *Diluent* to volume.

Standard solution: 2.2 µg/mL of USP Nebivolol Hydrochloride RS in *Diluent* from the *Standard stock solution*

Sample solution: Nominally equivalent to 1 mg/mL of nebivolol in *Diluent*, prepared as follows from crushed and finely powdered Tablets (see *Table 3*)

Table 3

Tablet Strength (mg)	Number of Tablets
2.5	50
5	25
10	20
20	20

Transfer an appropriate quantity from finely powdered Tablets to a suitable volumetric flask. Add *Diluent* to about 70% of the flask volume and sonicate for 30 min with intermittent shaking. Allow the solution to cool to room temperature and dilute with *Diluent* to volume. Pass through a suitable filter of 0.45- μ m pore size and discard the first 5 mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Temperatures

Autosampler: 15°

Column: 35°

Flow rate: 2 mL/min

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each degradation impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of nebivolol from the *Standard solution*

C_S = concentration of USP Nebivolol Hydrochloride RS in the *Standard solution* (μ g/mL)

C_U = nominal concentration of nebivolol in the *Sample solution* (μ g/mL)

M_{r1} = molecular weight of nebivolol, 405.44

M_{r2} = molecular weight of nebivolol hydrochloride, 441.90

Acceptance criteria

Individual degradation impurities: NMT 0.2%

Total degradation impurities: NMT 1.0%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Store at controlled room temperature in tight, light-resistant containers.
- **USP Reference Standards** <11>
USP Nebivolol Hydrochloride RS

◀(TBD)

BRIEFING

Nebivolol Hydrochloride. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated test methods, is proposed.

1. The liquid chromatographic procedures for the *Assay* and the test for *Organic Impurities* were validated using the Hypersil BDS C-18 brand of L1 column. The typical retention time for nebivolol is about 11 min under the conditions specified.
2. The liquid chromatographic procedure for the *Content of Nebivolol Related Compound C and Nebivolol Related Compound D* was validated using the Hypersil BDS C-18 brand of L1 column. The typical retention times for the nebivolol related compound C and nebivolol related compound D peaks are about 25 and 29 min, respectively.

This monograph is contingent on FDA approval of a product that meets the proposed monograph.

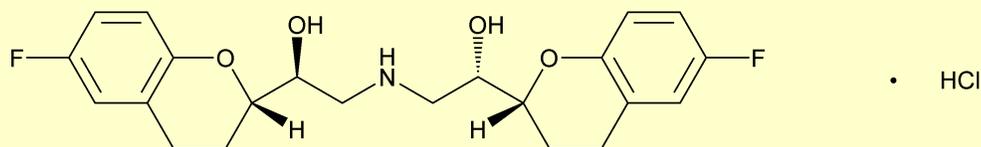

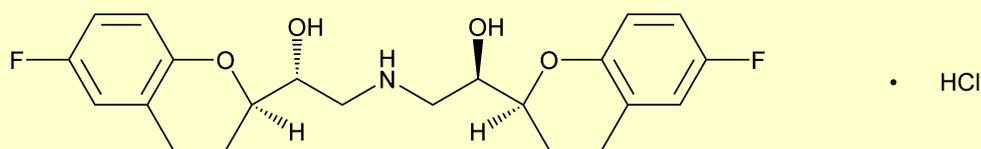

(CHM2: S. Ramakrishna.)

Correspondence Number—C108485

Comment deadline: November 30, 2015

Add the following:

►Nebivolol Hydrochloride

$C_{22}H_{25}F_2NO_4 \cdot HCl$ 441.90

2*H*-1-Benzopyran-2-methanol, α,α' -[iminobis(methylene)]bis[6-fluoro-3,4-dihydro]-, hydrochloride, (*aR,a'R,2R,2'S*)-*rel*-; (*1RS,1'RS*)-1,1'-[(*2RS,2'SR*)-Bis(6-fluoro-3,4-dihydro-2*H*-1-benzopyran-2-yl)]-2,2'-

iminodiethanol hydrochloride [152520-56-4].

DEFINITION

Nebivolol Hydrochloride contains NLT 98.0% and NMT 102.0% of nebivolol hydrochloride ($C_{22}H_{25}F_2NO_4 \cdot HCl$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. Infrared Absorption** (197K): Meets the requirements
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. Identification Tests—General** (191), *Chloride*: Meets the requirements

ASSAY

• Procedure

Buffer: Dissolve 3.4 g of tetrabutylammonium hydrogen sulfate in 1 L of water. Add 0.3 mL of diethylamine and mix.

Mobile phase: Acetonitrile and *Buffer* (25:75)

Diluent: Dilute 1.0 mL of phosphoric acid with water to 1 L.

Standard stock solution: 0.5 mg/mL of USP Nebivolol Hydrochloride RS prepared as follows. To an appropriate amount of USP Nebivolol Hydrochloride RS in a suitable volumetric flask, add acetonitrile to fill 50% of the total volume followed by *Diluent* to fill 75% of the total volume. Sonicate to dissolve and dilute with *Diluent* to volume.

Standard solution: 0.1 mg/mL of USP Nebivolol Hydrochloride RS from the *Standard stock solution* prepared as follows. To an appropriate volume of the *Standard stock solution* in a suitable volumetric flask, add acetonitrile to fill 50% of the total volume and dilute with *Diluent* to volume.

Sample stock solution: 0.5 mg/mL of Nebivolol Hydrochloride prepared as follows. To an appropriate amount of Nebivolol Hydrochloride in a suitable volumetric flask, add acetonitrile to fill 50% of the total volume followed by *Diluent* to fill 75% of the total volume. Sonicate to dissolve and dilute with *Diluent* to volume.

Sample solution: 0.1 mg/mL of Nebivolol Hydrochloride from the *Sample stock solution* prepared as follows. To an appropriate volume of the *Sample stock solution* in a suitable volumetric flask, add acetonitrile to fill 50% of the total volume and dilute with *Diluent* to volume.

Chromatographic system

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of nebivolol hydrochloride ($C_{22}H_{25}F_2NO_4 \cdot HCl$) in the portion of Nebivolol Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of nebivolol from the *Sample solution*

r_S = peak response of nebivolol from the *Standard solution*

C_S = concentration of USP Nebivolol Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Nebivolol Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

- **Residue on Ignition** (281): NMT 0.10%
- **Organic Impurities**

Buffer, Mobile phase, and Diluent: Prepare as directed in the *Assay*.

Standard stock solution 1: 0.125 mg/mL each of USP Nebivolol Related Compound A RS, USP Nebivolol Related Compound B RS, and USP Nebivolol Related Compound E RS prepared as follows. To appropriate amounts of USP Nebivolol Related Compound A RS, USP Nebivolol Related Compound B RS, and USP Nebivolol Related Compound E RS in a suitable volumetric flask, add acetonitrile to fill 50% of the total volume followed by *Diluent* to fill 75% of the total volume. Sonicate to dissolve, and dilute with *Diluent* to volume.

System suitability solution: 0.5 mg/mL of USP Nebivolol Hydrochloride RS and 0.75 μ g/mL each of USP Nebivolol Related Compound A RS, USP Nebivolol Related Compound B RS, and USP Nebivolol Related Compound E RS, in *Diluent* prepared as follows. To an appropriate amount of USP Nebivolol Hydrochloride RS in a suitable volumetric flask, add a suitable amount of *Standard stock solution 1* and acetonitrile to fill 50% of the total volume, followed by *Diluent* to fill 75% of the total volume. Sonicate to dissolve, and dilute with *Diluent* to volume.

Standard stock solution 2: 15 μ g/mL of USP Nebivolol Hydrochloride RS prepared as follows. To an appropriate amount of USP Nebivolol Hydrochloride RS in a suitable volumetric flask, add acetonitrile to fill 50% of the total volume followed by *Diluent* to fill 75% of the total volume. Sonicate to dissolve, and dilute with *Diluent* to volume.

Standard solution: 1.5 µg/mL of USP Nebivolol Hydrochloride RS and 0.75 µg/mL each of USP Nebivolol Related Compound A RS, USP Nebivolol Related Compound B RS, and USP Nebivolol Related Compound E RS from *Standard stock solution 1* and *Standard stock solution 2* prepared as follows. To an appropriate volume of *Standard stock solution 2* in a suitable volumetric flask, add a suitable volume of *Standard stock solution 1* and acetonitrile to fill 50% of the total volume. Dilute with *Diluent* to volume.

Sample solution: 0.5 mg/mL of Nebivolol Hydrochloride prepared as follows. To an appropriate amount of Nebivolol Hydrochloride in a suitable volumetric flask, add acetonitrile to fill 50% of the total volume followed by *Diluent* to fill 75% of the total volume. Sonicate to dissolve, and dilute with *Diluent* to volume.

Chromatographic system: Proceed as directed in the *Assay* except for the *Run time*.

Run time: NLT 5.5 times the retention time of the nebivolol peak

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between nebivolol and nebivolol related compound A; NLT 2.0 between nebivolol and the second-eluting nebivolol related compound B peak (closer to the nebivolol peak, relative retention time 0.90), *System suitability solution*

Tailing factor: NMT 2.0 for the nebivolol peak, *Standard solution*

Relative standard deviation: NMT 10.0% for the nebivolol peak, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each specified impurity in the portion of Nebivolol Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each specified impurity from the *Sample solution*

r_S = peak response of the corresponding nebivolol related compound from the *Standard solution*

C_S = concentration of the corresponding USP Nebivolol Related Compound RS in the *Standard solution* (mg/mL)

C_U = concentration of Nebivolol Hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of any unspecified impurity in the portion of Nebivolol Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any unspecified impurity from the *Sample solution*

r_S = peak response of nebivolol from the *Standard solution*

C_S = concentration of USP Nebivolol Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Nebivolol Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, (NMT %)
Nebivolol related compound E	0.76	0.15
Nebivolol related compound B	0.85 and 0.90	0.15
Nebivolol	1.00	—
Nebivolol related compound A	1.15	0.15
Any unspecified impurity	—	0.10
Total impurities	—	0.75

● **Content of Nebivolol Related Compound C and Nebivolol Related Compound D**

[Note—All solutions containing nebivolol related compound C are prepared fresh prior to use.]

Buffer, Mobile phase, and Diluent: Prepare as directed in the Assay.

Standard stock solution 1: 0.3 mg/mL of USP Nebivolol Related Compound C RS and USP Nebivolol Related Compound D RS prepared as follows. To an appropriate amount of USP Nebivolol Related Compound C RS and USP Nebivolol Related Compound D RS in a suitable volumetric flask, add acetonitrile to fill 50% of the total volume, followed by *Diluent* to fill 75% of the total volume. Sonicate to dissolve and dilute with *Diluent* to volume.

Standard stock solution 2: 15 µg/mL of USP Nebivolol Related Compound C RS and USP Nebivolol Related Compound D RS in *Diluent* from *Standard stock solution 1*

Standard solution: 0.375 µg/mL of USP Nebivolol Related Compound C RS and USP Nebivolol Related Compound D RS in *Diluent* from *Standard stock solution 2*

Sample solution: 10 mg/mL of Nebivolol Hydrochloride prepared as follows. To an appropriate amount of Nebivolol Hydrochloride in a suitable volumetric flask, add acetonitrile to fill 50% of the total volume followed by *Diluent* to fill 75% of the total volume. Sonicate to dissolve, and dilute with *Diluent* to volume. Filter if necessary using a suitable filter of 0.45-µm pore size, and discard the first 2 mL of the filtrate.

Chromatographic system: Proceed as directed in the Assay except for the *Injection volume* and *Run time*.

Injection volume: 50 µL

Run time: NLT 4 times the retention time of the nebivolol peak

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between the nebivolol related compound D and nebivolol related compound C peaks

Relative standard deviation: NMT 10.0% for both peaks

Signal-to-noise ratio: NLT 15 for both peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of nebivolol related compound D and nebivolol related compound

C in the portion of Nebivolol Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the corresponding nebivolol related compound from the *Sample solution*

r_S = peak response of the corresponding nebivolol related compound from the *Standard solution*

C_S = concentration of the corresponding USP Nebivolol Related Compound RS in the *Standard solution* (mg/mL)

C_U = concentration of Nebivolol Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (ppm)
Nebivolol	1.00	—
Nebivolol related compound C	2.63	37.5
Nebivolol related compound D	2.7	37.5
Total impurities	—	37.5

SPECIFIC TESTS

- **Water Determination** (921), *Method I*: NMT 1.0%
- **Optical Rotation** (781S), *Procedures, Specific Rotation*

Sample solution: 20 mg/mL of Nebivolol Hydrochloride in 80% tetrahydrofuran in water

Acceptance criteria: $0.0^\circ \pm 1.0^\circ$, measured at 20°

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Protect from light and moisture, and store at controlled room temperature.
- **USP Reference Standards** (11)
 - USP Nebivolol Hydrochloride RS
 - USP Nebivolol Related Compound A RS
 - A mixture of (S)-1-[(R)-6-Fluorochroman-2-yl]-2-({(R)-2-[(S)-6-fluorochroman-2-yl]-2-hydroxyethyl}amino)ethanol;
 - (R,1S,1'S)-2,2'-Azanediylobis{1-[(R)-6-fluorochroman-2-yl]ethanol};
 - (S,1R,1'R)-2,2'-Azanediylobis{1-[(S)-6-fluorochroman-2-yl]ethanol}.
 - $C_{22}H_{25}F_2NO_4 \cdot HCl$ 441.90
 - USP Nebivolol Related Compound B RS
 - A mixture of (R)-1-[(R)-6-Fluorochroman-2-yl]-2-({(S)-2-[(S)-6-fluorochroman-2-yl]-2-hydroxyethyl}amino)ethanol;
 - (R)-1-[(R)-6-Fluorochroman-2-yl]-2-({(R)-2-[(R)-6-fluorochroman-2-yl]-2-hydroxyethyl}amino)ethanol;
 - (S)-1-[(S)-6-Fluorochroman-2-yl]-2-({(S)-2-[(S)-6-fluorochroman-2-yl]-2-hydroxyethyl}amino)ethanol.

$C_{22}H_{25}F_2NO_4 \cdot HCl$ 441.90

USP Nebivolol Related Compound C RS

(*RS*)-6-Fluoro-2-[(*RS*)-oxiran-2-yl]chroman.

$C_{11}H_{11}FO_2$ 194.20

USP Nebivolol Related Compound D RS

(*RS*)-6-Fluoro-2-[(*SR*)-oxiran-2-yl]chroman.

$C_{11}H_{11}FO_2$ 194.20

USP Nebivolol Related Compound E RS

1-(Chroman-2-yl)-2-{[2-(6-fluorochroman-2-yl)-2-hydroxyethyl]amino}ethanol.

$C_{22}H_{26}FNO_4$ 387.44

◀(TBD)

BRIEFING

Niacin, page 7447 of the *First Supplement to USP 38*. On the basis of comments received, the following changes are proposed:

1. Change the acceptance criteria in *Identification* test B.
2. Remove the limit for total specific impurities in *Table 2* of the *Related Compounds* test.
3. Replace the limit for total unspecified impurities with the limit for total impurities in *Table 2* of the *Related Compounds* test.

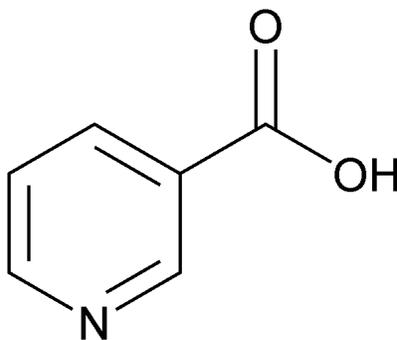

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(NBDS: H. Dinh.)

Correspondence Number—C162311

Comment deadline: November 30, 2015

Niacin

$C_6H_5NO_2$ 123.11

3-Pyridinecarboxylic acid;
Nicotinic acid [59-67-6].

DEFINITION

Change to read:

Niacin contains NLT \blacksquare 98.0% \blacksquare 1S (USP38) and NMT \blacksquare 102.0% \blacksquare 1S (USP38) of niacin ($C_6H_5NO_2$), calculated on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption** (197M)

Change to read:

- **B. Ultraviolet Absorption** (197U)

Wavelength range: 200–300 nm

\blacksquare **Buffer solution:** Dissolve 6.8 g of *monobasic potassium phosphate* in 1000 mL of water. Adjust with 50% sodium hydroxide solution to a pH of 7.0. \blacksquare 1S (USP38)

Sample solution: 20 μ g/mL in *Buffer solution*

Acceptance criteria: Meets the requirements. The A_{237}/A_{262} ratio is 0.46–0.50

\blacksquare A_{239}/A_{263} ratio is 0.46–0.52. \blacksquare 2S (USP39)

Add the following:

- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. \blacksquare 1S (USP38)

ASSAY

Change to read:

- **Procedure**

\blacksquare **Diluent:** Methanol and water (82:18)

Mobile phase: Methanol and water (82:18), adjusted with *glacial acetic acid* to a pH of 3.15 ± 0.05

System suitability solution: 0.25 mg/mL of USP Niacin RS, 0.050 mg/mL of USP 6-Hydroxynicotinic Acid RS, and 0.10 mg/mL of pyridine in *Diluent*

Standard solution: 0.25 mg/mL of USP Niacin RS in *Diluent*

Sample solution: 0.25 mg/mL of Niacin in *Diluent*

 - USP Niacin RS

BRIEFING

Phenol, *USP 38* page 4839. As part of the USP monograph modernization effort, the following revisions are proposed:

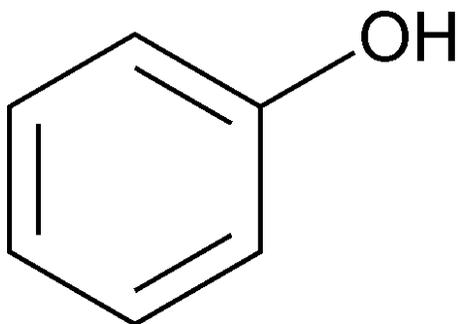

1. Replace the wet chemistry-based *Identification* tests *A* and *B* with an IR procedure and a retention time agreement based on the proposed *Assay*.
2. Replace the titration procedure in the *Assay* with a more specific HPLC procedure. The HPLC procedure is based on the analysis performed with the Dionex Acclaim Organic Acid brand of L60 column. The typical retention time for phenol is about 4 min.
3. Widen the *Definition* and *Assay* acceptance criteria from 99.0%–100.5% to 98.0%–102.0%, which is typical for a chromatographic assay.
4. Delete the *Clarity of Solution and Reaction* and *Congearing Temperature* tests in the *Specific Tests* section because the monograph contains sufficient tests to ensure the quality of the material.
5. Add USP Phenol RS to the *USP Reference Standards* section to support the proposed *Assay*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(CHM6: D.A. Porter.)

BRIEFING

Promethazine Hydrochloride Oral Solution, USP 38 page 5028. As part of the USP monograph modernization efforts, the following changes are proposed:

1. Replace the current *Identification* test *A* with the HPLC retention time agreement from the proposed *Assay* procedure. The current test uses toxic carbon disulfide in determining the IR absorption spectrum.
2. Add *Identification* test *B* based on the photodiode array spectrum agreement from the proposed *Assay*.
3. Replace the current UV absorbance procedure in the *Assay* with the same HPLC procedure that is proposed in the test for *Organic Impurities*. The procedure is based on analyses performed with the Inertsil ODS-3V brand of L1 column. The typical retention time for promethazine is about 10 min.
4. Add a test for *Organic Impurities*. The proposed HPLC procedure has the same chromatographic conditions as in the proposed *Assay*.
5. Add USP Promethazine Related Compound B RS to the *USP Reference Standards* section to support the proposed procedures in the *Assay* and the test for *Organic Impurities*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Promethazine Hydrochloride Oral Solution

DEFINITION

Promethazine Hydrochloride Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled

amount of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$).

[Note—Throughout the following procedures, protect the samples, Reference Standards, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

IDENTIFICATION

Change to read:

• A.

~~**Sample:** Treat 25 mL of Oral Solution as directed in the Assay, ending with “using only a current of air”.~~

~~**Analysis:** Dissolve the Sample in 2.5 mL of carbon disulfide, filter through paper if necessary, and determine the IR absorption spectrum as directed under *Identification: Organic Nitrogenous Bases* (181), obtaining the spectrum of USP Promethazine Hydrochloride RS as directed.~~

~~**Acceptance criteria:** Meets the requirements~~

■ The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay. ■ 2S (USP39)

Add the following:

■ • B. The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay. ■ 2S (USP39)

ASSAY

Change to read:

• Procedure

[Note—Use low-actinic glassware in this assay.]

~~**Standard solution:** 50 µg/mL of USP Promethazine Hydrochloride RS in dilute sulfuric acid (1 in 100)~~

~~**Sample solution:** Transfer a volume of Oral Solution, containing nominally 25 mg of promethazine hydrochloride to a 250-mL separator. Add 10 mL of ammonium hydroxide, and extract the promethazine base with six 40-mL portions of chloroform. Wash the combined chloroform extracts with 25 mL of dilute hydrochloric acid (1 in 9). Wash the acid solution with 25 mL of chloroform, and add the washings to the main chloroform extract. Evaporate the chloroform extract on a steam bath, with the aid of a current of air, to a volume of 5–10 mL, and finally evaporate, using only a current of air, to dryness. Dissolve the residue, with slight warming, in dilute sulfuric acid (1 in 100), and transfer to a 500-mL volumetric flask with the aid of additional acid. Cool, add dilute sulfuric acid (1 in 100) to volume, mix, and filter, rejecting the first half of the filtrate.~~

~~Instrumental conditions~~

~~**Mode:** UV~~

~~**Analytical wavelength:** Maximum absorbance at about 298 nm~~

~~**Cell:** 1 cm~~

~~**Blank:** Dilute sulfuric acid (1 in 100)~~

Analysis**Samples:** ~~Standard solution and Sample solution~~

Concomitantly determine the absorbances and calculate the percentage of the labeled amount of promethazine hydrochloride ($C_{17}H_{20}N_2S \cdot HCl$) in the portion of the Oral Solution taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the ~~Sample solution~~

A_S = absorbance of the ~~Standard solution~~

C_S = concentration of USP Promethazine Hydrochloride RS in the ~~Standard solution~~ ($\mu\text{g/mL}$)

C_U = nominal concentration of promethazine hydrochloride in the ~~Sample solution~~ ($\mu\text{g/mL}$)

Acceptance criteria: ~~90.0%–110.0%~~

BRIEFING

Quetiapine Extended-Release Tablets. Because there is no existing *USP* monograph for this dosage form, a new monograph based on validated methods of analysis is proposed. The isocratic liquid chromatographic procedures in the *Assay* and the test for *Organic Impurities* are based on analyses performed with the Zorbax RX C8 brand of L7 column. The typical retention time for quetiapine is about 15 min.

(CHM4: R. Ravichandran.)

Correspondence Number—C143427

Comment deadline: November 30, 2015

Add the following:

- **Quetiapine Extended-Release Tablets**

DEFINITION

Quetiapine Extended-Release Tablets contain quetiapine fumarate $[(C_{21}H_{25}N_3O_2S)_2 \cdot (C_4H_4O_4)]$ equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$).

IDENTIFICATION

- **A. Infrared Absorption** (197F)

Standard solution: Transfer 10 mg of USP Quetiapine Fumarate RS to a suitable vial. Add 10 mL of acetone and cap the vial. Sonicate for about 10 min. Allow the solution to equilibrate to room temperature. Evaporate the acetone completely. Add 2 mL of chloroform. Gently swirl for several min. Pass through a suitable filter of 0.45- μ m pore size. Use the filtrate.

Sample solution: Grind NLT 10 Tablets. Transfer an amount of powder equivalent to NLT 10 mg of quetiapine fumarate to a suitable vial. Add 10 mL of acetone and cap the vial. Sonicate for about 10 min. Allow the solution to equilibrate to room temperature. Evaporate the acetone completely. Add 2 mL of chloroform. Gently swirl for several min. Pass through a suitable filter of 0.45- μ m pore size. Use the filtrate.

Acceptance criteria: Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• Procedure

Buffer: Dissolve 2.6 g/L of *dibasic ammonium phosphate* in water.

Mobile phase: Methanol, acetonitrile, and *Buffer* (54:7:39)

Diluent: Acetonitrile and water (50:50)

System suitability stock solution: 0.5 mg/mL of USP Quetiapine System Suitability RS in *Mobile phase* prepared as follows. Transfer the required quantity of USP Quetiapine System Suitability RS to a suitable volumetric flask. Add 70% of the flask volume of *Mobile phase* and sonicate to dissolve. Dilute with *Mobile phase* to volume.

System suitability solution: 0.005 mg/mL of USP Quetiapine Related Compound H RS in *System suitability stock solution*

Standard solution: 0.2 mg/mL of USP Quetiapine Fumarate RS in *Mobile phase*

Sample stock solution: Transfer NLT 5 Tablets to a homogenizer vessel. Add 50 mL of acetonitrile, swirl to wet, and allow to stand for approximately 10 min. Add an additional 160 mL of *Diluent* and extract for about 10 min. Transfer the contents of the homogenizer to a 500-mL volumetric flask. Dilute with *Diluent* to volume. Pass a portion of the solution through a suitable filter of 0.45- μ m pore size and use the filtrate.

Sample solution: Nominally 0.16–0.18 mg/mL of quetiapine from the *Sample stock solution* in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L7

Flow rate: 1.3 mL/min

Injection volume: 30 μ L

Run time: NLT 2.5 times the retention time of quetiapine

System suitability

Samples: *System suitability solution* and *Standard solution*
[Note—See *Table 2* for the relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between quetiapine related compound G and quetiapine related compound H; NLT 2.0 between the quetiapine desthoxy and quetiapine peaks; *System suitability solution*

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times N \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Quetiapine Fumarate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of quetiapine in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of quetiapine free base, 383.51

M_{r2} = molecular weight of quetiapine fumarate, 883.09

N = number of moles of quetiapine free base per mole of quetiapine fumarate, 2

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• Dissolution (711)

Medium 1: Citrate buffer, pH 4.8. Dissolve 9.6 g of *anhydrous citric acid* in 600 mL of water. Add 90 mL of *1 N sodium hydroxide*. Dilute with water to 1 L, 900 mL.

Medium 2: Dissolve 17.9 g/L of *dibasic sodium phosphate dodecahydrate* in 400 mL of water. Add 460 mL of *1 N sodium hydroxide* and dilute with water to 1 L, 100 mL.

[Note—It is recommended to check the pH of the mixture of 90 mL of *Medium 1* and 10 mL of *Medium 2*, which should be between 6.4 and 6.8. If the pH of the mixture is less than 6.4, 10 mL/L of *1 N sodium hydroxide* may be added to *Medium 2*. If the pH of the mixture is greater than 6.8, 10 mL/L of *1 N hydrochloric acid* may be added to *Medium 2*.]

Start the test with 900 mL of *Medium 1*. Add 100 mL of *Medium 2* to the vessel after 5 h of the test and continue the test.

Apparatus 1: 200 rpm

Times: 1, 6, 12, and 20 h

Diluent: *Medium 1* and *Medium 2* (90:10)

Standard solution: ($L/400$) mg/mL of USP Quetiapine Fumarate RS in *Diluent*, where L is the label claim in mg/Tablet

Sample solution: Pass a suitable portion of the solution under test through a suitable filter.

Instrumental conditions

Mode: UV

Analytical wavelength: About 290 nm

Blank: *Diluent*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration, C_i , of quetiapine ($C_{21}H_{25}N_3O_2S$) in *Medium* (mg/mL) after time point (i):

$$C_i = (A_U/A_S) \times C_S \times (M_{r1}/M_{r2}) \times N$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

M_{r1} = molecular weight of quetiapine free base, 383.51

M_{r2} = molecular weight of quetiapine fumarate, 883.09

N = number of moles of quetiapine free base per mole of quetiapine fumarate, 2

Calculate the percentage of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) dissolved at each time point (i):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_S)] + (C_1 \times V_S)\} \times (1/L) \times 100$$

$$\text{Result}_3 = (\{C_3 \times [V - (2 \times V_S)]\} + [(C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

$$\text{Result}_4 = (\{C_4 \times [V - (3 \times V_S)]\} + [(C_3 + C_2 + C_1) \times V_S]) \times (1/L) \times 100$$

$C_1, C_2,$
 C_3, C_4 = concentration of quetiapine in *Medium* in the portion of sample withdrawn at time points 1, 2, 3, and 4, respectively (mg/mL)

V = volume of *Medium*, 900 mL for 1 h; 1000 mL for 6, 12, and 20 h time points

L = label claim (mg/Tablet)

V_S = volume of the *Sample solution* withdrawn from the vessel and replaced with *Medium* (mL)

Tolerances: See *Table 1*.

Table 1

Time Point (i)	Time (h)	Amount Dissolved
1	1	NMT 20%
2	6	47%–69%
3	12	65%–95%
4	20	NLT 85%

The percentages of the labeled amount of quetiapine ($C_{21}H_{25}N_3O_2S$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

- **Uniformity of Dosage Units** (905): Meet the requirements

IMPURITIES

- **Organic Impurities**

Buffer, Mobile phase, Diluent, System suitability solution, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

System suitability

Sample: *System suitability solution*

[Note—See *Table 2* for the relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between quetiapine related compound G and quetiapine related compound H; NLT 2.0 between the quetiapine desthoxy and quetiapine peaks

Analysis

Sample: *Sample solution*[Note—See *Table 2* for relative retention times.]

Calculate the percentage of each degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (1/F) \times 100$$

 r_U = peak response of each degradation product from the *Sample solution* r_S = peak response of quetiapine from the *Sample solution* F = relative response factor for the corresponding degradation product from *Table 2***Acceptance criteria:** See *Table 2*. Disregard peaks less than 0.05%.**Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Fumaric acid ^a	0.1	—	—
Quetiapine related compound G	0.48	1.4	0.2
Quetiapine related compound H	0.57	1.0	0.2
Quetiapine desethoxy ^b	0.87	—	—
Quetiapine	1.0	—	—
Quetiapine related compound B ^b	1.9	—	—
Any individual unspecified degradation product	—	1.0	0.2
Total degradation products	—	—	0.4

^a Counter ion peak, not to be included in the total impurities.

^b Process impurity controlled in the drug substance. Included for identification purposes only. Not reported for the drug product and not included in the total impurities.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers. Store at controlled room temperature.
- **USP Reference Standards** <11>
 - USP Quetiapine Fumarate RS
 - USP Quetiapine Related Compound H RS
4-(Dibenzo[*b,f*][1,4]thiazepin-11-yl)-1-[2-(2-hydroxyethoxy)ethyl]piperazine 1-oxide.
C₂₁H₂₅N₃O₃S 399.51
 - USP Quetiapine System Suitability RS
 It contains quetiapine fumarate and at least 0.1% of each of the following impurities:
 - Quetiapine related compound B: 11-(Piperazin-1-yl)dibenzo[*b,f*][1,4]thiazepine;
 - Quetiapine related compound G: Dibenzo[*b,f*][1,4]thiazepin-11(10*H*)-one; and
 - Quetiapine desethoxy: 2-[4-(Dibenzo[*b,f*][1,4]thiazepin-11-yl)piperazin-1-

yl]ethanol.

■ 2S (USP39)

BRIEFING

Ropinirole Extended-Release Tablets. Because there is no existing *USP* monograph for this dosage form, a new monograph, based on validated methods of analysis, is proposed.

1. The isocratic liquid chromatographic procedure in the *Assay* is based on analyses performed with the Kromasil C8 brand of L7 column. The typical retention time for ropinirole is about 4 min.
2. The isocratic liquid chromatographic procedure in the *Dissolution* test is based on analyses performed with the Kromasil C8 brand of L7 column. The typical retention time for ropinirole is about 6 min.
3. The gradient liquid chromatographic procedure in the *Organic Impurities* test is based on analyses performed with the Kromasil C8 brand of L7 column. The typical retention time for ropinirole is about 18 min.

(CHM4: R. Ravichandran.)

Correspondence Number—C137240

Comment deadline: November 30, 2015

Add the following:■ **Ropinirole Extended-Release Tablets****DEFINITION**

Ropinirole Extended-Release Tablets contain ropinirole hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of ropinirole free base ($C_{16}H_{24}N_2O$).

IDENTIFICATION

- **A.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY● **Procedure**

Buffer: Dissolve 4.5 g of *dibasic sodium phosphate dihydrate* in 900 mL of water. Adjust with *phosphoric acid* to a pH of 7.0. Dilute with water to 1 L.

Mobile phase: Methanol and *Buffer* (75:25)

Dilute phosphoric acid: Dissolve 0.7 mL of *phosphoric acid* in 1 L of water.

Diluent: Acetonitrile and *Dilute phosphoric acid* (80:20)

System suitability solution: 0.1 mg/mL of USP Ropinirole Hydrochloride RS and 0.003 mg/mL of USP Ropinirole Related Compound B RS in *Diluent*. Sonication may be used to aid dissolution.

Standard solution: 0.11 mg/mL of USP Ropinirole Hydrochloride RS in *Diluent*. Sonication may be used to aid dissolution.

Sample solution: 0.05–0.2 mg/mL of ropinirole prepared as follows. Transfer NLT 5 Tablets to a suitable volumetric flask containing 75% of the flask volume of *Diluent*. Sonicate for NLT 30 min. Allow to cool to room temperature. Dilute with *Diluent* to volume. Pass a portion of the solution through a nylon filter of 0.45- μ m pore size and use the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 250 nm. For *Identification* test A, use a diode-array detector in the range of 200–400 nm.

Column: 4.6-mm \times 12.5-cm; 5- μ m packing L7

Column temperature: 40°

Flow rate: 1 mL/min

Injection volume: 10 μ L

Run time: NLT 1.5 times the retention time of ropinirole

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between ropinirole related compound B and ropinirole, *System suitability solution*

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 1.5%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ropinirole ($C_{16}H_{24}N_2O$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of ropinirole from the *Sample solution*

r_S = peak response of ropinirole from the *Standard solution*

C_S = concentration of USP Ropinirole Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of ropinirole in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of ropinirole free base, 260.37

M_{r2} = molecular weight of ropinirole hydrochloride, 296.84

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **Dissolution** (711)

Solution A: 121.2 g/L of *trishydroxymethylaminomethane* in water

Buffer 1: Dissolve 2.1 g of *citric acid monohydrate* in 900 mL of water. Adjust with *Solution A* to a pH of 4.0.

Buffer 2: Dissolve 3.9 g of *ammonium acetate* in 900 mL of water. Adjust with *phosphoric acid* to a pH of 2.5. Dilute with water to 1 L.

Medium: *Buffer 1*; 500 mL. Deaerate as appropriate.

Apparatus 2: 100 rpm with tablet holder. See *Figure 1*.

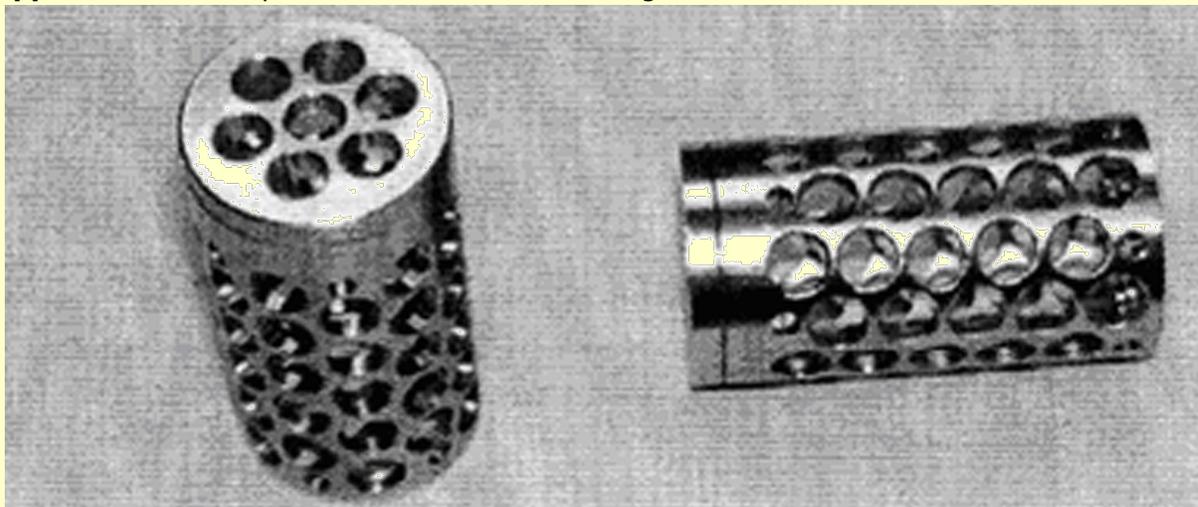

Figure 1. 37-mm(l) × 19-mm(d) stainless steel sinker; screw cap drilled with seven 4-mm holes, bottom drilled with seven 5-mm holes, 12 longitudinal series of 5-mm holes alternately starting and ending with one 3-mm hole, polished electrochemically or with a suitably validated alternative

Times: 2, 12, and 24 h

Mobile phase: Acetonitrile, methanol, and *Buffer 2* (14:6:80)

Standard solution: ($L/400$) mg/mL of USP Ropinirole Hydrochloride RS in *Medium* where L is the label claim in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter of 10- μ m pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 250 nm

Column: 4.6-mm × 12.5-cm; 5- μ m packing $L7$

Flow rate: 1 mL/min

Injection volume: 20 μ L for 12-mg Tablets; 100 μ L for all other strengths

Run time: NLT 2 times the retention time of ropinirole

System suitability

Sample: *Standard solution*

23	84	16
36	40	60
36.1	84	16
50	84	16

Diluent 1: Acetonitrile and *Solution A* (80:20)

Diluent 2: *Diluent 1* and *Solution A* (20:80)

System suitability solution: 0.03 mg/mL of USP Ropinirole Hydrochloride RS and 0.001 mg/mL of USP Ropinirole Related Compound B RS in *Diluent 2*. Sonication may be used to aid dissolution.

Sensitivity solution: 0.015 µg/mL of USP Ropinirole Hydrochloride RS in *Diluent 2*

Standard solution: 0.15 µg/mL of USP Ropinirole Related Compound B RS in *Diluent 2*

Sample stock solution: Nominally 0.13–0.14 mg/mL of ropinirole from a suitable number of Tablets containing 20–50 mg of ropinirole prepared as follows. Homogenize an appropriate number of Tablets in a suitable volume of *Diluent 1*. Pass a portion of the solution through a nylon filter of 0.45-µm pore size and use the filtrate.

Sample solution: Nominally 26–28 µg/mL of ropinirole from the *Sample stock solution* and *Solution A*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 250 nm

Column: 4.6-mm × 25-cm; 5-µm packing *L7*

Column Temperature: 40°

Flow rate: 1 mL/min

Injection volume: 100 µL

System suitability

Samples: *System suitability solution*, *Sensitivity solution*, and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between ropinirole related compound B and ropinirole, *System suitability solution*

Relative standard deviation: NMT 10% for ropinirole related compound B, *Standard solution*

Signal-to-noise ratio: NLT 10 for ropinirole, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of ropinirole related compound B in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of ropinirole related compound B from the *Sample solution*

r_S = peak response of ropinirole related compound B from the *Standard solution*

C_S = concentration of USP Ropinirole Related Compound B RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of ropinirole related compound B free base in the *Sample solution* ($\mu\text{g/mL}$)

M_{r1} = molecular weight of ropinirole related compound B free base, 274.36

M_{r2} = molecular weight of ropinirole related compound B hydrochloride, 310.82

Calculate the percentage of each degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/F)/[\Sigma(r_U/F) + r_R] \times 100$$

r_U = peak response of each degradation product from the *Sample solution*

F = relative response factor for the corresponding degradation product from *Table 3*

r_R = peak response of ropinirole from the *Sample solution*

Acceptance criteria: See *Table 3*. Disregard peaks less than 0.05%.

Table 3

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

■ 2S (USP39)

BRIEFING

Solifenacin Succinate. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated test methods, is proposed.

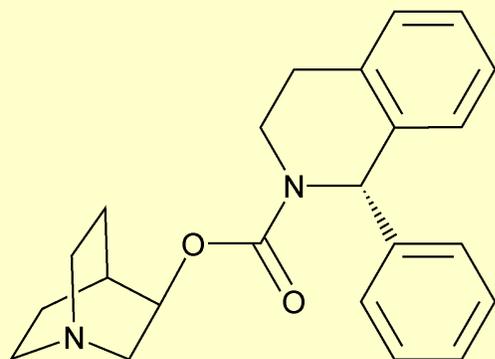

1. The liquid chromatographic procedures used in the *Assay* are based on analyses performed with the Zorbax SB Phenyl brand of *L11* column. The typical retention time for solifenacin is about 5 min.
2. The liquid chromatographic procedures used in the test for *Organic Impurities* are based on analyses performed with the Zorbax SB Phenyl brand of *L11* column. The typical retention time for solifenacin is about 15.5 min.
3. The test for *Stereoisomer Impurities* is adopted from the Solifenacin Succinate proposal published in *Pharmeuropa* 26.2. The liquid chromatographic procedure is based on analyses performed with the Chiralpak AD-H brand of *L51* column. The typical retention time for solifenacin is about 20 min.

This monograph is contingent on FDA approval of a product that meets the proposed monograph.

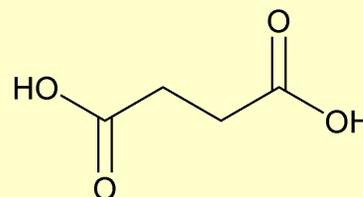

(CHM3: R.S. Prasad, E. Gonikberg.)

Correspondence Number—C134276

Comment deadline: November 30, 2015

Add the following:**► Solifenacin Succinate**

$C_{23}H_{26}N_2O_2 \cdot C_4H_6O_4$ 480.55

Butanedioic acid, compound with (1*S*)-(3*R*)-1-azabicyclo[2.2.2]oct-3-yl 3,4-dihydro-1-phenyl-2(1*H*)-isoquinolinecarboxylate (1:1);

(*R*)-Quinuclidin-3-yl (*S*)-1-phenyl-3,4-dihydroisoquinoline-2(1*H*)-carboxylate succinate salt (1:1). [242478-38-2].

Solifenacin $C_{23}H_{26}N_2O_2$ 362.46

[242478-37-1].

DEFINITION

Solifenacin Succinate contains NLT 98.0% and NMT 102.0% of solifenacin succinate ($C_{23}H_{26}N_2O_2 \cdot C_4H_6O_4$), calculated on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. Identification for Succinate**
 - Solution A:** 200 mg/mL of *cupric sulfate* in water
 - Solution B:** *Solution A* and *pyridine* (5:1)
 - Sample solution:** 10 mg/mL of Solifenacin Succinate in water
 - Analysis:** To 10 mL of the *Sample solution* add 1 mL of 1 N *sodium hydroxide* and filter. Add 1 mL of *Solution B* dropwise to the filtrate.
 - Acceptance criteria:** A precipitate is formed in the blue solution within 1 min.

ASSAY

- **Procedure**

Buffer: Dissolve 4.1 g of *monobasic potassium phosphate* in 1 L of water and add 2 mL of *triethylamine*. Adjust with *phosphoric acid* to a pH of 2.5.

Mobile phase: *Acetonitrile*, *methanol*, and *Buffer* (30:30:40)

Standard solution: 0.2 mg/mL of USP Solifenacin Succinate RS in *Mobile phase*

Sample solution: 0.2 mg/mL of Solifenacin Succinate in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; 5- μ m packing *L11*

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of solifenacin succinate ($C_{23}H_{26}N_2O_2 \cdot C_4H_6O_4$) in the portion of Solifenacin Succinate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of solifenacin from the *Sample solution*

r_S = peak response of solifenacin from the *Standard solution*

C_S = concentration of USP Solifenacin Succinate RS in the *Standard solution* (mg/mL)

C_U = concentration of Solifenacin Succinate in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **Residue on Ignition** (281): NMT 0.1%

- **Organic Impurities**

Buffer: Dissolve 4.1 g of *monobasic potassium phosphate* in 1 L of water and add 1 mL of *triethylamine*. Adjust with *phosphoric acid* to a pH of 3.3.

Solution A: *Acetonitrile*, *methanol*, and *Buffer* (15:15:70)

Solution B: *Acetonitrile*, *methanol*, and *Buffer* (35:35:30)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	75	25
5	75	25
25	30	70
50	35	65
55	75	25
60	75	25

Diluent: *Acetonitrile* and *Buffer* (50:50)

System suitability solution: 0.5 mg/mL of USP Solifenacin Identification Mixture A RS in *Diluent*

Standard solution: 0.0015 mg/mL of USP Solifenacin Succinate RS in *Diluent*

Sample solution: 1.5 mg/mL of Solifenacin Succinate in *Diluent*

Chromatographic system: Proceed as directed in the *Assay*.

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—See *Table 2* for relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between the phenyldihydroisoquinoline and phenyltetrahydroisoquinoline peaks; NLT 2.0 between the solifenacin and phenethylbenzamide peaks, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each individual impurity in the portion of Solifenacin Succinate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of solifenacin from the *Standard solution*

C_S = concentration of USP Solifenacin Succinate RS in the *Standard solution* (mg/mL)

C_U = concentration of Solifenacin Succinate in the *Sample solution* (mg/mL)

F = relative response factor for each individual impurity (see *Table 2*)

Acceptance criteria: For individual impurities, see *Table 2*. Disregard any impurity peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Succinic acid	0.17	—	disregard
Phenyldihydroisoquinoline	0.33	0.78	0.10
Phenyltetrahydroisoquinoline	0.38	1.1	0.10
Solifenacin	1.0	—	—
Phenethylbenzamide	1.12	2.0	0.10
Solifenacin <i>N</i> -oxide	1.63	1.0	0.10
Phenyltetrahydroisoquinoline ethyl carbamate	2.21	1.9	0.10
Any individual unspecified impurity	—	1.0	0.10

• Stereoisomer Impurities

Mobile phase: *Chromatographic n-Heptane, absolute alcohol, and diethylamine* (800:200:1)

System suitability solution: 2 mg/mL of USP Solifenacin Identification Mixture B RS in *Mobile phase*

Standard solution: 0.002 mg/mL of USP Solifenacin Succinate RS in *Mobile phase*

Sample solution: 2 mg/mL of Solifenacin Succinate in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 25-cm; 5-μm packing *L51*

Flow rate: 0.8 mL/min

Injection volume: 10 μ L

Run time: 1.5 times the retention time of solifenacin

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—See *Table 3* for relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between the solifenacin *R,S*-enantiomer and solifenacin *S,S*-diastereomer peaks and NLT 2.0 between the solifenacin *R,R*-enantiomer and solifenacin peaks, *System suitability solution*

Relative standard deviation: NMT 10.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each stereoisomer impurity in the portion of Solifenacin Succinate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each stereoisomer impurity from the *Sample solution*

r_S = peak response of solifenacin from the *Standard solution*

C_S = concentration of USP Solifenacin Succinate RS in the *Standard solution* (mg/mL)

C_U = concentration of Solifenacin Succinate in the *Sample solution* (mg/mL)

Acceptance criteria: For individual stereoisomer impurities, see *Table 3*.

Table 3

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Solifenacin <i>R,S</i> -enantiomer	0.67	0.10
Solifenacin <i>S,S</i> -diastereomer	0.73	0.15
Solifenacin <i>R,R</i> -diastereomer	0.84	0.10
Solifenacin	1.00	—

SPECIFIC TESTS

- **Loss on Drying** (731)

Analysis: Dry at 105° for 3 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers and protect from light. Store at a temperature NMT 30°.
- **USP Reference Standards** (11)
USP Solifenacin Succinate RS

USP Solifenacin Identification Mixture A RS

It contains Solifenacin Succinate and small amounts of the following impurities:

Phenethylbenzamide;

N-Phenethylbenzamide.

$C_{15}H_{15}NO$ 225.29

Phenyldihydroisoquinoline;

1-Phenyl-3,4-dihydroisoquinoline.

$C_{15}H_{13}N$ 207.28

Phenyltetrahydroisoquinoline;

S-1-Phenyl-1,2,3,4-tetrahydroisoquinoline.

$C_{15}H_{15}N$ 209.29

Phenyltetrahydroisoquinoline ethyl carbamate;

Ethyl (*S*)-1-phenyl-3,4-dihydroisoquinoline-2(1*H*)-carboxylate.

$C_{18}H_{19}NO_2$ 281.35

Solifenacin *N*-oxide;

(*R*)-3-{[(*S*)-1-Phenyl-1,2,3,4-tetrahydroisoquinoline-2-carbonyl]oxy}quinuclidine 1-oxide.

$C_{23}H_{26}N_2O_3$ 378.46

USP Solifenacin Identification Mixture B RS

It contains Solifenacin Succinate and small amounts of the following impurities:

Solifenacin *R,R*-diastereomer;

(*R*)-Quinuclidin-3-yl (*R*)-1-phenyl-3,4-dihydroisoquinoline-2(1*H*)-carboxylate hydrochloride.

$C_{23}H_{26}N_2O_2 \cdot HCl$ 398.93

Solifenacin *R,S*-enantiomer;

(*S*)-Quinuclidin-3-yl (*R*)-1-phenyl-3,4-dihydroisoquinoline-2(1*H*)-carboxylate succinate.

$C_{23}H_{26}N_2O_2 \cdot C_4H_6O_4$ 480.55

Solifenacin *S,S*-diastereomer;

(*S*)-Quinuclidin-3-yl (*S*)-1-phenyl-3,4-dihydroisoquinoline-2(1*H*)-carboxylate hydrochloride.

BRIEFING

Sulconazole Nitrate, USP 38 page 5371. As part of USP monograph modernization efforts, it is proposed to make the following changes:

1. Add *Identification* test C based on the HPLC retention time agreement for sulconazole from the proposed Assay.
2. Replace the existing HPLC Assay procedure with a validated stability-indicating reversed-phase UPLC method similar to the proposed *Organic Impurities* procedure. The proposed liquid chromatographic procedure is based on analyses performed with the Acquity UPLC BEH C18 brand of L1 column. The typical retention time for sulconazole nitrate is about 5.3 min.
3. Replace the current *Ordinary Impurities* method with a UHPLC procedure. The proposed liquid chromatographic procedure is used in the proposed Assay.
4. Add the new Reference Standard, USP Sulconazole Related Compound A RS, introduced

by the proposed UPLC procedure for *Organic Impurities*, to the *USP Reference Standards* section.

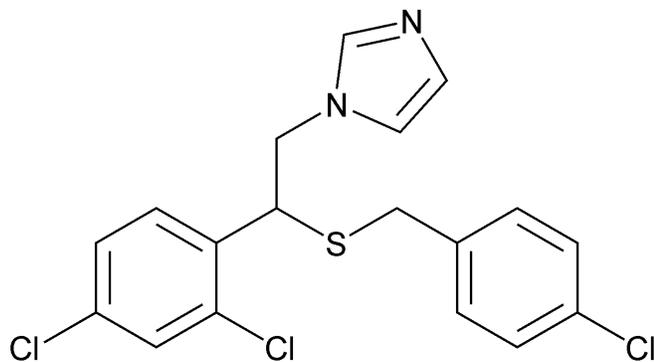

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(CHM1: C. Anthony.)

Correspondence Number—C120149

Comment deadline: November 30, 2015

Sulconazole Nitrate

• HNO₃

C₁₈H₁₅Cl₃N₂S·HNO₃ 460.76

1*H*-Imidazole, 1-[2-[[[(4-chlorophenyl)methyl]thio]-2-(2,4-dichlorophenyl)ethyl]-, mononitrate, (±)-;
(±)-1-[2,4-Dichloro-β-[(*p*-chlorobenzyl)thio]phenethyl]imidazole mononitrate [61318-91-0].

DEFINITION

Sulconazole Nitrate contains NLT 98.0% and NMT 102.0% of sulconazole nitrate (C₁₈H₁₅Cl₃N₂S·HNO₃), calculated on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption** (197K)
- **B. Identification Tests—General** (191), *Nitrate*: Meets the requirements for the ferrous sulfate–sulfuric acid test

Add the following:

- • **C.** The retention time of the major peak for sulconazole of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■_{2S} (USP39)

ASSAY

Change to read:

- **Procedure**

Mobile phase: Dissolve 1.9 g of sodium 1-pentane sulfonate in 300 mL of water and add 700 mL of methanol. Adjust with 2-N sulfuric acid to an apparent pH of 3.8 ± 0.1, filter, and degas.

Standard solution: ~~0.2 mg/mL of USP Sulconazole Nitrate RS in Mobile phase~~

Sample solution: ~~0.2 mg/mL of Sulconazole Nitrate in Mobile phase~~

BRIEFING

Sulfisoxazole, *USP 38* page 5407. As part of USP monograph modernization efforts, it is proposed to make the following changes:

1. Replace the current *Identification* test *C* that uses wet chemistry with a retention time agreement based on the proposed method in the *Assay*.
2. Replace the current *Assay* titration procedure with a stability-indicating HPLC method. The proposed liquid chromatographic procedure is based on analyses using the Zorbax Eclipse Plus C18 brand of L1 column. The typical retention time for sulfisoxazole is about 4 min.
3. Revise the acceptance criterion in the *Definition* and the *Assay* from NLT 99.0% and

NMT 101.0% to NLT 98.0% and NMT 102.0%, which is typical for chromatographic procedures.

4. Replace the test for *Ordinary Impurities* with an HPLC procedure using the same HPLC parameters as in the proposed *Assay* method.
5. Delete the *Melting Range or Temperature* test. The proposed test for *Organic Impurities* is sufficient to monitor the purity of the drug substance.

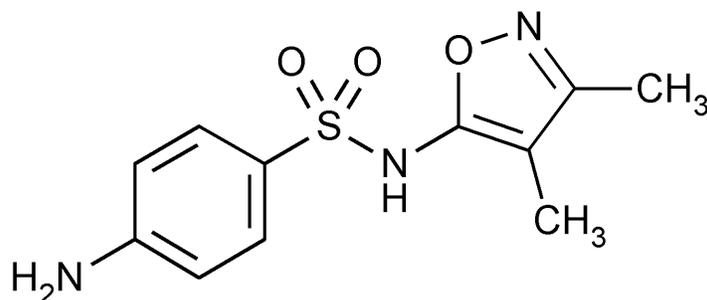

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Sulfisoxazole

$C_{11}H_{13}N_3O_3S$ 267.31

Benzenesulfonamide, 4-amino-*N*-(3,4-dimethyl-5-isoxazolyl)-;
*N*¹-(3,4-Dimethyl-5-isoxazolyl)sulfanilamide [127-69-5].

DEFINITION

Change to read:

Sulfisoxazole contains ~~NLT 99.0% and NMT 101.0%~~

■ NLT 98.0% and NMT 102.0% of sulfisoxazole ■ 2S (USP39)

($C_{11}H_{13}N_3O_3S$), calculated on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption** (197K)
- **B.**

Sample: 100 mg of Sulfisoxazole

Analysis: Prepare a solution (1 in 100,000) in *pH 7.5 Phosphate Buffer* (see *Reagents, Indicators, and Solutions—Buffer Solutions*) by dissolving the *Sample* in 10 mL of *sodium hydroxide* solution (1 in 250) and adding sufficient quantities of the buffer solution to make 100 mL, then diluting 10 mL of the resulting solution with the buffer solution to 1000 mL.

Acceptance criteria: The UV absorption spectrum exhibits maxima and minima at the same

wavelengths as that of a similar solution of USP Sulfisoxazole RS, concomitantly measured.

Delete the following:

■ ● **C. Procedure**

Sample: 10 mg of Sulfisoxazole

Analysis: Dissolve the *Sample* in 2 mL of 3 N *hydrochloric acid* with the aid of heat, and cool for 5 min in an ice bath. Add 3 drops of *sodium nitrite* solution (1 in 100), and dilute with water to 4 mL.

Acceptance criteria: A yellow solution is produced. Add 1 mL of *sodium hydroxide* (1 in 10) containing 10 mg of *2-naphthol*; an orange-red precipitate is formed. ■_{2S} (USP39)

Add the following:

- ● **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■_{2S} (USP39)

BRIEFING

Sulfisoxazole Acetyl, *USP 38* page 5408. As part of USP monograph modernization efforts,

it is proposed to make the following changes:

1. Replace the current *Assay* titration procedure with a stability-indicating liquid chromatographic method. The proposed liquid chromatographic procedure is based on analyses using the Zorbax Eclipse Plus C18 brand of L1 column. The typical retention time for sulfisoxazole acetyl is about 4 min.
2. Revise the acceptance criterion in the *Definition* and the *Assay* from NLT 98.0% and NMT 100.5% to NLT 98.0% and NMT 102.0%, which is typical for chromatographic procedures.
3. Add a liquid chromatographic procedure to the *Organic Impurities* test that is consistent with the proposed *Assay* method.
4. Delete the *Melting Range or Temperature* test. The proposed selective test for *Organic Impurities* is sufficient to monitor the purity of the drug substance.
5. Delete the *Ordinary Impurities* test. The proposed selective test for *Organic Impurities* is sufficient to monitor the impurities in the drug substance.

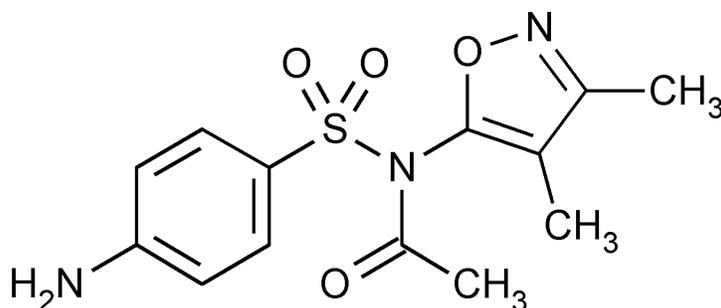

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

BRIEFING

Theophylline Oral Solution, USP 38 page 5527. As a part of USP monograph modernization efforts, the following revisions are proposed:

1. Replace the TLC procedure in *Identification* test A with a procedure in which the UV

spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the proposed *Assay*.

2. Replace the HPLC procedure in the *Assay* with the same procedure that is proposed in the added test for *Organic Impurities*. The liquid chromatographic procedure is performed using the Acquity BEH C8 brand of L7 column. The typical retention time for theophylline is about 3.8 min.
3. Add a stability-indicating liquid chromatographic procedure for the *Organic Impurities* test.
4. Revise the storage requirement in the *Packaging and Storage* section to be consistent with FDA-approved drug products.
5. Add four Reference Standards, USP Theophylline Related Compound D RS (a known degradant), USP Saccharin Sodium RS (potential excipient, for use in establishing system suitability), USP Alcohol Determination—Acetonitrile RS, and USP Alcohol Determination—Alcohol RS to the *USP Reference Standards* section.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Theophylline Oral Solution

DEFINITION

Theophylline Oral Solution contains NLT 95.0% and NMT 105.0% of the labeled amount of theophylline ($C_7H_8N_4O_2$).

IDENTIFICATION

Delete the following:

~~A. Thin-Layer Chromatographic Identification Test (201)~~

~~Standard solution:~~ 1 mg/mL of USP Theophylline RS in methanol

~~Sample solution:~~ Nominally 1 mg/mL of theophylline prepared as follows. Transfer a suitable quantity of Oral Solution, equivalent to 100 mg of theophylline, to a separatory funnel. Extract with two 25-mL portions of chloroform, collecting the extracts in a 100-mL volumetric flask. Dilute with methanol to volume.

~~Application volume:~~ 20 μ L

~~Developing solvent system:~~ Chloroform, methanol, and acetic acid (89:10:1)

~~Analysis~~

~~Samples:~~ *Standard solution* and *Sample solution*

Apply the *Standard solution* and the *Sample solution* as directed in the chapter, and dry the plate in a current of cool air. Place the plate in a suitable chromatographic chamber lined with filter paper and previously equilibrated with the *Developing solvent system*. Upon removing the plate from the chamber, dry with a current of warm air in a suitable hood.

Acceptance criteria: Meets the requirements ■_{2S} (USP39)

Add the following:

- ● **A.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■_{2S} (USP39)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

Trihexyphenidyl Hydrochloride Tablets, *USP 38* page 5688. As part of the USP monograph modernization efforts, it is proposed to revise the monograph as follows:

1. Add a test for *Organic Impurities* with a stability-indicating HPLC procedure. The validation of the proposed HPLC procedure is performed using the Phenomenex Kinetex XB-C18 brand of L1 column. The typical retention time for trihexyphenidyl is about 15 min.
2. Replace the current HPLC procedure in the *Assay* with the one that has the same HPLC parameters as proposed in the test for *Organic Impurities*.
3. Replace *Identification* test *A*, which requires chloroform for extraction, with the UV spectrum agreement of the major peak from the proposed *Assay*.
4. Delete *Identification* test *B* since chloride identification is already required for the drug substance.
5. Change the designation of *Identification* test *C* to *Identification* test *B*.
6. Add additional storage requirements in the *Packaging and Storage* section based on the information in the drug product package insert.
7. Add a new Reference Standard to the *USP Reference Standards* section to support the proposed test for *Organic Impurities*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Trihexyphenidyl Hydrochloride Tablets

DEFINITION

Trihexyphenidyl Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of trihexyphenidyl hydrochloride ($C_{20}H_{31}NO \cdot HCl$).

IDENTIFICATION

Delete the following:

■ ● ~~A.~~

~~**Sample:** Reduce a number of Tablets, equivalent to 20 mg of trihexyphenidyl hydrochloride, to a fine powder, and triturate with 25 mL of chloroform. Filter the mixture, and evaporate the filtrate to about 10 mL by gently heating. Add the solution to 100 mL of *n*-hexane: a white precipitate is formed. Allow the mixture to stand for 30 min, and collect the precipitate on a solvent-resistant membrane filter of 1- μ m pore size. Wash the crystals with a small portion of *n*-hexane, and allow them to air-dry.~~

~~**Acceptance criteria:** the IR absorption spectrum of a potassium bromide dispersion of the *Sample* so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Trihexyphenidyl Hydrochloride RS. ■ 2S (*USP39*)~~

Add the following:

- ● **A.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ■_{2S} (USP39)

Delete the following:

- ● **B. Identification Tests—General, Chloride** (191): The precipitate obtained in *Identification test A* meets the requirements. ■_{2S} (USP39)

Change to read:● **C.**

- **B.** ■_{2S} (USP39)

The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY**Change to read:**● **Procedure**

Mobile phase: ~~Acetonitrile, triethylamine and water (920: 0.2: 80). Adjust with phosphoric acid to a pH of 4.0.~~

Standard solution: 0.2 mg/mL of USP Trihexyphenidyl Hydrochloride RS in *Mobile phase*

Sample solution: Nominally 0.2 mg/mL of trihexyphenidyl hydrochloride in *Mobile phase* prepared as follows. Transfer 20 Tablets into a volumetric flask of appropriate size. Add a volume of 0.1 N hydrochloric acid equivalent to 10% of the capacity of the volumetric flask, and sonicate with occasional shaking until the Tablets have disintegrated. Add a volume of *Mobile phase* equivalent to about one-half of the capacity of the volumetric flask, sonicate with frequent shaking for 10 min, and shake by mechanical means for 10 min. Cool, dilute with *Mobile phase* to volume, mix, and filter.

BRIEFING

Ziprasidone Capsules. Because there is no existing *USP* monograph for this drug product, a new monograph is proposed based on validated methods of analyses.

1. The isocratic liquid chromatographic procedure used in the *Assay* and *Dissolution* tests is based on validations performed with the Inertsil ODS 3V brand of L1 column manufactured by GL Sciences. The typical retention times for ziprasidone are about 15 and 10 min in the *Assay* and *Dissolution* tests, respectively.
2. The gradient liquid chromatographic procedure used in the *Organic Impurities* test is based on validations performed with the Inertsil ODS 3V brand of L1 column manufactured by GL Sciences. The typical retention time for ziprasidone is about 21 min.

(CHM4: R. Ravichandran.)

Correspondence Number—C133990

Comment deadline: November 30, 2015

Add the following:

- **Ziprasidone Capsules**

DEFINITION

Ziprasidone Capsules contain an amount of ziprasidone hydrochloride equivalent to NLT 90.0%

and NMT 110.0% of the labeled amount of ziprasidone ($C_{21}H_{21}ClN_4OS$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• Procedure

Buffer: 0.3% (v/v) of *triethylamine* in water

Mobile phase: Acetonitrile and *Buffer* (35:65). Adjust with *glacial acetic acid* to a pH of 6.0.

Diluent: Acetonitrile, water, and *glacial acetic acid* (70:30:5)

Standard stock solution: 1.0 mg/mL of USP Ziprasidone Hydrochloride RS in *Diluent*

Standard solution: 0.2 mg/mL of USP Ziprasidone Hydrochloride RS from the *Standard stock solution* in *Mobile phase*

Sample stock solution: Nominally 1 mg/mL of ziprasidone prepared as follows. Empty the contents of NLT 20 Capsules into a container. Blend the contents. Transfer an amount of the contents, equivalent to NLT 50 mg of ziprasidone, to a suitable volumetric flask. Dissolve the contents in 60% of the flask volume of *Diluent*. Sonicate for NLT 5 min. Dilute with *Diluent* to volume. Pass a portion of the solution through a suitable filter of 0.45- μ m pore size and use the filtrate to prepare the *Sample solution*.

Sample solution: Nominally 0.2 mg/mL of ziprasidone prepared from the filtered *Sample stock solution* and *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm. For *Identification* test B, a diode array detector may be used in the wavelength range of 200–300 nm.

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Flow rate: 2.0 mL/min

Injection volume: 20 μ L

Run time: 1.5 times the retention time of ziprasidone

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ziprasidone ($C_{21}H_{21}ClN_4OS$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of ziprasidone from the *Sample solution*

r_S = peak response of ziprasidone from the *Standard solution*

C_S = concentration of USP Ziprasidone Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of ziprasidone in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of ziprasidone free base, 412.94

M_{r2} = molecular weight of ziprasidone hydrochloride, 467.41 for the monohydrate, 449.40 for the anhydrous form

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• Dissolution <711>

Tier I

pH 7.5 phosphate buffer: Dissolve 7.8 g of *monobasic sodium phosphate dihydrate* and 20 g of *sodium dodecylsulfate* in 1 L water. Sonicate to dissolve and adjust with *phosphoric acid* or *sodium hydroxide* to a pH of 7.5.

Medium: *pH 7.5 phosphate buffer*; 900 mL

Apparatus 2: 75 rpm. Use a suitable sinker, if necessary.

Time: 45 min

Buffer: 0.3% (v/v) of *triethylamine* in water, adjusted with *glacial acetic acid* to a pH of 6.0

Mobile phase: Acetonitrile and *Buffer* (45:55)

Diluent: Acetonitrile, water, and *glacial acetic acid* (70:30:5)

Standard stock solution: 0.24 mg/mL of USP Ziprasidone Hydrochloride RS prepared as follows. Dissolve a suitable amount of USP Ziprasidone Hydrochloride RS in a suitable volumetric flask first in 60% of the flask volume of *Diluent*, and dilute with *Diluent* to volume.

Standard solution: 0.024 mg/mL of USP Ziprasidone Hydrochloride RS in *Medium* from the *Standard stock solution*

Sample solution: Pass a portion of the solution through a suitable filter of 0.45- μ m pore size. Dilute with *Medium* to a concentration similar to that of the *Standard solution*.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing *L1*

Flow rate: 1.5 mL/min

Injection volume: 10 μ L

Run time: 1.5 times the retention time of ziprasidone

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ziprasidone ($C_{21}H_{21}ClN_4OS$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of ziprasidone from the *Sample solution*

r_S = peak response of ziprasidone from the *Standard solution*

C_S = concentration of USP Ziprasidone Hydrochloride RS in the *Standard solution* (mg/mL)

L = label claim (mg/Capsule)

V = volume of *Medium*, 900 mL

M_{r1} = molecular weight of ziprasidone free base, 412.94

M_{r2} = molecular weight of ziprasidone hydrochloride, 467.41 for the monohydrate, 449.40 for the anhydrous form

Tolerances: NLT 75% (Q) of the labeled amount of ziprasidone ($C_{21}H_{21}ClN_4OS$) is dissolved.

If the above tolerance cannot be met, proceed to *Tier II*.

Tier II

Solution A: Dissolve 7.8 g of *monobasic sodium phosphate dihydrate* in 1 L of water.

Sonicate to dissolve and adjust with *phosphoric acid* or *sodium hydroxide* to a pH of 7.5.

Dissolve 10 g of *pancreatin* in the resulting solution.

Solution B: Dissolve 7.8 g of *monobasic sodium phosphate dihydrate* in 1 L of water.

Adjust with *phosphoric acid* or *sodium hydroxide* to a pH of 7.5. Dissolve 90 g of *sodium dodecylsulfate* in the resulting solution. Sonicate to dissolve.

Medium: Transfer 700 mL of *Solution A* to the dissolution vessel and equilibrate at 37° for 15 min. Add 200 mL of *Solution B*; 900 mL.

Apparatus 2: 75 rpm. Use a suitable sinker, if necessary.

Time: 45 min

Analyze the *Sample solution* using the liquid chromatographic procedure described in *Tier I*.

Tolerances: NLT 75% (Q) of the labeled amount of ziprasidone ($C_{21}H_{21}ClN_4OS$) is dissolved.

- **Uniformity of Dosage Units** (905): Meet the requirements

IMPURITIES

- **Organic Impurities**

Buffer: 0.05 M *monobasic potassium phosphate*

Solution A: Methanol and *Buffer* (33:67). Adjust with *phosphoric acid* to a pH of 3.0.

Solution B: Acetonitrile, methanol, and *Buffer* (55:5:40). Adjust with *potassium hydroxide* to a pH of 6.0.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
15	100	0
20	85	15
30	85	15
40	55	45
55	40	60
65	25	75
70	20	80
71	100	0
75	100	0

Diluent: Acetonitrile, methanol, and water (40:10:50). Adjust with *phosphoric acid* to a pH of 2.5.

System suitability solution: 0.5 mg/mL of USP Ziprasidone Hydrochloride RS and 0.05 mg/mL each of USP Ziprasidone Related Compound B RS and USP Ziprasidone Related Compound F RS in *Diluent*

Standard solution: 0.002 mg/mL each of USP Ziprasidone Hydrochloride RS and USP Ziprasidone Related Compound B RS in *Diluent*. Sonication may be used to aid in dissolution.

Sample solution: Nominally 1.0 mg/mL of ziprasidone in *Diluent* from a portion of contents of Capsules (NLT 20) prepared as follows. Transfer a suitable amount of Capsule contents to a suitable volumetric flask. Add 60% of the flask volume of *Diluent*. Sonicate for 10 min. Dilute with *Diluent* to volume. Pass through a suitable filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 229 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L7

Column temperature: 30°

Flow rate: 1.5 mL/min

Injection volume: 10 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between ziprasidone related compound B and related compound F;
NLT 2.0 between ziprasidone related compound F and ziprasidone, *System suitability solution*

Tailing factor: NMT 1.5 for ziprasidone, *Standard solution*

Relative standard deviation: NMT 5.0% for both ziprasidone and ziprasidone related compound B, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of ziprasidone related compound B in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of ziprasidone related compound B from the *Sample solution*

r_S = peak response of ziprasidone related compound B from the *Standard solution*

C_S = concentration of USP Ziprasidone Related Compound B RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of ziprasidone in the *Sample solution* (mg/mL)

Calculate the percentage of any other unspecified degradation product in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each unspecified degradation product from the *Sample solution*

r_S = peak response of ziprasidone from the *Standard solution*

C_S = concentration of USP Ziprasidone Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of ziprasidone in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of ziprasidone free base, 412.94

M_{r2} = molecular weight of ziprasidone hydrochloride, 467.41 for the monohydrate, 449.40 for the anhydrous form

Acceptance criteria: See *Table 2*. Disregard any peak with an area below 0.05% in the *Sample solution*.

■ 2S (USP39)

BRIEFING

Ashwagandha Root, page 7775 of the *Second Supplement* to USP 38. The monograph proposes a new HPTLC procedure as *Identification* test A. In addition to the savings in time, solvent use, and improved experimental control, the proposed procedure enhances system suitability based on two chemical markers, withanolide A and β-sitosterol; simplifies sample preparation; and utilizes a different derivatization reagent.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(BDSHM: A. Bzhelyansky.)

Correspondence Number—C162480

Comment deadline: November 30, 2015

Ashwagandha Root

DEFINITION

Ashwagandha Root is the dried mature root of *Withania somnifera* (L.) Dunal (Fam. Solanaceae). It contains NLT 0.3% of withanolides, calculated on the dried basis as the sum of withanolide aglycones calculated as withanolide A, and withanolide glycosides calculated as withanoside IV.

IDENTIFICATION

Change to read:

- **A.**

- **HPTLC for Articles of Botanical Origin (203)** ■ *2S (USP39)*

Standard solution: ~~About 200 mg of USP Powdered Ashwagandha Root Extract RS in 10 mL of methanol. Heat gently for 10–15 min, centrifuge, and use the supernatant. [Note—Save the remaining supernatant for use in the test for *Content of Withanolides*.]~~

Sample solution: ~~Transfer about 5.0 g of Ashwagandha Root, finely powdered and accurately weighed, to a 250 mL flask fitted with a reflux condenser. Add 50 mL of methanol, reflux on a water bath for 10–15 min, cool to room temperature, and decant the supernatant. Repeat until the extract is colorless. Combine the extracts, filter, concentrate under vacuum to about 40 mL, and adjust the volume with methanol to 50.0 mL. [Note—Save the remaining volume of the *Sample solution* for use in the test for *Content of Withanolides*.]~~

Adsorbent: ~~0.25-mm layer of chromatographic silica gel (TLC plates)~~

Application volume: ~~25 µL~~

Developing solvent system: ~~A mixture of ethyl acetate, toluene, and acetic acid (45:55:3)~~

Derivatization reagent: ~~Mix 0.5 mL of anisaldehyde, 10 mL of glacial acetic acid, 85 mL of methanol, and 5 mL of concentrated sulfuric acid in the order given.~~

Analysis

Samples: ~~*Standard solution* and *Sample solution*~~

~~Apply the *Samples* as bands (see *Chromatography* (621)). Use a saturated chamber. Develop until the solvent front has moved up about 90% of the length of the plate. Dry the plate, spray with *Derivatization reagent*, heat for 5–10 min at 100°, and examine under white light.~~

Acceptance criteria: ~~The *Sample solution* exhibits five major grayish-blue bands with R_f~~

values of approximately 0.12, 0.29, 0.47, 0.67, and 0.73 that are similar in position and color to the bands in the *Standard solution*. Additional, less intense, bands may be observed in the *Sample solution* and the *Standard solution*.

■ **Standard solution A:** 0.2 mg/mL each of USP β -Sitosterol RS and USP Withanolide A RS in *methanol*

Standard solution B: 20 mg/mL of USP Powdered Ashwagandha Root Extract RS in *methanol*. Sonicate for 10 min, centrifuge, and use the supernatant. [Note—Retain the supernatant for use in the test for *Content of Withanolides*.]

Sample solution: Suspend about 1 g of Ashwagandha Root, finely powdered, in 10 mL of *methanol*, and sonicate for 15 min. Centrifuge, and use the supernatant.

Chromatographic system

Adsorbent: Chromatographic silica gel with an average particle size of 5 μ m (HPTLC plate).¹

Application volume: 2 μ L each of *Standard solution A* and *Standard solution B*, and 10 μ L of the *Sample solution*, as 8-mm bands

Relative humidity: Condition the plate to a relative humidity of 33%.

Temperature: Ambient, not to exceed 30°

Developing solvent system: *Toluene*, *ethyl acetate*, and *glacial acetic acid* (55:45:3)

Developing distance: 6 cm

Derivatization reagent: 20 mL of *sulfuric acid* combined with 180 mL of ice-cold *methanol*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the samples as bands and dry in air. Develop in a saturated chamber and dry in air. Treat the plate with the *Derivatization reagent*, heat at 100° for 5 min, and examine under UV light at 365 nm and under white light.

System suitability: Under UV light at 365 nm, the derivatized chromatogram of *Standard solution A* displays, in its lower third, a blue band due to withanolide A, and in the middle third a grayish-blue band due to β -sitosterol. The chromatogram of *Standard solution B* displays a light-gray to whitish band due to withanone below the withanolide A band, and a faint light-gray band above the β -sitosterol band; there is also a light-gray band close to the solvent front. A reddish band slightly above the application line is due to withaferin A. Under white light, the bands due to β -sitosterol and withanolide A appear violet-gray. Additional faint bands may appear.

Acceptance criteria: Under UV light at 365 nm and under white light, the chromatogram of the *Sample solution* displays the bands similar in position and color to those seen in *Standard solution B*. Additional bands may be observed, in particular a band just above that due to withanolide A (light-brown under UV light at 365 nm, dark-brown under white light), and a thin band below that due to β -sitosterol (light-blue under UV light at 365 nm, gray-violet under white light). Bands vary in intensity, and some of those seen in the chromatogram of *Standard solution B* may be very faint or absent from the *Sample solution*. ■ 2S (USP39)

Change to read:

- **B. HPLC**

Analysis: Proceed as directed in the test for *Content of Withanolides*.

Acceptance criteria: The *Sample solution* shows main peaks at retention times corresponding to those of withanolide A and withanoside IV in *Standard solution A* and *Standard solution B*, respectively. Identify other withanolide peaks in the *Sample solution* by comparison with *Standard solution C* and the reference chromatogram provided with the lot of USP Powdered Ashwagandha Root Extract RS being used. The *Sample solution* shows additional withanolide peaks: physagulin D, 27-hydroxywithanone, withanoside V, withanoside VI, withaferin A, withastramonolide, withanone, and withanolide B.

■ The *Sample solution* shows some of the withanolide peaks listed in Table 2. ■2S (USP39)

COMPOSITION

Change to read:

- **Content of Withanolides**

Solution A: Dissolve 0.14 g of potassium dihydrogen phosphate in 900 mL of water, add 0.5 mL of phosphoric acid, dilute with water to 1000 mL, and mix.

Solution B: Acetonitrile, filtered and degassed

~~**Standard solution A:** Dissolve, using gentle heat, a quantity of USP Withanolide A RS in methanol to obtain a solution having a known concentration of about 0.1 mg/mL.~~

~~**Standard solution B:** Dissolve, using gentle heat, a quantity of USP Withanoside IV RS in methanol to obtain a solution having a known concentration of about 0.1 mg/mL.~~

~~**Standard solution C:** Dilute 5 mL of the *Standard solution* prepared in *Identification test A* with methanol to 10 mL, and mix. Before injection, pass through a membrane filter of 0.45- μ m or finer pore size.~~

■ **Standard solution A:** A composite solution containing 0.1 mg/mL of USP Withanolide A RS and 0.1 mg/mL of USP Withanoside IV RS in *methanol*, accurately calculated. Use gentle heat to aid dissolution.

Standard solution B: Dilute two-fold a portion of *Standard solution B* from *Identification test A* with *methanol*, and mix well. Before injection, pass through a membrane filter of 0.45- μ m or finer pore size. ■2S (USP39)

~~**Sample solution:** Use the *Sample solution* prepared in *Identification test A*. Before injection, pass through a membrane filter of 0.45- μ m or finer pore size, discarding the first few mL of the filtrate.~~

■ Transfer about 5.00 g of Ashwagandha Root, finely powdered and accurately weighed, to a 250-mL round-bottom flask fitted with a reflux condenser. Add 50 mL of *methanol*, reflux on a water bath for 15 min, cool to room temperature, decant and retain the solvent. Repeat until the solvent is colorless. Combine the retained solvents, filter, concentrate under vacuum to about 40 mL, transfer to a 50-mL volumetric flask, and adjust the volume with *methanol*. Before injection, pass through a filter of 0.45- μ m or finer pore size, discarding the first few mL of the filtrate. ■2S (USP39)

Mobile phase: See Table 1.

30	95	5
40	95	5

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 227 nm

Column: 4.6-mm × 25-cm, end-capped; packing *L1*

Column temperature: 27°

Flow rate: 1.5 mL/min

Injection volume: 20 µL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Using the chromatogram of *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered Ashwagandha Root Extract RS being used, identify the retention times of the peaks corresponding to withanolide aglycones and glycosides. The approximate relative retention times are provided in *Table 2*.

Table 2

Analyte	Relative Retention Time
Withanoside IV	0.70
Physagulin D	0.75
27-Hydroxywithanone	0.80
Withanoside V	0.89
Withanoside VI	0.89
Withaferin A	0.92
Withastramonolide	0.96
Withanolide A	1.00
Withanone	1.01
Withanolide B	1.14

Suitability requirements

The chromatogram of *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered Ashwagandha Root Extract RS being used.

Resolution: NLT 1.0 between the withanolide A and withanone peaks, and NLT 3.0 between the withaferin A peak and the peak corresponding to coeluting withanoside V

and withanoside VI, *Standard solution B*

Tailing factor: NMT 1.5 for the withanolide A peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for replicate injections, withanolide A peak, *Standard solution A*

Analysis

Samples: *Standard solution A, Standard solution B, and Sample solution*

Calculate the percentage of withanolide aglycones in the portion of Ashwagandha Root taken:

$$\text{Result} = 5(r_T/r_S)(C_S/W)$$

r_T = sum of the peak responses for withaferin A, withastramonolide, withanolide A, withanone, and withanolide B from the *Sample solution*

r_S = peak response of withanolide A from *Standard solution A*

C_S = concentration of USP Withanolide A RS in *Standard solution A* (mg/mL)

W = weight of Ashwagandha Root taken to prepare the *Sample solution* (g)

Calculate the percentage of withanolide glycosides in the portion of Ashwagandha Root taken:

$$\text{Result} = 5(r_T/r_S)(C_S/W)$$

r_T = sum of the peak responses for withanoside IV, withanoside V, and withanoside VI from the *Sample solution*

r_S = peak response of USP Withanoside IV RS from *Standard solution B*

C_S = concentration of USP Withanoside IV RS in *Standard solution B* (mg/mL)

W = weight of Ashwagandha Root taken to prepare the *Sample solution* (g)

- Calculate the percentage of withanolide aglycones in the portion of Ashwagandha Root taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = sum of the peak areas of withaferin A, withastramonolide, withanolide A, withanone, and withanolide B from the *Sample solution*

r_S = peak area of withanolide A from *Standard solution A*

C_S = concentration of USP Withanolide A RS in *Standard solution A* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Ashwagandha Root taken to prepare the *Sample solution* (mg)

Calculate the percentage of withanolide glycosides in the portion of Ashwagandha Root taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = sum of the peak areas of withanoside IV, withanoside V, and withanoside VI from the *Sample solution*

r_S = peak area of withanoside IV from *Standard solution A*

C_S = concentration of USP Withanoside IV RS in *Standard solution A* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Ashwagandha Root taken to prepare the *Sample solution* (mg) ■ 2S (USP39)

Acceptance criteria: The sum of the percentages of withanolide aglycones and withanolide glycosides is NLT 0.3%, calculated on the dried basis. [Note—Because of inherent variation, some of the withanolides mentioned in this test may be present in minor quantities or may be totally absent. The sample will be deemed compliant if the sum of the withanolides is NLT 0.3%.]

IMPURITIES

- **Absence of Specified Microorganisms (2022)**, *Test Procedures, Test for Absence of Salmonella Species* and *Test for Absence of Escherichia coli*: Meets the requirements

SPECIFIC TESTS

● Botanical Characteristics

Macroscopic: Primary roots are not branched and are straight, conical, or fingerlike in shape and variable in thickness with age; some carry a crown, consisting of a number of remains of stem base; the outer surface is buff to grayish-yellow with longitudinal wrinkles; fracture is short and uneven; secondary roots are thin and fibrous.

Microscopic: Transverse section of root shows a narrow band of yellowish crumpled cork, moderate-size cortex, and a wide wood. The cork cells are rectangular, radially flattened, nonlignified, and filled with starch grains and reddish brown content; cork cambium is 2–4 diffused rows of cells; secondary cortex is formed of 20–25 rows of thin-walled parenchymatous cells, filled with starch grains, and shows occasional microsphenoidal crystals of calcium oxalate; phloem consists of sieve tubes, companion cells, and phloem parenchyma; vascular cambium consists of tangentially elongated parenchymatous cells; vessels and tracheids are in radial rows toward the periphery of the wood; medullary rays are uniseriate to 2- to 3-seriate, and are filled with starch grains; scattered vessels in groups are embedded in the parenchyma; vessels have pitted and scalariform thickenings, and generally the end walls are perforated; a few fibers with thick lignified walls are also found scattered in the wood.

● Loss on Drying (731)

Sample: 1.0 g of finely powdered Ashwagandha Root

Analysis: Dry the *Sample* at 105° for 3 h.

Acceptance criteria: NMT 12.0%

Powdered Ashwagandha Root

DEFINITION

Change to read:

Powdered Ashwagandha Root is Ashwagandha Root reduced to a fine or very fine powder. ■ It contains NLT 0.3% of withanolides, calculated on the dried basis as the sum of withanolide

aglycones calculated as withanolide A, and withanolide glycosides calculated as withanoside IV.

■ 2S (USP38)

IDENTIFICATION

Change to read:

● A. Thin-Layer Chromatography

■ HPTLC for Articles of Botanical Origin (203) ■ 2S (USP39)

Standard solution: Heat gently, for 10–15 min, about 200 mg of USP Powdered Ashwagandha Root Extract RS in 10 mL of methanol, centrifuge, and use the supernatant. [Note—Save the remaining supernatant for use in the test for *Content of Withanolides*.]

Sample solution: Transfer about 5.0 g of accurately weighed Powdered Ashwagandha Root to a 250 mL flask fitted with a reflux condenser. Add 50 mL of methanol, reflux on a water bath for 10–15 min, cool to room temperature, and decant the supernatant. Repeat until the extract is colorless. Combine the extracts, filter, concentrate under vacuum to about 40 mL, and adjust the volume with methanol to 50.0 mL. [Note—Save the remaining volume of the *Sample solution* for use in the test for *Content of Withanolides*.]

Adsorbent: 0.25 mm layer of chromatographic silica gel (TLC plates)

Application volume: 25 µL

Developing solvent system: A mixture of ethyl acetate, toluene, and acetic acid (45:55:3)

Derivatization reagent: Mix 0.5 mL of anisaldehyde, 10 mL of glacial acetic acid, 85 mL of methanol, and 5 mL of concentrated sulfuric acid in the order mentioned.

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Samples* as bands (see *Chromatography* (621)). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about 90% of the plate. Remove the plate from the chamber, dry, spray with *Derivatization reagent*, heat for 5–10 min at 100°, and examine under white light.

Acceptance criteria: The *Sample solution* exhibits five major grayish-blue bands with R_f values of approximately 0.12, 0.29, 0.47, 0.67, and 0.73 that are similar in position and color to the bands in the *Standard solution*. Additional, less intense, bands may be observed in the *Sample solution* and *Standard solution*.

■ **Standard solution A:** 0.2 mg/mL each of USP β -Sitosterol RS and USP Withanolide A RS in *methanol*

Standard solution B: 20 mg/mL of USP Powdered Ashwagandha Root Extract RS in *methanol*. Sonicate for 10 min, centrifuge, and use the supernatant. [Note—Retain the supernatant for use in the test for *Content of Withanolides*.]

Sample solution: Suspend about 1 g of Powdered Ashwagandha Root in 10 mL of *methanol*, and sonicate for 15 min. Centrifuge, and use the supernatant.

Chromatographic system

Adsorbent: Chromatographic silica gel with an average particle size of 5 µm (HPTLC)

plate).¹

Application volume: 2 μ L each of *Standard solution A* and *Standard solution B*, and 10 μ L of the *Sample solution*, as 8-mm bands

Relative humidity: Condition the plate to a relative humidity of 33%.

Temperature: Ambient, not to exceed 30°

Developing solvent system: *Toluene, ethyl acetate, and glacial acetic acid* (55:45:3)

Developing distance: 6 cm

Derivatization reagent: 20 mL of *sulfuric acid* combined with 180 mL of ice-cold *methanol*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the samples as bands and dry in air. Develop in a saturated chamber and dry in air. Treat the plate with the *Derivatization reagent*, heat at 100° for 5 min, and examine under UV light at 365 nm and under white light.

System suitability: Under UV light at 365 nm, the derivatized chromatogram of *Standard solution A* displays, in its lower third, a blue band due to withanolide A, and in the middle third a grayish-blue band due to β -sitosterol. The chromatogram of *Standard solution B* displays a light-gray to whitish band due to withanone below the withanolide A band, and a faint light-gray band above the β -sitosterol band; there is also a light-gray band close to the solvent front. A reddish band slightly above the application line is due to withaferin A. Under white light, the bands due to β -sitosterol and withanolide A appear violet-gray. Additional faint bands may appear.

Acceptance criteria: Under UV light at 365 nm and under white light, the chromatogram of the *Sample solution* displays the bands similar in position and color to those seen in *Standard solution B*. Additional bands may be observed, in particular a band just above that due to withanolide A (light-brown under UV light at 365 nm, dark-brown under white light), and a thin band below that due to β -sitosterol (light-blue under UV light at 365 nm, gray-violet under white light). Bands vary in intensity, and some of those seen in the chromatogram of *Standard solution B* may be very faint or absent from the *Sample solution*. ■2S (USP39)

Change to read:

• B. HPLC

Analysis: Proceed as directed in the test for *Content of Withanolides*.

Acceptance criteria: The *Sample solution* shows main peaks at retention times corresponding to those of withanolide A and withanoside IV in *Standard solution A*. ~~and *Standard solution B*, respectively. Identify other withanolide peaks in the *Sample solution* by comparison with *Standard solution C* and the reference chromatogram provided with the lot of USP Powdered Ashwagandha Root Extract RS being used. The *Sample solution* shows additional withanolide peaks: physagulin D, 27-hydroxywithanone, withanoside V, withanoside VI, withaferin A, withastramonolide, withanone, and withanolide B~~

■ The *Sample solution* shows some of the withanolide peaks listed in Table 2. ■2S (USP39)

COMPOSITION

Change to read:

- **Content of Withanolides**

Solution A: Dissolve 0.14 g of potassium dihydrogen phosphate in 900 mL of water, add 0.5 mL of phosphoric acid, dilute with water to 1000 mL, and mix.

Solution B: Acetonitrile, filtered and degassed

~~**Standard solution A:** Dissolve, using gentle heat, a quantity of USP Withanolide A RS in methanol to obtain a solution having a known concentration of about 0.1 mg/mL.~~

~~**Standard solution B:** Dissolve, using gentle heat, a quantity of USP Withanoside IV RS in methanol to obtain a solution having a known concentration of about 0.1 mg/mL.~~

~~**Standard solution C:** Dilute 5 mL of the *Standard solution* prepared in *Identification test A* with methanol to 10 mL, and mix. Before injection, pass through a membrane filter of 0.45- μ m or finer pore size.~~

■ **Standard solution A:** A composite solution containing 0.1 mg/mL of USP Withanolide A RS and 0.1 mg/mL of USP Withanoside IV RS in *methanol*, accurately calculated. Use gentle heat to aid dissolution.

Standard solution B: Dilute two-fold a portion of the *Standard solution B* from *Identification test A* with *methanol*, and mix well. Before injection, pass through a membrane filter of 0.45- μ m or finer pore size. ■2S (USP39)

~~**Sample solution:** Use the *Sample solution* prepared in *Identification test A*. Before injection, pass through a membrane filter of 0.45- μ m or finer pore size, discarding the first few mL of the filtrate.~~

■ Transfer about 5.00 g of accurately weighed Powdered Ashwagandha Root to a 250-mL round-bottom flask fitted with a reflux condenser. Add 50 mL of *methanol*, reflux on a water bath for 15 min, cool to room temperature, decant and retain the solvent. Repeat until the solvent is colorless. Combine the retained solvents, filter, concentrate under vacuum to about 40 mL, transfer to a 50-mL volumetric flask, and adjust the volume with *methanol*. Before injection, pass through a filter of 0.45- μ m or finer pore size, discarding the first few mL of the filtrate. ■2S (USP39)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	95	5
18	55	45
25	20	80
28	20	80
30	95	5
40	95	5

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 227 nm

Column: 4.6-mm × 25-cm, end-capped; packing *L1*

Column temperature: 27°

Flow rate: 1.5 mL/min

Injection volume: 20 µL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Using the chromatogram of *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered Ashwagandha Root Extract RS being used, identify the retention times of the peaks corresponding to withanolide aglycones and glycosides. The approximate relative retention times are provided in *Table 2*.

Table 2

Analyte	Relative Retention Time
Withanoside IV	0.70
Physagulin D	0.75
27-Hydroxywithanone	0.80
Withanoside V	0.89
Withanoside VI	0.89
Withaferin A	0.92
Withastramonolide	0.96
Withanolide A	1.00
Withanone	1.01
Withanolide B	1.14

Suitability requirements

The chromatogram of *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered Ashwagandha Root Extract RS being used.

Resolution: NLT 1.0 between the withanolide A and withanone peaks, and NLT 3.0 between the withaferin A peak and the peak corresponding to coeluting withanoside V and withanoside VI, *Standard solution B*

Tailing factor: NMT 1.5 for the withanolide A peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for replicate injections, withanolide A peak, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Calculate the percentage of withanolide aglycones in the portion of Powdered Ashwagandha Root taken:

$$\text{Result} = 5(r_T/r_S)(C_S/W)$$

r_T = sum of the peak responses for withaferin A, withastramonolide, withanolide A, withanone, and withanolide B from the *Sample solution*

r_S = peak response of withanolide A from *Standard solution A*

C_S = concentration of USP Withanolide A RS in *Standard solution A* (mg/mL)

W = weight of Powdered Ashwagandha Root taken to prepare the *Sample solution* (g)

Calculate the percentage of withanolide glycosides in the portion of Powdered Ashwagandha Root taken:

$$\text{Result} = 5(r_T/r_S)(C_S/W)$$

r_T = sum of the peak responses for withanoside IV, withanoside V, and withanoside VI in the *Sample solution*

r_S = peak response of USP Withanoside IV RS in *Standard solution B*

C_S = concentration of USP Withanoside IV RS in *Standard solution B* (mg/mL)

W = weight of Powdered Ashwagandha Root taken to prepare the *Sample solution* (g)

- Calculate the percentage of withanolide aglycones in the portion of Powdered Ashwagandha Root taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = sum of the peak areas of withaferin A, withastramonolide, withanolide A, withanone, and withanolide B from the *Sample solution*

r_S = peak area of withanolide A from *Standard solution A*

C_S = concentration of USP Withanolide A RS in *Standard solution A* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Powdered Ashwagandha Root taken to prepare the *Sample solution* (mg)

Calculate the percentage of withanolide glycosides in the portion of Powdered Ashwagandha Root taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = sum of the peak areas of withanoside IV, withanoside V, and withanoside VI from the *Sample solution*

r_S = peak area of withanoside IV from *Standard solution A*

C_S = concentration of USP Withanoside IV RS in *Standard solution A* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Powdered Ashwagandha Root taken to prepare the *Sample solution* (mg)

- 2S (USP39)

Acceptance criteria: The sum of the percentages of withanolide aglycones and withanolide glycosides is NLT 0.3%, calculated on the dried basis. [Note—Because of inherent variation, some of the withanolides mentioned in this test may be present in minor quantities or may be totally absent. The sample will be deemed compliant if the sum of the withanolides is NLT 0.3%.]

Solution A: Dissolve 0.14 g of potassium dihydrogen phosphate in 900 mL of water, add 0.5 mL of phosphoric acid, dilute with water to 1000 mL, and mix.

~~**Standard solution A:** Dissolve, using gentle heat, a quantity of USP Withanolide A RS in methanol to obtain a solution having a known concentration of about 0.1 mg/mL.~~

~~**Standard solution B:** Dissolve, using gentle heat, a quantity of USP Withanoside IV RS in methanol to obtain a solution having a known concentration of about 0.1 mg/mL.~~

~~**Standard solution C:** Dilute 5 mL of the *Standard solution* prepared in *Identification test A* with methanol to 10 mL, and mix. Before injection, pass through a membrane filter of 0.45- μ m or finer pore size.~~

■ **Standard solution A:** A composite solution containing 0.1 mg/mL of USP Withanolide A RS and 0.1 mg/mL of USP Withanoside IV RS in *methanol*, accurately calculated. Use gentle heat to aid dissolution.

Standard solution B: Dilute two-fold a portion of *Standard solution B* from *Identification test A* with *methanol*, and mix well. Before injection, pass through a membrane filter of 0.45- μ m or finer pore size. ■2S (USP39)

Sample solution: Transfer about 100 mg of Powdered Ashwagandha Root Extract, accurately weighed, to a 10-mL volumetric flask, add about 7 mL of *methanol*, heat gently

on a water bath for 20 min, cool, dilute with *methanol* to volume, and mix. Before injection, pass through a membrane filter of 0.45- μ m or finer pore size, discarding the first few mL of the filtrate.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	95	5
18	55	45
25	20	80
28	20	80
30	95	5
40	95	5

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 227 nm

Column: 4.6-mm \times 25-cm, end-capped; packing *L1*

Column temperature: 27 $^{\circ}$ \pm 1

■ ■ 2S (USP39)

Flow rate: 1.5 mL/min

Injection volume: 20 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

Using the chromatogram of *Standard solution B* and the reference chromatogram provided with the lot of USP Powdered Ashwagandha Root Extract RS being used, identify the retention times of the peaks corresponding to withanolide aglycones and glycosides. The approximate relative retention times are provided in *Table 2*.

Table 2

Analyte	Relative Retention Time
Withanoside IV	0.70
Physagulin D	0.75
27-Hydroxywithanone	0.80
Withanoside V	0.89
Withanoside VI	0.89
Withaferin A	0.92
Withastramonolide	0.96
Withanolide A	1.00
Withanone	1.01
Withanolide B	1.14

Suitability requirements

The chromatogram of *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered Ashwagandha Root Extract RS being used.

Resolution: NLT 1.0 between the withanolide A and withanone peaks, and NLT 3.0 between the withaferin A peak and the peak corresponding to coeluting withanoside V and withanoside VI, *Standard solution B*

Tailing factor: NMT 1.5 for the withanolide A peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for replicate injections, withanolide A peak, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Calculate the percentage of withanolide aglycones in the portion of Powdered Ashwagandha Root Extract taken:

$$\text{Result} = (r_T/r_S)(C_S/W)$$

r_T = sum of the peak responses for withaferin A, withastramonolide, withanolide A, withanone, and withanolide B from the *Sample solution*

r_S = peak response of withanolide A from *Standard solution A*

C_S = concentration of USP Withanolide A RS in *Standard solution A* (mg/mL)

W = weight of Powdered Ashwagandha Root Extract taken to prepare the *Sample solution* (g)

Calculate the percentage of withanolide glycosides in the portion of Powdered Ashwagandha Root Extract taken:

$$\text{Result} = (r_T/r_S)(C_S/W)$$

r_T = sum of the peak responses for withanoside IV, withanoside V and withanoside VI from the *Sample solution*

r_S = peak response of USP Withanoside IV from *Standard solution B*

C_S = concentration of USP Withanoside IV RS in *Standard solution B* (mg/mL)

W = weight of Powdered Ashwagandha Root Extract taken to prepare the *Sample solution* (g)

- Calculate the percentage of withanolide aglycones in the portion of Powdered Ashwagandha Root Extract taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = sum of the peak areas of withaferin A, withastramonolide, withanolide A, withanone and withanolide B from the *Sample solution*

r_S = peak area of withanolide A from *Standard solution A*

C_S = concentration of USP Withanolide A RS in *Standard solution A* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Powdered Ashwagandha Root Extract taken to prepare the *Sample solution* (mg)

Calculate the percentage of withanolide glycosides in the portion of Powdered Ashwagandha Root taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = sum of the peak areas of withanoside IV, withanoside V, and withanoside VI from the *Sample solution*

r_S = peak area of withanoside IV from *Standard solution A*

C_S = concentration of USP Withanoside IV RS in *Standard solution A* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Powdered Ashwagandha Root Extract taken to prepare the *Sample solution* (mg) ■ 2S (USP39)

Acceptance criteria: The sum of the percentages of the withanolide aglycones and withanolide glycosides is NLT 2.5%, calculated on the dried basis. [Note—Because of inherent variation, some of the withanolides mentioned in this test may be present in minor quantities or may be totally absent. The sample will be deemed compliant if the sum of the total withanolides is NLT 2.5%.]

IMPURITIES

BRIEFING

Curcuminoids, *USP 38* page 5984. It is proposed to make the following revisions:

1. Implement a new HPTLC procedure as *Identification* test A, which discontinues the use of chloroform and permits differentiation from two common confounders, *Curcuma zanthorrhiza* Roxb. and *Curcuma aromatica* Salisb.
2. Update the formula in the test for *Content of Curcuminoids* for clarity.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Curcuminoids

DEFINITION

Curcuminoids is a partially purified natural complex of diaryl heptanoid derivatives isolated from Turmeric, *Curcuma longa* L. It contains NLT 95.0% of curcuminoids, calculated on the dried basis, as the sum of curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin. It contains NLT 70.0% and NMT 80.0% of curcumin, NLT 15.0% and NMT 25.0% of desmethoxycurcumin, and NLT 2.5% and NMT 6.5% of bisdesmethoxycurcumin.

IDENTIFICATION

Change to read:

- **A. Thin-Layer Chromatographic Identification Test**

- **HPTLC for Articles of Botanical Origin** (203) ■ 2S (USP39)

Standard solution: 0.2 mg/mL of USP Curcuminoids RS in acetone

Sample solution: 2 mg/mL of Curcuminoids in acetone

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20-cm long (TLC plates)

Application volume: 10 μ L, as bands

Developing solvent system: ~~Chloroform, methanol, and formic acid (96:4:1)~~

Analysis

Samples: ~~Standard solution and Sample solution~~

~~Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography* (621), *Thin-Layer Chromatography*). Use saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the length of the plate. Remove the plate from the chamber, dry, and examine under UV light at 365 nm.~~

Acceptance criteria: ~~The *Sample solution* chromatogram shows yellowish-brown bands due to bisdesmethoxycurcumin, desmethoxycurcumin, and curcumin at R_f values of about 0.4, 0.6, and 0.7, respectively, corresponding in position and color to those obtained from the *Standard solution*.~~

▪ **Standard solution:** 1 mg/mL of USP Curcuminoids RS in *methanol*

Sample solution: Suspend about 5 mg of curcuminoids in 5 mL of *methanol*, and sonicate briefly.

Chromatographic system

Adsorbent: Chromatographic silica gel with an average particle size of 5 μm (HPTLC plate).¹

Application volume: 2 μL each of the *Standard solution* and the *Sample solution* as 8-mm bands

Relative humidity: Condition the plate to a relative humidity of 33%.

Temperature: Ambient, not to exceed 30°

Developing solvent system: *Toluene* and *glacial acetic acid* (4:1)

Developing distance: 6 cm

Derivatization reagent: 85 mL of ice-cold *methanol* combined with 10 mL of *glacial acetic acid*, 5 mL of *sulfuric acid*, and 0.5 mL of *p-anisaldehyde*

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Samples* as bands and dry in air. Develop in a saturated chamber and dry in air. Treat with *Derivatization reagent*, heat at 100° for 3 min, and examine under long-wave UV light (365 nm) and under white light.

System suitability: Under long-wave UV light (365 nm), the derivatized chromatogram of the *Standard solution* exhibits, in its lower half, three bands, in the order of increasing R_f : an orange band due to bisdesmethoxycurcumin, an orange band due to desmethoxycurcumin, and the red band due to curcumin. Under white light, the two lower bands appear orange, while the topmost band is reddish-pink.

Acceptance criteria: Under long-wave UV light (365 nm), the derivatized chromatogram of the *Sample solution* displays two orange bands and one red band, similar in position and color to those observed in the *Standard solution*. At the bottom part of the upper half of the plate, two purple bands are seen. Under white light, two orange bands and a darker red band are seen coincident with the bands due to bisdesmethoxycurcumin, desmethoxycurcumin, and curcumin in the *Standard solution*, in the order of increasing

R_f . In the upper half of the plate, the lower of the two bands appears purple, while the upper band is brown. No bands appear in the topmost quarter of the plate, which are characteristic of *Curcuma zanthorrhiza* Roxb. and *Curcuma aromatica* Salisb. These confounders, and occasional adulterants, also lack the lower orange band corresponding to bisdesmethoxycurcumin. Additional weak bands may be observed in the *Sample solution* under either illumination conditions. ■2S (USP39)

Change to read:

• **B.**

■ **HPLC** ■2S (USP39)

The retention times of the peaks for curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin of the *Sample solution* chromatogram correspond to those of the *Standard solution* for the appropriate USP Reference Standard, as obtained in the test for *Content of Curcuminoids*.

■ **Analysis:** Proceed as directed in the test for *Content of Curcuminoids*.

Acceptance criteria: The retention times of the peaks for curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin of the *Sample solution* correspond to those of *Standard solution A* and *Standard solution B*. ■2S (USP39)

COMPOSITION

Change to read:

• **Content of Curcuminoids**

Mobile phase: Tetrahydrofuran and 1 mg/mL of citric acid in water (4:6)

[~~Note—Sonication may be necessary to dissolve the RS in each *Standard solution*; all solutions should be passed through a filter of 0.45- μ m pore size before injection. USP Curcumin RS, USP Desmethoxycurcumin, and USP Bisdesmethoxycurcumin RS can also be prepared in one standard solution containing the final concentration specified below for each.]~~

■ ■2S (USP39)

SPECIFIC TESTS

- **Botanical Characteristics**

Macroscopic: The rhizome is knotty and of irregular cylindrical shape with a diameter of 15–40 mm. The heartwood area is light brown, and the connecting splint wood is pale yellow. The bark is approximately 2 mm thick and is firmly affixed to the xylem. The surface is gray-brown or black-brown, coarse, and longitudinally valliculate and plicate. A broken rhizome is coarse and fibrous, particularly inside the xylem. The fractured surface of the bark shows short, thin fibers. Numerous roots spring from the underside of the rhizome. These roots are 35–150 mm long, cylindrical and knotty, with a diameter of 3–15 mm. The surface of the roots is gray-brown to black-brown, smoother than the rhizome, and has longitudinal stripes. A 0.5-mm thin bark is tightly affixed to the pale yellow xylem. A broken root is sparsely fibrous and appears yellowish-gray where the thin epidermis is flaked off.

Microscopic: The roots have five to seven rows of brown cork cells. Secretory canals with brown contents appear in groups of four or five and are NMT 20 µm in diameter. Phloem fibers with thick lignified walls occur singly or in small groups; there are cluster crystals of calcium oxalate in the phloem parenchyma. Parenchymatous cells surround the secretory cells, and medullary ray cells contain small starch granules. The xylem shows reticulately thickened and pitted vessels. The rhizome is similar to the roots except for larger secretory canals, up to 25 µm in diameter, and the presence of a pith with parenchymatous cells containing starch granules.

- **Loss on Drying** (731)

Analysis: Dry at 105° to constant weight.

Acceptance criteria: NMT 14.0%

Powdered Eleuthero

■ **Eleuthero Root and Rhizome Powder** ■_{2S} (USP39)

DEFINITION

Change to read:

~~Powdered Eleuthero is Eleuthero—~~

■ **Eleuthero Root and Rhizome Powder** is Eleuthero Root and Rhizome ■_{2S} (USP39) reduced to a powder or very fine powder. It contains NLT 0.08% of the sum of eleutheroside B and eleutheroside E, calculated on the dried basis.

IDENTIFICATION

Change to read:

● **A. ■ HPTLC for Articles of Botanical Origin** (203) ■_{2S} (USP38)

Solvent: Alcohol and water (1:1)

Standard solution A: 1 mg/mL of USP Eleutheroside E RS in *methanol*

Standard solution B: 1 mg/mL of USP Eleutheroside B RS in *methanol*

Standard solution C: 0.1 g of USP Powdered Eleuthero Extract RS in 5 mL of *Solvent*.
Sonicate for 10 min, centrifuge, and use the supernatant.

Sample solution: Transfer about 1 g of ~~Powdered Eleuthero~~

■ **Eleuthero Root and Rhizome Powder** ■_{2S} (USP39)

to a centrifuge tube, add 5 mL of *Solvent*, and mix well. Sonicate for 10 min. Centrifuge or filter the solution, and use the supernatant or the filtrate.

Adsorbent: Chromatographic silica gel with an average particle size of 5 μm (HPTLC plates)

Application volume: 10 μL, as bands

■ **Relative humidity:** Condition the plate to a relative humidity of 33%.

Temperature: Ambient, not to exceed 30° ■_{2S} (USP39)

Developing solvent system: *Chloroform*, *methanol*, and water (35:15:2)

■ **Developing distance:** 6 cm ■_{2S} (USP39)

Derivatization reagent: To 18 mL of ice-cold *methanol* slowly and carefully add 2 mL of *sulfuric acid*, and mix well. Allow the mixture to adjust to room temperature.

Analysis

Samples: *Standard solution A, Standard solution B, Standard solution C, and Sample solution*

~~Before the development of the chromatogram, saturate the chamber for 20 min with *Developing solvent system*. If the ambient relative humidity exceeds 50%, condition the plate to about 30% relative humidity, using a suitable device. Develop the plate over a path of 6 cm, dry, and spray~~

■ Apply the *Samples* as bands and dry in air. Develop in a saturated chamber and dry in air. Treat the plate ■ 2S (USP39) with *Derivatization reagent*. Heat the plate at 100° for 5 min, and examine under white light and under UV light (365 nm).

Acceptance criteria: Under white light, the *Sample solution* exhibits two brown bands due to eleutheroside E and eleutheroside B at R_F values of about 0.34 and 0.45, corresponding in color and R_F to the bands exhibited by *Standard solution A* and *Standard solution B*, respectively. The *Sample solution* also exhibits two additional brown bands near the application zone, corresponding in color and R_F to the bands exhibited by *Standard solution C*. Other bands may be observed in the *Sample solution* and *Standard solution C* chromatograms. Under UV light, the *Sample solution* shows a brown band due to eleutheroside E corresponding in color and R_F to the band exhibited by *Standard solution A*.

- **B. HPLC:** The *Sample solution* in the test for *Content of Eleutherosides B and E* shows a peak at the retention time corresponding to that of eleutheroside B in *Standard solution B* and a peak at the retention time corresponding to that of eleutheroside E in *Standard solution A*.

COMPOSITION

Change to read:

- **Content of Eleutherosides B and E**

Solvent: *Methanol* and water (1:1)

Solution A: *Acetonitrile* and water (5:95)

Solution B: *Acetonitrile* and water (60:40)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	97	3
5	97	3
30	60	40
31	5	95
45	5	95
45.1	97	3
60	97	3

Standard solution A: 0.1 mg/mL of USP Eleutheroside E RS in *methanol*. Transfer 2.0 mL to a 5-mL volumetric flask, and dilute with *Solvent* to volume.

Standard solution B: 0.1 mg/mL of USP Eleutheroside B RS in *methanol*. Transfer 2.0 mL to a 5-mL volumetric flask, and dilute with *Solvent* to volume.

Standard solution C: 5.0 mg/mL of USP Powdered Eleuthero Extract RS in *Solvent*. Sonicate for 30 min, cool to room temperature, decant, and pass through a nylon filter of 0.45- μ m or finer pore size.

Sample solution: Transfer 5.0 g of Powdered Eleuthero

■ Eleuthero Root and Rhizome Powder, ■ 2S (USP39)

accurately weighed, to a round-bottom flask equipped with a condenser. Add 50 mL of *Solvent*, and heat under reflux for 30 min. Filter the supernatant through cotton wool into a 100-mL volumetric flask. Transfer the cotton wool to the round-bottom flask, and repeat the extraction twice, using 22 mL of *Solvent* for each extraction. Filter through cotton wool into the volumetric flask, wash the residue and the cotton wool with *Solvent*, cool to room temperature, dilute with *Solvent* to volume, and mix. Before injection, pass through a nylon filter of 0.45- μ m or finer pore size, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.0-mm \times 25-cm; 5- μ m packing L1

Flow rate: 1 mL/min

Injection volume: 10 μ L

System suitability

Samples: *Standard solution B* and *Standard solution C*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution C* is similar to the reference chromatogram provided with the lot of USP Powdered Eleuthero Extract RS being used.

Relative standard deviation: NMT 2.0%, determined from the eleutheroside B peak in replicate injections, *Standard solution B*

Analysis

Samples: *Standard solution A*, *Standard solution B*, ~~*Standard solution C*~~,

■ ■ 2S (USP39)

and *Sample solution*

Identify the eleutheroside B and eleutheroside E peaks in the *Sample solution* by comparison with the chromatograms of *Standard solution B* and *Standard solution A*, respectively.

Separately calculate the percentages of eleutheroside B and eleutheroside E in the portion of Powdered Eleuthero

■ Eleuthero Root and Rhizome Powder ■ 2S (USP39)

taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of eleutheroside E or eleutheroside B from *Standard solution A* or *Standard solution B*, respectively

C_S = concentration of eleutheroside E or eleutheroside B in *Standard solution A* or *Standard solution B*, respectively (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Powdered Eleuthero

■ Eleuthero Root and Rhizome Powder ■ 2S (USP39)

taken to prepare the *Sample solution* (mg)

Acceptance criteria: NLT 0.08% for the sum of the percentages of eleutheroside B and eleutheroside E on the dried basis

CONTAMINANTS

Delete the following:

- • **Heavy Metals** (231), *Method III*: NMT 20 ppm ■ 2S (USP38)

Add the following:

BRIEFING

Eleuthero Root and Rhizome Dry Extract Capsules. Because there is no existing *USP* monograph for this dietary supplement, a new monograph is being proposed. The liquid chromatographic procedure in the test for *Content of Eleutherosides B and E* is based on analyses performed with the Phenomenex Luna C18 brand of L1 column. The approximate retention times for eleutheroside B and eleutheroside E are 12.3 and 18.9 min, respectively.

(BDSHM: N. Davydova.)

Correspondence Number—C130331

Comment deadline: November 30, 2015

Add the following:

- **Eleuthero Root and Rhizome Dry Extract Capsules**

DEFINITION

Eleuthero Root and Rhizome Dry Extract Capsules contain Eleuthero Root and Rhizome Dry Extract. They contain NLT 95% of the labeled amount of eleutherosides, calculated as the sum of eleutheroside B and eleutheroside E. They may contain suitable added substances.

IDENTIFICATION

- **A. HPLC**

Analysis: Proceed as directed in the test for *Content of Eleutherosides B and E*.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits peaks at the retention times corresponding to the peaks due to eleutheroside B and eleutheroside E in the chromatogram of *Standard solution B*.

STRENGTH

- **Content of Eleutherosides B and E**

Extraction solvent: Methanol and water (6:4)

Solution A: 0.2% *o*-Phosphoric acid in water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
2	90	10
20	70	30
25	70	30
27	90	10
37	90	10

Standard solution A: 0.005 mg/mL of USP Eleutheroside B RS and 0.01 mg/mL of USP Eleutheroside E RS in *Extraction solvent*. Sonicate to dissolve, if necessary.

Standard solution B: 0.5 mg/mL of USP Powdered Eleuthero Extract RS in *Extraction solvent*. Sonicate for 30 min, cool to room temperature, and decant. Before injection, pass through a PVDF membrane filter of 0.45- μ m or finer pore size.

Sample solution: Determine the total weight of 20 Capsules. Open the Capsules and combine their contents in an appropriate container. Weigh the empty Capsule shells and calculate the average fill weight per Capsule. Transfer a portion of the Capsule contents, equivalent to 0.4 mg of eleutherosides (sum of eleutheroside B and eleutheroside E) to a 25-mL volumetric flask. Add 20 mL of *Extraction solvent* and sonicate for 30 min with occasional shaking. Shake the flask manually for 1 min, cool to room temperature, dilute

with *Extraction solvent* to volume, mix well, and pass through a PVDF membrane filter of 0.45- μm or finer pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm \times 25-cm; 5- μm packing L1

Column temperature: 35°

Flow rate: 0.8 mL/min

Injection volume: 20 μL

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered Eleuthero Extract RS being used.

Relative standard deviation: NMT 2.0% for the eleutheroside B and eleutheroside E peaks in replicate injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the peaks corresponding to eleutheroside B and eleutheroside E in the *Sample solution* chromatogram by comparison with the chromatogram from *Standard solution A* and the reference chromatogram provided with the lot of USP Powdered Eleuthero Extract RS being used. Measure the areas of the analyte peaks.

Calculate the quantity, in mg, of eleutheroside B and eleutheroside E in each Capsule taken:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (W_{AV}/W)$$

r_U = peak area of relevant eleutheroside from the *Sample solution*

r_S = peak area of corresponding eleutheroside from *Standard solution A*

C_S = concentration of relevant eleutheroside in *Standard solution A* (mg/mL)

V = volume of the solvent taken for preparation of the *Sample solution* (mL)

W_{AV} = average fill weight per Capsule (mg)

W = weight of the sample taken for preparation of the *Sample solution* (mg)

Calculate the percentage of the labeled amount of eleutherosides, as the sum of eleutheroside B and eleutheroside E, in each Capsule taken:

$$\text{Result} = (\Sigma Q_i/L) \times 100$$

ΣQ_i = sum of the quantities of eleutherosides as determined above (mg)

L = labeled amount of eleutherosides (mg)

Acceptance criteria: NLT 95% of the labeled amount of eleutherosides, calculated as the sum of eleutheroside B and eleutheroside E

PERFORMANCE TESTS

- **Disintegration and Dissolution** (2040), *Disintegration*: Meet the requirements
- **Weight Variation** (2091): Meet the requirements

CONTAMINANTS

- **Microbial Enumeration Tests** (2021): The total aerobic bacterial count does not exceed 10^4 cfu/g, and the total combined molds and yeasts count does not exceed 10^3 cfu/g.
- **Absence of Specified Microorganisms** (2022), *Test Procedures, Test for Absence of Salmonella Species* and *Test Procedures, Test for Absence of Escherichia coli*: Meet the requirements

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers, protected from light and moisture, and store at room temperature.
- **Labeling:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was derived. The label states the amount of eleutherosides, as the sum of eleutheroside B and eleutheroside E, and the amount of Powdered Eleuthero Extract in mg/Capsule.

 - USP Powdered Eleuthero Extract RS
 - USP Eleutheroside B RS
 - USP Eleutheroside E RS

■ 2S (USP39)

BRIEFING

Eleuthero Root and Rhizome Dry Extract Tablets. Because there is no existing *USP* monograph for this dietary supplement, a new monograph is being proposed. The liquid chromatographic procedure in the test for *Content of Eleutherosides B and E* is based on analyses performed with the Phenomenex Luna C18 brand of L1 column. The approximate retention times for eleutheroside B and eleutheroside E are 12.3 and 18.9 min, respectively.

(BDSHM: N. Davydova.)

Correspondence Number—C130330

Comment deadline: November 30, 2015

Add the following:

- **Eleuthero Root and Rhizome Dry Extract Tablets**

DEFINITION

Eleuthero Root and Rhizome Dry Extract Tablets contain Eleuthero Root and Rhizome Dry Extract. They contain NLT 95% of the labeled amount of eleutherosides, calculated as the sum

of eleutheroside B and eleutheroside E. They may contain added substances.

IDENTIFICATION

• A. HPLC

Analysis: Proceed as directed in the test for *Content of Eleutherosides B and E*.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits peaks at the retention times corresponding to the peaks due to eleutheroside B and eleutheroside E in the chromatogram of *Standard solution B*.

STRENGTH

• Content of Eleutherosides B and E

Extraction solvent: Methanol and water (6:4)

Solution A: 0.2% *o*-Phosphoric acid in water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
2	90	10
20	70	30
25	70	30
27	90	10
37	90	10

Standard solution A: 0.005 mg/mL of USP Eleutheroside B RS and 0.01 mg/mL of USP Eleutheroside E RS in *Extraction solvent*. Sonicate to dissolve, if necessary.

Standard solution B: 0.5 mg/mL of USP Powdered Eleuthero Extract RS in *Extraction solvent*. Sonicate for 30 min, cool to room temperature, and decant. Before injection, pass through a PVDF membrane filter of 0.45- μ m or finer pore size.

Sample solution: Weigh NLT 20 Tablets, determine the average tablet weight, and finely powder. Transfer a portion of finely powdered Tablets, nominally equivalent to 0.4 mg of eleutherosides (sum of eleutheroside B and eleutheroside E) to a 25-mL volumetric flask. Add 20 mL of *Extraction solvent* and sonicate for 30 min with occasional shaking. Shake the flask manually for 1 min, cool to room temperature, dilute with *Extraction solvent* to volume, mix well, and pass through a PVDF membrane filter of 0.45- μ m or finer pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Column temperature: 35°

Flow rate: 0.8 mL/min

Injection volume: 20 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram from *Standard solution B* is similar to the reference chromatogram provided with the lot of USP Powdered Eleuthero Extract RS being used.

Relative standard deviation: NMT 2.0% for the eleutheroside B and eleutheroside E peaks in replicate injections, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the peaks corresponding to eleutheroside B and eleutheroside E in the *Sample solution* chromatogram by comparison with the chromatogram from *Standard solution A* and the reference chromatogram provided with the lot of USP Powdered Eleuthero Extract RS being used. Measure the areas of the analyte peaks.

Calculate the quantity, in mg, of eleutheroside B and eleutheroside E in each Tablet taken:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (W_{AV}/W)$$

r_U = peak area of relevant eleutheroside from the *Sample solution*

r_S = peak area of corresponding eleutheroside from *Standard solution A*

C_S = concentration of relevant eleutheroside in *Standard solution A* (mg/mL)

V = volume of the solvent taken for preparation of the *Sample solution* (mL)

W_{AV} = average Tablet weight (mg)

W = weight of the sample taken for preparation of the *Sample solution* (mg)

Calculate the percentage of the labeled amount of eleutherosides, as the sum of eleutheroside B and eleutheroside E, in each Tablet taken:

$$\text{Result} = (\Sigma Q_i/L) \times 100$$

ΣQ_i = sum of the quantities of eleutherosides as determined above (mg)

L = labeled amount of eleutherosides (mg)

Acceptance criteria: NLT 95% of the labeled amount of eleutherosides, calculated as the sum of eleutheroside B and eleutheroside E

PERFORMANCE TESTS

- **Disintegration and Dissolution** (2040), *Disintegration*: Meet the requirements
- **Weight Variation** (2091): Meet the requirements

CONTAMINANTS

- **Microbial Enumeration Tests** (2021): The total aerobic bacterial count does not exceed 10^4 cfu/g, and the total combined molds and yeasts count does not exceed 10^3 cfu/g.

- **Absence of Specified Microorganisms** (2022), *Test Procedures, Test for Absence of Salmonella Species* and *Test Procedures, Test for Absence of Escherichia coli*: Meet the requirements

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers, protected from light and moisture, and store at room temperature.
- **Labeling:** The label states the Latin binomial and, following the official name, the part of the plant from which the article was derived. The label states the amount of eleutherosides, as the sum of eleutheroside B and eleutheroside E, and the amount of Powdered Eleuthero Extract in mg/Tablet.
- **USP Reference Standards** (11)
 - USP Powdered Eleuthero Extract RS
 - USP Eleutheroside B RS
 - USP Eleutheroside E RS

■ 2S (USP39)

BRIEFING

Japanese Honeysuckle Flower. Because there is no existing *USP* monograph for this dietary supplement, a new monograph is being proposed. The liquid chromatographic procedures in the tests for *Content of Caffeoylquinic Acids* and *Content of Iridoids* are both conducted using the Thermo Scientific Syncronis C18 brand of *L1* column with 5- μ m packing and a UV detector at 327 and 240 nm, respectively. The typical retention times for neochlorogenic acid, chlorogenic acid, cryptochlorogenic acid, 3,4-di-*O*-caffeoylquinic acid, 3,5-di-*O*-caffeoylquinic acid, and 4,5-di-*O*-caffeoylquinic acid are 8.1, 10.8, 11.4, 28.7, 31.2, and 32.6 min, respectively. The typical retention times for sweroside, secoxyloganin, and centauroside are 12.9, 15.2, and 27.3 min, respectively.

(BDSHM: C. Ma.)

Correspondence Number—C159653

Comment deadline: November 30, 2015

Add the following:

- **Japanese Honeysuckle Flower**

DEFINITION

Japanese Honeysuckle Flower consists of the dried flower buds or dried flowers in the early-opening stage of *Lonicera japonica* Thunb. (Fam. Caprifoliaceae) collected in early summer. It contains NLT 3.8% of caffeoylquinic acids, calculated as the sum of chlorogenic acid, 3,5-di-*O*-caffeoylquinic acid, and 4,5-di-*O*-caffeoylquinic acid on the dried basis; and NLT 0.80% of iridoids, calculated as the sum of sweroside, secoxyloganin, and centauroside on the dried basis.

IDENTIFICATION

- **A. HPTLC for Articles of Botanical Origin** (203)

Standard solution A: 0.2 mg/mL of USP Chlorogenic Acid RS, 0.25 mg/mL of USP Rutin RS, and 0.2 mg/mL of USP Luteolin-7-*O*-glucoside RS in methanol

Standard solution B: 10 mg/mL of USP *Lonicera japonica* Flower Dry Extract RS in methanol. Sonicate for 10 min, and filter. Evaporate the filtrate at about 50° under reduced pressure to dryness. Add 5 mL of water to dissolve the residue, and then add 10 mL of ethyl acetate and mix. After the solution separates into two layers, take the ethyl acetate layer. Repeat the extraction one more time. Combine the ethyl acetate extracts, evaporate the solvent at about 50° under reduced pressure to dryness, and dissolve the residue in methanol equivalent to 1/5 of the initial volume of USP *Lonicera japonica* Flower Dry Extract RS solution.

Sample solution: 500 mg of Japanese Honeysuckle Flower, finely powdered, in 10 mL of methanol. Sonicate for 10 min, and filter. Evaporate the filtrate at about 50° under reduced pressure to dryness. Add 5 mL of water to dissolve the residue, and then add 10 mL of ethyl acetate and mix. After the solution separates into two layers, take the ethyl acetate layer. Repeat the extraction one more time. Combine the ethyl acetate extracts, evaporate the solvent at about 50° under reduced pressure to dryness, and add 2 mL of methanol to dissolve the residue.

Chromatographic system

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 µm

Application volume: 5 µL, as 8-mm bands

Relative humidity: Condition the plate to a relative humidity of about 33% using a suitable device.

Temperature: About 25°

Developing solvent system: The upper layer solution of a mixture of *n*-butyl acetate, formic acid, and water (7:5:5)

Developing distance: 6 cm

Derivatization reagent A: 10 mg/mL of 2-aminoethyl diphenylborinate in methanol

Derivatization reagent B: 50 mg/mL of polyethylene glycol 4000 in alcohol

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the *Samples* as bands to a suitable HPTLC plate and dry in air. Develop in a saturated chamber, remove the plate from the chamber, and dry in air. Treat the plate with *Derivatization reagent A* and allow to air-dry. Immediately, treat the plate with *Derivatization reagent B*, allow to air-dry, and examine under UV light at 366 nm.

System suitability requirements: Under UV light at 366 nm, in the lower-third section, *Standard solution B* exhibits one blue fluorescent band corresponding in R_f to the band due to chlorogenic acid and one yellow band above chlorogenic acid corresponding in R_f to the band due to luteolin-7-*O*-glucoside in *Standard solution A*. One faint blue fluorescent band is below the chlorogenic acid band and another yellow band, due to rutin, is below the faint blue fluorescent band. In the middle-third section, *Standard solution B* exhibits three

blue fluorescent bands: the band with the highest R_f is due to 3,5-di-*O*-caffeoylquinic acid; the band with the middle R_f is due to 4,5-di-*O*-caffeoylquinic acid; and the band with the lowest R_f is due to 3,4-di-*O*-caffeoylquinic acid.

Acceptance criteria: Under UV light at 366 nm, the *Sample solution* exhibits the most intense band corresponding in R_f and color to the band of chlorogenic acid and a yellow band above chlorogenic acid corresponding in R_f and color to the band due to luteolin-7-*O*-glucoside in *Standard solution A*. The *Sample solution* exhibits another yellow band in the lower-third section corresponding to rutin and two blue bands in the middle-third section due to 3,5-di-*O*-caffeoylquinic acid and 4,5-di-*O*-caffeoylquinic acid corresponding in R_f and color to similar bands in *Standard solution B*.

- **B. Caffeoylquinic Acids HPLC Profile**

Analysis: Proceed as directed in the test for *Content of Caffeoylquinic Acids*.

Acceptance criteria: The *Sample solution* exhibits the most intense peak with a retention time corresponding to chlorogenic acid in *Standard solution A* and peaks at the retention times corresponding to 3,5-di-*O*-caffeoylquinic acid and 4,5-di-*O*-caffeoylquinic acid in *Standard solution B*. It meets the content ratios in *Table 2*.

- **C. Iridoids HPLC Profile**

Analysis: Proceed as directed in the test for *Content of Iridoids*.

Acceptance criteria: The *Sample solution* exhibits a peak with a retention time corresponding to secoxyloganin in *Standard solution A* and two additional iridoid peaks of sweroside and centauroside at retention times corresponding to the same iridoids in *Standard solution B*.

COMPOSITION

- **Content of Caffeoylquinic Acids**

Solution A: 0.1% Phosphoric acid in water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	86	14
8	81	19
14	81	19
34	69	31
35	10	90
39.5	10	90
40	86	14
48	86	14

[Note—Protect from light and proceed under low actinic light. The *Standard solutions* and the *Sample solution* are stable for 24 h at room temperature.]

Solvent: Methanol and water (7.5: 2.5)

Standard solution A: 0.30 mg/mL of USP Chlorogenic Acid RS in methanol

Standard solution B: 2.5 mg/mL of USP *Lonicera japonica* Flower Dry Extract RS in *Solvent*. Sonicate for 15 min, and pass through a membrane filter of 0.45- μ m or finer pore size.

Sample solution: Accurately transfer about 100 mg of Japanese Honeysuckle Flower, finely powdered, into a suitable stoppered conical flask, and accurately add 10.0 mL of *Solvent*. Weigh the filled flask with a precision of ± 0.1 mg, stopper, and sonicate for 30 min. After cooling to room temperature, adjust to the initial weight by adding *Solvent*. Pass through a membrane filter of 0.45- μ m or finer pore size, and discard the first portion of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 327 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing *L1*

Column temperature: 15 $^{\circ}$

Flow rate: 0.7 mL/min

Injection volume: 2 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Resolution: NLT 1.5 between the chlorogenic acid and cryptochlorogenic acid peaks, and the 3,4-di-*O*-caffeoylquinic acid and 3,5-di-*O*-caffeoylquinic acid peaks, *Standard solution B*

Tailing factor: NMT 2.0 for the chlorogenic acid peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for the chlorogenic acid peak in repeated injections, *Standard solution A*

Chromatographic similarity: The chromatogram of *Standard solution B* is similar to the reference chromatogram for caffeoylquinic acids provided with the lot of USP *Lonicera japonica* Flower Dry Extract RS being used.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using the chromatograms of *Standard solution A* and *Standard solution B*, and the reference chromatogram for caffeoylquinic acids provided with the lot of USP *Lonicera japonica* Flower Dry Extract RS being used, identify the retention times of the peaks of neochlorogenic acid, chlorogenic acid, cryptochlorogenic acid, 3,4-di-*O*-caffeoylquinic acid, 3,5-di-*O*-caffeoylquinic acid, and 4,5-di-*O*-caffeoylquinic acid in the *Sample solution*. [Note—See *Table 2* for relative retention times. These values are not monograph requirements. They may vary due to differences in the chromatographic conditions allowed by the system suitability requirements.]

Table 2

Analyte	Approximate Relative Retention Time	Conversion Factor	Content Ratio
Neochlorogenic acid ^a	0.75	1.00	Minor peak ^b
Chlorogenic acid ^c	1.00	1.00	1.0
Cryptochlorogenic acid ^d	1.05	1.00	Minor peak ^b
3,4-Di- <i>O</i> -caffeoylquinic acid ^e	2.65	0.92	Minor peak ^b
3,5-Di- <i>O</i> -caffeoylquinic acid ^f	2.88	0.77	0.3–0.8
4,5-Di- <i>O</i> -caffeoylquinic acid ^g	3.01	0.77	0.04–0.2

^a (1*R*,3*R*,4*S*,5*R*)-3-{[(*E*)-3-(3,4-Dihydroxyphenyl)acryloyl]oxy}-1,4,5-trihydroxycyclohexane-1-carboxylic acid.

^b The peak area is lower than the peak area of 4,5-di-*O*-caffeoylquinic acid.

^c (1*S*,3*R*,4*R*,5*R*)-3-{[(*E*)-3-(3,4-Dihydroxyphenyl)acryloyl]oxy}-1,4,5-trihydroxycyclohexane-1-carboxylic acid.

^d (1*S*,3*R*,4*S*,5*R*)-4-{[(*E*)-3-(3,4-Dihydroxyphenyl)acryloyl]oxy}-1,4,5-trihydroxycyclohexane-1-carboxylic acid.

^e (1*S*,3*R*,4*R*,5*R*)-3,4-Bis{[(*E*)-3-(3,4-dihydroxyphenyl)acryloyl]oxy}-1,5-dihydroxycyclohexane-1-carboxylic acid.

^f (1*S*,3*R*,4*S*,5*R*)-3,5-Bis{[(*E*)-3-(3,4-dihydroxyphenyl)acryloyl]oxy}-1,5-dihydroxycyclohexane-1-carboxylic acid.

^g (1*R*,3*R*,4*S*,5*R*)-3,4-Bis{[(*E*)-3-(3,4-dihydroxyphenyl)acryloyl]oxy}-1,5-dihydroxycyclohexane-1-carboxylic acid.

Separately calculate the percentages of chlorogenic acid, 3,5-di-*O*-caffeoylquinic acid, and 4,5-di-*O*-caffeoylquinic acid in the portion of Japanese Honeysuckle Flower taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of chlorogenic acid from *Standard solution A*

C_S = concentration of USP Chlorogenic Acid RS in *Standard solution A* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Japanese Honeysuckle Flower taken to prepare the *Sample solution* (mg)

F = conversion factor for the analyte (see *Table 2*)

Calculate the content of caffeoylquinic acids as the sum of the percentages of chlorogenic acid, 3,5-di-*O*-caffeoylquinic acid, and 4,5-di-*O*-caffeoylquinic acid.

Acceptance criteria: NLT 3.8% on the dried basis

• **Content of Iridoids**

Solution A, Solution B, Mobile phase, Standard solution B, and Sample solution:

Prepare as directed in the test for *Content of Caffeoylquinic Acids*.

Standard solution A: 0.05 mg/mL of USP Secoxyloganin RS in methanol

Chromatographic system: Proceed as directed in the test for *Content of Caffeoylquinic Acids* except for the *Detector*.

Detector: UV 240 nm

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Resolution: NLT 1.5 between the peak of secoxyloganin and the peak before it, *Standard solution B*

Tailing factor: NMT 2.0 for the secoxyloganin peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for the secoxyloganin peak in repeated injections, *Standard solution A*

Chromatogram similarity: The chromatogram of *Standard solution B* is similar to the reference chromatogram for iridoids provided with the lot of USP *Lonicera japonica* Flower Dry Extract RS being used.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using the chromatograms of *Standard solution A* and *Standard solution B*, and the reference chromatogram for iridoids provided with the lot of USP *Lonicera japonica* Flower Dry Extract RS being used, identify the peaks of sweroside, secoxyloganin, and centauroside in the *Sample solution*. [Note—The approximate relative retention times for the peaks of sweroside, secoxyloganin, and centauroside are 0.85, 1.00, and 1.80, respectively.]

Separately calculate the percentages of secoxyloganin, sweroside, and centauroside in the portion of Japanese Honeysuckle Flower taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of secoxyloganin from *Standard solution A*

C_S = concentration of USP Secoxyloganin RS in *Standard solution A* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Japanese Honeysuckle Flower taken to prepare the *Sample solution* (mg)

F = conversion factor for the analyte (1.00 for secoxyloganin, 1.03 for sweroside, and 0.89 for centauroside)

Calculate the content of iridoids as the sum of the percentages of secoxyloganin, sweroside, and centauroside.

Acceptance criteria: NLT 0.80% on the dried basis

CONTAMINANTS

- **Articles of Botanical Origin** (561), *Limits of Elemental Impurities*: Meets the requirements
- **Articles of Botanical Origin** (561), *Pesticide Residue Analysis*: Meets the requirements
- **Microbial Enumeration Tests** (2021): The total aerobic bacterial count does not exceed 10^5 cfu/g, the total combined molds and yeasts count does not exceed 10^3 cfu/g, and the bile-tolerant Gram-negative bacteria does not exceed 10^3 cfu/g.
- **Absence of Specified Microorganisms** (2022), *Test Procedures, Test for Absence of Salmonella species* and *Test for Absence of Escherichia coli*: Meets the requirements

SPECIFIC TESTS

- **Botanical Characteristics**

Macroscopic: Flower buds are clavate, tapered downwards, slightly curved; 2–3 cm long, about 3 mm in diameter in the upper part, and 1.5 mm in diameter in the lower part with densely pubescent surface; externally yellowish white, greenish white to yellowish green, gradually darkening over time to a golden color. The foliaceous bracts are occasionally visible. The calyx is green, pubescent, five-lobed at the apex, about 2 mm long. The corollas of opening flowers are tubular and two-lipped at the apex. The stamens are epipetalous, yellow, in groups of five, and the one ovary is glabrous.

Microscopic: The powder contains numerous glandular hairs. The heads of glandular hairs are multicellular, subround or slightly oblate, usually 30–70 μm in diameter, exceptionally up to 110 μm . The stalks of glandular hairs are unicellular or multicellular with up to five cells, usually 20–70 μm long, exceptionally up to 700 μm . Non-glandular hairs occur in two types: one with thick walls, unicellular, 45–900 μm long, 15–40 μm in diameter, with fine verrucae on the surface, some have corneous spirals; another type with thin walls, slender, curved or shrunken, with fine verrucae on the surface. Clusters of calcium oxalate are usually 6–45 μm in diameter. Pollen grains are spherical, with three germinal pores, 60–90 μm in diameter.

- **Limit of Triterpenoid Saponins**

Standard solution: 5.0 mg/mL of USP *Lonicera macranthoides* Flower Dry Extract RS in methanol. Sonicate for 10 min, and filter.

Sample solution: 500 mg of Japanese Honeysuckle Flower, finely powdered, in 10 mL of methanol. Sonicate for 10 min, and filter.

Chromatographic system

(See HPTLC for Articles of Botanical Origin (203).)

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 μm

Application volume: 3 μL , as 8-mm bands

Relative humidity: Condition the plate to a relative humidity of about 33% using a suitable device.

Developing solvent system: The upper layer solution of a mixture of *n*-butanol, formic acid, and water (4:1:5)

Developing distance: 6 cm

Derivatization reagent: 10% Sulfuric acid in ethanol

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Samples* as bands to a suitable HPTLC plate and dry in air. Develop in a saturated chamber, remove the plate from the chamber, and dry in air. Treat the plate with *Derivatization reagent*, heat at 105° for 5 min, and examine immediately under UV light at 366 nm.

System suitability requirements: Under UV light at 366 nm, in the lower-third section, the *Standard solution* exhibits three clearly separated brown bands: the band with the highest R_f is due to dipsacocide B; the middle band is due to macranthoidin A; the band with the lowest R_f is due to macranthoidin B.

Acceptance criteria: Under UV light at 366 nm, the *Sample solution* does not exhibit any bands corresponding in R_f and color to the bands due to dipsacocide B, macranthoidin A, and macranthoidin B in the *Standard solution*.

Add the following:

▪ **Japanese Honeysuckle Flower Dry Extract**

DEFINITION

Japanese Honeysuckle Flower Dry Extract is prepared from the dried flower buds or dried flowers in the early opening stage of *Lonicera japonica* Thunb. (Fam. Caprifoliaceae) collected in early summer and extracted with water or a hydroalcoholic mixture containing NMT 15% alcohol. Extracts may be further processed by adding alcohol, filtering, evaporating, and then adding water, filtering, and evaporating. It contains NLT 90.0% and NMT 110.0% of the labeled amount of caffeoylquinic acids, calculated as the sum of neochlorogenic acid, chlorogenic acid, cryptochlorogenic acid, 3,4-di-*O*-caffeoylquinic acid, 3,5-di-*O*-caffeoylquinic acid, and 4,5-di-*O*-caffeoylquinic acid on the dried basis; and NLT 90.0% and NMT 110.0% of the labeled amount of iridoids, calculated as the sum of sweroside, secoxyloganin, and centauroside on the dried basis.

IDENTIFICATION

• **A. HPTLC for Articles of Botanical Origin** <203>

Standard solution A: 0.2 mg/mL of USP Chlorogenic Acid RS, 0.25 mg/mL of USP Rutin RS, and 0.2 mg/mL of USP Luteolin-7-*O*-glucoside RS in methanol

Standard solution B: 10 mg/mL of USP *Lonicera japonica* Flower Dry Extract RS in methanol. Sonicate for 10 min, and filter. Evaporate the filtrate at about 50° under reduced pressure to dryness. Add 5 mL of water to dissolve the residue, and then add 10 mL of ethyl acetate and mix. After the solution separates into two layers, take the ethyl acetate layer. Repeat the extraction one more time. Combine the ethyl acetate extracts, evaporate the solvent at about 50° under reduced pressure to dryness, and dissolve the residue in methanol equivalent to 1/5 of the initial volume of the USP *Lonicera japonica* Flower Dry Extract RS solution.

Sample solution: 100 mg of Japanese Honeysuckle Flower Dry Extract in 10 mL of methanol. Sonicate for 10 min, and filter. Evaporate the filtrate at about 50° under reduced pressure to dryness. Add 5 mL of water to dissolve the residue, and then add 10 mL of ethyl acetate and mix. After the solution separates into two layers, take the ethyl

acetate layer. Repeat the extraction one more time. Combine the ethyl acetate extracts, evaporate the solvent at about 50° under reduced pressure to dryness, and add 2 mL of methanol to dissolve the residue.

Chromatographic system

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 µm

Application volume: 5 µL, as 8-mm bands

Relative humidity: Condition the plate to a relative humidity of about 33% using a suitable device.

Temperature: About 25°

Developing solvent system: The upper layer solution of a mixture of *n*-butyl acetate, formic acid, and water (7:5:5)

Developing distance: 6 cm

Derivatization reagent A: 10 mg/mL of 2-aminoethyl diphenylborinate in methanol

Derivatization reagent B: 50 mg/mL of polyethylene glycol 4000 in alcohol

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the *Samples* as bands to a suitable HPTLC plate and dry in air. Develop in a saturated chamber, remove the plate from the chamber, and dry in air. Treat the plate with *Derivatization reagent A* and allow to air-dry. Immediately, treat the plate with *Derivatization reagent B*, allow to air-dry, and examine under UV light at 366 nm.

System suitability requirements: Under UV light at 366 nm, in the lower-third section, *Standard solution B* exhibits one blue fluorescent band corresponding in R_f to the band due to chlorogenic acid and one yellow band above chlorogenic acid corresponding in R_f to the band due to luteolin-7-*O*-glucoside in *Standard solution A*. One faint blue fluorescent band is below the chlorogenic acid band and another yellow band, due to rutin, is below the faint blue fluorescent band. In the middle-third section, *Standard solution B* exhibits three blue fluorescent bands: the band with the highest R_f is due to 3,5-di-*O*-caffeoylquinic acid; the band with the middle R_f is due to 4,5-di-*O*-caffeoylquinic acid; and the band with the lowest R_f is due to 3,4-di-*O*-caffeoylquinic acid.

Acceptance criteria: Under UV light at 366 nm, in the lower-third section, the *Sample solution* exhibits one blue fluorescent band corresponding in R_f and color to the band of chlorogenic acid and one yellow band above chlorogenic acid corresponding in R_f and color to the band of luteolin-7-*O*-glucoside in *Standard solution A*. One faint blue fluorescent band is below the chlorogenic acid band and another yellow band, due to rutin, is below the faint blue fluorescent band corresponding in R_f and color to similar bands in *Standard solution B*. In the middle-third section, the *Sample solution* exhibits three blue fluorescent bands due to 3,5-di-*O*-caffeoylquinic acid, 4,5-di-*O*-caffeoylquinic acid, and 3,4-di-*O*-caffeoylquinic acid corresponding in R_f and color to similar bands in *Standard solution B*.

• B. Caffeoylquinic Acids HPLC Profile

Analysis: Proceed as directed in the test for *Content of Caffeoylquinic Acids*.

Acceptance criteria: The *Sample solution* exhibits the most intense peak with a retention time corresponding to chlorogenic acid in *Standard solution A* and peaks at the retention

times corresponding to neochlorogenic acid, cryptochlorogenic acid, 3,4-di-*O*-caffeoylquinic acid, 3,5-di-*O*-caffeoylquinic acid, and 4,5-di-*O*-caffeoylquinic acid in *Standard solution B*. The chlorogenic acid content is NMT 65% of the total caffeoylquinic acids.

- **C. Iridoids HPLC Profile**

Analysis: Proceed as directed in the test for *Content of Iridoids*.

Acceptance criteria: The *Sample solution* exhibits a peak with a retention time corresponding to secoxyloganin in *Standard solution A* and two additional iridoid peaks of sweroside and centauroside at retention times corresponding to the same iridoids in *Standard solution B*.

COMPOSITION

- **Content of Caffeoylquinic Acids**

Solution A: 0.1% Phosphoric acid in water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	86	14
8	81	19
14	81	19
34	69	31
35	10	90
39.5	10	90
40	86	14
48	86	14

[Note—Protect from light and proceed under low actinic light. The *Standard solutions* and the *Sample solution* are stable for 24 h at room temperature.]

Solvent: Methanol and water (7.5: 2.5)

Standard solution A: 0.30 mg/mL of USP Chlorogenic Acid RS in methanol

Standard solution B: 2.5 mg/mL of USP *Lonicera japonica* Flower Dry Extract RS in *Solvent*. Sonicate for 15 min, and pass through a membrane filter of 0.45- μ m or finer pore size.

Sample solution: Accurately transfer about 25 mg of Japanese Honeysuckle Flower Dry Extract into a suitable stoppered conical flask, and accurately add 10.0 mL of *Solvent*. Weigh the filled flask with a precision of ± 0.1 mg, stopper, and then sonicate for 30 min. After cooling to room temperature, adjust to the initial weight by adding *Solvent*. Pass through a membrane filter of 0.45- μ m or finer pore size, and discard the first portion of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 327 nm

Column: 4.6-mm × 25-cm; 5- μ m packing *L1*

Column temperature: 15°

Flow rate: 0.7 mL/min

Injection volume: 2 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Resolution: NLT 1.5 between the chlorogenic acid and cryptochlorogenic acid peaks, and the 3,4-di-*O*-caffeoylquinic acid and 3,5-di-*O*-caffeoylquinic acid peaks, *Standard solution B*

Tailing factor: NMT 2.0 for the chlorogenic acid peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for the chlorogenic acid peak in repeated injections, *Standard solution A*

Chromatographic similarity: The chromatogram of *Standard solution B* is similar to the reference chromatogram for caffeoylquinic acids provided with the lot of USP *Lonicera japonica* Flower Dry Extract RS being used.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using the chromatograms of *Standard solution A* and *Standard solution B*, and the reference chromatogram for caffeoylquinic acids provided with the lot of USP *Lonicera japonica* Flower Dry Extract RS being used, identify the retention times of the peaks of neochlorogenic acid, chlorogenic acid, cryptochlorogenic acid, 3,4-di-*O*-caffeoylquinic acid, 3,5-di-*O*-caffeoylquinic acid, and 4,5-di-*O*-caffeoylquinic acid in the *Sample solution*. [Note—See *Table 2* for relative retention times. These values are not monograph requirements. They may vary due to differences in the chromatographic conditions allowed by the system suitability requirements.]

Table 2

Analyte	Approximate Relative Retention Time	Conversion Factor
Neochlorogenic acid ^a	0.75	1.00
Chlorogenic acid ^b	1.00	1.00
Cryptochlorogenic acid ^c	1.05	1.00
3,4-Di- <i>O</i> -caffeoylquinic acid ^d	2.65	0.92
3,5-Di- <i>O</i> -caffeoylquinic acid ^e	2.88	0.77
4,5-Di- <i>O</i> -caffeoylquinic acid ^f	3.01	0.77

^a (1*R*,3*R*,4*S*,5*R*)-3-{[(*E*)-3-(3,4-Dihydroxyphenyl)acryloyl]oxy}-1,4,5-trihydroxycyclohexane-1-carboxylic acid.

^b (1*S*,3*R*,4*R*,5*R*)-3-{[(*E*)-3-(3,4-Dihydroxyphenyl)acryloyl]oxy}-1,4,5-trihydroxycyclohexane-1-carboxylic acid.

^c (1*S*,3*R*,4*S*,5*R*)-4-{[(*E*)-3-(3,4-Dihydroxyphenyl)acryloyl]oxy}-1,4,5-trihydroxycyclohexane-1-carboxylic acid.

^d (1*S*,3*R*,4*R*,5*R*)-3,4-Bis{[(*E*)-3-(3,4-dihydroxyphenyl)acryloyl]oxy}-1,5-dihydroxycyclohexane-1-carboxylic acid.

^e (1*S*,3*R*,4*S*,5*R*)-3,5-Bis{[(*E*)-3-(3,4-dihydroxyphenyl)acryloyl]oxy}-1,5-dihydroxycyclohexane-1-carboxylic acid.

^f (1*R*,3*R*,4*S*,5*R*)-3,4-Bis{[(*E*)-3-(3,4-dihydroxyphenyl)acryloyl]oxy}-1,5-dihydroxycyclohexane-1-carboxylic acid.

Separately calculate the percentages of neochlorogenic acid, chlorogenic acid, cryptochlorogenic acid, 3,4-di-*O*-caffeoylquinic acid, 3,5-di-*O*-caffeoylquinic acid, and 4,5-di-*O*-caffeoylquinic acid in the portion of Japanese Honeysuckle Flower Dry Extract taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of chlorogenic acid from *Standard solution A*

C_S = concentration of USP Chlorogenic Acid RS in *Standard solution A* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Japanese Honeysuckle Flower Dry Extract taken to prepare the *Sample solution* (mg)

F = conversion factor for the analyte (see *Table 2*)

Calculate the content of caffeoylquinic acids as the sum of the percentages of neochlorogenic acid, chlorogenic acid, cryptochlorogenic acid, 3,4-di-*O*-caffeoylquinic acid, 3,5-di-*O*-caffeoylquinic acid, and 4,5-di-*O*-caffeoylquinic acid.

Calculate the percentage of the labeled amount of caffeoylquinic acids in the portion of Dry Extract taken:

$$\text{Result} = (P/L) \times 100$$

P = content of caffeoylquinic acids as determined above (%)

L = labeled amount of caffeoylquinic acids (%)

Acceptance criteria: 90.0%–110.0% on the dried basis

- **Content of Iridoids**

Solution A, Solution B, Mobile phase, Standard solution B, and Sample solution:

Prepare as directed in the test for *Content of Caffeoylquinic Acids*.

Standard solution A: 0.05 mg/mL of USP Secoxyloganin RS in methanol

Chromatographic system: Proceed as directed in the test for *Content of Caffeoylquinic Acids* except for the *Detector*.

Detector: UV 240 nm

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Resolution: NLT 1.5 between the peak of secoxyloganin and the peak before it, *Standard solution B*

Tailing factor: NMT 2.0 for the secoxyloganin peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for the secoxyloganin peak in repeated injections, *Standard solution A*

Chromatogram similarity: The chromatogram of *Standard solution B* is similar to the reference chromatogram for iridoids provided with the lot of USP *Lonicera japonica* Flower Dry Extract RS being used.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using the chromatograms of *Standard solution A* and *Standard solution B*, and the reference chromatogram for iridoids provided with the lot of USP *Lonicera japonica* Flower Dry Extract RS being used, identify the peaks of sweroside, secoxyloganin, and centauroside in the *Sample solution*. [Note—The approximate relative retention times for the peaks of sweroside, secoxyloganin, and centauroside are 0.85, 1.00, and 1.80, respectively.]

Separately calculate the percentages of secoxyloganin, sweroside, and centauroside in the portion of Japanese Honeysuckle Flower Dry Extract taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of secoxyloganin from *Standard solution A*

C_S = concentration of USP Secoxyloganin RS in *Standard solution A* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Japanese Honeysuckle Flower Dry Extract taken to prepare the *Sample solution* (mg)

F = conversion factor for the analyte (1.00 for secoxyloganin, 1.03 for sweroside, and 0.89 for centauroside)

Calculate the content of iridoids as the sum of the percentages of secoxyloganin, sweroside, and centauroside.

Calculate the percentage of the labeled amount of iridoids in the portion of Dry Extract taken:

$$\text{Result} = (P/L) \times 100$$

P = content of iridoids as determined above (%)

L = labeled amount of iridoids (%)

Acceptance criteria: 90.0%–110.0% on the dried basis

CONTAMINANTS

- **Articles of Botanical Origin** (561), *Pesticide Residue Analysis*: Meets the requirements
- **Microbial Enumeration Tests** (2021): The total aerobic bacterial count does not exceed 10^4 cfu/g, the total combined molds and yeasts count does not exceed 10^2 cfu/g, and the bile-tolerant Gram-negative bacteria does not exceed 10^2 cfu/g.
- **Absence of Specified Microorganisms** (2022), *Test Procedures, Test for Absence of Salmonella species* and *Test for Absence of Escherichia coli*: Meets the requirements

SPECIFIC TESTS

• Limit of Triterpenoid Saponins

Standard solution: 5.0 mg/mL of USP *Lonicera macranthoides* Flower Dry Extract RS in methanol. Sonicate for 10 min, and filter.

Sample solution: 50 mg of Japanese Honeysuckle Flower Dry Extract in 10 mL of methanol. Sonicate for 10 min, and filter.

Chromatographic system

(See HPTLC for Articles of Botanical Origin (203).)

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 μm

Application volume: 3 μL , as 8-mm bands

Relative humidity: Condition the plate to a relative humidity of about 33% using a suitable device.

Developing solvent system: The upper layer solution of a mixture of *n*-butanol, formic acid, and water (4:1:5)

Developing distance: 6 cm

Derivatization reagent: 10% Sulfuric acid in ethanol

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Samples* as bands to a suitable HPTLC plate and dry in air. Develop in a saturated chamber, remove the plate from the chamber, and dry in air. Treat the plate with *Derivatization reagent*, heat at 105° for 5 min, and examine immediately under UV light at 366 nm.

System suitability requirements: Under UV light at 366 nm, in the lower-third section, the *Standard solution* exhibits three clearly separated brown bands: the band with the highest R_f is due to dipsacocide B; the middle band is due to macranthoidin A; the band with the lowest R_f is due to macranthoidin B.

Acceptance criteria: Under UV light at 366 nm, the *Sample solution* does not exhibit any bands corresponding in R_f and color to the bands due to dipsacocide B, macranthoidin A, and macranthoidin B in the *Standard solution*.

- **Loss on Drying** (731)

Sample: 1 g of Japanese Honeysuckle Flower Dry Extract

Analysis: Dry the *Sample* at 105° for 2 h.

Acceptance criteria: NMT 5.0%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers, protected from light and moisture, and store in a cool place.
- **Labeling:** The label states the Latin binomial and part(s) of the plant from which the article was prepared. It meets other labeling requirements under *Botanical Extracts* (565).

- **USP Reference Standards** (11)

USP Chlorogenic Acid RS

USP *Lonicera japonica* Flower Dry Extract RS

USP *Lonicera macranthoides* Flower Dry Extract RS

USP Luteolin-7-*O*-glucoside RS

USP Rutin RS

USP Secoxyloganin RS

■ 2S (USP39)

BRIEFING

Japanese Honeysuckle Flower Powder. Because there is no existing *USP* monograph for this dietary supplement, a new monograph is being proposed. The liquid chromatographic procedures in the tests for *Content of Caffeoylquinic Acids* and *Content of Iridoids* are both conducted using the Thermo Scientific Synchronis C18 brand of *L1* column with 5- μ m packing and a UV detector at 327 and 240 nm, respectively. The typical retention times for neochlorogenic acid, chlorogenic acid, cryptochlorogenic acid, 3,4-di-*O*-caffeoylquinic acid, 3,5-di-*O*-caffeoylquinic acid, and 4,5-di-*O*-caffeoylquinic acid are 8.1, 10.8, 11.4, 28.7, 31.2, and 32.6 min, respectively. The typical retention times for sweroside, secoxyloganin, and centauroside are 12.9, 15.2, and 27.3 min, respectively.

(BDSHM: C. Ma.)

Correspondence Number—C159654

Comment deadline: November 30, 2015

Add the following:

- **Japanese Honeysuckle Flower Powder**

DEFINITION

Japanese Honeysuckle Flower Powder consists of the dried flower buds or dried flowers in the early opening stage of *Lonicera japonica* Thunb. (Fam. Caprifoliaceae) collected in early summer and reduced to a fine or very fine powder. It contains NLT 3.8% of caffeoylquinic acids, calculated as the sum of chlorogenic acid, 3,5-di-*O*-caffeoylquinic acid, and 4,5-di-*O*-caffeoylquinic acid on the dried basis; and NLT 0.80% of iridoids, calculated as the sum of sweroside, secoxyloganin, and centauroside on the dried basis.

IDENTIFICATION

• A. HPTLC for Articles of Botanical Origin (203)

Standard solution A: 0.2 mg/mL of USP Chlorogenic Acid RS, 0.25 mg/mL of USP Rutin RS, and 0.2 mg/mL of USP Luteolin-7-*O*-glucoside RS in methanol

Standard solution B: 10 mg/mL of USP *Lonicera japonica* Flower Dry Extract RS in methanol. Sonicate for 10 min, and filter. Evaporate the filtrate at about 50° under reduced pressure to dryness. Add 5 mL of water to dissolve the residue, and then add 10 mL of ethyl acetate and mix. After the solution separates into two layers, take the ethyl acetate layer. Repeat the extraction one more time. Combine the ethyl acetate extracts, evaporate the solvent at about 50° under reduced pressure to dryness, and dissolve the residue in methanol equivalent to 1/5 of the initial volume of the USP *Lonicera japonica* Flower Dry Extract RS solution.

Sample solution: 500 mg of Japanese Honeysuckle Flower Powder in 10 mL of methanol. Sonicate for 10 min, and filter. Evaporate the filtrate at about 50° under reduced pressure to dryness. Add 5 mL of water to dissolve the residue, and then add 10 mL of ethyl acetate and mix. After the solution separates into two layers, take the ethyl acetate layer. Repeat the extraction one more time. Combine the ethyl acetate extracts, evaporate the solvent at about 50° under reduced pressure to dryness, and add 2 mL of methanol to dissolve the residue.

Chromatographic system

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 µm

Application volume: 5 µL, as 8-mm bands

Relative humidity: Condition the plate to a relative humidity of about 33% using a suitable device.

Temperature: About 25°

Developing solvent system: The upper layer solution of a mixture of *n*-butyl acetate, formic acid, and water (7:5:5)

Developing distance: 6 cm

Derivatization reagent A: 10 mg/mL of 2-aminoethyl diphenylborinate in methanol

Derivatization reagent B: 50 mg/mL of polyethylene glycol 4000 in alcohol

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the *Samples* as bands to a suitable HPTLC plate and dry in air. Develop in a saturated chamber, remove the plate from the chamber, and dry in air. Treat the plate with *Derivatization reagent A* and allow to air-dry. Immediately, treat the plate with

Derivatization reagent B, allow to air-dry, and examine under UV light at 366 nm.

System suitability requirements: Under UV light at 366 nm, in the lower-third section, *Standard solution B* exhibits one blue fluorescent band corresponding in R_f to the band due to chlorogenic acid and one yellow band above chlorogenic acid corresponding in R_f to the band due to luteolin-7-*O*-glucoside in *Standard solution A*. One faint blue fluorescent band is below the chlorogenic acid band and another yellow band, due to rutin, is below the faint blue fluorescent band. In the middle-third section, *Standard solution B* exhibits three blue fluorescent bands: the band with the highest R_f is due to 3,5-di-*O*-caffeoylquinic acid; the band with the middle R_f is due to 4,5-di-*O*-caffeoylquinic acid; and the band with the lowest R_f is due to 3,4-di-*O*-caffeoylquinic acid.

Acceptance criteria: Under UV light at 366 nm, the *Sample solution* exhibits the most intense band corresponding in R_f and color to the band of chlorogenic acid and a yellow band above chlorogenic acid corresponding in R_f and color to the band due to luteolin-7-*O*-glucoside in *Standard solution A*. The *Sample solution* exhibits another yellow band in the lower-third section corresponding to rutin and two blue bands in the middle-third section due to 3,5-di-*O*-caffeoylquinic acid and 4,5-di-*O*-caffeoylquinic acid corresponding in R_f and color to similar bands in *Standard solution B*.

- **B. Caffeoylquinic Acids HPLC Profile**

Analysis: Proceed as directed in the test for *Content of Caffeoylquinic Acids*.

Acceptance criteria: The *Sample solution* exhibits the most intense peak with a retention time corresponding to chlorogenic acid in *Standard solution A* and peaks at the retention times corresponding to 3,5-di-*O*-caffeoylquinic acid and 4,5-di-*O*-caffeoylquinic acid in *Standard solution B*. It meets the content ratios in *Table 2*.

- **C. Iridoids HPLC Profile**

Analysis: Proceed as directed in the test for *Content of Iridoids*.

Acceptance criteria: The *Sample solution* exhibits a peak with a retention time corresponding to secoxyloganin in *Standard solution A* and two additional iridoid peaks of sweroside and centauroside at retention times corresponding to the same iridoids in *Standard solution B*.

COMPOSITION

- **Content of Caffeoylquinic Acids**

Solution A: 0.1% Phosphoric acid in water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	86	14
8	81	19
14	81	19
34	69	31
35	10	90
39.5	10	90
40	86	14
48	86	14

[Note—Protect from light and proceed under low actinic light. The *Standard solutions* and the *Sample solution* are stable for 24 h at room temperature.]

Solvent: Methanol and water (7.5: 2.5)

Standard solution A: 0.30 mg/mL of USP Chlorogenic Acid RS in methanol

Standard solution B: 2.5 mg/mL of USP *Lonicera japonica* Flower Dry Extract RS in *Solvent*. Sonicate for 15 min, and pass through a membrane filter of 0.45- μ m or finer pore size.

Sample solution: Accurately transfer about 100 mg of Japanese Honeysuckle Flower Powder into a suitable stoppered conical flask, and accurately add 10.0 mL of *Solvent*. Weigh the filled flask with a precision of ± 0.1 mg, stopper, and then sonicate for 30 min. After cooling to room temperature, adjust to the initial weight by adding *Solvent*. Pass through a membrane filter of 0.45- μ m or finer pore size, and discard the first portion of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 327 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing *L1*

Column temperature: 15°

Flow rate: 0.7 mL/min

Injection volume: 2 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Resolution: NLT 1.5 between the chlorogenic acid and cryptochlorogenic acid peaks, and the 3,4-di-*O*-caffeoylquinic acid and 3,5-di-*O*-caffeoylquinic acid peaks, *Standard solution B*

Tailing factor: NMT 2.0 for the chlorogenic acid peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for the chlorogenic acid peak in repeated injections, *Standard solution A*

Chromatographic similarity: The chromatogram of *Standard solution B* is similar to

the reference chromatogram for caffeoylquinic acids provided with the lot of USP *Lonicera japonica* Flower Dry Extract RS being used.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using the chromatograms of *Standard solution A* and *Standard solution B*, and the reference chromatogram for caffeoylquinic acids provided with the lot of USP *Lonicera japonica* Flower Dry Extract RS being used, identify the retention times of the peaks of neochlorogenic acid, chlorogenic acid, cryptochlorogenic acid, 3,4-di-*O*-caffeoylquinic acid, 3,5-di-*O*-caffeoylquinic acid, and 4,5-di-*O*-caffeoylquinic acid in the *Sample solution*. [Note—See *Table 2* for relative retention times. These values are not monograph requirements. They may vary due to differences in the chromatographic conditions allowed by the system suitability requirements.]

Table 2

Analyte	Approximate Relative Retention Time	Conversion Factor	Content Ratio
Neochlorogenic acid ^a	0.75	1.00	Minor peak ^b
Chlorogenic acid ^c	1.00	1.00	1.0
Cryptochlorogenic acid ^d	1.05	1.00	Minor peak ^b
3,4-Di- <i>O</i> -caffeoylquinic acid ^e	2.65	0.92	Minor peak ^b
3,5-Di- <i>O</i> -caffeoylquinic acid ^f	2.88	0.77	0.3–0.8
4,5-Di- <i>O</i> -caffeoylquinic acid ^g	3.01	0.77	0.04–0.2

^a (1*R*,3*R*,4*S*,5*R*)-3-{[(*E*)-3-(3,4-Dihydroxyphenyl)acryloyl]oxy}-1,4,5-trihydroxycyclohexane-1-carboxylic acid.

^b The peak area is lower than the peak area of 4,5-di-*O*-caffeoylquinic acid.

^c (1*S*,3*R*,4*R*,5*R*)-3-{[(*E*)-3-(3,4-Dihydroxyphenyl)acryloyl]oxy}-1,4,5-trihydroxycyclohexane-1-carboxylic acid.

^d (1*S*,3*R*,4*S*,5*R*)-4-{[(*E*)-3-(3,4-Dihydroxyphenyl)acryloyl]oxy}-1,4,5-trihydroxycyclohexane-1-carboxylic acid.

^e (1*S*,3*R*,4*R*,5*R*)-3,4-Bis{[(*E*)-3-(3,4-dihydroxyphenyl)acryloyl]oxy}-1,5-dihydroxycyclohexane-1-carboxylic acid.

^f (1*S*,3*R*,4*S*,5*R*)-3,5-Bis{[(*E*)-3-(3,4-dihydroxyphenyl)acryloyl]oxy}-1,5-dihydroxycyclohexane-1-carboxylic acid.

^g (1*R*,3*R*,4*S*,5*R*)-3,4-Bis{[(*E*)-3-(3,4-dihydroxyphenyl)acryloyl]oxy}-1,5-dihydroxycyclohexane-1-carboxylic acid.

Separately calculate the percentages of chlorogenic acid, 3,5-di-*O*-caffeoylquinic acid, and 4,5-di-*O*-caffeoylquinic acid in the portion of Japanese Honeysuckle Flower Powder

taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of chlorogenic acid from *Standard solution A*

C_S = concentration of USP Chlorogenic Acid RS in *Standard solution A* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Japanese Honeysuckle Flower Powder taken to prepare the *Sample solution* (mg)

F = conversion factor for the analyte (see *Table 2*)

Calculate the content of caffeoylquinic acids as the sum of the percentages of chlorogenic acid, 3,5-di-*O*-caffeoylquinic acid, and 4,5-di-*O*-caffeoylquinic acid.

Acceptance criteria: NLT 3.8% on the dried basis

- **Content of Iridoids**

Solution A, Solution B, Mobile phase, Standard solution B, and Sample solution:

Prepare as directed in the test for *Content of Caffeoylquinic Acids*.

Standard solution A: 0.05 mg/mL of USP Secoxyloganin RS in methanol

Chromatographic system: Proceed as directed in the test for *Content of Caffeoylquinic Acids* except for the *Detector*.

Detector: UV 240 nm

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Resolution: NLT 1.5 between the peak of secoxyloganin and the peak before it, *Standard solution B*

Tailing factor: NMT 2.0 for the secoxyloganin peak, *Standard solution A*

Relative standard deviation: NMT 2.0% for the secoxyloganin peak in repeated injections, *Standard solution A*

Chromatogram similarity: The chromatogram of *Standard solution B* is similar to the reference chromatogram for iridoids provided with the lot of USP *Lonicera japonica* Flower Dry Extract RS being used.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Using the chromatograms of *Standard solution A* and *Standard solution B*, and the reference chromatogram for iridoids provided with the lot of USP *Lonicera japonica* Flower Dry Extract RS being used, identify the peaks of sweroside, secoxyloganin, and centauroside in the *Sample solution*. [Note—The approximate relative retention times for the peaks of sweroside, secoxyloganin, and centauroside are 0.85, 1.00, and 1.80, respectively.]

Separately calculate the percentages of secoxyloganin, sweroside, and centauroside in

the portion of Japanese Honeysuckle Flower Powder taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times F \times 100$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of secoxyloganin from *Standard solution A*

C_S = concentration of USP Secoxyloganin RS in *Standard solution A* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Japanese Honeysuckle Flower Powder taken to prepare the *Sample solution* (mg)

F = conversion factor for the analyte (1.00 for secoxyloganin, 1.03 for sweroside, and 0.89 for centauroside)

Calculate the content of iridoids as the sum of the percentages of secoxyloganin, sweroside, and centauroside.

Acceptance criteria: NLT 0.80% on the dried basis

CONTAMINANTS

- **Articles of Botanical Origin** <561>, *Limits of Elemental Impurities*: Meets the requirements
- **Articles of Botanical Origin** <561>, *Pesticide Residue Analysis*: Meets the requirements

- **Absence of Specified Microorganisms** <2022>, *Test Procedures, Test for Absence of Salmonella species* and *Test for Absence of Escherichia coli*: Meets the requirements

SPECIFIC TESTS

• Botanical Characteristics

Macroscopic: Yellowish-white to yellowish-green powder, darkening over time to a golden color

Microscopic: Glandular hairs are numerous. The heads of glandular hairs are multicellular, subround or slightly oblate, usually 30–70 μm in diameter, exceptionally up to 110 μm . The stalks of glandular hairs are unicellular or multicellular with up to five cells, usually 20–70 μm long, exceptionally up to 700 μm . Non-glandular hairs occur in two types: one with thick walls, unicellular, 45–900 μm long, 15–40 μm in diameter, with fine verrucae on the surface, some have corneous spirals; another type with thin walls, slender, curved, or shrunken, with fine verrucae on the surface. Clusters of calcium oxalate are usually 6–45 μm in diameter. Pollen grains are spherical, with three germinal pores, 60–90 μm in diameter.

• Limit of Triterpenoid Saponins

Standard solution: 5.0 mg/mL of USP *Lonicera macranthoides* Flower Dry Extract RS in methanol. Sonicate for 10 min, and filter.

Sample solution: 500 mg of Japanese Honeysuckle Flower Powder in 10 mL of methanol. Sonicate for 10 min, and filter.

Chromatographic system

(See *HPTLC for Articles of Botanical Origin* (203).)

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 μm

Application volume: 3 μL , as 8-mm bands

Relative humidity: Condition the plate to a relative humidity of about 33% using a suitable device.

Developing solvent system: The upper layer solution of a mixture of *n*-butanol, formic acid, and water (4:1:5)

Developing distance: 6 cm

Derivatization reagent: 10% Sulfuric acid in ethanol

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Samples* as bands to a suitable HPTLC plate and dry in air. Develop in a saturated chamber, remove the plate from the chamber, and dry in air. Treat the plate with *Derivatization reagent*, heat at 105° for 5 min, and examine immediately under UV light at 366 nm.

System suitability requirements: Under UV light at 366 nm, in the lower-third section, the *Standard solution* exhibits three clearly separated brown bands: the band with the highest R_f is due to dipsacoside B; the middle band is due to macranthoidin A; the band with the lowest R_f is due to macranthoidin B.

Acceptance criteria: Under UV light at 366 nm, the *Sample solution* does not exhibit any bands corresponding in R_f and color to the bands due to dipsacoside B, macranthoidin A, and macranthoidin B in the *Standard solution*.

BRIEFING

Olive Leaf. Because there is currently no existing *USP* monograph for this dietary supplement, a new monograph is being proposed. The liquid chromatographic procedure in the test for *Content of Oleuropein* is performed on the Phenomenex Luna C18(2) brand of L1 column with 5- μ m packing. The typical retention time of oleuropein is 18 min.

(BDSHM: A. Bzhelyansky.)

Correspondence Number—C160782

Comment deadline: November 30, 2015

Add the following:

- **Olive Leaf**

DEFINITION

Olive Leaf consists of the dried leaf of *Olea europaea* L. (Fam. Oleaceae). It contains NLT 6.0% of oleuropein ($C_{25}H_{32}O_{13}$), calculated on the dried basis.

IDENTIFICATION

- **A. HPTLC for Articles of Botanical Origin** <203>

Flavonoids

Standard solution A: 1 mg/mL of USP Rutin RS and 2 mg/mL each of USP Verbascoside RS, USP Oleuropein RS, and USP Oleanolic Acid RS in methanol

Standard solution B: 25 mg/mL of USP Olive Leaf Dry Extract RS in methanol. Sonicate for 10 min, centrifuge, and use the supernatant.

Sample solution: Suspend about 500 mg of Olive Leaf, finely powdered, in 5 mL of methanol, and sonicate for 10 min. Centrifuge, and use the supernatant.

Chromatographic system

Adsorbent: Chromatographic silica gel with an average particle size of 5 μ m (HPTLC plate)¹

Application volume: 2 μ L each of *Standard solution A*, *Standard solution B*, and *Sample solution* as 8-mm bands

Relative humidity: Condition the plate to a relative humidity of 33%.

Temperature: Ambient temperature, not to exceed 30°

Developing solvent system: Ethyl formate, formic acid, toluene, and water (60:8:3:6)

Developing distance: 6 cm

Derivatization reagent A: 5 mg/mL of 2-aminoethyl diphenylborinate in ethyl acetate

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the *Samples* as bands and dry in air. Develop in a saturated chamber and dry in air. Heat at 100° for 3 min. While the plate is still warm, treat with *Derivatization reagent A*, and examine under long-wave UV light (365 nm). [Note—Immediately after examination, use the same developed and derivatized plate for *Identification test B*.]

System suitability: Under long-wave UV (365 nm), the derivatized chromatogram of *Standard solution B* displays, in its lower third, three yellowish bands: the first close to the application line; the second located just above, or coincident with, the rutin band in *Standard solution A*; the third, due to luteolin-7-*O*-glucoside positioned above the light-blue band corresponding to verbascoside in *Standard solution A*. There is a bluish-green band just above the band due to rutin. A faint light-blue band may appear just below the verbascoside band. The bands due to verbascoside and luteolin-7-*O*-glucoside are clearly separated. Above the yellow band due to luteolin-7-*O*-glucoside, there is a faint blue zone and a faint yellow band.

Acceptance criteria: Under long-wave UV light (365 nm), the chromatogram of the *Sample solution* displays the bands similar in position and color to those seen in *Standard solution B*. Additional faint bands may be observed.

● B. HPTLC for Articles of Botanical Origin (203)

Secoiridoids and Triterpenoids

[Note—Apply *Derivatization reagent B* to the plate used earlier in *Identification test A*. Perform the second derivatization within 20 min of the first one.]

Chromatographic system

Derivatization reagent B: 85 mL of ice-cold methanol combined with 10 mL of glacial acetic acid, 5 mL of sulfuric acid, and 0.5 mL of *p*-anisaldehyde

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Treat the plate with *Derivatization reagent B*, dry in air, heat for 3 min at 100°, and immediately examine under white light.

System suitability: Under white light, the derivatized chromatogram of the *Standard solution B* exhibits, in its lower third, a number of faint grayish-brown bands. In the middle of the chromatogram, an intense gray-brown band corresponding to oleuropein in *Standard solution A* appears. An intense violet band, corresponding to the oleanolic acid band in *Standard solution A*, is seen near the solvent front, and a weaker blue band due to maslinic acid just below it.

Acceptance criteria: Under white light, the chromatogram of the *Sample solution* displays the bands similar in position and color to those seen in *Standard solution B*. Additional bands may be observed.

COMPOSITION**• Content of Oleuropein**

Mobile phase: 0.1% Phosphoric acid in water and acetonitrile (80:20)

Standard solution: 0.2 mg/mL of USP Oleuropein RS in *Mobile phase*

Sample solution: Transfer about 1.0 g of Olive Leaf, finely powdered and accurately weighed, to a 50-mL centrifuge tube, add 15 mL of *Mobile phase*, cap tightly, and sonicate for 20 min. Centrifuge, and transfer the supernatant to a 50-mL volumetric flask. Repeat with two additional 15-mL aliquots of *Mobile phase*, and combine all supernatants into the same volumetric flask. Dilute with *Mobile phase* to volume, and mix well. Dilute the resulting solution 10-fold with *Mobile phase*. Pass through a PTFE filter of 0.45- μ m or finer pore size, discarding the initial few mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: HPLC

Detector: UV 230 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Column temperature: 25°

Flow rate: 1.5 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0 for the oleuropein peak

Relative standard deviation: NMT 2.0% determined for the oleuropein peak in replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Using the chromatogram of the *Standard solution*, identify the retention time of the peak corresponding to oleuropein in the *Sample solution*.

Calculate the percentage of oleuropein (C₂₅H₃₂O₁₃) in the portion of Olive Leaf taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times D \times 100$$

r_U = peak area of oleuropein from the *Sample solution*

r_S = peak area of oleuropein from the *Standard solution*

C_S = concentration of USP Oleuropein RS in the *Standard solution* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Olive Leaf taken to prepare the *Sample solution* (mg)

D = dilution factor, 10

Acceptance criteria: NLT 6.0% on the dried basis

CONTAMINANTS

- **Articles of Botanical Origin** <561>, *Limits of Elemental Impurities*: Meets the requirements
- **Articles of Botanical Origin** <561>, *Pesticide Residue Analysis*: Meets the requirements
- **Microbial Enumeration Tests** <2021>: The total aerobic bacterial count does not exceed 10^5 cfu/g, the total combined molds and yeasts count does not exceed 10^5 cfu/g, and the bile-tolerant Gram-negative bacterial count does not exceed 10^2 cfu/g.
- **Absence of Specified Microorganisms** <2022>, *Test Procedures, Test for Absence of Salmonella Species* and *Test for Absence of Escherichia coli*: Meets the requirements

SPECIFIC TESTS

- **Botanical Characteristics**

Macroscopic: The leaf is simple, sessile, thick, coriaceous, lanceolate to obovate, 3–8 cm long, 0.5–2 cm broad; base cuneate; apex apiculate to mucronulate. The margins are entire and folded abaxially. Nervation of the leaf is reticular. The upper surface is grayish-green to dark-green, glabrous and shiny; the lower surface silvery (or reddish in some species), and tomentous (densely pilous), densely covered with a layer of peltate scales but without filamentous hairs.

Microscopic: The leaf has iso-bilateral structure. Both the adaxial epidermis and the abaxial epidermis are simple, with thick cuticle. The anticlinal walls of both adaxial and abaxial epidermal cells are straight. The adaxial epidermis has sporadic and the abaxial epidermis numerous densely distributed, nonglandular, very large scutiform trichomes. The leaves are hypostomatic and their numerous stomata possess highly cutinized guard cells. The mesophyll is constituted of three layers of condensed long palisade cells located under the adaxial epidermis and one or two layers of short palisade cells on the abaxial epidermis. The central part of the leaf contains tiny cells of spongy parenchyma with large intercellulars. Present in the mesophyll are filiform sclereids, which are long, fiber-like, and sometimes branched. Microscopically, the olive leaf can be clearly identified by fragments of epidermis with long filiform sclereids and characteristic very large scutiform trichomes. Presence of fragments of epidermis with crypts may indicate adulteration with oleander leaves, while presence of numerous anomocytic stomata and large cluster crystals suggests adulteration with pittosporum.

Add the following:

- **Olive Leaf Dry Extract**

DEFINITION

Olive Leaf Dry Extract is prepared from the dried leaf of *Olea europaea* L. (Fam. Oleaceae) by extraction with hydroalcoholic mixtures, ethyl acetate, or other suitable solvents. It contains NLT 90% and NMT 110% of the labeled amount of oleuropein (C₂₅H₃₂O₁₃), calculated on the dried basis. The ratio of starting plant material to extract is between 5:1 and 60:1. It may contain suitable added substances.

IDENTIFICATION

- **A. HPTLC for Articles of Botanical Origin** <203>

Flavonoids

Standard solution A: 1 mg/mL of USP Rutin RS and 2 mg/mL each of USP Verbascoside RS, USP Oleuropein RS, and USP Oleanolic Acid RS in methanol

Standard solution B: 25 mg/mL of USP Olive Leaf Dry Extract RS in methanol. Sonicate for 10 min, centrifuge, and use the supernatant.

Sample solution: Suspend about 125 mg of Olive Leaf Dry Extract in 5 mL of methanol, and sonicate for 10 min. Centrifuge, and use the supernatant.

Chromatographic system

Adsorbent: Chromatographic silica gel with an average particle size of 5 μ m (HPTLC

plate)¹

Application volume: 2 μ L each of *Standard solution A*, *Standard solution B*, and *Sample solution* as 8-mm bands

Relative humidity: Condition the plate to a relative humidity of 33%.

Temperature: Ambient temperature, not to exceed 30°

Developing solvent system: Ethyl formate, formic acid, toluene, and water (60:8:3:6)

Acceptance criteria: NLT 6.0% on the dried basis

CONTAMINANTS

- **Articles of Botanical Origin** (561), *Limits of Elemental Impurities*: Meets the requirements
- **Articles of Botanical Origin** (561), *Pesticide Residue Analysis*: Meets the requirements
- **Microbial Enumeration Tests** (2021): The total aerobic bacterial count does not exceed 10⁵ cfu/g, the total combined molds and yeasts count does not exceed 10⁵ cfu/g, and the bile-tolerant Gram-negative bacterial count does not exceed 10² cfu/g.
- **Absence of Specified Microorganisms** (2022), *Test Procedures, Test for Absence of Salmonella Species* and *Test for Absence of Escherichia coli*: Meets the requirements

SPECIFIC TESTS

- **Botanical Characteristics**

Macroscopic: The powder is yellowish-green.

Microscopic: The powder shows fragments of abaxial epidermis with small anomocytic stomata and adaxial epidermis with thick-walled polygonal cells, palisade composed of three layers of cells and spongy parenchyma composed of small cells. Fragments of the lamina show thick cuticle. Long filiform sclereids and very large characteristic scutiform trichomes are abundant. Presence of fragments of epidermis with crypts may indicate adulteration with oleander leaves, while presence of numerous anomocytic stomata and large cluster crystals suggests adulteration with pittosporum.

- **Loss on Drying** (731)

Sample: 1.0 g of Olive Leaf Powder

Analysis: Dry the *Sample* at 105° for 2 h.

Acceptance criteria: NMT 10.0%

- **Articles of Botanical Origin** (561), *Total Ash*

Sample: 1.0 g of Olive Leaf Powder

Acceptance criteria: NMT 9.0%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers, protected from light and moisture, and store at room temperature.
 - **Labeling:** The label states the official name of the article and the corresponding Latin binominal.

BRIEFING

Red Clover Aerial Parts Isoflavone Aglycones Dry Extract. Because there is no existing *USP* monograph for this dietary supplement, a new monograph is being proposed. The article defines an extract where isoflavones exist predominantly as aglycones. The chromatographic tests in this monograph are analogous to those in the *Powdered Red Clover Extract* monograph proposed elsewhere in this issue of *Pharmacopeial Forum*, although no hydrolysis is required in the test for *Content of Isoflavones*. The liquid chromatographic procedure in the test for *Content of Isoflavones* is performed on the Waters Sunfire C18 brand of L1 end-capped column with 5- μ m packing. The typical retention times for daidzein, genistein, formononetin, and biochanin A are 7.2, 9.7, 11.5, and 13.1 min, respectively.

(BDSHM: A. Bzhelyansky.)

Correspondence Number—C149439

Comment deadline: November 30, 2015

Add the following:**■ Red Clover Aerial Parts Isoflavone Aglycones Dry Extract****DEFINITION**

Red Clover Aerial Parts Isoflavone Aglycones Dry Extract is prepared from dried aerial parts of *Trifolium pratense* L. (Fam. Fabaceae) by extraction with hydroalcoholic mixtures or other suitable solvents. It contains NLT 36.0% and NMT 44.0% of isoflavones, predominantly as aglycones, calculated on the dried basis as the sum of daidzein, genistein, formononetin, and biochanin A. It contains NMT 1.0% of daidzein and NMT 1.0% of genistein, both on the dried basis. The ratio of 5,7-dihydroxyisoflavones to 7-hydroxyisoflavones is between 0.9 and 1.7. It may contain suitable excipients.

IDENTIFICATION**• A. HPTLC for Articles of Botanical Origin <203>****Presence of biochanin A and formononetin**

Solvent: Methanol and water (7:3)

Standard solution A: 1 mg/mL each of USP Biochanin A RS and USP Formononetin RS in methanol

Standard solution B: 10 mg/mL of USP Red Clover Aerial Parts Isoflavone Aglycones Dry Extract RS in *Solvent*. Shake to disperse, heat on a water bath at 60°–80° for 10 min, centrifuge, and use the supernatant.

Sample solution: 10 mg/mL of Dry Extract in *Solvent*. Shake to disperse, heat on a water bath at 60°–80° for 10 min, centrifuge, and use the supernatant.

Chromatographic system

Adsorbent: Chromatographic silica gel with an average particle size of 5 µm (HPTLC plate)¹

Application volume: 2 µL each of *Standard solution A*, *Standard solution B*, and *Sample solution*, as 8-mm bands

Relative humidity: Condition the plate to a relative humidity of about 33% using a suitable device.

Temperature: Ambient, not to exceed 30°

Developing solvent system: Ethyl acetate, toluene, and formic acid (30:70:1)

Developing distance: 6 cm

Derivatization reagent: 5 mg/mL of 2-aminoethyl diphenylborinate in ethyl acetate

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the *Samples* and dry in air. Develop in a saturated chamber. Remove the plate from the chamber, heat at 100° for 5 min, derivatize while warm with the

Derivatization reagent, dry in air, and examine under UV light at 365 nm.

System suitability: *Standard solution A* exhibits a bluish band at about one-third of the chromatogram due to formononetin, and a greenish band due to biochanin A at about the middle of the chromatogram. *Standard solution B* exhibits prominent bands of similar color and position to those of formononetin and biochanin A in *Standard solution A*. A red band appears below the formononetin band in *Standard solution B*.

Acceptance criteria: The *Sample solution* exhibits the following prominent bands similar in position and color to those in *Standard solution B*: two greenish bands at about the middle of the chromatogram (a distinction from white clover, soy, and alfalfa), one of them corresponding to biochanin A in *Standard solution A*; a bluish band at about one-third of the chromatogram, corresponding to the formononetin band in *Standard solution B*; and a red band below that due to formononetin.

● B. HPLC

Analysis: Proceed as directed in the test for *Content of Isoflavones*.

Using the values obtained in the test for *Content of Isoflavones*, calculate the ratio of 5,7-dihydroxyisoflavones to 7-hydroxyisoflavones:

$$\text{Result} = (B + G)/(D + F)$$

B = percentage of biochanin A

G = percentage of genistein

D = percentage of daidzein

F = percentage of formononetin

Acceptance criteria: The *Sample solution* exhibits peaks for daidzein, genistein, formononetin, and biochanin A at retention times corresponding to those in *Standard solution A* and *Standard solution B*. The ratio of 5,7-dihydroxyisoflavones to 7-hydroxyisoflavones is between 0.9 and 1.7.

COMPOSITION

● Content of Isoflavones

Solution A: Acetonitrile and water (1:3) containing 0.05% trifluoroacetic acid

Solution B: Acetonitrile containing 0.05% trifluoroacetic acid

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
2	100	0
2.5	87	13
7.5	80	20
7.8	73	27
8.0	55	45
11.0	50	50
13.0	40	60
15.0	26	74
16.0	0	100
18.1	100	0
23.0	100	0

Diluent: Alcohol and water (1:1)

Standard solution A: Prepare a 0.10–0.15 mg/mL solution of USP Red Clover Aerial Parts Isoflavone Aglycones Dry Extract RS in *Diluent*, sonicate briefly, and filter through a membrane of 0.45- μ m or finer pore size.

Standard solution B: 0.1 mg/mL of USP Formononetin RS, 0.02 mg/mL of USP Genistein RS, 0.02 mg/mL of USP Daidzein RS, and 0.1 mg/mL of USP Biochanin A RS in a mixture of *n*-propanol and water (1:1)

Sample solution: Accurately weigh a quantity of Dry Extract, equivalent to 12 mg of the labeled content of isoflavones, and transfer to a 100-mL volumetric flask. Add 50 mL of *Diluent*, sonicate to disperse, and dilute with *Diluent* to volume. Before injection, pass through a filter of 0.45- μ m or finer pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; end-capped 5- μ m packing *L1*

Column temperature: 45°

Flow rate: 1.0 mL/min

Injection volume: 10 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Tailing factor: NMT 2.0 for the formononetin peak, *Standard solution B*

Relative standard deviation: NMT 2.0%, determined from the formononetin peak in replicate injections, *Standard solution B*

Chromatogram similarity: The chromatogram of *Standard solution A* is similar to the reference chromatogram provided with the lot of USP Red Clover Aerial Parts

Isoflavone Aglycones Dry Extract RS being used.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Identify the peaks corresponding to daidzein, genistein, formononetin, and biochanin A in the *Sample solution* by comparison with the chromatograms obtained from *Standard solution A*, *Standard solution B*, and the reference chromatogram supplied.

Calculate the percentage of each isoflavone in the portion of Dry Extract taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (V/W) \times 100$$

r_U = peak area of a relevant isoflavone from the *Sample solution*

r_S = peak area of a relevant isoflavone from *Standard solution B*

C_S = concentration of a relevant isoflavone in *Standard solution B* (mg/mL)

V = volume of the *Sample solution* (mL)

W = weight of Dry Extract taken to prepare the *Sample solution* (mg)

Acceptance criteria: 36.0%–44.0% of isoflavones as the sum of daidzein, genistein, formononetin, and biochanin A, calculated on the dried basis; NMT 1.0% of daidzein and NMT 1.0% of genistein, both on the dried basis

BRIEFING

Powdered Red Clover Extract, *USP 38* page 6191. It is proposed to make the following revisions to the monograph.

1. In the *Content of Isoflavones* test, the proposed revisions will streamline the preparation of *Standard solution A* and the *Sample solution*, correct the calculation, and add a calculation for percent label claim.
2. The test for enterobacterial count is removed as it is no longer required in *Microbiological Attributes of Nonsterile Nutritional and Dietary Supplements* (2023).

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Relative humidity: Condition the plate to a relative humidity of 33%.

Temperature: Ambient, not to exceed 30°

Developing solvent system: *Ethyl acetate, glacial acetic acid, formic acid, water, and methylene chloride* (10: 1.0: 1.0: 1.1: 2.5)

Developing distance: 6 cm

Derivatization reagent A: 5 mg/mL of 2-aminoethyl diphenylborinate in *ethyl acetate*

Derivatization reagent B: 10 mg/mL of polyethylene glycol 400 in *methylene chloride*

Analysis

Samples: *Standard solution A, Standard solution B, Standard solution C, and Sample solution*

Apply the *Samples* as bands, and dry in air. Develop in a saturated chamber, remove the plate from the chamber, and dry in air. Heat the plate at 105° for 3 min, treat while still warm with *Derivatization reagent A*, and dry in air. Then treat with *Derivatization reagent B*, dry in air, and examine under UV light at 366 nm.

System suitability: *Standard solution C* exhibits, in the lower third section, two yellowish-orange fluorescent bands corresponding to rutin and hyperoside in *Standard solution A* and *Standard solution B*, respectively; a blue fluorescent band directly below the hyperoside band corresponding to chlorogenic acid; and two red fluorescent bands due to pseudohypericin (lower R_F) and hypericin in the upper third section of the chromatogram. The bands due to pseudohypericin and hypericin are clearly separated.

Acceptance criteria: The *Sample solution* exhibits the following: two yellowish-orange fluorescent bands at R_F corresponding to rutin and hyperoside in *Standard solution A*, *Standard solution B*, and *Standard solution C*; a blue fluorescent band directly below the hyperoside band corresponding to chlorogenic acid in *Standard solution C*; two red fluorescent bands at R_F corresponding to pseudohypericin and hypericin in *Standard solution C*; and two to three yellowish-orange fluorescent bands in the middle third section of the chromatogram corresponding to similar bands in *Standard solution C*.

• B. Thin-Layer Chromatography

Presence of hyperforin

Standard solution: 50 mg/mL of USP Powdered St. John's Wort Extract RS in *methanol*. Sonicate for 20 min, and use the clear supernatant.

Sample solution: 50 mg/mL of Powdered St. John's Wort Extract in *methanol*. Sonicate for 20 min, and use the clear supernatant.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.50-mm layer of chromatographic silica gel mixture

Application volume: 10 μ L

Developing solvent system: *Hexane* and *ethyl acetate* (4:1)

Derivatization reagent: 0.38 g of *ceric ammonium sulfate* and 3.8 g of *ammonium molybdate* in 100 mL of 2 N *sulfuric acid*.

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatograms in a saturated chamber until the solvent front has moved NLT 18 cm, and dry the plate in a current of air. Treat the plate with *Derivatization reagent*, heat at 140° for 15 min, and examine under white light.

Acceptance criteria: The blue zone due to hyperforin at an R_F value of about 0.54 in the *Sample solution* corresponds in color and position to that in the *Standard solution*.

COMPOSITION

Change to read:

• Content of Hypericin and Pseudohypericin

[Note—Conduct all sample preparations with minimal exposure to subdued light, and use low-actinic glassware.]

Solvent: *Methanol* and *acetone* (1:1)

Solution A: *Phosphoric acid* and *water* (3:997)

Solution B: *Acetonitrile*

Solution C: *Methanol*

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)	Solution C (%)
0	100	0	0
10	85	15	0
30	70	20	10
40	10	75	15
55	5	80	15
56	100	0	0
66	100	0	0

Standard solution A: 2.5 µg/mL of USP Oxybenzone RS in *Solvent*

Standard solution B: 1 mg/mL of USP Powdered St. John's Wort Extract RS in *Solvent*

Sample solution: 1 mg/mL of Powdered St. John's Wort Extract in a mixture of *methanol* and *water* (9:1). Sonicate to dissolve, pass through a PTFE filter of 0.45-µm or finer pore size, and use the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 270 nm and Vis 588 nm

Columns

Guard: Packing *L1*

Analytical: 4.6-mm × 25-cm; packing *L1*

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 20 µL. [Note—First equilibrate the system with 100% *Solution A*.]

System suitability

Samples: *Standard solution A* (record the peak responses at 270 nm) and *Standard solution B* (record the peak responses at 270 and 588 nm)

Suitability requirements

Chromatogram similarity: The chromatograms of *Standard solution B* are similar to the respective reference chromatograms provided with the lot of USP Powdered St. John's Wort Extract RS being used.

Column efficiency: NLT 100,000 theoretical plates for oxybenzone, *Standard solution A*

Tailing factor: NMT 1.5 for oxybenzone, *Standard solution A*

Relative standard deviation: NMT 2.0% in replicate injections, *Standard solution A*

Analysis

Samples: *Standard solution A* and *Sample solution*

Measure the areas of the relevant peaks in the *Sample solution* at 270 nm. Calculate the percentage of the labeled amount of hypericin ($C_{30}H_{16}O_8$) and pseudohypericin ($C_{30}H_{16}O_9$) in the portion of Powdered St. John's Wort Extract taken:

$$\text{Result} = (\Sigma r_{Uj}/F_i) \times (1/r_S) \times (C_S/C_U) \times 100$$

$\Sigma r_{Uj}/F_i$ = sum of the peak areas of hypericin and pseudohypericin from the *Sample solution* divided by their respective response factors relative to oxybenzone; 1.30 for hypericin and 1.24 for pseudohypericin

r_S = peak area of oxybenzone from *Standard solution A*

C_S = concentration of USP Oxybenzone RS in *Standard solution A* (mg/mL)

C_U = nominal concentration of the total hypericins content in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% on the dried-

■ the anhydrous ■ 2S (USP39)

basis

Change to read:

• Content of Hyperforin

Analysis: Using the chromatograms obtained in the test for *Content of Hypericin and Pseudohypericin*, calculate the percentage of hyperforin ($C_{35}H_{52}O_4$) in the portion of Powdered Extract taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 1/F \times 100$$

r_U = peak area of hyperforin from the *Sample solution*

r_S = peak area of oxybenzone from *Standard solution A*

C_S = concentration of USP Oxybenzone RS in *Standard solution A* (mg/mL)

C_U = nominal concentration of hyperforin in the *Sample solution* (mg/mL)

F = relative response factor for hyperforin relative to oxybenzone, 0.46

Acceptance criteria: 90.0%–110.0% on the dried-

ADDITIONAL REQUIREMENTS

- **Packaging and Storage**: Preserve in tight containers, protected from moisture and light.
- **Labeling**: The label states the Latin binomial and, following the official name, the part of the plant from which the article was prepared. The label also indicates the content of hypericin, pseudohypericin, and hyperforin; the extracting solvent or solvent mixture used for preparation; and the ratio of the starting crude plant material to Powdered Extract. The label bears a statement indicating that "Rare cases of allergic reactions and photosensitivity have been reported with the use of St. John's Wort. St. John's Wort interacts with numerous medications. Check with your healthcare provider before using."
- **USP Reference Standards** (11)
 - USP Hyperoside RS
 - USP Oxybenzone RS
 - USP Rutin RS
 - USP Powdered St. John's Wort Extract RS

BRIEFING

Schizochytrium Oil, page 7915 of the *Second Supplement to USP 38*. On the basis of comments received regarding the additional types of schizochytrium oils that currently exist on the market, the following changes are proposed to be implemented as a flexible monograph:

1. The *Definition* section is revised by removing the acceptance criteria for DHA and adding EPA, DPA and others as the minor polyunsaturated fatty acid components in the article.
2. *Identification test A* is revised by adding *Standard solution 2a* and *Standard solution 2b* to the *Analysis* section, and additional acceptance criteria are added.
3. The table in the *Identification test A* is changed to *Table 1* and is revised by adding new

columns titled *Acceptance criteria II, III, and IV* for articles labeled as Type IA, Type II, or Type III, respectively.

4. A labeling requirement is added to the *Labeling* section to indicate whether the article meets the acceptance criteria for Type IA, Type II, or Type III.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(NBDS: H. Dinh.)

Correspondence Number—C136489

Comment deadline: November 30, 2015

Schizochytrium Oil

DEFINITION

Change to read:

Schizochytrium Oil is obtained by fermentation and extraction of algae of the genus *Schizochytrium* and contains ~~NLT 30.0% (w/w) of docosahexaenoic acid (DHA, C₂₂H₃₂O₂) (C22:6 n-3), as the main polyunsaturated fatty acid~~

■ docosahexaenoic acid (DHA, C₂₂H₃₂O₂) (C22:6 n-3) as the major polyunsaturated fatty acid component. It may contain eicosapentaenoic acid (EPA, C₂₀H₃₀O₂) (C20:5 n-3), docosapentaenoic acid (DPA, C₂₂H₃₄O₂) (C22:5 n-6), arachidonic acid (C₂₀H₃₂O₂) (C20:4 n-6), and dihomo gamma linolenic acid (C₂₀H₃₄O₂) (C20:3 n-6) as the minor polyunsaturated fatty acid components. DHA content may be standardized with other appropriate oils.

■ 2S (USP39)

Suitable antioxidants in appropriate concentrations may be added.

IDENTIFICATION

Change to read:

- **A. Long Chain Unsaturated Fatty Acid Profile:** Proceed as directed in *Fats and Fixed Oils* (401), *Omega-3 Fatty Acids Determination and Profile*.

Analysis

Samples: ~~Standard Solution 2~~

■ *Standard Solution 2a, Standard Solution 2b, 2S (USP39)* and *Test Solution 1*

Calculate the area percentage for dihomo gamma linolenic acid, arachidonic acid, and docosapentaenoic acid as methyl ester in *Test Solution 1*:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each individual fatty acid as methyl ester

r_T = sum of the responses of all the peaks, except the solvent and butylated hydroxytoluene peaks

Acceptance criteria: The retention times of the peaks of the docosahexaenoic acid methyl

ester and the eicosapentaenoic acid methyl ester of *Test Solution 1* correspond to those of *Standard Solution 2*

■ *Standard Solution 2a* and *Standard Solution 2b*, respectively, ■ 2S (USP39)

as obtained in the test for *Content of DHA and EPA*. The area percentages for the methyl esters of dihomogamma linolenic acid, arachidonic acid, and docosapentaenoic acid from the chromatogram of *Test Solution 1* meet *Acceptance criteria I, II, III, or IV* in the table below:

■ *Table 1*.

Fatty Acid	Relative Retention Time	Shorthand Notation	Lower Limit (Area %)	Upper Limit (Area %)
Dihomogammalinolenic acid	0.71	20:3 n-6	1.7	2.8
Arachidonic acid	0.73	20:4 n-6	0.6	1.3
Eicosapentaenoic acid (EPA)	0.79	20:5 n-3	1.3	3.9
Docosapentaenoic acid (DPA n-6)	0.94	22:5 n-6	10.5	16.5
Docosahexaenoic acid (DHA)	1.00	22:6 n-3	30.0	40.0

Table 1

Fatty Acid	Relative Retention Time	Shorthand Notation	Acceptance criteria I Limit (Area%)	Acceptance criteria II (For articles labeled as Type IA) Limit (Area%)	Acceptance criteria III (For articles labeled as Type II) Limit (Area%)	Acceptance criteria IV (For articles labeled as Type III) Limit (Area%)
Dihomogamma linolenic acid	0.71	20:3 n-6	NMT 2.8	NMT 1.0	NMT 1.0	NMT 1.0
Arachidonic acid	0.73	20:4 n-6	NMT 1.3	NMT 3.5	NMT 3.5	NMT 3.5
Eicosapentaenoic acid (EPA)	0.79	20:5 n-3	NMT 3.9 ^a	NMT 3.5 ^a	NLT 10.0 ^a	NMT 20.0 ^a
Docosapentaenoic acid (DPA)	0.94	22:5 n-6	NMT 16.5	NMT 25.0	NMT 3.5	NMT 6.0
Docosahexaenoic acid (DHA)	1.00	22:6 n-3	NLT 30.0 ^a	NLT 35.0 ^a	NLT 20.0 ^a	NLT 35.0 ^a

^a Limit is expressed as w/w%.

● **Limit of Arsenic**

[Note—For the preparation of all aqueous solutions and for the rinsing of glass, polytef, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of arsenic as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytef, and plastic vessels before use by soaking in warm 8 N *nitric acid* for 30 min and by rinsing with deionized water.]

Solution A: Transfer 1 g of ultrapure palladium metal to a Teflon beaker. Add 20 mL of water and 10 mL of *nitric acid*, and warm on a hot plate to dissolve. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution B: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of *nitric acid*, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% *nitric acid* (3:2:5). A volume of 5 μL provides 0.015 mg of palladium and 0.01 mg of *magnesium nitrate*.

Blank: *Nitric acid* and water (1:19)

Standard stock solution: Transfer 10.0 mL of *Standard Arsenic Solution*, prepared as directed in *Arsenic* (211), to a 100-mL volumetric flask. Add 40 mL of water and 5 mL of *nitric acid*, and dilute with water to volume. This solution contains 0.10 $\mu\text{g}/\text{mL}$ of arsenic.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 $\mu\text{g}/\text{mL}$ of arsenic.

Sample solution: For preparation of the *Sample solution*, use a microwave oven with a magnetron frequency of 2455 MHz and a selectable output power of 0–950 W in 1% increments, equipped with advanced composite vessels with 100-mL polytef liners. Use rupture membranes to vent vessels should the pressure exceed 125 psi. The vessels fit into a turntable, and each vessel can be vented into an overflow container. Equip the microwave oven with an exhaust tube to ventilate fumes. [**Caution**—Wear proper eye protection and protective clothing and gloves.] Transfer approximately 500 mg of Schizochytrium Oil, weighed to the nearest 0.1 mg, to a Teflon digestion vessel liner. Prepare samples in duplicate. Add 15 mL of *nitric acid*, and swirl gently. Cover the vessels with lids, leaving the vent fitting off. Predigest overnight under a hood. Place the rupture membrane in the vent fitting, and tighten the lid. Place all vessels on the microwave oven turntable. Connect the vent tubes to the vent trap, and connect the pressure-sensing line to the appropriate vessel. Initiate a two-stage digestion procedure by heating the microwave at 15% power for 15 min, followed by 25% power for 45 min. Remove the turntable of vessels from the oven, and allow the vessels to cool to room temperature. [Note—A cool water bath may be used to speed the cooling process.] Vent the vessels when they reach room temperature. Remove the lids, and slowly add 2 mL of *hydrogen peroxide* to each. Allow the reactions to subside, and seal the vessels. Return the vessels on the turntable to the microwave oven, and heat for an additional 15 min at 30% power. Remove the vessels from the oven, and allow them to cool to room temperature. Transfer the cooled digests to 25-mL volumetric flasks, and dilute with water to volume.

Analysis: Program the graphite furnace as follows. Dry at 115°, using a 1-s ramp, a 65-s hold, and an argon flow of 300 mL/min; char the sample at 1000°, using a 1-s ramp, a 20-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2400°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 µL of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for arsenic. Determine the peak area at the arsenic emission line at 193.7 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of arsenic, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in µg/mL, of arsenic in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of arsenic in the portion of Schizochytrium Oil taken:

$$\text{Result} = (C/W) \times 25$$

C = concentration as obtained above

W = weight of Schizochytrium Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

Change to read:

• **Limit of Lead**

[Note—For the preparation of all aqueous solutions and for the rinsing of glass, polytef, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytef, and plastic vessels before use by soaking in warm 8 N *nitric acid* for 30 min and by rinsing with deionized water.]

Solution A: 10 g of ultrapure monobasic ammonium phosphate in 1 mL of *nitric acid* and 40 mL of water to dissolve the phosphate. Dilute with deionized water to 100 mL.

Solution B: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of *nitric acid*, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% *nitric acid* (2:1:2). A volume of 5 µL provides 0.2 mg of phosphate plus 0.01 mg of *magnesium nitrate*.

Blank: *Nitric acid* and water (1:19)

Standard stock solution: Transfer 10.0 mL of **lead nitrate stock solution TS_{2S} (USP38)** to a 100-mL volumetric flask, add 40 mL of water and 5 mL of *nitric acid*, and dilute with water to volume. Transfer 1.0 mL of this solution to a second 100-mL volumetric flask, add 50 mL of water and 1 mL of *nitric acid*, and dilute with water to volume. This solution contains 0.10 µg/mL of lead.

Standard solutions: Dilute the *Standard stock solution* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 µg/mL of lead.

Sample solution: Prepare as directed for *Sample solution* in the test for *Limit of Arsenic*.

Analysis: Program the graphite furnace as follows. Dry at 120°, using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min; char the sample at 850°, using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2100°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 µL of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for lead. Determine the peak area at the lead emission line at 283.3 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of lead, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in µg/mL, of lead in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of lead in the portion of Schizochytrium Oil taken:

$$\text{Result} = (C/W) \times 25$$

C = concentration, as obtained above

W = weight of Schizochytrium Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 0.1 µg/g

• **Limit of Cadmium**

[Note—For the preparation of all aqueous solutions and for the rinsing of glass, polytef, and plastic vessels before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin before use. Select all reagents to have as low a content of cadmium as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glass, polytef, and plastic vessels before use by soaking in warm 8 N *nitric acid* for 30 min and by rinsing with deionized water.]

Solution A: 10 g of ultrapure monobasic ammonium phosphate in 40 mL of water and 1 mL of *nitric acid* to dissolve the phosphate. Dilute with deionized water to 100 mL.

Solution B: Transfer 1 g of ultrapure magnesium nitrate to a Teflon beaker. Add 40 mL of water and 1 mL of *nitric acid*, and warm on a hot plate to dissolve the solids. Allow the solution to cool to room temperature, transfer it to a 100-mL volumetric flask, and dilute with deionized water to volume.

Solution C: *Solution A*, *Solution B*, and 2% *nitric acid* to volume (2:1:2). A volume of 5 µL provides 0.2 mg of phosphate and 0.01 mg of *magnesium nitrate*.

Blank: *Nitric acid* and water (1:19)

Standard stock solution A: 0.1372 mg/mL of *cadmium nitrate*

Standard stock solution B: *Standard stock solution A*, *nitric acid*, and water (2:1:97). This solution contains 0.10 µg/mL of cadmium. [Note—Before makeup to final volume, dissolve in a portion of water and *nitric acid*.]

Standard solutions: Dilute *Standard stock solution B* with the *Blank* to obtain concentrations of 0.002, 0.005, 0.010, 0.025, and 0.050 µg/mL of cadmium.

Sample solution: Prepare as directed for *Sample solution* in the test for *Limit of Arsenic*.

Analysis: Program the graphite furnace as follows. Dry at 120°, using a 1-s ramp, a 55-s hold, and an argon flow of 300 mL/min; char the sample at 850°, using a 1-s ramp, a 30-s hold, and an airflow of 300 mL/min; cool down, and purge the air from the furnace for 10 s, using a 20° set temperature and an argon flow of 300 mL/min; atomize at 2400°, using a 0-s ramp and a 5-s hold with the argon flow stopped; and clean out at 2600° with a 1-s ramp and a 5-s hold. Separately inject equal volumes (20 µL) of the *Standard solutions*, the *Sample solution*, and the *Blank*, followed by an injection of 5 µL of *Solution C* for each of the samples, into the graphite tube of a suitable graphite furnace atomic absorption spectrometer equipped with a hollow-cathode lamp for cadmium. Determine the peak area at the cadmium emission line at 228.8 nm, corrected for background absorption. Plot the corrected peak areas of the *Standard solutions* versus their contents of cadmium, in µg/mL, and calculate the regression line best fitting the points. Determine the concentration, *C*, in µg/mL, of cadmium in each mL of the *Sample solution* by interpolation from the regression line.

Calculate the content of cadmium in the portion of Schizochytrium Oil taken:

$$\text{Result} = (C/W) \times 25$$

C = concentration, as obtained above

W = weight of Schizochytrium Oil taken to prepare the *Sample solution* (g)

 - USP Methyl Tricosanoate RS

BRIEFING

Turmeric, page 7926 of the *Second Supplement to USP 38*. The monograph proposes a new HPTLC procedure as *Identification* test A, which discontinues the use of chloroform and permits differentiation from two common confounders, *Curcuma zanthorrhiza* Roxb. and *Curcuma aromatica* Salisb.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Comment deadline: November 30, 2015

Turmeric**DEFINITION****Change to read:**

Turmeric is the dried rhizome of *Curcuma longa* L., also known as *C. domestica* Val. (Fam. Zingiberaceae). It is commonly known as Curcuma, Curcum, Haridra, and Indian Saffron. It contains NLT 3.0% of curcuminoids, calculated on the dried

- anhydrous ■2S (USP39)
- basis.

IDENTIFICATION**Delete the following:**

- **A. Thin-Layer Chromatography**

Standard solution: 0.2 mg/mL of USP Curcuminoids RS in acetone

Sample solution: Pulverize about 5 g of Turmeric. Transfer about 0.2 g of the pulverized sample to a test tube, add 3 mL of acetone, sonicate for 30 min, and centrifuge. Use the supernatant.

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm long (TLC plates)

Application volume: 10 µL, as bands

Developing solvent system: Chloroform, methanol, and formic acid (96:4:1)

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Samples* as bands (see *Chromatography* (621)). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the length of the plate. Remove the plate from the chamber, dry, and examine under white light and under UV light at 365 nm.

Acceptance criteria: The *Sample solution* chromatogram shows yellowish-brown bands due to bisdesmethoxycurcumin, desmethoxycurcumin, and curcumin at R_f values of about 0.4, 0.6, and 0.7, respectively, corresponding in position and color to those obtained with the *Standard solution*. ■ 2S (USP39)

Add the following:

■ ● A. HPTLC for Articles of Botanical Origin <203>

Standard solution: 1 mg/mL of USP Curcuminoids RS in *methanol*

Sample solution: Suspend about 200 mg of Turmeric, finely powdered, in 3 mL of *methanol*, and sonicate for 10 min. Centrifuge or filter, and use the supernatant or the filtrate.

Chromatographic system

Adsorbent: Chromatographic silica gel with an average particle size of 5 μm (HPTLC plate).¹

■ 2S (USP39)

Application volume: 2 μL each of the *Standard solution* and the *Sample solution* as 8-mm bands

Relative humidity: Condition the plate to a relative humidity of 33%.

Temperature: Ambient, not to exceed 30°

Developing solvent system: *Toluene* and *glacial acetic acid* (4:1)

Developing distance: 6 cm

Derivatization reagent: 85 mL of ice-cold *methanol* combined with 10 mL of *glacial acetic acid*, 5 mL of *sulfuric acid*, and 0.5 mL of *p-anisaldehyde*

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the *Samples* as bands and dry in air. Develop in a saturated chamber and dry in air. Treat with *Derivatization reagent*, heat at 100° for 3 min, and examine under long-wave UV light (365 nm) and under white light.

System suitability: Under long-wave UV light (365 nm), the derivatized chromatogram of the *Standard solution* exhibits, in its lower half, three bands, in the order of increasing R_f : an orange band due to bisdesmethoxycurcumin, an orange band due to desmethoxycurcumin, and the red band due to curcumin. Under white light, the two lower bands appear orange, while the topmost band is reddish-pink.

Acceptance criteria: Under long-wave UV light (365 nm), the derivatized chromatogram of the *Sample solution* displays two orange bands and one red band, similar in position and

color to those observed in the *Standard solution*. At the bottom part of the upper half of the plate, two purple bands are seen. Under white light, two orange bands and a darker red band are seen coincident with the bands due to bisdesmethoxycurcumin, desmethoxycurcumin, and curcumin in the *Standard solution*, in the order of increasing R_f . In the upper half of the plate, the lower of the two bands appears purple, while the upper band is brown. No bands appear in the topmost quarter of the plate, which are characteristic of *Curcuma zanthorrhiza* Roxb. and *Curcuma aromatica* Salisb. These confounders, and occasional adulterants, of Turmeric also lack the lower orange band corresponding to bisdesmethoxycurcumin. Additional weak bands may be observed in the *Sample solution* under either illumination conditions. ■2S (USP39)

Delete the following:

- ● ~~B.~~ The retention times of the peaks for curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin of the *Sample solution* chromatogram correspond to those of the *Standard solution* for the appropriate USP Reference Standard, as obtained in the test for *Content of Curcuminoids*. ■2S (USP39)

Add the following:

- ● **B. HPLC**

Analysis: Proceed as directed in the test for *Content of Curcuminoids*.

Acceptance criteria: The retention times of the peaks for curcumin, desmethoxycurcumin, and bisdesmethoxycurcumin of the *Sample solution* correspond to those of *Standard solution A* and *Standard solution B*. ■2S (USP39)

COMPOSITION

Change to read:

- **Content of Curcuminoids**

Mobile phase: *Tetrahydrofuran* and 1 mg/mL of *citric acid* in water (4:6)

[~~Note—Sonication may be necessary to dissolve the USP Reference Standard in each *Standard solution*; all solutions should be passed through a filter of 0.45- μ m pore size before injection. USP Curcumin RS, USP Desmethoxycurcumin RS, and USP Bisdesmethoxycurcumin RS can also be prepared in one standard solution containing the final concentration specified below for each.]~~

■ ■2S (USP39)

Standard solution A: 40 μ g/mL of USP Curcuminoids RS in *Mobile phase*

~~**Standard solution B:** 40 μ g/mL of USP Curcumin RS in *Mobile phase*~~

~~**Standard solution C:** 10 μ g/mL of USP Desmethoxycurcumin RS in *Mobile phase*~~

~~**Standard solution D:** 2 μ g/mL of USP Bisdesmethoxycurcumin RS in *Mobile phase*~~

■ **Standard solution B:** A composite solution containing 40 μ g/mL of USP Curcumin RS, 10 μ g/mL of USP Desmethoxycurcumin RS, and 2.0 μ g/mL of USP Bisdesmethoxycurcumin RS in *Mobile phase*. Use sonication if necessary. Before injection, pass through a filter of 0.45- μ m pore size, and discard the initial 10 mL of the filtrate. ■2S (USP39)

Sample stock solution: Pulverize about 5.0 g of Turmeric. Transfer about 0.5 g of the pulverized sample to a 50-mL volumetric flask, add 30 mL of *acetone*, and sonicate for 30

min. Dilute with *acetone* to volume, mix, and centrifuge.

Sample solution: Transfer 5.0 mL of the *Sample stock solution* to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

■ Before injection, pass through a filter of 0.45- μ m pore size, and discard the initial 10 mL of the filtrate. ■ 2S (USP39)

SPECIFIC TESTS

● Botanical Characteristics

Macroscopic: Turmeric occurs as ovate, oblong, or pear-shaped primary rhizomes, also known as bulb or round turmeric, about 3 cm in diameter and 4–5 cm long, and showing transverse annular leaf scars, and as cylindrical, sometimes short-branched secondary rhizomes, also known as finger or long turmeric, about 1 cm in diameter and 2–7 cm long, and showing scars of lateral branches. The cured and dried turmeric of commerce is bright yellow to dull yellow in appearance, with a rough or polished surface and a characteristic aromatic odor. The texture is hard and uneasily broken, and the fracture is smooth and finely granular. Internally it is orange-yellow to orange, showing a cortex separated from a central cylinder by a distinct endodermis.

Microscopic: Transverse section of rhizome shows a row of thin-walled, flattened

epidermal cells; a few layers of thin-walled, brick-shaped parenchyma cells of the cork; a broad cortex consisting of multiple layers of thin-walled parenchyma cells showing scattered vascular bundles; a thin layer of oblong cells of the endodermis; pericycle consisting of one to two rows of parenchyma cells; and a pith consisting of parenchyma cells showing scattered vascular bundles, most of them forming discontinuous rings near the endodermis and fewer inward. The vascular bundles are of the collateral type; the vessels have mainly spiral thickening, and a few have reticulate and annular thickening. Scattered throughout the parenchyma of the pith and cortex are oleoresin cells containing oil and scattered particles of an orange-yellow pigment, and prisms of calcium oxalate, which are usually obscured due to the bright yellow color of the pigment content. The parenchyma cells are full of starch granules, 15–30 µm in size, and flat or disk-shaped. Bast fibers are absent.

Powdered Turmeric Extract

DEFINITION

Powdered Turmeric Extract is prepared from the pulverized rhizomes of *Curcuma longa* L. (Fam. Zingiberaceae), using acetone, methanol, or other suitable solvents. It contains NLT 20% of total curcuminoids, calculated on the dried basis. It may contain other added substances.

IDENTIFICATION

Delete the following:

■ ● **A. Thin-Layer Chromatography**

Standard solution: 0.2 mg/mL of USP Curcuminoids RS in acetone

Sample solution: 10 mg/mL of Powdered Turmeric Extract in acetone

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, typically 20 cm long (TLC plates)

Application volume: 10 μ L, as bands

Developing solvent system: Chloroform, methanol, and formic acid (96:4:1)

Analysis

Samples: *Standard solution* and *Sample solution*

Apply the samples as bands to a suitable thin-layer chromatographic plate (see *Chromatography (621), Thin-Layer Chromatography*). Use a saturated chamber. Develop the chromatograms until the solvent front has moved up about three-fourths of the length of the plate. Remove the plate from the chamber, dry, and examine in daylight and under UV light at 365 nm.

Acceptance criteria: The ~~Sample solution~~ chromatogram shows yellowish-brown bands due to bisdesmethoxycurcumin, desmethoxycurcumin, and curcumin at R_f values of about 0.4, 0.6, and 0.7, respectively, corresponding in position and color to those obtained from the ~~Standard solution~~. ■ 2S (USP39)

BRIEFING

Benzalkonium Chloride Solution, *NF 33* page 6540. As part of the USP monograph modernization effort, it is proposed to replace the test procedure for *Alcohol Content* with a GC method with improved accuracy and precision, as well as reliability. The proposed procedure is based on a GC method of analysis performed with the Restek Rxi-624Sil MS brand of G43 column. The typical retention times for alcohol, 2-propanol, and tertiary butyl alcohol are 1.8, 2.15, and 2.4 min, respectively.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(EXC1: H. Wang.)

Correspondence Number—C159907

Comment deadline: November 30, 2015

Benzalkonium Chloride Solution

DEFINITION

Benzalkonium Chloride Solution contains NLT 95.0% and NMT 105.0% of the labeled amount of benzalkonium chloride in a solution having a concentration of 1.0% or more; and NLT 93.0% and NMT 107.0% of the labeled amount of benzalkonium chloride in a solution having a concentration of less than 1.0%. It may contain a suitable coloring agent and may contain NMT 10% of alcohol.

[**Caution**—Mixing Benzalkonium Chloride Solution with ordinary soaps and anionic detergents may decrease or destroy the bacteriostatic activity of the Solution.]

IDENTIFICATION

• **A.**

Analysis: To 2 mL of a solution having an equivalent of 10 mg/mL of benzalkonium chloride add 1 mL of 2 N nitric acid.

Acceptance criteria: A white precipitate is formed and is dissolved after adding 5 mL of *alcohol*.

• **B. Identification Tests—General** (191), *Chloride*: A solution of it in a mixture of equal volumes of water and *alcohol* meets the requirements.

• **C.**

Analysis: Dissolve the residue, obtained by evaporating on a steam bath a volume of Solution equivalent to 200 mg of benzalkonium chloride, in 1 mL of *sulfuric acid*. Add 100 mg of *sodium nitrate*, and heat on a steam bath for 5 min. Cool, dilute with water to 10 mL, add 500 mg of zinc dust, and warm for 5 min on a steam bath. To 2 mL of the clear supernatant add 1 mL of sodium nitrite solution (1 in 20), cool in ice water, then add 3 mL of a solution of 500 mg of *2-naphthol* in 10 mL of 6 N *ammonium hydroxide*.

Acceptance criteria: An orange-red color is produced.

• **D. Chromatographic Identity**

Analysis: Proceed as directed in the test for *Ratio of Alkyl Components*.

Acceptance criteria: The retention times of the major peaks for benzalkonium chloride of the *Sample solution* correspond to those of the *Standard solution*.

ASSAY

• **Ratio of Alkyl Components**

Solution A: Adjust a 0.1 M solution of *sodium acetate* with *glacial acetic acid* to a pH of 5.0.

Mobile phase: *Acetonitrile* and *Solution A* (9:11). *Acetonitrile* and *Solution A* may be adjusted from (2:3) to (3:2) to meet system suitability requirements.

Standard solution: 4 mg/mL of benzalkonium chloride prepared from USP Benzalkonium Chloride RS and water

Sample solution: Transfer a volume of *Solution*, equivalent to 400 mg of benzalkonium chloride, to a 100-mL volumetric flask, and dilute with water to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 30-cm; packing *L10* or 4.6-mm × 25-cm; 10-μm packing *L10*

Flow rate: 2 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

[Note—See *Table 1*. Relative retention times are provided for information only, and the Standard should be used to ensure appropriate peak identification.]

Table 1

Name	Relative Retention Time
C ₁₀ homolog	0.9
C ₁₂ homolog	1.0
C ₁₄ homolog	1.3
C ₁₆ homolog	1.7

Suitability requirements

Resolution: NLT 1.5 between the C₁₂ and C₁₄ homologs

Relative standard deviation: NMT 2.0% for the C₁₂ homolog

Analysis

Samples: *Standard solution* and *Sample solution*

Identify the homolog peaks by comparison of the retention times from the *Sample solution* with those of the *Standard solution*.

Calculate the percentage of each quaternary ammonium homolog in the portion of Solution taken:

$$\text{Result} = \frac{r_U \times M_r}{\sum_i (r_U \times M_r)} \times 100$$

r_U = peak area of each homolog from the *Sample solution*

M_r = molecular weight of each homolog. The molecular weights of the C₁₀, C₁₂, C₁₄, and C₁₆ homologs are 312, 340, 368, and 396, respectively.

Acceptance criteria: On the solid basis, the content of the *n*-C₁₂H₂₅ homolog is NLT 40.0%, and the content of the *n*-C₁₄H₂₉ homolog is NLT 20.0% of the total alkylbenzyltrimethylammonium chloride content. The amount of the *n*-C₁₂H₂₅ and *n*-C₁₄H₂₉ homolog components together is NLT 70.0% of the total alkylbenzyltrimethylammonium chloride content.

- **Total Alkylbenzyltrimethylammonium Chlorides**

Sample solution: Evaporate or dilute with water to 30 mL a volume of Solution equivalent to 500 mg of benzalkonium chloride.

Analysis: Transfer the *Sample solution*, with the aid of a minimum quantity of water, to a glass-stoppered, 250-mL conical separator. Transfer 25 mL of *methylene chloride*. Add 10 mL of 0.1 N sodium hydroxide, and 10.0 mL of freshly prepared potassium iodide solution (1 in 20), insert the stopper in the separator, shake, allow the layers to separate, and discard the methylene chloride layer. Wash the aqueous layer with three 10-mL portions of *methylene chloride*, and discard the washings. Transfer the aqueous layer to a glass-stoppered, 250-mL conical flask, and rinse the separator with three 5-mL portions of water, adding the washings to the flask. Add 40 mL of cold *hydrochloric acid* to the flask, mix, and titrate with 0.05 M potassium iodate VS until the solution becomes light brown in color. Add 5 mL of *methylene chloride*, insert the stopper into the flask, and shake vigorously. Continue the titration, dropwise, with shaking after each addition, until the methylene chloride layer no longer changes color and the aqueous layer is clear yellow. Record the titrant volume, V_T , in mL. Perform a blank determination, using 20 mL of water as the sample, and record the titrant volume, V_B , in mL. [Note— $V_B > V_T$.] The difference between the two titrations represents the amount of potassium iodate equivalent to the weight of benzalkonium chloride in the sample. Each mL of 0.05 M potassium iodate is equivalent to $x/10$ mg of benzalkonium chloride, where x represents the average molecular weight of the sample, derived by summing, for all homologs, the products:

$$\text{Result } (x) = \sum_i [(r_U/r_T) \times M_r]$$

r_U = peak area of each homolog from the test for *Ratio of Alkyl Components*

r_T = sum of all the peak areas of the homologs from the test for *Ratio of Alkyl Components*

M_r = molecular weight of each homolog. The molecular weights of the C₁₀, C₁₂, C₁₄, and C₁₆ homologs are 312, 340, 368, and 396, respectively.

Acceptance criteria

For labeled concentrations of NLT 1.0%: 95.0%–105.0%

For labeled concentrations less than 1.0%: 93.0%–107.0%

OTHER COMPONENTS

Change to read:

- **Alcohol Content** (if added)

Internal standard solution: ~~0.06 mL/mL of tertiary butyl alcohol in water~~

Alcohol stock solution: ~~0.03 mL/mL of alcohol (C₂H₅OH) in water~~

Standard solutions: ~~Introduce 5, 10, and 20 mL, respectively, of Alcohol stock solution into three separate identical 50 mL volumetric flasks. To each flask add a 5 mL portion of the Internal standard solution. Dilute with water to volume, and mix thoroughly. The Standard solutions contain 0.003, 0.006, and 0.012 mL/mL of alcohol (C₂H₅OH), respectively.~~

Sample solution: ~~Weigh an appropriate amount of Solution into a 50 mL volumetric flask, and pipet 5 mL of the Internal standard solution into the flask. Dilute with water to volume, and mix thoroughly to obtain a solution containing 0.003–0.012 mL/mL of alcohol (C₂H₅OH).~~

Chromatographic system

~~(See Chromatography (621), System Suitability.)~~

±	—	±	8
±	±0	3	2±

Injection volume: 1 µL

Injection type: Split 75:1

System suitability

Sample: Standard solution containing 0.006 mL/mL of alcohol (C₂H₅OH)

[Note—The relative retention times for alcohol and tertiary butyl alcohol are 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between alcohol and tertiary butyl alcohol

Relative standard deviation: NMT 10%

Analysis

Samples: Standard solutions and Sample solution

Plot the peak response ratios of the alcohol to tertiary butyl alcohol in the Standard solutions versus the content, in mL/mL, of alcohol, and draw the straight line best fitting the plotted points. From the graph obtained, determine the content, *C*, in mL/mL, of alcohol (C₂H₅OH) in the Sample solution.

Calculate the percentage of alcohol (C₂H₅OH) in the portion of Solution (v/v) taken:

$$\text{Result} = V \times (C \times D / W) \times 100$$

V = volume of the Sample solution, 50 mL

D = density of the Benzalkonium Chloride Solution (g/mL)

W = weight of Benzalkonium Chloride Solution taken to prepare the Sample solution (g)

▪ **Diluent:** 2-Propanol and water (8:2)

Internal standard solution: 0.005 g/mL of tertiary butyl alcohol in water

Alcohol stock solution: 0.015 g/mL of alcohol (C₂H₅OH) in water

Standard solutions: Introduce 1, 2, and 4 mL, respectively, of Alcohol stock solution into

three separate and identical 25-mL volumetric flasks. To each flask add a 5-mL portion of the *Internal standard solution*. Dilute with *Diluent* to volume, and mix thoroughly. The *Standard solutions* contain 0.0006, 0.0012, and 0.0024 g/mL of alcohol (C₂H₅OH), respectively.

Sample solution: Weigh an appropriate amount of Solution into a 25-mL volumetric flask, and pipet 5 mL of the *Internal standard solution* into the flask. Dilute with *Diluent* to volume, and mix thoroughly to obtain a solution containing 0.0006–0.0024 g/mL of alcohol (C₂H₅OH).

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Initial Flow (mL/min)	Flow Ramp (mL/min ²)	Final Flow (mL/min)	Hold Time at Final Flow (min)
1.4	—	1.4	6
1.4	5	3	8.6

Injection volume: 0.5 μL

Injection type: Split, 75:1

Inlet liner: 4-mm liner with deactivated glass wool

System suitability

Sample: *Standard solution* containing 0.0012 g/mL of alcohol (C₂H₅OH)

[Note—The relative retention times for alcohol, 2-propanol, and tertiary butyl alcohol are 0.75, 0.90, and 1.0, respectively.]

Suitability requirements**Resolution:** NLT 2.0 between 2-propanol and tertiary butyl alcohol**Relative standard deviation:** NMT 2% for the peak response ratio of alcohol to the internal standard**Analysis****Samples:** *Standard solutions* and *Sample solution*

Plot the peak response ratios of alcohol to tertiary butyl alcohol in the *Standard solutions* versus the content, in g/mL, of alcohol, and draw the straight line best fitting the plotted points. From the graph obtained, determine the content, *C*, in g/mL, of alcohol (C₂H₅OH) in the *Sample solution*.

Calculate the percentage of alcohol (C₂H₅OH) in the portion of Solution (v/v) taken:

$$\text{Result} = (V \times C \times D_S) / (W \times D_A) \times 100$$

V = volume of the *Sample solution*, 25 mL*D_S* = density of the Solution (g/mL)*W* = weight of Solution taken to prepare the *Sample solution* (g)*D_A* = density of alcohol (g/mL)

■ 2S (NF34)

Acceptance criteria: If present, 95.0%–105.0% of the labeled amount of alcohol (C₂H₅OH)**IMPURITIES**● **Limit of Amines and Amine Salts****Sample:** A quantity of Solution equivalent to 5.0 g of benzalkonium chloride

Analysis: Dissolve the *Sample* by heating carefully (e.g., on top of a steam bath with water as the steam source) in 20 mL of a mixture of *methanol* and 1 N hydrochloric acid VS (97:3). [Note—The mixed solution, however, must not reach the boiling point.] Add 100 mL of *isopropyl alcohol*, and pass a stream of nitrogen slowly through the solution. Gradually add 12.0 mL of 0.1 N tetrabutylammonium hydroxide VS while recording the potentiometric titration curve.

Acceptance criteria: If the curve shows two inflection points, the volume of titrant added between the two points is NMT 5.0 mL, corresponding to NMT 0.1 mmol/g of amines and amine salts. If the curve shows no point of inflection, the substance being examined does not comply with the test. If the curve shows one point of inflection, repeat the test, but add 3.0 mL of a 25.0 mg/mL solution of *dimethyldecylamine* in *isopropyl alcohol* before the titration. If after the addition of 12.0 mL of the titrant, the titration curve shows only one point of inflection, the substance being examined does not comply with the test.

● **Limit of Benzyl Alcohol, Benzaldehyde, and (Chloromethyl)benzene**

[Note—Prepare the solutions immediately before use.]

Solution A: Dissolve 1.09 g of *sodium 1-hexanesulfonate* and 6.9 g of *monobasic sodium phosphate* in water in a 1000-mL volumetric flask, adjust with *phosphoric acid* to a pH of 3.5, and dilute with water to volume.

Solution B: *Methanol*

Mobile phase: See *Table 4*.

Table 4

Time (min)	Solution A (%)	Solution B (%)
0	80	20
10	80	20
14	50	50
35	50	50
36	20	80
55	20	80
56	80	20
65	80	20

Standard solution A: 0.25 mg/mL of USP Benzyl Alcohol RS in methanol

Standard solution B: 0.075 mg/mL of USP Benzaldehyde RS in methanol

Standard solution C: 0.025 mg/mL of USP Benzyl Alcohol RS in methanol, prepared from *Standard solution A* and methanol

Sample solution: Determine the density of the Solution. Dilute a quantity of the Solution equivalent to 2.5 g of benzalkonium chloride with methanol to 50.0 mL. This solution contains 50 mg/mL of benzalkonium chloride.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 210 nm for benzyl alcohol and (chloromethyl)benzene; UV 257 nm for benzaldehyde

Column: 4.6-mm × 15-cm; 5-µm packing *L1*

Column temperature: 30°

Flow rate: 1.0 mL/min

Injection volume: 20 µL

System suitability

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

[Note—See *Table 5* for relative retention times.]

Table 5

Name	Relative Retention Time
Benzyl alcohol	1.0
Benzaldehyde	1.3
(Chloromethyl)benzene	2.4

Suitability requirements

Relative standard deviation: NMT 5.0% for benzyl alcohol, *Standard solution A*

Signal-to-noise ratio: NLT 10 for the principal peak, *Standard solution C*

Analysis

Samples: *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Calculate the content of (chloromethyl)benzene by multiplying the peak area of (chloromethyl)benzene by 1.3. [Note—The correction factor is used to adjust for baseline shift.]

Acceptance criteria

Benzyl alcohol: The response of the benzyl alcohol peak from the *Sample solution* is NMT that of the benzyl alcohol peak from *Standard solution A*, corresponding to NMT 0.5%.

Benzaldehyde: The response of the benzaldehyde peak from the *Sample solution* is NMT that of the benzaldehyde peak from *Standard solution B*, corresponding to NMT 0.15%.

(Chloromethyl)benzene: The response of the (chloromethyl)benzene peak from the *Sample solution* is NMT 0.1 times that of the principal peak from *Standard solution A*, corresponding to NMT 0.05%.

SPECIFIC TESTS

- **Microbial Enumeration Tests** (61) and **Tests for Specified Microorganisms** (62): A solution containing less than 5.0% of benzalkonium chloride meets the requirements of the test for absence of *Pseudomonas aeruginosa*.
- **Acidity or Alkalinity**

Sample solution: Evaporate or dilute with *carbon dioxide-free water* to prepare a 50-mL solution of 10 mg/mL of benzalkonium chloride in water.

Analysis: To the *Sample solution* add 0.1 mL of *bromocresol purple TS*.

Acceptance criteria: NMT 0.5 mL of 0.1 N hydrochloric acid or 0.1 N sodium hydroxide is required to change the color of the indicator.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers, and prevent contact with metals.
- **Labeling:** Label it to indicate the concentration of benzalkonium chloride, and to indicate the name and quantity of the coloring agent added. The labeling also indicates the concentration of alcohol added.
- **USP Reference Standards** (11)
 - USP Benzaldehyde RS
 - USP Benzalkonium Chloride RS
 - USP Benzyl Alcohol RS

BRIEFING

Calcium Propionate, *NF 33* page 6560; **Potassium Benzoate**, *NF 33* page 6835; **Sodium Cetostearyl Sulfate**, *NF 33* page 6868. In preparation for the omission of the flame tests from

Identification Tests—General (191), proposed in PF 41(2) [Mar.–Apr. 2015], the reference to (191) in the *Identification* test is deleted and a complete description of the flame test is included in each monograph. Manufacturers are encouraged to submit a replacement wet chemistry test or an instrumental procedure for the Expert Committee's consideration.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Comment deadline: November 30, 2015

Calcium Propionate

Change to read:

▲NF33

$C_6H_{10}CaO_4$ 186.22
[4075-81-4].

DEFINITION

Calcium Propionate contains NLT 98.0% and NMT 100.5% of calcium propionate ($C_6H_{10}CaO_4$), calculated on the anhydrous basis.

IDENTIFICATION

Delete the following:

- ● **A. Identification Tests—General, Calcium** (191): A solution (1 in 20) meets the requirements of the flame test. ■2S (NF34)

Add the following:

- ● **A.** A solution of Calcium Propionate (1 in 20) imparts a transient yellowish red color to a nonluminous flame. ■2S (NF34)

ASSAY

- **Procedure**

Sample solution: 4 mg/mL of Calcium Propionate

Analysis: While stirring, preferably with a magnetic stirrer, add 30 mL of 0.05 M edetate disodium VS from a 50-mL buret to 100 mL of the *Sample solution*. Add 15 mL of 1 N sodium hydroxide and 300 mg of hydroxy naphthol blue indicator, and continue the titration to a blue endpoint. Each mL of 0.05 M edetate disodium VS is equivalent to 9.311 mg of calcium propionate ($C_6H_{10}CaO_4$).

Acceptance criteria: 98.0%–100.5% on the anhydrous basis

IMPURITIES

• Limit of Fluoride

Buffer: 294.1 mg/mL of sodium citrate dihydrate

Standard solution: 2.21 mg/mL of USP Sodium Fluoride RS. [Note—Store solution in a plastic bottle.] On the day of use, transfer 5.0 mL of the resulting solution to a 1000-mL volumetric flask, dilute with water to volume, and mix. Each mL of this solution contains 5 µg of fluoride ion.

Electrode system: Use a fluoride-specific, ion-indicating electrode and a silver–silver chloride reference electrode connected to a pH meter capable of measuring potentials with a minimum reproducibility of ± 0.2 mV (see *pH* (791)).

Standard response line: Transfer 1.0, 2.0, 3.0, 5.0, 10.0, and 15.0 mL of the *Standard solution* to separate 250-mL plastic beakers. Add 50 mL of water, 5 mL of 1 N hydrochloric acid, 10 mL of *Buffer*, and 10 mL of 0.2 M edetate disodium to each beaker, and mix. Transfer each solution to separate 100-mL volumetric flasks, dilute with water to volume, and mix. Transfer a 50-mL portion of each solution to separate 125-mL plastic beakers, and read the potential, in mV, of each solution using the electrode system. Plot the calibration curve versus potential, in mV, on two-cycle semilogarithmic paper with µg of fluoride per 100 mL of solution on the logarithmic scale.¹

Sample: 1.0 g

Analysis: Transfer the *Sample* to a 150-mL glass beaker, add 10 mL of water, and, while stirring continuously, slowly add 20 mL of 1 N hydrochloric acid to dissolve the *Sample*. Boil rapidly for 1 min. Transfer to a 250-mL plastic beaker, and cool rapidly in ice water. Add 15 mL of *Buffer* and 10 mL of 0.2 M edetate disodium, and mix. Adjust the pH to 5.5 ± 0.1 with 1 N hydrochloric acid or 1 N sodium hydroxide, if necessary. Transfer to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer a 50-mL portion of this solution to a 125-mL plastic beaker, and record the potential using the electrode system. Determine the concentration of fluoride, in µg/mL, in the *Sample*.

Acceptance criteria: NMT 30 µg/g

Change to read:

• Limit of Lead

▲▲NF33

25% Sulfuric acid solution: Cautiously add 100 mL of sulfuric acid to 300 mL of water with constant stirring while cooling in an ice bath.

▲ **Standard solutions:**▲NF33 On the day of use, transfer 5.0, 10.0, and 20.0 mL of ▲ standard lead solution TS▲NF33 to three separate 100-mL volumetric flasks, add 10 mL of 3 N hydrochloric acid to each, and dilute with water to volume corresponding to 0.5-,

1.0-, and 2.0- $\mu\text{g}/\text{mL}$ standards.

Sample blank: Add 5 mL of 25% *Sulfuric acid solution* into an evaporating dish. Within a hood, place the dish on a steam bath to evaporate most of the water. Place the dish on a burner, and slowly pre-ash the sample by expelling most of the sulfuric acid. Place the dish in a muffle furnace that has been set at 525°, and ash the sample until the residue appears free from carbon. Cool, and cautiously wash down the inside of the evaporation dish with water. Add 5 mL of 1 N *hydrochloric acid*. Place the dish on a steam bath, and evaporate to dryness. Add 1.0 mL of 3 N *hydrochloric acid* and approximately 5 mL of water, and heat briefly on a steam bath to dissolve any residue. Transfer the solution quantitatively to a 10-mL volumetric flask, dilute to volume, and mix.

Sample solution: Place 10 g of Calcium Propionate, to the nearest 0.1 mg, into an evaporating dish. Add a sufficient amount of 25% *Sulfuric acid solution*, and distribute the sulfuric acid uniformly through the sample. Proceed as directed under *Sample blank* beginning with "Within a hood..."

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption

Analytical wavelength: 283.3 nm

Lamp: Lead electrodeless discharge

Flame: Air-acetylene

Slit width: 0.7 nm

Instrument blank: Water

Standard curve

Samples: ▲ *Standard solutions* ▲NF33 and *Sample blank*

Plot: Corrected absorbance values versus their corresponding concentration ($\mu\text{g}/\text{mL}$).

[Note—Determine corrected absorbance values by subtracting the absorbance of the *Sample blank* from the absorbance of the ▲ *Standard solutions*. ▲NF33]

Analysis

Samples: *Sample blank* and *Sample solution*

[Note—Determine corrected absorbance values by subtracting the absorbance of the *Sample blank* from the absorbance of the *Sample solution*.]

From the *Standard curve*, determine the lead concentration in the *Sample solution*. Calculate the lead content in the portion of Calcium Propionate taken:

$$\text{Result} = (C_S \times V) / W$$

C_S = concentration of lead from the *Standard curve* ($\mu\text{g}/\text{mL}$)

V = final volume of the sample (mL)

W = weight of the sample taken (g)

Acceptance criteria: NMT 2 $\mu\text{g}/\text{g}$

- **Magnesium** (as MgO)

Magnesium standard solution: Dissolve 50.0 mg of *magnesium* metal in 1 mL of

hydrochloric acid in a 1000-mL volumetric flask, dilute with water to volume, and mix.

Sample solution: Place 400.0 mg of Calcium Propionate, 5 mL of 2.7 N *hydrochloric acid*, and about 10 mL of water in a small beaker, and dissolve the Calcium Propionate by heating on a hot plate.

Analysis: Evaporate the *Sample solution* to a volume of about 2 mL, and cool. Transfer the residual liquid to a 100-mL volumetric flask, dilute with water to volume, and mix. Dilute 7.5 mL of this solution with water to 20 mL, add 2 mL of 1 N *sodium hydroxide* and 0.05 mL of a 1:1000 solution of *thiazole yellow*, and mix. Allow to stand for 10 min, and shake. Any color produced does not exceed that produced by 1.0 mL of *Magnesium standard solution* in the same volume as that of a control containing 2.5 mL of the *Sample solution* (corresponding to 10 mg of Calcium Propionate) and the quantities of the reagents used in the test.

Acceptance criteria: The solution passes the test (about 0.4%).

SPECIFIC TESTS

• Water-Insoluble Substances

Sample: 10 g

Analysis: Dissolve the *Sample* in 100 mL of hot water, pass through a tared filtering crucible, wash the insoluble residue with hot water, and dry at 105° to constant weight.

Acceptance criteria: NMT 0.2%

- **pH** (791): 7.5–10.5, in a solution (1 in 10)
- **Water Determination** (921), *Method I*: NMT 5.0%
- **Loss on Drying** (731)

Analysis: Dry at 105° for 2 h.

Acceptance criteria: NMT 4%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Store in tightly closed containers. No storage requirements specified.
- **USP Reference Standards** (11)
USP Sodium Fluoride RS

BRIEFING

Deoxycholic Acid, *NF 33* page 6636. See the *Briefing* under *Desoxycholic Acid* appearing elsewhere in this issue of *PF*. This monograph is proposed for inclusion in the *Second Supplement* to *USP 39—NF 34* with an official date of December 1, 2016. Use of the name Deoxycholic Acid will be permitted as of December 1, 2016, however its use will not be mandatory until December 1, 2021. The 60-month extension will provide the time deemed necessary for labeling changes to be made for the article and the numerous preparations in which it is an ingredient, as well as for practitioners, consumers, and regulatory agencies to become familiar with the new terminology. Because of the use of deoxycholic acid as an active pharmaceutical ingredient (API) in an FDA approved drug, it is proposed to change the

monograph designation from *NF* to *USP* and to include new tests and acceptance criteria to reflect the use of deoxycholic acid as an API. This monograph will be listed in the *NF* section as a cross reference to the *USP* general monographs section to reflect its use as both an active and inactive ingredient. The HPLC method in the *Assay* and *Organic Impurities* tests is based on analysis performed with the Phenomenex Pursuit 3 C18 brand of L1 column. The retention times for cholic acid; 3 α ,12 β -dihydroxy-5 β -cholan-24-oic acid; 3 α ,12 α -dihydroxy-5 β -chol-9(11)-en-24-oic acid; deoxycholic acid; and ethyl 3 α ,12 α -dihydroxy-5 β -cholan-24-oate are about 7.3, 9.0, 11.3, 13.0, and 20.9 min, respectively.

■ This test and *Acceptance criteria* are only applicable to Deoxycholic Acid of animal origin. ■ 2S (NF34)

Select reagents having as low a lead content as practicable, and store all solutions in high-density polyethylene containers. Rinse all plastic and glassware thoroughly with warm, 50% nitric acid followed by water.]

Standard solutions: [Note—Prepare these solutions on the day of use.] Transfer 10.0 and 50.0 mL of ▲ *standard lead solution TS* ▲NF33 into two separate 100-mL volumetric flasks, add 10 mL of 3 N *hydrochloric acid* to each, and dilute with water to volume. The third standard, 10.0 µg/mL, is taken directly from ▲ *standard lead solution TS*. ▲NF33

Sample solution: Transfer 10.0 g of ~~Desoxycholic~~

■ Deoxycholic ■ 2S (NF34)

Acid, weighed to the nearest 0.1 mg, into an evaporating dish. Add 5 mL of 25% sulfuric acid (made by adding 25 mL of *sulfuric acid* to 75 mL of water), and distribute the 25% sulfuric acid solution uniformly. Within a hood, place the dish on a steam bath to evaporate most of the water. Place the dish on a burner, and slowly pre-ash the remaining *Sample solution* by expelling most of the sulfuric acid. Place the dish in a muffle furnace that has been set at 525°, and ash the contents of the dish until the residue appears free from carbon. Cool, and cautiously wash down the inside of the evaporation dish with water. Add 5 mL of 1 N *hydrochloric acid*. Place the dish on a steam bath, and evaporate to dryness. Add 1.0 mL of 3 N *hydrochloric acid* and approximately 5 mL of water, and heat briefly on a steam bath to dissolve any residue. Transfer to a 10-mL volumetric flask, dilute with water to volume, and mix.

Sample blank: Prepare by ashing 5 mL of 25% sulfuric acid solution. Cool, and cautiously wash down the inside of the evaporation dish with water. Add 5 mL of 1 N *hydrochloric acid*. Place the dish on a steam bath, and evaporate to dryness. Add 1.0 mL of 3 N *hydrochloric acid* and approximately 5 mL of water, and heat briefly on a steam bath to dissolve any residue. Transfer to a 10-mL volumetric flask, dilute with water to volume, and mix.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption

Analytical wavelength: 283.3 nm

Lamp: Lead electrodeless discharge

Flame: Air-acetylene

Slit width: 0.7 nm

Instrument blank: Water

Standard curve

Samples: *Standard solutions* and *Sample blank*

Plot: Corrected absorbance values versus their corresponding concentration (µg/mL).

[Note—Determine corrected absorbance values by subtracting the absorbance of the *Sample blank* from the absorbance of the *Standard solutions*.]

Analysis

Samples: *Sample solution* and *Sample blank*

[Note—Determine corrected absorbance values by subtracting the absorbance of the *Sample blank* from the absorbance of the *Sample solution*.]

From the *Standard curve*, determine the lead concentration in the *Sample solution*.

Calculate the lead content in the portion of ~~Desoxycholic~~

■ Deoxycholic ■ 2S (NF34)

Acid taken:

$$\text{Result} = (C_S \times V) / W$$

C_S = concentration of lead from the *Standard curve* ($\mu\text{g/mL}$)

V = final volume of the sample (mL)

W = weight of the sample taken (g)

Acceptance criteria: NMT 4 $\mu\text{g/g}$

Add the following:

■ • **Heavy Metals** (231), *Method II*: NMT 20 $\mu\text{g/g}$

[Note—This test and *Acceptance criteria* are only applicable to Deoxycholic Acid of synthetic origin.]

■ 2S (NF34)

Add the following:

■ • **Organic Impurities**

Diluent, Mobile phase, Standard solution, and Chromatographic system: Proceed as described in the procedure for *Assay*.

Sensitivity solution: 0.5 $\mu\text{g/mL}$ of USP Deoxycholic Acid RS in *Diluent*

Sample stock solution: 1.0 mg/mL of Deoxycholic Acid in *Diluent*

Sample solution: 0.01 mg/mL of Deoxycholic Acid in *Diluent* prepared from the *Sample stock solution*

System suitability

Samples: *Standard solution* and *Sensitivity solution*

[Note—The retention time of deoxycholic acid is about 13.0 min. The relative retention times for cholic acid and deoxycholic acid are 0.56 and 1, respectively. The relative retention times for other impurities are listed in *Table 2*.]

Suitability requirements

Relative standard deviation: NMT 3.0% for six injections, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Sample stock solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Deoxycholic Acid taken:

$$\text{Result} = [r_U / (r_S \times 100 + r_T)] \times 100$$

r_U = peak area of individual impurity from the *Sample stock solution*

r_S = peak area of deoxycholic acid from the *Sample solution*

r_T = sum of peak areas of all impurities from the *Sample stock solution*

Acceptance criteria

Deoxycholic Acid of animal origin

Cholic acid: NMT 1.0%

Total impurities: NMT 2.0%

Deoxycholic Acid of synthetic origin: See *Table 2*.

Table 2

Name	Relative Retention Time	Acceptance Criteria NMT (%)
3 α , 12 β -Dihydroxy-5 β -cholan-24-oic acid	0.69	0.15
3 α , 12 α -Dihydroxy-5 β -chol-9(11)-en-24-oic acid	0.87	0.15
Ethyl 3 α , 12 α -dihydroxy-5 β -cholan-24-oate	1.61	0.15
Any individual unspecified impurity	—	0.10
Total impurities	—	2.0

■ 2S (NF34)

SPECIFIC TESTS

Change to read:

- **Optical Rotation** (781S), *Specific Rotation*

Sample solution: 1% (w/v) solution in *ethanol*

Acceptance criteria NLT +55°

■ **Deoxycholic Acid of animal origin:** NLT +55°

Deoxycholic Acid of synthetic origin: +50° to +60° ■ 2S (NF34)

Delete the following:

Delete the following:

- • ~~**Loss on Drying** (731)~~

~~**Analysis:** Dry at 140° under vacuum of NMT 5 mm of mercury for 4 h.~~

~~**Acceptance criteria:** NMT 1% ■ 2S (NF34)~~

Add the following:

- • **Water Determination** (921), *Method Ic:* NMT 1.0% ■ 2S (NF34)

Add the following:

- • **Clarity of Solution**

[Note—If intended for use in preparing parenteral dosage forms, it meets the requirements of the *Clarity of Solution* test.]

Hydrazine solution: 10 mg/mL of *hydrazine sulfate*. Allow to stand 4–6 h before use.

Methenamine solution: Transfer 2.5 g of *methenamine* to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension: To the flask containing *Methenamine solution* add 25.0 mL of the *Hydrazine solution*, mix, and allow to stand for 24 h. This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.

Opalescence standard: Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, and dilute with water to volume. Use this suspension within 24 h after preparation.

Reference suspension: Transfer 5.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, and dilute with water to volume.

Sample solution: 5 mg/mL of Deoxycholic Acid in 0.1 N *sodium hydroxide*

Analysis: Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer a portion of the *Reference suspension* to a separate matching test tube. Compare the *Sample solution* and the *Reference suspension* in diffused daylight, viewing vertically against a black background (see *Nephelometry, Turbidimetry, and Visual Comparison* (855)) for 5 min after preparation of the *Reference suspension*.

Acceptance criteria: The *Sample solution* is not more opalescent than the *Reference suspension*. ■2S (NF34)

Add the following:

■ ● **Color of Solution**

[Note—If intended for use in preparing parenteral dosage forms, it meets the requirements of the *Color of Solution* test.]

Diluent: 27.5 mL of *hydrochloric acid* in 1000 mL of water

Standard stock solutions: Prepare two solutions, A and B, containing, respectively, the following parts of *ferric chloride CS*, *cobaltous chloride CS*, *cupric sulfate CS*, and *Diluent*.

Standard stock solution A: 2.4: 0.6: 0: 7.0

Standard stock solution B: 2.4: 1.0: 0.4: 6.2

Standard solutions

[Note—Prepare and use these solutions immediately.]

Standard solution A: Transfer 2.5 mL of *Standard stock solution A* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Standard solution B: Transfer 2.5 mL of *Standard stock solution B* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Sample solution: 5 mg/mL of Deoxycholic Acid in 0.1 N *sodium hydroxide*

Analysis: Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm, to

obtain a depth of 40 mm. Similarly transfer portions of *Standard solution A* and *Standard solution B* to separate matching test tubes. Compare the color of the *Sample solution* with that of the *Standard solution A* and *Standard solution B* in diffused daylight, viewing vertically against a white background (see *Nephelometry, Turbidimetry, and Visual Comparison* (855)).

Acceptance criteria: The *Sample solution* is not more intensely colored than *Standard solution A* and *Standard solution B*. ■ 2S (NF34)

Add the following:

- ● **Bacterial Endotoxins Test** (85): If labeled for use in preparing parenteral dosage forms, it meets the requirements of NMT 240 Endotoxin Units/g. ■ 2S (NF34)

Add the following:

- ● **Microbial Enumeration Tests** (61) and **Tests for Specified Microorganisms** (62): If labeled for use in preparing parenteral dosage forms, the total aerobic microbial count does not exceed 100 cfu/g, and the total combined molds and yeasts count does not exceed 10 cfu/g. ■ 2S (NF34)

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers. No storage requirements specified.

Add the following:

- ● **Labeling:** Label it to indicate whether Deoxycholic Acid is derived from an animal or synthetic source. Deoxycholic Acid intended for use in preparing parenteral dosage forms is so labeled. Deoxycholic Acid of animal origin is labeled for excipient use only. ■ 2S (NF34)

Add the following:

- ● **USP Reference Standards** (11)
 - USP Deoxycholic Acid RS
 - USP Endotoxin RS
- 2S (NF34)

BRIEFING

Desoxycholic Acid, NF 33 page 6636. Because of the use of desoxycholic acid as an active pharmaceutical ingredient (API) in an FDA approved drug, it is proposed to change the monograph designation from *NF* to *USP* and to update the monograph tests to reflect the use of desoxycholic acid as an API. This updated monograph will be listed in the *NF* section as a cross reference to the *USP* general monographs section to reflect its use as both an active and inactive ingredient. The proposed revisions are listed as follows:

1. The title "Desoxycholic Acid" is proposed to be changed to "Deoxycholic Acid" to reflect the nomenclature used in the *USAN* and in the FDA Inactive Ingredient Database. This revised monograph is proposed for inclusion in the *Second Supplement to USP 39–NF 34*, with an official date of December 1, 2016. Use of the name "Deoxycholic Acid" will be permitted as of December 1, 2016; however, its use will not be mandatory until December 1, 2021. The 60-month extension will provide the time deemed necessary for labeling changes to be made for the article and the numerous preparations in which it is an ingredient, as well as for practitioners, consumers, and regulatory agencies to

- become familiar with the new title.
2. In the *Definition*, revise the acceptance criteria from NLT 98.0% and NMT 102.0% to NMT 97.0% and NMT 103.0%. The acceptance criteria range in the *Assay* is widened to account for the performance of the proposed HPLC method with charged aerosol detection (CAD).
 3. In the *Definition*, add a statement that Desoxycholic Acid can be of animal or synthetic origin.
 4. Replace the current *Identification* test *A* based on the wet chemistry procedure with an identification test based on *Infrared Absorption* (197A). This test requires the use of USP Deoxycholic Acid RS.
 5. Add *Identification* test *B* based on the identification by retention time as obtained in the *Assay*.
 6. Replace the existing titrimetric method employed in the *Assay* with an HPLC-CAD method. This method is based on analyses performed with the Phenomenex Pursuit 3 C18 brand of L1 column. The retention times for cholic acid; 3 α , 12 β -dihydroxy-5 β -cholan-24-oic acid; 3 α , 12 α -dihydroxy-5 β -chol-9(11)-en-24-oic acid; desoxycholic acid; and ethyl 3 α , 12 α -dihydroxy-5 β -cholan-24-oate are about 7.3, 9.0, 11.3, 13.0 and 20.9 min, respectively.
 7. Add a test for *Organic Impurities* that employs the same HPLC-CAD method as in the *Assay*.
 8. Add a *Note* to the test for *Limit of Lead* stating that it is applicable only to Desoxycholic Acid of animal origin.
 9. Add a *Heavy Metals* (231) test with a statement that it is only applicable to Desoxycholic acid of synthetic origin.
 10. In the *Optical Rotation* test, assign the *Acceptance criteria* of NLT +55° to Desoxycholic Acid of animal origin, and add an *Acceptance criteria* of +50° to +60° for Desoxycholic Acid of synthetic origin.
 11. In the *Specific Tests*, delete the test for *Melting Range or Temperature* (741)
 12. In the *Specific Tests*, replace *Loss on Drying* with *Water Determination, Method Ic*, and change the *Acceptance criteria* from NMT 1% to NMT 1.0%. Replace "on the dried basis" with "on the anhydrous basis" in the *Definition* and *Assay* acceptance criteria.
 13. In the *Specific Tests*, add tests for *Clarity of Solution*, *Color of Solution*, *Bacterial Endotoxins Test* (85), *Microbial Enumeration Tests* (61), and *Tests for Specified Microorganisms* (62) for desoxycholic acid intended for use in parenteral dosage forms.
 14. Add the *Labeling* section to indicate the origin of Desoxycholic Acid, the use in parenteral dosage forms, and to label Desoxycholic Acid of animal origin for excipient use only.
 15. Add the *USP Reference Standards* section containing USP Deoxycholic Acid RS and USP Endotoxin RS.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Add a few drops of phenolphthalein TS to the solution, and titrate with 0.1 N sodium hydroxide to a pink endpoint that persists for 15 s. Each mL of 0.1 N sodium hydroxide is equivalent to 39.26 mg of desoxycholic acid (C₂₄H₄₀O₄).

Acceptance criteria: 98.0%–102.0% on the dried basis

■ **Diluent:** Methanol and water (80:20)

Solution A: 0.1% Formic acid in water

Solution B: 0.1% Formic acid in acetonitrile

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0.0	75.0	25.0
2.0	55.0	45.0
14.0	42.0	58.0
24.0	0.0	100.0
35.0	0.0	100.0

Standard solution: 0.01 mg/mL of USP Deoxycholic Acid RS in *Diluent*

Sample solution: 0.01 mg/mL of Desoxycholic Acid in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Charged aerosol

Column: 4.6-mm × 15-cm; 3-μm packing L1

Flow rate: 1.0 mL/min

Autosampler temperature: 5°

Injection volume: 25 μL

Run time: 35 min

System suitability

Sample: *Standard solution*

[Note—The retention time of desoxycholic acid is about 13.0 min.]

Suitability requirements

Relative standard deviation: NMT 3.0% for six injections

Analysis**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of desoxycholic acid ($C_{24}H_{40}O_4$) in the portion of Desoxycholic Acid taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

r_U = peak area of desoxycholic acid from the *Sample solution*

r_S = peak area of desoxycholic acid (desoxycholic acid) from the *Standard solution*

C_S = concentration of the USP Desoxycholic Acid RS in the *Standard solution*

C_U = concentration of Desoxycholic Acid in the *Sample solution*

P = labeled purity of USP Desoxycholic Acid RS expressed as a percentage

Acceptance criteria: 97.0%–103.0% on the anhydrous basis ■_{2S} (NF34)

IMPURITIES

- **Residue on Ignition** (281)

Sample: 1.0 g

Acceptance criteria: NMT 0.2%

Change to read:

- **Limit of Lead**

[Note—

■ This test and *Acceptance criteria* are only applicable to Desoxycholic Acid of animal origin. ■_{2S} (NF34)

Select reagents having as low a lead content as practicable, and store all solutions in high-density polyethylene containers. Rinse all plastic and glassware thoroughly with warm, 50% nitric acid followed by water.]

▲▲_{NF33}

Standard solutions: [Note—Prepare these solutions on the day of use.] Transfer 10.0 and 50.0 mL of ▲ *standard lead solution TS* ▲_{NF33} into two separate 100-mL volumetric flasks, add 10 mL of 3 N *hydrochloric acid* to each, and dilute with water to volume. The third standard, 10.0 µg/mL, is taken directly from ▲ *standard lead solution TS*. ▲_{NF33}

Sample solution: Transfer 10.0 g of Desoxycholic Acid, weighed to the nearest 0.1 mg, into an evaporating dish. Add 5 mL of 25% sulfuric acid (made by adding 25 mL of *sulfuric acid* to 75 mL of water), and distribute the 25% sulfuric acid solution uniformly. Within a hood, place the dish on a steam bath to evaporate most of the water. Place the dish on a burner, and slowly pre-ash the remaining *Sample solution* by expelling most of the sulfuric acid. Place the dish in a muffle furnace that has been set at 525°, and ash the contents of the dish until the residue appears free from carbon. Cool, and cautiously wash down the inside of the evaporation dish with water. Add 5 mL of 1 N *hydrochloric acid*. Place the dish on a steam bath, and evaporate to dryness. Add 1.0 mL of 3 N *hydrochloric acid* and approximately 5 mL of water, and heat briefly on a steam bath to dissolve any residue. Transfer to a 10-mL volumetric flask, dilute with water to volume, and mix.

Sample blank: Prepare by ashing 5 mL of 25% sulfuric acid solution. Cool, and cautiously

wash down the inside of the evaporation dish with water. Add 5 mL of 1 N *hydrochloric acid*. Place the dish on a steam bath, and evaporate to dryness. Add 1.0 mL of 3 N *hydrochloric acid* and approximately 5 mL of water, and heat briefly on a steam bath to dissolve any residue. Transfer to a 10-mL volumetric flask, dilute with water to volume, and mix.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption

Analytical wavelength: 283.3 nm

Lamp: Lead electrodeless discharge

Flame: Air-acetylene

Slit width: 0.7 nm

Instrument blank: Water

Standard curve

Samples: *Standard solutions* and *Sample blank*

Plot: Corrected absorbance values versus their corresponding concentration ($\mu\text{g/mL}$).
[Note—Determine corrected absorbance values by subtracting the absorbance of the *Sample blank* from the absorbance of the *Standard solutions*.]

Analysis

Samples: *Sample solution* and *Sample blank*

[Note—Determine corrected absorbance values by subtracting the absorbance of the *Sample blank* from the absorbance of the *Sample solution*.]

From the *Standard curve*, determine the lead concentration in the *Sample solution*. Calculate the lead content in the portion of Desoxycholic Acid taken:

$$\text{Result} = (C_S \times V) / W$$

C_S = concentration of lead from the *Standard curve* ($\mu\text{g/mL}$)

V = final volume of the sample (mL)

W = weight of the sample taken (g)

Acceptance criteria: NMT 4 $\mu\text{g/g}$

Add the following:

- ● **Heavy Metals** (231), *Method II*: NMT 20 $\mu\text{g/g}$

[Note—This test and *Acceptance criteria* are only applicable to Desoxycholic Acid of synthetic origin.]

- 2S (NF34)

Add the following:

- ● **Organic Impurities**

Diluent, Mobile phase, Standard solution, and Chromatographic system: Proceed as described in the procedure for *Assay*.

Sensitivity solution: 0.5 $\mu\text{g/mL}$ of USP Deoxycholic Acid RS in *Diluent*

Sample stock solution: 1.0 mg/mL of Desoxycholic Acid in *Diluent*

Sample solution: 0.01 mg/mL Desoxycholic Acid in *Diluent* prepared from the *Sample stock solution*

System suitability

Samples: *Standard solution* and *Sensitivity solution*

[Note—The retention time of desoxycholic acid is about 13.0 min. The relative retention times for cholic acid and desoxycholic acid are 0.56 and 1, respectively. The relative retention times for other impurities are listed in *Table 2*.]

Suitability requirements

Relative standard deviation: NMT 3.0% for six injections, *Standard solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Sample stock solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Desoxycholic Acid taken:

$$\text{Result} = [r_U / (r_S \times 100 + r_T)] \times 100$$

r_U = peak area of individual impurity from the *Sample stock solution*

r_S = peak area of desoxycholic acid from the *Sample solution*

r_T = sum of peak areas of all impurities from the *Sample stock solution*

Acceptance criteria

Desoxycholic Acid of animal origin

Cholic acid: NMT 1.0%

Total impurities: NMT 2.0%

Desoxycholic Acid of synthetic origin: See *Table 2*.

Table 2

Name	Relative Retention Time	Acceptance Criteria NMT (%)
3 α , 12 β -Dihydroxy-5 β -cholan-24-oic acid	0.69	0.15
3 α , 12 α -Dihydroxy-5 β -chol-9(11)-en-24-oic acid	0.87	0.15
Ethyl 3 α , 12 α -dihydroxy-5 β -cholan-24-oate	1.61	0.15
Any individual unspecified impurity	—	0.10
Total impurities	—	2.0

Delete the following:

▪ • ~~**Loss on Drying** (731)~~

~~**Analysis:** Dry at 140° under vacuum of NMT 5 mm of mercury for 4 h.~~

~~**Acceptance criteria:** NMT 1% ■ 2S (NF34)~~

Add the following:

▪ • **Water Determination** (921), *Method Ic:* NMT 1.0% ■ 2S (NF34)

Add the following:

▪ • **Clarity of Solution**

[Note—If intended for use in preparing parenteral dosage forms, it meets the requirements of the *Clarity of Solution* test.]

Hydrazine solution: 10 mg/mL of *hydrazine sulfate*. Allow to stand 4–6 h before use.

Methenamine solution: Transfer 2.5 g of *methenamine* to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension: To the flask containing *Methenamine solution* add 25.0 mL of the *Hydrazine solution*, mix, and allow to stand for 24 h. This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.

Opalescence standard: Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, and dilute with water to volume. Use this suspension within 24 h after preparation.

Reference suspension: Transfer 5.0 mL of the *Opalescence standard* to a 100-mL volumetric flask, and dilute with water to volume.

Sample solution: 5 mg/mL of Desoxycholic Acid in 0.1 N *sodium hydroxide*

Analysis: Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer a portion of the *Reference suspension* to a separate matching test tube. Compare the *Sample solution* and the *Reference suspension* in diffused daylight, viewing vertically against a black background (see *Nephelometry, Turbidimetry, and Visual Comparison* (855)) for 5 min after preparation of the *Reference suspension*.

Acceptance criteria: The *Sample solution* is not more opalescent than the *Reference suspension*. ■ 2S (NF34)

Add the following:

▪ • **Color of Solution**

[Note—If intended for use in preparing parenteral dosage forms, it meets the requirements of the *Color of Solution* test.]

Diluent: 27.5 mL of *hydrochloric acid* in 1000 mL of water

Standard stock solutions: Prepare two solutions, A and B, containing, respectively, the following parts of *ferric chloride CS*, *cobaltous chloride CS*, *cupric sulfate CS*, and *Diluent*.

Standard stock solution A: 2.4: 0.6: 0: 7.0

Standard stock solution B: 2.4: 1.0: 0.4: 6.2

Standard solutions

[Note—Prepare and use these solutions immediately.]

Standard solution A: Transfer 2.5 mL of *Standard stock solution A* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Standard solution B: Transfer 2.5 mL of *Standard stock solution B* to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

Sample solution: 5 mg/mL of Desoxycholic Acid in 0.1 N *sodium hydroxide*

Analysis: Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm, to obtain a depth of 40 mm. Similarly transfer portions of *Standard solution A* and *Standard solution B* to separate matching test tubes. Compare the color of the *Sample solution* with that of the *Standard solution A* and *Standard solution B* in diffused daylight, viewing vertically against a white background (see *Nephelometry, Turbidimetry, and Visual Comparison* (855)).

Acceptance criteria: The *Sample solution* is not more intensely colored than *Standard solution A* and *Standard solution B*. ■2S (NF34)

Add the following:

- ● **Bacterial Endotoxins Test** (85): If labeled for use in preparing parenteral dosage forms, it meets the requirements of NMT 240 Endotoxin Units/g. ■2S (NF34)

Add the following:

- ● **Microbial Enumeration Tests** (61) and **Tests for Specified Microorganisms** (62): If labeled for use in preparing parenteral dosage forms, the total aerobic microbial count does not exceed 100 cfu/g, and the total combined molds and yeasts count does not exceed 10 cfu/g. ■2S (NF34)

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers. No storage requirements specified.

Add the following:

- ● **Labeling:** Label it to indicate whether Desoxycholic Acid is derived from an animal or synthetic source. Desoxycholic Acid intended for use in preparing parenteral dosage forms is so labeled. Desoxycholic Acid of animal origin is labeled for excipient use only. ■2S (NF34)

Add the following:

- ● **USP Reference Standards** (11)
 - USP Deoxycholic Acid RS
 - USP Endotoxin RS

■2S (NF34)

Hydrogenated Castor Oil, *NF 33* page 6594. As part of the USP monograph modernization effort, it is proposed to make the following revisions:

1. Add a CAS number and chemical structure.
2. Update the monograph *Definition*.
3. Add an *Identification* test *A, Identity by Fatty Acid Composition*. The added procedure is based on a GC method of analysis performed with the Agilent DB Wax or Supelco 10 brand of G16 column. The typical retention times for methyl palmitate, methyl stearate, methyl arachidate, methyl 12-ketostearate, and methyl 12-hydroxystearate are 6.44, 8.73, 12.70, 20.01, and 23.43 min, respectively.
4. Move the test for *Melting Range or Temperature* from *Specific Tests* to the *Identification* section as test *B*.
5. In the *Assay*, add a test for *Triglyceride Composition*, which is based on analyses performed using the Phenomenex Prodigy ODS-3 or Phenomenex Ultremex C18 brand of column that contains 5- μ m packing L1. The typical retention times for glyceryl tri(12-hydroxystearate) [or tri(12-hydroxystearoyl)-glycerol], di(12-hydroxystearoyl)-(12-oxostearoyl)-glycerol, di(12-hydroxystearoyl)-palmitoyl-glycerol, di(12-hydroxystearate)-stearoyl-glycerol, and di(12-hydroxystearate)-arachidoyl-glycerol are 9.6, 10.2, 15.1, 16.9, and 18.1 min, respectively.
6. Update the *Acceptance criteria* for the *Fats and Fixed Oils* (401), *Acid Value (Free Fatty Acids)* test.
7. Add a specification for residual nickel based on the newly released Q3D Step 4 Guideline.
8. Add a specification for *Alkaline Impurities*.
9. Add a *USP Reference Standards* section, including USP Hydrogenated Castor Oil RS, USP Methyl 12-Hydroxystearate RS, USP Methyl Palmitate RS, and USP Methyl Stearate RS.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Correspondence Number—C155322

Comment deadline: November 30, 2015

Hydrogenated Castor Oil

Add the following:

ketostearate, USP Methyl Stearate RS, and USP Methyl 12-Hydroxystearate RS, in *Diluent*

Standard solution 2: 4 mg/mL each of methyl stearate and methyl 12-hydroxystearate, from USP Methyl Stearate RS and USP Methyl 12-Hydroxystearate RS, in *Diluent*

Sample solution: Transfer 140 mg of Hydrogenated Castor Oil to a 10-mL screw-cap test tube, add 3.0 mL of *Diluent*, and mix well. Add 0.5 mL of 0.5 M sodium methoxide in methanol,¹ and mix with the sample. Allow the reaction to proceed at room temperature for 2 h. After 2 h, add 5 mL of water, and mix. Centrifuge the test tube at 1000 ×g for 5 min at 4° until a clear upper layer forms. Separate the organic layer (the upper layer), and remove the lower layer. Place an aliquot of the organic layer into an autosampler vial.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m fused silica capillary bonded with a 0.25-μm layer of phase G16

Temperatures

Injection port: 240°

Detector: 250°

Column: See *Table 1* for oven program.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)	Total Time (min)
80	0	80	1	1
80	30	140	0	3
140	20	180	5	10
180	2	250	10	55

Carrier gas: Hydrogen

Flow rate: 5.0 mL/min, constant flow mode

Injection volume: 1.0 μL

Injection type: Split ratio 120:1 or 60:1

Liner: Single taper, low-pressure drop liner with deactivated wool

Run time: 55 min

System suitability

Sample: *Standard solution 1*

[Note—See *Table 2* for relative retention times.]

Table 2

Component	Relative Retention Time
Methyl palmitate (C16:0)	0.27
Methyl stearate (C18:0)	0.37
Methyl arachidate (C20:0)	0.54
Methyl 12-ketostearate	0.85
Methyl 12-hydroxystearate	1.00

Suitability requirements

Resolution: NLT 10 between any two adjacent peaks

Relative standard deviation: NMT 2.0% for the peak area ratio of methyl 12-hydroxystearate to methyl 12-ketostearate

Analysis

Samples: *Standard solution 1, Standard solution 2, and Sample solution*

Calculate the relative response factor, F , for methyl 12-hydroxystearate:

$$F = (r_S/r_R) \times (C_R/C_S)$$

r_S = peak area of methyl stearate from *Standard solution 2*

r_R = peak area of methyl 12-hydroxystearate from *Standard solution 2*

C_R = concentration of USP Methyl 12-Hydroxystearate RS in *Standard solution 2* (mg/mL)

C_S = concentration of USP Methyl Stearate RS in *Standard solution 2* (mg/mL)

Correct the peak area of methyl 12-hydroxystearate in the *Sample solution* by multiplying by F .

Calculate the percentage of each fatty acid component in the portion of sample taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area of each individual fatty acid methyl ester, except for the uncorrected peak area of methyl 12-hydroxystearate (or the corrected peak area of methyl 12-hydroxystearate), from the *Sample solution*

r_T = sum of all the peak areas, excluding the solvent and methyl 12-hydroxystearate peaks and including the corrected peak area of methyl hydroxystearate, from the *Sample solution*

Acceptance criteria: Hydrogenated Castor Oil exhibits the composition profile of fatty acids shown in *Table 3*.

Table 3

Component	Percentage (%)
Palmitic acid (C16:0)	≤2.0
Stearic acid (C18:0)	7.0–14.0
Arachidic acid (C20:0)	≤1.0
12-Ketostearic acid (or 12-oxostearic acid)	≤5.0
12-Hydroxystearic acid	78.0–91.0
Any other unidentified fatty acid	≤3.0

■ 2S (NF34)

Add the following:

- ● **B. Melting Range or Temperature** (741), *Class II*: 85°–88° ■ 2S (NF34)

ASSAY

Add the following:

- ● **Triglyceride Composition**

Solution A: Methanol

Solution B: 2-Propanol

Mobile phase: See *Table 4*.

Table 4

Time (min)	Solution A (%)	Solution B (%)
0	100	0
20	50	50
23	0	100
25	100	0
35	100	0

Diluent: Methylene chloride

System suitability solution: 3.0 mg/mL of Hydrogenated Castor Oil in *Diluent*. [Note—Due to low solubility, sonicate the solution for about 2–3 min.]

Sample solution: 3.0 mg/mL of Hydrogenated Castor Oil in *Diluent*. [Note—Due to low solubility, sonicate the solution for about 2–3 min.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Evaporative light-scattering

Column: 4.6-mm × 25-cm; 5- μ m packing L1

Temperatures

Column: 25°

Detector: 40°

Flow rate: 1.0 mL/min

Injection volume: 5 μ L

Run time: 35 min

[Note—Depending on the different settings of the *Detector*, the *Temperature* and *Flow rate* can be adjusted as long as system suitability requirements are met.]

System suitability

Sample: *System suitability solution*

[Note—See *Table 5* for relative retention times.]

Table 5

Component	Relative Retention Time
Glyceryl tri(12-hydroxystearate) [or tri(12-hydroxystearoyl)-glycerol]	1.0
Di(12-hydroxystearoyl)-(12-oxostearoyl)-glycerol	1.1
Di(12-hydroxystearoyl)-palmitoyl-glycerol	1.7
Di(12-hydroxystearoyl)-stearoyl-glycerol	1.8
Di(12-hydroxystearoyl)-arachidoyl-glycerol	1.9

Suitability requirements

Resolution: NLT 1.5 between glyceryl tri(12-hydroxystearate) and di(12-hydroxystearoyl)-(12-oxostearoyl)-glycerol

Tailing factor: 0.8–1.8 for the glyceryl tri(12-hydroxystearate) peak

Relative standard deviation: NMT 2% for the peak area of glyceryl tri(12-hydroxystearate)

Analysis

Samples: *System suitability solution* and *Sample solution*

Calculate the percentage of each of the triglycerides in the portion of sample taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area of each individual triglyceride from the *Sample solution*

r_T = sum of all the peak areas, excluding the solvent peak, from the *Sample solution*

Acceptance criteria: Hydrogenated Castor Oil exhibits the composition profile shown in *Table 6*.

Table 6

Component	Percentage (%)
Glyceryl tri(12-hydroxystearate) [or tri(12-hydroxystearoyl)-glycerol]	≥70.0
Di(12-hydroxystearoyl)-(12-oxostearoyl)-glycerol	≤14.0
Di(12-hydroxystearoyl)-palmitoyl-glycerol	≤2.0
Di(12-hydroxystearoyl)-stearoyl-glycerol	10.0–23.0
Di(12-hydroxystearoyl)-arachidoyl-glycerol	≤2.0

■ 2S (NF34)

IMPURITIES

Delete the following:

● ● **Heavy Metals** (231), *Method II*: NMT 10 µg/g ● (Official 1-Dec-2015)

Add the following:

■ ● **Limit of Nickel**

[**Caution**—When using closed high-pressure digestion vessels and laboratory microwave

equipment, the safety precautions and operating instructions given by the manufacturer must be followed.]

[Note—If an alternative apparatus is used, adjustment of the instrument parameters may be necessary.]

Nickel standard stock solution: Dilute *nickel standard solution TS* two-fold with water. This solution contains the equivalent of 5 µg/mL of nickel.

Standard solutions: Transfer 25, 50, 75, and 100 µL of *Nickel standard stock solution* to four identical 25-mL volumetric flasks. To each flask add 0.5 mL of a 10-mg/mL solution of magnesium nitrate, 0.5 mL of a 100-mg/mL solution of monobasic ammonium phosphate, and 6.0 mL of nickel-free nitric acid. Dilute with water to volume, and mix well.

[Note—Content of nickel in the nickel-free nitric acid is NMT 0.005 ppm.] The *Standard solutions* contain 0.005, 0.01, 0.015, and 0.02 µg/mL of nickel, respectively.

Sample solution: Transfer about 250 mg of Hydrogenated Castor Oil to a suitable high-pressure-resistant digestion vessel (fluoropolymer or quartz glass), and add 6.0 mL of nickel-free nitric acid and 2.0 mL of 30% hydrogen peroxide. Place the closed vessel in a laboratory microwave oven, and digest using an appropriate program, e.g., 1000 W for 40 min. Allow the digestion vessel to cool before opening. Add 2.0 mL of 30% hydrogen peroxide, and repeat the digestion step. Allow the digestion vessel to cool down before opening. Quantitatively transfer to a 25-mL volumetric flask, add 0.5 mL of a 10-mg/mL solution of magnesium nitrate and 0.5 mL of a 100-mg/mL solution of monobasic ammonium phosphate. Dilute with water to volume, and mix well.

Blank solution: Place 6.0 mL of nickel-free nitric acid and 2.0 mL of 30% hydrogen peroxide in a suitable high-pressure-resistant digestion vessel. Proceed as directed under *Sample solution*, beginning with "Place the closed vessel in a laboratory microwave oven, and digest using an appropriate program, e.g., 1000 W for 40 min."

Zero solution: In a 50-mL volumetric flask, introduce 1.0 mL of a 10-mg/mL solution of magnesium nitrate, 1.0 mL of a 100-mg/mL solution of monobasic ammonium phosphate, and 12.0 mL of nickel-free nitric acid. Dilute with water to volume, and mix well.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852))

Mode: Atomic absorption, equipped with a graphite furnace, a background compensation system, and a coated tube resistant to pyrolysis

Analytical wavelength: 232.0 nm

Lamp: Nickel hollow-cathode

Temperature: Maintain the drying temperature of the furnace at 120° for 35 s after a 5-s ramp; maintain the ashing temperature at 1100° for 10 s after a 30-s ramp; maintain the cooling temperature at 800° for 5 s after a 5-s decrease; and maintain the atomization temperature at 2600° for 7 s. [Note—The temperature program may be modified to obtain optimum furnace temperatures.]

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank solution*

Concomitantly determine the absorbances of the *Samples* using the *Instrumental conditions* described above. Use the *Zero solution* to set the instrument to zero. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of nickel, and

draw the straight line best fitting the plotted points. From this graph, determine the concentration, C_T , in $\mu\text{g/mL}$, of nickel in the *Sample solution*, and determine the concentration, C_B , in $\mu\text{g/mL}$, of nickel in the *Blank solution*. If necessary, dilute with the *Zero solution* to obtain a reading within the calibrated absorbance range.

Calculate the quantity, in μg , of nickel in each g of Hydrogenated Castor Oil taken:

$$\text{Result} = V \times (C_T - C_B) / W$$

V = volume of the *Sample solution* and the *Blank solution*, 25 mL

C_T = concentration of nickel in the *Sample solution* ($\mu\text{g/mL}$)

C_B = concentration of nickel in the *Blank solution* ($\mu\text{g/mL}$)

W = weight of Hydrogenated Castor Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 20 $\mu\text{g/g}$ ■ 2S (NF34)

Add the following:

■ ● **Alkaline Impurity**

Sample: 1.0 g

Analysis: Dissolve the *Sample* by gently heating in a mixture of 1.5 mL of alcohol and 3.0 mL of toluene. Add 0.05 mL of bromophenol blue TS, and titrate with 0.01 N hydrochloric acid VS to a yellow endpoint.

Acceptance criteria: NMT 0.2 mL of 0.01 N hydrochloric acid. ■ 2S (NF34)

SPECIFIC TESTS

Sample solution: Melt 20 g in a conical flask on a steam bath, add 75 mL of hot alcohol that has previously been neutralized with 0.1 N sodium hydroxide to phenolphthalein TS, swirl, and add 1 mL of phenolphthalein TS.

Analysis: Titrate with 0.1 N sodium hydroxide VS, swirling vigorously, until the solution remains faintly pink after being shaken for 60 s.

Acceptance criteria: NMT 11.0 mL of 0.1 N sodium hydroxide VS,

■ corresponding to NMT 3.1 for acid value ■ 2S (NF34)

- **Fats and Fixed Oils** (401), *Hydroxyl Value*

Sample solution: 2 g in a glass-stoppered, 250-mL conical flask. Add 5.0 mL of a freshly prepared mixture of acetic anhydride and pyridine (1:3), and swirl to mix. Connect the flask to a reflux condenser, and heat on a steam bath for 2 h. Add 10 mL of water through the condenser, swirl to mix, heat on a steam bath for an additional 10 min, and allow to cool to room temperature. Add through the condenser 15 mL of normal butyl alcohol that has previously been neutralized to phenolphthalein, remove the condenser, wash the tip of

the condenser and the sides of the flask with an additional 10 mL of neutralized normal butyl alcohol, and add 1 mL of phenolphthalein TS.

Analysis: Titrate with 0.5 N alcoholic potassium hydroxide VS to a faint pink endpoint.

Perform a blank determination on a 5.0-mL portion of the acetic anhydride–pyridine mixture. To determine the amount of free acid in the Oil, weigh 10 g into a 250-mL conical flask, add 10 mL of pyridine that has previously been neutralized to phenolphthalein, swirl to mix, add 1 mL of phenolphthalein TS, and titrate with 0.5 N alcoholic potassium hydroxide VS to a faint pink endpoint.

Calculate the hydroxyl value in the portion of Oil taken:

$$\text{Result} = M_r \times N \times [A + (B \times W/D) - C] / W$$

M_r = molecular weight of potassium hydroxide, 56.1

N = normality of the alcoholic potassium hydroxide solution

A = volume of 0.5 N alcoholic potassium hydroxide consumed by the *Blank* (mL)

B = volume consumed in the free-acid titration (mL)

W = weight of Oil taken (g)

D = weight of Oil used in the free-acid titration (g)

C = volume consumed in the sample titration (mL)

Acceptance criteria: 154–162

BRIEFING

Magnesium Aluminum Silicate, NF 33 page 6733. The Magnesium Aluminum Silicate monograph was identified as a monograph that is in need of strengthening the *Identification* section. Although the X-ray diffraction method employed in the current *Identification* test A is definitive for the clays comprising magnesium aluminum silicate, it does not address differentiation among the four magnesium aluminum silicate *Types*. As part of the USP monograph modernization effort and on the basis of the comments received, it is proposed to make the following changes:

1. Add the *Viscosity* test to the *Identification* section of the monograph as *Identification* test B.

2. Add the requirement for *Ratio of aluminum content to magnesium content* to the *Identification* section of the monograph as *Identification test C*.
3. Add *Appearance* to the *Identification* section of the monograph as *Identification test D*.
4. Remove the reference to the adjustment of the temperature at which viscosity is measured in the *Viscosity* test. Because of poor heat transfer of the magnesium aluminum silicate dispersion, adjusting the temperature to $33 \pm 3^\circ$ will take longer than 5 min resulting in invalid viscosity data. Instead add a requirement that the sample temperature should be $33 \pm 3^\circ$.
5. Add clarification to the preparation of the *Standard solution* and the *Sample solution* in the *Aluminum Content and Magnesium Content* test.
6. Add references to a suitable blender and viscometer used in the *Viscosity* test.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Comment deadline: November 30, 2015

Magnesium Aluminum Silicate

DEFINITION

Change to read:

Magnesium Aluminum Silicate is a blend of colloidal montmorillonite and saponite that has been processed to remove grit and nonswellable ore components.

The requirements for viscosity and ratio of aluminum content to magnesium content differ for the several types of Magnesium Aluminum Silicate, as set forth in the table below.

-	Viscosity (cps)		Al Content/ Mg Content	
	Min.	Max.	Min.	Max.
IA	225	600	0.5	1.2
IB	150	450	0.5	1.2
IC	800	2200	0.5	1.2
IIA	100	300	1.4	2.8

Type	Viscosity (mPa·s)		Al Content/ Mg Content		Appearance
	Min.	Max.	Min.	Max.	
IA	225	600	0.5	1.2	Fine granules or flakes
IB	150	450	0.5	1.2	Microfine powder
IC	800	2200	0.5	1.2	Fine granules or flakes
IIA	100	300	1.4	2.8	Fine granules or flakes

■ 2S (NF34)

IDENTIFICATION

• A.

Sample: 2 g

Analysis 1: Add the *Sample* in small portions to 100 mL of water with intense agitation.

Allow to stand for 12 h to ensure complete hydration. Place 2 mL of the resulting mixture on a suitable glass slide, and allow to air-dry at room temperature to produce an oriented film. Place the slide in a vacuum desiccator over a free surface of ethylene glycol.

Evacuate the desiccator, and close the stopcock so that the ethylene glycol saturates the desiccator chamber. Allow to stand for 12 h. Record the X-ray diffraction pattern (see *X-Ray Diffraction* (941)), and calculate the *d* values.

Acceptance criteria 1: The largest peak corresponds to a *d* value between 15.0 and 17.2 Å.

Analysis 2: Prepare a random powder specimen of Magnesium Aluminum Silicate, record the X-ray diffraction pattern, and determine the *d* values in the region between 1.48 and 1.54 Å.

Acceptance criteria 2: Peaks are found at 1.492–1.504 Å and at 1.510–1.540 Å.

Add the following:

- • **B.** It meets the requirements of the test for *Viscosity* in *Specific Tests*. ■ 2S (NF34)

Add the following:

- • **C.** It meets the requirements for *Ratio of aluminum content to magnesium content* in the test for *Aluminum Content and Magnesium Content*. ■ 2S (NF34)

Add the following:

- • **D.** Its appearance corresponds to the description in the *table* in the *Definition*. ■ 2S (NF34)

- **Arsenic** (211), *Method I*

Standard preparation: • Transfer 5.0 mL (5 µg of arsenic) of the *Standard Arsenic Solution* to a 25-mL volumetric flask, and add dilute hydrochloric acid (1:25) to volume. • (ERR 1-Apr-2014)

Test preparation: Transfer 13.3 g of Magnesium Aluminum Silicate to a 250-mL beaker containing 100 mL of dilute *hydrochloric acid* (1:25), mix, cover with a watch glass, and boil gently with occasional stirring for 15 min without allowing excessive foaming. Allow the insoluble material to settle, and decant the hot supernatant through a rapid-flow filter paper into a 200-mL volumetric flask, retaining as much sediment as possible in the beaker. Add 25 mL of hot dilute *hydrochloric acid* (1:25) to the residue in the beaker, stir, and heat to boiling. Allow the insoluble material to settle, and decant the supernatant through the filter into the 200-mL volumetric flask. Repeat the extraction with four additional 25-mL portions of hot dilute *hydrochloric acid* (1:25), decanting each hot supernatant through the filter into the volumetric flask. At the last extraction, transfer as

much of the insoluble material as possible onto the filter. Cool the combined filtrates to room temperature, add dilute *hydrochloric acid* (1:25) to volume, and mix. Use 25 mL for the test.

Acceptance criteria: NMT 3 µg/g; •the absorbance due to any red color from the *Test preparation* does not exceed that produced by the *Standard preparation*. •(ERR 1-Apr-2014)

Change to read:

• **Lead**

Standard preparation: On the day of use, dilute 3.0 mL of ▲*lead nitrate stock solution* TS▲NF33 with water to 100 mL. Each mL contains the equivalent of 3 µg of lead.

Sample: 10.0 g

Test preparation: Transfer the *Sample* to a 250-mL beaker containing 100 mL of dilute *hydrochloric acid* (1:25), stir, cover with a watch glass, and boil for 15 min. Cool to room temperature, and allow the insoluble matter to settle. Decant the supernatant through a rapid-flow filter paper into a 400-mL beaker. Add 25 mL of hot water to the insoluble matter in the 250-mL beaker, and stir. Allow the insoluble matter to settle, and decant the supernatant through the filter into the 400-mL beaker. Repeat the extraction with two additional 25-mL portions of water, decanting each supernatant portion through the filter into the 400-mL beaker. Wash the filter with 25 mL of hot water, collecting this filtrate in the 400-mL beaker. Concentrate the combined extracts by gentle boiling to approximately 20 mL. If a precipitate appears, add 2–3 drops of *nitric acid*, heat to boiling, and cool to room temperature. Filter the concentrated extracts through a rapid-flow filter paper into a 50-mL volumetric flask. Transfer the remaining contents of the 400-mL beaker through the filter paper and into the flask with water. Dilute with water to volume.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometer equipped with a deuterium arc background correction and a single-slot burner

Analytical wavelength: 284 nm

Lamp: Lead hollow-cathode

Flame: Oxidizing flame of air and acetylene

Acceptance criteria: The absorbance of the *Test preparation* is NMT that of the *Standard preparation* (15 µg/g).

SPECIFIC TESTS

- **Microbial Enumeration Tests** (61) and **Tests for Specified Microorganisms** (62): Its total aerobic microbial count does not exceed 10^3 cfu/g, and it meets the requirements of the test for absence of *Escherichia coli*.
- **pH** (791)
 - Sample suspension:** 50 mg/mL

Sample: solution:

■ **2S (NF34)**

After determining the *Loss on Drying*, weigh a quantity of Magnesium Aluminum Silicate, equivalent to 25.0 g on the dried basis. Over a period of a few seconds, transfer the undried test specimen to a suitable 1-L blender jar containing an amount of water, maintained at a temperature of $25 \pm 2^\circ$, that is sufficient to produce a mixture weighing 500 g. Blend for 3 min, accurately timed, at 14,000–15,000 rpm (high speed).

■ **1** ■ **2S (NF34)**

■ **2S (NF34)**

[Note—Heat generated during blending causes a temperature rise to above 30° .]

Analysis: Transfer the contents of the blender to a 600-mL beaker, and allow to stand for 5 min. ~~and adjust, if necessary, to a temperature of $33 \pm 3^\circ$~~

■ The sample temperature should be $33 \pm 3^\circ$. ■ **2S (NF34)**

Using a suitable rotational viscometer

■ **2** ■ **2S (NF34)**

■ **2S (NF34)**

equipped with a spindle as specified below, operate the viscometer at 60 rpm for 6 min, accurately timed, and record the scale reading.

For Type IA, use a spindle with a cylinder 1.87 cm in diameter and 0.69 cm high attached to a shaft 0.32 cm in diameter, the distance from the top of the cylinder to the lower tip of the shaft being 2.54 cm, and the immersion depth being 5.00 cm (No. 2 spindle). If the scale reading is greater than 90% of full scale, repeat the measurement, using a spindle similar to the No. 2 spindle but with the cylinder 1.27 cm in diameter and 0.16 cm high instead (No. 3 spindle).

For Type IC, use a No. 3 spindle. If the scale reading is greater than 90% of full scale, repeat the measurement using a spindle consisting of a cylindrical shaft 0.32 cm in diameter and with an immersion depth of 4.05 cm (No. 4 spindle).

For Types IB and IIA, use a No. 2 spindle.

Acceptance criteria

Type IA: 225–600

Type IB: 150–450

Type IC: 800–2200

Type IIA: 100–300

● **Acid Demand**

Sample: After determining the *Loss on Drying*, weigh a quantity of Magnesium Aluminum Silicate equivalent to 5.00 g.

Analysis: Disperse the *Sample* in 500 mL of water with the aid of a suitable blender fitted with a 1-L jar. Using a stopwatch, designate zero time. With constant mixing, add 3.0-mL portions of 0.100 N hydrochloric acid at 5, 65, 125, 185, 245, 305, 365, 425, 485, 545,

605, 665, and 725 s, and add a 1.0-mL portion at 785 s. Determine the pH potentiometrically at 840 s.

Acceptance criteria: NMT 4.0

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers.
- **Labeling:** Label it to indicate its type.

¹ A suitable blender is available from Waring as Waring Commercial Blender Model 7009G or equivalent with 1-L glass jar and tachometer adapter, Model CAC24 or equivalent.

² A suitable viscometer is available from Brookfield as Viscometer Model LVF or LVT, or equivalent.

BRIEFING

Polyoxyl 35 Castor Oil, *NF* 33 page 6820. As part of the USP monograph modernization effort, it is proposed to make the following revisions:

1. Add chemical names and a CAS number.
2. Replace the current *Identification* test C based on a decolorization test with the test for *Identity by Fatty Acid Composition*.
3. The procedure for *Identity by Fatty Acid Composition* is based on a GC method of analysis performed with the Agilent DB-225 or Restek Rtx-225 brand of G7 column. The typical retention times for methyl palmitate, methyl stearate, methyl oleate, methyl *cis*-11-octadecenoate, methyl linoleate, methyl *cis*-11-eicosenoate, and methyl ricinoleate are 7.91, 12.73, 13.02, 13.24, 13.84, 22.11, and 29.89 min, respectively.
4. Add a specification for residual ethylene oxide and dioxane by using the procedure in *Ethylene Oxide and Dioxane* (228).
5. Add a specification for residual ethylene glycol and diethylene glycol by using the procedure in *Ethylene Glycol, Diethylene Glycol, and Triethylene Glycol in Ethoxylated Substances* (469).
6. Update the *Packaging and Storage* section.
7. Add USP Methyl Linoleate RS, USP Methyl Ricinoleate RS, USP Methyl Palmitate RS, and USP Methyl Stearate RS to the *USP Reference Standards* section.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Polyoxyl 35 Castor Oil

Add the following:

- Polyethylene glycol 35 castor oil;
Polyoxyethylene 35 castor oil [61791-12-6]. ■ 2S (*NF34*)

DEFINITION

Polyoxyl 35 Castor Oil contains mainly the tri-ricinoleate ester of ethoxylated glycerol with smaller amounts of polyethylene glycol ricinoleate and the corresponding free glycols. It results from the reaction of glycerol ricinoleate with 35 moles of ethylene oxide.

IDENTIFICATION

- **A. Infrared Absorption** (197F)
- **B.**

Sample: 0.1 g

Analysis: Dissolve the *Sample* in 10 mL of *alcoholic potassium hydroxide TS*, boil for 3 min, and evaporate to dryness. Mix the residue with 5 mL of water.

Acceptance criteria: The residue dissolves, yielding a clear solution. Add a few drops of glacial acetic acid. A white precipitate is formed.

Delete the following:

- • ~~€.~~

~~**Sample solution:** 1 in 20~~

~~**Analysis:** Add bromine TS dropwise to the *Sample solution*.~~

~~**Acceptance criteria:** The bromine is decolorized. ■ 2S (NF34)~~

Add the following:

- • **C. Identity by Fatty Acid Composition**

Diluent: *n*-Heptane

Standard solution 1: 0.2 mg/mL each of methyl palmitate, methyl stearate, methyl oleate, methyl linoleate, methyl *cis*-11-eicosenoate, and methyl ricinoleate, from USP Methyl Palmitate RS, USP Methyl Stearate RS, USP Methyl Oleate RS, USP Methyl Linoleate RS, methyl *cis*-11-eicosenoate, and USP Methyl Ricinoleate RS, in *Diluent*

Standard solution 2: 4 mg/mL each of methyl stearate and methyl ricinoleate from USP Methyl Stearate RS and USP Methyl Ricinoleate RS in *Diluent*

Sample solution: Transfer 140 mg of Polyoxyl 35 Castor Oil to a 10-mL screw-cap test tube, add 3.0 mL of *Diluent*, and mix well. Add 0.5 mL of 0.5 M sodium methoxide in methanol,¹ and mix with the sample. Allow the reaction to proceed at room temperature for 2 h. After 2 h, add 5 mL of water, and mix. Centrifuge the test tube at 1000 ×*g* for 10–15 min until a clear upper layer forms. Separate the organic layer (the upper layer), and remove the lower layer. Place an aliquot of the organic layer into an autosampler vial.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm × 15-m fused silica capillary; bonded with a 0.25-μm layer of phase G7

Temperatures

Injection port: 240°

Detector: 250°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)	Total Time (min)
80	0	80	1	1
80	30	140	0	3
140	3	150	0	6.3
150	1	155	0	11.3
155	2	165	0	16.3
165	3	220	10	45

Column mode: See *Table 2* for the pressure program.

Table 2

Pressure (psi)	Pressure Ramp (psi/min)	Hold Time (min)	Total Time (min)
10	0	16	16
4	5	9 or 0 ^a	26.2 or 17.2
3	10	19 or 28	45

^a If considerable discrimination of late eluting compounds is observed, the hold time can be adjusted from 9 to 0 min. Thus the total time should be 17.2 min. Then the next step of the hold time should be 28 min.

Carrier gas: Hydrogen

Injection volume: 0.5 µL

Injection type: Split ratio, 60:1

Liner: Single taper, low-pressure drop liner with deactivated wool

Run time: 45 min

System suitability

Sample: *Standard solution 1*

[Note—See *Table 3* for relative retention times.]

Table 3

Component	Relative Retention Time
Methyl palmitate (C16:0)	0.61
Methyl stearate (C18:0)	0.98
Methyl oleate (C18:1)	1.00
Methyl linoleate (C18:2)	1.02
Methyl <i>cis</i> -11-eicosenoate (C20:1)	1.70
Methyl ricinoleate	2.30

Suitability requirements

Resolution: NLT 1.5 between methyl stearate and methyl oleate peaks

Relative standard deviation: NMT 2.0% for the peak area ratio of methyl ricinoleate to methyl linoleate

Analysis

Samples: *Standard solution 1, Standard solution 2, and Sample solution*

The peak of methyl *cis*-11-octadecenoate, which is an isomer of methyl oleate, can be resolved from the methyl oleate peak with a resolution of about 1 and a relative retention time of 1.01 with respect to methyl oleate.

Calculate the relative response factor, F , for methyl ricinoleate:

$$F = (r_S/r_R) \times (C_R/C_S)$$

r_S = peak area of methyl stearate from *Standard solution 2*

r_R = peak area of methyl ricinoleate from *Standard solution 2*

C_R = concentration of USP Methyl Ricinoleate RS in *Standard solution 2* (mg/mL)

C_S = concentration of USP Methyl Stearate RS in *Standard solution 2* (mg/mL)

Correct the peak area of methyl ricinoleate in the *Sample solution* by multiplying by F . Calculate the percentage of each fatty acid component in the portion of Polyoxyl 35 Castor Oil taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area of each individual fatty acid methyl ester except for the uncorrected peak area of methyl ricinoleate (or the corrected peak area of methyl ricinoleate) from the *Sample solution*

r_T = sum of all the peak areas, excluding the solvent and methyl ricinoleate peaks and including the corrected peak area of methyl ricinoleate from the *Sample solution*

Acceptance criteria: Polyoxyl 35 Castor Oil exhibits the composition profile of fatty acids shown in *Table 4*.

Table 4

Component	Percentage (%)
Palmitic acid (C16:0)	≤4.0
Stearic acid (C18:0)	≤5.0
Oleic acid (C18:1)	4.0–10.0
Linoleic acid (C18:2)	1.0–5.0
<i>cis</i> -11-Eicosenoic acid (C20:1)	≤1.0
Ricinoleic acid	45.0–75.0

■ 1 0.5 M sodium methoxide in methanol is available from Sigma-Aldrich (www.sigmaaldrich.com), product #403067. Any other equivalent reagent can be used as well. ■ 2S (NF34)

BRIEFING

Polyoxyl 40 Hydrogenated Castor Oil, *NF 33* page 6821. As part of the USP monograph modernization effort, it is proposed to make the following revisions:

1. Add chemical names and a CAS number.
2. Replace the current *Identification* test *A* based on a wet chemical test with a test for *Identity by Fatty Acid Composition*.
3. The procedure for *Identity by Fatty Acid Composition* is based on a GC method of analysis performed with the Agilent DB Wax or Supelco 10 brand of G16 column. The typical retention times for methyl palmitate, methyl stearate, methyl arachidate, methyl 12-ketostearate, and methyl 12-hydroxystearate are 6.49, 8.78, 12.83, 20.18, and 23.62 min, respectively.
4. Add a specification for residual ethylene oxide and dioxane by using the procedure in *Ethylene Oxide and Dioxane* (228).
5. Add a specification for residual nickel based on the newly released Q3D Step 4 Guideline.
6. Change the lower limit of *Hydroxyl Value* from 60 to 57.
7. Update the *Packaging and Storage* section.
8. Add a *USP Reference Standards* section including USP Methyl 12-Hydroxystearate RS, USP Methyl Palmitate RS, and USP Methyl Stearate RS.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Comment deadline: November 30, 2015

Polyoxyl 40 Hydrogenated Castor Oil

Add the following:

■ Polyethylene glycol 40 hydrogenated castor oil;
 Polyoxyethylene 40 hydrogenated castor oil [61788-85-0]. ■ 2S (NF34)

DEFINITION

Change to read:

Polyoxyl 40 Hydrogenated Castor Oil contains mainly the tri-hydroxystearate ester of ethoxylated glycerol, with smaller amounts of polyethylene glycol tri-

■ 2S (NF34)

hydroxystearate and the corresponding free glycols. It results from the reaction of glycerol trihydroxystearate with 40–45 moles of ethylene oxide.

IDENTIFICATION

Delete the following:

■ • ~~A.~~

Sample: ~~0.1 g~~

Analysis: ~~Dissolve the Sample in 1 mL of water, add 9 mL of sodium chloride solution (50 mg/mL), and heat in a water bath.~~

Acceptance criteria: ~~The solution becomes turbid at 70°–85°.~~ ■ 2S (NF34)

Add the following:

■ • **A. Identity by Fatty Acid Composition**

Diluent: Chloroform

Standard solution 1: 0.4 mg/mL each of methyl palmitate, methyl arachidate, methyl 12-ketostearate, methyl stearate, and methyl 12-hydroxystearate, from USP Methyl Palmitate RS, *methyl arachidate*, methyl 12-ketostearate, USP Methyl Stearate RS, and USP Methyl 12-Hydroxystearate RS, in *Diluent*

Standard solution 2: 4 mg/mL each of methyl stearate and methyl 12-hydroxystearate from USP Methyl Stearate RS and USP Methyl 12-Hydroxystearate RS in *Diluent*

Sample solution: Transfer 140 mg of Polyoxyl 40 Hydrogenated Castor Oil to a 10-mL screw-cap test tube, add 3.0 mL of *Diluent*, and mix well. Add 0.5 mL of 0.5 M sodium methoxide in methanol,¹ and mix with the sample. Allow the reaction to proceed at room temperature for 2 h. After 2 h, add 5 mL of water, and mix. Centrifuge the test tube at 2000 ×g for 10 min at 4° until a clear upper layer forms. Separate the organic layer (the upper layer), and remove the lower layer. Place an aliquot of the organic layer into an autosampler vial.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 30-m fused silica capillary; bonded with a 0.25-μm layer of phase G16

Temperatures

Injection port: 240°

Detector: 250°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)	Total Time (min)
80	0	80	1	1
80	30	140	0	3
140	20	180	5	10
180	2	250	10	55

Carrier gas: Hydrogen

Flow rate: 5.0 mL/min, constant flow mode

Injection volume: 1.0 µL

Injection type: Split ratio, 120:1 or 60:1

Liner: Single gooseneck liner with deactivated wool

Run time: 55 min

System suitability

Sample: *Standard solution 1*

[Note—See *Table 2* for relative retention times.]

Table 2

Component	Relative Retention Time
Methyl palmitate (C16:0)	0.27
Methyl stearate (C18:0)	0.37
Methyl arachidate (C20:0)	0.54
Methyl 12-ketostearate	0.85
Methyl 12-hydroxystearate	1.00

Suitability requirements

Resolution: NLT 10 between any two adjacent peaks

Relative standard deviation: NMT 2.0% for the peak area ratio of methyl 12-hydroxystearate to methyl 12-ketostearate

Analysis

Samples: *Standard solution 1, Standard solution 2, and Sample solution*

Calculate the relative response factor, F , for methyl 12-hydroxystearate:

$$F = (r_S/r_R) \times (C_R/C_S)$$

r_S = peak area of methyl stearate from *Standard solution 2*

r_R = peak area of methyl 12-hydroxystearate from *Standard solution 2*

C_R = concentration of USP Methyl 12-Hydroxystearate RS in *Standard solution 2* (mg/mL)

C_S = concentration of USP Methyl Stearate RS in *Standard solution 2* (mg/mL)

Correct the peak area of methyl 12-hydroxystearate in the *Sample solution* by multiplying

by F .

Calculate the percentage of each fatty acid component in the portion of Polyoxyl 40 Hydrogenated Castor Oil taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area of each individual fatty acid methyl ester except for the uncorrected peak area of methyl 12-hydroxystearate (or the corrected peak area of methyl 12-hydroxystearate), from the *Sample solution*

r_T = sum of all the peak areas, excluding the solvent and methyl 12-hydroxystearate peaks and including the corrected peak area of methyl hydroxystearate, from the *Sample solution*

Acceptance criteria: Polyoxyl 40 Hydrogenated Castor Oil exhibits the composition profile of fatty acids shown in *Table 3*.

Table 3

Component	Percentage (%)
Palmitic acid (C16:0)	≤4.0
Stearic acid (C18:0)	15.0–25.0
Arachidic acid(C20:0)	≤2.0
12-Ketostearic acid (or 12-oxostearic acid)	≤5.0
12-Hydroxystearic acid	50.0–70.0

■ 2S (NF34)

● **B.**

Sample: 0.1 g

Analysis: Dissolve the *Sample* in 10 mL of *alcoholic potassium hydroxide TS*, boil for 3 min, and evaporate to dryness. Mix the residue with 5 mL of water.

Acceptance criteria: The residue dissolves, yielding a clear solution. Add a few drops of glacial acetic acid. A white precipitate is formed.

IMPURITIES

- **Residue on Ignition** (281): NMT 0.3%

Add the following:

- ● **Ethylene Oxide and Dioxane** (228), *Method I*

Acceptance criteria

Ethylene oxide: NMT 1 µg/g

Dioxane: NMT 10 µg/g

■ 2S (NF34)

Delete the following:

- ● **Heavy Metals** (231), *Method II*: NMT 10 µg/g • (Official 1-Dec-2015)

Add the following:

- ● **Limit of Nickel**

[**Caution**—When using closed high-pressure digestion vessels and laboratory microwave

equipment, the safety precautions and operating instructions given by the manufacturer must be followed.]

[Note—If an alternative apparatus is used, adjustment of the instrument parameters may be necessary.]

Nickel standard stock solution: Dilute *nickel standard solution TS* two-fold with water. This solution contains the equivalent of 5 µg/mL of nickel.

Standard solutions: Transfer 25, 50, 75, and 100 µL of *Nickel standard stock solution* to four identical 25-mL volumetric flasks. To each flask add 0.5 mL of a 10-mg/mL solution of magnesium nitrate, 0.5 mL of a 100-mg/mL solution of monobasic ammonium phosphate, and 6.0 mL of nickel-free nitric acid. Dilute with water to volume, and mix well.

[Note—Content of nickel in the nickel-free nitric acid is NMT 0.005 ppm.] The *Standard solutions* contain 0.005, 0.01, 0.015, and 0.02 µg/mL of nickel, respectively.]

Sample solution: Transfer about 250 mg of Polyoxyl 40 Hydrogenated Castor Oil to a suitable high-pressure-resistant digestion vessel (fluoropolymer or quartz glass), and add 6.0 mL of nickel-free nitric acid and 2.0 mL of 30% hydrogen peroxide. Place the closed vessel in a laboratory microwave oven, and digest using an appropriate program, e.g., 1000 W for 40 min. Allow the digestion vessel to cool before opening. Add 2.0 mL of 30% hydrogen peroxide, and repeat the digestion step. Allow the digestion vessel to cool before opening. Quantitatively transfer to a 25-mL volumetric flask, add 0.5 mL of a 10-mg/mL solution of magnesium nitrate and 0.5 mL of a 100-mg/mL solution of monobasic ammonium phosphate. Dilute with water to volume, and mix well.

Blank solution: Place 6.0 mL of nickel-free nitric acid and 2.0 mL of 30% hydrogen peroxide in a suitable high-pressure-resistant digestion vessel. Prepare as directed in the *Sample solution*, beginning with "Place the closed vessel in a laboratory microwave oven..."

Zero solution: In a 50-mL volumetric flask, introduce 1.0 mL of a 10-mg/mL solution of magnesium nitrate, 1.0 mL of a 100-mg/mL solution of monobasic ammonium phosphate, and 12.0 mL of nickel-free nitric acid. Dilute with water to volume, and mix well.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852))

Mode: Atomic absorption, equipped with a graphite furnace, a background compensation system, and a coated tube resistant to pyrolysis

Analytical wavelength: 232.0 nm

Lamp: Nickel hollow-cathode

Temperature: Maintain the drying temperature of the furnace at 120° for 35 s after a 5-s ramp; maintain the ashing temperature at 1100° for 10 s after a 30-s ramp; maintain the cooling temperature at 800° for 5 s after a 5-s decrease; and maintain the atomization temperature at 2600° for 7 s. [Note—The temperature program may be modified to obtain optimum furnace temperatures.]

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank solution*

Concomitantly determine the absorbances of the *Samples* using the *Instrumental conditions* described above. Use the *Zero solution* to set the instrument to zero. Plot the

absorbances of the *Standard solutions* versus the concentration, in $\mu\text{g/mL}$, of nickel, and draw the straight line best fitting the plotted points. From the graph so obtained, determine the concentration, C_T , in $\mu\text{g/mL}$, of nickel in the *Sample solution*, and determine the concentration, C_B , in $\mu\text{g/mL}$, of nickel in the *Blank solution*. If necessary, dilute with the *Zero solution* to obtain a reading within the calibrated absorbance range. Calculate the quantity, in μg , of nickel in each g of Polyoxyl 40 Hydrogenated Castor Oil taken:

$$\text{Result} = V \times [(C_T - C_B) / W]$$

V = volume of the *Sample solution* and the *Blank solution*, 25 mL

C_T = concentration of nickel in the *Sample solution* ($\mu\text{g/mL}$)

C_B = concentration of nickel in the *Blank solution* ($\mu\text{g/mL}$)

W = weight of Polyoxyl 40 Hydrogenated Castor Oil taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 20 $\mu\text{g/g}$ ■ 2S (NF34)

SPECIFIC TESTS

- **Congeeing Temperature** (651): 16°–26°
- **Fats and Fixed Oils** (401), *Acid Value*: NMT 2.0

 - USP Methyl 12-Hydroxystearate RS
 - USP Methyl Palmitate RS
 - USP Methyl Stearate RS

■ 2S (NF34)

■ 1 0.5 M sodium methoxide in methanol is available from Sigma-Aldrich (www.sigmaaldrich.com), product #403067. Any other equivalent reagent can be used as well. ■ 2S (NF34)

BRIEFING

Polyvinyl Acetate Dispersion, *NF 33* page 6831. As part of the *USP* monograph modernization effort, and on the basis of comments and data received, it is proposed to make the following changes:

1. Add the test title for *Identification* test A.
2. For *Identification* test B, add a reference to *Infrared Absorption* (197).
3. Change the *Assay* procedure which uses a calculation for the percentage content of polyvinyl acetate based on saponification value to a calculation for the percentage content of polyvinyl acetate based on ester value.
4. In the test for *Limit of Acetic Acid/Acetate*, the improved HPLC procedure is based on analyses performed using the Aquasil C18 brand of column that contains 5- μ m packing L1. The typical retention times for malonic acid and acetic acid are 5.3 and 6.1 min, respectively.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Comment deadline: November 30, 2015

Polyvinyl Acetate Dispersion

DEFINITION

Dispersion of polyvinyl acetate in water. It contains 25.0% to 30.0% of polyvinyl acetate. It may contain suitable surface active agents and stabilizers.

IDENTIFICATION

Change to read:

- A.

- **Film Formation:** ■ 2S (NF34)

Place one drop of Dispersion on a glass plate and allow to dry. A clear and homogeneous film is formed.

Change to read:

- B. Infrared Absorption

- (See *Spectrophotometric Identification Tests* (197), *Infrared Absorption*.)

- 2S (NF34)

Analysis: Place one drop of the Dispersion on a glass plate, and cover the test substance with a water-resistant crystal disk (silver chloride or KRS-5).¹ Gently press on, and then remove the crystal disk. Dry the crystal disk in a drying chamber until a homogeneous film is formed.

Acceptance criteria: The IR absorption spectrum of the film so formed exhibits maxima corresponding to the same wavelengths as those of a similar preparation of USP Polyvinyl

Acetate Dispersion RS treated in the same manner.

ASSAY

Change to read:

• Procedure

■ **Sample 1:** 10 g of Dispersion

Solvent: 50 mL of a mixture of equal volumes of *alcohol* and *petroleum ether* with a 100°–120° boiling range, which is previously neutralized with 0.1 N potassium hydroxide or 0.1 N sodium hydroxide

Analysis 1: Dissolve *Sample 1* in the *Solvent*. Add 0.5 mL of *phenolphthalein TS*, and titrate with 0.1 N potassium hydroxide or 0.1 N sodium hydroxide until the pink color persists for at least 15 s.

Calculate the acid value, I_A :

$$\text{Result} = (M_{r1} \times V \times N) / W$$

M_{r1} = molecular weight of potassium hydroxide, 56.11

V = volume of 0.1 N potassium hydroxide or 0.1 N sodium hydroxide consumed in the actual test (mL)

N = exact normality of the potassium hydroxide solution or sodium hydroxide solution

W = weight of Dispersion taken for the test (g)

■ 2S (NF34)

Sample

■ **2:** ■ 2S (NF34)

1.5 g of Dispersion

Analysis

■ **2:** ■ 2S (NF34)

Transfer *Sample*

■ **2:** ■ 2S (NF34)

to a 250-mL borosilicate glass flask fitted with a reflux condenser. Add 25.0 mL of 0.5 M *alcoholic potassium hydroxide* and a few glass beads. Attach the condenser and heat under reflux for 30 min. Add 1 mL of *phenolphthalein TS*, and titrate immediately (while still hot) with 0.5 N hydrochloric acid VS. Perform a blank determination under the same conditions (see *Titrimetry* (541), *Residual Titrations*.)

Calculate the saponification value, I_S :

$$\text{Result} = [M_{r1} \times (V_B - V_T) \times N] / W$$

M_{r1} = molecular weight of potassium hydroxide, 56.11

V_B = volume of 0.5 N hydrochloric acid consumed in the blank test (mL)

V_T = volume of 0.5 N hydrochloric acid consumed in the actual test (mL)

N = exact normality of the hydrochloric acid

W = weight of Dispersion taken for the test (g)

Calculate the percentage content of polyvinyl acetate in the portion of Dispersion taken:

$$\text{Result} = F \times (M_{r2} \times I_S / M_{r1}) \times 100$$

$$\text{Result} = F \times \{M_{r2} \times [(I_S - I_A) / M_{r1}]\} \times 100 \quad \text{2S (NF34)}$$

F = factor converting mg to g, 10^{-3} g/mg

M_{r2} = molecular weight of vinyl acetate, 86.09

I_S = saponification value

I_A = acid value 2S (NF34)

M_{r1} = molecular weight of potassium hydroxide, 56.11

Acceptance criteria: The content of polyvinyl acetate is 25.0%–30.0%.

OTHER COMPONENTS

Stabilizers or Surface Active Agents

- **Povidone**

[Note—Perform this test only if the Dispersion contains povidone.]

Sample: 0.25 g

Analysis: Perform nitrogen determination by sulfuric acid digestion on the *Sample* as directed in *Nitrogen Determination* (461), *Method II*.

Calculate the percentage content of povidone in the portion of Dispersion taken:

$$\text{Result} = N/N_V$$

N = percentage content of nitrogen

N_V = percentage content, expressed as a decimal number, of nitrogen in vinylpyrrolidone, 0.126

Acceptance criteria: The content of povidone is NMT 4.0%.

IMPURITIES

- **Residue on Ignition** (281)

Sample: 1.0 g of Dispersion

Analysis: Heat a silica crucible to redness for 30 min, allow to cool in a desiccator, and weigh. Evenly distribute the *Sample* in the crucible and weigh. Dry the crucible at 100° – 105° for 1 h and ignite in a muffle furnace at $600 \pm 25^{\circ}$, until the test substance is thoroughly charred. Continue the experiment as directed in *Residue on Ignition* (281) on the residue obtained, beginning with "Moisten the sample with a small amount (usually 1 mL) of sulfuric acid..."

Acceptance criteria: NMT 0.5%

- **Limit of Vinyl Acetate**

Solution A: *Acetonitrile*, *methanol*, and water (5:5:90)

Solution B: *Acetonitrile*, *methanol*, and water (45:5:50)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
2	100	0
40	85	15
42	0	100
48	0	100
51	100	0

Standard solution: Transfer 50 mg of *vinyl acetate* to a 100-mL volumetric flask, dissolve in and dilute with *methanol* to volume, and mix well. Dilute 5.0 mL of the solution with *Solution A* to 100 mL. Dilute 10.0 mL of this solution with *Solution A* to 100 mL. The *Standard solution* contains about 2.5 µg/mL of vinyl acetate. [Note—This solution should be analyzed within 1 h when stored at room temperature.]

System suitability solution: Transfer 50 mg of *vinyl acetate* and 50 mg of *1-vinylpyrrolidin-2-one* to a 50-mL volumetric flask, add 10 mL of *methanol*, sonicate or gently shake the flask to dissolve the materials. Dilute with *Solution A* to volume. Dilute 10 mL of this solution with *Solution A* to 100 mL. Dilute 5 mL of this solution with *Solution A* to 100 mL. The *System suitability solution* contains about 5 µg/mL each of vinyl acetate and 1-vinylpyrrolidin-2-one.

Sample solution: Transfer 250 mg of Dispersion to a 10-mL volumetric flask, add about 4 mL of *methanol*, and sonicate. After cooling to ambient temperature, dilute with water to volume, and mix. Centrifuge at 4000 ×g for 10 min, and pass through a 0.2-µm membrane filter. [Note—This solution should be analyzed within 1 h when stored at room temperature.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Columns

Precolumn: 4.0-mm × 3-cm; 5-µm packing *L1* may be used if a matrix effect is observed. [Note—The matrix effect may result in poor reproducibility of the retention times and of the peak shapes.]

Analytical: 4.0-mm × 25-cm; 5-µm packing *L1*

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Sample: *System suitability solution*

[Note—The relative retention times for vinyl acetate and 1-vinylpyrrolidin-2-one are 1.0 and 1.2, respectively.]

Suitability requirements

Resolution: NLT 5.0 between vinyl acetate and 1-vinylpyrrolidin-2-one

Relative standard deviation: NMT 5.0% determined from the 1-vinylpyrrolidin-2-one peak

Analysis

Samples: *Standard solution* and *Sample solution*

Acceptance criteria: The response of the vinyl acetate peak from the *Sample solution* is NMT that of the vinyl acetate peak from the *Standard solution*, corresponding to NMT 100 ppm of vinyl acetate.

Change to read:

• **Limit of Acetic Acid/Acetate**

Mobile phase: ~~5 mM sulfuric acid~~

Standard solution: ~~0.3 mg/mL for each of acetic acid and citric acid in *Mobile phase*~~

Sample solution: ~~Transfer 200 mg of the Dispersion to a 10-mL volumetric flask, add about 8 mL of water, and sonicate for about 10 min. Cool to ambient temperature, and dilute with water to volume.~~

Chromatographic system

~~(See *Chromatography* (621), *System Suitability*.)~~

Mode: ~~LC~~

Detector: ~~UV 205 nm~~

Column: ~~4.6 mm × 25 cm; 5-µm packing L1~~

Column clean: ~~After each injection, rinse the column with a mixture of equal volumes of *Mobile phase* and acetonitrile.~~

Column temperature: ~~Ambient~~

Flow rate: ~~1 mL/min~~

Injection size: ~~20 µL~~

System suitability

Sample: ~~*Standard solution*~~

~~[Note—The relative retention times for acetic acid and citric acid are 1.0 and 1.2, respectively.]~~

Suitability requirements

Resolution: ~~NLT 2.0 between acetic acid and citric acid~~

Relative standard deviation: ~~NMT 5.0% determined from the acetic acid peak~~

Analysis

Samples: ~~*Standard solution* and *Sample solution*~~

Acceptance criteria: ~~The response of the acetic acid peak from the *Sample solution* is NMT that of the acetic acid peak from the *Standard solution*, corresponding to NMT 1.5% of acetic acid.~~

▪ **Solution A:** 5 mM sulfuric acid

Solution B: Acetonitrile and 5 mM sulfuric acid (1:1)

Mobile phase: See *Table 2*.

TABLE 2

Time (min)	Solution A (%)	Solution B (%)
0	100	0
10	100	0
10.5	0	100
20	0	100
20.5	100	0
30	100	0

System suitability solution: Transfer 30 mg of *glacial acetic acid* and 30 mg of malonic acid to a 25-mL volumetric flask, dilute with *methanol* to volume, and mix well. Transfer 1 mL of the solution to a 25-mL flask, dilute with water to volume, and mix well. The solution contains 0.048 mg/mL each of acetic acid and malonic acid.

Standard solution: 0.1 mg/mL of acetic acid in water

Sample solution: Transfer 330 mg of Dispersion to a 50-mL volumetric flask, add about 5 mL of *methanol*, and dilute with water to volume which leads to a precipitation of sample. Pass the dispersion through a 0.2- μ m regenerated cellulose membrane filter.²

■ ■2S (NF34)

Use the filtrate.

Column temperature: 25°

Flow rate: 1 mL/min

Injection volume: 20 μ L

Run time: 30 min

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for malonic acid and acetic acid are 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between malonic acid and acetic acid, *System suitability solution*

Relative standard deviation: NMT 5.0% determined from the acetic acid peak, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of acetic acid in the portion of Dispersion taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of acetic acid from the *Sample solution*

r_S = peak response of acetic acid from the *Standard solution*

C_S = concentration of acetic acid in the *Standard solution* (mg/mL)

C_U = concentration of Polyvinyl Acetate Dispersion in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 1.5% of acetic acid ■_{2S} (NF34)

SPECIFIC TESTS

- **Microbial Enumeration Tests** (61) and **Tests for Specified Microorganisms** (62): The total aerobic microbial count is NMT 1000 cfu/g, and the total combined molds and yeasts count is NMT 100 cfu/g.
- **pH** (791): 3.0–5.5
- **Loss on Drying** (731)
 - Sample:** 1.0 g of Dispersion
 - Analysis:** Dry the *Sample* at 110° for 5 h.
 - Acceptance criteria:** 68.5%–71.5%
- **Coagulum Content**
 - Sample:** 100 g of Dispersion
 - Analysis:** Accurately weigh a stainless steel sieve with 45- μ m openings or a suitable single-woven wire cloth with a mesh width of 45 μ m, and filter the *Sample* through it. [Note—Suitable single-woven wire cloth mesh meets the requirements set in ISO 9044.] Wash the sieve or the cloth with distilled water until a clear filtrate is obtained, and dry the sieve or the cloth to constant weight at 100°–105°.
 - Acceptance criteria:** The weight of the residue is NMT 500 mg (0.5%).

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers at a temperature below 25°. Protect from freezing.
- **Labeling:** Label it to indicate the names and quantities of any added surface active agents and stabilizers.
- **USP Reference Standards** (11)
USP Polyvinyl Acetate Dispersion RS

Comment deadline: November 30, 2015

Sodium Cetostearyl Sulfate**DEFINITION**

Sodium Cetostearyl Sulfate is a mixture of sodium cetyl sulfate and sodium stearyl sulfate. It contains NLT 40.0% of sodium cetyl sulfate ($C_{16}H_{33}NaSO_4$), and the sum of the sodium cetyl sulfate content and sodium stearyl sulfate ($C_{18}H_{37}NaSO_4$) content is NLT 90.0% (both contents calculated on the anhydrous basis). It may contain a suitable buffer.

IDENTIFICATION

- **A.** The retention times of the two major peaks of *Sample solution C* correspond to those of

Chromatographic system*(See Chromatography (621), System Suitability.)***Mode:** GC**Detector:** Flame ionization**Column:** 0.25-mm × 25-m fused silica capillary; phase G2**Temperatures****Injection port:** 250°**Detector:** 250°**Column:** See Table 1.**Table 1**

150	5	250	Duration of analysis

Carrier gas: Nitrogen**Flow rate:** 1 mL/min**Injection volume:** 1 µL**Injection type:** Split ratio 100:1**System suitability****Sample:** *System suitability solution***Suitability requirements****Resolution:** NLT 4.0 between cetyl alcohol and stearyl alcohol**Relative standard deviation:** NMT 1.5%**Analysis**

Correction for interference: Inject *Sample solution A* and *Sample solution B* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. If *Sample solution B* shows a peak at the same retention time as the internal standard peak of *Sample solution A*, calculate the ratio, *R*:

$$R = S_{CB}/S_I$$

S_{CB} = peak response of cetyl alcohol from *Sample solution B*

S_I = peak response with the same retention time as the internal standard of *Sample solution B*

If *R* is less than 300, calculate the corrected area, $S_{A(corr)}$, of the peak corresponding to the internal standard of *Sample solution A*:

$$S_{A(corr)} = S_{HA} - (S_I \times S_{CA}/S_{CB})$$

S_{HA} = peak response of the internal standard from *Sample solution A*

S_I = peak response with the same retention time as the internal standard of *Sample solution B*

S_{CA} = peak response of cetyl alcohol from *Sample solution A*

S_{CB} = peak response of cetyl alcohol from *Sample solution B*

Inject *Sample solution C* and *Sample solution D* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Carry out the *Correction for interference* in the same manner as for *Sample solution A*, and calculate the corrected area of the peak corresponding to the internal standard of *Sample solution C*, $S_{C(corr)}$.

Samples: *System suitability solution*, *Sample solution C*, and *Sample solution D*

[Note—The substances are eluted in the following order: cetyl alcohol, 1-heptadecanol (internal standard), and stearyl alcohol. Identify the cetyl alcohol and stearyl alcohol peaks in the chromatograms of the *Sample solutions* by comparison with the *System suitability solution*.]

Calculate the percentage of sodium cetyl sulfate ($C_{16}H_{33}NaSO_4$) in the portion of Sodium Cetostearyl Sulfate taken:

$$\text{Result} = (r_C \times W_{CH}) / (S_{C(corr)} \times W_C) \times F \times 100$$

r_C = peak response of cetyl alcohol from *Sample solution C*

W_{CH} = weight of the internal standard added in the preparation of *Sample solution C* (mg)

$S_{C(corr)}$ = corrected area of the peak corresponding to the internal standard of *Sample solution C*

W_C = weight of Sodium Cetostearyl Sulfate taken to prepare *Sample solution C*, calculated on the anhydrous basis (mg)

F = correction factor, 1.421

Calculate the percentage of sodium stearyl sulfate ($C_{18}H_{37}NaSO_4$) in the portion of Sodium Cetostearyl Sulfate taken:

$$\text{Result} = (B_C \times W_{CH}) / (S_{C(corr)} \times W_C) \times F \times 100$$

B_C = peak response of stearyl alcohol from *Sample solution C*

W_{CH} = weight of the internal standard added in the preparation of *Sample solution C* (mg)

$S_{C(corr)}$ = corrected area of the peak corresponding to the internal standard of *Sample solution C*

W_C = weight of Sodium Cetostearyl Sulfate taken to prepare *Sample solution C*, calculated on the anhydrous basis (mg)

F = correction factor, 1.377

Acceptance criteria

Sodium cetyl sulfate: NLT 40.0% on the anhydrous basis

Sum of sodium cetyl sulfate and sodium stearyl sulfate: NLT 90.0% on the anhydrous basis

IMPURITIES

- **Limit of Sodium Chloride and Sodium Sulfate**

Sodium chloride**Sample:** 5 g**Titrimetric system****Mode:** Direct titration**Titrant:** 0.1 N silver nitrate VS**Endpoint detection:** Potentiometric

Analysis: Dissolve the *Sample* in 50 mL of water, and add *diluted nitric acid* dropwise until the solution is neutral to blue litmus paper. To the resulting solution add 1 mL of *potassium chromate TS* and titrate with *Titrant*.

Calculate the percentage of sodium chloride (NaCl) in the portion of Sodium Cetostearyl Sulfate taken:

$$\text{Result} = (V \times N) / W \times F$$

V = volume of the *Titrant* (mL)

N = actual normality of the *Titrant*

W = weight of Sodium Cetostearyl Sulfate (g)

F = equivalence factor for sodium chloride, 5.844

Sodium sulfate

Dichloroacetic acid solution: Dilute 67 mL of *dichloroacetic acid* with water to 300 mL, and neutralize to blue litmus paper using *ammonia TS*. Cool, add 33 mL of *dichloroacetic acid*, and dilute with water to 600 mL.

Sample: 0.5 g**Titrimetric system****Mode:** Direct titration**Titrant:** 0.01 M lead nitrate VS**Endpoint detection:** Potentiometric

Analysis: Dissolve the *Sample* in 20 mL of water, warming gently if necessary, and add 1 mL of a solution containing 0.5 g/L of *dithizone* in *acetone*. If the solution is red, add 1 mL *nitric acid* dropwise until a bluish-green color is obtained. To the resulting solution add 2.0 mL of *Dichloroacetic acid solution* and 80 mL of *acetone*, and titrate with *Titrant* until a persistent orange-red color is obtained.

Calculate the percentage of sodium sulfate (Na₂SO₄) in the portion of Sodium Cetostearyl Sulfate taken:

$$\text{Result} = (V \times M) / W \times F$$

V = volume of *Titrant* (mL)

M = actual molarity of *Titrant*

W = weight of Sodium Cetostearyl Sulfate (g)

F = equivalence factor for sodium sulfate, 14.20

Acceptance criteria: The sum of the percentages of sodium chloride and sodium sulfate is NMT 8.0%.

Change to read:

- **Limit of Free Cetostearyl Alcohol**

Analysis: Examine the chromatogram of *Sample solution A*, obtained as directed in the *Assay*.

Calculate the percentage of free cetostearyl alcohol in the portion of Sodium Cetostearyl Sulfate taken:

$$\bullet \text{Result} = 100(r_A + r_B) \times W_{IS} / (S_{A(\text{corr})} \times W) \bullet (\text{ERR 1-Jun-2015})$$

- r_A = peak response of the cetyl alcohol peak from *Sample solution A*
 r_B = peak response of stearyl alcohol from *Sample solution A*
 W_{IS} = weight of the internal standard added in the preparation of *Sample solution A* (mg)
 $\bullet S_{A(\text{corr})} \bullet (\text{ERR 1-Jun-2015})$ = corrected peak area corresponding to the internal standard of *Sample solution A* (see *Assay*)
 W = weight of Sodium Cetostearyl Sulfate taken to prepare *Sample solution A* (mg)

Acceptance criteria: NMT 4.0%

SPECIFIC TESTS

- **Acidity or Alkalinity**

Sample: 500 mg

Analysis: Dissolve the *Sample* by heating in a mixture of 10 mL of water and 15 mL of 90% alcohol. Add 0.1 mL of phenolphthalein TS.

Acceptance criteria: The resulting solution is colorless. Add 0.1 mL of 0.1 N sodium hydroxide, and the resulting solution becomes red.

- **Water Determination** (921), *Method I*: NMT 1.5%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers. No storage requirements specified.
- **Labeling:** Label it to indicate the name and concentration of any added buffer.
- **USP Reference Standards** (11)

Tailing factor: 0.8–2.0, *Standard solution*

Relative standard deviation: NMT 0.5%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of sodium succinate ($C_4H_4Na_2O_4$) in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Anhydrous Sodium Succinate RS in the *Standard solution* (mg/mL)

C_U = concentration of Anhydrous Sodium Succinate or Sodium Succinate Hexahydrate in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0%

IMPURITIES

• Limit of Sodium Acetate, Sodium Maleate, and Sodium Fumarate

Solution A, Mobile phase, Diluent, and Chromatographic system: Proceed as directed in the *Assay*.

Acetic acid stock solution: Transfer 37.5 mg of USP Glacial Acetic Acid RS to a 25-mL volumetric flask that contains 10 mL of *Diluent*. Dissolve and dilute with *Diluent* to volume. Transfer 1.0 mL of this solution to a 10-mL volumetric flask and dilute with *Diluent* to volume. This solution is equivalent to 200 µg/mL of sodium acetate in *Diluent*.

Maleic acid stock solution: Transfer 36.5 mg of USP Maleic Acid RS to a 50-mL volumetric flask. Dissolve and dilute with *Diluent* to volume. Transfer 1.0 mL of this solution to a 10-mL volumetric flask and dilute with *Diluent* to volume. This solution is equivalent to 100 µg/mL of sodium maleate in *Diluent*.

Fumaric acid stock solution: Transfer 36.5 mg of USP Fumaric Acid RS to a 50-mL volumetric flask. Dissolve and dilute with *Diluent* to volume. Transfer 1.0 mL of this solution to a 10-mL volumetric flask and dilute with *Diluent* to volume. This solution is equivalent to 100 µg/mL of sodium fumarate in *Diluent*.

System suitability solution: 10 mg/mL of USP Anhydrous Sodium Succinate RS, 15 µg/mL of USP Glacial Acetic Acid RS, and 7.3 µg/mL each of USP Maleic Acid RS and USP Fumaric Acid RS in *Diluent*. Dry USP Anhydrous Sodium Succinate RS at 120° for 2 h before use.

Standard solution: Transfer 1 mL each of *Acetic acid stock solution*, *Maleic acid stock solution*, and *Fumaric acid stock solution* to a 10-mL volumetric flask and dilute with *Diluent* to volume.

Sample solution: 10 mg/mL of Anhydrous Sodium Succinate or Sodium Succinate Hexahydrate in *Diluent*

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for acetic acid, maleic acid, succinic acid, and fumaric acid are 0.7, 0.8, 1.0, and 1.2, respectively]

Suitability requirements

Resolution: NLT 1.5 between acetic acid and maleic acid; NLT 2.0 between succinic acid and fumaric acid, *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Based on the *Standard solution*, identify the peaks of acetic acid, maleic acid, and fumaric acid. Compare peak areas of acetic acid, maleic acid, and fumaric acid in the *Standard solution* and the *Sample solution*.

Acceptance criteria

Sodium acetate: The peak area of acetic acid in the *Sample solution* is NMT the peak area of acetic acid in the *Standard solution*, corresponding to NMT 0.2% of sodium acetate in Sodium Succinate.

Sodium maleate: The peak area of maleic acid in the *Sample solution* is NMT the peak area of maleic acid in the *Standard solution*, corresponding to NMT 0.1% of sodium maleate in Sodium Succinate.

Sodium fumarate: The peak area of fumaric acid in the *Sample solution* is NMT the peak area of fumaric acid in the *Standard solution*, corresponding to NMT 0.1% of sodium fumarate in Sodium Succinate.

• Limit of Sulfate

Standard solution: 0.4 mL of 0.005 mol/L sulfuric acid

Sample solution: Dissolve 1.0 g of Anhydrous Sodium Succinate or Sodium Succinate Hexahydrate in 30 mL of water and neutralize with a diluted hydrochloric acid (1 in 40).

Analysis: Proceed as directed in *Chloride and Sulfate* (221), *Sulfate*.

Acceptance criteria: NMT 0.019% as SO_4

SPECIFIC TESTS

• Acidity and Alkalinity

Sample solution: Dissolve 1.0 g of Anhydrous Sodium Succinate or Sodium Succinate Hexahydrate in carbon dioxide-free water and dilute with water to 20 mL.

Analysis: Proceed as directed in *pH* (791).

Acceptance criteria: 7.0–9.0

• Loss on Drying (731)

Analysis: Proceed as directed in *Loss on Drying* (731). Dry at 120° for 2 h.

Acceptance criteria

Anhydrous Sodium Succinate: NMT 2.0%

Sodium Succinate Hexahydrate: 37.0%–41.0%

ADDITIONAL REQUIREMENTS

• **Packaging and Storage:** Preserve in tight containers. Store at room temperature.

• **Labeling:** Label it to state, as part of the official title, anhydrous or hexahydrate for sodium succinate.

• **USP Reference Standards** (11)

USP Anhydrous Sodium Succinate RS

USP Fumaric Acid RS

BRIEFING

Carnauba Wax, *NF 33* page 6949. As part of the USP monograph modernization effort and on the basis of comments and data received, it is proposed to add an infrared *Identification* test because the current *NF* monograph lacks an *Identification* test.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(EXC2: J. Liu.)

Correspondence Number—C125488

Comment deadline: November 30, 2015

Carnauba Wax**DEFINITION**

Carnauba Wax is obtained from the leaves of *Copernicia cerifera* Mart. (Fam. Palmae).

IDENTIFICATION**Add the following:**

- **A. Infrared Absorption** (197F) or (197A) ■ 2S (NF34)

IMPURITIES

- **Residue on Ignition** (281)

Sample: 2 g

Analysis: Heat the *Sample* in an open porcelain or platinum dish over a flame; it volatilizes without emitting an acrid odor. Ignite.

Acceptance criteria: The weight of the residue is NMT 5 mg, corresponding to NMT 0.25%.

Delete the following:

- ~~**Heavy Metals**, Method II (231): 20 ppm~~ (Official 1-Dec-2015)

SPECIFIC TESTS

- **Melting Range or Temperature** (741), *Procedure for Class II:* 80°–86°

- **Acid Value**

Sample: 3 g

Analysis: Weigh the *Sample* into a 250-mL flask attached to a reflux condenser. Add 50 mL of a mixture of isopropyl alcohol and toluene (5:4), and boil gently until the wax is completely dissolved. Remove the flask from the condenser, add 1 mL of *phenolphthalein TS*, and immediately titrate with 0.5 N alcoholic potassium hydroxide VS to a faint, reddish-yellow color. [Note—Do not allow the solution to cool. Titrate at warm temperature after refluxing.]

Calculate the acid value as the number of mg of potassium hydroxide required to neutralize the free acids in 1 g of Carnauba Wax.

Acceptance criteria: 2–7

- **Fats and Fixed Oils** (401), *Saponification Value*

Sample: Use the solution from the test for *Acid Value*.

Analysis: To the *Sample* add 15.0 mL of 0.5 N alcoholic potassium hydroxide VS, reflux for 3 h, and titrate the excess alkali with 0.5 N hydrochloric acid VS to a yellow-amber color. Perform a blank determination (see *Titrimetry* (541), *Residual Titrations*).

Calculate the ester value. The saponification value is the sum of the ester value and the acid value.

Acceptance criteria: 78–95

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers.

Stage 4 Harmonization

This section contains monographs or chapters undergoing harmonization by the Pharmacopeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization consists of several steps (**Stages 1** through **7**, as defined below). Stage 4 drafts are available for comments. Below are descriptions of the developmental Stages as defined by the United States Pharmacopeia, the European Pharmacopoeia, and the Japanese Pharmacopoeia.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

BRIEFING

(644) **Conductivity of Solutions.** The United States Pharmacopoeia is the coordinating pharmacopeia for the international harmonization of the compendial standards for *Conductivity of Solutions* (644), as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopeias. The following document, which represents the revised OFFICIAL INQUIRY STAGE 4 document, is based in part on comments from the *Japanese Pharmacopoeia* and the *European Pharmacopoeia*. There is a growing use of electrical conductivity measurements of fluids in pharmaceutical processes, and there is a void in the *USP* general chapters on information regarding the use of this analytical tool. This is a harmonized chapter within the Pharmacopeial Discussion Group and it is ready for public comments in the three pharmacopeias.

(GCCA: A. Hernandez-Cardoso.)

Comment deadline: November 30, 2015

Add the following:

(644) CONDUCTIVITY OF SOLUTIONS

INTRODUCTION

This chapter provides information on how to apply electrical conductivity measurements (hereafter referred to as “conductivity”) of fluid solutions, including pure fluids. ♦This chapter does not replace the official *Water Conductivity* (645) procedure, which is used to ensure the ionic purity of compendial waters such as *Water for Injection*, *Purified Water*, *Pure Steam condensate*, and *Sterile Water for Injection*, among others. ♦This chapter is intended for other fluid applications when conductivity is used to measure, monitor, or control chemical dispensing, chemical purity, ionic concentration, and other applications where the ionic character of the fluid needs to be known or controlled.

Applications include, but are not limited to, solutions that may be used in clean-in-place, chromatography detection, ionic solution preparations, end point detection, dosing, fermentation, and buffer production. In some cases, conductivity measurements can be extended to pure organic fluids such as alcohols and glycols where a weak conductivity signal exists, and the signal can be significantly increased if the organics become contaminated with water or salts. ♦[Note—For additional background information, see *Theory and Practice of Electrical Conductivity Measurements of Solutions* (1644).] ♦

Conductivity is the measurement of the ability of a fluid to conduct electricity via its chemical ions. The ability of any ion to electrically conduct is directly related to its ion mobility. Conductivity is directly proportional to the concentrations of ions in the fluid, according to *Equation 1*:

$$\kappa = 1000 \sum_{\substack{\text{all} \\ \text{ions} \\ i}} C_i \lambda_i \quad [1]$$

κ = conductivity (S/cm)

C_i = concentration of chemical ion i (mol/L)

λ_i = specific molar conductance of ion i (S·cm²/mol)

Although the SI unit S/m is the appropriate SI unit for conductivity, historically the unit S/cm has been selected by industry as the accepted unit.

On the basis of *Equation 1*, conductivity is not ion selective because it responds to all ions. Furthermore, the specific molar conductance of each ion is different. As a result, unless the percentage composition of ions of the solution is limited and known, the precise concentrations of ionic species cannot be determined from conductivity measurements. However, for examples such as a solution of a single salt or acid or base, such as a caustic solution used in cleaning, the precise concentration can be directly determined. Despite the lack of ionic specificity, conductivity is a valuable laboratory and process tool for measurement and control of total ionic content because it is proportional to the sum of the concentrations of all ionic species (anions and cations) as described in *Equation 1*. Conductivity measurements cannot be applied to solids or gases, but they can be applied to the condensate of gases.

Another variable that influences conductivity measurements is the fluid temperature. As the fluid temperature increases, the ion conductance increases, making this physicochemical phenomenon the predominant reason for the temperature-compensation requirement when testing conductive fluids.

The conductivity, κ , is proportional to the conductance, K (S), of a fluid between two electrodes (*Equation 2*):

$$\kappa = K \times \left(\frac{d}{A} \right) = K \times \theta \quad [2]$$

κ = conductivity (S/cm)

K = conductance (S)

d = distance between the electrodes (cm)

A = area of the conducting electrodes (cm²)

θ = cell constant (cm⁻¹), which also equals the ratio of d/A

The resistivity ρ (Ω -cm) of the fluid is, by definition, the reciprocal of the conductivity (*Equation 3*):

$$\rho = \frac{1}{\kappa} = \frac{1}{K \times \theta} = \frac{R}{\theta} \quad [3]$$

ρ = resistivity (Ω -cm)

κ = conductivity (S/cm)

K = conductance (S)

θ = cell constant (cm^{-1})

R = resistance (Ω), which is the reciprocal of the conductance, K

APPARATUS

An electrical conductivity measurement consists of the determination of resistance of the fluid between and around the electrodes of the conductivity sensor. To achieve this measurement, the primary instrumentation is the resistance-measuring circuit and the conductivity sensor, and they are usually connected by a cable when the sensor and the user interface are separated.

The resistance measurement is made by applying an alternating current (AC, meaning the flow of electric charge periodically reverses direction) voltage (or current) to the electrodes, measuring the current (or voltage), and calculating the resistance according to Ohm's Law. The alternating source is used to prevent the polarization (collection of ions) at the electrodes. The measuring frequency of the AC signal adjusts automatically according to the measuring conditions of the instrument, and there may be multiple resistance-measuring circuits embedded in the measuring system. The resistance-measurement circuit may be embedded in the transmitter or in the sensor.

The conductivity sensor consists of at least two electrical conductors of a fixed size and geometry, separated by an electrical insulator. The electrodes, insulator, and any other wetted materials should be constructed of materials that are unreactive to fluids with which they may come into contact. Also, the sensor construction should withstand the environmental conditions (process or ambient temperature, pressure, cleaning applications) that it would be subjected to.

Most conductivity sensors have temperature devices such as a platinum resistance temperature device (RTD) or negative temperature coefficient (NTC) thermistor embedded inside the sensor, although external temperature measurement is possible. The purpose of the temperature measurement is for temperature compensation of the conductivity measurement.

CELL CONSTANT DETERMINATION

The purpose of the sensor's cell constant is to normalize the conductance (or resistance) measurement for the geometrical construction of the two electrodes.

The cell constant is determined by immersing the conductivity sensor in a solution of known conductivity. Solutions of known conductivity can be obtained by 1) preparation of specific mixtures according to national authoritative sources, 2) procurement of commercially available

certified and traceable standard solutions, or 3) comparison to other reference conductivity measuring systems. These mixtures or certified solutions can range from 5 to 200,000 $\mu\text{S}/\text{cm}$, depending on the level of accuracy desired. [Note—Conductivity measurements are not perfectly linear with concentration. Dilution of a reference solution by x-fold does not imply that the conductivity of that diluted fluid is x-fold less. Negative deviations from linearity range from 5% to 10% for commonly used reference solutions.]

The measured cell constant of the conductivity sensor must be within 5% of the value indicated by the sensor certificate.

Modern conductivity sensors normally do not change their cell constant over their lifetime. If a change of the cell constant is detected during calibration, a cleaning of the sensor is appropriate according to the manufacturer's recommendations. Following that, the calibration procedure should be repeated. Sometimes "memory effects" appear, particularly when changing from high to low concentrations if the sensor is not well flushed.

TEMPERATURE COMPENSATION

Because the conductivity of a fluid is temperature dependent, temperature compensation of the conductivity measurement is normally necessary. An appropriate temperature compensation algorithm will ensure that changes in the conductivity measurement can be ascribed to concentration changes and not temperature changes. Conductivity measurements are normally referenced to 25°. A common form of linear temperature compensation uses *Equation 4*:

$$\kappa_{25} = \frac{\kappa_T}{\left[1 + \alpha(T - 25)\right]} \quad [4]$$

κ_{25} = conductivity compensated to 25°

κ_T = conductivity at T

α = linear temperature compensation factor

T = measured temperature

A value of 0.021 for a temperature coefficient of 2.1% per 1° is commonly used for many salt solutions. Most salt-based solutions have linear compensation factors ranging from 1.9% to 2.2% per 1°. Depending on the application, other values can be used for acids, bases, and other fluids. Another known, nonlinear form of temperature compensation is described in ISO 7888:1985 *Water quality—Determination of electrical conductivity*. Depending on the fluid samples, other forms of temperature compensation may be appropriate. In cases of very low conductivity (<10 $\mu\text{S}/\text{cm}$), such as purified pharmaceutical waters, two compensations need to be made. One is for the intrinsic conductivity of water, and the other is for the other ionic species in water. These compensations are normally combined and embedded in the microprocessor-controlled conductivity measurement systems. This is not supplied in all conductivity measurement technologies.

CALIBRATION OF TEMPERATURE AND MEASUREMENT ELECTRONICS

In addition to verifying the sensor's cell constant, the embedded temperature device (or external temperature device) should be appropriately calibrated for the application to apply the temperature compensation algorithm accurately. The temperature accuracy that is required depends on the criticality of the temperature to the application. An accuracy of $\pm 1^\circ$ typically suffices.

The measurement circuit of the system is fundamentally an AC resistance measuring device. Appropriate verification and/or calibration of the measuring circuit is required. This is accomplished by disconnecting the measuring circuit from the sensor's electrodes, attaching traceable resistors of known value to the measuring circuit, and verifying that the measured resistance agrees with the resistor value to an acceptable level. A typical acceptance criterion for the resistance accuracy is $< 2\%$ of the reading at resistances $> 100 \Omega$, and increasing to 5% at lower resistances. However, the application criticality should ultimately determine the desired accuracy.

For conductivity systems that cannot have the resistance-measuring circuit disconnected from the electrodes, directly adjusting or verifying the circuit accuracy may be difficult, depending on the sensor design. An alternative method of verifying the circuit accuracy can be used by performing a sensor cell constant calibration at two (or more) measurement points for each measuring circuit that is intended to be used.

If verification/calibration of the sensor's cell constant, temperature device, and measuring circuit are done at the same service interval, the measuring circuit should be verified first, the temperature device next, and the cell constant last. Because all of these parameters are typically very stable due to modern electronics and stable sensor construction, frequent calibration (such as daily) is not usually required. Comparison to qualified reference systems is also a proper means of calibration. Calibration cycles range from 6 to 12 months.

CONDUCTIVITY MEASUREMENT OF FLUIDS

For off-line batch measurements, rinse the cleaned sensor with the fluid to be measured. Then immerse the sensor in the fluid to be measured, and record the temperature and the temperature-compensated conductivity as required. Be sure that the position of the sensor in the container does not affect the conductivity measurement, because the container walls can affect the measurement for some electrode designs.

For continuous on-line or at-line measurements, install the cleaned sensor into the pipe, tank, or other containment vessel, and flush, if necessary. Make sure proper installation procedures are applied to prevent bubbles or particles from collecting between the electrodes. Be sure that the position of the sensor in the pipe or tank does not affect the conductivity measurement, because the nearby surfaces can affect the measurement for some electrode designs.

Record the temperature and the temperature-compensated conductivity as required.

For all batch or continuous measurements, ensure that the wetted components of the sensor are compatible with the fluid and the temperature to be measured.

STIMULI TO THE REVISION PROCESS

Stimuli articles do not necessarily reflect the policies of the USPC or the USP Council of Experts

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of Expert Committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues.

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* section. Readers interested in submitting comments should see *Instructions to Authors*.

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously in any language or medium and that they are not simultaneously under consideration by any other publication. All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication they will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention (USPC) and may not be subsequently published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

Style and Usage—*Stimuli* articles generally follow the current *Chicago Manual of Style* except in scientific usage (numbers, abbreviations, etc.). For the latter, authors should use the current *AMA Manual of Style* or the current *ACS Style Guide*. Authors may usefully consult a current edition of *Pharmacopeial Forum*.

References—Consult the current *AMA Manual of Style*, which is generally consistent with the National Library of Medicine's *Recommended Formats for Bibliographic Citation*. A current edition of *Pharmacopeial Forum* will offer examples of reference formats.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Disclosure of Potential Conflicts of Interest—Maintaining independence and impartiality are critical to the integrity and credibility of USP's public health mission. Accordingly, authors are expected to conform to the Conflict of Interest provisions of the USP Code of Ethics (see link below), including as part of their manuscript submission disclosure of all financial and personal relationships that may potentially influence, or be perceived to influence, their article. USP staff are available to provide additional guidance to authors on the range of disclosure that would be appropriate. Although USP *Stimuli* articles are not the type of source likely to be relied on as a basis for governmental actions (e.g., not a vehicle for reports of human clinical research), USP nevertheless supports the overall policies of the International Committee of Medical Journal Editors (ICMJE) regarding Uniform Requirements for Manuscripts Submitted to Biomedical Journals and Ethical Considerations in the Conduct and Reporting of Research (links below).
USP Code of Ethics:

<http://www.usp.org/aboutUSP/governance/policies/codeOfEthics.html>

ICMJE Uniform Requirements:

http://www.icmje.org/urm_main.html

ICMJE Conflicts of Interest:

<http://www.icmje.org/conflicts-of-interest/>

Contact Person—USP will designate a Scientific Liaison in the Documentary Standards Division as the corresponding author. This ensures that USP receives all comments generated by the *Stimuli* article. Authors should contact the Scientific Liaison if they would like to receive copies of comments generated by their *Stimuli* articles.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

An Evaluation of the Indifference Zone of the USP (905) Content Uniformity Test¹

Dennis Sandell,^{a,b} Greg Lerner,^{a,c} James Bergum,^{a,d} Walter Hauck,^{a,e} Jeffrey Hofer,^{a,f} William Brown,^{g,h} Horacio Pappa^g

ABSTRACT The indifference zone, in the test for *Uniformity of Dosage Units* (905), was questioned in a recent *Stimuli* article (*PF* 37(1) [Jan.–Feb. 2011]) in which the authors found that the current test rewards batches with an off-target mean. In this *Stimuli* article, this potential issue is reviewed. This article demonstrates that the monograph potency requirement implicitly ensures that the potential issue cannot occur in practice, because an off-target batch will fail potency. On the basis of the investigations performed, and considering the difficulties involved in modifying the harmonized (905) test, we recommend retaining the current test in the chapter as-is.

INTRODUCTION

The current method for confirming content uniformity in *Uniformity of Dosage Units* (905) (1) continues to attract interest and inspires research and the possibility for improvement. The extension of (905) to applications where large sample sizes (>30) are collected is currently in debate, and several proposals on this subject have been published (2–5). Additionally, the *European Pharmacopoeia* (*Ph Eur*) has published a chapter on this subject (6). USP has established a “Content Uniformity with Large Sample Sizes Expert Panel” (CULSS EP) to develop a new chapter on statistical analysis and acceptance criteria (“Large N test”) when assessing content uniformity in sample sizes larger than those called for in the (905) test. Another task of the CULSS EP is to address a characteristic of the current (905) that was described in a *Stimuli* article in *PF* 37(1) [Jan.–Feb. 2011] (7). That article demonstrated that the indifference zone (IDZ; see below for a description of this element of the test) of (905) introduces a deviation that, for a given coverage, benefits batches with significantly off-target mean. Shen and Tsong (7) describe this deviation as a “bias”, and we will use this term throughout the remainder of this *Stimuli* article.

The purpose of this *Stimuli* article is to describe and put into perspective the possible bias identified by Shen and Tsong (7), review the history behind the introduction of the IDZ, remind the reader of the harmonization process that was a key element of the development of (905) as it stands today, and explore the consequences of removing the IDZ and/or modifying the current (905) test. Resolving this issue is critical for the CULSS EP because clarifying the *Content Uniformity* test in (905) is the starting point for developing a Large N test. Another purpose of this article is to briefly discuss the difference between batch release testing and compliance testing as described in (905). Unfortunately, there is considerable confusion among industry and regulatory agencies regarding the role of USP tests for batch release. USP has clarified that (905) is not intended for batch release and that it is the sponsors’ responsibility to arrange batch release testing to provide reasonable assurance that a released batch will comply with (905) whenever tested (8). The current plan for the CULSS EP, following the planned publication of a chapter containing the Large N test, includes development of a chapter on some approaches to perform batch release testing to ensure

compliance with (905).

THE ISSUE

The harmonized test in (905) is summarized below [assuming a manufacturing target (*T*) of 100, a limit (*L1*) for the acceptance value of 15.0, and a limit (*L2*) for individual doses of 25.0]:

- Collect a sample of 30 dosage units from the batch.
- Assay 10 units.
- Express the individual results as percentage of the label claim.
- Calculate the average (\bar{X}) and standard deviation (*s*) of the 10 results.
- Let $M = 98.5$ if $\bar{X} < 98.5$, $M = 101.5$ if $\bar{X} > 101.5$, and $M = \bar{X}$ otherwise (this is the *IDZ*).
- Calculate the acceptance value (*AV*): $AV = | M - \bar{X} | + 2.4 \cdot s$.
- The sample complies if $AV \leq 15.0$.
- If $AV > 15.0$, assay the remaining 20 units.
- Express the individual results as percentage of the label claim.
- Calculate the average (\bar{X}) and standard deviation (*s*) of the 30 results in the combined sample.
- Let $M = 98.5$ if $\bar{X} < 98.5$, $M = 101.5$ if $\bar{X} > 101.5$, and $M = \bar{X}$ otherwise.
- Calculate $AV = | M - \bar{X} | + 2.0 \cdot s$.
- The sample complies if $AV \leq 15.0$ and all results are within 75.0%–125.0% of *M*.

The operating characteristics (OC) curve for the harmonized pharmacopeial test is shown in *Figure 1*, assuming that the data follow a normal distribution. *Figure 1* shows, for a selection of batch means in the range of 86%–100% label claim (LC), the probability to pass the test in (905) vs. coverage of the interval of 85%–115% LC. This coverage is the true proportion of dosage units in the batch with a content in the range of 85%–115% LC.

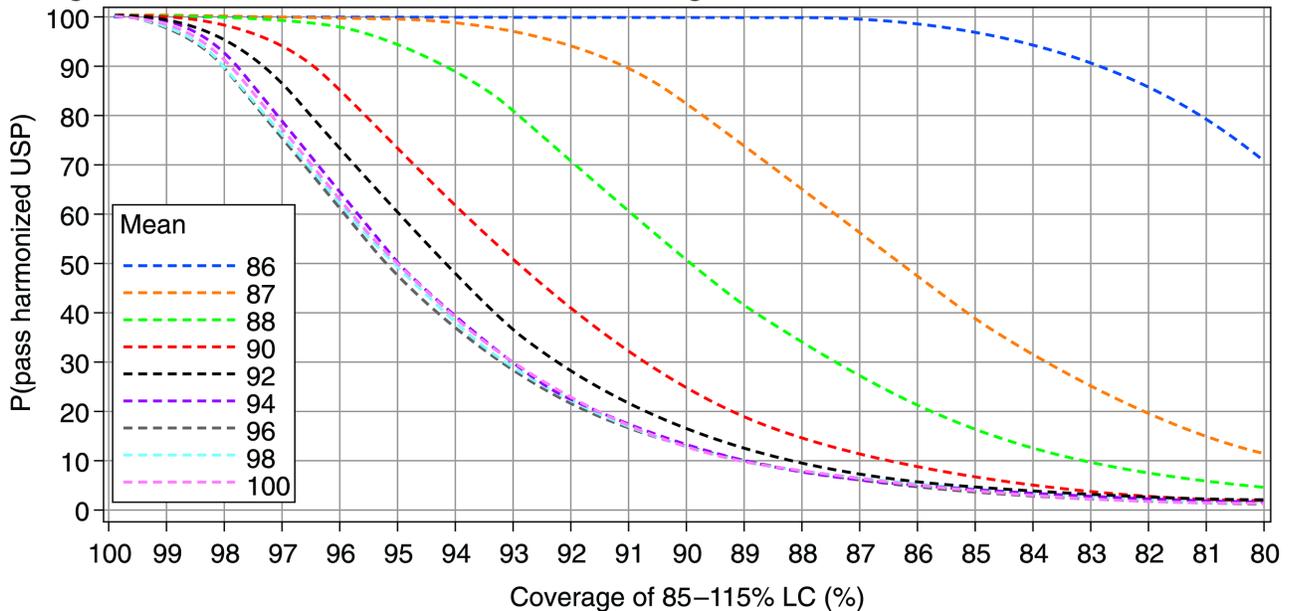

Figure 1. Harmonized *USP* test vs. coverage of 85%–115% LC.

Figure 1 illustrates the issue described by Shen and Tsong (7). As long as the batch mean is in the range of 94%–106% LC, the OC curves are similar (so the chance to pass is essentially independent of batch mean), but outside this range the probability to pass (for a given

coverage) increases with an increasing mean deviation from the target. This bias clearly appears to be an undesirable property of the test in (905).

Figure 1 shows that for a fixed coverage, the probability to pass increases with decreasing batch mean. To keep the coverage constant when the mean deviation from the target increases, the associated standard deviation must decrease. This is illustrated in Figure 2, which shows four normal distributions that all have 91% coverage of 85%–115% LC [a coverage of 91% was chosen for the illustration because this was previously studied by Shen and Tsong (7)]. The difference between the distributions is the mean; this has been set to 86%, 90%, 95%, and 100% LC in this graph. Consequently, to keep the coverage constant, the standard deviation has been modified as appropriate.

Figure 2 introduces the question of whether equal coverage directly corresponds to equal quality. If one requires that the probability to comply with the (905) test should be constant for a given coverage, regardless of the batch mean, one has implicitly decided that the four distributions in Figure 2 represent equal quality. But is this reasonable? One can argue that the batch with a mean of 100% LC is better, because patients receiving medication from this batch would more often receive the intended dose. It can also be argued that the batch with a mean of 86% LC is better, because this is much more uniform, meaning that patients will obtain a more precise dose. What is best is thus a matter of opinion on how best to balance mean and standard deviation. For this reason, it is not at all obvious that the OC curves for different batch means in the (905) test should be required to overlap; this would be a reasonable requirement only if it was agreed that the four distributions in Figure 2 are equally good.

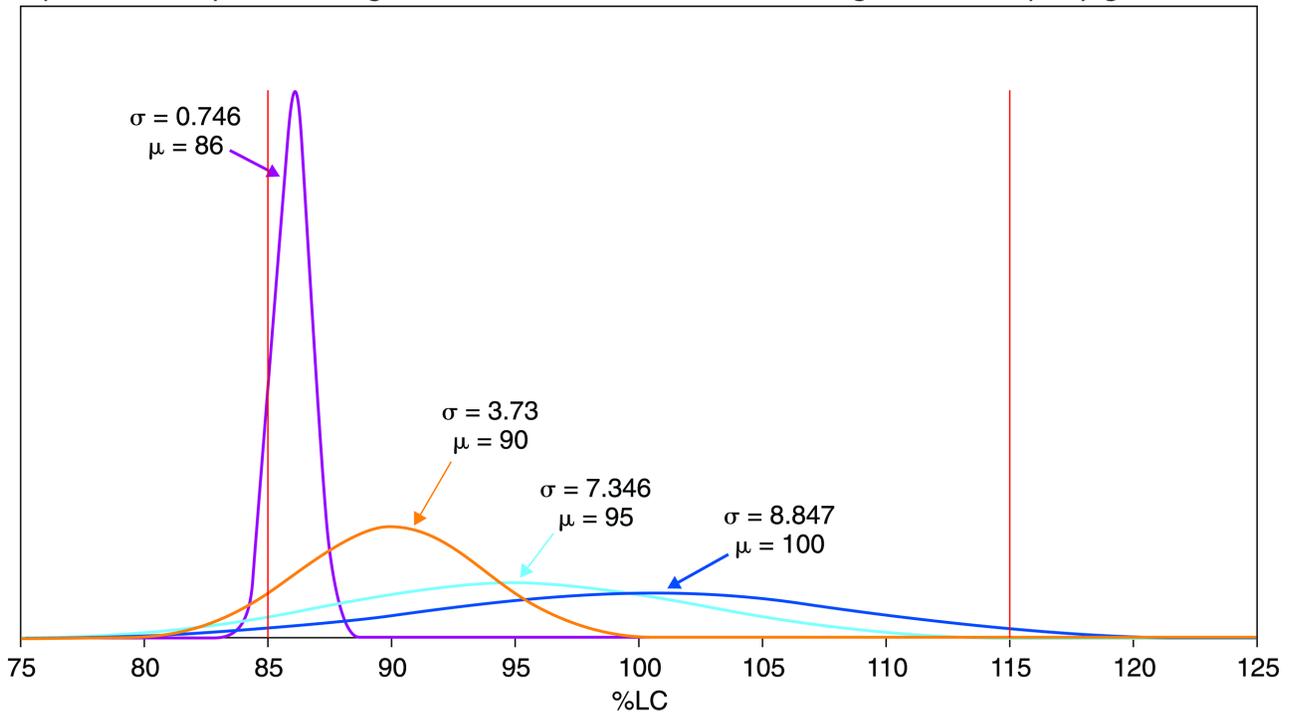

Figure 2. Normal distributions with means of 86%, 90%, 95%, and 100% LC, all with 91% coverage of 85%–115% LC.

Another approach that puts the bias into perspective is illustrated in Figure 3. This figure shows the same data as in Figure 1, but here the probability to pass the harmonized (905) is displayed against batch standard deviation.

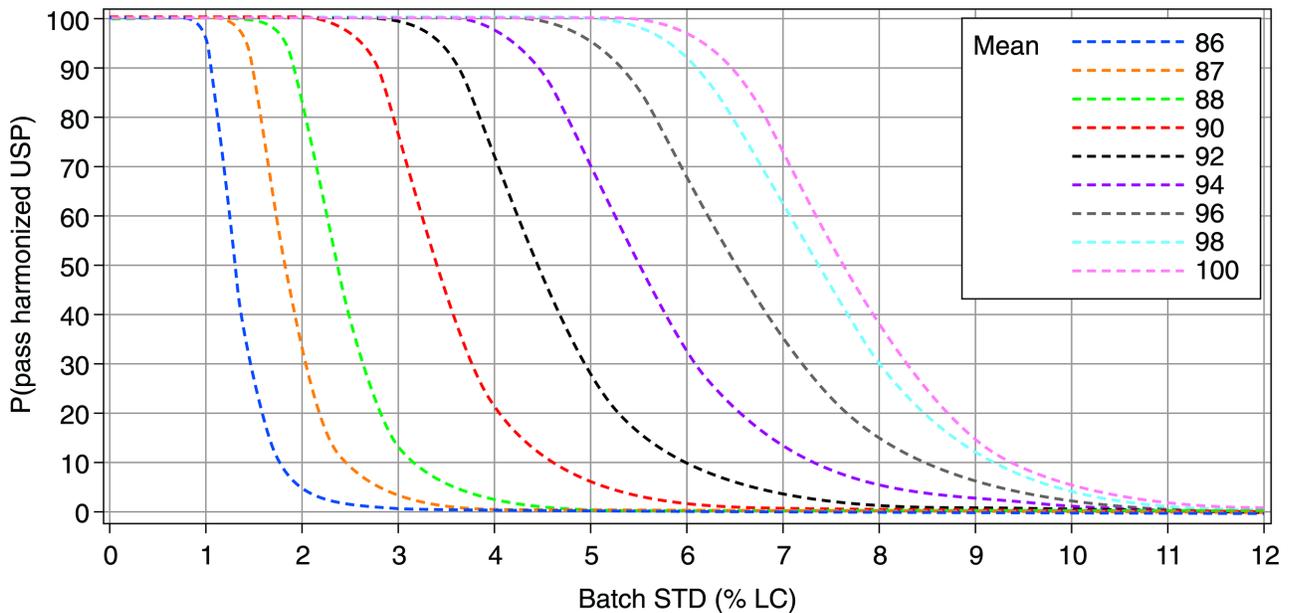

Figure 3. Harmonized USP test vs. batch standard deviation (% LC).

Figure 3 indicates that the issue with the bias observed in Figure 1 might not be a concern because the bias effect is no longer seen. Also, extremely small standard deviations are required to “allow” an off-target batch to comply with (905). Figure 3 shows, for example, that if the batch mean is 86% LC, the standard deviation must be <1% LC for the probability to pass to exceed 95%.

For completeness, Figure 4 shows the same data once more, now displaying batch mean on the x-axis and showing the probability to pass the harmonized (905) for different standard deviations (STD).

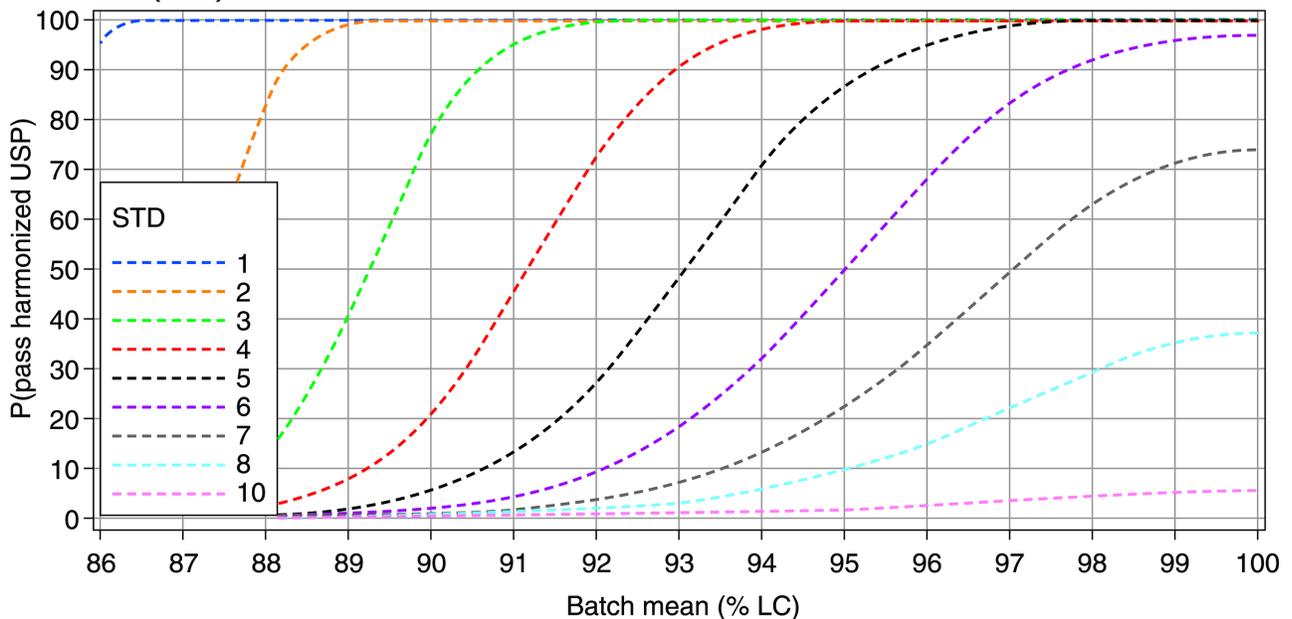

Figure 4. Harmonized USP test vs. batch mean (% LC).

A final approach to demonstrate the uniformity required is the following: for each mean in the range of 86%–100% LC, the standard deviations corresponding to 50%, 75%, 80%, 85%, 90%,

95%, 97.5%, 99%, and 99.9% probability to pass (905) were determined. The results from this exercise are shown in *Figure 5*.

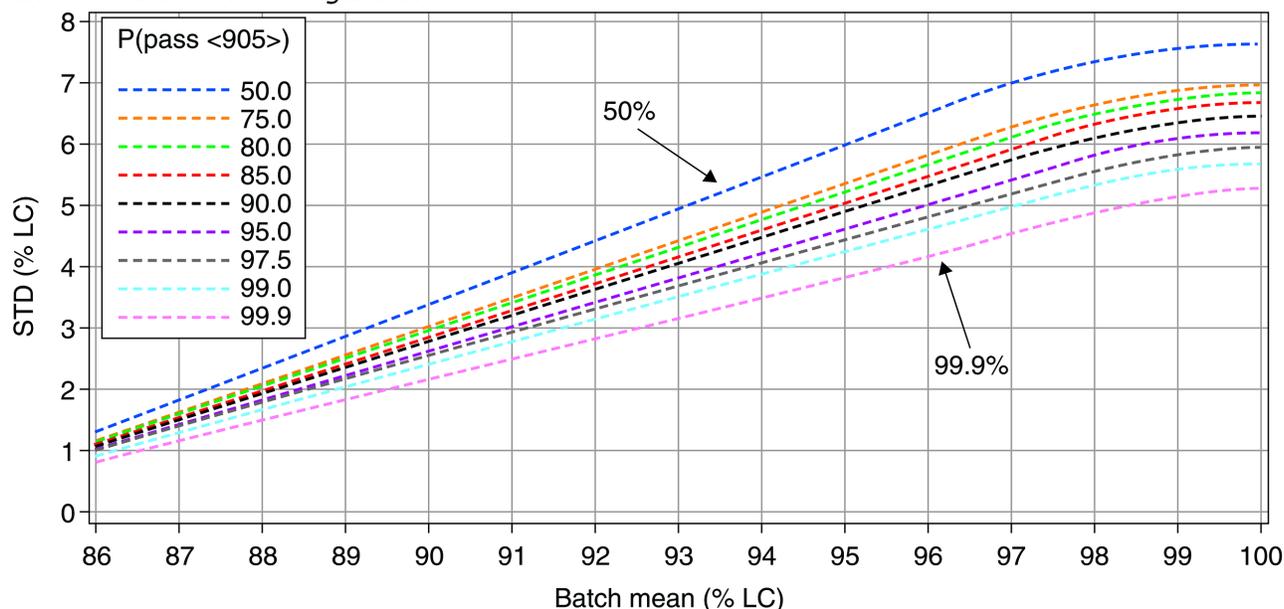

Figure 5. Standard deviation (% LC) corresponding to different probabilities to pass (905) vs. batch mean (% LC).

Figure 5 illustrates the change in standard deviation required to increase the probability to pass the uniformity test in (905) from 50% to 99.9%. Furthermore, *Figure 5* demonstrates that the change in standard deviation required varies with batch mean; when the batch mean is on target, the standard deviation range is about 5.2%–7.6% LC, whereas when off-target the range is much narrower. For an extreme batch mean of 86% of target, *Figure 5* illustrates that a marginal change in standard deviation from 0.9% to 1.2% LC would reduce the probability to pass from 99.9% to 50%.

In summary, this section has shown that although the harmonized (905) exhibits some sort of bias, it appears to have minor practical influence in that batches that would benefit from the bias require such a small standard deviation that they are unlikely to exist. Moreover, whether the bias is indeed a bias is a matter of opinion, depending on how one prefers to balance an on-target mean and low variability. This bias is reviewed below in further detail, along with possible approaches to remove the questioned characteristics of (905).

HISTORY OF (905)

This section provides a brief historical review of how the USP criterion for content uniformity has developed over the years.

In *USP 15* (from 1955, page 945) and *USP 16* (from 1960, page 941), there was a section for "Weight Variation" in *Physical Tests*, but this did not include content uniformity. The first *USP* content uniformity chapter appeared in *USP 17* (from 1965), although there were separate headings under *Physical Tests* that included "Content Uniformity" (page 905) and "Weight Variation" (page 926). All measurement of dosage units and criteria were expressed as a percentage of the "average of the tolerances" called AT (i.e., potency specifications).

All versions of the *Content Uniformity* test from *USP 17* to the most recent *USP* have consisted of two stages. Stage 1 consisted of testing 10 dosage units. If all 10 results met the

acceptance criteria, then the sample passed the test for *Content Uniformity*. If the Stage 1 criteria were not met, then an additional 20 dosage units were tested for Stage 2. If the Stage 2 criteria were met, then the sample passes the *Content Uniformity* test; otherwise, it fails. In Stage 1 of *USP 17*, if all results were between 85% and 115% of the *AT*, then the sample passed the content uniformity test. If NMT 1 result fell outside 85%–115% *AT*, then the test proceeded to Stage 2; otherwise, it failed. At Stage 2, if NMT 1 result of all 30 fell outside 85%–115% *AT*, then the sample passed the *Content Uniformity* test; otherwise, it failed. These criteria were subsequently adjusted in *USP 18* and *19*, as follows.

In *USP 18* (from 1970), a new requirement was added to the *Content Uniformity* test that no result could fall outside 75%–125% *AT* in either stage. Additionally, *USP 18* introduced new and different criteria for tablets and capsules. In Stage 1, if NMT 1 result fell outside 85%–115% *AT* for both tablets and capsules, then the sample passed the content uniformity test. For the first 10 dosage units, if NMT 2 results for tablets or 3 results for capsules fell outside 85%–115% *AT*, then the test proceeded to Stage 2; otherwise, it failed. In Stage 2, NMT 2 tablets from both Stages 1 and 2 could fall outside 85%–115% *AT* to pass the *Content Uniformity* test; whereas for capsules, NMT 3 capsules from both Stages 1 and 2 could fall outside 85%–115% *AT* to pass the content uniformity test.

In *USP 19* (from 1975), the number of decimal places in the criteria was changed to the tenths place. *USP 19* also added a correction for *Special Procedures* in the content uniformity requirement to adjust results based on the difference between the weight of the single dosage unit when using the assay vs. using the special procedure, when different analytical methods were used for assay and content uniformity.

In *USP 20* (from 1980), there were separate general chapters for weight variation and content uniformity: *Content Uniformity* (681) and *Weight Variation* (931). Chapter (905) first appeared in *USP 20–NF 15, Addendum to the Third Supplement* (official September 1, 1982). The chapter combined (681) and (931) and allowed uniformity of dosage units to be demonstrated by either weight variation or content uniformity. Weight variation could be applied if the product was a liquid-filled soft capsule or if the product contained 50 mg or more of a single active ingredient comprising 50% or more, by weight, of the dosage-form unit. The *Addendum* changed the expression of results to LC from *AT*, added a coefficient of variation ($CV = 100 \cdot s/\text{mean}$) criterion, and the number of decimal places in the allowable ranges for individual results was changed to a whole number. The test and criteria from the *Addendum* are provided in *Table 1*.

Table 1. Content Uniformity Test/Criteria before Harmonization

If $AV > 15.0$, go to Stage 2.</p>	<p>Express individual results as a percentage of the average. Calculate the average (\bar{X}) of the 10 results. Express individual results as a percentage of the average.</p> <p>Count the number of units outside 85%–115% of the average (n_{15}) and the number of units outside 75%–125% of the average (n_{25}).</p> <p>Pass if $n_{15} = 0$ and $n_{25} = 0$. If $n_{25} = 0$ and $n_{15} = 1$, then go to Stage 2.</p>

Stage	Number Tested	USP 20 Content Uniformity Test/Criteria	JP XIII Content Uniformity Test/Criteria	Ph Eur Uniformity of Content of Single-Dose Preparations, Test A
2	20	Express individual results as a percentage of the label claim. Tablets: Pass if NMT 1 result is outside 85%–115% LC, no result is outside 75%–125% LC, and CV < 7.8%. Otherwise, the sample fails content uniformity. Capsules: Pass if NMT 3 results are outside 85%–115% LC, no result is outside 75%–125% LC, and CV < 7.8%. Otherwise, the sample fails <i>Content Uniformity</i> .	Express individual results as a percentage of the label claim. Calculate the average (\bar{X}) and standard deviation (s) of the 30 results. $AV = 100 - \bar{X} + 1.9 \cdot s$ Pass if $AV \leq 15.0$ and all results are within 75%–125% LC.	Express individual results as a percentage of the average. Calculate the average (\bar{X}) of the 30 results. Express individual results as a percentage of the average. Count the number of units outside 85%–115% of the average and the number of units outside 75%–125% of the average. Pass if $n_{15} \leq 1$ and $n_{25} = 0$.

The *Addendum* also contained criteria for the situation where the average of the potency specifications was 100% LC or less. The test is the same as shown in *Table 1*.

USP 20, Addendum to the Fourth Supplement (page 915) contained criteria for the situation where the average of the potency specifications was >100% LC. In this case, if the average value of the dosage units tested is greater than or equal to the average of the potency limits, then LC in *Table 1* is replaced by LC multiplied by the average of the limits specified in the potency definition. If the average value of the dosage units tested is between 100% LC and the average of the potency limits, then LC in *Table 1* is replaced by the average of the dosage units tested.

USP 20, Fifth Supplement (page 1114) updated (905) to clarify instances of potency specifications >100.0%, by adding “expressed as a percent of label claim” to the average value of the dosage units tested. A limit was added to permit the use of the *Special Procedure* for the ratio of the calculated adjustment to the *Special Procedure* mean. If the ratio is <0.030, then no adjustment is needed.

HARMONIZATION

The current harmonized “uniformity of dosage units” (UDU) test in (905) was developed in an effort to harmonize UDU testing for content and mass/weight variation between the existing (905) UDU test (9) and the corresponding tests in the *Japanese Pharmacopeia* (JP) (10) and *Ph Eur* (11). The *USP*, *JP*, and *Ph Eur* tests that were in effect at the time are described in *Table 1*.

For the functional form of the test, the goal of the harmonization was to retain the *JP* approach to use an AV. The choice of the values of k_1 , k_2 , and the *IDZ* for the mean has been an area

of much discussion and research. The history of the establishment of these values is provided to dispel any confusion on this topic.

As mentioned above, the goal of the harmonized UDU test was to develop a test that was similar to the *USP* and *JP* tests in effect at that time, when the true mean was equal to 100%, and to also provide a test that was approximately a 50/50 compromise from an operating characteristic curve perspective for means differing from 100. The values 96% LC and 92% LC were examined because they were thought to be the maximum range of reasonable means to consider given the typical assay specifications of 90.0%–110.0% LC in the U.S. Initially, the goal was to retain separate criteria for tablets and capsules, but this would inhibit harmonization; therefore, the focus was on the previous *USP* tablet test and the *JP* test. Because the *JP* test defined its own values of k_1 and k_2 and lacked an *IDZ*, an initial examination showed that simply evaluating alternative values of k_1 and k_2 without an *IDZ* would not achieve the desired goals. Therefore, the addition of an *IDZ* was considered. An extensive matrix of possible values of k_1 , k_2 , and *IDZ* were evaluated to identify the combination that achieved the best 50/50 compromise between the previous *USP* tablet test and *JP* test. The initial proposal that best met the desired goals was $k_1 = 2.3$, $k_2 = 2.0$, and *IDZ* = 1.5. After negotiation at an International Conference on Harmonisation (ICH) meeting (Japan, 1999) where separate criteria for capsules ($k_1 = 2.4$ and $k_2 = 1.9$, and *IDZ* = 3.5) were considered, the final parameters of the test were established as they are today: $k_1 = 2.4$, $k_2 = 2.0$, and *IDZ* = 1.5.

The following two graphs (*Figures 6 and 7*) show that the goal of the harmonization process for content uniformity was achieved with the current *USP* test (shown as *Harm UDU* in graphs).

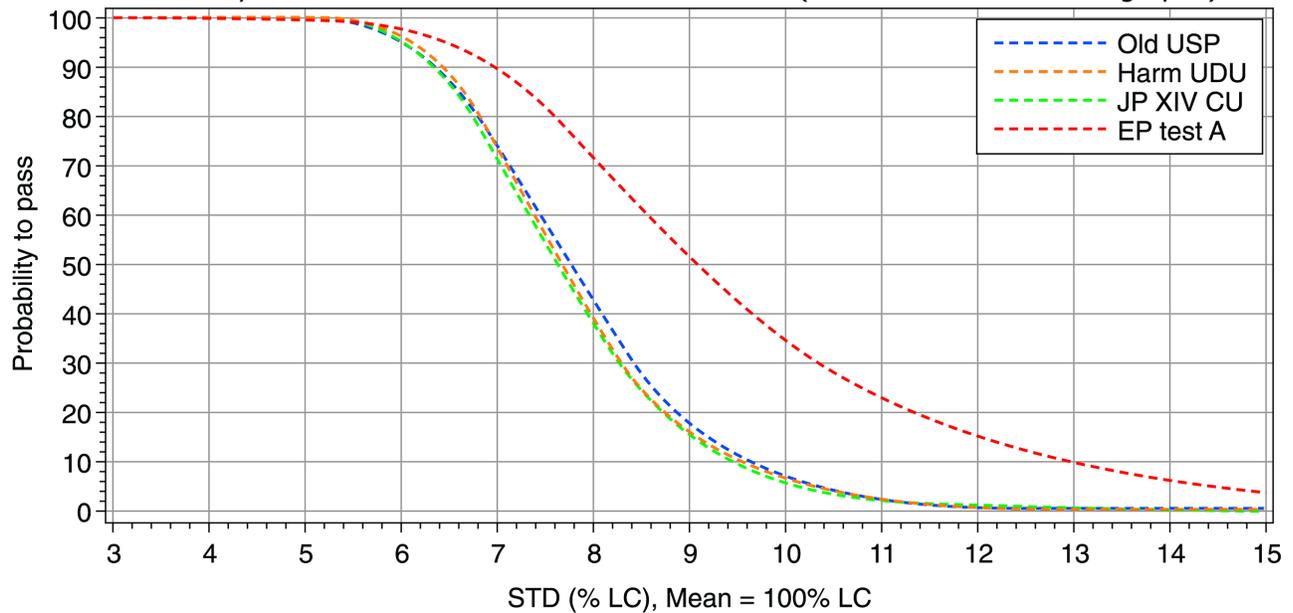

Figure 6. Comparison of harmonized UDU (*Harm UDU*) test and regional tests in effect at the time for harmonization (batch mean at 100% LC).

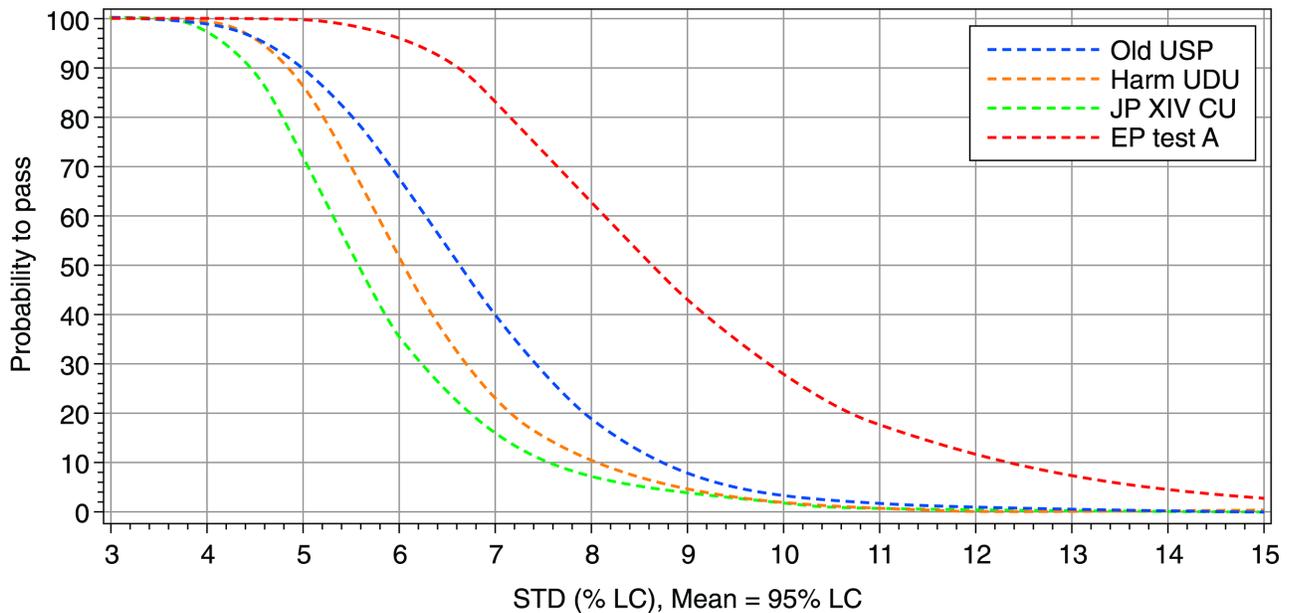

Figure 7. Comparison of harmonized UDU (*Harm UDU*) test and regional tests in effect at the time for harmonization (batch mean at 95% LC).

Figures 6 and 7 show that the harmonized UDU test is almost always tighter than the *Ph Eur* test A, is virtually identical to the old *JP* and *USP* tests when batch mean is on target, and is a reasonable compromise between old *JP* and *USP* tests for off-target batch means.

It is noted that despite the appearance of being tolerance interval factors, the selection of the values of *k1* and *k2* was not to achieve any stated confidence or coverage. As discussed, the parameters of the test were derived to develop a test criteria that was a 50/50 compromise between the old *JP* and *USP* tests. The introduction of the *IDZ* was a key element in achieving this compromise. A removal of the *IDZ* will make the resulting test tighter, therefore inhibiting the original goal of harmonization, unless some modification is introduced to counter this unwanted shift. This issue will be studied in the next section.

INVESTIGATING POTENTIAL SOLUTIONS

Shen and Tsong (7) suggest in their *Stimuli* article that the *IDZ* be removed from (905) to avoid the bias. In Figure 8, the OC curves for (905) with the *IDZ* removed are shown. As seen in the graph, this approach does resolve the bias issue; the OC curves for means $\leq 96\%$ LC overlap, and there is no tendency for a large deviation from the target to be associated with a greater chance to fulfill the testing requirements.

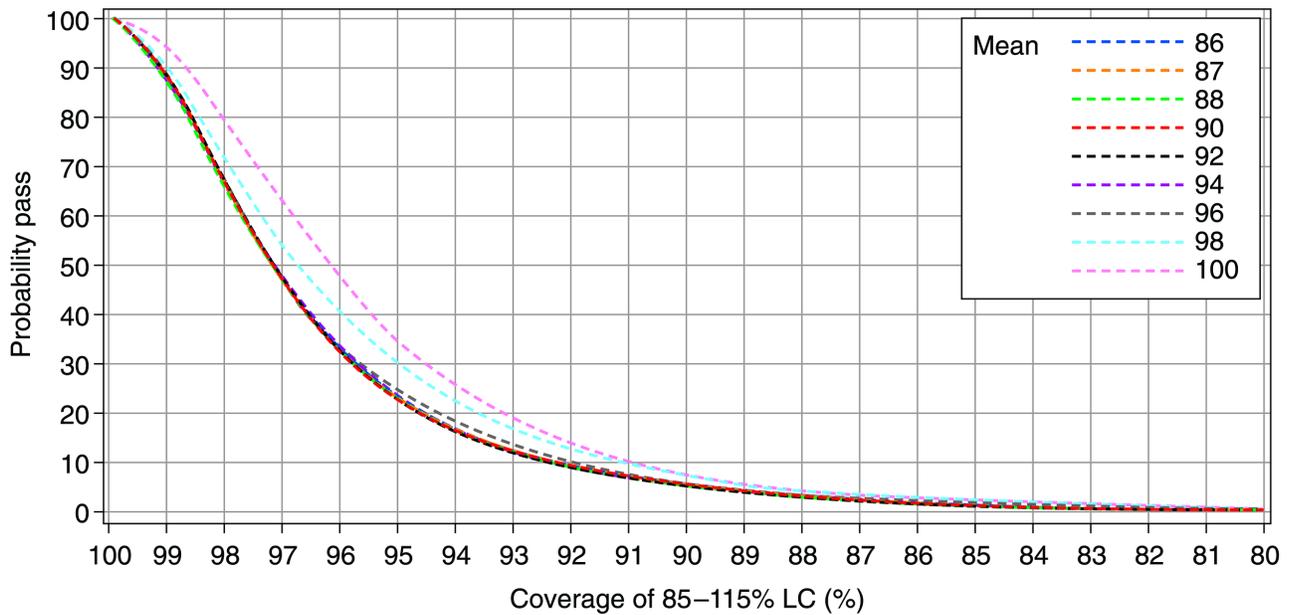

Figure 8. Operating characteristics of the harmonized *USP* test without *IDZ* vs. coverage of 85%–115% LC for different batch means.

As described above, the current (905) was constructed to be a compromise between the old (905) and the *JP* content uniformity test in effect at that time. A natural question is whether this compromise still exists after removal of the *IDZ*. To explore this, *Figure 9* compares the (905) test with the *IDZ* (current *USP*, *solid lines*) to the same test but without the *IDZ* (*dotted lines*). The two tests are compared for means of 100%, 96%, and 92% LC (the same means that were used in the development of the harmonized *USP* test).

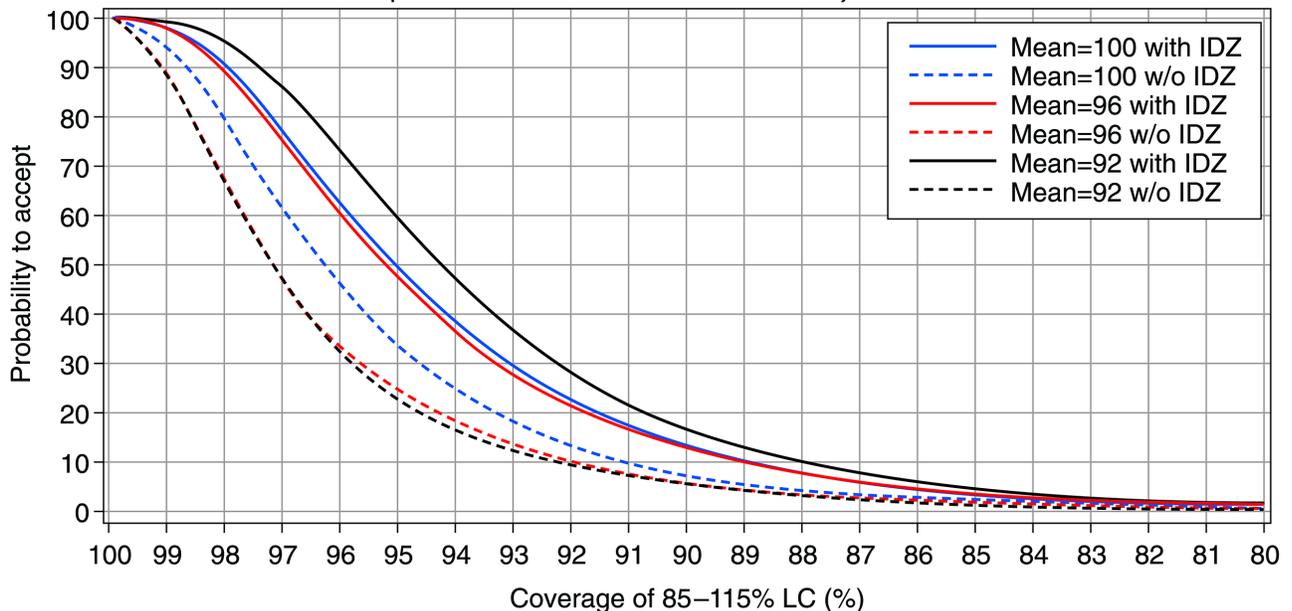

Figure 9. Operating characteristics of harmonized *USP* test with and without (*w/o*) *IDZ* vs. coverage of 85–115% LC for mean = 92%, 96%, and 100% LC.

Figure 9 clearly shows that for all batch means, removing the *IDZ* will lead to a significant tightening of the current requirements. For example, if the true mean is at target, to have 90% probability to fulfill requirements, the required coverage of 85%–115% LC increases from 98.0% to 98.6%. This illustrates that if the *IDZ* is removed, something needs to be changed to retain

the same tightness as that of the current requirement; otherwise, the compromise reached during the harmonization effort would no longer be maintained.

One alternative to avoid the claimed bias while keeping the *IDZ* would be to include some additional requirement. Because the bias appears only when the true batch mean deviates significantly from target, a natural addition would be to add a requirement on the sample average. Indeed, there is already an implicit requirement on the average because the potency is typically required to be within 90%–110% LC. This means that in practice, the test in (905) should be seen in the light of the need to also fulfill the potency requirement. To review the effect of this combined requirement ((905) and potency), *Figure 10* shows the OC curves for the current (905) when a requirement is added that the average be within 90%–110% LC.

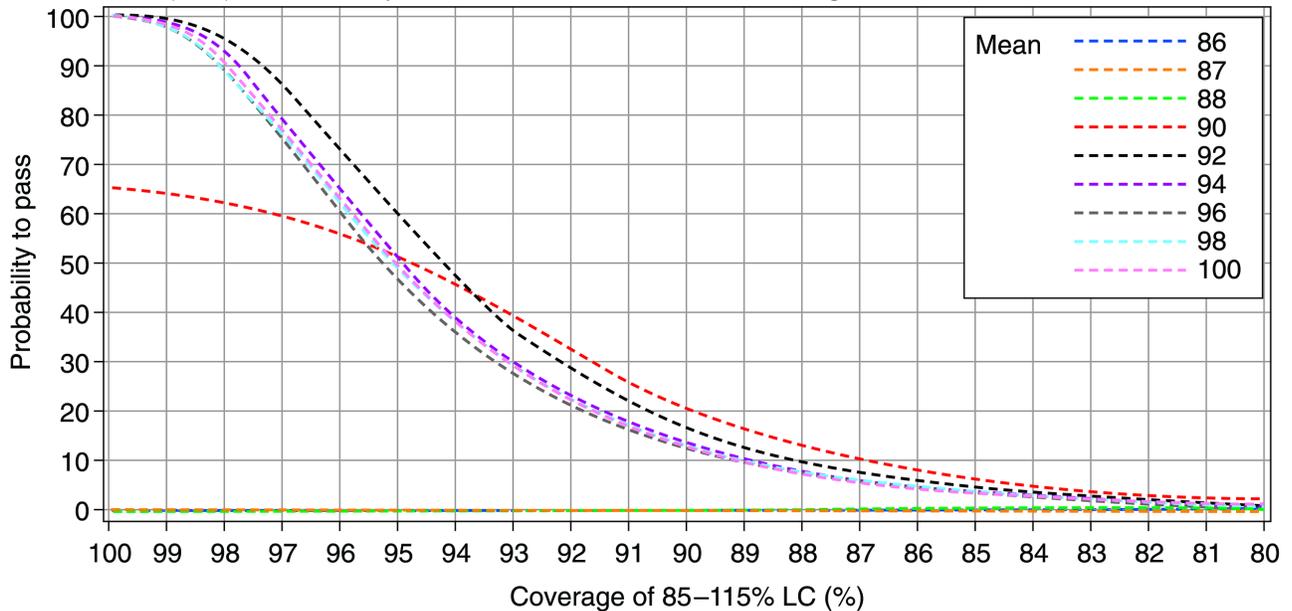

Figure 10. Operating characteristics of the harmonized *USP* test with the additional requirement that the average is within 90–110% LC vs. coverage of 85%–115% LC.

Figure 10 illustrates that that the potency requirement solves the majority of the bias issue (there is still some minor bias for batch means in the range of 90%–92% LC). This analysis explains why the perceived bias has not been an issue in practice; the potency requirement has ensured that the bias has never played a role.

To fully remove the bias, the potency requirement on the average would need to be further tightened. In *Figure 11*, the performance of the current (905) combined with a requirement that the average is within 92.0%–108.0% LC is shown. As seen in *Figure 11*, the additional requirement completely removes the bias because the operating characteristics of the modified *USP* test remain practically unchanged when the batch mean is in the range of 92%–108% LC.

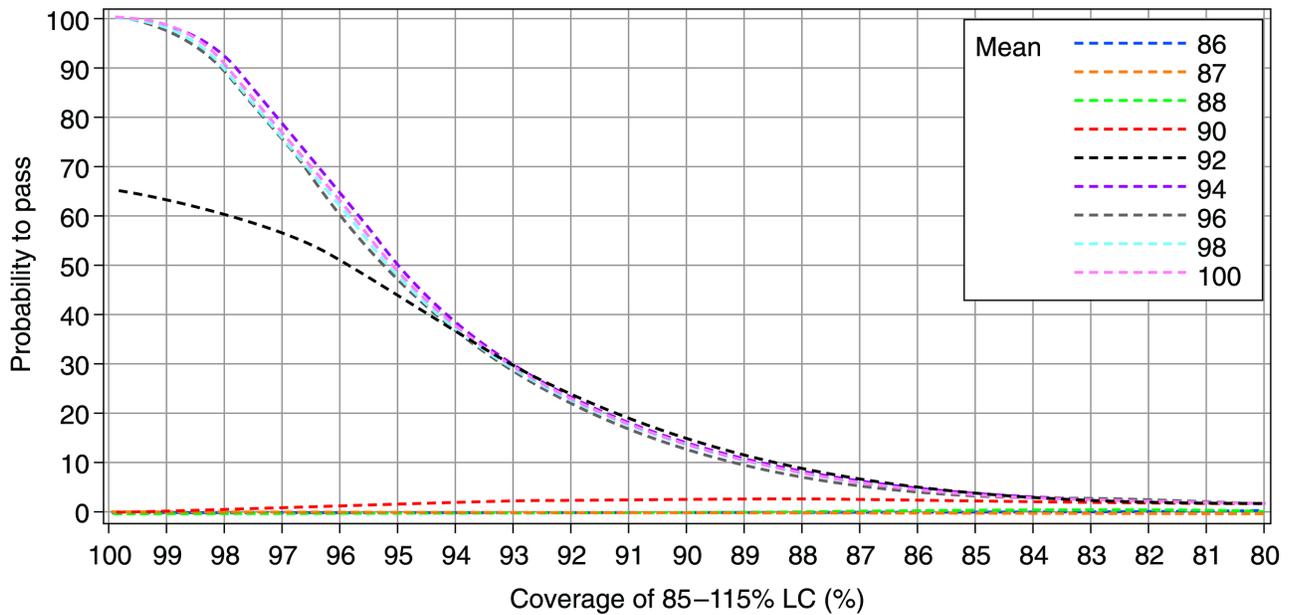

Figure 11. Operating characteristics of a harmonized *USP* test with an additional requirement that the average is within 92-108% LC vs. coverage of 85%-115% LC.

To remove the bias while keeping the *IDZ* in the test, one option is thus to add a requirement for the sample average. Another option is to remove the *IDZ*, but one must compensate for this by changing the values of k_1 and k_2 . In *Figure 12*, the effect of changing the value of k_1 while keeping $k_2 = 2.0$ is shown. In this graph, the mean is at 95% LC, because this is when the (905) test is tightest, both with and without *IDZ* (compare *Figures 1* and *7*). The figure shows the OC curve of the harmonized test in (905) (*solid line*) compared to those of the same test without *IDZ* but with different values of k_1 (*dotted lines*). This graph demonstrates that it is not possible to change only the value k_1 to achieve a match.

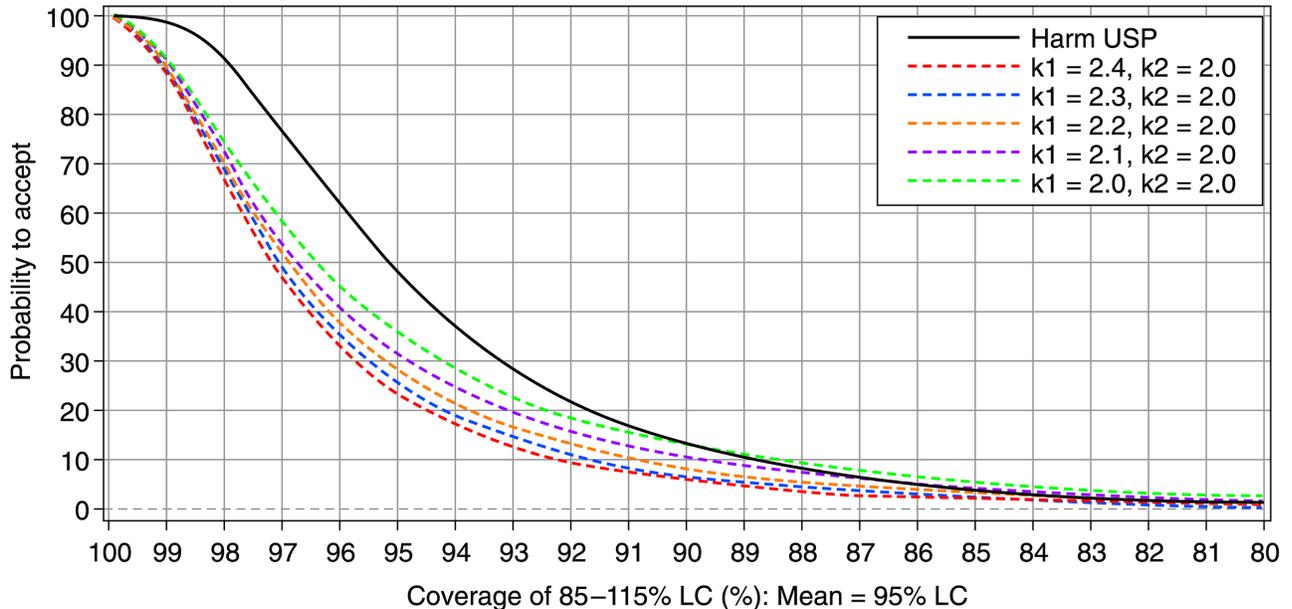

Figure 12. Operating characteristics of a harmonized *USP* (*Harm USP*) test compared to (905) without *IDZ*, $k_2 = 2.0$, and different k_1 's vs. coverage of 85%-115% LC (mean = 95% LC).

In *Figure 13*, the option of changing the value of k_2 while keeping $k_1 = 2.4$ is explored in the same manner as in *Figure 12*. This analysis shows that reducing the value of k_2 to 1.7 results in

an almost perfect match of the test without *IDZ* to the harmonized *USP* test, when the mean is at 95% LC.

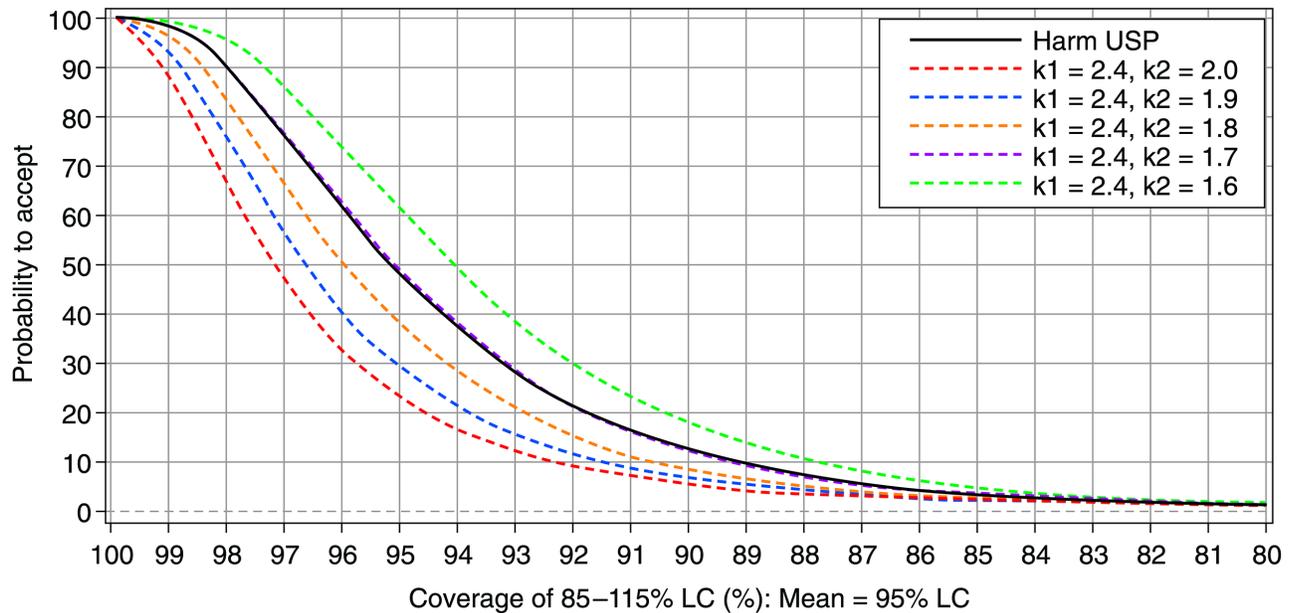

Figure 13. Operating characteristics of the harmonized *USP* test compared to (905) without *IDZ*, $k_1 = 2.4$, and different k_2 's vs. coverage of 85%–115% LC (mean = 95% LC).

Next is explored how this altered test (harmonized *USP* without *IDZ* and $k_2 = 1.7$) with different choices for the value of k_1 compares to the current (905) when the mean is at target; this is shown in *Figure 14*.

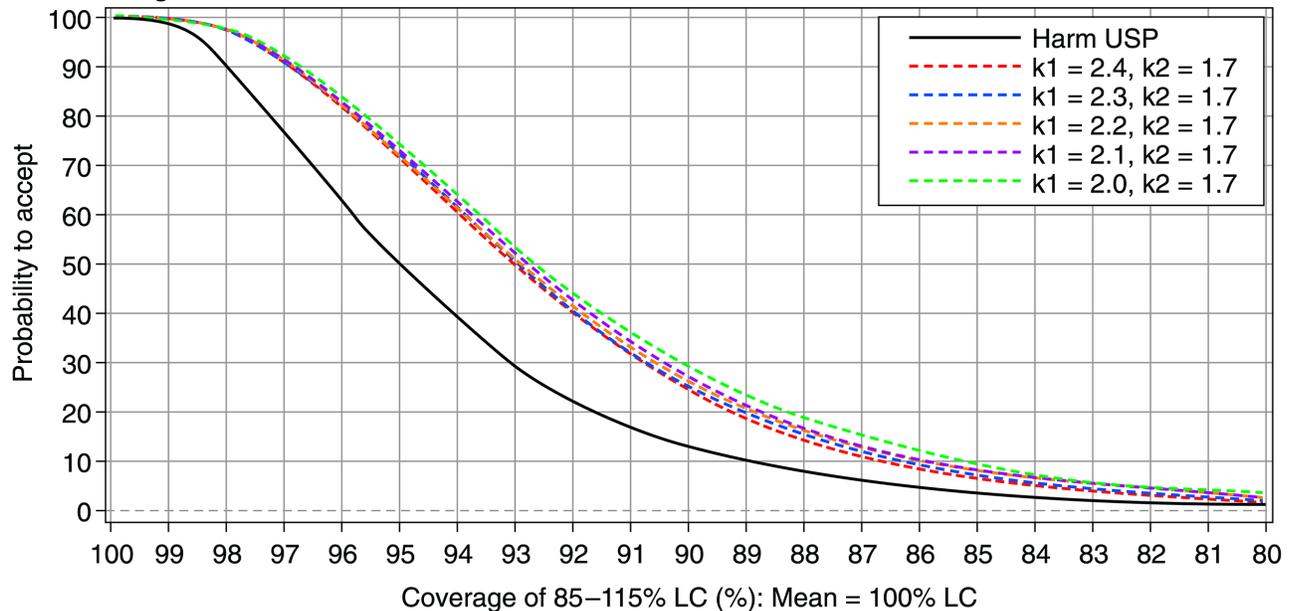

Figure 14. Operating characteristics of the harmonized *USP* (*Harm USP*) test compared to (905) without *IDZ*, $k_2 = 1.7$, and different k_1 's vs. coverage of 85%–115% LC (mean = 100% LC).

Figure 14 clearly shows that the test without *IDZ* is more relaxed than the current test and that no modification of k_1 can solve this. This is a general finding; if we determine k_1 or k_2 for an off-target mean so the test without *IDZ* matches the test with *IDZ*, then the test without *IDZ* will be more relaxed for means that are close to target. Similarly, if we determine a value of

k_1 or k_2 for a match of OC curves when the mean is at target, the test without *IDZ* will be tighter than the current test when the mean is off-target. As discussed above, this is the same challenge that the developers of the harmonized *Content Uniformity* test faced (12–14); their solution was to introduce the *IDZ* and select this, together with the k_1 and k_2 values, to achieve the compromise between the *USP* and *JP* tests.

There are, of course, other alternatives for adjusting the test without an *IDZ* so that its outcome matches the current (905). One such alternative is to let the values of k_1 and k_2 depend on the observed sample average, or to consider another balance between the first- and second-stage sample sizes. Such alternatives suggest that, apart from adding an explicit requirement on the sample average, there is no simple modification of the current (905) that can balance the potential removal of the *IDZ*.

BATCH RELEASE VS. *USP* TESTING

Understanding the purpose of the test is a necessary precondition when evaluating the current harmonized *Content Uniformity* test and any potential modifications. Unfortunately, there is considerable confusion among industry and regulatory agencies regarding the role of *USP* tests for batch release. *USP* is clear that the results of *USP* tests apply only to the sample tested; no inference is intended. Specifically, *USP General Notices Section 3.10 (8)* states, “The similarity to statistical procedures may seem to suggest an intent to make inference to some larger group of units, but in all cases, statements about whether the compendial standard is met apply only to the units tested.” *USP* tests are, therefore, not intended to be informative about the properties of the batch the sample from which it originated. This intention, however, does not conflict with the fact that a sample from the batch is often evaluated against (905) at the time of batch release, because the sample should comply with *USP*. Thus, failure of content uniformity or of any *USP* test at the time of the intended batch release is a warning that needs to be investigated. Importantly, the contrary is not the case—compliance of one sample from the batch with (905) is not typically sufficient evidence to conclude that the batch properties are sufficient to control the risk of future samples not complying with *USP*.

Another important aspect of *USP* tests is that any sample, if within its stated shelf life and if stored properly, should meet all *USP* requirements for that product when tested. Although it is not realistic to expect all possible samples of size 10–30 (typical pharmacopeial sample sizes) from a batch that may contain millions of units to meet the pharmacopeial requirements, the probability of failing is a business risk to be controlled. Failure raises the issue of adulteration or misbranding under the Federal Food, Drug, and Cosmetic Act.

The relationship of *USP* tests to batch release tests is now clear. It is the responsibility of the manufacturer to determine how to assess a batch so that, if released, it has a sufficiently high probability of passing the *USP* tests when tested, where “sufficiently high” is then a business decision that must be made. For content uniformity, the manufacturer may accomplish this with a content uniformity test that includes a sample size appropriate for this purpose (15,16), or they may use process analytical technologies or other approaches without a specific content uniformity test at release.

The use of OC curves to evaluate *USP* tests in this paper and by others is useful as demonstrated above, although no inference is intended. The OC curves are from the company perspective: for batches of given characteristics, what is the risk of samples from those batches failing the *USP* test?

One consequence of this relationship is that the pharmacopeial test will have less stringent acceptance criteria than a properly designed batch release test. Complaints that the

pharmacopeial test is not stringent enough may be due to falsely considering the *USP* test as a batch release test. One of the authors, when working for *USP*, was often asked what is learned from the batch, based on the pharmacopeial test, reflecting this confusion. It appears that Shen and Tsong (7) also have confused pharmacopeial testing and batch release testing. They note that the *USP* test is "incapable of inferring the characteristics of the population (the lot)". They then propose to replace the test in (905) with a significantly tighter test, such as a parametric two-sided tolerance interval or two parametric one-sided tolerance intervals; use of these tests as a pharmacopeial test is not reasonable for the reason described above. However, using one of these tests, with sample size and tightness determined by the manufacturer, as a batch release test to ensure that the batch complies with the test in (905), whenever tested, could be a reasonable approach.

To assist companies faced with these content uniformity issues, the CULSS EP is planning two additional general chapters. The first will present some methods and acceptance criteria for *USP* testing of content uniformity in sample sizes larger than those specified in (905). The second will address some approaches to setting batch release specifications to ensure a high probability of meeting the (905) uniformity standard when tested.

CONCLUSIONS

As detailed above, the observation from Shen and Tsong (7) that due to the *IDZ* included in *USP* (905), the operating characteristics of the test vary with sample mean and favors off-target lots have been discussed extensively. This claimed bias is only apparent when the probability to pass (905) is displayed vs. the coverage of the batch. After comparing the characteristics of batches with different means but identical coverage, we learn that it is a matter of opinion of which has the better quality. Should one favor good uniformity or being on target, and how should these be balanced? One can conclude that the observed bias can be either good or bad, depending on what is desired.

The harmonization process between the *United States*, *European*, and *Japanese Pharmacopeias* aimed to establish common acceptance criteria for content uniformity testing. This resulted in an effort to find a requirement of the *JP* type (a tolerance interval test) that could provide a 50/50 compromise (regardless of true batch mean) between the *JP* and *USP* content uniformity tests in effect at the time. This turned out to be a challenging exercise that could only be solved by introducing an *IDZ* of appropriate size. As a consequence, it is concluded that the *IDZ* cannot simply be removed without destroying the compromise between the pharmacopeias; we believe that this is not warranted.

The current (905) has been used for several years without the claimed bias being an issue in practice. As explained above, this is shown to be due to the potency requirement which specifies that the mean should be within 90%–110% LC; this implicitly ensures that significantly off-target batches will not be released. It is, however, somewhat unattractive to ensure content uniformity by two independent pharmacopeial requirements. Perhaps consideration could be given toward adding a requirement on the sample average to the current test in (905). It was shown above that 92%–108% LC could be suitable, and that this would not tighten the current requirements but remove any possibility that off-target material could be released. Finally, the option to remove the *IDZ* and instead modify the stage *k1* and *k2* values was reviewed. This showed, as was found in the development work during the harmonization process, that although it is simple to find new *k* values to match the OC curve of the current test for a particular batch mean, the resulting test will be tighter or wider than the current standard for other mean values.

In summary:

- One can question if the claimed bias is indeed a bias. The same coverage does not mean equal uniformity. Variability is directly linked to uniformity. What appears to be a bias from a coverage perspective is merely the content uniformity test being true to its character and favoring low variability/better uniformity.
- Because of the potency requirement, the claimed bias is not a problem from a practical point of view; there is no relevant risk that significantly off-target batches will be released.
- If desired, the addition of a 92.0%–108.0% LC acceptance criterion for the sample average to the test in (905) will explicitly ensure that the bias is removed.
- Removal of the *IDZ* from the (905) test will result in a tighter requirement, and some modification of the test will be required to retain its desired properties; this is not simply a task of modifying the *k* values.
- It is important to retain the harmonization of content uniformity testing between pharmacopeias.
- It does not appear that there are any significant reasons to modify the current harmonized (905) test.

USP Responses to Comments on *Stimuli* Article *Proposed New USP General Information Chapter: Shear Cell Methodology for Powder Flow Testing* (1063)

Bruno Hancock,^a David Goldfarb,^a Steve Hoag,^a Geoff Zhang,^a Jim Prescott,^b Andres Orlando,^b Galina Holloway^c

ABSTRACT In *Pharmaceutical Forum* 39(3) [May–Jun 2013], the General Chapters—Physical Analysis Expert Committee of the 2010–2015 United States Pharmacopeia (USP) revision cycle and USP staff published a *Stimuli* article (1) describing the use of shear cells for testing the powder flow properties of selected pharmaceutical ingredients. The article expanded on the brief description of the shear cell apparatus, which is used in one of the four methods listed in *Powder Flow* (1174), and laid the foundation for a proposed new general chapter, *Shear Cell Methodology for Powder Flow Testing* (1063). The authors focused on the three most popular shear cell types: translational (Jenike type); annular (Schulze type); and rotational (Peschl type). The ultimate objective was to identify and build up areas of consensus that could be included in the general chapter. Following publication of the original *Stimuli* article, three commenters submitted their comments. This *Stimuli* article responds to these public comments.

INTRODUCTION

In 2013, the General Chapters—Physical Analysis Expert Committee of the 2010–2015 United States Pharmacopeia (USP) revision cycle and USP staff published a *Stimuli* article titled “*Proposed New USP General Information Chapter: Shear Cell Methodology for Powder Flow Testing* (1063)” (1). Comments about the article were received from three commenters during the public comment period. The Expert Committee and USP staff have considered these comments and have responded by way of this article.

The original *Stimuli* article was seeking specific input from users in the pharmaceutical industry regarding the following questions:

1. Would identification of a pharmaceutical reference material be of benefit to shear cell users in the industry? If so, what material should that be?
2. Would a “round-robin” test of standard pharmaceutical materials using different shear cells under various specified conditions be of value to the industry? If so, specifically what value would be provided and which materials should be tested and why?

On the basis of comments received and after much discussion, the Expert Committee concluded that the certified reference material, BCR-116 limestone, should suffice, even though the use of a less cohesive and more pharmaceutically relevant material (such as microcrystalline cellulose) as a reference material was suggested. The BCR limestone is relatively cohesive and is not representative of more free-flowing powders; however, shear cell analysis is most often needed when characterizing the flow of poorly flowing (cohesive) materials. In addition, the BCR limestone is widely available at modest cost and it is a well-controlled material that has been established as a worldwide standard for since 1992. Finally, there are other examples of nonpharmaceutical materials being used as standards for physical measurements, such as

polystyrene beads for particle sizing measurements.

Representative data for several pharmaceutical powders (including microcrystalline cellulose) have now been added to the proposed General Chapter.

The overall consensus in the comments and further discussion with the Expert Committee was that several round-robin studies have already been performed (2–4), and little value would be added by doing another similar study.

COMMENTS

Comment summary #1:

The commenter noted that the shear cell method is currently mentioned in a general overview chapter in each of three pharmacopeias: *Powder Flow* (1174) (USP); 2.9.36. *Powder Flow* (European Pharmacopoeia); and *Powder Flow* (Japanese Pharmacopoeia), without any technical details or guidance for the application. The commenter recommended that a more detailed chapter about flowability testing using a ring shear tester would be highly appreciated. But even more importantly, it would be valuable to have such a chapter under the umbrella of pharmacopeial harmonization.

Response: USP plans to share the proposed general chapter with the other pharmacopeias, and will ask them to evaluate whether a harmonized chapter would be of value.

Comment summary #2:

The commenter had a concern that the *Stimuli* article abstract suggested that (1063) is to be included in *Excipient Performance* (1059), which primarily deals with excipients. Because the commenter mentioned not being familiar with how the chapters are used, is there a possibility that this test method, or even other test methods, are not applied to active pharmaceutical ingredients or formulations by the end users, due to the perception generated by where the information resides?

Response: The general chapter will not be restricted to use with excipients and is intended to be applicable to all powder materials (including formulated products, excipients, and drug substances).

Comment summary #3:

In the interest of objectivity and full disclosure, the commenter suggested disclosing that Jenike & Johanson, Inc., by whom one of the Physical Analysis Expert Committee members is employed, is the exclusive distributor in the United States for the Schulze annular ring shear cell. In addition, the commenter recommended that as many as possible of the manufacturers of shear cells are included in the review and discussion around this *Stimuli* article, to ensure that the descriptions relating to their specific equipment and preferred testing protocols are correctly represented.

Response: Comments not incorporated. Where a *Stimuli* article is authored by a USP Expert Committee, it is not USP's practice to list all affiliations of the Expert Committee members, who are required to abide by strict conflict of interest rules in order to serve on an Expert Committee. During the drafting of the general chapter, input was sought from a variety of subject matter experts including users and those associated with the manufacture and distribution of shear cells. Additionally, comments on the *Stimuli* article have been received from both users and the suppliers of the common types of shear cells described in the general chapter.

Comment summary #4:

The commenter considered the questions regarding the reference material and round-robin testing to be very pertinent. Because there is, within the ASTM, an increased interest in such validations, the commenter recommended liaising with them to discuss options.

Response: Please see the recommendation of the authors with respect to the development of a pharmaceutical reference standard and a round-robin testing program.

Comment summary #5:

In the *Background* section of the *Stimuli* article, the commenter recommended changing "significant progress in data interpretation" to "significant progress in data interpretation and engineering."

Response: Comment not incorporated. The final version of the general chapter does not contain the *Background* section.

Comment summary #6:

In the *Background* section of the *Stimuli* article, the commenter suggested enhancing "quasi-static mode" by including the phrase "transition from static to dynamic flow," or something similar.

Response: Comment not incorporated. The final version of the general chapter does not contain the *Background* section. However, the Expert Committee also concluded that the original text was sufficiently clear to the majority of readers.

Comment summary #7:

In the *Background* section of the *Stimuli* article, the commenter agreed with the statement, "A properly designed and operated shear cell has the advantage of providing device-independent results," and suggested including several qualifications, especially relating to the relative size of the particles (and the proportion of large particles) with respect to the dimensions of the shear cell.

Response: Comment not incorporated. The final version of the general chapter does not contain the *Background* section. However, the Expert Committee included the suggested qualifications in the *Sample Preparation* section of the general chapter.

Comment summary #8:

In the *Background* section of the *Stimuli* article, the commenter recommended that it should also be noted that the use of shear data for evaluating processing behavior in unit operations other than silos/hoppers is not widespread as, in general, the stress regimes employed by a shear cell do not coincide with those in the majority of powder processing environments, as duly noted in (1174).

Response: Comment not incorporated. The final version of the general chapter does not contain the *Background* section. The Expert Committee considered further discussion of the potential uses or limitations of shear cell data to be beyond the scope of the general chapter, which focuses on best practices for instrument operation.

Comment summary #9:

In the *Scope* section, the commenter suggested making it clear that the angle of internal friction, unconfined yield strength, and cohesion are also derived parameters, based on results derived from a mathematical line fitting exercise that was performed to fit the shear stress/normal stress data pairs as a function of a specific treatment of the pre-shear data.

Thus, to suggest that these are not derived parameters is incorrect.

Response: Comment incorporated. The word "derived" has been replaced with the word "related" to avoid any further misunderstandings. This text now appears in the *Introduction* section of the general chapter.

Comment summary #10:

In the *Theory and Principles* section, the commenter recommended ending the sentence, "The yield locus for a given powder..." with the caveat "...amongst others," as there are other powder properties that could affect the flow behavior, such as electrostatic charging.

Response: Comment not incorporated. The original sentence is retained as it clearly states that the factors listed are only examples, and it is not intended to be an exhaustive listing.

Comment summary #11:

In the *Theory and Principles* section, the commenter suggested modifying the sentence beginning, "Hence, determining the yield locus..." as it is only the quasi static (static to dynamic transition) that it is representative of, and other states are not represented by shear tests, such as behavior in mixers or filling of dies, for example.

Response: Comment not incorporated. The original sentence is retained as it clearly states that any measurements should be made under conditions that are representative of the manufacturing process that is of interest. Further discussion of the potential uses or limitations of shear cell data have not been included, as they are beyond the scope of <1063>, which focuses on best practices for instrument operation.

Comment summary #12:

In the *Theory and Principles* section, the commenter recommended describing the consistency of the powder bed very carefully. Consistent bulk density will only be achieved in the most precisely prepared bed by using multiple compression steps. The consistency of the shear zone is achieved by pre-shearing, and there should not be any confusion about this.

Response: This point is clearly stated in <1063> as follows, "...preparation of a uniform powder bed...is the first critical step of shear cell testing." The uniform density is achieved, not only through proper/consistent initial fill methods, but also as part of preconsolidation (if used) and pre-shear steps. Additional details on how to achieve this will vary from one material to another and between instruments, and are beyond the scope of the *Theory and Principles* section of a general chapter on the technique.

Comment summary #13:

In the *Theory and Principles* section, the commenter suggested that there needs to be a sentence to the effect that "this procedure is repeated several times over a range of stresses to allow the plotting of a yield locus." This new sentence should follow the sentence beginning, "A shear stress is applied..."

Response: Comment incorporated.

Comment summary #14:

Regarding the text in the *Description of Shear Cell Components and Designs* section, the commenter stated, "Whilst the application of a load to the powder will undoubtedly be as uniform as possible for each given design, there is no way of knowing if this is actually the case or if the powder is in a net uniform consolidated state (bulk density) as was mentioned earlier."

Response: The Expert Committee agreed with the commenter's statement and clarified that the text in this section only refers to the uniform application of a normal stress.

Comment summary #15:

The commenter expressed concern that in the *Description of Shear Cell Components and Designs* section, there is no mention of the effect of blade length or other influencing factors [see Schmitt R, Feise H. Influence of tester geometry, speed and procedure on the results from a ring shear tester. *Part Part Syst Charact.* 2004;21(5):403-410].

Response: Comment not incorporated. The general chapter describes the design of three types of shear cells (including baffles and surface features such as blades or fins) in a generic manner. As each brand of shear cell is unique in its design, it is not feasible to describe the impact of minor construction details in a general chapter, even if they may influence the results. Such features can vary from brand to brand, from model to model, and from year to year, and they are the subject of ongoing study and refinement.

Comment summary #16:

In the *Description of Shear Cell Components and Designs* section, with regard to wall friction and infinite travel testers, the commenter would like to see some comment regarding how the powder tracks against the grain of the wall coupon.

Response: Comment not incorporated. In the *Test Procedure* section it states "wall-friction... tests can be conducted with the three types of shear cells described in this chapter as long as directionality (if any) of the wall surface relative to the cell movement is taken into account."

Comment summary #17:

In the *Sample Preparation* section, the commenter suggested mentioning the proportion of larger particles present in the bulk sample, and also said that the increase in bias will have a contributory effect from the reduction in the shear surface/volume with respect to the diameter.

Response: Comment incorporated. A statement has been added noting the importance of the proportion of large particles in the sample.

Comment summary #18:

In the *Sample Preparation* section, the commenter pointed out that the sentence about shear strength of fibrous or flaky solids being due to interlocking is also equally applicable to powders with large (relative to the cell size) particles and more free-flowing powders.

Response: Comment incorporated. This sentence in the *Sample Preparation* section has been modified to include this point.

Comment summary #19:

In the *Sample Preparation* section, the commenter suggested that the sentence about controlling environmental conditions should also include the preparation, as well as the sample handling and storage.

Response: Comment not incorporated. This point is covered by the following sentence: "Powder samples must be handled and tested under conditions that are relevant from a practical standpoint."

Comment summary #20:

In the *Sample Preparation* section, the commenter proposed modifying the statement about

testing some powders immediately to include typical processing storage/wait time during manufacture to best replicate what is going to happen during manufacture.

Response: Comment not incorporated. This point is adequately covered by the existing text that states in several locations that the conditions for sample handling, storage, and testing should be both tightly controlled and relevant from a practical standpoint.

Comment summary #21:

In the *Instrument Preparation* section, the commenter suggested reflecting the following: Although in some instances the effect of strain rate is not believed to be influential (Schmitt and Feise), the instrument must still be properly calibrated to ensure that shearing is undertaken at the required strain rate and that this rate is also constant and invariant (within the applicable tolerances).

Response: Comment incorporated. The following sentence has been added to this section: "The rate of any changes in force and displacement will need to be confirmed as part of this calibration."

Comment summary #22:

In the *Instrument Preparation* section, the commenter noted that the statements about orientation of the wall coupons are extremely difficult to apply to infinite travel testers, as mentioned previously.

Response: Comment not incorporated. A discussion of the pros and cons of using each type of tester for wall friction evaluations is beyond the scope of this general chapter. In general terms, all three types of shear cells can be used for wall friction testing, provided that the coupons are oriented in a manner that is representative of real-life processing conditions.

Comment summary #23:

In the *Instrument Preparation* section, the commenter suggested emphasizing the importance of cleaning certain components of shear cells by revising the sentence to say, "particularly wall coupons."

Response: Comment not incorporated. The importance of cleaning all of the shear cell components is clearly stated in the general chapter text.

Comment summary #24:

In the *Selection of Test Conditions* section, the commenter noted that the testing procedure in the article by Ackers (5) also gives some suggested consolidating/normal stresses to use during testing.

Response: The Expert Committee agreed with the commenter and stated that additional suggestions for the selection of pre-shear stresses can be obtained from several sources in the literature, and the general chapter text allows for this.

Comment summary #25:

In the *Selection of Test Conditions* section, the commenter noted that the discussion of extended hold times is too brief and should be more detailed, as it is currently a confusing way of introducing this concept.

Response: Comment incorporated. Changes have been made to the text in an attempt to improve the clarity of this point.

Comment summary #26:

In the *Selection of Test Conditions* section, the commenter recommended adding a statement that powders with very small unconfined yield strengths may require an expanded range of normal stresses to limit the reliance on extrapolation of the yield locus and to review its linearity. This is equally important as the statement that powders with high unconfined yield strength or internal friction may require a narrower range.

Response: Comment incorporated. The following sentence has been added to address this concern: "The range of normal shear stress levels should be sufficient to allow meaningful fitting and extrapolation of the data to determine the unconfined yield stress and other related parameters."

Comment summary #27:

The commenter commented on the section *Test Procedure* as follows: "Interestingly, many of the shear testers do not record the actual applied normal stress at the point of incipient failure—it is often simply assumed to be the set-point value. In all instances, the applied normal stress should be 'controlled' and recorded. 1. The first point is, due to the nature of powders and commented on earlier, unlikely to be possible. Equally, if the even distribution of powder is 'essential,' how is this achieved? Is it tester specific? 2. This is not strictly accurate as the FT4 Powder Rheometer shear cell also performs a pre-consolidation step. 3. The whole area of pre-shearing is more complex than is mentioned here. It is recommended that this is discussed in more detail with the manufacturers. In this vein, care should also be taken to avoid under-shearing the sample—particularly pertinent for freer flowing materials."

Response: Comment incorporated. The text of the general chapter has been updated to clearly state that the applied normal stress should be both controlled and recorded during the test procedure. Over- or under-consolidation would not result in a proper preshear, although under-consolidation is easily detected because a plateau is not reached, whereas over-consolidation is not easily detectable without breaking from the procedure and intentionally creating a failed test. Because this is more difficult to detect and requires increased skill, the note emphasizing that care must be taken not to over- or under-consolidate the specimen was added to the specific step in the *Test Procedure* section. In addition, the use of a powder preconsolidation step is clarified in the section on instrument operation.

Comment summary #28:

In the *Test Procedure* section, the commenter recommended adding a description of the steps relevant to the operation of a rotational tester. The commenter noted that the four steps listed realistically apply to the translational cell only—there is no mention of re-application of the consolidating stress, intermediate pre-shear and testing at a lower stress, as would be normal practice in an infinite (rotational) tester. The commenter thought that given the fact that the vast majority of shear cells in use are of this variety, this was a serious omission.

Response: Comment incorporated. The text describing the steps has been revised to ensure that the different approaches needed for the different instrument types are clearly described.

Comment summary #29:

In the *Test Procedure* section, the commenter suggested that timed tests (mentioned in the last paragraph of this section) should be incorporated into a separate section about this part of shear testing, to simplify the description.

Response: Comment not incorporated. A detailed description of time-consolidation tests is

beyond the current scope of the general chapter. It may be considered for future inclusion.

Comment summary #30:

In the *Data Analysis and Calculations* section, the commenter requested adding the concept of 'pro-rating.'

Response: Comment incorporated. A brief description of the pro-rating approach has been added.

Comment summary #31:

In the *Data Analysis and Calculations* section, the commenter recommended adding a description of the form of the curve used in the flow function schematic, and a description of what type of curve and what sort of curve-fitting protocol is used in the wall friction schematic that shows a curved wall yield locus.

Response: Comment not incorporated. A specific form or shape (linear, curved) is not assumed for any flow function. The schematic is intended to be illustrative for understanding and not for inferring any particular shape. The experimental data points should all fall on a common curve, but because of normal experimental error, a curve-fitting procedure is usually used to create the yield locus. Common mathematical curve-fitting approaches (for example, regression analysis) are acceptable in the majority of cases. As with all data analysis, the user needs to use their judgment on what degree of fit is acceptable and should be aware of potential curve-fitting problems (such as a negative y-axis intercept in the case of the yield locus). These general principles of "good data analysis" are not specifically described in this general chapter as they may reasonably vary from one occasion to another.

Comment summary #32:

The commenter suggested that the statement about choosing the most appropriate test should appear at the start of any full document, not in the *Data Analysis and Calculations* section.

Response: Comment incorporated. The *Introduction* section has been carefully reviewed and updated to ensure that appropriate guidance on test method selection is included.

Comment summary #33:

In the *Data Analysis and Calculations* section, the commenter requested changing the phrase "...equipment that is holding the powder" to "...equipment that contains..."

Response: Comment not incorporated. However, this phrase has been updated to eliminate the word "holding."

Comment summary #34:

In the *Data Analysis and Calculations* section, the commenter recommended balancing the statement about operator performance with the potential for variability in the test powder, which can vary between tests and can be susceptible to humidity, temperature, electrostatics, and other factors.

Response: Comment incorporated. This point is now explicitly stated in several locations in the updated general chapter.

Comment summary #35:

In the *Reference Materials and Reproducibility* section, the commenter suggested including a note stating that CRM-116 can also be supplied by some of the shear cell manufacturers themselves in a more usable volume than the minimum quantity supplied by the European

Commission.

Response: Comment incorporated.

Comment summary #36:

In the *Reference Materials and Reproducibility* section, the commenter noted that the statement that suggests that pharmaceutical powders can be more cohesive than CRM-116 seems a little odd in isolation. Although this is true in some instances, there are many pharmaceutical powders—particularly some of the more common excipients—that are very much more free flowing than the limestone.

Response: Comment incorporated. This statement has been removed from the revised general chapter text.

Comment summary #37:

In the *Appendix*, the commenter recommended adding units (degrees) for Angle of internal friction.

Response: Comment incorporated.

Comment summary #38:

In the *Appendix*, the commenter suggested including the point that Bulk density may be a function of the sample preparation prior to any test.

Response: Comment incorporated. The revised text states that this property is a function of the sample history and applied normal stress.

Comment summary #39:

In the *Appendix*, the commenter recommended adding units (Pa, kPa) for Cohesion.

Response: Comment incorporated.

Comment summary #40:

In the *Appendix*, the commenter recommended adding units (degrees) for Effective angle of friction.

Response: Comment incorporated.

Comment summary #41:

In the *Appendix*, the commenter recommended adding a symbol (FF) for Flow function.

Response: Comment not incorporated. No symbol is used in the final version of the general chapter for the Flow function term.

Comment summary #42:

In the *Appendix*, the commenter recommended adding the FT4 rotational cell to the *Comments* column for Preconsolidation because it is also a step that is used for the FT4 rotational cell to limit travel of the shear head into the powder and reduce any wall effects.

Response: Comment not incorporated. However the table has been updated to reflect this point; this topic has also been expanded in the *Test Procedure* section.

Comment summary #43:

In the *Appendix*, the commenter recommended adding the FT4 powder rheometer shear cell accessory to the *Comments* column for Rotational shear cell.

Response: Comment incorporated.

Comment summary #44:

In the *Appendix*, the commenter suggested changing the current symbol for Unconfined yield strength to f_c .

Response: Comment incorporated.

Comment summary #45:

In the *Appendix*, the commenter recommended removing the references to Mass flow, Ratholing, and Funnel flow. Although absolutely relevant in the wider context, they are not described in detail in the body of the text and are a distraction and potential source of confusion.

Response: Comment not incorporated. These technical terms are used in the main body of the text, and thus they are defined in the *Appendix* for the reader's benefit.

The Use of Endotoxin as an Analyte in Biopharmaceutical Product Hold-Time Studies

Jay Bolden,^a Cheryl Platco,^b John Dubczak,^c James F. Cooper,^d Karen Zink McCullough^{e,f}

ABSTRACT

Low lipopolysaccharide recovery (LLR) has been reported in biopharmaceutical formulation matrices containing divalent-cation-chelating buffers and polysorbate. This poor recovery of biological activity as measured by the Bacterial Endotoxins Test (BET) led to questions regarding the utility of the *Bacterial Endotoxins Test* (85) as a robust predictor of pyrogenicity and patient safety. Our data demonstrate that the biological activity of laboratory-prepared endotoxin was fully recovered by *Limulus* amoebocyte lysate (LAL) assays and was pyrogenic in rabbits when spiked into undiluted matrices containing citrate and polysorbate. In sharp contrast, the activities of spikes of bacterial lipopolysaccharide (LPS) into the same poor-recovery conditions were rapidly lost to detection by LAL reagent and by rabbit pyrogen studies. Apparently, endotoxins, which contain LPS and other cell-wall components, have a conformation that allows recovery of activity to be resistant to LLR conditions and yet recoverable by LAL and pyrogen tests, demonstrating that natural endotoxins are a clinically relevant predictor of endotoxin activity, pyrogenicity, and thus, patient safety. These data plus the historical perspective on drugs formulated in chelating buffers and polysorbate support the contention that hold-time studies for parenteral drugs are not necessary because, in the unlikely case of endotoxin contamination, the BET will detect naturally occurring endotoxin through appropriate dilution and end-product testing as required by the compendial *USP-NF*. The data presented herein demonstrate that endotoxins, defined as cell-wall fragments of Gram-negative bacteria (GNB), are preferable to the purified LPS standards when used as analytes for endotoxin hold-time studies in undiluted biologics, should such studies be indicated.

INTRODUCTION

Because of its convenience and reliability, bacterial lipopolysaccharide (LPS) has historically been used for positive controls during the development of testing protocols for the detection of endotoxins in parenterals. The advent and ongoing availability of a global Reference Endotoxin Standard (RSE) enabled uniform sensitivity determination of *Limulus* amoebocyte lysate (LAL) reagents and calibration of secondary LPS standards, known as Control Standard Endotoxins (CSE). The use of these LPS preparations has served the parenteral industry well as primary and secondary calibration standards for suitability (inhibition/enhancements) studies and routine use of the assay. However, LPS is not endotoxin. Rather, it is the active entity in the endotoxin complex that resides within the cell walls of Gram-negative bacteria (GNB). Poor recovery of LPS activity, as measured by the Bacterial Endotoxins Test (BET) was reported in hold-time studies for a group of monoclonal antibodies (mAbs) that were formulated in the presence of divalent-cation-chelating buffers ("chelators") and polysorbate; replacement of magnesium cations did not mitigate this interference (1,2). Chen (2) further reported that a three-rabbit pyrogen test was reactive to a nominal LPS value of 7.5 Endotoxin units (EU)/kg. The term "low endotoxin recovery" (LER) was coined to describe this phenomenon. In contrast,

valid recovery of the LPS was achieved when the same product matrix was diluted in water for BET, according to suitability tests, and subjected to the *USP Bacterial Endotoxins Test* (85) BET.

Inferences were immediately drawn from the initial work of Chen and Vinther (1) that there is a potential public health concern because of the poor recovery of LPS activity, suggesting that the BET assay may not be a good predictor of pyrogenicity in parenteral products because of potential underquantification. As a result, Food and Drug Administration (FDA) reviewers have requested, in communications with parenteral firms, that firms conduct LPS hold-time challenge studies and rabbit pyrogen tests on new biological formulations that might be susceptible to LER conditions.

Notably, a number of investigators, including Chen (2), Bolden et al. (3,4), Platco (5,6), and Dubczak (7) have reported that a valid recovery of activity as measured by BET was achieved when laboratory-prepared endotoxin, rather than the purified LPS, was introduced to the undiluted mAb as the challenge material for the same hold-time studies.

Data presented below indicate that the so-called LER phenomenon is a unique form of BET interference that is caused by an alteration in LPS activity when it is introduced into an undiluted citrate/polysorbate matrix. Data will further show that endotoxin and LPS behave differently in experimental conditions representing this phenomenon. Conclusions drawn from the data suggest that LPS is unsuitable for non-BET hold-time studies where chelator/polysorbate formulae alter the activity of LPS, and that endotoxin prepared in the laboratory is the most appropriate analyte for these studies. Therefore, the purpose of this discussion is to support the proposition that LPS is an inappropriate surrogate for natural endotoxin when demonstrating the stability of assayable endotoxins.

THE BACTERIAL ENDOTOXINS TEST

The *USP* chapter (85) requires the user to demonstrate suitability of the chosen method with the material under test. Suitability is also known as the "test for interfering factors" or inhibition/enhancement testing.

Dilution in water for BET is the easiest and most common way to overcome test interferences. To conduct the compendial suitability study, a known amount of LPS is spiked into a diluted or otherwise prepared sample, not undiluted product, and activity is subsequently recovered from that preparation. As such, compendial suitability studies do not answer questions of: 1) possible inherent ability of the product formulation in its undiluted form to destroy, alter, or mask LPS activity; and 2) co-dilution of LPS with the product. See McCullough (8) for a discussion of suitability testing.

BET Test Interferences

Investigators from both FDA and industry have reported poor recovery of LPS activity in undiluted and inadequately diluted product (9–12). These reports consistently suggest that:

1. Most products, when tested undiluted, exhibit a level of interference with recovery of LPS activity using LAL reagent, and
2. The extent of the interference can be dependent on many product and assay attributes including, but not limited to, product matrix, product batch-to-batch variability, experimental design, data interpretation, vendor-specific lysate formulation, and BET method.

The following factors can significantly affect the ability of the compendial assay to recover LPS in suitability studies (13–15):

- Non-neutral pH range
- Insufficient divalent cations
- Chelating agents
- Surfactants
- Proteins
- Agents that denature proteins
- Container extractables
- Lipids and liposomes
- Metal ions

Each of these known interferences has a mitigation strategy involving dilution in water for BET or chemical intervention.

LPS Aggregation Interference

LPS aggregation is rapidly reduced when introduced into an undiluted matrix containing a chelating agent and a detergent. Data presented below indicate that the so-called LER phenomenon, redefined here as “low LPS recovery” (LLR), is a unique form of BET interference that is caused by LPS changes rather than inhibition of the LAL cascade. LLR relates to an altered state of the LPS analyte that results in diminished LAL activity and rabbit pyrogenicity. This discussion will show that endotoxin and LPS behave differently in an aqueous environment of chelator, detergent, and drug substance.

Tsuchiya (16) recently reviewed the ways that LPS is altered in the presence of dispersing agents. LPS aggregates can be dissociated by the detergent sodium deoxycholate (NaD) to monomers (17). Rabbit pyrogenicity was reduced coincidentally with reductions in LPS aggregation sizes. LPS pyrogenicity was completely lost in 0.5% NaD but was recovered after the NaD concentration was reduced by dilution or dialysis (16,17).

In summary, LPS is an amphipathic molecule that exists in an aggregated form in water (18). The LPS, in natural endotoxin, aggregates and forms micelles differently than those of purified LPS, because LPS in natural endotoxin is embedded in other GNB cell-wall components. Endotoxin micelles are larger and more spherical than LPS structures (19). Presumably, the size, shape, and the presence of other cell-wall components renders them more resistant to LLR conditions.

REDEFINING TERMS RELATED TO ENDOTOXIN AND LPS RECOVERY

Purified LPS does not exist in nature, and therefore cannot be present as a contaminant during parenteral product manufacture or in parenteral drug products. Although RSE and CSE are called “endotoxins”, RSE and CSE are preparations of purified LPS that are the biologically active portion of the natural endotoxin complex, but they are not endotoxins. The compendial RSE is an allocated number of vials of the 3rd International Standard prepared in 2012 for the World Health Organization by the National Institutes for Biological Standards and Control (NISBC) in England. This standard preparation contains highly purified LPS, lactose, and polyethylene glycol (PEG). The intended use of the International Standard is as a calibrant for

(85) (20).

The RSE is used for three purposes in the harmonized pharmacopeial chapter for BET to:

1. Assign a sensitivity to gel clot lysate or to confirm a standard curve range for quantitative BET methods
2. Standardize LPS/CSE secondary calibration standards
3. Execute suitability testing (inhibition/enhancement) as required by *USP* (85). However, LAL users almost always use CSE, a secondary calibration standard, for this purpose to conserve RSE.

The authors recognized the need for more precise definitions of endotoxin-related terms to address LLR issues and for consistency in further public discussions and publications. For clarity, we offer the following endotoxin definitions. We caution the reader on three fronts: 1) the terms "endotoxin", "LPS", and "RSE/CSE" are not interchangeable, because they have specific technical meanings; 2) the terms "activity" and "potency" are not synonymous, because they are defined by different units; and 3) the terms "standardization" and "characterization" are not synonymous.

Bacterial Endotoxins and LPS

The terms endotoxin, LPS, and RSE/CSE are not interchangeable, because they have specific technical meanings. Bacterial endotoxins, often termed "naturally occurring endotoxins" (NOE), are components of the outer cell walls of GNB. Endotoxins exist as vesicles containing the active LPS molecule, outer membrane surface proteins, lipoproteins, and phospholipids. Endotoxins found in pharmaceutical products are cell-wall fragments shed as the result of the normal GNB life cycle. Although control of endotoxins in pharmaceutical manufacturing has improved considerably since the introduction of the BET, whole GNB and/or cell-wall fragments containing endotoxins may enter the manufacturing process via raw materials, particularly those from natural sources, processing equipment that was not cleaned and dried properly, and water. Endotoxins may be prepared in the laboratory from a GNB of known origin under a set of well-documented and well-controlled conditions. For the purposes of this discussion, the terms "endotoxins", "laboratory-derived endotoxins", and "naturally occurring endotoxins" are synonymous, because these are the analytes of clinical relevance, namely pyrogenicity, and LPS refers to the primary and secondary calibration standards.

LPS is the pyrogenic component of the endotoxin molecule. LPS, however, is not endotoxin, because it is only one component of the cell-wall fragment. Given its highly purified status, it is used primarily as a calibrant to standardize LAL reagents and to perform compendial suitability studies.

For the purpose of this article the term, endotoxin refers to laboratory-derived endotoxin, and the term LPS refers to the primary and secondary calibration standards.

Activity, Potency, and Concentration

The terms activity and potency are not synonymous, because they are defined by different units and therefore define different attributes. Historically, the term, activity has been defined as the biological effect of an endotoxin or LPS preparation on the fever response in mammals as

measured by the *Pyrogen Test* (151) (21). Since the advent of the BET, the definition has been expanded to include the effect of LPS or endotoxin on the LAL cascade as measured in any of the (85) assays. The EU is the unit of measure of activity in a BET assay.

The potency, or specific activity, of an LPS preparation is the level of activity per unit weight, usually expressed as EU/ng or EU/pg. Purified LPS preparations from different GNB may have different potencies, but in each case, their presence, after addition to a liquid preparation, is measured in terms of their activity in EU/mL. Determination of the potency of a CSE is conducted by comparing the activity of the primary standard (RSE) in EU/mL with the activity of the CSE in ng/mL. The units for the resulting potency determination for the CSE are EU/ng. Potency and activity are clearly related but are not synonymous. Because laboratory-derived endotoxin preparations are liquid, they are not measured by potency but rather by concentration, which is expressed as activity per unit volume, or EU/mL. The measure of activity for BET assays is EU/mL in a sample preparation. BET assays are not sensitive to the origin of the activity (LPS or endotoxin), and they cannot distinguish between bacterial species or preparations by a level of activity. To the BET assay, 1 EU = 1 EU, regardless of the origin.

Standardization and Characterization

As measured by a BET assay, standardization is a term used to describe the process of comparing the activities of the primary standard in EU/mL, and the secondary standard, in ng/mL is used to assign a relative activity to the secondary standard in EU/mL. Characterization is the assignment of a biological activity concentration value (EU/mL) to a liquid laboratory-derived endotoxin preparation.

REPLICATING LOW-RECOVERY PHENOMENON

LER was reported after experiments that were undertaken to fulfill one firm's broad interpretation of Question 3 of the 2012 FDA BET Guidance, indicating that assayable endotoxin must remain detectable during sample storage and hold times (22). Chen and Vinther (1) reported that when CSE was added to their undiluted mAb product that was formulated in a citrate/polysorbate matrix at a nominal value of 5 EU/mL, approximately 80% of the activity of the LPS spike was not recoverable within the first 4 h of storage at 2–8°. This effect was greater when samples were kept at room temperature, but at either temperature, essentially no LPS activity was recovered at 24 h. Chen (2) further reported that in a three-rabbit test, the rabbits were reactive to a nominal value of 7.5 EU of LPS/kg of the product matrix, whereas the LAL test remained nonreactive (<0.125 EU/mL for gel clot and <0.05 EU/mL for kinetic chromogenic assay).

Because protein solutions formulated in a chelator with a surfactant are common in biotechnology products, a number of industry BET scientists including Jay Bolden (Eli Lilly and Company), Cheryl Platco (Merck Research Laboratories), and John Dubczak (Charles River Laboratories) have independently attempted to replicate the LER response and rabbit pyrogen data originally reported by Chen and Vinther (1,2).

At the 2014 Bacterial Endotoxin Summit (7), Dubczak presented unpublished data on the rapid decay of the RSE in the LER polysorbate 20/citrate matrix. The results shown in *Figure 1* indicate that 80% of the RSE activity is lost in 15 min. Ninety percent of the RSE activity is lost within 30 min. These data demonstrate that, in the absence of proteins, the polysorbate 20/citrate matrix is capable of producing a rapid and extreme loss of LPS activity. Because of

this rapid loss of activity, LER investigational studies using LPS must consider an immediate mitigation/neutralization strategy to obtain a more accurate zero time measurement.

RSE Decay in Tween/Citrate/Saline Matrix

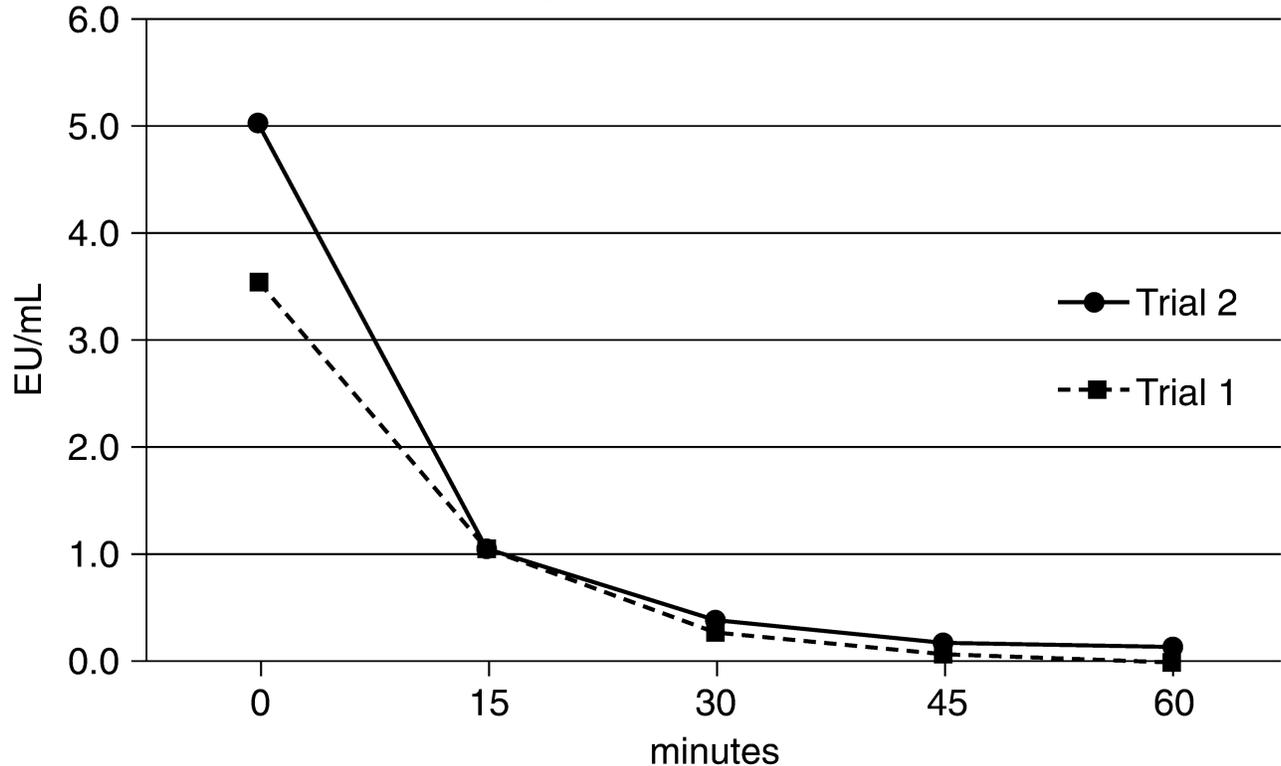

Figure 1. RSE decay in a polysorbate 20/citrate LER matrix.

Bolden et al. (3), Platco (5), and Dubczak (7) have consistently reported that the LER phenomenon is effectively mitigated when endotoxins, prepared from various GNB, were used for the analyte instead of LPS. In 2011, Bowers and Lynn (23) published a method for the laboratory preparation of endotoxin. Dubczak’s and Bolden’s preparation methods were different, but all methods yielded a characterized and stable endotoxin stock preparation for use in hold-time studies.

Figure 2 shows the results of challenge studies conducted by Bolden and colleagues (3) where both laboratory-derived endotoxin and LPS were used to spike approximately 18 EU/mL into three different batches of a low-protein concentration, mAb formulated in a citrate/polysorbate 80 buffer. Samples were stored in the final product glass container at 2–8° (3,4). The *solid lines* represent activity in EU/mL when endotoxin was used as the analyte for the study; the *broken lines* represent activity in EU/mL when LPS (CSE) was used as the analyte. A significant drop in recovery of LPS activity was seen at day 2 and beyond, whereas recoveries of endotoxin activity were approximately 100%.

Recovery of LPS and Endotoxin Activity in a Low Protein Concentration Monoclonal in a Citrate/polysorbate 80 Buffer

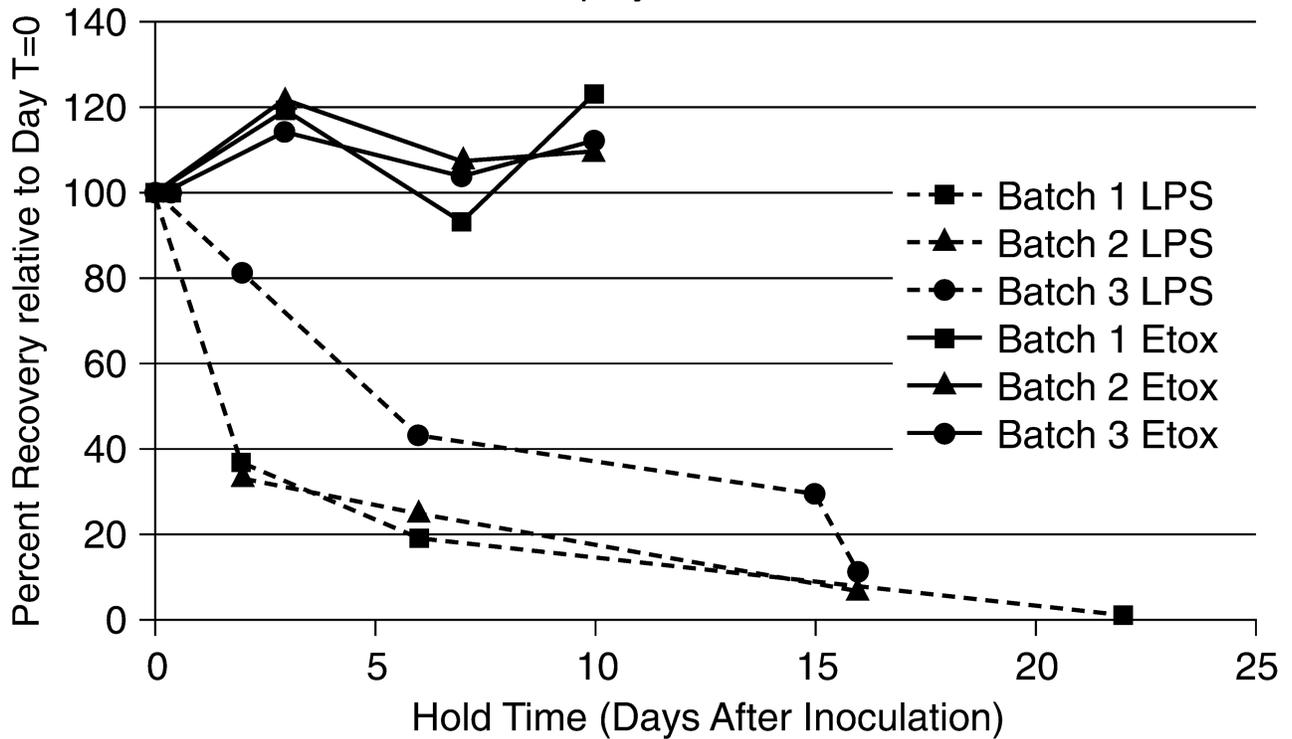

Figure 2. Recovery of LPS and endotoxin activity in challenge studies.

Platco (5,6) also studied the relative recoveries of LPS and endotoxin activity (nominal spike, 7.5 EU/mL) in two different mAb preparations formulated in a citrate/polysorbate buffer system. Spiked solutions were held at 2–8° in borosilicate glass. *Figure 3* presents Platco’s results, where the *solid lines* represent endotoxin recoveries, and the *broken lines* represent LPS recoveries.

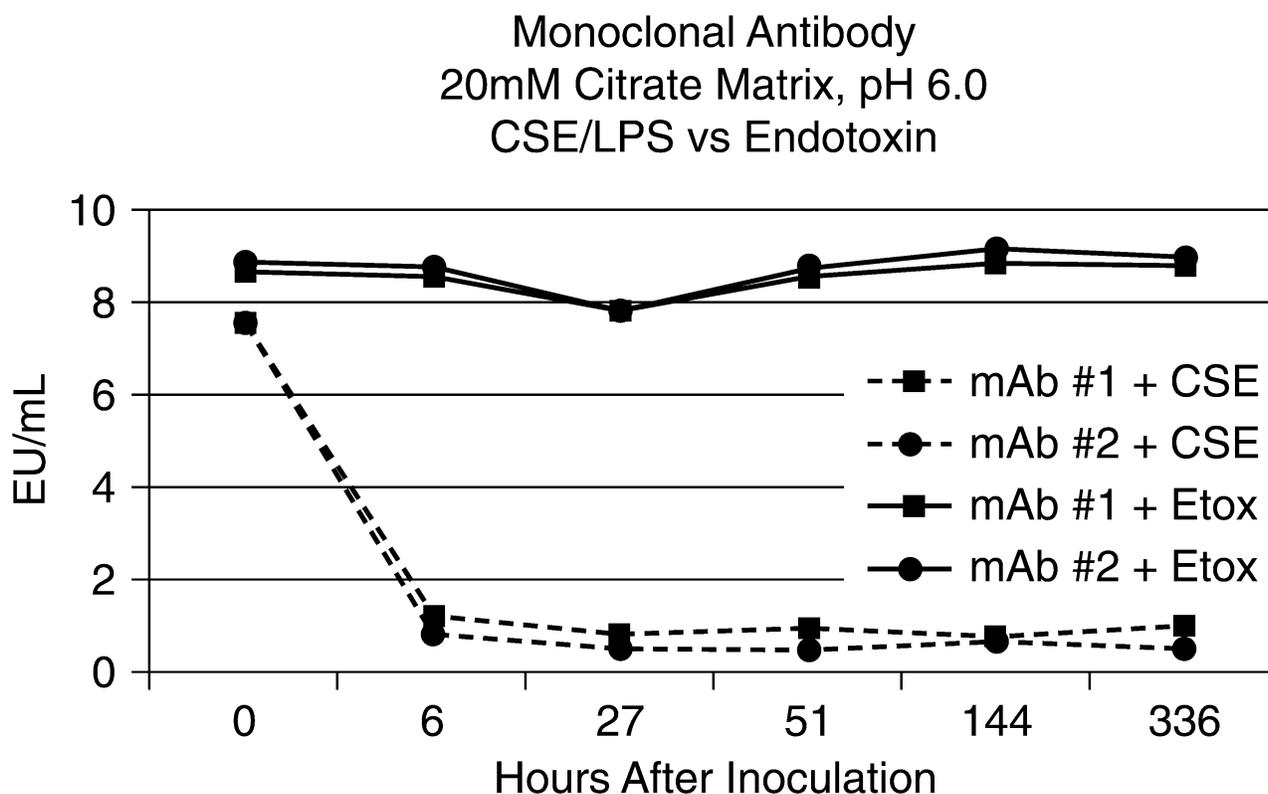

Figure 3. Recovery of LPS and endotoxin activity in two mAb preparations.

Figure 3 reveals a significant and permanent drop in activity at a point between $T = 0$ and $T = 6$ h using LPS as the spike, which is consistent with data reported by Chen and Vinther (1) and Bolden et al. (3,4). However, consistent with Bolden's observations in Figure 1 and other published studies, recoveries of endotoxin activity were repeatedly observed to be approximately 100% for the full 336-h (14-day) term of the challenge study (3-7). Platco (5) reported that a similar phenomenon was observed with other mAb formulations, and that the use of endotoxin as the analyte for these formulations mitigated recovery issues for all other matrices studied.

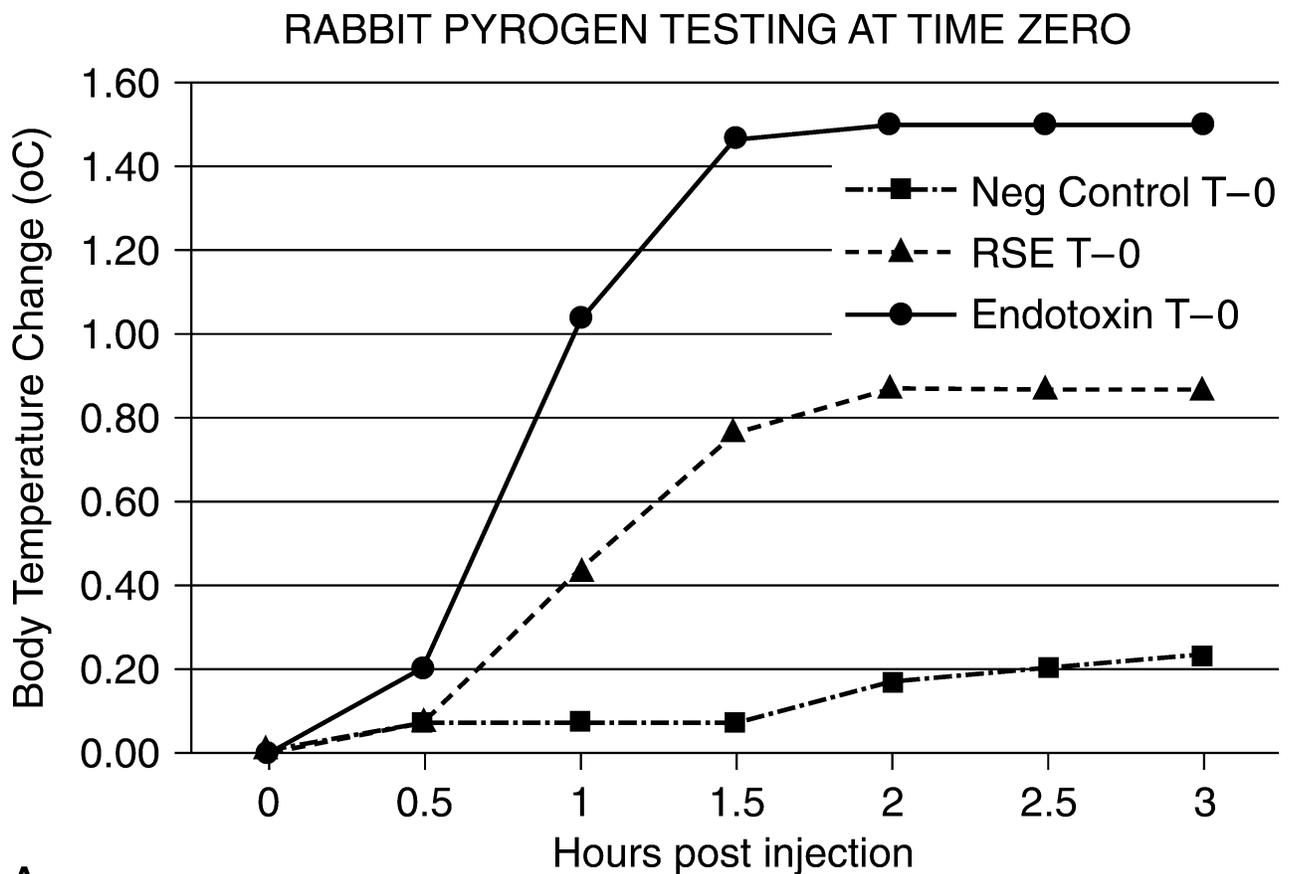

LER and the USP Rabbit Pyrogen Test

Chapter (151) is a compendial test for pyrogens that requires the measurement of rabbit temperature for 3 h after injection with the material under test. The test is initially performed on three rabbits. If no rabbit shows an individual temperature rise of 0.5° or more over baseline, the product meets the requirements for the absence of pyrogens. However, if any rabbit shows an individual temperature rise of 0.5° or more, the test is continued on five more rabbits for a total of eight. This extension is allowed because of the highly variable nature of this biological test system. If NMT three of the eight rabbits show individual rises in temperature of 0.5° or more, and if the sum of the eight-rabbit maximum temperature increases does not exceed 3.3° , the material under test meets the requirements for the absence of pyrogens.

Dubczak (7) extended his experimental work with LPS and endotoxin to compare the relative activities of these preparations to both rabbit and BET tests. Data from these experiments are seen in Figures 4a and 4b. The experimental design for the rabbit/BET comparison was as follows:

1. Polysorbate 20/citrate buffer with no active ingredient was used for all testing.

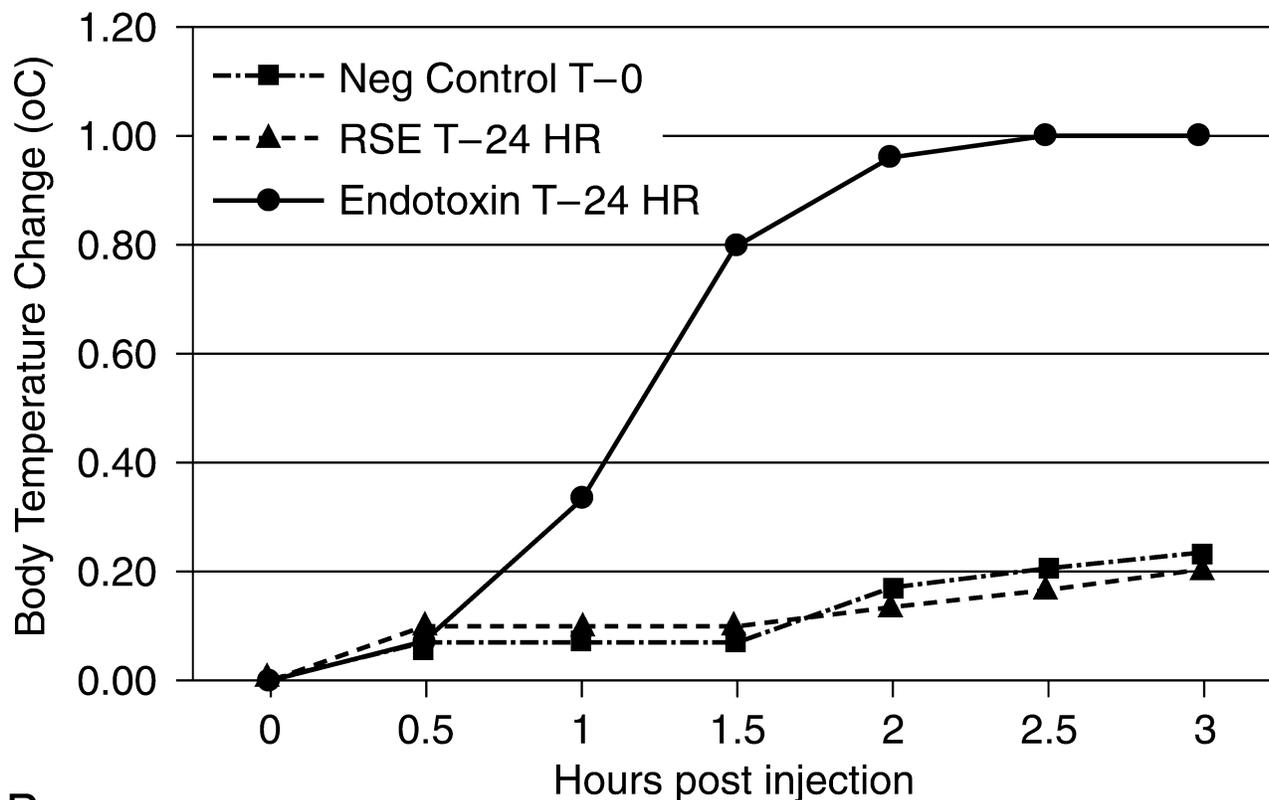

2. RSE was used to spike the matrix. It was reconstituted and vortex mixed according to the package insert.
3. Parallel sets of experiments were conducted: one with RSE and the other with bacterial endotoxin prepared from *Enterobacter cloacae*, ATCC 7256.
4. The stock concentration for both analytes (LPS and endotoxin) was nominally 40 EU/mL.
5. A negative control of normal saline was used to establish the baseline for the rabbit test.
6. The rabbit injection dose was 1.5 mL/kg, which equals about 60 EU/kg for a young adult rabbit.
7. BET and rabbit testing were coordinated to assure that rabbit injection and the LAL assay were initiated at precisely the same time, resulting in true zero-time testing.
8. The BET assay was a standard kinetic chromogenic assay.

A

Figure 4a. Rabbit pyrogen test at $T = 0$ for a citrate/polysorbate 20 buffer spiked with both endotoxin and RSE.

RABBIT PYROGEN TESTING AT 24 HOURS

B

Figure 4b. Rabbit pyrogen test at $T = 24$ h for a citrate/polysorbate 20 buffer spiked with both endotoxin and RSE.

Dubczak's (7) rabbit data at 24 h are in conflict with the three-rabbit data reported by Chen (2). At the beginning of the study ($T = 0$), rabbits responded to both endotoxin and RSE preparations stored in citrate/polysorbate buffer. Given that the rabbits received the same level of RSE and endotoxin, the temperature rise was consistently higher at 24 h with endotoxin than with RSE, which did not differ from the control (*Figure 4b*). Furthermore, at 24 h, the rabbit responded only to the preparation containing endotoxin, demonstrating that after the hold time, the RSE became not only nondetectable by the BET assay but also nonreactive in the rabbit, presumably due to buffer-induced disaggregation of RSE activity. The chromogenic BET results for these experiments are provided in *Table 1*.

Table 1. LAL Results for LAL/Rabbit Studies (*Figures 4a and 4b*)

Material	$T = 0$	$T = 24$
RSE/LPS	34.3 EU/mL	<0.5 EU/mL
Endotoxin	31.7 EU/mL	12.2 EU/mL

LAL data for the RSE and five endotoxins are described in *Figures 5a and 5b* (24). These data confirm that the RSE lost both pyrogenicity and LAL activity after the 24-h hold period. Both pyrogenicity and LAL activity were retained for all of the endotoxin preparations after 24 h. Taken together, these data confirm that: 1) endotoxin is a better analyte for any hold-time study involving biotechnology product matrices than the surrogate LPS, and 2) the BET is an excellent predictor of pyrogenicity.

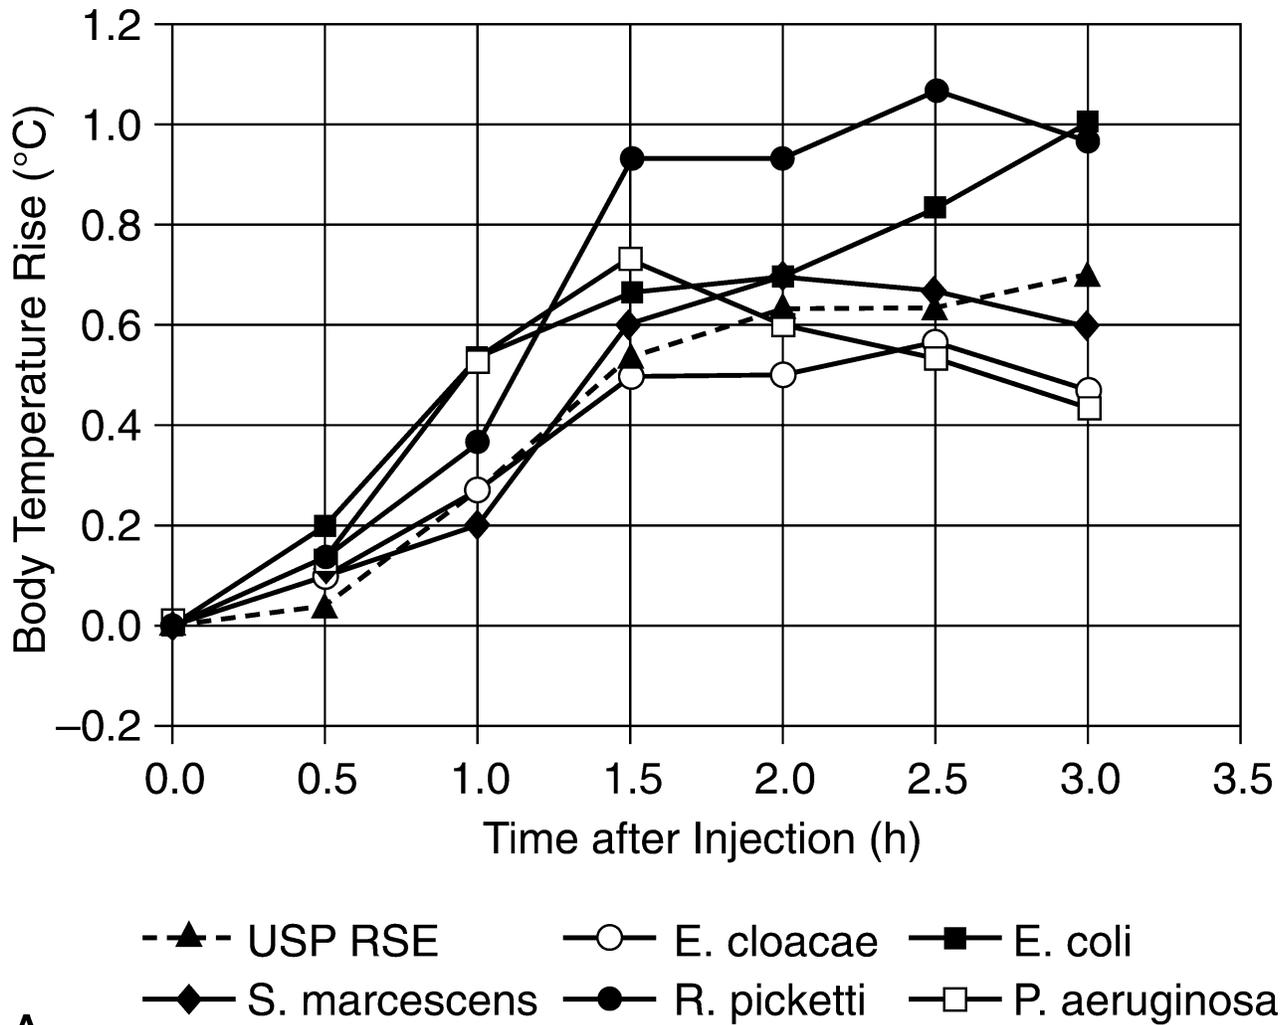

Figure 5a. Average temperature rise with a three-rabbit test in a polysorbate 20/citrate/NaCl matrix at $T = 0$. *S. marcescens*, *Serratia marcescens*; *E. cloacae*, *Enterobacter cloacae*; *R. picketti*, *Ralstonia picketti*; *E. coli*, *Escherichia coli*; *P. aeruginosa*, *Pseudomonas aeruginosa*.

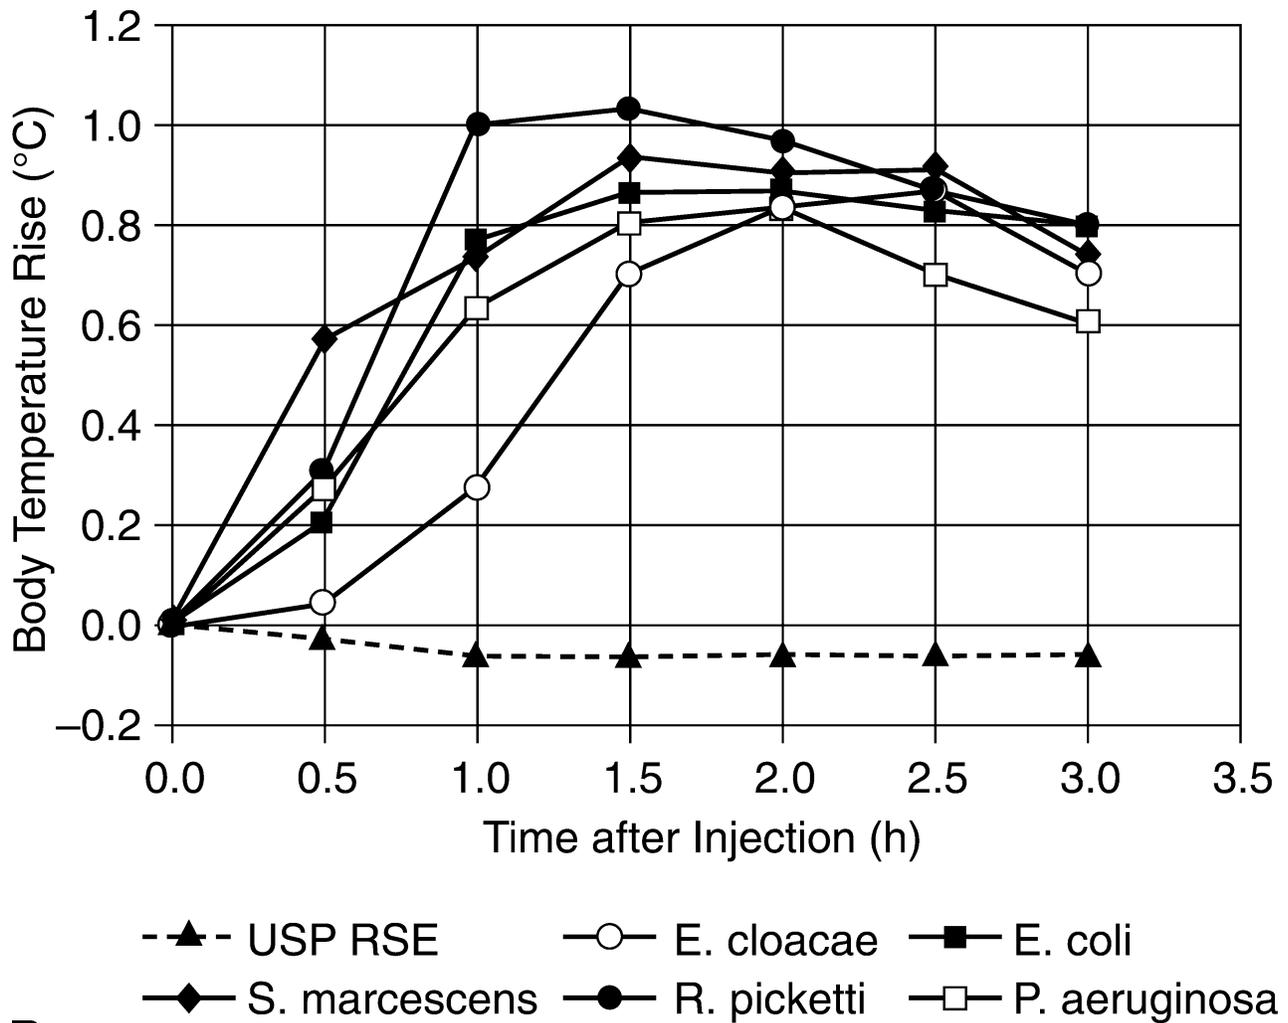

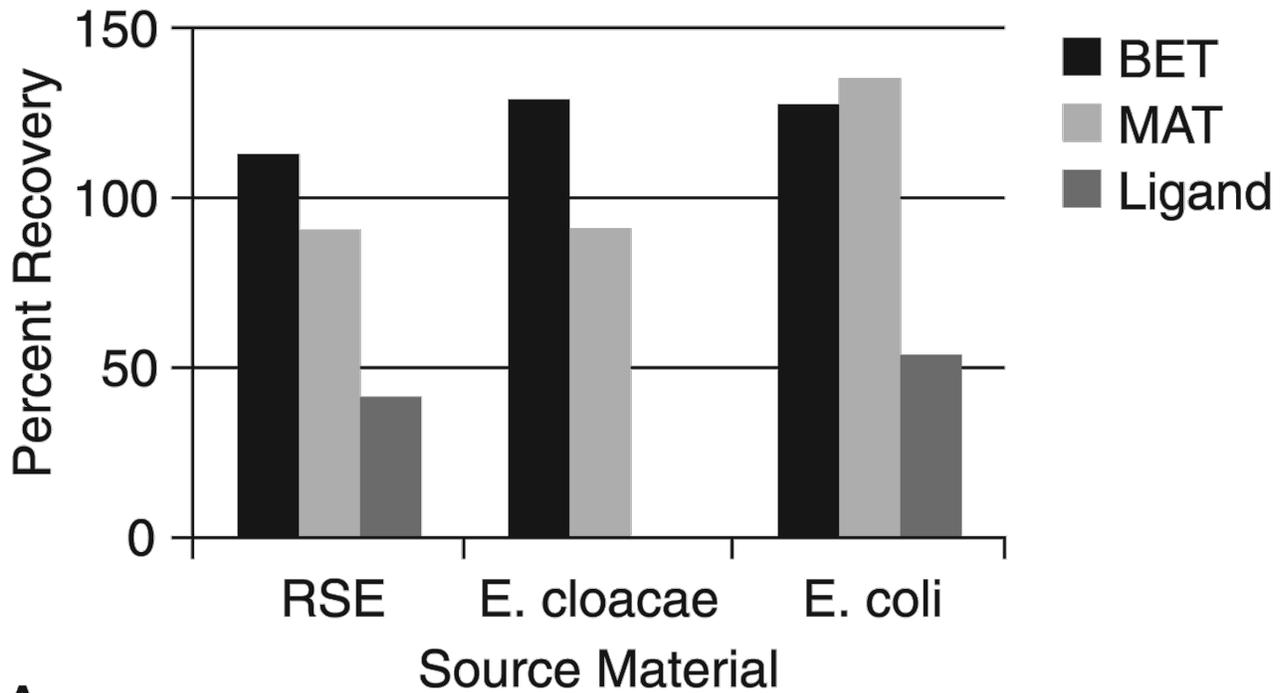

Figure 5b. Average temperature rise in a polysorbate 20/citrate/NaCl matrix at $T = 24$ h. *S. marcescens*, *Serratia marcescens*; *E. cloacae*, *Enterobacter cloacae*; *R. picketti*, *Ralstonia picketti*; *E. coli*, *Escherichia coli*; *P. aeruginosa*, *Pseudomonas aeruginosa*.

Alternative Methods for Endotoxin Detection

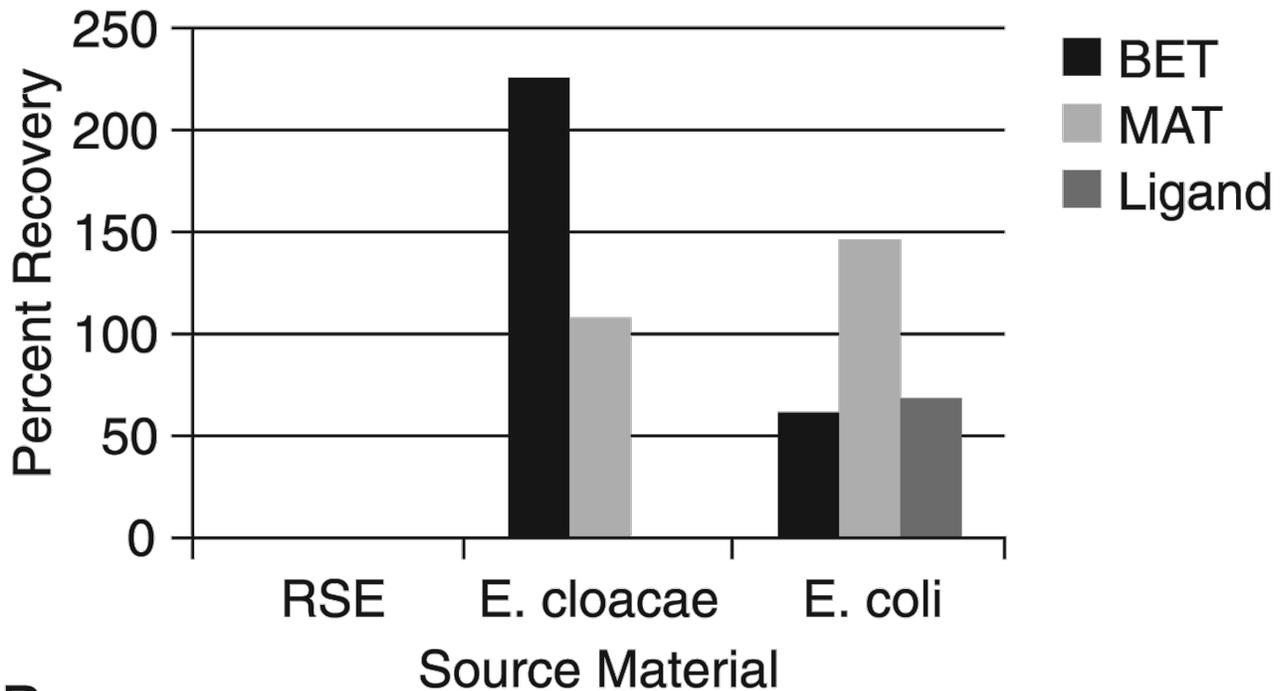

Dubczak (7) concurrently studied the LLR effect using a chromogenic LAL assay, the monocyte activation test (MAT), and a commercially available ligand assay. Comparative data are presented in Figures 6a–6c for a normal saline diluent control, a polysorbate 20/citrate buffer, and a protein formulated in polysorbate 20/citrate, respectively. These studies used laboratory-derived endotoxins from *E. cloacae* and *E. coli* and RSE. All assays were conducted according to the manufacturers’ instructions. All LAL, MAT, and ligand test samples were stored at 2–8° in borosilicate glass containers and analyzed at zero time and 24 h concurrently; i.e., all samples were executed on the same analysis plate and analyzed against the same standard curve. For Figures 6a–6c, the solid black bars represent activity measured by an LAL chromogenic assay, striped bars represent activity by the MAT assay, and dotted bars represent activity as measured by the ligand assay.

A

Figure 6a. Normal saline (NaCl) control, nominal spike value = 50 EU/mL.

Figure 6a shows the relative percent recovery after a 24-h hold in normal saline, as measured by the three test methods. Given the nominal spike value of 50 EU/mL, the data indicate that both the BET and the MAT recovered endotoxin at approximately 100%. In contrast, the ligand test recovered <50% of the RSE, approximately 50% of the *E. coli* endotoxin but none of the *E. cloacae* endotoxin.

B

Figure 6b. Citrate/polysorbate 20/NaCl, nominal spike value = 50 EU/mL.

Experiments in *Figure 6b* measure the recovery of activity of RSE, as well as *E. coli* and *E. cloacae* endotoxin in a citrate/polysorbate/NaCl buffer after a hold of 24 h at 2–8°. The BET and MAT detected both the *E. coli* and *E. cloacae* endotoxins, but the ligand test detected only the *E. coli* endotoxin. None of the tests detected RSE after the 24-h hold time.

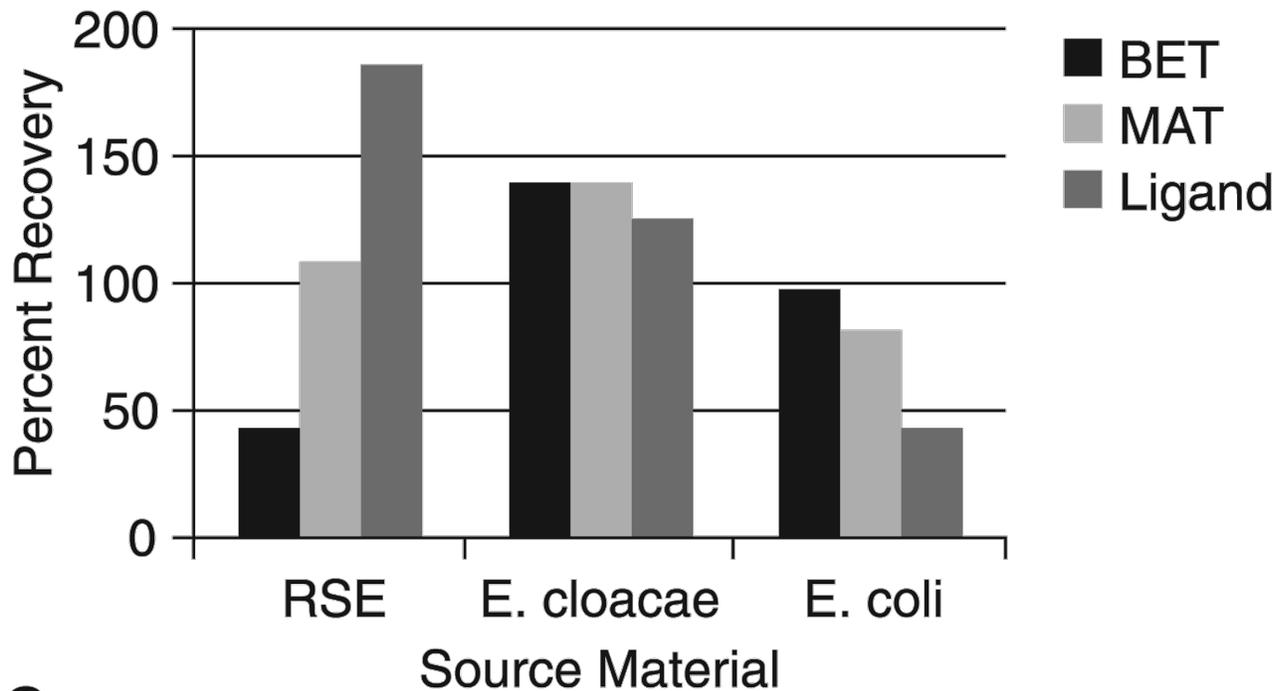

Figure 6c. Product protein in citrate/polysorbate 20/NaCl matrix, nominal spike value = 50 EU/mL.

Data in *Figure 6c* suggest that the presence of drug substance protein in the formulation matrix provides some level of protection from the LLR effect, because the presence of the drug substance improved recovery of *E. cloacae* endotoxin activity in the ligand assay.

Data from these studies suggest:

1. The LAL test is the most consistent of the three tests in the detection of endotoxin activity in each of the three matrices.
2. The endotoxin preparations are consistently detected in the saline and the product matrix.
3. The RSE standard is recovered for the 24-h hold time relative to the nominal spike in the control matrix and in the citrate/polysorbate/protein matrix but not in the matrix containing citrate/polysorbate.

Experimental Design

Because of the biological nature of LAL reagents, the compendia and regulatory authorities recognize some variability in test results. However, when undertaking any BET study, particularly hold-time studies, strict attention must be paid to experimental design and data interpretation. For example:

- When measuring $T = 0$, the laboratory must be attentive to the fact that the LLR phenomenon can happen very quickly after addition of the LPS spike; therefore,

measurement should be taken immediately after the addition of the LPS.

- Bolden et al. (3) described an association between variability in y -intercept and the extent of the LER effect, demonstrating the clear impact of standard curve control on the accuracy of any tests result. When corrected for the y -intercept variability, the LER effect was significantly reduced, demonstrating that experimental design and attention to control strategies for inherent assay variability are important factors when screening for LER as well as for routine testing. For an in-depth discussion of standard curve effects on the accuracy of test results, see McCullough (8).
- Rabbit pyrogen testing is notoriously subject to many variables. When performing pyrogen tests, be certain that the requirements and interpretation described in (151) are strictly held, and that the person performing the test is experienced to avoid false-positive results.

DISCUSSION

Biological formulations containing protein, chelating buffer, and polysorbate have been in production since the late 1980s and have been tested/released using the compendial BET assays with no reports of pyrogenic outbreaks, suggesting that assayable endotoxin in these products has been detected appropriately for about 30 years. It was only after one company's broad interpretation of Question 3 in the current FDA Guidance that the suggestion of underquantitation of endotoxin activity by the BET assay was made using LPS as a surrogate for contaminating endotoxin.

Studies conducted by Bolden et al. (3,4), Platco (5,6), and Dubczak (7) replicated earlier reports of loss of LPS activity by a product matrix consisting of polysorbate and citrate or phosphate buffers. Parallel studies using LPS and naturally derived endotoxin demonstrated that endotoxin is the appropriate analyte for conducting challenge studies in these formulations, because they are the more appropriate surrogates for real-life, cell-wall fragment contaminants. Endotoxin activity was recovered within acceptable assay variability when endotoxin was used as the analyte in LLR conditions and the experimental design and assays were tightly controlled. Although LPS preparations may be well characterized by the *USP-NF Pharmacopeia* for specific uses as a standard for biological activity (pyrogenicity) and as a calibration standard for the BET assay, LPS bears little resemblance to the endotoxin analyte that might be present during pharmaceutical manufacturing. In retrospect, to expect purified LPS activity to react similarly to endotoxin contamination in all situations is both unrealistic and unreasonable.

CONCLUSION

Chelating buffers with detergents, such as citrate and polysorbate, are excellent carriers for delivering vital therapeutic agents, particularly mAbs. Although LPS is the convenient form of endotoxin used for experimentation, it is rapidly rendered nonreactive in the BET assay and nonpyrogenic in the presence of such carriers. The proper term for this phenomenon is LLR. Fortunately, naturally occurring endotoxin, the actual pyrogenic contaminant from Gram-negative bioburden, remains LAL active and pyrogenic in rabbits under prescribed LLR storage conditions. Although the presence of endotoxin is improbable, 30 years of history plus data derived from controlled experiments indicate that endotoxin contamination in drug product would clearly be detected by verified USP methodology. We conclude that LLR poses no public health concern, that the phenomenon presents no threat to the utility, accuracy, and repeatability of the BET, and that a continued requirement to execute LLR experiments using

the surrogate LPS analyte is a resource-laden exercise with little value.

Please address comments on *Pharmacopeial Forum* content to
USP Executive Secretariat
12601 Twinbrook Parkway
Rockville, MD 20852
execsec@usp.org

ISSN: 1542-1945

Pharmacopeial Forum is covered in *Current Contents/Life Sciences* and in the *Science Citation Index (SCI)*, in *International Pharmaceutical Abstracts*, and in *Current Awareness in Biological Sciences*.

The United States Pharmacopeial Convention comprises representatives from academic institutions; health practitioner and scientific associations; consumer organizations; manufacturer and trade associations; government bodies and associations; and non-governmental standards-setting and conformity assessment bodies. It publishes the U.S. Pharmacopeia and National Formulary, the legally recognized compendia of standards for drugs and products of other health care technologies. The USP and NF include assays and tests for the determination of strength, quality, and purity and requirements for packaging and labeling. **Pharmacopeial Forum's Public Review and Comment Process**

This section presents an overview of the public review and comment process, conducted through *Pharmacopeial Forum (PF)*, for the development of official standards in the *United States Pharmacopeia* and the *National Formulary (USP-NF)*.

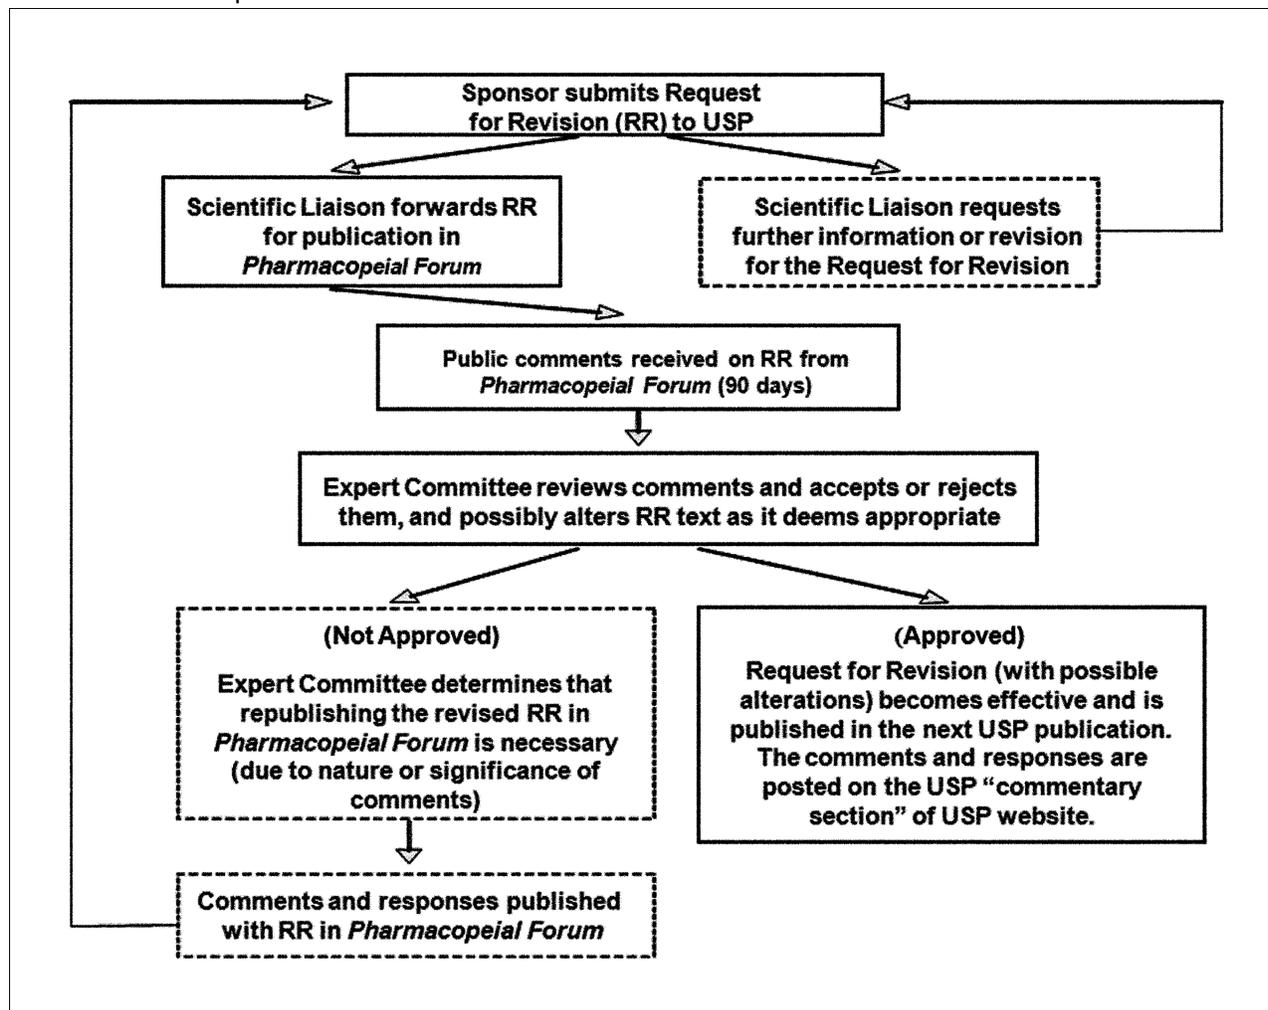

USP publishes *PF* on a bimonthly basis to provide an opportunity to review and comment on new or revised standards.

There are two types of proposed revisions in *PF*:

1. **Proposed Revisions**—New or revised standards targeted for adoption through USP's Standard Revision Process. USP's Revision Process calls for publication of a proposed revision in *PF* for a 90-day notice and comment period. After the comment period and subsequent review of comments and approval by the relevant USP Expert Committee, the official standard is published in the next available *USP-NF* or *Supplement*. If comments received are significant, or if the Expert Committee's consideration of comments results in significant additional changes, the Expert Committee may determine that republishing in *PF* is necessary prior to the revision becoming official. See the *In-Process Revision* section for current proposed revisions.
2. **Proposed Interim Revision Announcements**—New or revised standards that become official through an accelerated process in accordance with USP's Guideline on Accelerated Revisions (available on the USP Web site). *Interim Revision Announcements (IRAs)* allow for a revision to become official prior to the next *USP-NF* or *Supplement*. *IRAs* are first presented for a 90-day public comment period in the *Proposed Interim Revision Announcement* section of the *PF*. Note that final *IRAs*, as well as *Errata*, and *Revision Bulletins*, which also are defined in the Accelerated Revision Guideline, appear only on the USP Web site.

USP welcomes comments and data on proposed revisions. A summary of comments received, along with USP’s responses, will be published in the *Revisions and Commentary* section of the USP website (<http://www.usp.org/USPNF/revisions/>).

The chart below shows the public review and comment process and its relationship to standards development.

Questions on the process should be addressed to the USP Executive Secretariat, United States Pharmacopeia, 12601 Twinbrook Parkway, Rockville, MD 20852 (e-mail: execsec@usp.org).

HOW TO USE PF

The various sections of *PF* are briefly described below. A more detailed description of each section is provided at the beginning of that section. A general description of the types and amount of information expected in a *Request for Revision* is available in the *Guideline for Submitting Requests for Revision to the USP–NF* on the USP Web site (www.usp.org/USPNF/submitMonograph/subGuide.html). Note that the Expert Committee listing and the Scientific Staff Directory also are located on the USP Web site (see below for links).

Staff Directory

Names and contact information of key USP scientific staff members who work on the development of USP compendial standards

(<http://www.usp.org/USPNF/devProcess/contactScientists.html>)

Proposed Interim Revision Announcements

This section includes proposals for *Interim Revision Announcements (IRAs)* that will be published as official *USP* or *NF* standards. There is a 90-day comment period for these proposals (see <http://www.usp.org/USPNF/pf/pfRedesign.html> for the *PF* comment schedule). Readers should review material in this section and provide comments to the Scientific Liaison using the contact information appearing at the end of each proposed *IRA*. Information on how to comment can be found under the "Participation" section of www.usp.org. It is important to send comments promptly so that the Expert Committee members can consider reader's input as they are deciding whether to advance standards to official status. The approved official text will be published under *IRAs* in the "New Official Text" section of USP's Web site.

Each proposal is preceded by a Briefing that indicates the proposed revisions.

Symbols—New text is enclosed in symbols and set off from the current official text as shown in the following example: *new text*. Where the symbols appear together with no enclosed text, such as ***, it means that text has been deleted and no new text was proposed to replace it. In all revisions, the closing symbol is accompanied by an identifier that indicates the date the proposal, if approved, will become official as an *IRA*. For example, *(IRA 1-Apr-2011)

BRIEFING

Ketorolac Tromethamine, *USP 38* page 4010. On the basis of comments received, it is proposed to make the following changes:

1. Replace the *UV Identification* test *B* with an orthogonal identification test based on HPLC retention time agreement from the *Assay*.
2. Reinstate the individual unspecified impurity limit to the test for *Organic Impurities*, which was inadvertently omitted during the monograph redesign.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

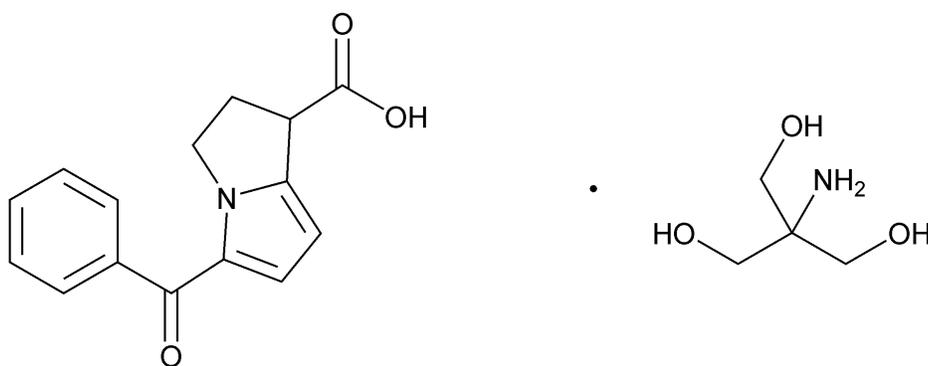

The comment period for this revision ends on Jan 31, 2016. In the absence of significant adverse comments, it is proposed to implement this revision through an *Interim Revision Announcement*, with an official date of May 1, 2016.

(CHM2: H. Cai.)

Correspondence Number—C161928

Comment deadline: January 31, 2016

Ketorolac Tromethamine

1*H*-Pyrrolizine-1-carboxylic acid, 5-benzoyl-2,3-dihydro, (±)-, compound with 2-amino-2-(hydroxymethyl)-1,3-propanediol (1:1);
 (±)-5-Benzoyl-2,3-dihydro-1*H*-pyrrolizine-1-carboxylic acid, compound with 2-amino-2-(hydroxymethyl)-1,3-propanediol (1:1) [74103-07-4].

DEFINITION

Ketorolac Tromethamine contains NLT 98.5% and NMT 101.5% of ketorolac tromethamine ($\text{C}_{15}\text{H}_{13}\text{NO}_3 \cdot \text{C}_4\text{H}_{11}\text{NO}_3$), calculated on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption** (197K)

Delete the following:

- ~~• **B. Ultraviolet Absorption** (197U)~~

~~**Sample solution:** 10 µg/mL~~

~~**Medium:** Methanol~~

~~**Acceptance criteria:** Meets the requirements (IRA 1-May-2016)~~

Add the following:

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. (IRA 1-May-2016)

- **C. Thin-Layer Chromatography, Tromethamine Test**

Diluent: Dichloromethane and methanol (2:1)

Standard solution: 5 mg/mL of USP Ketorolac Tromethamine RS in *Diluent*

Sample solution: 5 mg/mL of Ketorolac Tromethamine in *Diluent*

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 40 µL

Developing solvent system: Dichloromethane, acetone, and glacial acetic acid

(95:5:2)

Spray reagent: Freshly prepared alcoholic solution containing 30 mg/mL of *ninhydrin*

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and allow the solvent to evaporate. Spray the plate with *Spray reagent*, and heat the plate at about 150° for 2–5 min.

Acceptance criteria: Yellow spots with pink to purple borders develop on the plate in the areas where the *Standard solution* and the *Sample solution* were applied.

ASSAY

• Procedure

Protect all the solutions from light.

Buffer: 5.75 g/L of *monobasic ammonium phosphate*. Adjust with *phosphoric acid* to a pH of 3.0.

Mobile phase: *Tetrahydrofuran* and *Buffer* (30:70)

Diluent: *Tetrahydrofuran* and water (30:70)

System suitability solution: In a 250-mL separator, mix 100 mL of water, 100 mL of *dichloromethane*, 30 mg of USP Ketorolac Tromethamine RS, and 1 mL of 1 N hydrochloric acid. Insert the stopper, shake, and allow the layers to separate. Transfer the lower *dichloromethane* layer to a stoppered borosilicate glass flask, and discard the upper layer. Expose the *dichloromethane* solution to direct sunlight for 10–15 min. Transfer 1.0 mL of the solution to a vial, evaporate in a current of air or in a stream of nitrogen to dryness, add 1.0 mL of *Diluent*, and swirl to dissolve. [Note—This solution may be stored under refrigeration and used as long as the chromatogram obtained as directed for *Analysis* is suitable for identifying the peaks due to the ketorolac 1-keto analog and ketorolac 1-hydroxy analog, and for the measurement of the resolution between the ketorolac 1-keto analog and ketorolac.]

Standard solution: 0.4 mg/mL of USP Ketorolac Tromethamine RS in *Diluent*

Sample solution: 0.4 mg/mL of Ketorolac Tromethamine in *Diluent*

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 313 nm

Column: 4.6-mm × 25-cm; 5- μ m packing L7

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 10 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for the ketorolac 1-hydroxy analog, the ketorolac 1-keto analog, and ketorolac are about 0.63, 0.89, and 1.0, respectively. Make adjustments, if necessary, to achieve a retention time for ketorolac of about 8–12 min.]

Suitability requirements

Resolution: NLT 1.5 between ketorolac 1-keto analog and ketorolac, *System suitability solution*

Column efficiency: NLT 5500 theoretical plates, *Standard solution*

Relative standard deviation: NMT 1.5%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of ketorolac tromethamine ($C_{15}H_{13}NO_3 \cdot C_4H_{11}NO_3$) in the portion of Ketorolac Tromethamine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Ketorolac Tromethamine RS in the *Standard solution* (mg/mL)

C_U = concentration of Ketorolac Tromethamine in the *Sample solution* (mg/mL)

Acceptance criteria: 98.5%–101.5% on the dried basis

IMPURITIES

- **Residue on Ignition** (281): NMT 0.1%

Delete the following:

- ~~• **Heavy Metals, Method II** (231): NMT 20 ppm (Official 1-Jan-2018)~~

Change to read:

- **Organic Impurities**

Mobile phase, Diluent, System suitability solution, Standard solution, and Sample solution: Prepare as directed in the *Assay*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 313 nm

Column: 4.6-mm × 25-cm; 5-μm packing L7

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 10 μL

Run time: 3 times the retention time of ketorolac

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each individual impurity in the portion of Ketorolac Tromethamine taken:

$$\text{Result} = (r_U/r_T) \times F \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_T = sum of all the peak responses from the *Sample solution*

F = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Impurity having a 0.54 relative retention time	0.54	2.2	0.5
Ketorolac 1-hydroxy analog	0.63	0.67	0.1
Impurity having a 0.66 relative retention time	0.66	0.91	0.5
Ketorolac 1-keto analog	0.89	0.52	0.1
* Individual unspecified impurity	—	1.0	0.5*(IRA 1-May-2016)
Ketorolac tromethamine	1.0	1.0	—
Total impurities	—	—	1.0

SPECIFIC TESTS

- **pH** (791)

Sample solution: 10 mg/mL

Acceptance criteria: 5.7–6.7

- **Loss on Drying** (731)

Analysis: Dry under vacuum at 60° for 3 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

- **USP Reference Standards** (11)

USP Ketorolac Tromethamine RS

In-Process Revision

This section contains proposals for adoption as official *USP* or *NF* standards (either proposed *new* standards or proposed *revisions* of current *USP* or *NF* standards). These may be any of the following: (1) proposed revisions placed directly under *In-Process Revision*, (2) modifications of revisions previously proposed under *In-Process Revision*, or (3) proposed revisions for articles

awaiting approval by FDA. Readers should review material in this section and provide comments to the Scientific Liaison using the contact information appearing at the end of each proposal. Information on how to comment can be found under the "Participation" section of www.usp.org. It is important to send comments promptly, before the comment deadline listed after each title.

Briefings Each Proposal is preceded by a Briefing in the following format:

Briefing
Name of Item , citations of the most recent USP publications in which this item appeared. Rationale for the revision. Other relevant information. (For example, if a chromatographic method is being proposed, column specifications and retention times for compounds of interest.) Finally, the Expert Committee acronym (the name of the Scientific Liaison who handled the particular monograph or general chapter, and the USP tracking correspondence number, as shown in the example below:
(Expert Committee Acronym: Liaison Name.)
Correspondence Number—CXXXXX

Symbols Proposed revisions are shown with language proposed for deletion or replacement crossed out. All *USP-NF* revisions use the following symbols that indicate the final destination of the official text: * new text * if slated for an *IRA*; ▲ new text ▲ if slated for *USP-NF*; ■ new text ■ if slated for a *Supplement* to *USP-NF*; ▶ new text ◀ for articles awaiting approval by FDA. The same symbols indicate recent revisions that are already official. Where the symbols appear together with no enclosed text, such as * * , or ■ ■ , or ▲ ▲ , or ▶ ▶ , it means that text has been deleted and no new text was proposed to replace it.

In revisions, the closing symbol is accompanied by an identifier that indicates the particular *IRA*, *Supplement*, or the *USP* or *NF* as the publication where the revision will appear if approved. For example, ■_{2S} (*USP 34*) indicates that the proposed revision is slated for the *Second Supplement to USP 34*, and ▲_{USP35} and ▲_{NF30} indicates that the revisions are proposed for *USP 35* and *NF 30*, respectively. In the case of revisions for articles awaiting approval by FDA, the symbols are followed by TBD indicating that the official publication is To Be Determined. For example, ▶ (TBD) does not yet have a target official publication.

Official Title Changes Where the specification "**Monograph title change**" is found, it indicates that the official title stated after that specification will be substituted for the former title in the appropriate places throughout that monograph once this revision becomes official.

BRIEFING

⟨151⟩ **Pyrogen Test**, *USP 38* page 211. To encourage the use of in vitro alternatives to in vivo animal tests, a revision is proposed to introduce text into the *Introduction* of the chapter that allows the use of a validated, equivalent in vitro pyrogen or bacterial endotoxin test in place of the in vivo rabbit pyrogen test, where appropriate. There is no impact on any of the monographs that reference this chapter.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style.

(GCM: R.Tirumalai.)

Correspondence Number—C164217

Comment deadline: January 31, 2016

(151) PYROGEN TEST

Change to read:

INTRODUCTION ▲*USP40*

The pyrogen test is designed to limit to an acceptable level the risks of febrile reaction in the patient to the administration, by injection, of the product concerned. The test involves measuring the rise in temperature of rabbits following the intravenous injection of a test solution and is designed for products that can be tolerated by the test rabbit in a dose not to exceed 10 mL/kg injected intravenously within a period of not more than 10 min. For products that require preliminary preparation or are subject to special conditions of administration, follow the additional directions given in the individual monograph or, in the case of antibiotics or biologics, the additional directions given in the federal regulations (see *Biologics* (1041)).

▲ A validated, equivalent in vitro pyrogen or bacterial endotoxin test may be used in place of the in vivo rabbit pyrogen test,¹ where appropriate. ▲*USP40*

▲*USP40*

APPARATUS AND DILUENTS

Render the syringes, needles, and glassware free from pyrogens by heating at 250° for NLT 30 min or by any other suitable method. Treat all diluents and solutions for washing and rinsing of devices or parenteral injection assemblies in a manner that will assure that they are sterile and pyrogen-free. Periodically perform control pyrogen tests on representative portions of the diluents and solutions for washing or rinsing of the apparatus. Where *Sodium Chloride Injection* is specified as a diluent, use Injection containing 0.9% of sodium chloride (NaCl).

TEMPERATURE RECORDING

Use an accurate temperature-sensing device such as a clinical thermometer, or thermistor probes or similar probes that have been calibrated to assure an accuracy of $\pm 0.1^\circ$ and have been tested to determine that a maximum reading is reached in less than 5 min. Insert the temperature-sensing probe into the rectum of the test rabbit to a depth of NLT 7.5 cm, and, after a period of time NLT that previously determined as sufficient, record the rabbit's body temperature.

TEST ANIMALS

Use healthy, mature rabbits. House the rabbits individually in an area of uniform temperature between 20° and 23° and free from disturbances likely to excite them. The temperature varies

NMT $\pm 3^\circ$ from the selected temperature. Before using a rabbit for the first time in a pyrogen test, condition it NMT 7 days before use by a sham test that includes all of the steps as directed in *Procedure* except injection. Do not use a rabbit for pyrogen testing more frequently than once every 48 h, nor prior to 2 weeks following a maximum rise of its temperature of 0.6° or more while being subjected to the pyrogen test, or following its having been given a test specimen that was adjudged pyrogenic.

PROCEDURE

Perform the test in a separate area designated solely for pyrogen testing and under environmental conditions similar to those under which the animals are housed and free from disturbances likely to excite them. Withhold all food from the rabbits used during the period of the test. Access to water is allowed at all times, but may be restricted during the test. If rectal temperature-measuring probes remain inserted throughout the testing period, restrain the rabbits with light-fitting neck stocks that allow the rabbits to assume a natural resting posture. NMT 30 min prior to the injection of the test dose, determine the "control temperature" of each rabbit: this is the base for the determination of any temperature increase resulting from the injection of a test solution. In any one group of test rabbits, use only those rabbits whose control temperatures do not vary by more than 1° from each other, and do not use any rabbit with a temperature exceeding 39.8° .

Unless otherwise specified in the individual monograph, inject into an ear vein of each of three rabbits 10 mL of the test solution per kg of body weight, completing each injection within 10 min after start of administration. The test solution is *either* the product, constituted if necessary as directed in the labeling, *or* the material under test treated as directed in the individual monograph and injected in the dose specified therein. For pyrogen testing of devices or injection assemblies, use washings or rinsings of the surfaces that come in contact with the parenterally administered material or with the injection site or internal tissues of the patient. Assure that all test solutions are protected from contamination. Perform the injection after warming the test solution to a temperature of $37 \pm 2^\circ$. Record the temperature at 30-min intervals between 1 and 3 h subsequent to the injection.

TEST INTERPRETATION AND CONTINUATION

Consider any temperature decreases as zero rise. If no rabbit shows an individual rise in temperature of 0.5° or more above its respective control temperature, the product meets the requirements for the absence of pyrogens. If any rabbit shows an individual temperature rise of 0.5° or more, continue the test using five other rabbits. If NMT three of the eight rabbits show individual rises in temperature of 0.5° or more and if the sum of the eight individual maximum temperature rises does not exceed 3.3° , the material under examination meets the requirements for the absence of pyrogens.

RADIOACTIVE PHARMACEUTICALS

Test Dose for Preformulated, Ready-to-Use Products Labeled with Radioactivity

AGGREGATED ALBUMIN AND OTHER PARTICLE-CONTAINING PRODUCTS

For the rabbit pyrogen test, dilute the product with *Sodium Chloride Injection* to NLT 100 $\mu\text{Ci}/\text{mL}$, and inject a dose of 3 mL/kg of body weight into each rabbit.

OTHER PRODUCTS

Where physical half-life of radionuclide is greater than 1 day: Calculate the maximum volume of the product that might be injected into a human subject. This calculation takes into account the maximum recommended radioactive dose of the product, in μCi , and the radioactive assay, in $\mu\text{Ci}/\text{mL}$, of the product at its expiration date or time. Using this information, calculate the maximum volume dose per kg to a 70-kg human subject.

For the rabbit pyrogen test, inject a minimum of 10 times this dose per kg of body weight into each rabbit. If necessary, dilute with *Sodium Chloride Injection*. The total injected volume per rabbit is NLT 1 mL and NMT 10 mL of solution.

Where physical half-life of radionuclide is less than 1 day: For products labeled with radionuclides with a half-life of less than 1 day, the dosage calculations are identical to those described in the first paragraph in *Other Products*. These products may be released for distribution prior to completion of the rabbit pyrogen test, but such test must be initiated at NMT 36 h after release.

Test Dose for Pharmaceutical Constituents or Reagents to Be Labeled

The following test dose requirements pertain to reagents that are to be labeled or constituted prior to use by the direct addition of radioactive solutions such as *Sodium Pertechnetate Tc 99m Injection*, i.e., "cold kits".

Assume that the entire contents of the vial of nonradioactive reagent will be injected into a 70-kg human subject, or that $1/70$ of the total contents per kg will be injected. If the contents are dry, constitute with a measured volume of *Sodium Chloride Injection*.

For the rabbit pyrogen test, inject ($1/7$) of the vial contents per kg of body weight into each rabbit. The maximum dose per rabbit is the entire contents of a single vial. The total injected volume per rabbit is NLT 1 mL and NMT 10 mL of solution.

BRIEFING

(481) **Riboflavin Assay**, *USP* 38 page 326. This general test chapter is being revised as part of the *USP* monograph modernization effort. The following changes are proposed:

1. Convert the current existing method in the chapter from the classic format to the redesigned format to more closely align with the current *USP-NF* monograph style.
2. Consolidate all of the existing chromatographic procedures in the various monographs by migrating them to this chapter, which will serve as a central location for cross-references for all riboflavin assay procedures described in the individual monographs.
3. Add a new high-performance liquid chromatography (HPLC) assay, *Chromatographic Methods, Procedure 4*, using hydrophilic interaction liquid chromatography (HILIC) for the determination of riboflavin in the dietary supplements dosage forms.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style.

The following Briefing list includes monographs and/or chapters that both reference the General Chapter under revision and require revision to keep references to the General Chapter accurate. Other monographs and/or chapters may also be listed, even where the reference to the General Chapter remains unchanged, as additional notice to stakeholders where there is believed to be potential for the change in the general chapter itself to affect pass-fail determinations for particular monograph articles.

(481) RIBOFLAVIN ASSAY

ASSAY

Change to read:

•

▲ Chemical Methods, Procedure 1▲^{USP40}

The following procedure is suitable for preparations in which riboflavin is a constituent of a mixture of several ingredients. In using the procedure, keep the pH of solutions below 7.0, and protect the solutions from direct sunlight at all stages.

Standard riboflavin stock solution: To 50.0 mg of USP Riboflavin RS, previously dried and stored protected from light in a desiccator over phosphorus pentoxide, add about 300 mL of 0.02 N *Acetic Acid*, and heat the mixture on a steam bath with frequent agitation until the riboflavin has dissolved, then cool. To this solution add 0.02 N *Acetic Acid* to make 500 mL; then mix. Store the solution under toluene in a refrigerator.

Dilute an accurately measured portion of this solution by using 0.02 N *Acetic Acid* to a concentration of 10.0 µg/mL of the dried USP Riboflavin RS to obtain the *Standard riboflavin stock solution*. Store the solution under toluene in a refrigerator.

Standard solution: Dilute with water 10.0 mL of *Standard riboflavin stock solution* in a 100-mL volumetric flask to volume, and mix. Each mL represents 1.0 µg of USP Riboflavin RS. Prepare fresh *Standard solution* for each assay.

Sample solution: Place an amount of the material to be assayed in a flask of suitable size, and add a volume of 0.1 N *Hydrochloric Acid* equal in mL to NLT 10 times the dry weight of the material in grams, but the resulting solution will contain NMT 100 µg/mL of riboflavin. If the material is not readily soluble, comminute the material so that it may be evenly dispersed in the liquid. Agitate vigorously, and wash down the sides of the flask with 0.1 N *Hydrochloric Acid*.

Heat the mixture in an autoclave at 121°–123° for 30 min, and cool. If clumping occurs, agitate the mixture until the particles are evenly dispersed. Adjust the mixture, with vigorous agitation, to a pH of 6.0–6.5 with *Sodium Hydroxide* solution,¹ then add *Hydrochloric Acid* solution¹ immediately until no further precipitation occurs (usually at a pH of approximately 4.5, which is the isoelectric point of many of the proteins present).

Dilute the mixture with water to make a measured volume that contains about 0.11 µg of riboflavin in each mL, and filter through paper known not to adsorb riboflavin. To an aliquot of the filtrate add, with vigorous agitation, *Sodium Hydroxide* solution¹ to produce a pH of 6.6–6.8, dilute the solution with water to make a final measured volume that contains approximately 0.1 µg of riboflavin in each mL, and if cloudiness occurs, filter again.

Instrumental conditions

(See *Fluorescence Spectroscopy* (853).)

Mode: Fluorescence

Excitation wavelength: 444 nm

Emission wavelength: 530 nm

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

To each of four or more tubes (or reaction vessels) add 10.0 mL of the *Sample solution*. To each of two or more of these tubes add 1.0 mL of the *Standard solution*, and mix; and to each of two or more of the remaining tubes add 1.0 mL of water, and mix. To each tube add 1.0 mL of *Glacial Acetic Acid*, mix, then add, with mixing, 0.50 mL of *Potassium Permanganate* solution (1 in 25), and allow to stand for 2 min. To each tube add, with mixing, 0.50 mL of *Hydrogen Peroxide Solution*, whereupon the permanganate color is destroyed within 10 s. Shake the tubes vigorously until excess oxygen is expelled. Remove any gas bubbles remaining on the sides of the tubes after foaming has ceased by tipping the tubes so that the solution flows slowly from end to end.

Measure the fluorescence of all tubes, designating the average reading from the tubes containing only the *Sample solution* as I_U , and designating the average from the tubes containing both the *Sample solution* and the *Standard solution* as I_S . Then to each of one or more tubes of each kind add, with mixing, 20 mg of *Sodium Hydrosulfite*, and within 5 s again measure the fluorescence, designating the average reading as I_B .

Calculate the quantity, in mg, of riboflavin ($C_{17}H_{20}N_4O_6$) in each mL of the *Sample solution* taken:

$$\text{Result} = [0.0001 \times (I_U - I_B)] / (I_S - I_U)$$

I_U = average reading of the tubes containing only the *Sample solution*

I_B = average reading of fluorescence of the tubes after adding 20 mg of sodium hydrofluorite

I_S = average reading of the tubes containing both the *Sample solution* and *Standard solution*

Calculate the quantity, in mg, of riboflavin ($C_{17}H_{20}N_4O_6$) in each Capsule or Tablet.

Add the following:

▲ ● Chemical Methods, Procedure 2

This procedure is suitable for the determination of riboflavin as a dietary ingredient or active pharmaceutical ingredient. [Note—Conduct the entire *Analysis* without exposure to direct sunlight.]

Standard solution: Transfer 50 mg of USP Riboflavin RS to a 1000-mL volumetric flask

containing 50 mL of water. Add 5 mL of *Acetic Acid* and sufficient water to make 800 mL. Heat on a steam bath, protected from light, with frequent agitation until dissolved. Cool to 25°, and dilute with water to volume. Dilute this solution with water to bring it within the operating sensitivity of the fluorometer used.

Sample solution: Transfer 50 mg of Riboflavin to a 1000-mL volumetric flask containing 50 mL of water. Add 5 mL of *Acetic Acid* and sufficient water to make 800 mL. Heat on a steam bath, protected from light, with frequent agitation until dissolved. Cool to 25°, and dilute with water to volume. Dilute this solution with water to bring it to the same concentration as that of the *Standard solution*.

Blank: Prepare as directed for the *Sample solution*, except omit the test specimen.

Instrumental conditions

(See *Fluorescence Spectroscopy* (853).)

Mode: Fluorescence

Excitation wavelength: 444 nm

Emission wavelength: 530 nm

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Measure the fluorescence intensity of the *Standard solution*. Immediately after the reading, add to the solution 10 mg of *Sodium Hydrosulfite*, stirring with a glass rod until dissolved, and at once measure the fluorescence again. [Note—Depending on the final concentration of riboflavin in the solution, it may be necessary to increase the amount of *Sodium Hydrosulfite* to suppress the fluorescence activity completely.] The difference between the two readings represents the fluorescence intensity (I_S) due to the *Standard solution*. Similarly, measure the fluorescence intensity (I_U) due to the *Sample solution*. Perform the *Blank* determination, and make any necessary correction.

Calculate the percentage of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of Riboflavin taken:

$$\text{Result} = (I_U/I_S) \times (C_S/C_U) \times 100$$

I_U = fluorescence of the *Sample solution*

I_S = fluorescence of the *Standard solution*

C_S = concentration of USP Riboflavin RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = concentration of riboflavin the *Sample solution* ($\mu\text{g/mL}$)

▲USP40

Add the following:

▲The following liquid chromatographic procedures are provided for the determination of riboflavin as an active pharmaceutical ingredient, a dietary supplement ingredient, or a component in the dietary supplements or pharmaceutical dosage forms. Use the appropriate USP Reference Standards.

Throughout these procedures, protect solutions containing and derived from the test specimen and the Reference Standards from the atmosphere and light, preferably by the use of low-actinic glassware.▲USP40

Add the following:

▲ ● Chromatographic Methods, Procedure 1

This procedure can be used to determine riboflavin in:

- *Oil- and Water-Soluble Vitamins Capsules*
- *Oil- and Water-Soluble Vitamins Tablets*
- *Oil- and Water-Soluble Vitamins with Minerals Capsules*
- *Oil- and Water-Soluble Vitamins with Minerals Tablets*
- *Water-Soluble Vitamins Capsules*
- *Water-Soluble Vitamins Tablets*
- *Water-Soluble Vitamins with Minerals Capsules*
- *Water-Soluble Vitamins with Minerals Tablets*

This is the procedure that involves the extraction of riboflavin from the formulation by the *Diluent*, heat, and mechanical shaking.

Unless specified in the individual monographs, the *Standard solution*, *Sample solutions*, and reagent solutions are prepared as follows.

Diluent: *Acetonitrile*, *Glacial Acetic Acid*, and water (5:1:94)

Mobile phase: A mixture of *Methanol*, *Glacial Acetic Acid*, and water (27:1:73) containing 140 mg of *Sodium 1-Hexanesulfonate* per 100 mL

Standard solution: Transfer 20 mg of USP Riboflavin RS to a 200-mL volumetric flask, and add 180 mL of *Diluent*. Immerse the flask in a hot water bath maintained at 65°–70° for 10 min with regular shaking, or using a vortex mixer, until all of the solid materials are dissolved. Chill rapidly in a cold water bath for 10 min to room temperature, and dilute with *Diluent* to volume.

Sample solution for Capsules: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without loss of shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air until the odor of ether is no longer perceptible. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the average net weight per Capsule. Transfer a portion of the Capsule contents, equivalent to 2.5 mg of riboflavin, to a 50-mL centrifuge tube. Add 25.0 mL of *Diluent*, and mix using a vortex mixer for 30 s to completely suspend the powder. Immerse the centrifuge tube in a hot water bath maintained at 65°–70°, heat for 5 min, and mix on a vortex mixer for 30 s. Return the tube to the hot water bath, heat for another 5 min, and mix on a vortex mixer for 30 s. Filter a portion of the solution, cool to room temperature, and use the clear filtrate. [Note—Use the filtrate within 3 h of filtration.]

Sample solution for Tablets: Finely powder NLT 30 Tablets. Transfer a portion of the powder, equivalent to 2.5 mg of riboflavin, to a 50-mL centrifuge tube. Add 25.0 mL of *Diluent*, and mix using a vortex mixer for 30 s to completely suspend the powder. Immerse the centrifuge tube in a hot water bath maintained at 65°–70°, heat for 5 min, and mix on a vortex mixer for 30 s. Return the tube to the hot water bath, heat for another 5 min, and mix on a vortex mixer for 30 s. Filter a portion of the solution, cool to room temperature, and use the clear filtrate. [Note—Use the filtrate within 3 h of filtration.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Column: 4.6-mm × 25-cm; packing *L1*

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and appropriate *Sample solution*

Calculate the percentage of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of *Sample* taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of riboflavin from the appropriate *Sample solution*

r_S = peak response of riboflavin from the *Standard solution*

C_S = concentration of USP Riboflavin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of riboflavin in the appropriate *Sample solution* (mg/mL)

▲USP40

Add the following:

▲ ● Chromatographic Methods, Procedure 2

This procedure can be used to determine riboflavin in:

- *Oil- and Water-Soluble Vitamins Capsules*
- *Oil- and Water-Soluble Vitamins Tablets*
- *Oil- and Water-Soluble Vitamins with Minerals Capsules*
- *Oil- and Water-Soluble Vitamins with Minerals Tablets*
- *Water-Soluble Vitamins Capsules*
- *Water-Soluble Vitamins Tablets*
- *Water-Soluble Vitamins with Minerals Capsules*
- *Water-Soluble Vitamins with Minerals Tablets*

This is the procedure that involves the extraction of riboflavin from the formulation by the *Extraction solvent*, heat, and mechanical shaking.

Unless specified in the individual monographs, the *Standard solution*, *Sample solutions*, and reagent solutions are prepared as follows.

Extraction solvent: Transfer 1 mL of *Glacial Acetic Acid* and 2.5 g of *Edetate Disodium* to a 100-mL volumetric flask. Dissolve in and dilute with water to volume. Mix the resulting solution with *Methanol* (3:1).

Solution A: 6.8 g of *Sodium Acetate* per 1000 mL of water

Mobile phase: Prepare a mixture of *Solution A* and *Methanol* (13:7). Add 2 mL of *Triethylamine* per L of the mixture, and adjust with *Glacial Acetic Acid* to a pH of 5.2.

Standard stock solution: Transfer 20 mg of USP Riboflavin RS to a 200-mL volumetric

flask, and add 180 mL of *Extraction solvent*. Immerse the flask for 5 min in a water bath maintained at 65°–75°. Mix well, and repeat if necessary until dissolved. Chill rapidly in a cold water bath to room temperature, and dilute with *Extraction solvent* to volume.

Standard solution: Dilute 5.0 mL of the *Standard stock solution* with *Extraction solvent* to 25.0 mL.

Sample solution for Capsules: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without loss of shell material, and transfer the contents to a beaker. Remove any contents adhering to the shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the net weight of the Capsule contents. Transfer a portion of the Capsule contents, equivalent to 2 mg of riboflavin, to a 200-mL volumetric flask. Add 100.0 mL of *Extraction solvent*, and mix for 20 min using a wrist-action shaker. Immerse the flask in a water bath maintained at 70°–75°, and heat for 20 min. Mix on a vortex mixer for 30 s, cool to room temperature, and filter. Use the clear filtrate.

Sample solution for Tablets: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to a nominal amount of 2 mg of riboflavin, to a 200-mL volumetric flask. Add 100.0 mL of *Extraction solvent*, and mix for 20 min using a wrist-action shaker. Immerse the flask in a water bath maintained at 70°–75°, and heat for 20 min. Mix on a vortex mixer for 30 s, cool to room temperature, and filter. Use the clear filtrate.

Chromatographic system

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and appropriate *Sample solution*

Calculate the percentage of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of *Sample* taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of riboflavin from the appropriate *Sample solution*

r_S = peak response of riboflavin from the *Standard solution*

C_S = concentration of USP Riboflavin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of riboflavin in the appropriate *Sample solution* (mg/mL)

Add the following:**▲ ● Chromatographic Methods, Procedure 3**

This procedure can be used to determine riboflavin in:

- *Oil- and Water-Soluble Vitamins Capsules*
- *Oil- and Water-Soluble Vitamins Tablets*
- *Oil- and Water-Soluble Vitamins with Minerals Capsules*
- *Oil- and Water-Soluble Vitamins with Minerals Tablets*
- *Water-Soluble Vitamins Capsules*
- *Water-Soluble Vitamins Tablets*
- *Water-Soluble Vitamins with Minerals Capsules*
- *Water-Soluble Vitamins with Minerals Tablets*

This is the procedure that involves the extraction of riboflavin from the formulation by mixtures of organic solvents, heat, and mechanical shaking.

Unless specified in the individual monographs, the *Standard solutions*, *Sample solutions*, and reagent solutions are prepared as follows.

Diluent: 25 mg/mL of *Eдетate Disodium* in water

Mobile phase: Transfer 0.4 mL of *Triethylamine*, 15.0 mL of *Glacial Acetic Acid*, and 350 mL of *Methanol* to a 2000-mL volumetric flask. Dilute with 0.008 M *Sodium 1-Hexanesulfonate* to volume.

Standard stock solution: 0.08 mg/mL of USP Riboflavin RS in *Diluent*, with heating if necessary

Standard solution for Capsules/Tablets: Transfer 5.0 mL of *Standard stock solution* to a stoppered 125-mL flask. Add 10.0 mL of a mixture of *Methanol* and *Glacial Acetic Acid* (9:1) and 30.0 mL of a mixture of *Methanol* and *Ethylene Glycol* (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Standard solution for Oral Solution: 8 µg/mL of USP Riboflavin RS in *Diluent*, diluted from the *Standard stock solution*

Sample solution for Capsules: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without the loss of shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the empty shells by washing, if necessary, with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air until the odor of ether is no longer perceptible. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the average net weight per Capsule. Transfer a portion of the Capsule contents, equivalent to 0.4 mg of riboflavin, to a stoppered 125-mL flask. Add 10.0 mL of a mixture of *Methanol* and *Glacial Acetic Acid* (9:1) and 30.0 mL of a mixture of methanol and ethylene glycol (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Sample solution for Oral Solution: Equivalent to 8 µg/mL of riboflavin from oral solution in the *Diluent*

Sample solution for Tablets: Weigh and finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 0.4 mg of riboflavin, to a stoppered 125-mL flask. Add 10.0 mL of a mixture of *Methanol* and *Glacial Acetic Acid* (9:1) and 30.0 mL of a mixture of

Methanol and *Ethylene Glycol* (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, discarding the first few mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Column temperature: 50°

Flow rate: 2 mL/min

Injection volume: 5 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: Appropriate *Standard solution* and appropriate *Sample solution*

For Capsules and Tablets, calculate the percentage of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of *Sample* taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of riboflavin from the appropriate *Sample solution*

r_S = peak response of riboflavin from the *Standard solution* for Capsules/Tablets

C_S = concentration of USP Riboflavin RS in the *Standard solution* for Capsules/Tablets (mg/mL)

C_U = nominal concentration of riboflavin in the appropriate *Sample solution* (mg/mL)

For Oral Solution, calculate the percentage of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of *Sample* taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of riboflavin from the *Sample solution* for Oral Solution

r_S = peak response of riboflavin from the *Standard solution* for Oral Solution

C_S = concentration of USP Riboflavin RS in the *Standard solution* for Oral Solution (mg/mL)

C_U = nominal concentration of riboflavin in the *Sample solution* for Oral Solution (mg/mL)

▲USP40

Add the following:

▲ ● Chromatographic Methods, Procedure 4

This procedure can be used to determine riboflavin in:

- *Oil- and Water-Soluble Vitamins Capsules*
- *Oil- and Water-Soluble Vitamins Tablets*
- *Oil- and Water-Soluble Vitamins with Minerals Capsules*

- *Oil- and Water-Soluble Vitamins with Minerals Tablets*
- *Water-Soluble Vitamins Capsules*
- *Water-Soluble Vitamins Tablets*
- *Water-Soluble Vitamins with Minerals Capsules*
- *Water-Soluble Vitamins with Minerals Tablets*

This is a newly added procedure as part of the USP monograph modernization efforts. The procedure uses hydrophilic interaction liquid chromatography (HILIC), and the sample preparation involves the extraction of riboflavin from the formulation by the *Diluent*, heat, and mechanical shaking.

Unless specified in the individual monographs, the *Standard solution*, *Sample solutions*, and reagent solutions are prepared as follows.

Diluent: *Methanol, Glacial Acetic Acid, and water (50:1:49)*

Solution A: *50 mM Ammonium Formate; adjust to a pH of 9.0 with Ammonium Hydroxide.*

Solution B: *Acetonitrile*

Mobile phase: Gradient elution. See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	11	89
8	17	83
15	23	77
20	30	70
21	50	50
24	50	50
25	11	89
30	11	89

Standard solution: Transfer 20 mg of USP Riboflavin RS to a 200-mL volumetric flask, and add 160 mL of *Diluent*. Immerse the flask in a hot water bath maintained at 65°–70° for 10 min with regular shaking or using a vortex mixer, until all of the solid materials are dissolved. Chill rapidly in a cold water bath for 10 min to room temperature, and dilute with *Diluent* to volume.

Sample solution for Capsules: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without the loss of shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the empty shells by washing, if necessary, with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air until the odor of ether is no longer perceptible. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the average net weight per Capsule. Transfer a portion of the Capsule contents, equivalent to 2.5 mg of riboflavin, to a 50-mL centrifuge tube. Add 25.0 mL of *Diluent*, and mix using a vortex mixer for 30 s to completely suspend the powder. Immerse the centrifuge tube in a hot water bath maintained at 68°, heat for 10 min, and mix on a vortex mixer for 30 s. Return the tube to the hot water bath, heat for another 10 min, and mix on a vortex mixer for 30 s. Filter a portion of the solution, cool to room temperature, and use the clear filtrate.

Sample solution for Tablets: Finely powder NLT 30 Tablets. Transfer a portion of the powder, equivalent to 2.5 mg of riboflavin, to a 50-mL centrifuge tube. Add 25.0 mL of *Diluent*, and mix using a vortex mixer for 30 s to completely suspend the powder. Immerse the centrifuge tube in a hot water bath maintained at 65°–70°, heat for 10 min, and mix on a vortex mixer for 30 s. Return the tube to the hot water bath, heat for another 10 min, and mix on a vortex mixer for 30 s. Filter a portion of the solution, cool to room temperature, and use the clear filtrate. [Note—Use the filtrate within 3 h of filtration.]

Analysis

Samples: *Standard solution* and appropriate *Sample solution*

Calculate the percentage of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of *Sample* taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of riboflavin from the appropriate *Sample solution*

r_S = peak response of riboflavin from the *Standard solution*

C_S = concentration of USP Riboflavin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of riboflavin in the appropriate *Sample solution* (mg/mL)

▲USP40

ADDITIONAL REQUIREMENTS

- **USP Reference Standards** (11)

USP Riboflavin RS

¹ The concentrations of the hydrochloric acid and sodium hydroxide solutions used are not stated in each instance, because these concentrations may be varied depending upon the amount of material taken for assay, volume of test solution, and buffering effect of material.

BRIEFING

(531) **Thiamine Assay**, *USP* 38 page 334. This general test chapter is being revised as part of the USP monograph modernization effort. The following changes are proposed:

1. Convert the currently existing method in the chapter from the classic format to the redesigned format to more closely align with current *USP-NF* monograph style.

2. Consolidate all of the existing chromatographic procedures in the various monographs by migrating them to this chapter, which will serve as a central location for cross-references for all thiamine assay procedures described in the individual monographs.
3. Add a new high-performance liquid chromatography (HPLC) assay, *Chromatographic Methods, Procedure 7*, using hydrophilic interaction liquid chromatography (HILIC) for the determination of thiamine in the dietary supplements dosage forms.

Additionally, minor editorial changes have been made to update the chapter to current *USP* style.

The following Briefing list includes monographs and/or chapters that both reference the General Chapter under revision and require revision to keep references to the General Chapter accurate. Other monographs and/or chapters may also be listed, even where the reference to the General Chapter remains unchanged, as additional notice to stakeholders where there is believed to be potential for the change in the general chapter itself to affect pass-fail determinations for particular monograph articles.

(531) THIAMINE ASSAY

ASSAY

Change to read:

- **Chemical Methods, Procedure 1**

▲ The following procedure is provided for the determination of thiamine as an ingredient of pharmacopeial preparations containing other active constituents. The procedure involves thiamine reacting with potassium ferricyanide and subsequently being determined by fluorescence detection. Throughout the procedure, protect solutions containing and derived from the test specimen and the Reference Standard from the atmosphere and light, preferably by the use of low-actinic glassware.

▲*USP40*

Potassium ferricyanide solution: Dissolve 1.0 g of *Potassium Ferricyanide* in water to make 100 mL. Prepare fresh on the day of use.

Oxidizing reagent: Mix 4.0 mL of *Potassium Ferricyanide* solution with a sufficient amount of 3.5 N *Sodium Hydroxide* to make 100 mL. Use this solution within 4 h.

Quinine sulfate stock solution: Dissolve 10 mg of quinine sulfate in 0.1 N *Sulfuric Acid* to make 1000 mL. Preserve this solution, protected from light, in a refrigerator.

Quinine sulfate standard solution: Dilute 0.1 N *Sulfuric Acid* with *Quinine sulfate stock solution* (39:1). This solution fluoresces to approximately the same degree as the thiochrome obtained from 1 µg of thiamine hydrochloride and is used to correct the fluorometer at frequent intervals for variation in sensitivity from reading to reading within an assay. Prepare this solution fresh on the day of use.

Standard thiamine hydrochloride stock solution: Transfer about 25 mg of USP Thiamine Hydrochloride RS, accurately weighed, to a 1000-mL volumetric flask. Dissolve the weighed *Standard* in about 300 mL of dilute alcohol solution (1 in 5) adjusted with 3 N *Hydrochloric Acid* to a pH of 4.0, and add the acidified, dilute alcohol to volume. Store in a refrigerator in a light-resistant container. Prepare this stock solution fresh each month.

Standard solution: Dilute a portion of *Standard thiamine hydrochloride stock solution* quantitatively and stepwise with 0.2 N *Hydrochloric Acid* to obtain the *Standard solution*, each mL of which represents 0.2 µg of USP Thiamine Hydrochloride RS.

Sample solution: Place in a suitable volumetric flask a sufficient amount of the material to be assayed, accurately weighed or measured by volume as directed, such that when diluted to volume with 0.2 N *Hydrochloric Acid*, the resulting solution will contain about 100 µg of thiamine hydrochloride (or mononitrate) per mL. If the sample is difficult to dissolve, the solution may be heated on a steam bath, and then cooled and diluted with the acid to volume. Dilute 5 mL of this solution, quantitatively and stepwise, using 0.2 N *Hydrochloric Acid*, to an estimated concentration of 0.2 µg of thiamine hydrochloride (or mononitrate) per mL.

Instrumental conditions

(See *Fluorescence Spectroscopy* (853).)

Mode: Fluorescence

Excitation wavelength: 365 nm

Emission wavelength: 435 nm

Analysis: To each of three or more tubes (or other suitable vessels) of about 40-mL capacity, pipet 5 mL of *Standard solution*. To each of two of these tubes, add rapidly (within 1 to 2 s), with mixing, 3.0 mL of *Oxidizing reagent*, and within 30 s add 20.0 mL of *Isobutyl Alcohol*, then mix vigorously for 90 s by shaking the capped tubes manually, or by bubbling a stream of air through the mixture. Prepare a blank in the remaining tube of the standard by substituting for the *Oxidizing reagent* with an equal volume of 3.5 N *Sodium Hydroxide* and proceed in the same manner. Into each of three or more similar tubes, pipet 5 mL of the *Sample solution*. Treat these tubes in the same manner as directed for the tubes containing the *Standard solution*. Into each of the six tubes, pipet 2 mL of *Dehydrated Alcohol*, swirl for a few seconds, allow the phases to separate, and decant or draw off about 10 mL of the clear, supernatant isobutyl alcohol solution into the standardized cells; then measure the fluorescence in a suitable fluorometer, having an input filter of narrow transmittance range with a maximum at about 365 nm and an output filter of narrow transmittance range with a maximum at about 435 nm. Calculate the quantity, in µg, of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in each 5 mL of the *Sample solution*:

$$\text{Result} = (A - b)/(S - d)$$

A = average fluorometer readings of the portions of the *Sample solution* treated with the *Oxidizing reagent*

b = reading for the blank of the *Sample solution*

S = average fluorometer readings of the portions of the *Standard solution* treated with the *Oxidizing reagent*

d = reading for the blank of the *Standard solution*

Calculate the quantity, in mg, of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the assay material on the basis of the aliquots taken. Where indicated, the quantity, in mg, of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) may be calculated by multiplying the quantity of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) found by 0.9706.

Add the following:

▲ The following liquid chromatographic procedures are provided for the determination of thiamine as an active pharmaceutical ingredient, a dietary supplement ingredient, or a component in dietary supplements or pharmaceutical dosage forms.

Throughout these procedures, protect solutions containing and derived from the test specimen and the Reference Standards from the atmosphere and light, preferably by the use of low-actinic glassware. ▲USP40

Add the following:

▲ ● **Chromatographic Methods, Procedure 1**

This procedure can be used to determine thiamine in:

- *Oil- and Water-Soluble Vitamins Capsules*
- *Oil- and Water-Soluble Vitamins Tablets*
- *Oil- and Water-Soluble Vitamins with Minerals Capsules*
- *Oil- and Water-Soluble Vitamins with Minerals Tablets*
- *Water-Soluble Vitamins Capsules*
- *Water-Soluble Vitamins Tablets*
- *Water-Soluble Vitamins with Minerals Capsules*
- *Water-Soluble Vitamins with Minerals Tablets*

This is the procedure that involves the extraction of thiamine from the formulation by the *Diluent*, heat, and mechanical shaking.

Unless specified in the individual monographs, the *Standard solution*, *Sample solutions*, and reagent solutions are prepared as follows.

Diluent: *Acetonitrile*, *Glacial Acetic Acid*, and water (5:1:94)

Mobile phase: A mixture of *Methanol*, *Glacial Acetic Acid*, and water (27:1:73) containing 140 mg of *Sodium 1-Hexanesulfonate* per 100 mL

Standard solution: Transfer 20 mg of USP Thiamine Hydrochloride RS to a 200-mL volumetric flask, and add 180 mL of the *Diluent*. Immerse the flask in a hot water bath maintained at 65°–70° for 10 min with regular shaking or using a vortex mixer until all of the solid materials are dissolved. Chill rapidly in a cold water bath for 10 min to room temperature, and dilute with the *Diluent* to volume.

Sample solution for Capsules: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without loss of shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the shells by washing with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air until the odor of ether is no longer perceptible. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the average net weight per Capsule. Transfer a portion of the Capsule contents, equivalent to 2.5 mg of thiamine hydrochloride, to a 50-mL centrifuge tube. Add 25.0 mL of the *Diluent*, and mix using a vortex mixer for 30 s to completely suspend the powder. Immerse the centrifuge tube in a hot water bath

maintained at 65°–70°, heat for 5 min, and mix on a vortex mixer for 30 s. Return the tube to the hot water bath, heat for another 5 min, and mix on a vortex mixer for 30 s. Filter a portion of the solution, cool to room temperature, and use the clear filtrate. [Note—Use the filtrate within 3 h of filtration.]

Sample solution for Tablets: Finely powder NLT 30 Tablets. Transfer a portion of the powder, equivalent to 2.5 mg of thiamine hydrochloride, to a 50-mL centrifuge tube. Add 25.0 mL of the *Diluent*, and mix using a vortex mixer for 30 s to completely suspend the powder. Immerse the centrifuge tube in a hot water bath maintained at 65°–70°, heat for 5 min, and mix on a vortex mixer for 30 s. Return the tube to the hot water bath, heat for another 5 min, and mix on a vortex mixer for 30 s. Filter a portion of the solution, cool to room temperature, and use the clear filtrate. [Note—Use the filtrate within 3 h of filtration.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; packing *L1*

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and appropriate *Sample solution*

For products containing thiamine hydrochloride, calculate the percentage of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of *Sample* taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of thiamine from the appropriate *Sample solution*

r_S = peak response of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine hydrochloride in the appropriate *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of *Sample* taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of thiamine from the appropriate *Sample solution*

r_S = peak response of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the appropriate *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

▲USP40

Add the following:

▲ ● **Chromatographic Methods, Procedure 2**

This procedure can be used to determine thiamine in:

- *Oil- and Water-Soluble Vitamins Capsules*
- *Oil- and Water-Soluble Vitamins Tablets*
- *Oil- and Water-Soluble Vitamins with Minerals Capsules*
- *Oil- and Water-Soluble Vitamins with Minerals Tablets*
- *Water-Soluble Vitamins Capsules*
- *Water-Soluble Vitamins Tablets*
- *Water-Soluble Vitamins with Minerals Capsules*
- *Water-Soluble Vitamins with Minerals Tablets*

This is the procedure that involves the extraction of thiamine from the formulation by dilute hydrochloric acid, heat, and mechanical shaking.

Unless specified in the individual monographs, the *Standard solution*, *Sample solutions*, and reagent solutions are prepared as follows.

Solution A: 1.88 g/L of *Sodium 1-Hexanesulfonate* in 0.1% *Phosphoric Acid*

Mobile phase: *Solution A* and *Acetonitrile* (46:9)

Standard stock solution: 0.1 mg/mL of USP Thiamine Hydrochloride RS in 0.2 N *Hydrochloric Acid*

Standard solution: 0.02 mg/mL of USP Thiamine Hydrochloride RS from *Standard stock solution* diluted with 0.2 N *Hydrochloric Acid*

Sample solution for Capsules: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without the loss of shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the empty shells by washing, if necessary, with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air until the odor of ether is no longer perceptible. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the average net weight per Capsule. Mix a portion of the Capsule contents with a volume of 0.2 N *Hydrochloric Acid* to obtain a concentration of 0.02 mg/mL of thiamine. Shake the solution for 15 min with a wrist-action shaker, and heat to boiling for 30 min. Cool to room temperature, and filter. Use the clear filtrate.

Sample solution for Tablets: Weigh and finely powder NLT 20 Tablets. Mix a portion of the powder with a volume of 0.2 N *Hydrochloric Acid* to obtain a concentration of 0.02 mg/mL of thiamine. Shake for 15 min with a wrist-action shaker, and heat to boiling for 30 min. Cool to room temperature, and filter. Use the clear filtrate.

Add the following:

▲ ● **Chromatographic Methods, Procedure 3**

This procedure can be used to determine thiamine in:

- *Oil- and Water-Soluble Vitamins Capsules*
- *Oil- and Water-Soluble Vitamins Oral Solution*
- *Oil- and Water-Soluble Vitamins Tablets*
- *Oil- and Water-Soluble Vitamins with Minerals Capsules*
- *Oil- and Water-Soluble Vitamins with Minerals Oral Solution*
- *Oil- and Water-Soluble Vitamins with Minerals Tablets*
- *Water-Soluble Vitamins Capsules*
- *Water-Soluble Vitamins Tablets*

- *Water-Soluble Vitamins with Minerals Capsules*
- *Water-Soluble Vitamins with Minerals Oral Solution*
- *Water-Soluble Vitamins with Minerals Tablets*

This is the procedure that involves the extraction of thiamine from the formulation by mixtures of organic solvents, heat, and mechanical shaking.

Unless specified in the individual monographs, the *Standard solutions*, *Sample solutions*, and reagent solutions are prepared as follows.

Diluent: 25 mg/mL of *Edetate Disodium* in water

Mobile phase: Transfer 0.4 mL of *Triethylamine*, 15.0 mL of *Glacial Acetic Acid*, and 350 mL of *Methanol* to a 2000-mL volumetric flask. Dilute with 0.008 M *Sodium 1-Hexanesulfonate* to volume.

Standard stock solution: 0.24 mg/mL of USP Thiamine Hydrochloride RS in the *Diluent*, with heating if necessary

Standard solution for Capsules/Tablets: Transfer 5.0 mL of *Standard stock solution* to a stoppered 125-mL flask. Add 10.0 mL of a mixture of *Methanol* and *Glacial Acetic Acid* (9:1) and 30.0 mL of a mixture of *Methanol* and *Ethylene Glycol* (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, and discard the first few mL of the filtrate.

Standard solution for Oral Solution: 24 µg/mL of USP Thiamine Hydrochloride RS, diluted from the *Standard stock solution* with *Diluent*

Sample solution for Capsules: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without the loss of shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the empty shells by washing, if necessary, with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air until the odor of ether is no longer perceptible. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the average net weight per Capsule. Transfer a portion of the Capsule contents, equivalent to 1.2 mg of thiamine hydrochloride, to a stoppered 125-mL flask. Add 10.0 mL of a mixture of *Methanol* and *Glacial Acetic Acid* (9:1) and 30.0 mL of a mixture of *Methanol* and *Ethylene Glycol* (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, and discard the first few mL of the filtrate.

Sample solution for Oral Solution: Equivalent to 24 µg/mL of thiamine hydrochloride or thiamine mononitrate from oral solution in the *Diluent*

Sample solution for Tablets: Weigh and finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 1.2 mg of thiamine, to a stoppered 125-mL flask. Add 10.0 mL of a mixture of *Methanol* and *Glacial Acetic Acid* (9:1) and 30.0 mL of a mixture of *Methanol* and *Ethylene Glycol* (1:1). Insert the stopper, shake for 15 min in a water bath maintained at 60°, and cool. Filter, and discard the first few mL of the filtrate.

Add the following:

▲ ● **Chromatographic Methods, Procedure 4**

This procedure can be used to determine thiamine in:

- An active pharmaceutical ingredient
- A dietary ingredient

This is the procedure that involves the dissolution of the sample directly into the *Mobile phase*. The procedure is applicable for the determination of thiamine hydrochloride or thiamine mononitrate as active pharmaceutical or dietary supplement ingredients.

Unless specified in the individual monographs, the *Standard solution*, *Sample solution*, and reagent solutions are prepared as follows.

Solution A: 0.005 M *Sodium 1-Octanesulfonate* in dilute *Glacial Acetic Acid* (1 in 100)

Solution B: *Methanol* and *Acetonitrile* (3:2)

Mobile phase: *Solution A* and *Solution B* (60:40)

Internal standard solution: 2% (v/v) of methylbenzoate in *Methanol*

Standard solution: Prepare a 1-mg/mL solution of USP Thiamine Hydrochloride RS in *Mobile phase*. Transfer 20.0 mL of this solution and 5.0 mL of *Internal standard solution* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume. The *Standard solution* contains 400 µg/mL of thiamine hydrochloride.

Sample solution: Prepare a 2-mg/mL solution of thiamine hydrochloride or thiamine mononitrate in *Mobile phase*. Transfer 10.0 mL of this solution and 5.0 mL of *Internal standard solution* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing *L1*

Flow rate: 1 mL/min. [Note—The flow rate may be adjusted to obtain a retention time of about 12 min for thiamine.]

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 4.0 between the thiamine and methylbenzoate peaks

Tailing factor: NMT 2.0 for the thiamine peak

Column efficiency: NLT 1500 theoretical plates for the thiamine

Relative standard deviation: NMT 2.0% for the ratios of thiamine peak response to the internal standard peak response

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of *Sample* taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = internal standard ratio (peak response of thiamine/peak response of the internal standard) from the *Sample solution*

R_S = internal standard ratio (peak response of thiamine/peak response of the internal standard) from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of thiamine hydrochloride in the *Sample solution* (mg/mL)

If the active pharmaceutical or dietary supplement ingredient is thiamine mononitrate,

calculate the percentage of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of *Sample* taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

R_U = internal standard ratio (peak response of thiamine/peak response of the internal standard) from the *Sample solution*

R_S = internal standard ratio (peak response of thiamine/peak response of the internal standard) from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of thiamine mononitrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

▲USP40

Add the following:

▲ ● Chromatographic Methods, Procedure 5

This procedure can be used to determine thiamine in:

- *Thiamine Hydrochloride Injection*
- *Thiamine Hydrochloride Oral Solution*
- *Thiamine Mononitrate Oral Solution*

This is the procedure that involves the dissolution of the sample directly into the *Mobile phase*. The procedure is applicable for the determination of thiamine hydrochloride or thiamine mononitrate as an active ingredient in the formulations such as those used in *Thiamine Hydrochloride Injection*, *Thiamine Hydrochloride Oral Solution*, and *Thiamine Mononitrate Oral Solution*.

Unless specified in the individual monographs, the *Standard solution*, *Internal standard solution*, and *Sample solution* are prepared as follows.

Mobile phase: *Methanol* and 0.04 M aqueous *Monobasic Potassium Phosphate* (45:55)

Internal standard solution: 100 µg/mL of methylparaben in *Mobile phase*

Standard stock solution: 500 µg/mL of USP Thiamine Hydrochloride RS in *Mobile phase*

Standard solution: Dilute a mixture of equal volumes of the *Standard stock solution* and *Internal standard solution* with *Mobile phase* to obtain a concentration of USP Thiamine Hydrochloride RS of about 50 µg/mL.

Sample stock solution: Equivalent to 500 µg/mL of thiamine hydrochloride or thiamine mononitrate in *Mobile phase* from an accurately measured volume of Oral Solution or Injection

Sample solution: Dilute a mixture of equal volumes of the *Internal standard solution* and *Sample stock solution* with *Mobile phase* to obtain a concentration of thiamine hydrochloride or thiamine mononitrate of about 50 µg/mL.

Chromatographic system

Add the following:

▲ ● **Chromatographic Methods, Procedure 6**

This procedure can be used to determine thiamine in the following:

- *Thiamine Hydrochloride Tablet*

This is the procedure that involves the dissolution of the sample directly into water. The procedure is applicable to the performance (dissolution) test for thiamine hydrochloride

tablets.

Unless specified in the individual monographs, the *Standard solution* and *Sample solution* are prepared as follows.

Medium: Water, 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Mobile phase: A mixture of *Methanol*, *Glacial Acetic Acid*, and water (27:1:73) containing 140 mg of *Sodium 1-Hexanesulfonate* per 100 mL

Standard solution: A known concentration of USP Thiamine Hydrochloride RS in *Medium* (water)

Sample solution: Filtered portion of the solution under test, suitably diluted with the *Medium* (water) if necessary

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; packing *L1*

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of *Sample* taken:

$$\text{Result} = (r_U/r_S) \times (C_S \times D \times V/L) \times 100$$

r_U = peak response of thiamine from the *Sample solution*

r_S = peak response of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

D = dilution factor for the *Sample solution*

V = volume of *Medium*, 900 mL

L = labeled amount of thiamine hydrochloride (mg/Tablet)

▲USP40

Add the following:

▲ ● Chromatographic Methods, Procedure 7

This procedure can be used to determine thiamine in:

- *Oil- and Water-Soluble Vitamins Capsules*
- *Oil- and Water-Soluble Vitamins Oral Solution*

- *Oil- and Water-Soluble Vitamins Tablets*
- *Oil- and Water-Soluble Vitamins with Minerals Capsules*
- *Oil- and Water-Soluble Vitamins with Minerals Oral Solution*
- *Oil- and Water-Soluble Vitamins with Minerals Tablets*
- *Water-Soluble Vitamins Capsules*
- *Water-Soluble Vitamins Tablets*
- *Water-Soluble Vitamins with Minerals Capsules*
- *Water-Soluble Vitamins with Minerals Oral Solution*
- *Water-Soluble Vitamins with Minerals Tablets*

This is a newly added procedure as part of the USP monograph modernization efforts. The procedure uses hydrophilic interaction liquid chromatography (HILIC), and the sample preparation involves the extraction of thiamine from the formulation by the *Diluent*, heat, and mechanical shaking.

Unless specified in the individual monographs, the *Standard solution*, *Sample solutions*, and reagent solutions are prepared as follows.

Diluent: *Methanol, Glacial Acetic Acid*, and water (50:1:49)

Solution A: 50 mM *Ammonium Formate*; adjust to a pH of 9.0 with *Ammonium Hydroxide*.

Solution B: *Acetonitrile*

Mobile phase: Gradient elution. See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	11	89
8	17	83
15	23	77
20	30	70
21	50	50
24	50	50
25	11	89
30	11	89

Standard solution: Transfer 20 mg of USP Thiamine Hydrochloride RS to a 200-mL volumetric flask, and add 160 mL of the *Diluent*. Immerse the flask in a hot water bath maintained at 65°–70° for 10 min with regular shaking or using a vortex mixer, until all of the solid materials are dissolved. Chill rapidly in a cold water bath for 10 min to room temperature, and dilute with the *Diluent* to volume.

Sample solution for Capsules: Weigh NLT 20 Capsules in a tared weighing bottle. Open the Capsules, without the loss of shell material, and transfer the contents to a 100-mL beaker. Remove any contents adhering to the empty shells by washing, if necessary, with several portions of ether. Discard the washings, and dry the Capsule shells with the aid of a current of dry air until the odor of ether is no longer perceptible. Weigh the empty Capsule shells in the tared weighing bottle, and calculate the average net weight per Capsule. Transfer a portion of the Capsule contents, equivalent to 2.5 mg of thiamine hydrochloride, to a 50-mL centrifuge tube. Add 25.0 mL of *Diluent*, and mix using a vortex

mixer for 30 s to completely suspend the powder. Immerse the centrifuge tube in a hot water bath maintained at 68°, heat for 10 min, and mix on a vortex mixer for 30 s. Return the tube to the hot water bath, heat for another 10 min, and mix on a vortex mixer for 30 s. Filter a portion of the solution, cool to room temperature, and use the clear filtrate.

Sample solution for Oral Solution: Equivalent to 0.1 mg/mL of thiamine hydrochloride in *Diluent*, from an accurately measured volume of Oral Solution. In an appropriate volumetric flask, dissolve the sample with the *Diluent* to about 80% of the total volume, immerse the flask in a water bath maintained at 68° for 10 min, chill rapidly in a cold water bath to room temperature, and dilute with the *Diluent*. Mix well, and filter a portion of the solution; finally, use the clear filtrate.

Sample solution for Tablets: Finely powder NLT 30 Tablets. Transfer a portion of the powder, equivalent to 2.5 mg of thiamine hydrochloride, to a 50-mL centrifuge tube. Add 25.0 mL of the *Diluent*, and mix using a vortex mixer for 30 s to completely suspend the powder. Immerse the centrifuge tube in a hot water bath maintained at 65°–70°, heat for 10 min, and mix on a vortex mixer for 30 s. Return the tube to the hot water bath, heat for another 10 min, and mix on a vortex mixer for 30 s. Filter a portion of the solution, cool to room temperature, and use the clear filtrate. [Note—Use the filtrate within 3 h of filtration.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 267 nm

Column: 4.6-mm × 15-cm; 3.5 μm packing L68

Column temperature: 40°

Flow rate: 1.2 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and appropriate *Sample solution*

For products containing thiamine hydrochloride, calculate the percentage of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) in the portion of *Sample* taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of thiamine from the appropriate *Sample solution*

r_S = peak response of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine in the appropriate *Sample solution* (mg/mL)

For products containing thiamine mononitrate, calculate the percentage of the labeled

amount of thiamine mononitrate ($C_{12}H_{17}N_5O_4S$) in the portion of *Sample* taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of thiamine from the appropriate *Sample solution*

r_S = peak response of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of thiamine mononitrate in the appropriate *Sample solution* (mg/mL)

M_{r1} = molecular weight of thiamine mononitrate, 327.36

M_{r2} = molecular weight of thiamine hydrochloride, 337.27

ADDITIONAL REQUIREMENTS

- **USP Reference Standards** <11>

USP Thiamine Hydrochloride RS

BRIEFING

<797> **Pharmaceutical Compounding—Sterile Preparations**, *USP 39* page 626. It is proposed to revise this chapter to improve clarity, respond to stakeholder input, and reflect new science. Major edits to the chapter include:

1. Reorganized existing chapter to group similar topics together, eliminate redundancies, and clarify requirements. Key procedural information is placed in boxes so that it can be easily referenced and followed.
2. Collapsed compounded sterile preparations (CSP) microbial risk categories from three to two and changed terminology. No sterile compounding is inherently “low risk” and preparation of all CSPs must be done carefully. Categories were renamed neutrally as Category 1 and 2 CSPs, which are distinguished primarily by the conditions under which they are made and the time within which they are used. Category 1 CSPs have a shorter beyond use date (BUD) and may be prepared in a segregated compounding area; Category 2 CSPs have a longer BUD and must be prepared in a cleanroom environment.
3. Removed specific information on handling of hazardous drugs and added references to *Hazardous Drugs—Handling in Healthcare Settings* <800>.
4. Introduced terminology for “in-use time” to refer to the time before which a conventionally manufactured product used to make a CSP must be used after it has been opened or punctured, or a CSP must be used after it has been opened or punctured.

Additionally, the chapter was revised to add requirements for maintaining master formulation and compounding records, provide guidance on use of isolators, and add guidance for sterility testing of CSP prepared in batch sizes of less than 40.

The proposed chapter is posted online at www.usp.org/usp-nf/notices/general-chapter-797-proposed-revision with line numbers. Please provide the line numbers corresponding to your comments when submitting comments to CompoundingSL@usp.org.

Additionally, minor editorial changes have been made to update the chapter to current *USP*

style.

The following Briefing list includes monographs and/or chapters that both reference the General Chapter under revision and require revision to keep references to the General Chapter accurate. Other monographs and/or chapters may also be listed, even where the reference to the General Chapter remains unchanged, as additional notice to stakeholders where there is believed to be potential for the change in the general chapter itself to affect pass-fail determinations for particular monograph articles.

(797) PHARMACEUTICAL COMPOUNDING—STERILE PREPARATIONS

Change to read:

INTRODUCTION

~~The objective of this chapter is to describe conditions and practices to prevent harm, including death, to patients that could result from (1) microbial contamination (nonsterility), (2)~~

excessive bacterial endotoxins, (3) variability in the intended strength of correct ingredients that exceeds either monograph limits for official articles (see "official" and "article" in the *General Notices and Requirements*) or 10% for nonofficial articles, (4) unintended chemical and physical contaminants, and (5) ingredients of inappropriate quality in compounded sterile preparations (CSPs). Contaminated CSPs are potentially most hazardous to patients when administered into body cavities, central nervous and vascular systems, eyes, and joints, and when used as baths for live organs and tissues. When CSPs contain excessive bacterial endotoxins (see *Bacterial Endotoxins Test* (85)), they are potentially most hazardous to patients when administered into the central nervous system.

Despite the extensive attention in this chapter to the provision, maintenance, and evaluation of air quality, the avoidance of direct or physical contact contamination is paramount. It is generally acknowledged that direct or physical contact of critical sites of CSPs with contaminants, especially microbial sources, poses the greatest probability of risk to patients. Therefore, compounding personnel must be meticulously conscientious in precluding contact contamination of CSPs both within and outside ISO Class 5 (see *Table 1*) areas.

To achieve the above five conditions and practices, this chapter provides minimum practice and quality standards for CSPs of drugs and nutrients based on current scientific information and best sterile compounding practices. The use of technologies, techniques, materials, and procedures other than those described in this chapter is not prohibited so long as they have been proven to be equivalent or superior with statistical significance to those described herein. The standards in this chapter do not pertain to the *clinical administration* of CSPs to patients via application, implantation, infusion, inhalation, injection, insertion, instillation, and irrigation, which are the routes of administration. Four specific categories of CSPs are described in this chapter: low risk level, medium risk level, and high risk level, and immediate use. Sterile compounding differs from nonsterile compounding (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)—

• (CN 1 May 2016)

) primarily by requiring the maintenance of sterility when compounding exclusively with sterile ingredients and components (i.e., with immediate use CSPs, low risk level CSPs, and medium risk level CSPs) and the achievement of sterility when compounding with nonsterile ingredients and components (i.e., with high risk level CSPs). Some differences between standards for sterile compounding in this chapter and those for nonsterile compounding in *Pharmaceutical Compounding—Nonsterile Preparations* (795) include, but are not limited to, ISO-classified air environments (see *Table 1*); personnel garbing and gloving; personnel training and testing in principles and practices of aseptic manipulations and sterilization; environmental quality specifications and monitoring; and disinfection of gloves and surfaces of ISO Class 5 (see *Table 1*) sources.

Table 1. ISO Classification of Particulate Matter in Room Air (limits are in particles of 0.5 μm and larger per cubic meter [current ISO] and cubic feet [former Federal Standard No. 209E, FS-209E])*

Class Name		Particle Count	
ISO Class	U.S. FS 209E	ISO, m ³	FS 209E, ft ³
3	Class 1	35.2	1
4	Class 10	352	10
5	Class 100	3,520	100
6	Class 1,000	35,200	1,000
7	Class 10,000	352,000	10,000
8	Class 100,000	3,520,000	100,000

*Adapted from former Federal Standard No. 209E, General Services Administration, Washington, DC, 20407 (September 11, 1992) and ISO 14644-1:1999, Cleanrooms and associated controlled environments—Part 1: Classification of air cleanliness. For example, 3,520 particles of 0.5 µm per m³ or larger (ISO Class 5) is equivalent to 100 particles per ft³ (Class 100) (1 m³ = 35.2 ft³).

The standards in this chapter are intended to apply to all persons who prepare CSPs and all places where CSPs are prepared (e.g., hospitals and other healthcare institutions, patient treatment clinics, pharmacies, physicians' practice facilities, and other locations and facilities in which CSPs are prepared, stored, and transported). Persons who perform sterile compounding include pharmacists, nurses, pharmacy technicians, and physicians. These terms recognize that most sterile compounding is performed by or under the supervision of pharmacists in pharmacies and also that this chapter applies to all healthcare personnel who prepare, store, and transport CSPs. For the purposes of this chapter, CSPs include any of the following:

1. Compounded biologics, diagnostics, drugs, nutrients, and radiopharmaceuticals, including but not limited to the following dosage forms that must be sterile when they are administered to patients: aqueous bronchial and nasal inhalations, baths and soaks for live organs and tissues, injections (e.g., colloidal dispersions, emulsions, solutions, suspensions), irrigations for wounds and body cavities, ophthalmic drops and ointments, and tissue implants.
2. Manufactured sterile products that are either prepared strictly according to the instructions appearing in manufacturers' approved labeling (product package inserts) or prepared differently than published in such labeling. [Note—The FDA states that "Compounding does not include mixing, reconstituting, or similar acts that are performed in accordance with the directions contained in approved labeling provided by the product's manufacturer and other manufacturer directions consistent with that labeling" [21 USC 321 (k) and (m)]. However, the FDA approved labeling (product package insert) rarely describes environmental quality (e.g., ISO Class air designation, exposure durations to non-ISO classified air, personnel garbing and gloving, and other aseptic precautions by which sterile products are to be prepared for administration). Beyond-use exposure and storage dates or times (see *General Notices and Requirements and Pharmaceutical Compounding—Nonsterile Preparations* (795)) for sterile products that have been either opened or prepared for administration are not specified in all package inserts for all sterile products. Furthermore, when such durations are specified, they may refer to chemical stability and not necessarily to microbiological purity or safety.]

ORGANIZATION OF THIS CHAPTER

The sections in this chapter are organized to facilitate the practitioner's understanding of the fundamental accuracy and quality practices for preparing CSPs. They provide a foundation for the development and implementation of essential procedures for the safe preparation of low-risk, medium-risk, and high-risk level CSPs and immediate-use CSPs, which are classified according to the potential for microbial, chemical, and physical contamination. The chapter is divided into the following main sections:

- Responsibility of Compounding Personnel
- CSP Microbial Contamination Risk Levels
- Personnel Training and Evaluation in Aseptic Manipulation Skills
- Immediate-Use CSPs
- Single-Dose and Multiple-Dose Containers
- Hazardous Drugs as CSPs
- Radiopharmaceuticals as CSPs
- Allergen Extracts as CSPs
- Verification of Compounding Accuracy and Sterility
- Environmental Quality and Control
- Suggested Standard Operating Procedures (SOPs)
- Elements of Quality Control
- Verification of Automated Compounding Devices (ACDs) for Parenteral Nutrition Compounding
- Finished Preparation Release Checks and Tests
- Storage and Beyond-Use Dating
- Maintaining Sterility, Purity, and Stability of Dispensed and Distributed CSPs
- Patient or Caregiver Training
- Patient Monitoring and Adverse Events Reporting
- Quality Assurance (QA) Program
- Abbreviations and Acronyms
- Glossary
- Appendices I–V

The requirements and recommendations in this chapter are summarized in *Appendix I*. A list of abbreviations and acronyms is included at the end of the main text, before the *Appendices*.

All personnel who prepare CSPs shall be responsible for understanding these fundamental practices and precautions, for developing and implementing appropriate procedures, and for continually evaluating these procedures and the quality of final CSPs to prevent harm.

RESPONSIBILITY OF COMPOUNDING PERSONNEL

Compounding personnel are responsible for ensuring that CSPs are accurately identified, measured, diluted, and mixed and are correctly purified, sterilized, packaged, sealed, labeled, stored, dispensed, and distributed. These performance responsibilities include maintaining appropriate cleanliness conditions and providing labeling and supplementary instructions for the proper clinical administration of CSPs.

Compounding supervisors shall ensure, through either direct measurement or appropriate information sources, that specific CSPs maintain their labeled strength within monograph limits for *USP* articles, or within 10% if not specified, until their BUDs. All CSPs are prepared in a manner that maintains sterility and minimizes the introduction of particulate matter.

~~A written quality assurance procedure includes the following in-process checks that are applied, as appropriate, to specific CSPs: accuracy and precision of measuring and weighing; the requirement for sterility; methods of sterilization and purification; safe limits and ranges for strength of ingredients, bacterial endotoxins, and particulate matter; pH; labeling accuracy and completeness; BUD assignment; and packaging and storage requirements. The dispenser shall, when appropriate and practicable, obtain and evaluate results of testing for identity, strength, purity, and sterility before a CSP is dispensed. Qualified licensed healthcare professionals who supervise compounding and dispensing of CSPs shall ensure that the following objectives are achieved:~~

- ~~1. Compounding personnel are adequately skilled, educated, instructed, and trained to correctly perform and document the following activities in their sterile compounding duties:~~
 - ~~a. perform antiseptic hand cleansing and disinfection of nonsterile compounding surfaces;~~
 - ~~b. select and appropriately don protective garb;~~
 - ~~c. maintain or achieve sterility of CSPs in ISO Class 5 (see *Table 1*) PEC devices and protect personnel and compounding environments from contamination by radioactive, cytotoxic, and chemotoxic drugs (see *Hazardous Drugs as CSPs* and *Radiopharmaceuticals as CSPs*);~~
 - ~~d. identify, weigh, and measure ingredients; and~~
 - ~~e. manipulate sterile products aseptically, sterilize high-risk level CSPs, and label and quality inspect CSPs.~~
- ~~2. Ingredients have their correct identity, quality, and purity.~~
- ~~3. Opened or partially used packages of ingredients for subsequent use in CSPs are properly stored under restricted access conditions in the compounding facility. Such packages cannot be used when visual inspection detects unauthorized breaks in the container, closure, and seal; when the contents do not possess the expected appearance, aroma, and texture; when the contents do not pass identification tests specified by the compounding facility; and when either the BUD or expiration date has been exceeded.~~
- ~~4. Water-containing CSPs that are nonsterile during any phase of the compounding procedure are sterilized within 6 hours after completing the preparation in order to minimize the generation of bacterial endotoxins.~~
- ~~5. Sterilization methods achieve sterility of CSPs while maintaining the labeled strength of active ingredients and the physical integrity of packaging.~~
- ~~6. Measuring, mixing, sterilizing, and purifying devices are clean, appropriately accurate, and effective for their intended use.~~
- ~~7. Potential harm from added substances and differences in rate and extent of bioavailability of active ingredients for other than oral route of administration are carefully evaluated before such CSPs are dispensed and administered.~~
- ~~8. Packaging selected for CSPs is appropriate to preserve the sterility and strength until the BUD.~~
- ~~9. While being used, the compounding environment maintains the sterility or the presterilization purity, whichever is appropriate, of the CSP.~~
- ~~10. Labels on CSPs list the names and amounts or concentrations of active ingredients, and the labels or labeling of injections (see *Preservation, Packaging, Storage, and Labeling in the General Notices and Requirements*) list the names and amounts or concentrations~~

of all ingredients (see *Labeling (7)* (CN-1 May 2016)). Before being dispensed or administered, the clarity of solutions is visually confirmed; also, the identity and amounts of ingredients, procedures to prepare and sterilize CSPs, and specific release criteria are reviewed to ensure their accuracy and completeness.

11. BUDs are assigned on the basis of direct testing or extrapolation from reliable literature sources and other documentation (see *Stability Criteria and Beyond-Use Dating* under *Pharmaceutical Compounding—Nonsterile Preparations (795)*).
12. Procedures for measuring, mixing, dilution, purification, sterilization, packaging, and labeling conform to the correct sequence and quality established for the specified CSP.
13. Deficiencies in compounding, labeling, packaging, and quality testing and inspection can be rapidly identified and corrected.
14. When time and personnel availability so permit, compounding manipulations and procedures are separated from postcompounding quality inspection and review before CSPs are dispensed.

This chapter emphasizes the need to maintain high standards for the quality and control of processes, components, and environments and for the skill and knowledge of personnel who prepare CSPs. The rigor of in-process quality control checks and of postcompounding quality inspection and testing increases with the potential hazard of the route of administration. For example, nonsterility, excessive bacterial endotoxin contamination, large errors in strength of correct ingredients, and incorrect ingredients in CSPs are potentially more dangerous to patients when the CSPs are administered into the vascular and central nervous systems than when administered by most other routes.

CSP MICROBIAL CONTAMINATION RISK LEVELS

The three contamination categories for CSPs described in this section are assigned primarily according to the potential for microbial contamination during the compounding of low-risk level CSPs and medium-risk level CSPs or the potential for not sterilizing high-risk level CSPs, any of which would subject patients to risk of harm, including death. High-risk level CSPs must be sterilized before being administered to patients. The appropriate risk level—low, medium, or high—is assigned according to the corresponding probability of contaminating a CSP with (1) microbial contamination (e.g., microbial organisms, spores, endotoxins) and (2) chemical and physical contamination (e.g., foreign chemicals, physical matter). Potential sources of contamination include, but are not limited to, solid and liquid matter from compounding personnel and objects; nonsterile components employed and incorporated before terminal sterilization; inappropriate conditions within the restricted compounding environment; prolonged presterilization procedures with aqueous preparations; and nonsterile dosage forms used to compound CSPs.

The characteristics described below for low-, medium-, and high-risk level CSPs are intended as a guide to the breadth and depth of care necessary in compounding, but they are neither exhaustive nor prescriptive. The licensed healthcare professionals who supervise compounding are responsible for determining the procedural and environmental quality practices and attributes that are necessary for the risk level they assign to specific CSPs.

These risk levels apply to the quality of CSPs immediately after the final aseptic mixing or filling or immediately after the final sterilization, unless precluded by the specific characteristics of

the preparation. Upon subsequent storage and shipping of freshly finished CSPs, an increase in the risks of chemical degradation of ingredients, contamination from physical damage to packaging, and permeability of plastic and elastomeric packaging is expected. In such cases, compounding personnel are responsible for considering the potential additional risks to the integrity of CSPs when assigning BUDs. The pre-administration storage duration and temperature limits specified in the following subsections apply in the absence of direct sterility testing results that justify different limits for specific CSPs.

Low-Risk Level CSPs

CSPs compounded under all the following conditions are at a low risk of contamination.

Low-Risk Conditions—

1. The CSPs are compounded with aseptic manipulations entirely within ISO Class 5 (see *Table 1*) or better air quality using only sterile ingredients, products, components, and devices.
2. The compounding involves only transfer, measuring, and mixing manipulations using not more than three commercially manufactured packages of sterile products and not more than two entries into any one sterile container or package (e.g., bag, vial) of sterile product or administration container/device to prepare the CSP.
3. Manipulations are limited to aseptically opening ampuls, penetrating disinfected stoppers on vials with sterile needles and syringes, and transferring sterile liquids in sterile syringes to sterile administration devices, package containers of other sterile products, and containers for storage and dispensing.
4. For a low risk level preparation, in the absence of passing a sterility test (see *Sterility Tests (71)*), the storage periods cannot exceed the following time periods: before administration, the CSPs are properly stored and are exposed for not more than 48 hours at controlled room temperature (see *General Notices and Requirements*), for not more than 14 days at a cold temperature (see *General Notices and Requirements*), and for 45 days in solid frozen state between -25° and -10° .

Examples of Low-Risk Compounding—

1. Single volume transfers of sterile dosage forms from ampuls, bottles, bags, and vials using sterile syringes with sterile needles, other administration devices, and other sterile containers. The solution content of ampuls should be passed through a sterile filter to remove any particles.
2. Simple aseptic measuring and transferring with not more than three packages of manufactured sterile products, including an infusion or diluent solution to compound drug admixtures and nutritional solutions.

Low-Risk Level CSPs with 12-Hour or Less BUD—If the PEC is a CAI or CACI that does not meet the requirements described in *Placement of Primary Engineering Controls* or is a laminar airflow workbench (LAFW) or a biological safety cabinet (BSC) that cannot be located within an ISO-Class 7 (see *Table 1*) buffer area, then only low risk level nonhazardous and radiopharmaceutical CSPs pursuant to a physician's order for a specific patient may be prepared, and administration of such CSPs shall commence within 12 hours of preparation or as recommended in the manufacturers' package insert, whichever is less. Low risk level CSPs with

a 12-hour or less BUD shall meet all of the following four criteria:

1. PECs (LAFWs, BSCs, CAIs, CACIs,) shall be certified and maintain ISO Class 5 (see *Table 1*) as described in *Facility Design and Environmental Controls* for exposure of critical sites and shall be in a segregated compounding area restricted to sterile compounding activities that minimize the risk of CSP contamination.
2. The segregated compounding area shall not be in a location that has unsealed windows or doors that connect to the outdoors or high traffic flow, or that is adjacent to construction sites, warehouses, or food preparation. Note that this list is not intended to be all inclusive.
3. Personnel shall follow the procedures described in *Personnel Cleansing and Garbing and Additional Personnel Requirements* prior to compounding. Sinks should not be located adjacent to the ISO Class 5 (see *Table 1*) PEC. Sinks should be separated from the immediate area of the ISO Class 5 (see *Table 1*) PEC device.
4. The specifications in *Cleaning and Disinfecting the Sterile Compounding Areas, Personnel Training and Competency Evaluation of Garbing, Aseptic Work Practices and Cleaning/Disinfection Procedures*, and *Viable and Nonviable Environmental Sampling (ES) Testing* shall be followed as described in the chapter.

Compounding personnel must recognize that the absence of an ISO Class 7 (see *Table 1*) buffer area environment in a general uncontrolled environment increases the potential of microbial contamination, and administration durations of microbially contaminated CSPs exceeding a few hours increase the potential for clinically significant microbial colonization, and thus for patient harm, especially in critically ill or immunocompromised patients.

Quality Assurance—Quality assurance practices include, but are not limited to the following:

1. Routine disinfection and air quality testing of the direct compounding environment to minimize microbial surface contamination and maintain ISO Class 5 (see *Table 1*) air quality.
2. Visual confirmation that compounding personnel are properly donning and wearing appropriate items and types of protective garments, including eye protection and face masks.
3. Review of all orders and packages of ingredients to ensure that the correct identity and amounts of ingredients were compounded.
4. Visual inspection of CSPs to ensure the absence of particulate matter in solutions, the absence of leakage from vials and bags, and the accuracy and thoroughness of labeling.

Media-Fill Test Procedure—This test or an equivalent test is performed at least annually by each person authorized to compound in a low-risk level environment under conditions that closely simulate the most challenging or stressful conditions encountered during compounding of low-risk level CSPs. Once begun, this test is completed without interruption. *Example of test procedure:* within an ISO Class 5 (see *Table 1*) air quality environment, three sets of four 5-mL aliquots of sterile Soybean-Casein Digest Medium (also known as trypticase soy broth or trypticase soy agar [TSA]) are transferred with the same sterile 10-mL syringe and vented needle combination into separate sealed, empty, sterile 30-mL clear vials (i.e., four 5-mL aliquots into each of three 30-mL vials). Sterile adhesive seals are aseptically affixed to the rubber closures on the three filled vials, then the vials are incubated at 20° to 25° or at 30° to 35° for a minimum of 14 days. If two temperatures are used for incubation of media-filled

~~samples, then these filled containers should be incubated for at least 7 days at each temperature (see *Microbiological Control and Monitoring of Aseptic Processing Environments* (1116)). Inspect for microbial growth over 14 days as described in *Personnel Training and Competency Evaluation of Garbing, Aseptic Work Practices and Cleaning/Disinfection Procedures*.~~

Medium-Risk Level CSPs

~~When CSPs are compounded aseptically under *Low-Risk Conditions* and one or more of the following conditions exists, such CSPs are at a medium risk of contamination.~~

Medium-Risk Conditions—

- ~~1. Multiple individual or small doses of sterile products are combined or pooled to prepare a CSP that will be administered either to multiple patients or to one patient on multiple occasions.~~
- ~~2. The compounding process includes complex aseptic manipulations other than the single-volume transfer.~~
- ~~3. The compounding process requires unusually long duration, such as that required to complete dissolution or homogeneous mixing.~~
- ~~4. For a medium-risk preparation, in the absence of passing a sterility test (see *Sterility Tests* (71)), the storage periods cannot exceed the following time periods: before administration, the CSPs are properly stored and are exposed for not more than 30 hours at controlled room temperature (see *General Notices and Requirements*), for not more than 9 days at a cold temperature (see *General Notices and Requirements*), and for 45 days in solid frozen state between -25° and -10° .~~

Examples of Medium-Risk Compounding—

- ~~1. Compounding of total parenteral nutrition fluids using manual or automated devices during which there are multiple injections, detachments, and attachments of nutrient source products to the device or machine to deliver all nutritional components to a final sterile container.~~
- ~~2. Filling of reservoirs of injection and infusion devices with more than three sterile drug products and evacuation of air from those reservoirs before the filled device is dispensed.~~
- ~~3. Transfer of volumes from multiple ampuls or vials into one or more final sterile containers.~~

Quality Assurance—~~Quality assurance procedures for medium-risk level CSPs include all those for low-risk level CSPs, as well as a more challenging media-fill test passed annually or more frequently.~~

Media-Fill Test Procedure—~~This test or an equivalent test is performed at least annually under conditions that closely simulate the most challenging or stressful conditions encountered during compounding. Once begun, this test is completed without interruption. *Example of test procedure:* within an ISO Class 5 (see *Table 1*) air quality environment, six 100-mL aliquots of sterile Soybean Casein Digest Medium are aseptically transferred by gravity through separate tubing sets into separate evacuated sterile containers. The six containers are then arranged as three pairs, and a sterile 10-mL syringe and 18-gauge needle combination is used to exchange two 5-mL aliquots of medium from one container to the other container in the pair. For~~

example, after a 5-mL aliquot from the first container is added to the second container in the pair, the second container is agitated for 10 seconds, then a 5-mL aliquot is removed and returned to the first container in the pair. The first container is then agitated for 10 seconds, and the next 5-mL aliquot is transferred from it back to the second container in the pair. Following the two 5-mL aliquot exchanges in each pair of containers, a 5-mL aliquot of medium from each container is aseptically injected into a sealed, empty, sterile 10-mL clear vial, using a sterile 10-mL syringe and vented needle. Sterile adhesive seals are aseptically affixed to the rubber closures on the three filled vials, then the vials are incubated at 20° to 25° or at 30° to 35° for a minimum of 14 days. If two temperatures are used for incubation of media-filled samples, then these filled containers should be incubated for at least 7 days at each temperature (see *Microbiological Control and Monitoring of Aseptic Processing Environments* (1116)). Inspect for microbial growth over 14 days as described in *Personnel Training and Competency Evaluation of Garbing, Aseptic Work Practices and Cleaning/Disinfection Procedures*.

High-Risk Level CSPs

CSPs compounded under any of the following conditions are either contaminated or at a high risk to become contaminated:

High-Risk Conditions—

1. Nonsterile ingredients, including manufactured products not intended for sterile routes of administration (e.g., oral), are incorporated or a nonsterile device is employed before terminal sterilization.
2. Any of the following are exposed to air quality worse than ISO Class 5 (see *Table 1*) for more than 1 hour (see *Immediate-Use CSPs*):
 - sterile contents of commercially manufactured products,
 - CSPs that lack effective antimicrobial preservatives, and
 - sterile surfaces of devices and containers for the preparation, transfer, sterilization, and packaging of CSPs.
3. Compounding personnel are improperly garbed and gloved (see *Personnel Cleansing and Use of Barrier Protective Equipment*).
4. Nonsterile water-containing preparations are stored for more than 6 hours before being sterilized.
5. It is assumed, and not verified by examination of labeling and documentation from suppliers or by direct determination, that the chemical purity and content strength of ingredients meet their original or compendial specifications in unopened or in opened packages of bulk ingredients (see *Ingredient Selection under Pharmaceutical Compounding—Nonsterile Preparations* (795)).

For a sterilized high-risk level preparation, in the absence of passing a sterility test, the storage periods cannot exceed the following time periods: before administration, the CSPs are properly stored and are exposed for not more than 24 hours at controlled room temperature (see *General Notices and Requirements*), for not more than 3 days at a cold temperature (see *General Notices and Requirements*), and for 45 days in solid frozen state between –25° and –10°. [Note—Sterility tests for autoclaved CSPs are not required unless they are prepared in batches of more than 25 units.]

All nonsterile measuring, mixing, and purifying devices are rinsed thoroughly with sterile,

pyrogen-free water, and then thoroughly drained or dried immediately before use for high-risk compounding. All high-risk level CSP solutions subjected to terminal sterilization are prefiltered by passing through a filter with a nominal pore size not larger than 1.2 µm preceding or during filling into their final containers to remove particulate matter. Sterilization of high-risk level CSPs by filtration shall be performed with a sterile 0.2 µm or 0.22 µm nominal pore size filter entirely within an ISO Class 5 (see *Table 1*) or superior air quality environment.

Examples of High-Risk Conditions—

1. Dissolving nonsterile bulk drug and nutrient powders to make solutions that will be terminally sterilized.
2. Exposing the sterile ingredients and components used to prepare and package CSPs to room air quality worse than ISO Class 5 (see *Table 1*) for more than 1 hour (see *Immediate-Use CSPs*).
3. Measuring and mixing sterile ingredients in nonsterile devices before sterilization is performed.
4. Assuming, without appropriate evidence or direct determination, that packages of bulk ingredients contain at least 95% by weight of their active chemical moiety and have not been contaminated or adulterated between uses.

Quality Assurance—Quality assurance procedures for high-risk level CSPs include all those for low-risk level CSPs. In addition, a media-fill test that represents high-risk level compounding is performed semiannually by each person authorized to compound high-risk level CSPs.

Media-Fill Test Procedure for CSPs Sterilized by Filtration—This test or an equivalent test is performed under conditions that closely simulate the most challenging or stressful conditions encountered when compounding high-risk level CSPs. Once begun, this test is completed without interruption. *Example of test procedure* (in the following sequence):

1. Dissolve 3 g of nonsterile commercially available Soybean Casein Digest Medium in 100 mL of nonbacteriostatic water to make a 3% nonsterile solution.
2. Draw 25 mL of the medium into each of three 30 mL sterile syringes. Transfer 5 mL from each syringe into separate sterile 10 mL vials. These vials are the positive controls to generate exponential microbial growth, which is indicated by visible turbidity upon incubation.
3. Under aseptic conditions and using aseptic techniques, affix a sterile 0.2 µm or 0.22 µm nominal pore size filter unit and a 20-gauge needle to each syringe. Inject the next 10 mL from each syringe into three separate 10 mL sterile vials. Repeat the process for three more vials. Label all vials, affix sterile adhesive seals to the closure of the nine vials, and incubate them at 20° to 25° or at 30° to 35° for a minimum of 14 days. If two temperatures are used for incubation of media-filled samples, then these filled containers should be incubated for at least 7 days at each temperature (see *Microbiological Control and Monitoring of Aseptic Processing Environments (1116)*). Inspect for microbial growth over 14 days as described in *Personnel Training and Competency Evaluation of Garbing, Aseptic Work Practices and Cleaning/Disinfection Procedures*.

PERSONNEL TRAINING AND EVALUATION IN ASEPTIC MANIPULATION SKILLS

Personnel who prepare CSPs shall be trained conscientiously and skillfully by expert personnel and through audio-video instructional sources and professional publications in the theoretical principles and practical skills of aseptic manipulations and in achieving and maintaining ISO Class 5 (see *Table 1*) environmental conditions before they begin to prepare CSPs. Compounding personnel shall perform didactic review and pass written and media-fill testing of aseptic manipulative skills initially, at least annually thereafter for low- and medium-risk level compounding, and semiannually for high-risk level compounding. Compounding personnel who fail written tests or whose media-fill test vials result in gross microbial colonization shall be immediately re-instructed and re-evaluated by expert compounding personnel to ensure correction of all aseptic practice deficiencies.

Media-Fill Challenge Testing—The skill of personnel to aseptically prepare CSPs may be evaluated using sterile fluid bacterial culture media-fill verification¹ (i.e., sterile bacterial culture medium transfer via a sterile syringe and needle). Media-fill testing is used to assess the quality of the aseptic skill of compounding personnel. Media-fill tests represent the most challenging or stressful conditions actually encountered by the personnel being evaluated when they prepare particular risk level CSPs and when sterilizing high-risk level CSPs. Media-fill challenge tests that simulate high-risk level compounding are also used to verify the capability of the compounding environment and process to produce a sterile preparation.

Commercially available sterile fluid culture media, such as Soybean-Casein Digest Medium (see *Sterility Tests* (71)), shall be able to promote exponential colonization of bacteria that are most likely to be transmitted to CSPs from the compounding personnel and environment. Media-filled vials are generally incubated at 20° to 25° or at 30° to 35° for a minimum of 14 days. If two temperatures are used for incubation of media-filled samples, then these filled containers should be incubated for at least 7 days at each temperature (see *Microbiological Control and Monitoring of Aseptic Processing Environments* (1116)). Failure is indicated by visible turbidity in the medium on or before 14 days.

IMMEDIATE-USE CSPS

The immediate-use provision is intended only for those situations where there is a need for emergency or immediate patient administration of a CSP. Such situations may include cardiopulmonary resuscitation, emergency room treatment, preparation of diagnostic agents, or critical therapy where the preparation of the CSP under conditions described for *Low-Risk Level CSPs* subjects the patient to additional risk due to delays in therapy. Immediate-use CSPs are not intended for storage for anticipated needs or batch compounding. Preparations that are medium-risk level and high-risk level CSPs shall not be prepared as immediate-use CSPs.

Immediate-use CSPs are exempt from the requirements described for *Low-Risk Level CSPs* only when all of the following criteria are met:

1. The compounding process involves simple transfer of not more than three commercially manufactured packages of sterile nonhazardous products or diagnostic radiopharmaceutical products from the manufacturers' original containers and not more than two entries into any one container or package (e.g., bag, vial) of sterile infusion solution or administration container/device. For example, anti-neoplastics shall not be prepared as immediate-use CSPs because they are hazardous drugs.
2. Unless required for the preparation, the compounding procedure is a continuous process

- not to exceed 1 hour.
3. During preparation, aseptic technique is followed and, if not immediately administered, the finished CSP is under continuous supervision to minimize the potential for contact with nonsterile surfaces, introduction of particulate matter or biological fluids, mix-ups with other CSPs, and direct contact of outside surfaces.
 4. Administration begins not later than 1 hour following the start of the preparation of the CSP.
 5. Unless immediately and completely administered by the person who prepared it or immediate and complete administration is witnessed by the preparer, the CSP shall bear a label listing patient identification information, the names and amounts of all ingredients, the name or initials of the person who prepared the CSP, and the exact 1-hour BUD and time.
 6. If administration has not begun within 1 hour following the start of preparing the CSP, the CSP shall be promptly, properly, and safely discarded.

Compounding in worse than ISO Class 5 (see *Table 1*) conditions increases the likelihood of microbial contamination, and administration durations of microbially contaminated CSPs exceeding a few hours increase the potential for clinically significant microbial colonization and thus for patient harm, especially in critically ill or immunocompromised patients.

SINGLE-DOSE AND MULTIPLE-DOSE CONTAINERS

Opened or needle-punctured single-dose containers, such as bags, bottles, syringes, and vials of sterile products and CSPs shall be used within 1 hour if opened in worse than ISO Class 5 (see *Table 1*) air quality (see *Immediate-Use CSPs*), and any remaining contents must be discarded. Single-dose vials exposed to ISO Class 5 (see *Table 1*) or cleaner air may be used up to 6 hours after initial needle puncture. Opened single-dose ampuls shall not be stored for any time period. Multiple-dose containers (e.g., vials) are formulated for removal of portions on multiple occasions because they usually contain antimicrobial preservatives. The BUD after initially entering or opening (e.g., needle-punctured) multiple-dose containers is 28 days (see *Antimicrobial Effectiveness Testing* (51)) unless otherwise specified by the manufacturer.

HAZARDOUS DRUGS AS CSPS

Although the potential therapeutic benefits of compounded sterile hazardous drug preparations generally outweigh the risks of their adverse effects in ill patients, exposed healthcare workers risk similar adverse effects with no therapeutic benefit. Occupational exposure to hazardous drugs can result in (1) acute effects, such as skin rashes; (2) chronic effects, including adverse reproductive events; and (3) possibly cancer (see Appendix A of NIOSH Publication no. 2004-165).

Hazardous drugs shall be prepared for administration only under conditions that protect the healthcare workers and other personnel in the preparation and storage areas. Hazardous drugs shall be stored separately from other inventory in a manner to prevent contamination and personnel exposure. Many hazardous drugs have sufficient vapor pressures that allow volatilization at room temperature; thus storage is preferably within a containment area such as a negative pressure room. The storage area should have sufficient general exhaust ventilation, at least 12 air changes per hour (ACPH)² to dilute and remove any airborne contaminants.

Hazardous drugs shall be handled with caution at all times using appropriate chemotherapy

~~gloves during receiving, distribution, stocking, inventorying, preparation for administration, and disposal. Hazardous drugs shall be prepared in an ISO Class 5 (see *Table 1*) environment with protective engineering controls in place and following aseptic practices specified for the appropriate contamination risk levels defined in this chapter. Access shall be limited to areas where drugs are stored and prepared to protect persons not involved in drug preparation.~~

~~All hazardous drugs shall be prepared in a BSC³ or a CACI that meets or exceeds the standards for CACI in this chapter. The ISO Class 5 (see *Table 1*) BSC or CACI shall be placed in an ISO Class 7 (see *Table 1*) area that is physically separated (i.e., a different area from other preparation areas) and optimally has not less than 0.01-inch water column negative pressure to adjacent positive pressure ISO Class 7 (see *Table 1*) or better ante-areas, thus providing inward airflow to contain any airborne drug. A pressure indicator shall be installed that can be readily monitored for correct room pressurization. The BSC and CACI optimally should be 100% vented to the outside air through HEPA filtration.~~

~~If a CACI that meets the requirements of this chapter is used outside of a buffer area, the compounding area shall maintain a minimum negative pressure of 0.01-inch water column and have a minimum of 12 ACPHs.~~

~~When closed-system vial transfer devices (CSTDs) (i.e., vial transfer systems that allow no venting or exposure of hazardous substance to the environment) are used, they shall be used within the ISO Class 5 (see *Table 1*) environment of a BSC or CACI. The use of a CSTD is preferred because of their inherent closed-system process. In facilities that prepare a low volume of hazardous drugs, the use of two tiers of containment (e.g., CSTD within a BSC or CACI that is located in a non-negative pressure room) is acceptable.~~

~~Appropriate personnel protective equipment (PPE) shall be worn when compounding in a BSC or CACI and when using CSTD devices. PPE should include gowns, face masks, eye protection, hair covers, shoe covers or dedicated shoes, double gloving with sterile chemo-type gloves, and compliance with manufacturers' recommendations when using a CACI.~~

~~All personnel who compound hazardous drugs shall be fully trained in the storage, handling, and disposal of these drugs. This training shall occur prior to preparing or handling hazardous CSPs, and its effectiveness shall be verified by testing specific hazardous drugs preparation techniques. Such verification shall be documented for each person at least annually. This training shall include didactic overview of hazardous drugs, including mutagenic, teratogenic, and carcinogenic properties, and it shall include ongoing training for each new hazardous drug that enters the marketplace. Compounding personnel of reproductive capability shall confirm in writing that they understand the risks of handling hazardous drugs. The training shall include at least the following: (1) safe aseptic manipulation practices; (2) negative pressure techniques when utilizing a BSC or CACI; (3) correct use of CSTD devices; (4) containment, cleanup, and disposal procedures for breakages and spills; and (5) treatment of personnel contact and inhalation exposure.~~

~~*note—Because standards of assay and unacceptable quantities of contamination of each drug have not been established in the literature, the following paragraph is a recommendation only. Future standards will be adopted as these assay methods are developed and proven.*~~

~~In order to ensure containment, especially in operations preparing large volumes of hazardous drugs, environmental sampling to detect uncontained hazardous drugs should be performed~~

routinely (e.g., initially as a benchmark and at least every 6 months or more often as needed to verify containment). This sampling should include surface wipe sampling of the working area of BSCs and CACIs; counter tops where finished preparations are placed; areas adjacent to BSCs and CACIs, including the floor directly under the working area; and patient administration areas. Common marker hazardous drugs that can be assayed include cyclophosphamide, ifosfamide, methotrexate, and fluorouracil. If any measurable contamination (cyclophosphamide levels greater than 1.00 ng per cm² have been found to cause human uptake) is found by any of these quality assurance procedures, practitioners shall make the decision to identify, document, and contain the cause of contamination. Such action may include retraining, thorough cleaning (utilizing high pH soap and water), and improving engineering controls. Examples of improving engineering controls are (1) venting BSCs or CACIs 100% to the outside, (2) implementing a CSTD, or (3) re-assessing types of BSCs or CACIs.

Disposal of all hazardous drug wastes shall comply with all applicable federal and state regulations. All personnel who perform routine custodial waste removal and cleaning activities in storage and preparation areas for hazardous drugs shall be trained in appropriate procedures to protect themselves and prevent contamination.

RADIOPHARMACEUTICALS AS CSPS

In the case of production of radiopharmaceuticals for positron emission tomography (PET), general test chapter *Positron Emission Tomography Drugs for Compounding, Investigational, and Research Uses* (823) supersedes this chapter. Upon release of a PET radiopharmaceutical as a finished drug product from a production facility, the further handling, manipulation, or use of the product will be considered compounding, and the content of this section and chapter is applicable.

For the purposes of this chapter, radiopharmaceuticals compounded from sterile components in closed sterile containers and with a volume of 100 mL or less for a single dose injection or not more than 30 mL taken from a multiple dose container (see *• Packaging and Storage Requirements* (659) *•* (CN 1 May 2016) *•*) shall be designated as, and conform to, the standards for *Low-Risk Level CSPs*.

These radiopharmaceuticals shall be compounded using appropriately shielded vials and syringes in a properly functioning and certified ISO Class 5 (see *Table 1*) PEC located in an ISO Class 8 (see *Table 1*) or cleaner air environment to permit compliance with special handling, shielding, and negative air flow requirements.

Radiopharmaceutical vials designed for multi-use, compounded with technetium-99m, exposed to ISO Class 5 (see *Table 1*) environment, and punctured by needles with no direct contact contamination may be used up to the time indicated by manufacturers' recommendations. Storage and transport of properly shielded vials of radiopharmaceutical CSPs may occur in a limited access ambient environment without a specific ISO class designation.

Technetium-99m/molybdenum-99 generator systems shall be stored and eluted (operated) under conditions recommended by manufacturers and applicable state and federal regulations. Such generator systems shall be eluted in an ISO Class 8 (see *Table 1*) or cleaner air environment to permit special handling, shielding, and air flow requirements. To limit acute and chronic radiation exposure of inspecting personnel to a level that is as low as reasonably achievable (ALARA), direct visual inspection of radiopharmaceutical CSPs containing high

~~concentrations of doses of radioactivity shall be conducted in accordance with ALARA.~~

~~Radiopharmaceuticals prepared as *Low Risk Level CSPs with 12 Hour or Less BUD* shall be prepared in a segregated compounding area. A line of demarcation defining the segregated compounding area shall be established. Materials and garb exposed in a patient care and treatment area shall not cross a line of demarcation into the segregated compounding area.~~

ALLERGEN EXTRACTS AS CSPS

~~Allergen extracts as CSPs are single dose and multiple dose *intra*dermal or *subcutaneous injections* that are prepared by specially trained physicians and personnel under their direct supervision. Allergen extracts as CSPs are not subject to the personnel, environmental, and storage requirements for all *CSP Microbial Contamination Risk Levels* in this chapter only when all of the following criteria are met:~~

- ~~1. The compounding process involves simple transfer via sterile needles and syringes of commercial sterile allergen products and appropriate sterile added substances (e.g., glycerin, phenol in sodium chloride injection).~~
- ~~2. All allergen extracts as CSPs shall contain appropriate substances in effective concentrations to prevent the growth of microorganisms. Nonpreserved allergen extracts shall comply with the appropriate CSP risk level requirements in the chapter.~~
- ~~3. Before beginning compounding activities, personnel perform a thorough hand cleansing procedure by removing debris from under fingernails using a nail cleaner under running warm water followed by vigorous hand and arm washing to the elbows for at least 30 seconds with either nonantimicrobial or antimicrobial soap and water.~~
- ~~4. Compounding personnel don hair covers, facial hair covers, gowns, and face masks.~~
- ~~5. Compounding personnel perform antiseptic hand cleansing with an alcohol-based surgical hand scrub with persistent activity.~~
- ~~6. Compounding personnel don powder-free sterile gloves that are compatible with sterile 70% isopropyl alcohol (IPA) before beginning compounding manipulations.~~
- ~~7. Compounding personnel disinfect their gloves intermittently with sterile 70% IPA when preparing multiple allergen extracts as CSPs.~~
- ~~8. Ampul necks and vial stoppers on packages of manufactured sterile ingredients are disinfected by careful wiping with sterile 70% IPA swabs to ensure that the critical sites are wet for at least 10 seconds and allowed to dry before they are used to compound allergen extracts as CSPs.~~
- ~~9. The aseptic compounding manipulations minimize direct contact contamination (e.g., from glove fingertips, blood, nasal and oral secretions, shed skin and cosmetics, other nonsterile materials) of critical sites (e.g., needles, opened ampuls, vial stoppers).~~
- ~~10. The label of each multiple-dose vial (MDV) of allergen extracts as CSPs lists the name of one specific patient and a BUD and storage temperature range that is assigned based on manufacturers' recommendations or peer-reviewed publications.~~
- ~~11. Single-dose allergen extracts as CSPs shall not be stored for subsequent additional use.~~

~~Personnel who compound allergen extracts as CSPs must be aware of greater potential risk of microbial and foreign material contamination when allergen extracts as CSPs are compounded in compliance with the foregoing criteria instead of the more rigorous standards in this chapter for *CSP Microbial Contamination Risk Levels*. Although contaminated allergen extracts as CSPs can pose health risks to patients when they are injected *intra*dermally or *subcutaneously*, these~~

risks are substantially greater if the extract is inadvertently injected *intravenously*.

VERIFICATION OF COMPOUNDING ACCURACY AND STERILITY

The compounding procedures and sterilization methods for CSPs correspond to correctly designed and verified written documentation in the compounding facility. Verification requires planned testing, monitoring, and documentation to demonstrate adherence to environmental quality requirements, personnel practices, and procedures critical to achieving and maintaining sterility, accuracy, and purity of finished CSPs. For example, sterility testing (see *Test for Sterility of the Product To Be Examined under Sterility Tests* (71)) may be applied to specimens of low and medium risk level CSPs, and standard self-contained biological indicators (BI) shall be added to nondispensable specimens of high risk level CSPs before terminal sterilization for subsequent evaluation to determine whether the sterilization cycle was adequate (see *Biological Indicators for Sterilization* (1035)). Packaged and labeled CSPs shall be visually inspected for physical integrity and expected appearance, including final fill amount. The accuracy of identities, concentrations, amounts, and purities of ingredients in CSPs shall be confirmed by reviewing labels on packages, observing and documenting correct measurements with approved and correctly standardized devices, and reviewing information in labeling and certificates of analysis provided by suppliers. When the correct identity, purity, strength, and sterility of ingredients and components of CSPs cannot be confirmed (in cases of, for example, unlabeled syringes, opened ampuls, punctured stoppers of vials and bags, containers of ingredients with incomplete labeling), such ingredients and components shall be discarded immediately.

Some individual ingredients, such as bulk drug substances, are not labeled with expiration dates when they are stable indefinitely in their commercial packages under their labeled storage conditions. However, despite retaining full chemical stability, such ingredients may gain or lose moisture during storage and use. Changes in moisture content may require testing (see *Loss on Drying* (731)) to determine the correct amount to weigh for accurate content of active chemical moieties in CSPs (see *Pharmaceutical Calculations in Prescription Compounding* (1160)).

Although not required, a quantitative stability indicating chemical assay is recommended to ensure compounding accuracy of CSPs, especially those that contain drug ingredients with a narrow therapeutic plasma concentration range.

Sterilization Methods

The licensed healthcare professionals who supervise compounding shall be responsible for determining that the selected sterilization method (see *Methods of Sterilization under Sterilization and Sterility Assurance of Compendial Articles* (1211)) both sterilizes and maintains the strength, purity, quality, and packaging integrity of CSPs. The selected sterilization process is obtained from experience and appropriate information sources (e.g., see *Sterilization and Sterility Assurance of Compendial Articles* (1211)) and, preferably, verified wherever possible to achieve sterility in the particular CSPs. General guidelines for matching CSPs and components to appropriate sterilization methods include the following:

1. CSPs have been ascertained to remain physically and chemically stable when subjected to the selected sterilization method.
2. Glass and metal devices may be covered tightly with aluminum foil, then exposed to dry

heat in an oven at a mean temperature of 250° for 30 minutes to achieve sterility and depyrogenation (see *Dry Heat Sterilization* under *Sterilization and Sterility Assurance of Compendial Articles* (1211) and *Bacterial Endotoxins Test* (85)). Such items are either used immediately or stored until use in an environment suitable for compounding *Low-Risk Level CSPs* and *Medium-Risk Level CSPs*.

3. Personnel ascertain from appropriate information sources that the sterile microporous membrane filter used to sterilize CSP solutions, during either compounding or administration, is chemically and physically compatible with the CSP.

sterilization of high-risk level csps by filtration

Commercially available sterile filters shall be approved for human use applications in sterilizing pharmaceutical fluids. Sterile filters used to sterilize CSPs shall be pyrogen free and have a nominal pore size of 0.2 or 0.22 µm. They shall be certified by the manufacturer to retain at least 10⁷ microorganisms of a strain of *Brevundimonas (Pseudomonas) diminuta* on each square centimeter of upstream filter surface area under conditions similar to those in which the CSPs will be sterilized (see *High-Risk Conditions* in *High-Risk Level CSPs*).

The compounding supervisor shall ensure, directly or from appropriate documentation, that the filters are chemically and physically stable at the pressure and temperature conditions to be used, that they have enough capacity to filter the required volumes, and that they will achieve sterility and maintain prefiltration pharmaceutical quality, including strength of ingredients of the specific CSP. The filter dimensions and liquid material to be sterile filtered shall permit the sterilization process to be completed rapidly, without the replacement of the filter during the process. When CSPs are known to contain excessive particulate matter, a prefilter of larger nominal pore size membrane is placed upstream from the sterilizing filter to remove gross particulate contaminants in order to maximize the efficiency of the sterilizing filter.

Filter units used to sterilize CSPs shall also be subjected to manufacturers' recommended integrity test, such as the bubble point test.

Compounding personnel shall ascertain that selected filters will achieve sterilization of the particular CSPs being sterilized. Large deviations from usual or expected chemical and physical properties of CSPs (e.g., water miscible alcohols) may cause undetectable damage to filter integrity and shrinkage of microorganisms to sizes smaller than filter nominal pore size.

sterilization of high-risk level csps by steam

The process of thermal sterilization employing saturated steam under pressure, or autoclaving, is the preferred method to terminally sterilize aqueous preparations that have been verified to maintain their full chemical and physical stability under the conditions employed (see *Steam Sterilization* under *Sterilization and Sterility Assurance of Compendial Articles* (1211)). To achieve sterility, all materials are to be exposed to steam at 121° under a pressure of about 1 atmosphere or 15 psi for the duration verified by testing to achieve sterility of the items, which is usually 20 to 60 minutes for CSPs. An allowance shall be made for the time required for the material to reach 121° before the sterilization exposure duration is timed.

Not directly exposing items to pressurized steam may result in survival of microbial organisms and spores. Before their sterilization, plastic, glass, and metal devices are tightly wrapped in low-particle-shedding paper or fabrics or sealed in envelopes that prevent poststerilization microbial penetration. Immediately before filling ampuls and vials that will be steam sterilized,

solutions are passed through a filter having a nominal pore size not larger than 1.2 µm for removal of particulate matter. Sealed containers shall be able to generate steam internally; thus, stoppered and crimped empty vials shall contain a small amount of moisture to generate steam.

The description of steam sterilization conditions and duration for specific CSPs shall be included in written documentation in the compounding facility. The effectiveness of steam sterilization shall be verified using appropriate BIs of *Bacillus stearothermophilus* (see *Biological Indicators* (1035)) and other confirmation methods such as temperature sensing devices (see *Sterilization and Sterility Assurance of Compendial Articles* (1211) and *Sterility Tests* (71)).

~~sterilization of high-risk level csp's by dry heat~~

Dry heat sterilization is usually done as a batch process in an oven designed for sterilization. Heated filtered air shall be evenly distributed throughout the chamber by a blower device. The oven should be equipped with a system for controlling temperature and exposure period. Sterilization by dry heat requires higher temperatures and longer exposure times than does sterilization by steam. Dry heat shall be used only for those materials that cannot be sterilized by steam, when either the moisture would damage the material or the material is impermeable. During sterilization, sufficient space shall be left between materials to allow for good circulation of the hot air. The description of dry heat sterilization conditions and duration for specific CSPs shall be included in written documentation in the compounding facility. The effectiveness of dry heat sterilization shall be verified using appropriate BIs of *Bacillus subtilis* (see *Biological Indicators* (1035)) and other confirmation methods such as temperature sensing devices (see *Sterilization and Sterility Assurance of Compendial Articles* (1211) and *Sterility Tests* (71)). [Note—Dry heat sterilization may be performed at a lower temperature than may be effective for depyrogenation].

Depyrogenation by Dry Heat

Dry heat depyrogenation shall be used to render glassware or containers such as vials free from pyrogens as well as viable microbes. A typical cycle would be 30 minutes at 250°. The description of the dry heat depyrogenation cycle and duration for specific load items shall be included in written documentation in the compounding facility. The effectiveness of the dry heat depyrogenation cycle shall be verified using endotoxin challenge vials (ECVs). The bacterial endotoxin test should be performed on the ECVs to verify that the cycle is capable of achieving a 3-log reduction in endotoxin (see *Sterilization and Sterility Assurance of Compendial Articles* (1211) and *Bacterial Endotoxins Test* (85)).

ENVIRONMENTAL QUALITY AND CONTROL

Achieving and maintaining sterility and overall freedom from contamination of a CSP is dependent on the quality status of the components incorporated, the process utilized, personnel performance, and the environmental conditions under which the process is performed. The standards required for the environmental conditions depend on the amount of exposure of the CSP to the immediate environment anticipated during processing. The quality and control of environmental conditions for each risk level of operation are explained in this section. In addition, operations using nonsterile components require the use of a method of preparation designed to produce a sterile preparation.

Exposure of Critical Sites

Maintaining the sterility and cleanliness (i.e., freedom from sterile foreign materials) of critical sites is a primary safeguard for CSPs. Critical sites are locations that include any component or fluid pathway surfaces (e.g., vial septa, injection ports, beakers) or openings (e.g., opened ampuls, needle hubs) exposed and at risk of direct contact with air (e.g., ambient room or HEPA filtered), moisture (e.g., oral and mucosal secretions), or touch contamination. The risk of, or potential for, critical sites to be contaminated with microorganisms and foreign matter increases with increasing exposed area of the critical sites, the density or concentration of contaminants, and exposure duration to worse than ISO Class 5 (see *Table 1*) air. Examples include an opened ampul or vial stopper on a 10-mL or larger vial or an injection port on a package of intravenous solution having an area larger than the point of a needle or the tip of a syringe.

The nature of a critical site also affects the risk of contamination. The relatively rough, permeable surface of an elastomeric closure retains microorganisms and other contaminants after swabbing with a sterile 70% IPA pad more readily than does the smoother glass surface of the neck of an ampul. Therefore, the surface disinfection can be expected to be more effective for an ampul.

Protection of critical sites by precluding physical contact and airborne contamination shall be given the highest priority in sterile compounding practice. Airborne contaminants, especially those generated by sterile compounding personnel, are much more likely to reach critical sites than are contaminants that are adhering to the floor or other surfaces below the work level. Furthermore, large and high density particles that are generated and introduced by compounding manipulations and personnel have the potential to settle on critical sites even when those critical sites are exposed within ISO Class 5 (see *Table 1*) air.

ISO Class 5 Air Sources, Buffer Areas, and Ante-Areas

The most common sources of ISO Class 5 (see *Table 1*) air quality for exposure of critical sites are horizontal and vertical LAFWs, CAIs, and CACIs. A clean room (see *Microbiological Control and Monitoring of Aseptic Processing Environments* (1116)) is a compounding environment that is supplied with HEPA or HEPA filtered air that meets ISO Class 7 (see *Table 1*), the access to which is limited to personnel trained and authorized to perform sterile compounding and facility cleaning. A buffer area is an area that provides at least ISO Class 7 (see *Table 1*) air quality.

Figure 1 is a conceptual representation of the placement of an ISO Class 5 (see *Table 1*) PEC in a segregated compounding area used for low risk level CSPs with 12-hour or less BUD. This plan depicts the most critical operation area located within the PEC in a designated area (see definition of *Segregated Compounding Area*) separated from activities not essential to the preparation of CSPs. Placement of devices (e.g., computers, printers) and objects (e.g., carts, cabinets) that are not essential to compounding in the segregated area should be restricted or limited, depending on their effect on air quality in the ISO Class 5 (see *Table 1*) PEC.

Conceptual representation of USP Chapter <797> facility requirements

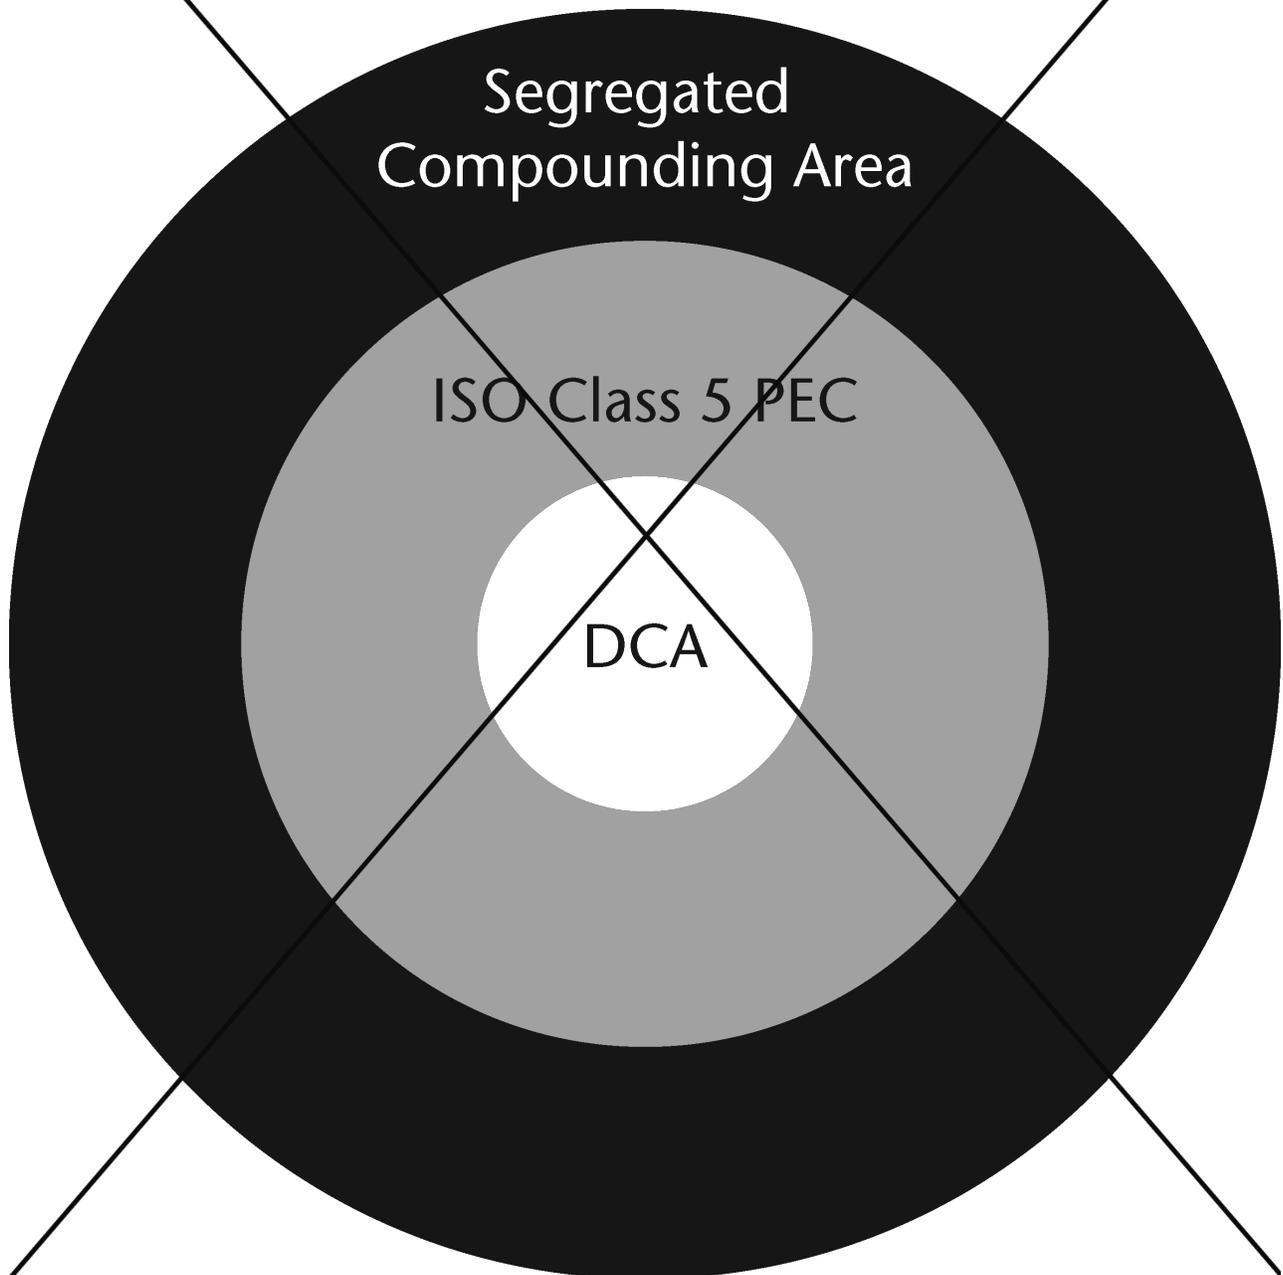

Figure 1. Conceptual representation of the placement of an ISO Class 5 PEC in a segregated compounding area used for low-risk level CSPs with 12-hour or less-BUD.

Figure 2 is a conceptual representation of the arrangement of a facility for preparation of CSPs categorized as low-, medium-, and high-risk level. The quality of the environmental air increases with movement from the outer boundary to the direct compounding area (DCA). Placement of devices in ante-areas and buffer areas is dictated by their effect on the designated environmental quality of atmospheres and surfaces, which shall be verified by monitoring (see *Viable and Nonviable Environmental Sampling (ES) Testing*). It is the

responsibility of each compounding facility to ensure that each source of ISO Class 5 (see *Table 1*) environment for exposure of critical sites and sterilization by filtration is properly located, operated, maintained, monitored, and verified.

Conceptual representation of USP Chapter <797> facility requirements

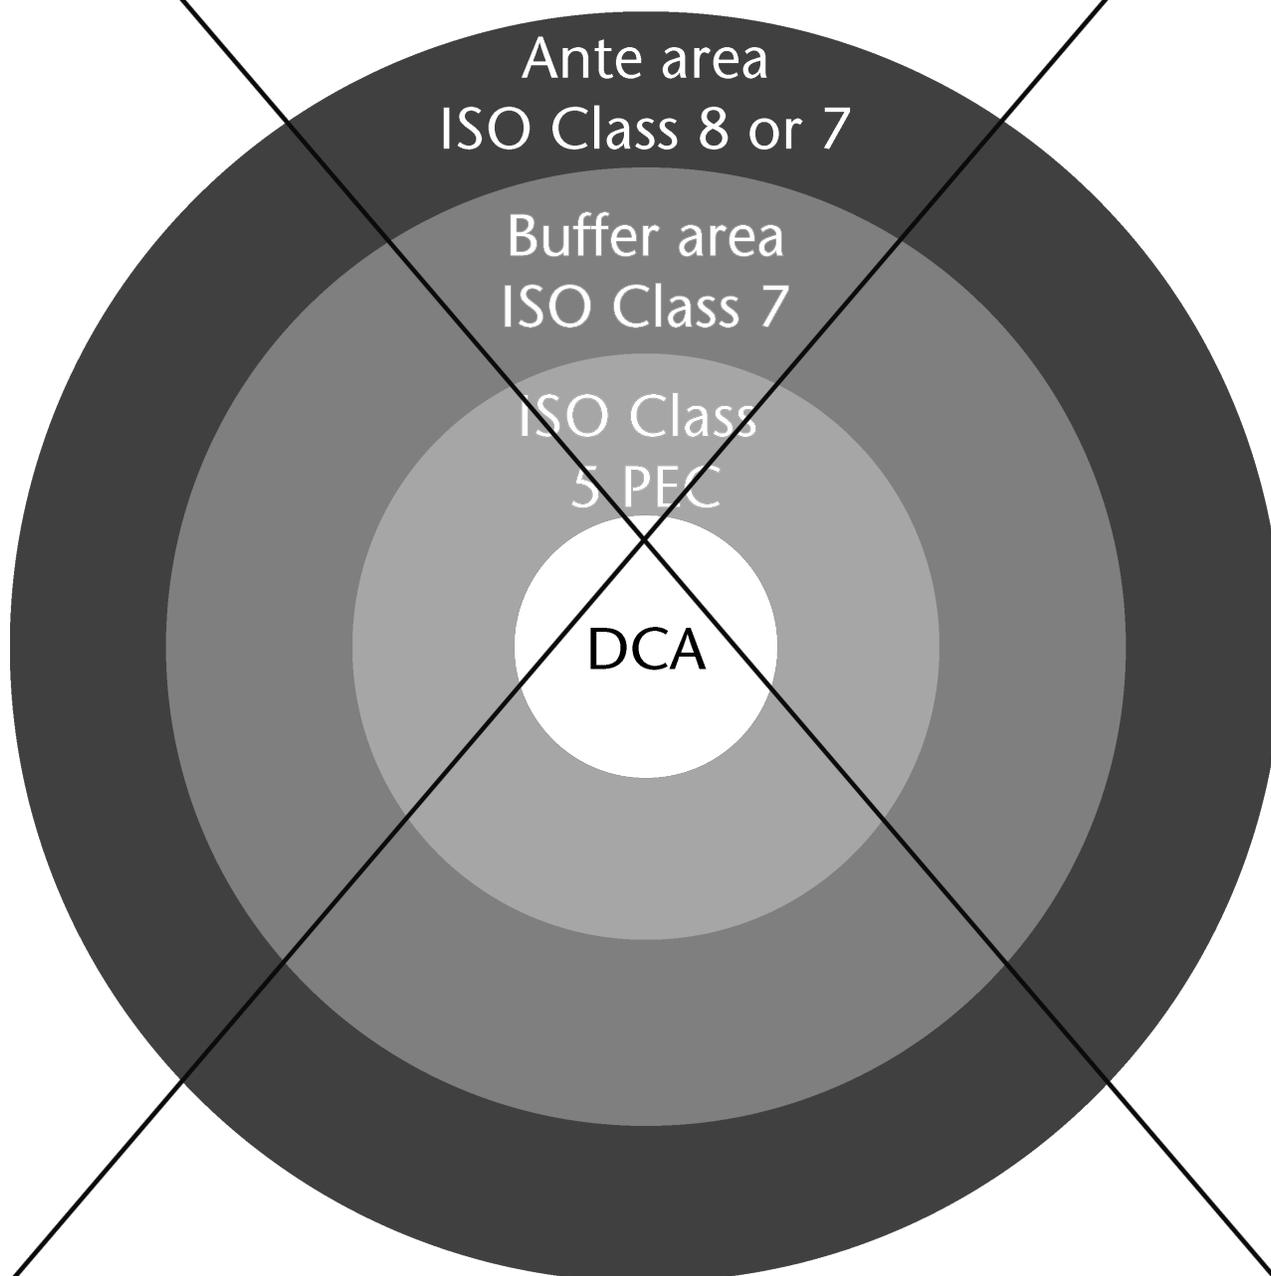

Figure 2. Conceptual representation of the arrangement of a facility for preparation of CSPs categorized as low, medium, and high risk level.

Placement of devices (e.g., computers, printers) and objects (e.g., carts, cabinets) that are not essential to compounding in buffer areas is dictated by their effect on the required environmental quality of air atmospheres and surfaces, which shall be verified by monitoring

~~(see *Viable and Nonviable Environmental Sampling (ES) Testing*). It is the responsibility of each compounding facility to ensure that each source of ISO Class 5 (see *Table 1*) environment for exposure of critical sites and sterilization by filtration is properly located, operated, maintained, monitored, and verified.~~

Facility Design and Environmental Controls

~~Compounding facilities are physically designed and environmentally controlled to minimize airborne contamination from contacting critical sites. These facilities shall also provide a comfortable and well-lighted working environment, which typically includes a temperature of 20° or cooler, to maintain comfortable conditions for compounding personnel to perform flawlessly when attired in the required aseptic compounding garb. PECs typically include, but are not limited to, LAFWs, BSCs, CAIs, and CACIs, which provide an ISO Class 5 (see *Table 1*) environment for the exposure of critical sites. PECs shall maintain ISO Class 5 (see *Table 1*) or better conditions for 0.5-µm particles (dynamic operating conditions) while compounding CSPs. Secondary engineering controls such as buffer areas and ante-areas generally serve as a core for the location of the PEC. Buffer areas are designed to maintain at least ISO Class 7 (see *Table 1*) conditions for 0.5-µm particles under dynamic conditions and ISO Class 8 (see *Table 1*) conditions for 0.5-µm and larger particles under dynamic conditions for the ante-areas. Airborne contamination control is achieved in the PEC through the use of HEPA filters. The airflow in the PEC shall be unidirectional (laminar flow), and because of the particle collection efficiency of the filter, the "first air" at the face of the filter is, for the purposes of aseptic compounding, free from airborne particulate contamination. HEPA-filtered air shall be supplied in critical areas (ISO Class 5, see *Table 1*) at a velocity sufficient to sweep particles away from the compounding area and maintain unidirectional airflow during operations. Proper design and control prevents turbulence and stagnant air in the critical area. In-situ air pattern analysis via smoke studies shall be conducted at the critical area to demonstrate unidirectional airflow and sweeping action over and away from the product under dynamic conditions.~~

~~The principles of HEPA-filtered unidirectional airflow in the work environment shall be understood and practiced in the compounding process in order to achieve the desired environmental conditions. Policies and procedures for maintaining and working within the PEC area shall be written and followed. The policies and procedures will be determined by the scope and risk levels of the aseptic compounding activities utilized during the preparation of the CSPs. The CSP work environment is designed to have the cleanest work surfaces (PEC) located in a buffer area. The buffer area shall maintain at least ISO Class 7 (see *Table 1*) conditions for 0.5-µm and larger particles under dynamic operating conditions. The room shall be segregated from surrounding, unclassified spaces to reduce the risk of contaminants being blown, dragged, or otherwise introduced into the filtered unidirectional airflow environment, and this segregation shall be continuously monitored. For rooms providing a physical separation through the use of walls, doors, and pass-throughs, a minimum differential positive pressure of 0.02 to 0.05-inch water column is required. For buffer areas not physically separated from the ante-areas, the principle of displacement airflow shall be employed. This concept utilizes a low pressure differential, high airflow principle. Using displacement airflow typically requires an air velocity of 40 ft per minute or more from the buffer area across the line of demarcation into the ante-area.~~

~~The displacement concept shall not be used for high-risk compounding.⁴ The PEC shall be placed within a buffer area in such a manner as to avoid conditions that could adversely affect their operation. For example, strong air currents from opened doors, personnel traffic, or air~~

streams from the HVAC systems can disrupt the unidirectional airflow in open-faced workbenches. The operators may also create disruptions in airflow by their own movements and by the placement of objects onto the work surface. The PEC shall be placed out of the traffic flow and in a manner to avoid disruption from the HVAC system and room cross-drafts. Room air exchanges are typically expressed as ACPHs. Adequate HEPA-filtered airflow supplied to the buffer area and ante-area is required to maintain cleanliness classification during operational activity through the number of ACPHs. Factors that should be considered when determining air-change requirements include number of personnel working in the room and compounding processes that generate particulates, as well as temperature effects. An ISO Class 7 (see *Table 1*) buffer area and ante-area supplied with HEPA-filtered air shall receive an ACPH of not less than 30. The PEC is a good augmentation to generating air changes in the air supply of an area but cannot be the sole source of HEPA-filtered air. If the area has an ISO Class 5 (see *Table 1*) recirculating device, a minimum of 15 ACPHs through the area supply HEPA filters is adequate, providing the combined ACPH is not less than 30. More air changes may be required, depending on the number of personnel and processes. HEPA-filtered supply air shall be introduced at the ceiling, and returns should be mounted low on the wall, creating a general top-down dilution of area air with HEPA-filtered make-up air. Ceiling-mounted returns are not recommended. All HEPA filters should be efficiency tested using the most penetrating particle size and should be leak tested at the factory and then leak tested again in situ after installation.⁵

Activities and tasks carried out within the buffer area shall be limited to only those necessary when working within a controlled environment. Only the furniture, equipment, supplies, and other material required for the compounding activities to be performed shall be brought into the area, and they shall be nonpermeable, nonshedding, cleanable, and resistant to disinfectants. Whenever such items are brought into the area, they shall first be cleaned and disinfected. Whenever possible, equipment and other items used in the buffer area shall not be taken out of the area except for calibration, servicing, or other activities associated with the proper maintenance of the item.

The surfaces of ceilings, walls, floors, fixtures, shelving, counters, and cabinets in the buffer area shall be smooth, impervious, free from cracks and crevices, and nonshedding, thereby promoting cleanability and minimizing spaces in which microorganisms and other contaminants may accumulate. The surfaces shall be resistant to damage by disinfectant agents. Junctionures of ceilings to walls shall be coved or caulked to avoid cracks and crevices where dirt can accumulate. If ceilings consist of inlaid panels, the panels shall be impregnated with a polymer to render them impervious and hydrophobic, and they shall be caulked around each perimeter to seal them to the support frame. Walls may be constructed of flexible material (e.g., heavy gauge polymer), panels locked together and sealed, or of epoxy-coated gypsum board. Preferably, floors are overlaid with wide sheet vinyl flooring with heat-welded seams and coving to the sidewall. Dust-collecting overhangs, such as ceiling utility pipes, and ledges, such as windowsills, should be avoided. The exterior lens surface of ceiling lighting fixtures should be smooth, mounted flush, and sealed. Any other penetrations through the ceiling or walls shall be sealed. The buffer area shall not contain sources of water (sinks) or floor drains. Work surfaces shall be constructed of smooth, impervious materials, such as stainless steel or molded plastic, so that they are easily cleaned and disinfected. Carts should be of stainless steel wire, nonporous plastic, or sheet metal construction with good quality, cleanable casters to promote mobility. Storage shelving, counters, and cabinets shall be smooth, impervious, free from cracks

and crevices, nonshedding, cleanable, and disinfectable; their number, design, and manner of installation shall promote effective cleaning and disinfection.

Placement of Primary Engineering Controls

PECs (LAFWs, BSCs, CAIs, and CACIs) shall be located within a restricted access ISO Class 7 (see *Table 1*) buffer area (see *Figure 1*), with the following CAI/CACI exceptions below:

- Only authorized personnel and materials required for compounding and cleaning shall be permitted in the buffer area.
- Presterilization procedures for high-risk level CSPs, such as weighing and mixing, shall be completed in no worse than an ISO Class 8 (see *Table 1*) environment.
- PECs shall be located out of traffic patterns and away from room air currents that could disrupt the intended airflow patterns.

CAIs and CACIs shall be placed in an ISO Class 7 (see *Table 1*) buffer area *unless* they meet all of the following conditions:

- The isolator shall provide isolation from the room and maintain ISO Class 5 (see *Table 1*) during dynamic operating conditions, including transferring ingredients, components, and devices into and out of the isolator and during preparation of CSPs.
- Particle counts sampled approximately 6 to 12 inches upstream of the critical exposure site shall maintain ISO Class 5 (see *Table 1*) levels during compounding operations.
- Not more than 3520 particles (0.5 μm and larger) per m^3 shall be counted during material transfer, with the particle counter probe located as near to the transfer door as possible without obstructing the transfer.⁶

It is incumbent on the compounding personnel to obtain documentation from the manufacturer that the CAI/CACI will meet this standard when located in environments where the background particle counts exceed ISO Class 8 (see *Table 1*) for 0.5 μm and larger particles. When isolators are used for sterile compounding, the recovery time to achieve ISO Class 5 (see *Table 1*) air quality shall be documented and internal procedures developed to ensure that adequate recovery time is allowed after material transfer before and during compounding operations.

If the PEC is a CAI or CACI that does not meet the requirements above or is a LAFW or BSC that cannot be located within an ISO Class 7 (see *Table 1*) buffer area, then only low-risk level nonhazardous and radiopharmaceutical CSPs pursuant to a physician order for a specific patient may be prepared, and administration of the CSP shall commence within 12 hours of preparation or as recommended in the manufacturer's package insert, whichever is less.

Viable and Nonviable Environmental Sampling (ES) Testing

The ES program should provide information to staff and leadership to demonstrate that the PEC is maintaining an environment within the compounding area that consistently ensures acceptably low viable and nonviable particle levels. The compounding area includes the ISO Class 5 (see *Table 1*) PEC (LAFWs, BSCs, CAIs, and CACIs), buffer areas, ante-areas, and segregated compounding areas.

Environmental sampling shall occur as part a comprehensive quality management program and shall occur minimally under any of the following conditions:

- as part of the commissioning and certification of new facilities and equipment;
- following any servicing of facilities and equipment;
- as part of the re-certification of facilities and equipment (i.e., every 6 months);

- in response to identified problems with end products or staff technique; or
- in response to issues with CSPs, observed compounding personnel work practices, or patient-related infections (where the CSP is being considered as a potential source of the infection).

ENVIRONMENTAL NONVIABLE PARTICLE TESTING PROGRAM

A program to sample nonviable airborne particles differs from that for viable particles in that it is intended to directly measure the performance of the engineering controls used to create the various levels of air cleanliness, for example, ISO Class 5, 7, or 8 (see *Table 1*).

Engineering Control Performance Verification—PECs (LAFWs, BSCs, CAIs, and CACIs) and secondary engineering controls (buffer and ante areas) are essential components of the overall contamination control strategy for aseptic compounding. As such, it is imperative that they perform as designed and that the resulting levels of contamination be within acceptable limits. Certification procedures such as those outlined in *Certification Guide for Sterile Compounding Facilities (CAG-003-2006)*⁷ shall be performed by a qualified individual no less than every 6 months and whenever the device or room is relocated or altered or major service to the facility is performed.

Total Particle Counts—Certification that each ISO classified area, for example, ISO Class 5, 7, and 8 (see *Table 1*), is within established guidelines shall be performed no less than every 6 months and whenever the LAFW, BSC, CAI, or CACI is relocated or the physical structure of the buffer area or ante area has been altered. Testing shall be performed by qualified operators using current, state-of-the-art electronic equipment with results of the following:

- ISO Class 5: not more than 3520 particles 0.5 μm and larger size per cubic meter of air for any LAFW, BSC, CAI, and CACI;
- ISO Class 7: not more than 352,000 particles of 0.5 μm size and larger per cubic meter of air for any buffer area;
- ISO Class 8: not more than 3,520,000 particles of 0.5 μm size and larger per cubic meter of air for any ante area.

All certification records shall be maintained and reviewed by supervising personnel or other designated employees to ensure that the controlled environments comply with the proper air cleanliness, room pressures, and ACPHs.

PRESSURE DIFFERENTIAL MONITORING

A pressure gauge or velocity meter shall be installed to monitor the pressure differential or airflow between the buffer area and the ante area and between the ante area and the general environment outside the compounding area. The results shall be reviewed and documented on a log at least every work shift (minimum frequency shall be at least daily) or by a continuous recording device. The pressure between the ISO Class 7 (see *Table 1*) and the general pharmacy area shall not be less than 5 Pa (0.02 inch water column). In facilities where low- and medium-risk level CSPs are prepared, differential airflow shall maintain a minimum velocity of 0.2 meters per second (40 feet per minute) between buffer area and ante area.

ENVIRONMENTAL VIABLE AIRBORNE PARTICLE TESTING PROGRAM

The risk of contaminating a CSP prepared under low-risk level and medium-risk level conditions is highly dependent on proper hand hygiene and garbing practices, compounding personnel aseptic technique, and the presence of surface contamination, assuming that all work is

performed in a certified and properly functioning ISO Class 5 (see *Table 1*) PEC and secondary engineering controls, ISO Class 7 (see *Table 1*) buffer area, and ISO Class 8 (see *Table 1*) ante-area. High-risk level CSPs pose the greatest threat to patients because compounding personnel are tasked with the requirement of processing nonsterile components and devices in order to achieve sterility.

A sampling program in conjunction with an observational audit is designed to evaluate the competency of compounding personnel work practices, allowing for the implementation of corrective actions on an ongoing basis (see *Personnel Training and Competency Evaluation of Garbing, Aseptic Work Practices and Cleaning/Disinfection Procedures*).

Sampling Plan—An appropriate environmental sampling plan shall be developed for airborne viable particles based on a risk assessment of compounding activities performed.

Selected sampling sites shall include locations within each ISO Class 5 (see *Table 1*) environment and in the ISO Class 7 and 8 (see *Table 1*) areas and in the segregated compounding areas at greatest risk of contamination (e.g., work areas near the ISO Class 5 [see *Table 1*] environment, counters near doors, pass-through boxes). The plan shall include sample location, method of collection, frequency of sampling, volume of air sampled, and time of day as related to activity in the compounding area and action levels.

Review of the data generated during a sampling event may detect elevated amounts of airborne microbial bioburden; such changes may be indicative of adverse changes within the environment. It is recommended that compounding personnel refer to *Microbiological Control and Monitoring of Aseptic Processing Environments* (1116) and the CDC's "Guidelines for Environmental Infection Control in Healthcare Facilities, 2003" for more information.

Growth Medium—A general microbiological growth medium such as Soybean Casein Digest Medium shall be used to support the growth of bacteria. Malt extract agar or some other media that supports the growth of fungi shall be used in high-risk level compounding environments. Media used for surface sampling must be supplemented with additives to neutralize the effects of disinfecting agents (e.g., TSA with lecithin and polysorbate 80).

Viable Air Sampling—Evaluation of airborne microorganisms using volumetric collection methods in the controlled air environments (LAFWs, CAIs, clean room or buffer areas, and ante-areas) shall be performed by properly trained individuals for all compounding risk levels.

Impaction shall be the preferred method of volumetric air sampling. Use of settling plates for qualitative air sampling may not be able to determine adequately the quality of air in the controlled environment. The settling of particles by gravity onto culture plates depends on the particle size and may be influenced by air movement. Consequently, the number of colony-forming units (cfu) on a settling plate may not always relate to the concentrations of viable particles in the sampled environment.

For low-, medium-, and high-risk level compounding, air sampling shall be performed at locations that are prone to contamination during compounding activities and during other activities such as staging, labeling, gowning, and cleaning. Locations shall include zones of air backwash turbulence within LAFW and other areas where air backwash turbulence may enter the compounding area (doorways, in and around ISO Class 5 [see *Table 1*] PEC and environments). Consideration should be given to the overall effect the chosen sampling method will have on the unidirectional airflow within a compounding environment.

For low-risk level CSPs with 12-hour or less BUD prepared in a PEC (LAFWs, BSCs, CAIs) that maintains an ISO Class 5 (see *Table 1*), air sampling shall be performed at locations inside the ISO Class 5 (see *Table 1*) environment and other areas that are in close proximity to the ISO Class 5 (see *Table 1*) environment during the certification of the PEC.

Air Sampling Devices—There are a number of manufacturers of electronic air sampling equipment. It is important that personnel refer to the manufacturer's recommended procedures when using the equipment to perform volumetric air sampling procedures. The instructions in the manufacturer's user's manual for verification and use of electric air samplers that actively collect volumes of air for evaluation must be followed. A sufficient volume of air (400 to 1000 liters) shall be tested at each location in order to maximize sensitivity. The volumetric air sampling devices need to be serviced and calibrated as recommended by the manufacturer.

It is recommended that compounding personnel also refer to *Methodology and Instrumentation for Quantitation of Viable Airborne Microorganisms* under *Microbiological Control and Monitoring of Aseptic Processing Environments* (1116), which provides more information on the use of volumetric air samplers and volume of air that should be sampled to detect environmental bioburden excursions.

Air Sampling Frequency and Process—Air sampling shall be performed at least semiannually (i.e., every 6 months) as part of the re-certification of facilities and equipment. If compounding occurs in multiple locations within an institution (e.g., main pharmacy, satellites), environmental sampling is required for each individual compounding area. A sufficient volume of air shall be sampled and the manufacturer's guidelines for use of the electronic air sampling equipment followed. Any facility construction or equipment servicing may require that air sampling be performed during these events.

Incubation Period—At the end of the designated sampling or exposure period for air sampling activities, the microbial growth media plates are recovered and their covers secured (e.g., taped), and they are inverted and incubated at a temperature and for a time period conducive to multiplication of microorganisms. TSA should be incubated at 30° to 35° for 48 to 72 hours. Malt extract agar or other suitable fungal media should be incubated at 26° to 30° for 5 to 7 days. The number of discrete colonies of microorganisms are counted and reported as cfu and documented on an environmental sampling form. Counts from air sampling need to be transformed into cfu per cubic meter of air and evaluated for adverse trends.

Action Levels, Documentation, and Data Evaluation—The value of viable microbial sampling of the air in the compounding environment is realized when the data are used to identify and correct an unacceptable situation. Sampling data shall be collected and reviewed on a periodic basis as a means of evaluating the overall control of the compounding environment. If an activity consistently shows elevated levels of microbial growth, competent microbiology personnel shall be consulted.

Any cfu count that exceeds its respective action level (see *Table 2*) should prompt a re-evaluation of the adequacy of personnel work practices, cleaning procedures, operational procedures, and air filtration efficiency within the aseptic compounding location. An investigation into the source of the contamination shall be conducted. Sources could include HVAC systems, damaged HEPA filters, and changes in personnel garbing or work practices. The source of the problem shall be eliminated, the affected area cleaned, and resampling performed. Counts of cfu are to be used as an approximate measure of the environmental microbial

bioburden. Action levels are determined on the basis of cfu data gathered at each sampling location and trended over time. The numbers in *Table 2* should be used only as guidelines. Regardless of the number of cfu identified in the pharmacy, further corrective actions will be dictated by the identification of microorganisms recovered (at least the genus level) by an appropriate credentialed laboratory of any microbial bioburden captured as a cfu using an impaction air sampler. Highly pathogenic microorganisms (e.g., Gram-negative rods, coagulase positive staphylococcus, molds and yeasts) can be potentially fatal to patients receiving CSPs and must be immediately remedied, regardless of cfu count, with the assistance of a competent microbiologist, infection control professional, or industrial hygienist.

Table 2. Recommended Action Levels for Microbial Contamination*

†(cfu per cubic meter [1000 liters] of air per plate)

Classification	Air Sample†
ISO Class 5	> 1
ISO Class 7	> 10
ISO Class 8 or worse	> 100
* -Guidance for Industry -Sterile Drug Products Produced by Aseptic Processing -Current Good Manufacturing Practice -US HHS, FDA -September 2004.	

Additional Personnel Requirements

Food, drinks, and materials exposed in patient care and treatment areas shall not enter ante-areas, buffer areas, or segregated compounding areas where components and ingredients of CSPs are present. When compounding activities require the manipulation of a patient's blood-derived or other biological material (e.g., radiolabeling a patient's or donor's white blood cells), the manipulations shall be clearly separated from routine material handling procedures and equipment used in CSP preparation activities, and they shall be controlled by specific SOPs in order to avoid any cross-contamination. Packaged compounding supplies and components, such as needles, syringes, tubing sets, and small and large volume parenterals, should be uncartoned and wiped down with a disinfectant that does not leave a residue (e.g., sterile 70% IPA), when possible in an ante-area of ISO Class 8 (see *Table 1*) air quality, before being passed into the buffer areas. Personnel hand hygiene and garbing procedures are also performed in the ante-area, which may contain a sink that enables hands-free use with a closed system of soap dispensing to minimize the risk of extrinsic contamination. There shall be some demarcation designation that separates the ante-area from the buffer area. Adequate provision for performing antiseptic hand cleansing using an alcohol-based surgical hand scrub with persistent activity followed by the donning of sterile gloves should be provided after entry into the buffer area.

Cleaning and Disinfecting the Compounding Area

Environmental contact is a major source of microbial contamination of CSPs. Consequently, scrupulous attention to cleaning and disinfecting the sterile compounding areas is required to minimize this as a source of CSP contamination.

The cleaning and disinfecting practices and frequencies in this section apply to ISO Class 5 (see *Table 1*) compounding areas for exposure of critical sites as well as buffer areas, ante-areas, and segregated compounding areas. Compounding personnel are responsible for ensuring that the frequency of cleaning is in accordance with the requirements stated in *Table 3* and

determining the cleaning and disinfecting products to be used (see *Appendix II*). Any organizational or institutional policies regarding disinfectant selection should be considered by compounding personnel. All cleaning and disinfecting practices and policies for the compounding of CSPs shall be included in written SOPs and shall be followed by all compounding personnel.

Table 3. Minimum Frequency of Cleaning and Disinfecting Compounding Areas

Site	Minimum Frequency
ISO Class 5 (see <i>Table 1</i>) Primary Engineering Control (e.g., LAFW, BSC, CAI, CACI)	At the beginning of each shift, before each batch, not longer than 30 minutes following the previous surface disinfection when ongoing compounding activities are occurring, after spills, and when surface contamination is known or suspected
Counters and easily cleanable work surfaces	Daily
Floors	Daily
Walls	Monthly
Ceilings	Monthly
Storage shelving	Monthly

The selection and use of disinfectants in healthcare facilities is guided by several properties, such as microbicidal activity, inactivation by organic matter, residue, and shelf life (see *Appendix II*). In general, highly toxic disinfectants, such as glutaraldehyde, are not used on housekeeping surfaces (e.g., floors, countertops). Many disinfectants registered by the EPA are one-step disinfectants. This means that the disinfectant has been formulated to be effective in the presence of light to moderate soiling without a pre-cleaning step.

Surfaces in LAFWs, BSCs, CAIs, and CACIs, which are intimate to the exposure of critical sites, require disinfecting more frequently than do housekeeping surfaces such as walls and ceilings. Disinfecting sterile compounding areas shall occur on a regular basis at the intervals noted in *Table 3* when spills occur, when the surfaces are visibly soiled, and when microbial contamination is known to have been or is suspected of having been introduced into the compounding areas.

When the surface to be disinfected has heavy soiling, a cleaning step is recommended prior to the application of the disinfectant. Trained compounding personnel are responsible for developing, implementing, and practicing the procedures for cleaning and disinfecting the DCAs written in the SOPs. Cleaning and disinfecting shall occur before compounding is performed. Items shall be removed from all areas to be cleaned, and surfaces shall be cleaned by removing loose material and residue from spills; for example, water-soluble solid residues are removed with sterile water (for injection or irrigation) and low-shedding wipes. This shall be followed by wiping with a residue-free disinfecting agent such as sterile 70% IPA, which is allowed to dry before compounding begins.

Cleaning and disinfecting surfaces in the LAFWs, BSCs, CAIs, and CACIs are the most critical practices before the preparation of CSPs. Consequently, such surfaces shall be cleaned and disinfected frequently, including at the beginning of each work shift, before each batch preparation is started, every 30 minutes during continuous compounding periods of individual CSPs, when there are spills, and when surface contamination is known or suspected from procedural breaches.

~~Work surfaces in the ISO Class 7 (see Table 1) buffer areas and ISO Class 8 (see Table 1) ante areas as well as segregated compounding areas shall be cleaned and disinfected at least daily, and dust and debris shall be removed when necessary from storage sites for compounding ingredients and supplies using a method that does not degrade the ISO Class 7 or 8 (see Table 1) air quality (see *Disinfectants and Antiseptics* (1072)).~~

~~Floors in the buffer or clean area, ante area, and segregated compounding area are cleaned by mopping with a cleaning and disinfecting agent once daily at a time when no aseptic operations are in progress. Mopping shall be performed by trained personnel using approved agents and procedures described in the written SOPs. It is incumbent on compounding personnel to ensure that such cleaning is performed properly. In the buffer or clean area, ante area, and segregated compounding area, walls, ceilings, and shelving shall be cleaned and disinfected monthly. Cleaning and disinfecting agents are to be used with careful consideration of compatibilities, effectiveness, and inappropriate or toxic residues (see *Appendix II*). Their schedules of use and methods of application shall be in accordance with written SOPs and followed by custodial or compounding personnel.~~

~~All cleaning materials, such as wipers, sponges, and mops, shall be nonshedding, preferably composed of synthetic micro fibers, and dedicated to use in the buffer or clean area, ante area, and segregated compounding areas and shall not be removed from these areas except for disposal. Floor mops may be used in both the buffer or clean area and ante area, but only in that order. Ideally, all cleaning tools are discarded after one use by collection in suitable plastic bags and removed with minimal agitation. If cleaning materials (e.g., mops) are reused, procedures shall be developed (based on manufacturers' recommendations) that ensure that the effectiveness of the cleaning device is maintained and that repeated use does not add to the bioburden of the area being cleaned.~~

~~Supplies and equipment removed from shipping cartons shall be wiped with a suitable disinfecting agent (e.g., sterile 70% IPA) delivered from a spray bottle or other suitable delivery method. After the disinfectant is sprayed or wiped on a surface to be disinfected, the disinfectant shall be allowed to dry, during which time the item shall not be used for compounding purposes.~~

~~Wiping with small sterile 70% IPA swabs that are commercially available in individual foil-sealed packages (or a comparable method) is preferred for disinfecting entry points on bags and vials, allowing the IPA to dry before piercing stoppers with sterile needles and breaking necks of ampuls. The surface of the sterile 70% IPA swabs used for disinfecting entry points of sterile packages and devices shall not contact any other object before contacting the surface of the entry point. Sterile 70% IPA wetted gauze pads or other particle-generating material shall not be used to disinfect the sterile entry points of packages and devices.~~

~~When sterile supplies are received in sealed pouches designed to keep them sterile until opening, the sterile supplies may be removed from the covering pouches as the supplies are introduced into the ISO Class 5 (see Table 1) PEC (LAFW, BSC, CAI, CACI) without the need to disinfect the individual sterile supply items. No shipping or other external cartons may be taken into the buffer or clean area or segregated compounding area.~~

Personnel Cleansing and Garbing

~~The careful cleansing of hands and arms and the correct donning of PPE by compounding personnel constitute the first major step in preventing microbial contamination in CSPs.~~

~~Personnel shall also be thoroughly competent and highly motivated to perform flawless aseptic manipulations with ingredients, devices, and components of CSPs. Squamous cells are normally shed from the human body at a rate of 10^6 or more per hour, and those skin particles are laden with microorganisms.^{8,9} When individuals are experiencing rashes, sunburn, weeping sores, conjunctivitis, active respiratory infection, as well as when they wear cosmetics, they shed these particles at even higher rates. Particles shed from compounding personnel pose an increased risk of microbial contamination of critical sites of CSPs. Therefore, compounding personnel with such conditions as mentioned above shall be excluded from working in ISO Class 5 (see *Table 1*) and ISO Class 7 (see *Table 1*) compounding areas until their conditions are remedied.~~

~~Before entering the buffer area or segregated compounding area (see *Low-Risk Level CSPs with 12-Hour or Less BUD*), compounding personnel shall remove personal outer garments (e.g., bandannas, coats, hats, jackets, scarves, sweaters, vests); all cosmetics, because they shed flakes and particles; and all hand, wrist, and other visible jewelry or piercings (e.g., earrings, lip or eyebrow piercings) that can interfere with the effectiveness of PPE (e.g., fit of gloves and cuffs of sleeves). The wearing of artificial nails or extenders is prohibited while working in the sterile compounding environment. Natural nails shall be kept neat and trimmed.~~

~~Personnel shall don the following PPE in an order that proceeds from those activities considered the dirtiest to those considered the cleanest. Garbing activities considered the dirtiest include donning of dedicated shoes or shoe covers, head and facial hair covers (e.g., beard covers in addition to face masks), and face masks/eye shields. Eye shields are optional unless working with irritants such as germicidal disinfecting agents or when preparing hazardous drugs.~~

~~After donning dedicated shoes or shoe covers, head and facial hair covers, and face masks, a hand-cleansing procedure shall be performed by removing debris from underneath fingernails using a nail cleaner under running warm water followed by vigorous hand washing. Hands and forearms shall be washed to the elbows for at least 30 seconds with soap (either nonantimicrobial or antimicrobial) and water while in the ante-area. The use of antimicrobial scrub brushes is not recommended because they can cause skin irritation and skin damage. Hands and forearms to the elbows will be completely dried using either lint-free disposable towels or an electronic hand dryer. After completion of hand washing, a nonshedding gown with sleeves that fit snugly around the wrists and enclosed at the neck is donned. Gowns designated for buffer area use shall be worn, and preferably they should be disposable. If reusable gowns are worn, they should be laundered appropriately for buffer area use.~~

~~Once inside the buffer area or segregated compounding area (see *Low-Risk Level CSPs with 12-Hour or Less BUD*), and prior to donning sterile powder-free gloves, antiseptic hand cleansing shall be performed using a waterless alcohol-based surgical hand scrub with persistent activity¹⁰ following manufacturers' recommendations. Hands are allowed to dry thoroughly before donning sterile gloves.~~

~~Sterile gloves shall be the last item donned before compounding begins. Gloves become contaminated when they contact nonsterile surfaces during compounding activities. Disinfection of contaminated gloved hands may be accomplished by wiping or rubbing sterile 70% IPA to all contact surface areas of the gloves and letting the gloved hands dry thoroughly. Only use gloves that have been tested for compatibility with alcohol disinfection by the manufacturer. Routine application of sterile 70% IPA shall occur throughout the compounding process and whenever nonsterile surfaces (e.g. vials, counter tops, chairs, carts) are touched. Gloves on~~

~~hands shall also be routinely inspected for holes, punctures, or tears and replaced immediately if such are detected. Antiseptic hand cleansing shall be performed as indicated above. Compounding personnel shall be trained and evaluated in the avoidance of touching critical sites.~~

~~When compounding personnel exit the compounding area during a work shift, the exterior gown may be removed and retained in the compounding area if not visibly soiled, to be re-donned during that same work shift only. However, shoe covers, hair and facial hair covers, face masks/eye shields, and gloves shall be replaced with new ones before re-entering the compounding area, and proper hand hygiene shall be performed.~~

~~During high-risk compounding activities that precede terminal sterilization, such as weighing and mixing of nonsterile ingredients, compounding personnel shall be garbed and gloved the same as when performing compounding in an ISO Class 5 (see *Table 1*) environment. Properly garbed and gloved compounding personnel who are exposed to air quality that is either known or suspected to be worse than ISO Class 7 (see *Table 1*) shall re-garb PPE along with washing their hands properly, performing antiseptic hand cleansing with a waterless alcohol-based surgical hand scrub, and donning sterile gloves upon re-entering the ISO Class 7 (see *Table 1*) buffer area. When CAIs and CACIs are the source of the ISO Class 5 (see *Table 1*) environment, the garbing and gloving requirements for compounding personnel should be as described above, unless the isolator manufacturer can provide written documentation based on validated environmental testing that any component(s) of PPE or personnel cleansing are not required.~~

Personnel Training and Competency Evaluation of Garbing, Aseptic Work Practices, and Cleaning/Disinfection Procedures

~~Personnel who prepare CSPs shall be trained conscientiously and skillfully by expert personnel and through multimedia instructional sources and professional publications in the theoretical principles and practical skills of garbing procedures, aseptic work practices, achieving and maintaining ISO Class 5 (see *Table 1*) environmental conditions, and cleaning and disinfection procedures. This training shall be completed and documented before any compounding personnel begin to prepare CSPs. Compounding personnel shall complete didactic training, pass written competence assessments, undergo skill assessment using observational audit tools, and media fill testing (see *Appendices III-V*).~~

~~Media fill testing of aseptic work skills shall be performed initially before beginning to prepare CSPs and at least annually thereafter for low and medium risk level compounding and semiannually for high-risk level compounding.~~

~~Compounding personnel who fail written tests or observational audits or whose media fill test vials have one or more units showing visible microbial contamination shall be re-instructed and re-evaluated by expert compounding personnel to ensure correction of all aseptic work practice deficiencies. Compounding personnel shall pass all evaluations prior to resuming compounding of sterile preparations. In addition to didactic evaluation and aseptic media fill, compounding personnel must demonstrate proficiency of proper hand hygiene, garbing, and consistent cleaning procedures.~~

~~In the event that cleaning and disinfecting procedures are also performed by other support personnel (e.g., institutional environmental services, housekeeping), thorough training of proper hand hygiene, garbing, and cleaning and disinfection procedures shall be done by a qualified~~

aseptic compounding expert. After completion of training, support personnel shall routinely undergo performance evaluation of proper hand hygiene, garbing, and all applicable cleaning and disinfecting procedures conducted by a qualified aseptic compounding expert.

COMPETENCY EVALUATION OF GARBING AND ASEPTIC WORK PRACTICE

The risk of contaminating a CSP prepared under low-risk level and medium-risk level conditions is highly dependent on proper hand hygiene and garbing practices, compounding personnel aseptic technique, and the presence of surface contamination, assuming that all work is performed in a certified and properly functioning ISO Class 5 (see *Table 1*) PEC and secondary engineering controls, ISO Class 7 (see *Table 1*) buffer area, and ISO Class 8 (see *Table 1*) ante-area. High-risk level CSPs pose the greatest threat to patients because compounding personnel are tasked with the requirement of processing nonsterile components and devices in order to achieve sterility. Compounding personnel shall be evaluated initially prior to beginning compounding CSPs and whenever an aseptic media fill is performed using a form such as the *Sample Form for Assessing Hand Hygiene and Garbing Related Practices of Compounding Personnel* (see *Appendix III*) and the personnel glove fingertip sampling procedures indicated below.

Aseptic Work Practice Assessment and Evaluation via Personnel Glove Fingertip

Sampling—Sampling of compounding personnel glove fingertips shall be performed for all CSP risk level compounding because direct touch contamination is the most likely source of introducing microorganisms into CSPs prepared by humans. Glove fingertip sampling shall be used to evaluate the competency of personnel in performing hand hygiene and garbing procedures in addition to educating compounding personnel on proper work practices, which include frequent and repeated glove disinfection using sterile 70% IPA during actual compounding of CSPs. All personnel shall demonstrate competency in proper hand hygiene and garbing procedures and in aseptic work practices (e.g., disinfection of component surfaces, routine disinfection of gloved hands).

Sterile contact agar plates shall be used to sample the gloved fingertips of compounding personnel after garbing in order to assess garbing competency and after completing the media-fill preparation (without applying sterile 70% IPA) in order to assess the adequacy of aseptic work practices prior to being initially allowed to prepare CSPs for human use and for more experienced personnel to maintain their qualifications to prepare CSPs for human use.

Garbing And Gloving Competency Evaluation—Compounding personnel shall be visually observed during the process of performing hand hygiene and garbing procedures (see *Personnel Cleansing and Garbing under Personnel Training and Evaluation in Aseptic Manipulation Skills* above). The visual observation shall be documented on a form such as the *Sample Form for Assessing Hand Hygiene and Garbing Related Practices of Compounding Personnel* (see *Appendix III*) and maintained to provide a permanent record and long-term assessment of personnel competency.

Gloved Fingertip Sampling—All compounding personnel shall successfully complete an initial competency evaluation and gloved fingertip/thumb sampling procedure (zero cfu) no less than three times before initially being allowed to compound CSPs for human use. Immediately after the compounding employee completes the hand hygiene and garbing procedure (e.g., donning of sterile gloves prior to any disinfection with sterile 70% IPA), the evaluator will collect a gloved fingertip and thumb sample from both hands of the compounding employee onto appropriate agar plates by lightly pressing each fingertip into the agar. The plates will be

incubated for the appropriate incubation period and at the appropriate temperature (see *Incubation Period*). After completing the initial gowning and gloving competency evaluation, re-evaluation of all compounding personnel for this competency shall occur at least annually for personnel who compound low and medium risk level CSPs and semi-annually for personnel who compound high risk level CSPs using one or more sample collections during any media-fill test procedure before they are allowed to continue compounding CSPs for human use.

Immediately prior to sampling, gloves shall not be disinfected with sterile 70% IPA. Disinfecting gloves immediately before sampling will provide false negative results. Plates filled with nutrient agar with neutralizing agents such as lecithin and polysorbate 80 added shall be used when sampling personnel fingertips. Personnel shall "touch" the agar with the fingertips of both hands in separate plates in a manner to create a slight impression in the agar. The sampled gloves shall be immediately discarded and proper hand hygiene performed after sampling. The nutrient agar plates shall be incubated as stated below (see *Incubation Period*). Results should be reported separately as number of cfu per employee per hand (left hand, right hand). The cfu action level for gloved hands will be based on the total number of cfu on both gloves, not per hand.

Incubation Period—At the end of the designated sampling period for compounding personnel competency assessment activities (surface or personnel), the agar plates are recovered and covers secured and they are inverted and incubated at a temperature and for a time period conducive to multiplication of microorganisms. TSA with lecithin and polysorbate 80 shall be incubated at 30° to 35° for 48 to 72 hours.

Aseptic Manipulation Competency Evaluation—After successful completion of an initial Hand Hygiene and Garbing Competency Evaluation, all compounding personnel shall have their aseptic technique and related practice competency evaluated initially during the *Media-Fill Test Procedure* and subsequent annual or semi-annual *Media-Fill Test Procedures*. Records of these evaluations will be maintained using a form such as the *Sample Form for Assessing Aseptic Technique and Related Practices of Compounding Personnel* (see *Appendix IV*) and maintained to provide a permanent record of and long-term assessment of personnel competency.

Media-Fill Test Procedure—The skill of personnel to aseptically prepare CSPs shall be evaluated using sterile fluid bacterial culture media-fill verification, (i.e., sterile bacterial culture medium transfer via a sterile syringe and needle). Media-fill testing is used to assess the quality of the aseptic skill of compounding personnel. Media-fill tests shall represent the most challenging or stressful conditions actually encountered by the personnel being evaluated when they prepare low and medium risk level CSPs and when sterilizing high risk level CSPs. Media-fill challenge tests are also used to verify the capability of the compounding environment and processes to produce sterile preparations.

A commercially available sterile fluid culture media, such as Soybean Casein Digest Medium (see *Sterility Tests* (71)), that is able to promote exponential colonization of bacteria that are most likely to be transmitted to CSPs from the compounding personnel and environment is commonly used. For high risk level CSPs nonsterile commercially available Soybean Casein Digest Medium may be used to make a 3% solution. Normal processing steps, including filter sterilization, shall be mimicked. Media-filled vials shall be incubated at 20° to 25° or at 30° to 35° for a minimum of 14 days. If two temperatures are used for incubation of media-filled samples, then these filled containers should be incubated for at least 7 days at each temperature (see

Microbiological Control and Monitoring of Aseptic Processing Environments (1116)). Failure is indicated by visible turbidity in any one of the media fill units on or before 14 days. Other methodologies recommended by a competent microbiologist to enhance recovery time and sensitivity to detect microbial contamination may be considered (see *CSP Microbial Contamination Risk Levels* for examples of media fill procedures).

SURFACE CLEANING AND DISINFECTION SAMPLING AND ASSESSMENT

Surface sampling is an important component of the maintenance of a suitable microbially controlled environment for compounding CSPs, especially since transfer of microbial contamination from improperly disinfected work surfaces via inadvertent touch contact by compounding personnel can be a potential source of contamination into CSPs. It is useful for evaluating facility and work surface cleaning and disinfecting procedures and employee competency in work practices such as disinfection of component/vial surface cleaning. Surface sampling shall be performed in all ISO classified areas on a periodic basis. Sampling can be accomplished using contact plates or swabs, and it shall be done at the conclusion of compounding. Locations to be sampled shall be defined in a sample plan or on a form. The size of the plate to be used for each sampled location usually ranges from 24 to 30 cm². Contact plates are filled with general solid agar growth medium and neutralizing agents above the rim of the plate, and they are used for sampling regular or flat surfaces. Swabs may be used for sampling irregular surfaces, especially for equipment (see *Microbiological Control and Monitoring of Aseptic Processing Environments (1116)*).

Cleaning and Disinfecting Competency Evaluation—Compounding personnel and other personnel responsible for cleaning shall be visually observed during the process of performing cleaning and disinfecting procedures, during initial personnel training on cleaning procedures, during changes in cleaning staff, and at the completion of any media fill test procedure (see *Cleaning and Disinfecting of Compounding Areas*).

The visual observation shall be documented using a form such as the *Sample Form for Assessing Cleaning and Disinfection Procedures* (see *Appendix V*) and maintained to provide a permanent record and long-term assessment of personnel competency.

Surface Collection Methods—To sample surfaces using a contact plate, gently touch the sample area with the agar surface and roll the plate across the surface to be sampled. The contact plate will leave a growth media residue behind; therefore, immediately after sampling with the contact plate, the sampled area shall be thoroughly wiped with a nonshedding wipe soaked in sterile 70% IPA.

If an area is sampled via the swab method, collection of the sample is processed by using appropriate procedures that will result in the surface location equivalent to that of a contact plate. After swabbing the surface to be sampled, swabs are placed in an appropriate diluent; an aliquot is planted on or in the specified nutrient agar. Results should be reported as cfu per unit of surface area.

Action Levels, Documentation, and Data Evaluation

The value of viable microbial monitoring of gloved fingertips and surfaces of components and the compounding environment are realized when the data are used to identify and correct an unacceptable work practice. Sampling data shall be collected and reviewed on a routine basis

as a means of evaluating the overall control of the compounding environment. If an activity consistently shows elevated levels of microbial growth, competent microbiology personnel shall be consulted.

Any cfu count that exceeds its respective action level (see *Table 4*) should prompt a re-evaluation of the adequacy of personnel work practices, cleaning procedures, operational procedures, and air filtration efficiency within the aseptic compounding location. An investigation into the source of the contamination shall be conducted. Sources could include HVAC systems, damaged HEPA filters, and changes in personnel garbing or working practices. The source of the problem shall be eliminated, the affected area cleaned, and resampling performed.

When gloved fingertip sample results exceed action levels after proper incubation, a review of hand hygiene and garbing procedures as well as glove and surface disinfection procedures and work practices shall be performed and documented. Employee training may be required to correct the source of the problem.

Counts of cfu are to be used as an approximate measure of the environmental microbial bioburden. Action levels are determined on the basis of cfu data gathered at each sampling location and trended over time. The numbers in *Table 4* should be used only as guidelines. Regardless of the number of cfu identified in the compounding facility, further corrective actions will be dictated by the identification of microorganisms recovered (at least the genus level) by an appropriate credentialed laboratory of any microbial bioburden captured as a cfu using an impaction air sampler. Highly pathogenic microorganisms (e.g., Gram-negative rods, coagulase positive staphylococcus, molds and yeasts) can be potentially fatal to patients receiving CSPs and shall be immediately remedied, regardless of cfu count, with the assistance of a competent microbiologist, infection control professional, or industrial hygienist.

Table 4. Recommended Action Levels for Microbial Contamination*

Classification	Fingertip Sample	Surface Sample (Contact Plate) (cfu per plate)
ISO Class 5	>3	>3
ISO Class 7	N/A	>5
ISO Class 8 or worse	N/A	>100
* Pharmaceutical Inspection Co-operation Scheme (PIC/S) Guide to Good Manufacturing Practice for Medicinal Products Annexes PE 009-6, 5 April 2007.		

SUGGESTED STANDARD OPERATING PROCEDURES (SOPS)

The compounding facility shall have written, properly approved SOPs designed to ensure the quality of the environment in which a CSP is prepared. The following procedures are recommended:

1. Access to the buffer area is restricted to qualified personnel with specific responsibilities or assigned tasks in the compounding area.
2. All cartoned supplies are decontaminated in the area by removing them from shipping cartons and wiping or spraying them with a nonresidue-generating disinfecting agent while they are being transferred to a clean and properly disinfected cart or other conveyance for introduction into the buffer area. Manufacturers' directions or published

- data for minimum contact time will be followed. Individual pouched sterile supplies need not be wiped because the pouches can be removed as these sterile supplies are introduced into the buffer area.
3. Supplies that are required frequently or otherwise needed close at hand but not necessarily needed for the scheduled operations of the shift are decontaminated and stored on shelving in the ante-area.
 4. Carts used to bring supplies from the storeroom cannot be rolled beyond the demarcation line in the ante-area, and carts used in the buffer area cannot be rolled outward beyond the demarcation line unless cleaned and disinfected before returning.
 5. Generally, supplies required for the scheduled operations of the shift are wiped down with an appropriate disinfecting agent and brought into the buffer area, preferably on one or more movable carts. Supplies that are required for back-up or general support of operations may be stored on the designated shelving in the buffer area, but excessive amounts of supplies are to be avoided.
 6. Nonessential objects that shed particles shall not be brought into the buffer area, including pencils, cardboard cartons, paper towels, and cotton items (e.g., gauze pads).
 7. Essential paper-related products (e.g., paper syringe overwraps, work records contained in a protective sleeve) shall be wiped down with an appropriate disinfecting agent prior to being brought into the buffer area.
 8. Traffic flow in and out of the buffer area shall be minimized.
 9. Personnel preparing to enter the buffer area shall remove all personal outer garments, cosmetics (because they shed flakes and particles), and all hand, wrist, and other visible jewelry or piercings that can interfere with the effectiveness of PPE.
 10. Personnel entering the ante-area shall don attire as described in *Personnel Cleansing and Garbing* and *Personnel Training and Competency Evaluation of Garbing, Aseptic Work Practices and Cleaning/Disinfection Procedures*.
 11. Personnel shall then thoroughly wash hands and forearms to the elbow with soap and water for at least 30 seconds. An air dryer or disposable nonshedding towels are used to dry hands and forearms after washing.
 12. Personnel entering the buffer area shall perform antiseptic hand cleansing prior to donning sterile gloves using a waterless alcohol-based surgical hand scrub with persistent activity.
 13. Chewing gum, drinks, candy, or food items shall not be brought into the buffer area or ante-area. Materials exposed in patient care and treatment areas shall never be introduced into areas where components and ingredients for CSPs are present.
 14. At the beginning of each compounding activity session, and whenever liquids are spilled, the surfaces of the direct compounding environment are first cleaned with USP Purified Water to remove water-soluble residues. Immediately thereafter, the same surfaces are disinfected with a nonresidue-generating agent using a nonlinting wipe.
 15. Primary engineering controls shall be operated continuously during compounding activity. When the blower is turned off and before other personnel enter to perform compounding activities, only one person shall enter the buffer area for the purposes of turning on the blower (for at least 30 minutes) and disinfecting the work surfaces.
 16. Traffic in the area of the DCA is minimized and controlled.
 17. Supplies used in the DCA for the planned procedures are accumulated and then decontaminated by wiping or spraying the outer surface with sterile 70% IPA or removing the outer wrap at the edge of the DCA as the item is introduced into the aseptic work area.

18. All supply items are arranged in the DCA so as to reduce clutter and provide maximum efficiency and order for the flow of work.
19. After proper introduction into the DCA of supply items required for and limited to the assigned operations, they are so arranged that a clear, uninterrupted path of HEPA-filtered air will bathe all critical sites at all times during the planned procedures. That is, no objects may be placed between the first air from HEPA filters and an exposed critical site.
20. All procedures are performed in a manner designed to minimize the risk of touch contamination. Gloves are disinfected with adequate frequency with an approved disinfectant such as sterile 70% IPA.
21. All rubber stoppers of vials and bottles and the necks of ampuls are disinfected by wiping with sterile 70% IPA and waiting for at least 10 seconds before they are used to prepare CSPs.
22. After the preparation of every CSP, the contents of the container are thoroughly mixed and then inspected for the presence of particulate matter, evidence of incompatibility, or other defects.
23. After procedures are completed, used syringes, bottles, vials, and other supplies are removed, but with a minimum of exit and re-entry into the DCA so as to minimize the risk of introducing contamination into the aseptic workspace.

ELEMENTS OF QUALITY CONTROL

A written description of specific training and performance evaluation program for individuals involved in the use of aseptic techniques for the preparation of sterile products shall be developed for each site. This program equips personnel with the appropriate knowledge and trains them in the required skills necessary to perform the assigned tasks. Each person assigned to the aseptic area in the preparation of sterile products shall successfully complete specialized training in aseptic techniques and aseptic area practices prior to preparing CSPs (see *Personnel Training and Evaluation in Aseptic Manipulation Skills* and *Personnel Training and Competency Evaluation of Garbing, Aseptic Work Practices and Cleaning/Disinfection Procedures*).

Ingredients and Devices

Compounding personnel ascertain that ingredients for CSPs are of the correct identity and appropriate quality using the following information: vendor labels, labeling, certificates of analysis, direct chemical analysis, and knowledge of compounding facility storage conditions:

STERILE INGREDIENTS AND DEVICES

Commercially available sterile drug products, sterile ready-to-use containers, and devices are examples of sterile components. A written procedure for unit-by-unit physical inspection preparatory to use is followed to ensure that these components are sterile, free from defects, and otherwise suitable for their intended use.

NONSTERILE INGREDIENTS AND DEVICES

If any nonsterile components, including containers and ingredients, are used to make a CSP, such CSPs must be high risk. Nonsterile active ingredients and added substances or excipients for CSPs should preferably be official *USP* or *NF* articles. When nonofficial ingredients are used, they shall be accompanied by certificates of analysis from their suppliers to aid compounding

personnel in judging the identity, quality, and purity in relation to the intended use in a particular CSP. Physical inspection of a package of ingredients is necessary in order to detect breaks in the container, looseness in the cap or closure, and deviation from the expected appearance, aroma, and texture of the contents.

Bulk or unformulated drug substances and added substances or excipients shall be stored in tightly closed containers under temperature, humidity, and lighting conditions that are either indicated in official monographs or approved by suppliers. The date of receipt by the compounding facility shall be clearly and indelibly marked on each package of ingredient. After receipt by the compounding facility, packages of ingredients that lack a supplier's expiration date cannot be used after 1 year unless either appropriate inspection or testing indicates that the ingredient has retained its purity and quality for use in CSPs.

Careful consideration and evaluation of nonsterile ingredient sources is especially warranted when the CSP will be administered into the vascular system, central nervous system, or eyes.

Upon receipt of each lot of the bulk drug substance or excipient used for CSPs, the individual compounding the preparation performs a visual inspection of the lot for evidence of deterioration, other types of unacceptable quality, and wrong identification. For bulk drug substances or excipients, visual inspection is performed on a routine basis as described in the written protocol.

Equipment

It is necessary that equipment, apparatus, and devices used to compound a CSP be consistently capable of operating properly and within acceptable tolerance limits. Written procedures outlining required equipment calibration, annual maintenance, monitoring for proper function, and controlled procedures for use of the equipment and specified time frames for these activities are established and followed. Routine maintenance and frequencies shall be outlined in these SOPs. Results from the equipment calibration, annual maintenance reports, and routine maintenance are kept on file for the lifetime of the equipment. Personnel are prepared through an appropriate combination of specific training and experience to operate or manipulate any piece of equipment, apparatus, or device they may use when preparing CSPs. Training includes gaining the ability to determine whether any item of equipment is operating properly or is malfunctioning.

VERIFICATION OF AUTOMATED COMPOUNDING DEVICES (ACDs) FOR PARENTERAL NUTRITION COMPOUNDING

ACDs for the preparation of parenteral nutrition admixtures are widely used by pharmacists in hospitals and other healthcare settings. They are designed to streamline the labor-intensive processes involved in the compounding of these multiple-component formulations by automatically delivering the individual nutritional components in a predetermined sequence under computerized control. Parenteral nutrition admixtures often contain 20 or more individual additives representing as many as 50 or more individual components (e.g., 15 to 20 crystalline amino acids, dextrose monohydrate, and lipids; 10 to 12 electrolyte salts; 5 to 7 trace minerals; and 12 vitamins). Thus, ACDs can provide improved accuracy and precision of the compounding process over the traditional manual compounding methods.

Accuracy

The accuracy of an ACD can be determined in various ways to ensure that the correct quantities of nutrients, electrolytes, or other nutritional components are delivered to the final infusion container. Initially, the ACD is tested for its volume and weight accuracy. For volume accuracy, a suitable volume of Sterile Water for Injection, USP, which represents a typical additive volume (e.g., 40 mL for small volume range of 1 to 100 mL, 300 mL for large volume range of 100 to 1000 mL), is programmed into the ACD and delivered to the appropriate volumetric container. The compounding personnel should then consult *Volumetric Apparatus* (31) for appropriate parameters to assess the volumetric performance of the ACD. For gravimetric accuracy, the balance used in conjunction with the ACD is tested using various weight sizes that represent the amounts typically used to deliver the various additives. Compounding personnel should consult *Balances* (41) (CN-1 May 2016) for acceptable tolerances of the weights used. In addition, the same volume of *Sterile Water for Injection* used to assess volumetric accuracy is then weighed on the balance used in conjunction with the ACD. For example, if 40 mL of water was used in the volumetric assessment, its corresponding weight should be about 40 g (assuming the relative density of water is 1.0). In addition, during the use of the ACD, certain additives, such as potassium chloride (corrected for density differences), can also be tested in the same manner as with an in-process test.

Finally, additional tests of accuracy may be employed that determine the content of certain ingredients in the final volume of the parenteral nutrition admixture. Generally, pharmacy departments do not have the capability to routinely perform chemical analyses such as analyses of dextrose or electrolyte concentrations. Consequently, hospital or institutional laboratories may be called upon to perform these quality assurance tests. However, the methods in such laboratories are often designed for biological, not pharmaceutical, systems. Thus, their testing procedures shall be verified to meet the *USP* requirements stated in the individual monograph for the component being tested. For example, under *Dextrose Injection*, the following is stated: It contains not less than 95.0% and not more than 105.0% of the labeled amount of $C_6H_{12}O_6 \cdot H_2O$. The hospital or institutional chemistry laboratories must validate their methods to apply to this range and correct for their typical measurement of anhydrous dextrose versus dextrose monohydrate. Similar ranges and issues exist, for example, for injections of calcium gluconate, magnesium sulfate, and potassium chloride. The critical point is the use of *USP* references and possible laboratory procedural differences.

Precision

The intermediate precision of the ACD can be determined on the basis of the day-to-day variations in performance of the accuracy measures. Thus, compounding personnel shall keep a daily record of the above-described accuracy assessments and review the results over time. This review shall occur at least at weekly intervals to avoid potentially clinically significant cumulative errors over time. This is especially true for additives with a narrow therapeutic index, such as potassium chloride.

FINISHED PREPARATION RELEASE CHECKS AND TESTS

The following quality metrics shall be performed for all CSPs before they are dispensed or administered:

Inspection of Solution Dosage Forms and Review of Compounding Procedures

All CSPs that are intended to be solutions shall be visually examined for the presence of

~~particulate matter and not administered or dispensed when such matter is observed. The prescription orders, written compounding procedure, preparation records, and expended materials used to make CSPs at all contamination risk levels are inspected for accuracy of correct identities and amounts of ingredients, aseptic mixing and sterilization, packaging, labeling, and expected physical appearance before they are administered or dispensed.~~

PHYSICAL INSPECTION

~~Finished CSPs are individually inspected in accordance with written procedures after compounding. If not distributed promptly, these CSPs are individually inspected just prior to leaving the storage area. Those CSPs that are not immediately distributed are stored in an appropriate location as described in the written procedures. Immediately after compounding, and as a condition of release, each CSP unit, where possible, should be inspected against lighted white or black background or both for evidence of visible particulates or other foreign matter. Prerelease inspection also includes container closure integrity and any other apparent visual defect. CSPs with observed defects should be immediately discarded or marked and segregated from acceptable products in a manner that prevents their administration. When CSPs are not distributed promptly after preparation, a predistribution inspection is conducted to ensure that a CSP with defects, such as precipitation, cloudiness, and leakage, which may develop between the time of release and the time of distribution, is not released.~~

Compounding Accuracy Checks

~~Written procedures for double-checking compounding accuracy shall be followed for every CSP during preparation and immediately prior to release. The double-check system should meet state regulations and include label accuracy and accuracy of the addition of all drug products or ingredients used to prepare the finished product and their volumes or quantities. The used additive containers and, for those additives for which the entire container was not expended, the syringes used to measure the additive should be quarantined with the final products until the final product check is completed. Compounding personnel shall visually confirm that ingredients measured in syringes match the written order being compounded. Preferably, a person other than the compounder can verify that correct volumes of correct ingredients were measured to make each CSP. For example, compounding personnel would pull the syringe plunger back to the volume measured.~~

~~When practical, the accuracy of measurements is confirmed by weighing a volume of the measured fluid, then calculating that volume by dividing the weight by the accurate value of the density, or specific gravity, of the measured fluid. Correct density or specific gravity values programmed in ACDs, which measure by weight using the quotient of the programmed volume divided by the density or specific gravity, shall be confirmed to be accurate before and after delivering volumes of the liquids assigned to each channel or port. These volume accuracy checks and the following additional safety and accuracy checks in this section shall be included in the SOP manual of the CSP facility.~~

Sterility Testing

~~All high-risk level CSPs that are prepared in groups of more than 25 identical individual single-dose packages (e.g., ampuls, bags, syringes, vials) or in multiple-dose vials (MDVs) for administration to multiple patients or that are exposed longer than 12 hours at 2° to 8° and longer than 6 hours at warmer than 8° before they are sterilized shall meet the sterility test~~

~~(see *Sterility Tests* (71)) before they are dispensed or administered. The *Membrane Filtration* method is the method of choice where feasible (e.g., components are compatible with the membrane). A method not described in the *USP* may be used if verification results demonstrate that the alternative is at least as effective and reliable as the *USP Membrane Filtration* method or the *USP Direct Inoculation of the Culture Medium* method where the *Membrane Filtration* method is not feasible.~~

~~When high-risk level CSPs are dispensed before receiving the results of their sterility tests, there shall be a written procedure requiring daily observation of the incubating test specimens and immediate recall of the dispensed CSPs when there is any evidence of microbial growth in the test specimens. In addition, the patient and the physician of the patient to whom a potentially contaminated CSP was administered are notified of the potential risk. Positive sterility test results should prompt a rapid and systematic investigation of aseptic technique, environmental control, and other sterility assurance controls to identify sources of contamination and correct problems in the methods or processes.~~

Bacterial Endotoxin (Pyrogen) Testing

~~All high-risk level CSPs, except those for inhalation and ophthalmic administration, that are prepared in groups of more than 25 identical individual single-dose packages (e.g., ampuls, bags, syringes, vials) or in MDVs for administration to multiple patients or that are exposed longer than 12 hours at 2° to 8° and longer than 6 hours at warmer than 8° before they are sterilized shall be tested to ensure that they do not contain excessive bacterial endotoxins (see *Bacterial Endotoxins Test* (85) and *Pyrogen Test* (151)). In the absence of a bacterial endotoxins limit in the official monograph or other CSP formula source, the CSP shall not exceed the amount of USP Endotoxin Units (per hour per kilogram of body weight or square meters of body surface area) specified in *Bacterial Endotoxins Test* (85) referenced above for the appropriate route of administration.~~

Identity and Strength Verification of Ingredients

~~Compounding facilities shall have at least the following written procedures for verifying the correct identity and quality of CSPs before they are dispensed and administered:~~

- ~~1. That labels of CSPs bear correct names and amounts or concentrations of ingredients, the total volume, the BUD, the appropriate route(s) of administration, the storage conditions, and other information for safe use.~~
- ~~2. That there are correct identities, purities, and amounts of ingredients by comparing the original written order with the written compounding record for the CSP.~~
- ~~3. That correct fill volumes in CSPs and correct quantities of filled units of the CSPs were obtained. When the strength of finished CSPs cannot be confirmed to be accurate, based on the above three inspections, the CSPs shall be assayed by methods that are specific for the active ingredients.~~

STORAGE AND BEYOND-USE DATING

~~BUDs for compounded preparations are usually assigned on the basis of professional experience, which should include careful interpretation of appropriate information sources for the same or similar formulations (see *Stability Criteria and Beyond-Use Dating* under *Pharmaceutical*~~

Compounding—Nonsterile Preparations (795). BUDs for CSPs are rarely based on preparation-specific chemical assay results, which are used with the Arrhenius equation to determine expiration dates (see *General Notices and Requirements*) for manufactured products. The majority of CSPs are aqueous solutions in which hydrolysis of dissolved ingredients is the most common chemical degradation reaction. The extent of hydrolysis and other heat-catalyzed degradation reactions at any particular time point in the life of a CSP represents the thermodynamic sum of exposure temperatures and durations. Such lifetime stability exposure is represented in the mean kinetic temperature calculation (see *Pharmaceutical Calculations in Prescription Compounding (1160)*). Drug hydrolysis rates increase exponentially with arithmetic temperature increase; thus, exposure of a beta-lactam antibiotic solution for 1 day at controlled room temperature (see *General Notices and Requirements*) will have an equivalent effect on the extent of hydrolysis of approximately 3 to 5 days in cold temperatures (see *General Notices and Requirements*).

Personnel who prepare, dispense, and administer CSPs shall store them strictly in accordance with the conditions stated on the label of ingredient products and finished CSPs. When CSPs are known to have been exposed to temperatures warmer than the warmest labeled limit or to temperatures exceeding 40° (see *General Notices and Requirements*) for more than 4 hours, such CSPs should be discarded unless direct assay data or appropriate documentation confirms their continued stability.

Determining Beyond-Use Dates

BUDs and expiration dates are not the same (see *General Notices and Requirements*). Expiration dates for the chemical and physical stability of manufactured sterile products are determined from results of rigorous analytical and performance testing, and they are specific for a particular formulation in its container and at stated exposure conditions of illumination and temperature. When CSPs deviate from conditions in the approved labeling of manufactured products contained in CSPs, compounding personnel may consult the manufacturer of particular products for advice on assigning BUDs based on chemical and physical stability parameters. BUDs for CSPs that are prepared strictly in accordance with manufacturers' product labeling shall be those specified in that labeling or from appropriate literature sources or direct testing. BUDs for CSPs that lack justification from either appropriate literature sources or by direct testing evidence shall be assigned as described in *Stability Criteria and Beyond-Use Dating under Pharmaceutical Compounding—Nonsterile Preparations (795)*.

In addition, compounding personnel may refer to applicable publications to obtain relevant stability, compatibility, and degradation information regarding the drug or its congeners. When assigning a beyond-use date, compounding personnel should consult and apply drug-specific and general stability documentation and literature where available, and they should consider the nature of the drug and its degradation mechanism, the container in which it is packaged, the expected storage conditions, and the intended duration of therapy (see *Expiration Date and Beyond-Use Date under Labeling in the General Notices and Requirements*). Stability information must be carefully interpreted in relation to the actual compounded formulation and conditions for storage and use. Predictions based on other evidence, such as publications, charts, and tables, would result in theoretical BUDs. Theoretically predicted beyond-use dating introduces varying degrees of assumptions and, hence, a likelihood of error or at least inaccuracy. The degree of error or inaccuracy would be dependent on the extent of differences

between the CSPs' characteristics (e.g., composition, concentration of ingredients, fill volume, container type and material) and the characteristics of the products from which stability data or information is to be extrapolated. The greater the doubt of the accuracy of theoretically predicted beyond use dating, the greater the need to determine dating periods experimentally. Theoretically predicted beyond use dating periods should be carefully considered for CSPs prepared from nonsterile bulk active ingredients having therapeutic activity, especially where these CSPs are expected to be compounded routinely. When CSPs will be distributed to and administered in residential locations other than healthcare facilities, the effect of potentially uncontrolled and unmonitored temperature conditions shall be considered when assigning BUDs. It must be ascertained that CSPs will not be exposed to warm temperatures (see *General Notices and Requirements*) unless the compounding facility has evidence to justify stability of CSPs during such exposure.

It should be recognized that the truly valid evidence of stability for predicting beyond use dating can be obtained only through product specific experimental studies. Semiquantitative procedures such as thin layer chromatography (TLC) may be acceptable for many CSPs. However, quantitative stability indicating assays such as high performance liquid chromatographic (HPLC) assays would be more appropriate for certain CSPs. Examples include CSPs with a narrow therapeutic index, where close monitoring or dose titration is required to ensure therapeutic effectiveness and to avoid toxicity; where a theoretically established beyond use dating period is supported by only marginal evidence; or where a significant margin of safety cannot be verified for the proposed beyond use dating period. In short, because beyond use dating periods established from product specific data acquired from the appropriate instrumental analyses are clearly more reliable than those predicted theoretically, the former approach is strongly urged to support dating periods exceeding 30 days.

To ensure consistent practices in determining and assigning BUDs, the compounding facility should have written policies and procedures governing the determination of the BUDs for all compounded products. When attempting to predict a theoretical BUD, a compounded or an admixed preparation should be considered as a unique system that has physical and chemical properties and stability characteristics that differ from its components. For example, antioxidant, buffering, or antimicrobial properties of a sterile vial for injection (SVI) might be lost upon its dilution, with the potential of seriously compromising the chemical stability of the SVI's active ingredient or the physical or microbiological stability of the SVI formulation in general. Thus, the properties stabilized in the SVI formulation usually cannot be expected to be carried over to the compounded or admixed preparation. Preparation specific, experimentally determined stability data evaluation protocols are preferable to published stability information.

Compounding personnel who assign BUDs to CSPs when lacking direct chemical assay results must critically interpret and evaluate the most appropriate available information sources to determine a conservative and safe BUD. The SOP manual of the compounding facility and each specific CSP formula record shall describe the general basis used to assign the BUD and storage conditions.

When manufactured MDVs (see *Multiple Dose Container* under *Preservation, Packaging, Storage, and Labeling* in the *General Notices and Requirements*) of sterile ingredients are used in CSPs, the stoppers of the MDVs are inspected for physical integrity and disinfected by wiping with a sterile 70% IPA swab before each penetration with a sterile withdrawal device. When contaminants or abnormal properties are suspected or observed in MDVs, such MDVs shall be discarded. The BUD after initially entering or opening (e.g., needle puncturing) multiple dose

containers is 28 days (see *Antimicrobial Effectiveness Testing* (51)) unless otherwise specified by the manufacturer.

Proprietary Bag and Vial Systems

The sterility storage and stability beyond use times for attached and activated (where activated is defined as allowing contact of the previously separate diluent and drug contents) container pairs of drug products for intravascular administration (e.g., ADD Vantage[®], Mini Bag Plus[®]) shall be applied as indicated by the manufacturer. In other words, follow manufacturers' instructions for handling and storing ADD Vantage[®], Mini Bag Plus[®], Add A Vial[®], Add Ease[®] products, and any others.

Monitoring Controlled Storage Areas

To ensure that product potency is retained through the manufacturer's labeled expiration date, compounding personnel shall monitor the drug storage areas within the compounding facility. Controlled temperature areas in compounding facilities include controlled room temperature, 20° to 25° with mean kinetic temperature 25°; controlled cold temperature, 2° to 8° with mean kinetic temperature 8°; cold temperature, 2° to 8°; freezing temperature, -25° and -10° (see *General Notices and Requirements*) if needed to achieve freezing, and the media specific temperature range for microbial culture media. A controlled temperature area shall be monitored at least once daily and the results documented on a temperature log. Additionally, compounding personnel shall note the storage temperature when placing the product into or removing the product from the storage unit in order to monitor any temperature aberrations. Suitable temperature recording devices may include a calibrated continuous recording device or a National Institute of Standards and Technology (NIST) calibrated thermometer that has adequate accuracy and sensitivity for the intended purpose, and it shall be properly calibrated at suitable intervals. If the compounding facility uses a continuous temperature recording device, compounding personnel shall verify at least once daily that the recording device itself is functioning properly.

The temperature sensing mechanisms shall be suitably placed in the controlled temperature storage space to reflect accurately its true temperature. In addition, the compounding facility shall adhere to appropriate procedures of all controlled storage spaces to ensure that such spaces are not subject to significantly prolonged temperature fluctuations as may occur, for example, by leaving a refrigerator door open too long.

MAINTAINING STERILITY, PURITY, AND STABILITY OF DISPENSED AND DISTRIBUTED CSPS

This section summarizes the responsibilities of compounding facilities for maintaining quality and control of CSPs that are dispensed and administered within their parent healthcare organizations.

Compounding personnel shall ensure proper storage and security of CSPs prepared by or dispensed from the compounding facility until either their BUDs are reached or they are administered to patients. In fulfilling this general responsibility, the compounding facility is responsible for the proper packaging, handling, transport, and storage of CSPs prepared by or dispensed from it, including the appropriate education, training, and supervision of compounding personnel assigned to these functions. The compounding facility should assist in the education

and training of noncompounding personnel responsible for carrying out any aspect of these functions.

Establishing, maintaining, and ensuring compliance with comprehensive written policies and procedures encompassing these responsibilities is a further responsibility of the compounding facility. Where noncompounding personnel are assigned tasks involving any of these responsibilities, the policies and procedures encompassing those tasks should be developed by compounding supervisors. The quality and control activities related to distribution of CSPs are summarized in the following five subsections. Activities or concerns that should be addressed as the compounding facility fulfills these responsibilities are as follows.

Packaging, Handling, and Transport

Inappropriate processes or techniques involved with packaging, handling, and transport can adversely affect quality and package integrity of CSPs. Although compounding personnel routinely perform many of the tasks associated with these functions, some tasks, such as transport, handling, and placement into storage, may be fulfilled by noncompounding personnel who are not under the direct administrative control of the compounding facility. Under these circumstances, appropriate SOPs shall be established by the compounding facility with the involvement of other departments or services whose personnel are responsible for carrying out those CSP-related functions for which the compounding facility has a direct interest. The performance of the noncompounding personnel is monitored for compliance to established policies and procedures.

The critical requirements that are unique to CSPs and that are necessary to ensure CSP quality and packaging integrity shall be addressed in SOPs. For example, techniques should be specified to prevent the depression of syringe plungers or dislodging of syringe tips during handling and transport. Additionally, disconnection of system components (e.g., where CSPs are dispensed with administration sets attached to them) shall be prevented through the BUD of the CSP. Foam padding or inserts are particularly useful where CSPs are transported by pneumatic tube systems. Regardless of the methods used, the compounding facility must evaluate their effectiveness and the reliability of the intended protection. Evaluation should be continuous—for example, through a surveillance system, including a system of problem reporting to the compounding facility.

Inappropriate transport and handling can adversely affect the quality of certain CSPs having unique stability concerns. For example, the physical shaking that might occur during pneumatic tube transport or undue exposure to heat or light must be addressed on a preparation-specific basis. Alternative transport modes or special packaging measures might be needed for the proper assurance of quality of these CSPs. The use of tamper-evident closures and seals on CSP ports can add an additional measure of security to ensure product integrity regardless of the transport method used.

Chemotoxic and other hazardous CSPs require safeguards to maintain the integrity of the CSP and to minimize the exposure potential of these products to the environment and to personnel who may come in contact with them. Transportation by pneumatic tube should be discouraged because of potential breakage and contamination. Special requirements associated with the packaging, transport, and handling of these agents include the prevention of accidental exposures or spills and the training of personnel in the event of an exposure or spill. Examples of special requirements of these agents also include exposure-reducing strategies such as the

~~use of Luer lock syringes and connections, syringe caps, the capping of container ports, sealed plastic bags, impact-resistant containers, and cautionary labeling.~~

Use and Storage

~~The compounding facility is responsible for ensuring that CSPs in the patient care setting maintain their quality until administered. The immediate labeling of the CSP container will display prominently and understandably the requirements for proper storage and expiration dating. Delivery and patient care setting personnel shall be properly trained to deliver the CSP to the appropriate storage location. Outdated and unused CSPs shall be returned to the compounding facility for disposition.~~

~~SOPs must exist to ensure that storage conditions in the patient care setting are suitable for the CSP-specific storage requirements. Procedures include daily monitoring and documentation of drug storage refrigerators to ensure temperatures between 2° and 8° and the monthly inspection of all drug storage locations by compounding personnel. Inspections shall confirm compliance with appropriate storage conditions, separation of drugs and food, proper use of MDVs, and the avoidance of using single-dose products as MDVs. CSPs, as well as all other drug products, shall be stored in the patient care area in such a way as to secure them from unauthorized personnel, visitors, and patients.~~

Readying for Administration

~~Procedures essential for generally ensuring quality, especially sterility assurance, when readying a CSP for its subsequent administration include proper hand washing, aseptic technique, site care, and change of administration sets. Additional procedures may also be essential for certain CSPs, devices, or techniques. Examples where such special procedures are needed include in-line filtration, the operation of automated infusion control devices, and the replenishment of CSPs into the reservoirs of implantable or portable infusion pumps. When CSPs are likely to be exposed to warmer than 30° for more than 1 hour during their administration to patients, the maintenance of their sterility and stability should be confirmed from either relevant and reliable sources or direct testing.~~

Redispensed CSPs

~~The compounding facility shall have the sole authority to determine when unopened, returned CSPs may be redispensed. Returned CSPs may be redispensed only when personnel responsible for sterile compounding can ensure that such CSPs are sterile, pure, and stable (contain labeled strength of ingredients). The following may provide such assurance: the CSPs were maintained under continuous refrigeration and protected from light, if required, and no evidence of tampering or any readying for use outside the compounding facility exists. Assignment of new storage times and BUDs that exceed the original dates for returned CSPs is permitted only when there is supporting evidence from sterility testing and quantitative assay of ingredients. Thus, initial preparation and thaw times should be documented and reliable measures should have been taken to prevent and detect tampering. Compliance with all procedures associated with maintaining product quality is essential. The CSPs shall not be redispensed if there is not adequate assurance that preparation quality and packaging integrity (including the connections of devices, where applicable) were continuously maintained between the time the CSPs left and the time they were returned. Additionally, CSPs shall not be redispensed if redispensing cannot be supported by the originally assigned BUD.~~

Education and Training

The assurance of CSPs' quality and packaging integrity is highly dependent on the proper adherence of all personnel to the pertinent SOPs. Compounding personnel shall design, implement, and maintain a formal education, training, and competency assessment program that encompasses all the functions and tasks addressed in the foregoing sections and all personnel to whom such functions and tasks are assigned. This program includes the assessment and documentation of procedural breaches, administration mishaps, side effects, allergic reactions, and complications associated with dosage or administration, such as extravasation. This program should be coordinated with the institution's adverse events and incident reporting programs.

Packing and Transporting CSPs

The following sections describe how to maintain sterility and stability of CSPs until they are delivered to patient care locations for administration:

packing cspsfor transit

When CSPs are distributed to locations outside the premises in which they are compounded, compounding personnel select packing containers and materials that are expected to maintain physical integrity, sterility, and stability of CSPs during transit. Packing is selected that simultaneously protects CSPs from damage, leakage, contamination, and degradation, and protects personnel who transport packed CSPs from harm. The SOP manual of the compounding facility specifically describes appropriate packing containers and insulating and stuffing materials, based on information from product specifications, vendors, and experience of compounding personnel. Written instructions that clearly explain how to safely open containers of packed CSPs are provided to patients and other recipients.

transit of csps

Compounding facilities that ship CSPs to locations outside their own premises shall select modes of transport that are expected to deliver properly packed CSPs in undamaged, sterile, and stable condition to recipients.

Compounding personnel should ascertain that temperatures of CSPs during transit by the selected mode will not exceed the warmest temperature specified on the storage temperature range on CSP labels. It is recommended that compounding personnel communicate directly with the couriers to learn shipping durations and exposure conditions that CSPs may encounter.

Compounding personnel shall include specific handling and exposure instructions on the exteriors of containers packed with CSPs to be transported and obtain reasonable assurance of compliance therewith from transporters. Compounding personnel shall periodically review the delivery performance of couriers to ascertain that CSPs are being efficiently and properly transported.

Storage in Locations Outside Compounding Facilities

Compounding facilities that ship CSPs to patients and other recipients outside their own premises shall ascertain or provide, whichever is appropriate, the following assurances:

1. Labels and accessory labeling for CSPs include clearly readable BUDs, storage instructions, and disposal instructions for out-of-date units.

2. ~~Each patient or other recipient is able to store the CSPs properly, including the use of a properly functioning refrigerator and freezer if CSPs are labeled for such storage.~~

PATIENT OR CAREGIVER TRAINING

~~A formal training program is provided as a means to ensure understanding and compliance with the many special and complex responsibilities placed on the patient or caregiver for the storage, handling, and administration of CSPs. The instructional objectives for the training program include all home care responsibilities expected of the patient or caregiver and is specified in terms of patient or caregiver competencies.~~

~~Upon the conclusion of the training program, the patient or caregiver should, correctly and consistently, be able to do the following:~~

1. ~~Describe the therapy involved, including the disease or condition for which the CSPs are prescribed, goals of therapy, expected therapeutic outcome, and potential side effects of the CSPs.~~
2. ~~Inspect all drug products, CSPs, devices, equipment, and supplies on receipt to ensure that proper temperatures were maintained during transport and that goods received show no evidence of deterioration or defects.~~
3. ~~Handle, store, and monitor all drug products, CSPs, and related supplies and equipment in the home, including all special requirements related to same.~~
4. ~~Visually inspect all drug products, CSPs, devices, and other items the patient or caregiver is required to use immediately prior to administration in a manner to ensure that all items are acceptable for use. For example, CSPs must be free from leakage, container cracks, particulates, precipitate, haziness, discoloration, or other deviations from the normal expected appearance, and the immediate packages of sterile devices must be completely sealed, with no evidence of loss of package integrity.~~
5. ~~Check labels immediately prior to administration to ensure the right drug, dose, patient, and time of administration.~~
6. ~~Clean the in-home preparation area, scrub hands, use proper aseptic technique, and manipulate all containers, equipment, apparatus, devices, and supplies used in conjunction with administration.~~
7. ~~Employ all techniques and precautions associated with CSP administration; for example, preparing supplies and equipment, handling of devices, priming the tubing, and discontinuing an infusion.~~
8. ~~Care for catheters, change dressings, and maintain site patency as indicated.~~
9. ~~Monitor for and detect occurrences of therapeutic complications such as infection, phlebitis, electrolyte imbalance, and catheter misplacement.~~
10. ~~Respond immediately to emergency or critical situations such as catheter breakage or displacement, tubing disconnection, clot formation, flow blockage, and equipment malfunction.~~
11. ~~Know when to seek and how to obtain professional emergency services or professional advice.~~
12. ~~Handle, contain, and dispose of wastes, such as needles, syringes, devices, biohazardous spills or residuals, and infectious substances.~~

~~Training programs include a hands-on demonstration and practice with actual items that the patient or caregiver is expected to use, such as CSP containers, devices, and equipment. The~~

~~patient or caregiver practices aseptic and injection technique under the direct observation of a health professional.~~

~~The compounding facility, in conjunction with nursing or medical personnel, is responsible for ensuring initially and on an ongoing basis that the patient or caregiver understands, has mastered, and is capable of and willing to comply with all of these home care responsibilities. This is achieved through a formal, written assessment program. All specified competencies in the patient or caregiver training program are formally assessed. The patient or caregiver is expected to demonstrate to appropriate healthcare personnel mastery of assigned activities before being allowed to administer CSPs unsupervised by a health professional.~~

~~Printed material such as checklists or instructions provided during training may serve as continuing post-training reinforcement of learning or as reminders of specific patient or caregiver responsibilities. Post-training verbal counseling can also be used periodically, as appropriate, to reinforce training and to ensure continuing correct and complete fulfillment of responsibilities.~~

~~PATIENT MONITORING AND ADVERSE EVENTS REPORTING~~

~~Compounding facilities shall clinically monitor patients treated with CSPs according to the regulations and guidelines of their respective state healthcare practitioner licensure boards or of accepted standards of practice. Compounding facilities shall provide patients and other recipients of CSPs with a way to address their questions and report any concerns that they may have with CSPs and their administration devices.~~

~~The SOP manuals of compounding facilities shall describe specific instructions for receiving, acknowledging, and dating receipts, and for recording, or filing, and evaluating reports of adverse events and of the quality of preparation claimed to be associated with CSPs. Reports of adverse events with CSPs shall be reviewed promptly and thoroughly by compounding supervisors to correct and prevent future occurrences. Compounding personnel are encouraged to participate in adverse event reporting and product defects programs of the FDA and USP.~~

~~QUALITY ASSURANCE (QA) PROGRAM~~

~~A provider of CSPs shall have in place a formal QA program intended to provide a mechanism for monitoring, evaluating, correcting, and improving the activities and processes described in this chapter. Emphasis in the QA program is placed on maintaining and improving the quality of systems and the provision of patient care. In addition, the QA program ensures that any plan aimed at correcting identified problems also includes appropriate follow-up to make certain that effective corrective actions were performed.¹¹~~

~~Characteristics of a QA program include the following:~~

- ~~1. Formalization in writing;~~
- ~~2. Consideration of all aspects of the preparations and dispensing of products as described in this chapter, including environmental testing and verification results;~~
- ~~3. Description of specific monitoring and evaluation activities;~~
- ~~4. Specification of how results are to be reported and evaluated;~~
- ~~5. Identification of appropriate follow-up mechanisms when action limits or thresholds are exceeded; and~~

6. ~~Delineation of the individuals responsible for each aspect of the QA program.~~

~~In developing a specific plan, focus is on establishing objective, measurable indicators for monitoring activities and processes that are deemed high risk, high volume, or problem prone. In general, the selection of indicators and the effectiveness of the overall QA program is reassessed on an annual basis.~~

~~ABBREVIATIONS AND ACRONYMS~~

ACD	automated compounding device
ACPH	air changes per hour
ALARA	as low as reasonably achievable
ASHRAE	American Society of Heating, Refrigerating and Air-Conditioning Engineers
BI	biological indicator
BSC	biological safety cabinet
BUD	beyond-use date
CACI	compounding aseptic containment isolator
CAI	compounding aseptic isolator
CDC	Centers for Disease Control and Prevention
CETA	Controlled Environment Testing Association
cfu	colony-forming unit(s)
CSP	compounded sterile preparation
ESTD	closed-system vial transfer device
DCA	direct compounding area
ECV	endotoxin challenge vial
EU	Endotoxin Unit
FDA	Food and Drug Administration
HEPA	high efficiency particulate air
HICPAC	Healthcare Infection Control Practices Advisory Committee
HVAC	heating, ventilation, and air conditioning
IPA	isopropyl alcohol
ISO	International Organization for Standardization
LAFW	laminar airflow workbench
MDVs	multiple-dose vials
MMWR	Morbidity and Mortality Weekly Report
NIOSH	National Institute for Occupational Safety and Health
NIST	National Institute of Standards and Technology
PEC	primary engineering control
PET	positron emission tomography
PPE	personnel protective equipment
psi	pounds per square inch
QA	quality assurance
SOP	standard operating procedure
SVI	sterile vial for injection
TSA	trypticase soy agar
USP	United States Pharmacopeia

GLOSSARY

Ante-Area: An ISO Class 8 (see *Table 1*) or better area where personnel hand hygiene and garbing procedures, staging of components, order entry, CSP labeling, and other high-

particulate-generating activities are performed. It is also a transition area that (1) provides assurance that pressure relationships are constantly maintained so that air flows from clean to dirty areas and (2) reduces the need for the heating, ventilating, and air-conditioning (HVAC) control system to respond to large disturbances.¹²

Aseptic Processing: (see *Microbiological Control and Monitoring of Aseptic Processing Environments* (1116)) A mode of processing pharmaceutical and medical products that involves the separate sterilization of the product and of the package (containers, closures, or packaging material for medical devices) and the transfer of the product into the container and its closure under at least ISO Class 5 (see *Table 1*) conditions.

Beyond-Use Date (BUD): (see *General Notices and Requirements and Pharmaceutical Compounding—Nonsterile Preparations* (795)) For the purpose of this chapter, the date or time after which a CSP shall not be stored or transported. The date is determined from the date or time the preparation is compounded.

Biological Safety Cabinet (BSC): A ventilated cabinet for CSPs, personnel, product, and environmental protection having an open front with inward airflow for personnel protection, downward high-efficiency particulate air (HEPA)-filtered laminar airflow for product protection, and HEPA-filtered exhausted air for environmental protection.

Buffer Area: An area where the primary engineering control (PEC) is physically located. Activities that occur in this area include the preparation and staging of components and supplies used when compounding CSPs.

Clean Room: (see *Microbiological Control and Monitoring of Aseptic Processing Environments* (1116) and also the definition of *Buffer Area*) A room in which the concentration of airborne particles is controlled to meet a specified airborne particulate cleanliness class. Microorganisms in the environment are monitored so that a microbial level for air, surface, and personnel gear are not exceeded for a specified cleanliness class.

Compounding Aseptic Containment Isolator (CACI): A compounding aseptic isolator (CAI) designed to provide worker protection from exposure to undesirable levels of airborne drug throughout the compounding and material transfer processes and to provide an aseptic environment for compounding sterile preparations. Air exchange with the surrounding environment should not occur unless the air is first passed through a microbial retentive filter (HEPA minimum) system capable of containing airborne concentrations of the physical size and state of the drug being compounded. Where volatile hazardous drugs are prepared, the exhaust air from the isolator should be appropriately removed by properly designed building ventilation.

Compounding Aseptic Isolator (CAI): A form of isolator specifically designed for compounding pharmaceutical ingredients or preparations. It is designed to maintain an aseptic compounding environment within the isolator throughout the compounding and material transfer processes. Air exchange into the isolator from the surrounding environment should not occur unless the air has first passed through a microbially retentive filter (HEPA minimum).¹³

Critical Area: An ISO Class 5 (see *Table 1*) environment.

Critical Site: A location that includes any component or fluid pathway surfaces (e.g., vial septa, injection ports, beakers) or openings (e.g., opened ampuls, needle hubs) exposed and at risk of direct contact with air (e.g., ambient room or HEPA filtered), moisture (e.g., oral and mucosal secretions), or touch contamination. Risk of microbial particulate contamination of the

critical site increases with the size of the openings and exposure time.

Direct Compounding Area (DCA): A critical area within the ISO Class 5 (see *Table 1*) primary engineering control (PEC) where critical sites are exposed to unidirectional HEPA filtered air, also known as first air.

Disinfectant: An agent that frees from infection, usually a chemical agent but sometimes a physical one, and that destroys disease causing pathogens or other harmful microorganisms but may not kill bacterial and fungal spores. It refers to substances applied to inanimate objects.

First Air: The air exiting the HEPA filter in a unidirectional air stream that is essentially particle free.

Hazardous Drugs: Drugs are classified as hazardous if studies in animals or humans indicate that exposures to them have a potential for causing cancer, development or reproductive toxicity, or harm to organs. (See current NIOSH publication.)

Labeling: [see *General Notices and Requirements* and 21 USC 321 (k) and (m)] A term that designates all labels and other written, printed, or graphic matter on an immediate container of an article or preparation or on, or in, any package or wrapper in which it is enclosed, except any outer shipping container. The term "label" designates that part of the labeling on the immediate container.

Media-Fill Test: (see *Microbiological Control and Monitoring of Aseptic Processing Environments* (1116)) A test used to qualify aseptic technique of compounding personnel or processes and to ensure that the processes used are able to produce sterile product without microbial contamination. During this test, a microbiological growth medium such as Soybean-Casein Digest Medium is substituted for the actual drug product to simulate admixture compounding.³ The issues to consider in the development of a media-fill test are media-fill procedures, media selection, fill volume, incubation, time and temperature, inspection of filled units, documentation, interpretation of results, and possible corrective actions required.

Multiple-Dose Container: (see *General Notices and Requirements* and ⁶⁵⁹ (CN 1 May 2016)) A multiple-unit container for articles or preparations intended for parenteral administration only and usually containing antimicrobial preservatives. The beyond-use date (BUD) for an opened or entered (e.g., needle-punctured) multiple-dose container with antimicrobial preservatives is 28 days (see *Antimicrobial Effectiveness Testing* (51)), unless otherwise specified by the manufacturer.

Negative Pressure Room: A room that is at a lower pressure than the adjacent spaces and, therefore, the net flow of air is *into* the room.¹²

Pharmacy Bulk Package: (see ⁶⁵⁹ (CN 1 May 2016)) A container of a sterile preparation for parenteral use that contains many single doses. The contents are intended for use in a pharmacy admixture program and are restricted to the preparation of admixtures for infusion or, through a sterile transfer device, for the filling of empty sterile syringes. The closure shall be penetrated only one time after constitution with a suitable sterile transfer device or dispensing set, which allows measured dispensing of the contents. The pharmacy bulk package is to be used only in a suitable work area such as a laminar flow hood (or an equivalent clean air compounding area).

Where a container is offered as a pharmacy bulk package, the label shall (a) state prominently

~~“Pharmacy Bulk Package—Not for Direct Infusion,” (b) contain or refer to information on proper techniques to help ensure safe use of the product, and (c) bear a statement limiting the time frame in which the container may be used once it has been entered, provided it is held under the labeled storage conditions.~~

~~**Primary Engineering Control (PEC):** A device or room that provides an ISO Class 5 (see *Table 1*) environment for the exposure of critical sites when compounding CSPs. Such devices include, but may not be limited to, laminar airflow workbenches (LAFWs), biological safety cabinets (BSCs), compounding aseptic isolators (CAIs), and compounding aseptic containment isolators (CACIs).~~

~~**Preparation:** A preparation, or a CSP, that is a sterile drug or nutrient compounded in a licensed pharmacy or other healthcare-related facility pursuant to the order of a licensed prescriber; the article may or may not contain sterile products.~~

~~**Product:** A commercially manufactured sterile drug or nutrient that has been evaluated for safety and efficacy by the FDA. Products are accompanied by full prescribing information, which is commonly known as the FDA-approved manufacturer's labeling or product package insert.~~

~~**Positive Pressure Room:** A room that is at a higher pressure than the adjacent spaces and, therefore, the net airflow is *out of* the room.¹²~~

~~**Single-Dose Container:** (see *General Notices and Requirements* and ~~• (659) • (CN 1 May 2016)~~) A single-dose container is a single-unit container for articles (see *General Notices and Requirements*) or preparations intended for parenteral administration only. It is intended for a single use. A single-dose container is labeled as such. Examples of single-dose containers include prefilled syringes, cartridges, fusion-sealed containers, and closure-sealed containers when so-labeled.~~

~~**Segregated Compounding Area:** A designated space, either a demarcated area or room, that is restricted to preparing low-risk level CSPs with 12-hour or less BUD. Such area shall contain a device that provides unidirectional airflow of ISO Class 5 (see *Table 1*) air quality for preparation of CSPs and shall be void of activities and materials that are extraneous to sterile compounding.~~

~~**Sterilizing Grade Membranes:** Membranes that are documented to retain 100% of a culture of 10^7 microorganisms of a strain of *Brevundimonas (Pseudomonas) diminuta* per square centimeter of membrane surface under a pressure of not less than 30 psi (2.0 bar). Such filter membranes are nominally at 0.22 μm or 0.2 μm nominal pore size, depending on the manufacturer's practice.~~

~~**Sterilization by Filtration:** Passage of a fluid or solution through a sterilizing grade membrane to produce a sterile effluent.~~

~~**Terminal Sterilization:** The application of a lethal process (e.g., steam under pressure or autoclaving) to sealed containers for the purpose of achieving a predetermined sterility assurance level of usually less than 10^{-6} , or a probability of less than one in one million of a nonsterile unit.¹³~~

~~**Unidirectional Flow** (see footnote 3): An airflow moving in a single direction in a robust and uniform manner and at sufficient speed to reproducibly sweep particles away from the critical~~

~~processing or testing area.~~

APPENDICES

Appendix I. Principal Competencies, Conditions, Practices, and Quality Assurances That Are Required († “shall”) and Recommended († “should”) in USP Chapter (797)

<p>note—This tabular appendix selectively abstracts and condenses the full text of (797) for rapid reference only. Compounding personnel are responsible for reading, understanding and complying with the full text and all official USP terminology, content, and conditions therein.</p>
<p>—</p>
<p>INTRODUCTION</p>
<p>† Chapter purpose is to prevent harm and death to patients treated with CSPs.</p>
<p>† Chapter pertains to preparation, storage, and transportation, but not administration, of CSPs.</p>
<p>† Personnel and facilities to which (797) applies; therefore, for whom and which it may be enforced by regulatory and accreditation authorities.</p>
<p>† Types of preparations designated to be CSPs according to their physical forms, and their sites and routes of administration to patients.</p>
<p>† Compounding personnel must be meticulously conscientious to preclude contact contamination of CSPs both within and outside ISO Class 5 areas.</p>
<p>—</p>
<p>ORGANIZATION</p>
<p>† All compounding personnel shall be responsible for understanding fundamental practices and precautions within USP (797), for developing and implementing appropriate procedures, and for continually evaluating these procedures and the quality of final CSPs to prevent harm.</p>
<p>—</p>
<p>RESPONSIBILITY OF COMPOUNDING PERSONNEL</p>
<p>† Practices and quality assurances required to prepare, store, and transport CSPs that are sterile, and acceptably accurate, pure, and stable.</p>
<p>—</p>
<p>CSP MICROBIAL CONTAMINATION RISK LEVELS</p>
<p>† Proper training and evaluation of personnel, proper cleansing and garbing of personnel, proper cleaning and disinfecting of compounding work environments, and proper maintenance and monitoring of controlled environmental locations (all of which are detailed in their respective sections).</p>
<p>Low-Risk Level CSPs</p>

† Aseptic manipulations within an ISO Class 5 environment using three or fewer sterile products and entries into any container.
† In absence of passing sterility test, store not more than 48 hours at controlled room temperature, 14 days at cold temperature, and 45 days in solid frozen state at -25° to -10° or colder.
† Media fill test at least annually by compounding personnel.
Low-Risk Level CSPs with 12-Hour or Less BUD
† Fully comply with all four specific criteria.
† Sinks should not be located adjacent to the ISO Class 5 primary engineering control.
† Sinks should be separated from the immediate area of the ISO Class 5 primary engineering control device.
Medium-Risk Level CSPs
† Aseptic manipulations within an ISO Class 5 environment using prolonged and complex mixing and transfer, more than three sterile products and entries into any container, and pooling ingredients from multiple sterile products to prepare multiple CSPs.
† In absence of passing sterility test, store not more than 30 hours at controlled room temperature, 9 days at cold temperature, and 45 days in solid frozen state at -25° to -10° or colder.
† Media fill test at least annually by compounding personnel.
High-Risk Level CSPs
† Confirmed presence of nonsterile ingredients and devices, or confirmed or suspected exposure of sterile ingredients for more than one hour to air quality inferior to ISO Class 5 before final sterilization.
† Sterilization method verified to achieve sterility for the quantity and type of containers.
† Meet allowable limits for bacterial endotoxins.
† Maintain acceptable strength and purity of ingredients and integrity of containers after sterilization.
† In absence of passing sterility test, store not more than 24 hours at controlled room temperature, 3 days at cold temperature, and 45 days in solid frozen state at -25° to -10° or colder.
† Media fill test at least semiannually by compounding personnel.
-
PERSONNEL TRAINING AND EVALUATION IN ASEPTIC MANIPULATIONS SKILLS
† Pass didactic, practical skill assessment and media fill testing initially, followed by an annual assessment for a low- and medium-risk level compounding and semi-annual assessment for high-risk level compounding.
† Compounding personnel who fail written tests, or whose media fill test vials result in gross microbial colonization, shall be immediately re-instructed and re-evaluated by expert compounding personnel to ensure correction of all aseptic practice deficiencies.
-
IMMEDIATE-USE CSPs
† Fully comply with all six specified criteria.
-
SINGLE-DOSE AND MULTIPLE-DOSE CONTAINERS
† Beyond use date 28 days, unless specified otherwise by the manufacturer, for closure sealed multiple-dose containers after initial opening or entry.

† Beyond use time of 6 hours, unless specified otherwise by the manufacturer, for closure sealed single dose containers in ISO Class 5 or cleaner air after initial opening or entry.
† Beyond use time of 1 hour for closure sealed single dose containers after being opened or entered in worse than ISO Class 5 air.
† Storage of opened single dose ampuls is not permitted.
-
HAZARDOUS DRUGS AS CSPs
† Appropriate personnel protective equipment.
† Appropriate primary engineering controls (BSCs and CACIs) are used for concurrent personnel protection and exposure of critical sites.
† Hazardous drugs shall be stored separately from other inventory in a manner to prevent contamination and personnel exposure.
† At least 0.01 inch water column negative pressure and 12 air changes per hour in non-cleanrooms in which CACIs are located.
† Hazardous drugs shall be handled with caution at all times using appropriate chemotherapy gloves during receiving, distribution, stocking, inventorying, preparing for administration, and disposal.
† Hazardous drugs shall be prepared in an ISO Class 5 environment with protective engineering controls in place, and following aseptic practices specified for the appropriate contamination risk levels.
† Access to drug preparation areas shall be limited to authorized personnel.
† A pressure indicator shall be installed that can readily monitor room pressurization, which is documented daily.
† Annual documentation of full training of personnel regarding storage, handling, and disposal of hazardous drugs.
† When used, a CSTD shall be used in an ISO Class 5 primary engineering control device.
† At least 0.01 inch water column negative pressure is required for compounding of hazardous drugs.
† Negative pressure buffer area is not required for low volume compounding operations when CSTD is used in BSC or CACI.
† Compounding personnel of reproductive capability shall confirm in writing that they understand the risks of handling hazardous drugs.
† Disposal of all hazardous drug wastes shall comply with all applicable federal and state regulations.
† Total external exhaust of primary engineering controls.
† Assay of surface wipe samples every 6 months.
-
RADIOPHARMACEUTICALS AS CSPs
† Positron Emission Tomography is according to USP chapter (823).
† Appropriate primary engineering controls and radioactivity containment and shielding.

<p>† Radiopharmaceuticals compounded from sterile components, in closed sterile containers, with volume of 100 mL or less for a single dose injection or not more than 30 mL taken from a multiple dose container shall be designated as and conform to the standards for low risk level CSPs.</p>
<p>† Radiopharmaceutical vials, designed for multi use, compounded with technetium-99m, exposed to ISO Class 5 environment and punctured by needles with no direct contact contamination may be used up to the time indicated by manufacturers' recommendations.</p>
<p>† Location of primary engineering controls permitted in ISO Class 8 controlled environment.</p>
<p>† Technetium-99m/Molybdenum-99 generators used according to manufacturer, state, and federal requirements.</p>
<p>† Radiopharmaceuticals prepared as low risk level CSPs with 12 hour or less BUD shall be prepared in a segregated compounding area.</p>
<p>† Materials and garb exposed in patient care and treatment area shall not cross a line of demarcation into the segregated compounding area.</p>
<p>† Technetium-99m/Molybdenum-99 generators must be eluted in ISO Class 8 conditions.</p>
<p>† Segregated compounding area will be designated with a line of demarcation.</p>
<p>† Storage and transport of properly shielded vials of radiopharmaceutical CSPs may occur in a limited access ambient environment without a specific ISO class designation.</p>
<p>-</p>
<p>ALLERGEN EXTRACTS AS CSPs</p>
<p>† Allergen extracts as CSPs are not subject to the personnel, environmental, and storage requirements for all CSP Microbial Contamination Risk Levels when certain criteria are met.</p>
<p>-</p>
<p>VERIFICATION OF COMPOUNDING ACCURACY AND STERILITY</p>
<p>† Review labels and document correct measurements, aseptic manipulations, and sterilization procedures to confirm correct identity, purity, and strength of ingredients in, and sterility of, CSPs.</p>
<p>† Assay finished CSPs to confirm correct identity and, or, strength of ingredients.</p>
<p>† Sterility test finished CSPs.</p>
<p>Sterilization Methods</p>
<p>† Verify that methods achieve sterility while maintaining appropriate strength, purity, quality, and packaging integrity.</p>
<p>† Prove effectiveness by USP chapter (71), equivalent, or superior sterility testing.</p>
<p>Sterilization of High-Risk Level CSPs by Filtration</p>
<p>† Nominal 0.2 µm pore size sterile membranes that are chemically and physically compatible with the CSP.</p>
<p>† Complete rapidly without filter replacement.</p>
<p>† Subject filter to manufacturer's recommended integrity test (e.g., bubble point test) after filtering CSPs.</p>
<p>Sterilization of High-Risk Level CSPs by Steam</p>
<p>† Test to verify the mass of containers to be sterilized will be sterile after the selected exposure duration in the particular autoclave.</p>
<p>† Ensure live steam contacts all ingredients and surfaces to be sterilized.</p>

† Pass solutions through a 1.2-µm or smaller nominal pore size filter into final containers to remove particulates before sterilization.
† Heated filtered air shall be evenly distributed throughout the chamber by a blower device.
† Dry heat shall only be used for those materials that cannot be sterilized by steam, when the moisture would either damage or be impermeable to the materials.
† Sufficient space shall be left between materials to allow for good circulation of the hot air.
† The description of dry heat sterilization conditions and duration for specific CSPs shall be included in written documentation in the compounding facility. The effectiveness of dry heat sterilization shall be verified using appropriate biological indicators and other confirmation.
† The oven should be equipped with a system for controlling temperature and exposure period.
Depyrogenation by Dry Heat
† Dry heat depyrogenation shall be used to render glassware or containers, such as vials free from pyrogens as well as viable microbes.
† The description of the dry heat depyrogenation cycle and duration for specific load items shall be included in written documentation in the compounding facility.
† The effectiveness of the dry heat depyrogenation cycle shall be verified using endotoxin challenge vials (ECVs).
† The bacterial endotoxin test should be performed on the ECVs to verify the cycle is capable of achieving a 3-log reduction in endotoxin.
-
ENVIRONMENTAL QUALITY AND CONTROL
Exposure of Critical Sites
† ISO Class 5 or better air.
† Preclude direct contact (e.g., touch and secretions) contamination.
ISO Class 5 Air Sources, Buffer Areas, and Ante-Areas
† A buffer area is an area that provides at least ISO Class 7 air quality.
† New representations of facility layouts.
† Each compounding facility shall ensure that each source of ISO Class 5 environment for exposure of critical sites and sterilization by filtration is properly located, operated, maintained, monitored, and verified.
† Devices (e.g., computers and printers) and objects (e.g., carts and cabinets) can be placed in buffer areas and shall be verified by testing or monitoring.
Viable and Nonviable Environmental Sampling (ES) Testing
† Environmental sampling shall occur as part a comprehensive quality management program and shall occur minimally when several conditions exist.
† The ES program should provide information to staff and leadership to demonstrate that the engineering controls are maintaining an environment within the compounding area that consistently maintains acceptably low viable and nonviable particle levels.
Environmental Nonviable Particle Testing Program
† Certification and testing of primary (LAFWs, BSCs, CAIs and CACIs) and secondary engineering controls (buffer and ante areas) shall be performed by a qualified individual no less than every six months and whenever the device or room is relocated, altered, or major service to the facility is performed. Certification procedures such as those outlined in the CETA Certification Guide for Sterile Compounding Facilities (CAG-003-2006) shall be used.
Total Particle Counts

<p>† Certification that each ISO classified area (e.g., ISO Class 5, 7 and 8) is within established guidelines shall be performed no less than every 6 months and whenever the LAFW, BSC, CAI, or CACI is relocated or the physical structure of the buffer room or ante-area has been altered.</p>
<p>† Testing shall be performed by qualified operators using current, state-of-the-art electronic equipment with results meeting ISO Class 5, 7, or 8 depending on the requirements of the area.</p>
<p>† All certification records shall be maintained and reviewed by supervising personnel or other designated employee to ensure that the controlled environments comply with the proper air cleanliness, room pressures, and air changes per hour.</p>
<p>Pressure Differential Monitoring</p>
<p>† A pressure gauge or velocity meter shall be installed to monitor the pressure differential or airflow between the buffer area and ante-area, and the ante-area and the general environment outside the compounding area.</p>
<p>† The results shall be reviewed and documented on a log at least every work shift (minimum frequency shall be at least daily) or by a continuous recording device.</p>
<p>† The pressure between the ISO Class 7 and general pharmacy area shall not be less than 5 Pa (0.02 inch water column (w.c.)).</p>
<p>† In facilities where low- and medium-risk level CSPs are prepared, differential airflow shall maintain a minimum velocity of 0.2 meter/second (40 fpm) between buffer area and ante-area.</p>
<p>Environmental Viable Airborne Particle Testing Program—Sampling Plan</p>
<p>† An appropriate environmental sampling plan shall be developed for airborne viable particles based on a risk assessment of compounding activities performed.</p>
<p>† Selected sampling sites shall include locations within each ISO Class 5 environment and in the ISO Class 7 and 8 areas, and the segregated compounding areas at greatest risk of contamination (e.g., work areas near the ISO Class 5 environment, counters near doors, pass-through boxes).</p>
<p>† The plan shall include sample location, method of collection, frequency of sampling, volume of air sampled, and time of day as related to activity in the compounding area and action levels.</p>
<p>† It is recommended that compounding personnel refer to USP Chapter <i>Microbiological Control and Monitoring of Aseptic Processing Environments</i> (1116) and the CDC Guidelines for Environmental Infection Control in Healthcare Facilities 2003 for more information.</p>
<p>Growth Media</p>
<p>† A general microbiological growth medium such as Soybean Casein Digest Medium (also known as trypticase soy broth (TSB) or agar (TSA)) shall be used to support the growth of bacteria.</p>
<p>† Malt extract agar (MEA) or some other media that supports the growth of fungi shall be used in high-risk level compounding environments.</p>
<p>† Media used for surface sampling shall be supplemented with additives to neutralize the effects of disinfecting agents (e.g., TSA with lecithin and polysorbate 80).</p>
<p>Viable Air Sampling</p>
<p>† Evaluation of airborne microorganisms using volumetric collection methods in the controlled air environments shall be performed by properly trained individuals for all compounding risk levels.</p>

<p>† Impaction shall be the preferred method of volumetric air sampling.</p>
<p>† For low-, medium-, and high-risk level compounding, air sampling shall be performed at locations that are prone to contamination during compounding activities and during other activities like staging, labeling, gowning, and cleaning.</p>
<p>† Locations shall include zones of air backwash turbulence within laminar airflow workbench and other areas where air backwash turbulence may enter the compounding area.</p>
<p>† For low-risk level CSPs with 12-hour or less BUD, air sampling shall be performed at locations inside the ISO Class 5 environment and other areas that are in close proximity to the ISO class 5 environment, during the certification of the primary engineering control.</p>
<p>† Consideration should be given to the overall effect the chosen sampling method will have on the unidirectional airflow within a compounding environment.</p>
<p>Air Sampling Devices</p>
<p>† The instructions in the manufacturer's user manual for verification and use of electric air samplers that actively collect volumes of air for evaluation shall be followed.</p>
<p>† A sufficient volume of air (400–1000 liters) shall be tested at each location in order to maximize sensitivity.</p>
<p>† It is recommended that compounding personnel also refer to USP Chapter (1116), which can provide more information on the use of volumetric air samplers and volume of air that should be sampled to detect environmental bioburden excursions.</p>
<p>Air Sampling Frequency and Process</p>
<p>† Air sampling shall be performed at least semiannually (i.e. every 6 months), as part of the re-certification of facilities and equipment for area where primary engineering controls are located.</p>
<p>† A sufficient volume of air shall be sampled and the manufacturer's guidelines for use of the electronic air sampling equipment followed.</p>
<p>† Any facility construction or equipment servicing may require the need to perform air sampling during these events.</p>
<p>Incubation Period</p>
<p>† The microbial growth media plates used to collect environmental sampling are recovered, covers secured (e.g., taped), inverted, and incubated at a temperature and for a time period conducive to multiplication of microorganisms.</p>
<p>† The number of discrete colonies of microorganisms shall be counted and reported as colony-forming units (cfu) and documented on an environmental monitoring form. Counts from air monitoring need to be transformed into cfu/cubic meter of air and evaluated for adverse trends.</p>
<p>† TSA should be incubated at 35° ± 2° for 2–3 days.</p>
<p>† MEA or other suitable fungal media should be incubated at 28° ± 2° for 5–7 days.</p>
<p>Action Levels, Documentation and Data Evaluation</p>
<p>† Sampling data shall be collected and reviewed on a periodic basis as a means of evaluating the overall control of the compounding environment.</p>
<p>† Competent microbiology personnel shall be consulted if an environmental sampling consistently shows elevated levels of microbial growth.</p>
<p>† An investigation into the source of the environmental contamination shall be conducted.</p>

<p>† Any cfu count that exceeds its respective action level should prompt a re-evaluation of the adequacy of personnel work practices, cleaning procedures, operational procedures, and air filtration efficiency within the aseptic compounding location.</p>
<p>† Table titled, Recommended Action Levels for Microbial Contamination should only be used as a guideline</p>
<p>Facility Design and Environmental Controls</p>
<p>† Compounding facilities are physically designed and environmentally controlled to minimize airborne contamination from contacting critical sites.</p>
<p>† Compounding facilities shall provide a comfortable and well-lighted working environment, which typically includes a temperature of 20° or cooler to maintain comfortable conditions for compounding personnel when attired in the required aseptic compounding garb.</p>
<p>† Primary engineering controls provide unidirectional (i.e., laminar) HEPA air at a velocity sufficient to prevent airborne particles from contacting critical sites.</p>
<p>† In-situ air pattern analysis via smoke studies shall be conducted at the critical area to demonstrate unidirectional airflow and sweeping action over and away from the product under dynamic conditions.</p>
<p>† Policies and procedures for maintaining and working within the primary engineering control area shall be written and followed. The policies and procedures will be determined by the scope and risk levels of the aseptic compounding activities used during the preparation of the CSPs.</p>
<p>† The principles of HEPA filtered unidirectional airflow in the work environment shall be understood and practiced in the compounding process in order to achieve the desired environmental conditions.</p>
<p>† Clean rooms for nonhazardous and nonradioactive CSPs are supplied with HEPA that enters from ceilings with return vents low on walls, and that provides not less than 30 air changes per hour.</p>
<p>† Buffer areas maintain 0.02 to 0.05 inch water column positive pressure, and do not contain sinks or drains.</p>
<p>† Air velocity from buffer rooms or zones to ante-areas is at least 40 feet/minute.</p>
<p>† The primary engineering controls shall be placed within a buffer area in such a manner as to avoid conditions that could adversely affect their operation.</p>
<p>† The primary engineering controls shall be placed out of the traffic flow and in a manner to avoid disruption from the HVAC system and room cross-drafts.</p>
<p>† HEPA filtered supply air shall be introduced at the ceiling.</p>
<p>† All HEPA filters shall be efficiency tested using the most penetrating particle size and shall be leak tested at the factory and then leak tested again in situ after installation.</p>
<p>† Activities and tasks carried out within the buffer area shall be limited to only those necessary when working within a controlled environment.</p>
<p>† Only the furniture, equipment, supplies, and other material required for the compounding activities to be performed shall be brought into the room.</p>
<p>† Surfaces and essential furniture in buffer rooms or zones and clean rooms shall be nonporous, smooth, nonshedding, impermeable, cleanable, and resistant to disinfectants.</p>
<p>† The surfaces of ceilings, walls, floors, fixtures, shelving, counters, and cabinets in the buffer area shall be smooth, impervious, free from cracks and crevices, and nonshedding, thereby promoting cleanability, and minimizing spaces in which microorganisms and other contaminants may accumulate.</p>
<p>† The surfaces shall be resistant to damage by disinfectant agents.</p>

† Juncitures of ceilings to walls shall be covered or caulked to avoid cracks and crevices where dirt can accumulate.
† Ceiling tiles shall be caulked around each perimeter to seal them to the support frame.
† The exterior lens surface of ceiling lighting fixtures shall be smooth, mounted flush, and sealed.
† Any other penetrations through the ceiling or walls shall be sealed.
† The buffer area shall not contain sources of water (sinks) or floor drains. Work surfaces shall be constructed of smooth, impervious materials, such as stainless steel or molded plastic, so that they are easily cleaned and disinfected.
† Carts shall be of stainless steel wire, nonporous plastic, or sheet metal construction with good quality, cleanable casters to promote mobility.
† Storage shelving, counters, and cabinets shall be smooth, impervious, free from cracks and crevices, nonshedding, cleanable, and disinfectable.
† Their number, design, and manner of installation the itmes above shall promote effective cleaning and disinfection.
† If ceilings consist of inlaid panels, the panels should be impregnated with a polymer to render them impervious and hydrophobic.
† Dust collecting overhangs, such as ceiling utility pipes, or ledges, such as windowsills, should be avoided.
† Air returns should be mounted low on the wall creating a general top-down dilution of room air with HEPA filtered make-up air.
Placement of Primary Engineering Controls Within ISO Class 7 Buffer Areas
† Primary engineering controls for nonhazardous and nonradioactive CSPs are located in buffer areas, except for CAIs that are proven to maintain ISO Class 5 air when particle counts are sampled 6 to 12 inches upstream of critical site exposure areas during performance of normal inward and outward transfer of materials, and compounding manipulations when such CAIs are located in air quality worse than ISO Class 7.
† Presterilization procedures for high-risk level CSPs, such as weighing and mixing, shall be completed in no worse than an ISO Class 8 environment.
† Primary engineering controls shall be located out of traffic patterns and away from room air currents that could disrupt the intended airflow patterns.
† When isolators are used for sterile compounding, the recovery time to achieve ISO Class 5 air quality shall be documented and internal procedures developed to ensure that adequate recovery time is allowed after material transfer before and during compounding operations.
† When compounding activities require the manipulation of a patient's blood-derived or other biological material (e.g., radiolabeling a patient's or a donor's white blood cells), the manipulations shall be clearly separated from routine material handling procedures and equipment used in CSP preparation activities, and they shall be controlled by specific standard operating procedures in order to avoid any cross-contamination.
† Food, drinks, and items exposed in patient care areas, and unpacking of bulk supplies and personnel cleansing and garbing are prohibited from buffer areas or rooms.
† Demarcation designation between buffer areas or rooms and ante-areas.
† Antiseptic hand cleansing and sterile gloves in buffer areas or rooms.
† Packaged compounding supplies and components, such as needles, syringes, tubing sets, and small and large volume parenterals, should be uncartoned and wiped down with a disinfectant that does not leave a residue (e.g., sterile 70% IPA) when possible in an ante-area, of ISO Class 8 air quality, before being passed into the buffer areas.
Cleaning and Disinfecting the Sterile Compounding Areas

<p>† Trained personnel write detailed procedures including cleansers, disinfectants, and non-shedding wipe and mop materials.</p>
<p>† Cleaning and disinfecting surfaces in the LAFWs, BSCs, CAIs, and CACIs shall be cleaned and disinfected frequently, including at the beginning of each work shift, before each batch preparation is started, every 30 minutes during continuous compounding periods of individual CSPs, when there are spills, and when surface contamination is known or suspected from procedural breaches.</p>
<p>† Trained compounding personnel are responsible for developing, implementing, and practicing the procedures for cleaning and disinfecting the DCAs written in the SOPs.</p>
<p>† Cleaning and disinfecting shall occur before compounding is performed. Items shall be removed from all areas to be cleaned, and surfaces shall be cleaned by removing loose material and residue from spills, e.g., water-soluble solid residues are removed with Sterile Water (for Injection or Irrigation) and low-shedding wipes. This shall be followed by wiping with a residue-free disinfecting agent, such as sterile 70% IPA, which is allowed to dry before compounding begins.</p>
<p>† Work surfaces in ISO Class 7 and 8 areas and segregated compounding areas are cleaned at least daily.</p>
<p>† Dust and debris shall be removed when necessary from storage sites for compounding ingredients and supplies, using a method that does not degrade the ISO Class 7 or 8 air quality.</p>
<p>† Floors in ISO Class 7 and 8 areas are cleaned daily when no compounding occurs.</p>
<p>† IPA (70% isopropyl alcohol) remains on surfaces to be disinfected for at least 30 seconds before such surfaces are used to prepare CSPs.</p>
<p>† Emptied shelving, walls, and ceilings in ante-areas are cleaned and disinfected at least monthly.</p>
<p>† Mopping shall be performed by trained personnel using approved agents and procedures described in the written SOPs.</p>
<p>† Cleaning and disinfecting agents, their schedules of use and methods of application shall be in accordance with written SOPs and followed by custodial and/or compounding personnel.</p>
<p>† All cleaning materials, such as wipers, sponges, and mops, shall be nonshedding, preferably composed of synthetic micro fibers, and dedicated to use in the buffer area, or ante-area, and segregated compounding areas and shall not be removed from these areas except for disposal.</p>
<p>† If cleaning materials are reused (e.g., mops), procedures shall be developed (based on manufacturer recommendations) that ensure that the effectiveness of the cleaning device is maintained and repeated use does not add to the bioburden of the area being cleaned.</p>
<p>† Supplies and equipment removed from shipping cartons shall be wiped with a suitable disinfecting agent (e.g., sterile 70% IPA) delivered from a spray bottle or other suitable delivery method.</p>
<p>† After the disinfectant is sprayed or wiped on a surface to be disinfected, the disinfectant shall be allowed to dry, and during this time the item shall not be used for compounding purposes.</p>
<p>† Sterile 70% IPA wetted gauze pads or other particle-generating material shall not be used to disinfect the sterile entry points of packages and devices.</p>
<p>Personnel Cleansing and Garbing</p>
<p>† Personnel shall also be thoroughly competent and highly motivated to perform flawless aseptic manipulations with ingredients, devices, and components of CSPs.</p>

<p>† Personnel with rashes, sunburn, weeping sores, conjunctivitis, active respiratory infection, and cosmetics are prohibited from preparing CSPs.</p>
<p>† Compounding personnel shall remove personal outer garments; cosmetics; artificial nails; hand, wrist, and body jewelry that can interfere with the fit of gowns and gloves; and visible body piercing above the neck.</p>
<p>† Order of compounding garb and cleansing in ante-area: shoes or shoe covers, head and facial hair covers, face mask, fingernail cleansing, hand and forearm washing and drying; non-shedding gown.</p>
<p>† Order of cleansing and gloving in buffer room or area: hand cleansing with a persistently active alcohol-based product with persistent activity; allow hands to dry; don sterile gloves.</p>
<p>† Routinely disinfect gloves with sterile 70% IPA after contacting nonsterile objects.</p>
<p>† Inspect gloves for holes and replace when breaches are detected.</p>
<p>† Personnel repeat proper procedures after they are exposed to direct contact contamination or worse than ISO Class 8 air.</p>
<p>† These requirements are exempted only for immediate use CSPs and CAIs for which manufacturers provide written documentation based on validated testing that such personnel practices are not required to maintain sterility in CSPs.</p>
<p>-</p>
<p>Personnel Training and Competency Evaluation of Garbing, Aseptic Work Practices and Cleaning/Disinfection Procedures</p>
<p>† Personnel who prepare CSPs shall be trained conscientiously and skillfully by expert personnel, multi-media instructional sources, and professional publications in the theoretical principles and practical skills of garbing procedures, aseptic work practices, achieving and maintaining ISO Class 5 environmental conditions, and cleaning and disinfection procedures.</p>
<p>† This training shall be completed and documented before any compounding personnel begin to prepare CSPs.</p>
<p>† Compounding personnel shall complete didactic training, pass written competence assessments, undergo skill assessment using observational audit tools, and media fill testing.</p>
<p>† Media fill testing of aseptic work skills shall be performed initially before beginning to prepare CSPs and at least annually thereafter for low and medium risk level compounding; and semiannually for high risk level compounding.</p>
<p>† Compounding personnel who fail written tests, observational audits, or whose media fill test vials have one or more units showing visible microbial contamination, shall be reinstructed and re-evaluated by expert compounding personnel to ensure correction of all aseptic work practice deficiencies.</p>
<p>† Compounding personnel shall pass all evaluations prior to resuming compounding of sterile preparations.</p>
<p>† Compounding personnel must demonstrate proficiency of proper hand hygiene, garbing, and consistent cleaning procedures in addition to didactic evaluation and aseptic media fill.</p>
<p>† Cleaning and disinfecting procedures performed by other support personnel shall be thoroughly trained in proper hand hygiene, and garbing, cleaning, and disinfection procedures by a qualified aseptic compounding expert.</p>
<p>† Support personnel shall routinely undergo performance evaluation of proper hand hygiene, garbing, and all applicable cleaning and disinfecting procedures conducted by a qualified aseptic compounding expert.</p>
<p>Competency Evaluation of Garbing and Aseptic Work Practices</p>

<p>‡ Compounding personnel shall be evaluated initially prior to beginning compounding CSPs and whenever an aseptic media fill is performed using a Sample Form for Assessing Hand Hygiene and Garbing Related Practices of Compounding Personnel and the personnel glove fingertip sampling procedures.</p>
<p>Aseptic Work Practice Assessment and Evaluation via Personnel Glove Fingertip Sampling</p>
<p>‡ Monitoring of compounding personnel glove fingertips shall be performed for all CSP risk level compounding.</p>
<p>‡ Glove fingertip sampling shall be used to evaluate the competency of personnel in performing hand hygiene and garbing procedures in addition to educating compounding personnel on proper work practices.</p>
<p>‡ All personnel shall demonstrate competency in proper hand hygiene and garbing procedures in addition to aseptic work practices.</p>
<p>‡ Sterile contact agar plates shall be used to sample the gloved fingertips of compounding personnel after garbing to assess garbing competency and after completing the media fill preparation.</p>
<p>‡ Gloves shall not be disinfected with sterile 70% IPA immediately prior to sampling.</p>
<p>Garbing and Gloving Competency Evaluation</p>
<p>‡ Compounding personnel shall be visually observed during the process of performing hand hygiene and garbing procedures.</p>
<p>‡ The visual observation shall be documented on a Sample Form for Assessing Hand Hygiene and Garbing Related Practices of Compounding Personnel and maintained to provide a permanent record of and long term assessment of personnel competency.</p>
<p>Gloved Fingertip Sampling</p>
<p>‡ Immediately after the compounder completes the hand hygiene and garbing procedure, the evaluator shall collect a gloved fingertip and thumb sample from both hands of the compounder onto appropriate agar plates by lightly pressing each finger tip into the agar.</p>
<p>‡ The plates shall be incubated for the appropriate incubation period and at the appropriate temperature.</p>
<p>‡ All employees shall successfully complete an initial competency evaluation and gloved fingertip/thumb sampling procedure (0 cfu) no less than three times before initially being allowed to compound CSPs for human use.</p>
<p>‡ After completing the initial gowning and gloving competency evaluation, re-evaluation of all compounding personnel shall occur at least annually for low- and medium-risk level CSPs and semiannually for high-risk level CSPs before being allowed to continue compounding CSPs.</p>
<p>‡ Gloves shall not be disinfected with sterile 70% IPA prior to testing.</p>
<p>‡ The sampled gloves shall be immediately discarded and proper hand hygiene performed after sampling. The nutrient agar plates shall be incubated as stated below.</p>
<p>‡ The cfu action level for gloved hands shall be based on the total number of cfu on both gloves and not per hand.</p>
<p>‡ Results should be reported separately as number of cfu per employee per hand (left hand, right hand).</p>
<p>Incubation Period</p>
<p>‡ At the end of the designated sampling period, the agar plates are recovered, covers secured, inverted and incubated at a temperature and for a time period conducive to multiplication of microorganisms. Trypticase soy agar (TSA) with lecithin and polysorbate 80 shall be incubated at 35°± 2° for 2-3 days.</p>

Aseptic Manipulation Competency Evaluation
† All compounding personnel shall have their aseptic technique and related practice competency evaluated initially during the media fill test procedure and subsequent annual or semiannual media fill test procedures on the Sample Form for Assessing Aseptic Technique and Related Practices of Compounding Personnel.
Media-Fill Test Procedure
† The skill of personnel to aseptically prepare CSPs shall be evaluated using sterile fluid bacterial culture media fill verification.
† Media-filled vials shall be incubated within a range of 35° ± 2° for 14 days.
Surface Cleaning and Disinfection Sampling and Assessment
† Surface sampling shall be performed in all ISO-classified areas on a periodic basis and can be accomplished using contact plates and/or swabs and shall be done at the conclusion of compounding.
† Locations to be sampled shall be defined in a sample plan or on a form.
Cleaning and Disinfecting Competency Evaluation
† Compounding personnel and other personnel responsible for cleaning shall be visually observed during the process of performing cleaning and disinfecting procedures during initial personnel training on cleaning procedures, changes in cleaning staff and at the completion of any Media-Fill Test Procedure.
† Visual observation shall be documented on a Sample Form for Assessing Cleaning and Disinfection Procedures and maintained to provide a permanent record of, and long-term assessment of, personnel competency.
Surface Collection Methods
† Immediately after sampling a surface with the contact plate, the sampled area shall be thoroughly wiped with a non-shedding wipe soaked in sterile 70% IPA.
† Results should be reported as cfu per unit of surface area.
Action Levels, Documentation, and Data Evaluation
† Environmental sampling data shall be collected and reviewed on a routine basis as a means of evaluating the overall control of the compounding environment.
† If an activity consistently shows elevated levels of microbial growth, competent microbiology personnel shall be consulted.
† An investigation into the source of the contamination shall be conducted.
† When gloved fingertip sample results exceeds action levels after proper incubation, a review of hand hygiene and garbing procedures as well as glove and surface disinfection procedures and work practices shall be performed and documented.
† Any cfu count that exceeds its respective action level should prompt a re-evaluation of the adequacy of personnel work practices, cleaning procedures, operational procedures, and air filtration efficiency within the aseptic compounding location.
-
SUGGESTED STANDARD OPERATING PROCEDURES
† All facilities are required to have these, and they must include at least the items enumerated in this section.
-
FINISHED PREPARATION RELEASE CHECKS AND TESTS
Inspection of Solution Dosage Forms and Review of Compounding Procedures

<p>‡ Review procedures and documents to ensure sterility, purity, correct identities and amounts of ingredients, and stability.</p>
<p>‡ Visually inspect for abnormal particulate matter and color, and intact containers and seals.</p>
<p>Sterility Testing</p>
<p>‡ High-risk level CSPs prepared in batches of more than 25 identical containers, or exposed longer than 12 hours at 2° to 8°, and 6 hours at warmer than 8° before being sterilized.</p>
<p>Bacterial Endotoxin (Pyrogen) Testing</p>
<p>‡ High-risk level CSPs, excluding those for inhalation and ophthalmic administration, prepared in batches of more than 25 identical containers, or exposed longer than 12 hours at 2° to 8°, and 6 hours at warmer than 8°, before being sterilized.</p>
<p>Identity and Strength Verification of Ingredients</p>
<p>‡ Written procedures to verify correct identity, quality, amounts, and purities of ingredients used in CSPs.</p>
<p>‡ Written procedures to ensure labels of CSPs contain correct names and amounts or concentrations of ingredients, total volumes, beyond-use dates, storage conditions, and route(s) of administration.</p>
<p>-</p>
<p>STORAGE AND BEYOND-USE DATING</p>
<p>Determining Beyond-Use Dates</p>
<p>‡ Use the general criteria in USP (795) in the absence of direct stability-indicating assays or authoritative literature that supports longer durations.</p>
<p>-</p>
<p>MAINTAINING STERILITY, PURITY, AND STABILITY OF DISPENSED AND DISTRIBUTED CSPs</p>
<p>‡ Written procedures for proper packaging, storage, and transportation conditions to maintain sterility, quality, purity, and strength of CSPs.</p>
<p>Redispensed CSPs</p>
<p>‡ When sterility, and acceptable purity, strength, and quality can be ensured.</p>
<p>‡ Assignment of sterility storage times and stability beyond-use dates that occur later than those of originally dispensed CSPs must be based on results of sterility testing and quantitative assay of ingredients.</p>
<p>Packaging and Transporting CSPs</p>
<p>‡ Packaging maintains physical integrity, sterility, stability, and purity of CSPs.</p>
<p>‡ Modes of transport that maintain appropriate temperatures and prevent damage to CSPs.</p>
<p>-</p>
<p>PATIENT OR CAREGIVER TRAINING</p>
<p>‡ Multiple component formal training program to ensure patients and caregivers understand the proper storage, handling, use, and disposal of CSPs.</p>
<p>-</p>
<p>PATIENT MONITORING AND ADVERSE EVENTS REPORTING</p>

† Written standard procedures describe means for patients to ask questions and report concerns and adverse events with CSPs, and for compounding supervisors to correct and prevent future problems.
† Adverse events and defects with CSPs reported to FDA's MedWatch and USP's MEDMARX programs.
-
GLOSSARY
† Twenty-eight terms are defined and integral to complying with USP (797).

Appendix II. Common Disinfectants Used in Health Care for Inanimate Surfaces and Noncritical Devices, and Their Microbial Activity and Properties¹

Chemical Category of Disinfectant							
		Isopropyl alcohol	Accelerated hydrogen peroxide	Quaternary Ammonium (e.g., dodecyl dimethyl ammonium chloride)	Phenolics	Chlorine (e.g., sodium hypochlorite)	Iodophors (e.g., povidone-iodine)
Concentration Used	-	60-95%	0.5% ³	0.4-1.6% aq	0.4-1.6% aq	100-5000 ppm	30-50 ppm
Microbial Inactivation ²	Bacteria	+	+	+	+	+	+
	Lipophilic viruses	+	+	+	+	+	+
	Hydrophilic viruses	±	+	±	±	+	±
	M. tuberculosis	+	+	±	+	+	±
	Mycotic agents (fungi)	+	+	+	+	+	±
Important Chemical & Physical Properties	Bacterial Spores	-	-	-	-	+	-
	Shelf life > 1 week	+	+	+	+	+	+
	Corrosive or deleterious effects	±	-	-	-	±	±
	Non-evaporable residue	-	-	+	+	-	+
	Inactivated by organic matter	+	±	+	±	+	+
	Skin irritant	±	-	+	+	+	±
	Eye irritant	+	-	+	+	+	+
Respiratory irritant	-	-	-	-	+	-	
Systemic toxicity	+	-	-	+	+	+	+

Key to abbreviation and symbols: aq = diluted with water; ppm = parts per million; + = yes; - = no; ± = variable results.

¹ Modified from World Health Organization, Laboratory Bio-Safety Manual 1983 and Rutala WA, "Antisepsis, disinfection and sterilization in the hospital and related institutions," *Manual of Clinical Microbiology*, American Society for Microbiology, Washington, DC, 1995, pages 227-245.

² Inactivation of the most common microorganisms (i.e., bacteria) occurs with a contact time of ≤1 minute; inactivation of spores requires longer contact times (e.g., 5-10 minutes for 5,000 ppm chlorine solution against *C. difficile* spores). Reference: Perez J, Springthorpe VS, Sattar SA, "Activity of selected oxidizing microbicides against the spores of *Clostridium difficile*: Relevance to environmental control," *American Journal of Infection Control*, August 2005, pages 320-325.

³ Accelerated hydrogen peroxide is a new generation of hydrogen peroxide-based germicides in which the potency and performance of the active ingredient have been enhanced and accelerated through the use of appropriate acids and detergents.

Appendix III. Sample Form for Assessing Hand Hygiene and Garbing Related Practices of Compounding Personnel

-	
Printed name and position/title of person assessed:	-
Name of facility or location:	-
-	
Hand Hygiene and Garbing Practices: The qualified evaluator will check each space for which the person being assessed has acceptably completed the described activity, prints N/A if the activity is not applicable to the assessment session or N/O if the activity was not observed.*	

-	-	
-	Presents in a clean appropriate attire and manner.	
-	Wears no cosmetics or jewelry (watches, rings, earrings, etc. piercing jewelry included) upon entry into ante areas.	
-	Brings no food or drinks into or stored in the ante areas or buffer areas.	
-	Is aware of the line of demarcation separating clean and dirty sides and observes required activities.	
-	Dons shoe covers or designated clean area shoes one at a time, placing the covered or designated shoe on clean side of the line of demarcation, as appropriate.	
-	Dons beard cover if necessary.	
-	Dons head cover assuring that all hair is covered.	
-	Dons face mask to cover bridge of nose down to include chin.	
-	Performs hand hygiene procedure by wetting hands and forearms and washing using soap and warm water for at least 30 seconds.	
-	Dries hands and forearms using lint free towel or hand dryer.	
-	Selects the appropriate sized gown examining for any holes, tears, or other defects.	
-	Dons gown and ensures full closure.	
-	Disinfects hands again using a waterless alcohol based surgical hand scrub with persistent activity and allows hands to dry thoroughly before donning sterile gloves.	
-	Dons appropriate sized sterile gloves ensuring that there is a tight fit with no excess glove material at the fingertips.	
-	Examines gloves ensuring that there are no defects, holes, or tears.	
-	While engaging in sterile compounding activities, routinely disinfects gloves with sterile 70% IPA prior to work in the direct compounding area (DCA) and after touching items or surfaces that may contaminate gloves.	
-	Removes PPE on the clean side of the ante area.	
-	Removes gloves and performs hand hygiene.	
-	Removes gown and discards it, or hangs it on hook if it is to be reused within the same work day.	
-	Removes and discards mask, head cover, and beard cover (if used).	
-	Removes shoe covers or shoes one at a time, ensuring that uncovered foot is placed on the dirty side of the line of demarcation and performs hand hygiene again. (Removes and discards shoe covers every time the compounding area is exited).	
-		
*The person assessed is immediately informed of all unacceptable activities (i.e., spaces lacking check marks, N/A, or N/O) and shown and informed of specific corrections.

Appendix IV. Sample Form for Assessing Aseptic Technique and Related Practices of Compounding Personnel

-	
Printed name and position/title of person assessed:	-
Name of facility or location:	-
-	
<p>Aseptic Technique, Safety, and Quality Assurance Practices: The qualified evaluator checks each space for which the person being assessed has acceptably completed the described activity, prints N/A if the activity is not applicable to the assessment session or N/O if the activity was not observed.*</p>	
-	-
-	Completes the Hand Hygiene and Garbing Competency Assessment Form.
-	Performs proper hand hygiene, garbing, and gloving procedures according to SOPs.
-	Disinfects ISO Class 5 device surfaces with an appropriate agent.
-	Disinfects components/vials with an appropriate agent prior to placing into ISO Class 5 work area.
-	Introduces only essential materials in a proper arrangement in the ISO Class 5 work area.
-	Does not interrupt, impede, or divert flow of first air to critical sites.
-	Ensures syringes, needles, and tubing remain in their individual packaging and are only opened in ISO Class 5 work area.
-	Performs manipulations only in the appropriate DCA of the ISO Class 5 device.
-	Does not expose critical sites to contact contamination or worse than ISO Class 5 air.
-	Disinfects stoppers, injection ports, and ampul necks by wiping with sterile 70% IPA and allows sufficient time to dry.
-	Affixes needles to syringes without contact contamination.
-	Punctures vial stoppers and spikes infusion ports without contact contamination.
-	Labels preparation(s) correctly.
-	Disinfects sterile gloves routinely by wiping with sterile 70% IPA during prolonged compounding manipulations.
-	Cleans, sets up, and calibrates automated compounding device (e.g., "TPN compounder") according to manufacturer's instructions.
-	Disposes of sharps and waste according to institutional policy or recognized guidelines.
-	

*The person assessed is immediately informed of all unacceptable activities (i.e., spaces lacking check marks, N/A, or N/O) and shown and informed of specific corrections.

Appendix V. Sample Form for Assessing Cleaning and Disinfection Procedures

-	-
Printed name and position/title of person assessed:	-
Name of facility or location:	-
-	-
Cleaning and Disinfection Practices: The qualified evaluator will check each space for which the person being assessed has acceptably completed the described activity, prints N/A if the activity is not applicable to the assessment session or N/O if the activity was not observed.*	
-	-
Daily Tasks:	
-	Prepares correct concentration of disinfectant solution according to manufacturer's instructions.
-	Uses appropriately labeled container for the type of surface to be cleaned (floor, wall, production bins, etc.).
-	Documents disinfectant solution preparation.
-	Follows garbing procedures when performing any cleaning activities.
-	At the beginning of each shift, cleans all ISO Class 5 devices prior to compounding in the following order: walls, IV bar, automated compounders, and work surface.
-	Uses a lint free wipe soaked with sterile 70% IPA or other approved disinfectant solution and allows to dry completely.
-	Removes all compounder components and cleans all ISO Class 5 areas as stated above at the end of each shift.
-	Cleans all counters and easily cleanable work surfaces.
-	Mops floors, using the mop labeled "floors," starting at the wall opposite the room entry door; mops floor surface in even strokes toward the operator. Moves carts as needed to clean entire floor surface. Use of a microfiber cleaning system is an acceptable alternative to mops.
-	In the ante-area, cleans sink and all contact surfaces; cleans floor with a disinfectant solution or uses microfiber cleaning system.
-	-
Monthly Tasks:	
-	Performs monthly cleaning on a designated day. Prepares a disinfectant solution as stated in daily tasks that is appropriate for the surfaces to be cleaned.

-	Cleans buffer area and ante-area ceiling, walls, and storage shelving with a disinfectant solution and a mop or uses a microfiber cleaning system.	
-	Once ISO Class 5 area is clean, cleans compounding room ceiling, followed by walls and ending with the floor. Uses appropriate labeled mops or microfiber cleaning system.	
-	Cleans all buffer area totes and storage shelves by removing contents and using a germicidal detergent soaked lint free wipe, cleans the inside surfaces of the tote and then the entire exterior surfaces of the tote. Allows totes to dry. Prior to replacing contents into tote, wipes tote with sterile 70% IPA to remove disinfectant residue. Uses new wipe as needed.	
-	Cleans all buffer area carts by removing contents and using germicidal detergent soaked lint free wipe, cleans all carts starting with the top shelf and top of post, working down to wheels. Cleans the under side of shelves in a similar manner. Uses a new wipe for each cart. Allows to dry. Wipes carts with sterile 70% IPA wetted lint free wipe to remove any disinfectant residue. Uses new wipe as needed.	
-	Cleans buffer area chairs, the interior and exterior of trash bins, and storage bins using disinfectant solution soaked lint free wipe.	
-	Documents all cleaning activities as to who performed such activities with date and time noted.	
-		
*The person assessed is immediately informed of all unacceptable activities (i.e., spaces lacking check marks, N/A, or N/O) and shown and informed of specific corrections:

1. INTRODUCTION AND SCOPE

This chapter describes the minimum practices and quality standards to be followed when preparing compounded sterile human and animal drugs (compounded sterile preparations, or CSPs). These practices and standards must be used to prevent harm, including death, to human and animal patients that could result from 1) microbial contamination (nonsterility), 2) excessive bacterial endotoxins, 3) variability from the intended strength of correct ingredients, 4) chemical and physical contaminants, and/or 5) use of ingredients of inappropriate quality.

1.1 Scope

CSP AFFECTED

The requirements and standards described in this chapter must be used to ensure the sterility of any CSP. Although the list below is not exhaustive, the following must be sterile:

- Injections
- Aqueous bronchial inhalations

- Baths and soaks for live organs and tissues
- Irrigations for internal body cavities (i.e., any space that does not freely communicate with the environment outside of the body)
- Ophthalmics
- Implants

For the compounding of hazardous drugs, see *Hazardous Drugs—Handling in Healthcare Settings* (800).

PERSONNEL AND SETTINGS AFFECTED

This chapter applies to all persons who prepare CSPs (e.g., pharmacists, pharmacy technicians, physicians, veterinarians, and nurses) at all places where CSPs are prepared (e.g., hospitals and other healthcare institutions, patient treatment sites, infusion facilities, pharmacies, and physicians' or veterinarians' practice sites).

The compounding organization's leadership and all employees involved in preparing, storing, and transporting CSPs are responsible for 1) ensuring that the applicable practices and quality standards in this chapter are continually and consistently applied to their operations, and 2) proactively identifying and remedying potential problems within their operations.

SPECIFIC PRACTICES

Administration of medications: This chapter is not intended to address administration of sterile medications. Administration of sterile medications should be performed in accordance with the Centers for Disease Control and Prevention's Safe Injection Practices¹ and the manufacturer's or compounder's labeling of the sterile medication.

Proprietary bag and vial systems: Docking and activation of proprietary bag and vial systems (e.g., ADD-Vantage®, Mini Bag Plus®, addEASE®) strictly in accordance with the manufacturer's instructions for immediate administration to an individual patient is not considered compounding. However, aseptic technique must be followed when attaching the proprietary bag and vial system.

Docking of the proprietary bag and vial systems for future activation and administration is considered compounding and must be performed in accordance with this chapter, with the exception of 12. *Establishing Beyond-Use Dates and In-Use Times*. Beyond-use dates (BUDs) for proprietary bag and vial systems must be assigned in accordance with the manufacturer's instructions provided in product labeling.

Reconstitution or dilution: Reconstituting or diluting a conventionally manufactured sterile product with no intervening steps strictly in accordance with the manufacturer's labeling for administration to an individual patient is not considered compounding. However, aseptic technique must be followed during preparation, and procedures must be in place to minimize the potential for contact with nonsterile surfaces and introduction of particulate matter or biological fluids.

Any other reconstitution or dilution of a conventionally manufactured sterile product is considered compounding and must be performed in accordance with this chapter.

Repackaging: Repackaging of a conventionally manufactured sterile product from its original primary container into another primary container must be performed in accordance with the requirements in this chapter for CSPs, including assignment of BUDs and in-use times as

described in 12. *Establishing Beyond-Use Dates and In-Use Times*.

1.2 Factors Affecting the Risks Associated with CSPs

CSPs can be compounded using only sterile starting ingredients or using some or all nonsterile starting ingredients. If all of the components used to compound a drug are sterile to begin with, the sterility of the components must be maintained during compounding to produce a sterile compounded preparation. If one or more of the starting components being used to compound is not sterile, the sterility of the compounded preparation must be achieved through a sterilization process, such as terminal sterilization in the final sealed container or sterile filtration, and then maintained through subsequent manipulations of the preparation. When compounding with nonsterile starting ingredients, the quality of the components and the effectiveness of the sterilization step are particularly critical to achieving a sterile preparation. In all cases, failure to achieve and/or maintain sterility of CSPs can lead to serious harm, including death. Personnel engaged in compounding and handling CSPs must strictly adhere to the standards in this chapter throughout the compounding process and until the preparation reaches the intended patient(s).

The risks to the sterility associated with a particular CSP depend on a number of factors, including the following:

- Batch size
- Complexity of the compounding process (e.g., number of manipulations involved; whether starting with nonsterile or sterile components)
- Inherent nature of the drug being compounded (e.g., whether the drug is susceptible to microbial growth; whether the preparation will be preservative free)
- Complexity of the compounding operation (e.g., multiple people in the cleanroom at the same time; multiple CSPs being prepared at the same time; activity in the surrounding areas)
- Length of time between the start of compounding (including making a stock solution) and administration of the drug to the patient

Ultimately, the risk to the population of patients is lower if the compounding is done for an individual patient as compared to when the compounding is done in a batch for multiple patients. When applying the standards in this chapter, the risks of a particular compounding operation must be considered, and steps commensurate with these risks must be taken to ensure a quality CSP.

1.3 Risk Categories

Consistent with this risk-based approach, this chapter distinguishes between two categories of CSPs, Category 1 and Category 2, primarily by the conditions under which they are made and the time within which they will be used. Category 1 CSPs are those assigned a maximum BUD of 12 hours or less at controlled room temperature or 24 hours or less if refrigerated if made in accordance with all of the applicable standards for Category 1 CSPs in this chapter. Category 2 CSPs are those that may be assigned a BUD of greater than 12 hours at room temperature or greater than 24 hours if refrigerated (see 12. *Establishing Beyond-Use Dates and In-Use Times*) if made in accordance with all of the applicable standards for Category 2 CSPs in this chapter. See *Table 1* for a summary comparison of the minimum requirements in this chapter for Category 1 and 2 CSPs.

This chapter describes minimum requirements that apply to compounding of all CSPs, and also

to repackaging of sterile products. If a compounder does not meet all of the Category 2 requirements, the CSP or repackaged sterile product will be considered a Category 1, and the shorter BUD applicable to Category 1 CSPs must be assigned. The minimum requirements not specifically described as applicable to Category 1 or Category 2, such as minimum training and competency testing and personal hygiene for personnel, are applicable to compounding of all CSPs and repackaging of sterile products.

Table 1. Summary Comparison of Minimum Requirements for Category 1 and Category 2 CSPs^a

	Category 1 CSPs	Category 2 CSPs
Personnel Qualifications		
Visual observation of hand hygiene and garbing	Quarterly	Quarterly
Gloved fingertip sampling	Quarterly	Quarterly
Media fill testing	Quarterly	Quarterly
Personal Protective Equipment		
See Table 2.		
Buildings and Facilities		
Primary engineering control (PEC)	Not required to be placed in a classified area	Required to be placed in a classified area
Recertification	Every 6 months	Every 6 months
Environmental Monitoring		
Nonviable airborne monitoring	Every 6 months	Every 6 months
Viable airborne monitoring	Monthly	Monthly
Surface sampling	Monthly	Monthly
Release Testing		
Physical inspection	Required	Required
Sterility testing	Not required	Based on assigned BUD
Endotoxin testing	Not required	Required if prepared from nonsterile ingredient(s) ^b
BUD		
BUD assignment	≤12 hours at controlled room temperature or ≤24 hours if refrigerated	>12 hours at controlled room temperature or >24 hours if refrigerated
<p>^a This table summarizes the requirements that apply specifically to Category 1 and Category 2 CSPs. There are numerous requirements in the chapter that are not summarized in this table because they apply to all CSPs, regardless of whether they are Category 1 or Category 2.</p> <p>^b See exemptions in 10.3 Bacterial Endotoxins Testing.</p>		

1.4 Urgent-Use CSPs

A CSP may be prepared in worse than International Organization for Standardization (ISO) Class

5 air quality (see 4.1 *Protection from Airborne Contaminants*) in rare circumstances when a CSP is needed urgently (e.g., cardiopulmonary resuscitation) for a single patient, and preparation of the CSP under conditions described for Category 1 or Category 2 would subject the patient to additional risk due to delays in therapy. In these circumstances, the compounding procedure must be a continuous process not to exceed 1 hour, and administration of the CSP must begin immediately upon completion of preparation of the CSP. Aseptic technique must be followed during preparation, and procedures must be in place to minimize the potential for contact with nonsterile surfaces, introduction of particulate matter or biological fluids, and mix-ups with other CSPs.

1.5 Roadmap through Chapter

The chapter is organized as follows:

1. Introduction and Scope
2. Personnel Qualifications—Training, Evaluation, and Requalification
3. Personal Hygiene and Personal Protective Equipment
4. Buildings and Facilities
5. Environmental Monitoring
6. Cleaning and Disinfecting Compounding Areas
7. Equipment and Components
8. Sterilization and Depyrogenation
9. SOPs and Master Formulation and Compounding Records
10. Release Testing
11. Labeling
12. Establishing Beyond-Use Dates and In-Use Times
13. Quality Assurance and Quality Control
14. CSP Storage, Handling, Packaging, and Transport
15. Complaint Handling and Adverse Event Reporting
16. Documentation
17. Radiopharmaceuticals as CSPs

Glossary

Appendices

Appendix 1. Acronyms

Appendix 2. Common Disinfectants Used in Health Care for Inanimate Surfaces and Noncritical Devices, and Their Microbial Activity and Properties

2. PERSONNEL QUALIFICATIONS—TRAINING, EVALUATION, AND REQUALIFICATION

Because the failure of compounding personnel to follow procedures and adhere to quality standards poses the greatest risk of CSP contamination, all personnel involved in the preparation and handling of CSPs must be trained and qualified and must undergo annual refresher training and requalification in appropriate sterile compounding standards and practices. Training, qualification, and requalification of personnel must be documented.

Each compounding facility must develop a written training program that describes the required training, the frequency of training, and the process for evaluating the performance of individuals involved in sterile compounding. This program should equip personnel with the appropriate knowledge and train them in the required skills necessary to perform their assigned

tasks. This section describes the minimum qualifications for personnel preparing and handling CSPs, including the training, evaluation, and requalification of such personnel.

Separate from the formal competency testing and requalification described in this section, supervisors of compounding personnel should observe compounding activities on a daily basis and take immediate corrective action if deficient practices are observed.

2.1 Demonstrating Proficiency in Core Competencies

Before beginning to prepare CSPs, personnel must complete training and be able to demonstrate proficiency in the theoretical principles and hands-on skills of sterile manipulations and in achieving and maintaining appropriate environmental conditions. Successful completion must be demonstrated through written testing and hands-on demonstration of skills. Proficiency must be demonstrated in at least the following core competencies:

- Hand hygiene and garbing
- Cleaning and disinfection
- Measuring and mixing
- Aseptic manipulation
- Proper cleanroom behavior
- Methods of sterilization and depyrogenation, if applicable
- Use of equipment
- Documentation of the compounding process (e.g., master formulation and compounding records)
- Understanding the direction of the HEPA-filtered unidirectional airflow within the ISO Class 5 area
- Proper use of PECs
- The potential impact of personnel activities such as moving materials into and out of the compounding area

The following sections describe in detail the competency testing that must be conducted initially for all sterile compounding personnel in garbing and hand hygiene and aseptic manipulation, and the requirements for retraining and requalification.

2.2 Competency Testing in Garbing and Hand Hygiene

Gloved fingertip/thumb sampling is important because direct touch contamination is the most likely source of microorganisms. Gloved fingertip sampling evaluates a compounding person's competency in correctly performing hand hygiene and garbing (see *Box 2-1*). All persons performing compounding must successfully complete an initial competency evaluation, including visual observation and gloved fingertip/thumb sampling [zero colony-forming units (CFUs)] no fewer than three times before being allowed to compound CSPs, to demonstrate that they can perform the procedure consistently. After the initial competency evaluation, compounding personnel must successfully complete gloved fingertip/thumb sampling quarterly (no more than a total of three CFUs). Each fingertip/thumb evaluation must occur after separate, full hand hygiene and garbing procedures.

Compounding personnel must be visually observed by competent personnel while performing hand hygiene and garbing procedures (see *3. Personal Hygiene and Personal Protective Equipment*). The visual audit must be documented and the documentation maintained to provide a permanent record and long-term assessment of personnel competency.

Sampling must be performed on sterile gloves inside of an ISO Class 5 PEC. If conducting gloved

fingertip/thumb sampling in a Restricted Access Barrier System (RABS) [e.g., Compounding Aseptic Isolator (CAI) or Compounding Aseptic Containment Isolator (CACI)] or an isolator, samples must be taken from the sterile gloves placed over the gauntlet gloves. In addition, gloved fingertip/thumb sampling must be performed after completing the media-fill preparation without applying sterile alcohol or any other agent that could interfere with the ability of the gloved fingertip test to assess the adequacy of aseptic work practices.

Box 2-1 Gloved Fingertip Sampling and Testing Procedures

- Use two plates filled with nutrient agar containing neutralizing agents (e.g., lecithin and polysorbate 80) in a size range of 24- to 30-cm² in size.
- Do NOT disinfect gloves with sterile 70% isopropyl alcohol (IPA) or any other disinfectant immediately before touching the agar plate because this could cause a false-negative result.
- Collect a gloved fingertip and thumb sample from both hands by lightly pressing each fingertip into the agar. Use a separate plate for each hand.
- Re-cover the agar plates without further contact with agar. Label the plates with a personnel identifier, right or left hand, date, and time.
- Immediately discard the gloves after sampling.
- Invert the plates and incubate them at a temperature and for a time period conducive to multiplication of microorganisms (e.g., 20°–35° for 5 days).
- Record the number of CFU per hand (left hand, right hand).
- Determine whether the CFU action level for gloved hands (i.e., zero CFU initially or three CFU thereafter) is exceeded by counting the total number of CFUs on both gloves, not per hand.

2.3 Competency Testing in Aseptic Manipulation

After successful completion of the initial hand hygiene and garbing competency evaluation, all sterile compounding personnel must have their sterile technique and related practices evaluated during a media-fill test (see *Box 2-2*). Evaluation results must be documented and the documentation maintained to provide a permanent record and long-term assessment of personnel competency.

Box 2-2 Media-Fill Testing Procedures

- When performing these testing procedures, use the most difficult and challenging compounding procedures and processing conditions encountered by the person during a work shift (e.g., the most manipulations, most complex flow of materials, longest time to compound), replacing all the components used in the CSPs with microbial growth medium.
 - Include all normal processing steps and incorporate worst-case conditions, including sterilizing filtration if used.
 - Do not interrupt the test once it has begun, unless the normal work day involves interruptions.
 - If all of the starting components are sterile to begin with, transfer sterile fluid microbial culture medium, such as sterile soybean-casein digest, into the same types of container-closure systems commonly used at the facility to evaluate a person's skill at aseptically processing CSPs into finished dosage forms.
 - If some of the starting components are nonsterile to begin with, use a nonsterile commercially available medium, such as soybean-casein digest powder, to make a 3% solution. Prepare the nonsterile culture medium according to the manufacturer's instructions and manipulate it in a manner that reflects nonsterile-to-sterile compounding activities.
 - Incubate media-filled vials at 20°–35° for a minimum of 14 days. If two temperatures are used for incubation of media-filled samples, incubate the filled containers for at least 7 days at the lower temperature (20°–25°) followed by 7 days at 30°–35°. Failure is indicated by visible turbidity or other visual manifestations of growth in the medium in one or more container-closure unit(s) on or before 14 days. Investigate media-fill failures to determine possible causes (e.g., sterilizing filter failure). Document and discuss investigational findings with personnel before any re-testing.
 - If using a purchased pre-prepared microbial growth medium, either verify that the growth medium is growth promoting, or obtain a certificate of analysis (COA) from the supplier of the growth medium to ensure that it will support the growth of microorganisms.
 - If using a microbial growth medium prepared in-house, the growth promotion capability of the medium must be demonstrated and documented (see *Sterility Tests* (71)).
- Always store microbial growth media in accordance with manufacturer instructions and use them before their expiration date.

2.4 Reevaluation, Retraining, and Requalification

REQUALIFICATION AFTER FAILURE

Persons who fail written tests; visual observation of hand hygiene, garbing, and aseptic technique; gloved fingertip/thumb sampling; or media-fill tests must undergo immediate requalification through additional training by competent compounding personnel. Personnel who fail visual observation of hand hygiene, garbing, and aseptic technique; gloved fingertip/thumb sampling; or media-fill tests must pass three successive reevaluations in the deficient area before they can resume compounding of sterile preparations.

REFRESHER TRAINING PROGRAM

Compounding personnel must successfully complete annual refresher training in the core competencies listed in *2.1 Demonstrating Proficiency in Core Competencies*. Successful completion must be demonstrated through written testing and hands-on demonstration of skills.

TIMING OF REEVALUATION AND REQUALIFICATION

- Visual observation—Compounding personnel must be visually observed while performing hand hygiene and garbing procedures initially and then at least quarterly.
- Gloved fingertip sampling—Compounding personnel must perform fingertip/thumb sampling three times initially and then quarterly to confirm their competency and work practices. Fingertip sampling conducted as part of a routine media-fill test can be counted in fulfilling these reevaluation requirements.
- Media-fill testing—After initial qualification, conduct media-fill tests of all personnel engaged in compounding CSPs at least quarterly to evaluate aseptic technique and requalify them.
- Cleaning and disinfecting—Retrain and requalify personnel in cleaning and disinfecting compounding areas after a change in cleaning and disinfecting procedures.
- After a pause in compounding—Personnel who have not compounded CSPs in more than 3 months must be requalified in all core competencies before resuming compounding duties.

If compounding is done less frequently than the frequencies specified above (e.g., quarterly), personnel reevaluation and requalification must occur before each compounding session begins.

3. PERSONAL HYGIENE AND PERSONAL PROTECTIVE EQUIPMENT

Because personnel preparing CSPs are the most likely cause of CSP contamination, compounding personnel must maintain proper personal hygiene and use personal protective equipment (PPE).

Personnel suffering from rashes, sunburn, oozing tattoos or sores, conjunctivitis, active respiratory infection, or other active communicable disease must be excluded from working in compounding areas until their conditions are resolved.

3.1 Personnel Preparation

Compounding personnel must take appropriate steps to prevent microbial contamination of CSPs. Squamous cells are normally shed from the human body at a rate of 10^6 or more per hour, and those skin particles are laden with microorganisms.^{2,3} Before entering a designated compounding area, compounding staff must remove any items that are not easily cleanable and that are not necessary for compounding. For example, personnel must:

- Remove personal outer garments (e.g., bandanas, coats, hats, jackets, scarves, sweaters, and vests)
- Remove all cosmetics because they shed flakes and particles
- Remove all hand, wrist, and other exposed jewelry or piercings (e.g., rings, watches, bracelets, earrings, and lip or eyebrow rings) that can interfere with the effectiveness of PPE (e.g., fit of gloves, cuffs of sleeves, and eye protection). Cover any jewelry that cannot be removed (e.g., surgically implanted jewelry)
- Remove ear buds, headphones, and cell phones, or other similar devices
- Keep natural nails clean and neatly trimmed to minimize particle shedding and avoid glove punctures. Nail polish, artificial nails, and extenders must be removed.

3.2 Hand Hygiene

Hand hygiene is required before initiating any compounding activities and when re-entering the

ante-area after a break in compounding activity. After donning shoe covers, head and facial hair covers, and face masks, hand hygiene must be conducted (see *Box 3-1*). Hands must be washed with unscented soap and water. Alcohol hand sanitizers alone are not sufficient. Do not combine antimicrobial soaps and handrubs with alcohol-based products because of potential adverse dermatologic reactions. Brushes are not recommended for hand hygiene because of the potential for skin irritation and increased bacterial shedding. Dry hands and forearms with either low-lint disposable towels or wipes. After hands are washed and dried, perform hand antisepsis using a suitable alcohol-based handrub with sustained antimicrobial activity immediately before donning sterile gloves. Follow the manufacturer's instructions for application times, and apply the product to dry hands only. [Note—Soap must not be added to a partially empty soap dispenser. This practice of "topping off" dispensers can lead to bacterial contamination of soap.]

Box 3-1 Hand Hygiene Procedures

- Remove debris from underneath fingernails, if present, using a nail cleaner under warm running water.
- Wash hands and forearms up to the elbows with unscented soap and water for at least 30 seconds.
- Dry hands and forearms to the elbows completely with low-lint disposable towels or wipes.
- Immediately prior to donning sterile gloves, apply a suitable alcohol-based handrub with sustained antimicrobial activity, following the manufacturer's instructions for application times, and use a sufficient amount of product to keep the hands wet for the duration of the application time.
- Allow hands to dry thoroughly before donning sterile gloves.

3.3. Garb and Glove Requirements

The garb and glove requirements for CSPs depend on the category of CSP and type of PEC used. *Table 2* summarizes the minimum garb and glove requirements for CSPs.

Table 2. Minimum Garb and Glove Requirements

CSP Category	PEC type	Minimum Requirement
Category 1	Any	<ul style="list-style-type: none"> • Non-cotton, low-lint, disposable gown or coveralls • Low-lint, disposable covers for shoes • Low-lint, disposable covers for head and facial hair that cover the ears and forehead • Sterile gloves and sterile sleeves^a
Category 2	Laminar airflow system (LAFS) and biological safety cabinet (BSC)	<ul style="list-style-type: none"> • Non-cotton, low-lint, disposable gowns or coveralls • Low-lint, disposable covers for shoes • Low-lint, disposable covers for head and facial hair that cover the ears and forehead • Mask • Sterile gloves and sterile sleeves^a • Eye shield is optional
Category 2	RABS (CAI or CACI) or isolator	<ul style="list-style-type: none"> • Non-cotton, low-lint, disposable gowns or coveralls • Low-lint, disposable covers for shoes and hair • Sterile gloves
<p>^a If a sterile gown is used, the use of sterile sleeves is optional.</p>		

Personnel intending to enter a buffer area or segregated compounding area must put on protective clothing. Protective clothing must be put on in an order that eliminates the greatest risk of contamination. As noted previously, put on shoe covers, head and facial hair covers, face masks, and gown, before completing hand cleansing procedures and then put on sterile gloves and sterile sleeves (if used). If sterile gowns are used, put on sterile gloves and gowns after hand cleansing procedures. Garbing and degarbing should not occur in the ante-area at the same time.

GOWNS

Visibly soiled gowns must be changed immediately. Gowns and other garbing items must be segregated and stored before use in an enclosure to prevent contamination (e.g., away from sinks to avoid splashing). Coveralls and sterile gowns must not be reused.

GLOVES

Gloves must be sterile and powder free. Use only gloves that have been tested by the manufacturer for compatibility with alcohol disinfection. Before putting on gloves, perform hand hygiene as described in *Box 3-1*. Hands must be completely dry before putting on sterile gloves. Unless donning a sterile gown, sterile gloves must be the last item put on before handling anything in the buffer or segregated compounding area and before compounding begins in the PEC. If donning a sterile gown, put on the gloves first, then the sterile gown.

Routine application of sterile 70% IPA to gloves must occur throughout the compounding process and whenever nonsterile surfaces (e.g., vials, counter tops, chairs, carts) are touched. Contaminated gloved hands can be disinfected by rubbing sterile 70% IPA solution onto all contact surface areas of the gloves and letting the gloved hands dry thoroughly.

Gloves on hands and gauntlet sleeves on RABS and isolators must be inspected routinely by the personnel using them for holes, punctures, or tears and must be replaced immediately if such defects are detected. Sterile gloves must be placed over the gauntlet gloves of the RABS and isolators.

EXITING AND REENTERING COMPOUNDING AREAS

When compounding personnel exit the buffer or segregated compounding area during a work shift, a nonsterile gown can be removed and retained in the ante or segregated compounding area if not visibly soiled, to be re-donned during that same work shift only. Coveralls and sterile gowns may not be reused and must be replaced with new ones. Shoe covers, hair and facial hair covers, face masks, head covering, gloves, and sleeves may not be reused and must be replaced with new ones. Goggles must be either sterilized or disinfected with sterile 70% IPA before each use. Hand hygiene must be performed before resuming sterile compounding.

COMPOUNDING HAZARDOUS DRUGS

For PPE requirements when handling hazardous drugs, refer to (800).

4. BUILDINGS AND FACILITIES

Buildings and facilities in which compounding will be taking place must be designed, built, outfitted, and maintained properly to prevent airborne contamination of CSPs. Areas related to compounding operations in such facilities (i.e., ante-area, buffer area, segregated compounding area, and PEC) must be separated from areas not directly related to compounding and must be appropriately controlled to achieve and maintain required air quality classification levels (see *Table 3*), depending on the nature of the operation being performed in the specific area.

A facility's design must ensure that the movement of personnel, equipment, and components into and out of the compounding area does not disrupt air quality in the area or create a route of contamination. The number of operations being performed, the number of personnel in the compounding area (and in adjacent areas), and the complexity of the compounding procedures are critical factors that determine whether a facility will be able to maintain control of environmental conditions. All of these factors must be taken into account when designing and outfitting a facility in which sterile compounding will be performed.

This section describes applicable air quality standards and the appropriate design of buildings and facilities intended for the preparation of CSPs. It describes in detail the materials to be used and the steps to be taken in designing facilities to ensure suitable conditions. This section also discusses the environmental controls that must be in place to ensure achievement and maintenance of sterility for CSPs.

4.1 Protection from Airborne Contaminants

Buildings and facilities used in compounding must be designed to prevent airborne contamination of the area in which sterile compounding occurs. Without proper design and controls, airborne contaminants are likely to reach the area where compounding occurs, increasing the risk that CSPs will be exposed to microbial contamination.

APPLICABLE AIR QUALITY STANDARDS

The internationally accepted standards for air quality in controlled environments are described

in *Table 3* and referenced throughout this chapter.

Table 3. ISO Classification of Particulate Matter in Room Air

ISO Class	Particle Count ^a /m ³
3	35.2
4	352
5	3,520
6	35,200
7	352,000
8	3,520,000
^a Limits for number of particles $\geq 0.5 \mu\text{m}$ measured under typical operating conditions.	

DESIGN REQUIREMENTS TO MAINTAIN AIR QUALITY

For compounding Category 1 or 2 CSPs, buildings and facilities intended for compounding CSPs must be designed so that air quality increases with movement through separate operational areas to the PEC. Separate areas of operation must be appropriately controlled, depending on the necessary level of air quality. Classified areas in which the air quality is controlled include ante-areas, buffer areas, and PECs.

- Ante-areas must meet at least ISO Class 8 standards. Typically, personnel hand hygiene and garbing procedures, staging of components, order entry, CSP handling, and other activities that potentially generate high levels of particulates are performed in this area. Ante-areas are also transition areas to ensure that proper air pressure relationships are maintained between designated areas.
- A buffer area must provide at least ISO Class 7 air quality. Activities in this area must be especially carefully controlled to avoid affecting the air quality in the area where CSP preparation occurs.
- Areas intended for CSP preparation must meet ISO Class 5 standards. ISO Class 5 standards are achieved through use of a PEC, such as a LAFS, BSC, CAI, CACI, or isolator.

A PEC used for compounding may be placed in an unclassified, segregated compounding area (see below) if only Category 1 CSPs are compounded in the PEC.

4.2 Facility Design and Environmental Controls

In addition to minimizing airborne contamination and protecting CSPs, compounding facilities must be designed and controlled to provide a well-lit and comfortable working environment, with appropriate temperature and humidity for compounding personnel wearing the required garb. The room must be maintained at a temperature of 20° or cooler and a humidity below 60% at all times. Temperature and humidity must be controlled through an efficient heating, ventilation, and air conditioning (HVAC) system rather than through use of humidifiers and dehumidifiers, which can contain standing water that can contribute to microbial contamination.

It is the responsibility of compounding facility management to ensure that each operational area related to CSP preparation meets the ISO-classified air quality standard appropriate for the activities to be conducted there and, specifically, that the ISO Class 5 areas are optimally located, operated, maintained, monitored, and verified to have appropriate air quality.

DESIGN OF A COMPOUNDING FACILITY

A compounding facility generally consists of separate, designated operational clean areas, including an ante-area, a buffer area, and a PEC, or a segregated compounding area containing a PEC where CSPs are prepared. See *Placement and Use of Primary Engineering Controls* for the requirements for a segregated compounding area. The ante-area must be separated from the surrounding, unclassified sections of the building to reduce the risk of contaminants being blown, dragged, tracked, or otherwise introduced into the high-efficiency particulate air (HEPA)-filtered clean environment. This separation must be continuously maintained and monitored (see 5. *Environmental Monitoring*). When compounding Category 2 CSPs, the ISO Class 8 ante-area and the ISO Class 7 buffer area must be separate rooms, with walls and doors between them and controls to prevent the flow of lower-quality air into the more controlled areas.

The PEC must be located in the buffer area or the segregated compounding area so as to avoid conditions that could adversely affect their separate operations. For example, strong air currents from opened doors, personnel traffic, or air streams from the HVAC system(s) can disrupt the unidirectional airflow of an open-faced PEC such as a laminar airflow workbench (LAFW). Compounding personnel can also create disruptions in airflow by their own movements adjacent to the PEC, their manipulations within the PEC, and by placing objects onto work surfaces within the PEC. Access of personnel to controlled areas must be limited. For example, only authorized personnel and materials required for compounding and cleaning should be permitted in the buffer area.

Due to the interdependence of the various rooms or areas that make up a compounding facility, it is essential to carefully define and control the dynamic interactions permitted between areas and rooms. When designing doors, consider door closures, door surfaces, and the swing of the door, all of which can affect airflow.

Airlocks and interlocking doors can be used to facilitate better control of air balance between a higher classified area and an area of lesser air quality (e.g., between the buffer area and ante-area), or between a classified area and an unclassified area (e.g., between the ante-area and an uncontrolled area such as a hallway). If a pass-through is used, it must only be opened one door at a time; both doors must never be opened at the same time.

It is critical to adequately control materials (e.g., supplies, equipment, and utensils) as they move from lesser to higher classified areas to prevent the influx of contaminants. For this reason, when designing a facility, consider the movement of materials.

When designing the facility, consider whether all materials used can be easily cleaned. Avoid using door seals and sweeps that are difficult to clean. Hands-free access doors are preferred. Do not use tacky mats in ISO-classified areas.

THE CSP PROCESSING ENVIRONMENT

All CSPs must be prepared in a PEC, which provides an ISO Class 5 environment (with the exception of Urgent-Use CSPs, see 1.4 *Urgent-Use CSPs*). The compounding environment must continuously meet ISO Class 5 or better conditions for 0.5- μ m particles and must exclude microbial contamination during compounding of CSPs (typical operating conditions).

HEPA filters and unidirectional (laminar) airflow are used to maintain the appropriate airborne particulate classification of the area. Unidirectional airflow must be maintained in the PEC at all times. HEPA-filtered air must be supplied to the PEC at a velocity sufficient to sweep particles

away from critical sites and maintain unidirectional airflow during operations. Proper design and control prevents turbulence and creation of eddies or stagnant air in the PEC.

Air must be introduced through HEPA filters located at the ceiling of the buffer area containing the PEC, and returns should be mounted low on the wall, creating a general top-down dilution of area air through HEPA-filtered air.

PLACEMENT AND USE OF PRIMARY ENGINEERING CONTROLS

Proper placement of the PEC is critical to ensuring an ISO Class 5 environment for compounding CSPs.

LAFS: Provides an ISO Class 5 or better environment for sterile compounding. A LAFS provides smooth, unidirectional HEPA-filtered airflow that is designed to prevent contamination of a sterile compounding environment. The LAFS can consist of either a LAFW or a HEPA filter alone creating an ISO Class 5 zone within an ISO Class 7 room, as long as unidirectional airflow is maintained.

The LAFS must be located out of traffic patterns and away from room air currents that could disrupt the intended airflow patterns. If used to prepare only Category 1 CSPs, the ISO Class 5 environment can be obtained by placing a LAFW in a segregated compounding area. If used to prepare Category 2 CSPs, the LAFS must be located within a restricted access buffer area with an ISO Class 7 or better air quality.

BSC: A ventilated cabinet with an open front and inward and downward HEPA-filtered airflow and HEPA-filtered exhaust. A BSC must be located out of traffic patterns and away from room air currents that could disrupt the intended airflow patterns. A BSC used to prepare only Category 1 CSPs can be placed in an unclassified area. If used to prepare Category 2 CSPs, the BSC must be located within a restricted access buffer area with an ISO Class 7 or better air quality. If a BSC is used to prepare hazardous drugs, see (800).

RABS: Can include a CAI or a CACI, and can be used to provide an ISO Class 5 environment for preparing CSPs (see *Microbiological Control and Monitoring of Aseptic Processing Environments* (1116)). A RABS is different from an isolator (see description of isolators below). In a RABS, glove ports are used to provide physical separation between the surrounding area and the aseptic manipulations. If used to prepare Category 2 CSPs, the area surrounding the RABS must meet ISO Class 7 or better air quality.

All transport ports on the RABS must be closed during compounding. When a RABS is used, the recovery time after opening to achieve ISO Class 5 air quality must be documented, and internal procedures must be developed to ensure that adequate recovery time is allowed after opening and closing the RABS, both before and during compounding operations.

Isolator: Provides isolation from the surrounding area and maintains ISO Class 5 air quality during typical operating conditions. The following standards must be met to qualify as an isolator:

- High-integrity transfer ports are used to move supplies, ingredients, components, and devices into and out of the isolator.
- The isolator is decontaminated using a generator that distributes a sporicidal chemical agent throughout the isolator chamber.
- The isolator maintains constant overpressure of at least 0.05-inch water column.
- The manufacturer has provided documentation that the isolator will continuously meet

ISO Class 5 conditions, including during material transfer.

If ISO Class 5 classification is achieved using an isolator that meets the requirements above, the isolator can be located in an ISO Class 8 area and used to prepare Category 2 CSPs. In addition, when using an isolator, some functions, such as hand washing, can be done in the ISO Class 8 area. Water sources such as sinks and drains must be located at least 1 meter from the isolator. If the isolator does not meet the requirements above, it is considered a RABS that must be located within at least an ISO Class 7 area to prepare Category 2 CSPs, or within a segregated compounding area to prepare Category 1 CSPs.

Segregated Compounding Areas: In some situations, a PEC may be located within an unclassified area, without a buffer or ante-area. This type of design is called a segregated compounding area. Category 2 CSPs must never be compounded in segregated compounding areas; only Category 1 CSPs can be compounded in facilities with such designs. It is critical to locate a segregated compounding area away from unsealed windows, doors that connect to the outdoors, and significant traffic flow. A segregated compounding area must not be located adjacent to construction sites, warehouses, food preparation areas, or other environmental control challenges. The impact of activities that will be conducted around or adjacent to the segregated compounding area must be considered carefully when designing such an area, and the perimeter of the segregated compounding area must be defined.

ACTIVITIES IN RELATION TO THE PEC

The facility where CSPs are prepared must be designed so that activities such as hand hygiene and gowning will not adversely affect the ability of the PEC to function as designed. In facilities with ante-areas and buffer areas, the sink used for hand hygiene must not be placed in the buffer area. The sink should be placed in the ante-area to allow for hand washing before entering the buffer area. In a segregated compounding area, the sink must be located at least 1 meter from the PEC.

AIR-EXCHANGE REQUIREMENTS

For facilities designed with ante-areas and buffer areas, adequate HEPA-filtered airflow to the buffer and ante-areas is required to maintain the appropriate cleanliness classification during compounding activities. Airflow adequacy is measured in terms of the number of air changes per hour (ACPH). Factors that should be considered when determining appropriate air-exchange requirements for an area include the maximum number of personnel permitted to work in the area, the number of particulates that may be generated from activities and processes in the area, and the effects of temperature.

An ISO Class 7 buffer or ante-area supplied with HEPA-filtered air must measure an ACPH of not less than 30, and the ACPH may need to be higher to maintain the classification, depending on the factors previously described. The ACPH of 30 can include recirculated HEPA-filtered air, but at least half (a minimum of 15 ACPH) must be HEPA-filtered fresh air.

If an isolator that meets the specifications described above is used to achieve ISO Class 5 air quality, air exchange requirements in the room where the isolator is located can be reduced to 15 ACPH.

ESTABLISHING AND MAINTAINING PRESSURE DIFFERENTIALS

To prevent the flow of poorer quality air from one area to another area of higher air quality

classification, except when a segregated compounding area is used, a minimum differential positive pressure of 0.02-inch water column is required to separate each ISO-classified area. The pressure differential between the ISO Class 7 area and the general pharmacy area must not be less than 0.02-inch water column.

A pressure gauge or velocity meter must be used to monitor the pressure differential or airflow between the ante-area and buffer area and between the ante-area and the general environment outside the classified areas. The results must be reviewed and documented on a log at least daily or by a continuous recording device.

4.3 Constructing Areas to Achieve Easily Cleanable Conditions

The surfaces of ceilings, walls, floors, fixtures, shelving, counters, and cabinets in a classified area or in a segregated compounding area must be smooth, impervious, free from cracks and crevices, and non-shedding, thereby promoting cleanability and minimizing spaces in which microorganisms and other contaminants can accumulate. Surfaces must be resistant to damage by disinfectants. Junctures between the ceiling and the walls must be coved or sealed to eliminate cracks and crevices where dirt can accumulate. If ceilings consist of inlaid panels, the panels must be impregnated with a polymer to render them impervious and hydrophobic, and they must be sealed.

Walls must be constructed of durable material (e.g., heavy-gauge polymer). Panels must be locked together and sealed. If gypsum board is used, it must be epoxy-coated. Floors must be overlaid with wide sheet vinyl flooring with heat-welded seams and coving to the sidewall. Classified areas and segregated compounding areas must not contain dust-collecting overhangs, such as utility pipes, or ledges, such as windowsills. The exterior lens surface of ceiling light fixtures must be smooth, mounted flush, and sealed. Any other penetrations through the ceiling or walls must be sealed. The buffer area or area inside the perimeter of a segregated compounding area cannot contain water sources (e.g., sinks) or floor drains.

Work surfaces must be constructed of smooth, impervious materials, such as stainless steel or molded plastic, so that they can be easily cleaned and disinfected.

4.4 Placement and Movement of Materials

Only furniture, storage shelving, counters, cabinets, supplies, and other materials necessary for performing compounding activities are permitted in buffer or segregated compounding areas. Any objects located in buffer or segregated compounding areas must be smooth, impervious, free from cracks and crevices, non-shedding, and easily cleaned and disinfected. Their number, design, and manner of installation must promote effective cleaning and disinfecting. Certain items are not permitted in buffer areas. These include, but are not limited to, coarse cardboard, external shipping containers, and nonessential paper (e.g., paper towels and tissues).

Carts used to transport components or equipment into classified areas must be constructed from stainless steel, nonporous plastic, or sheet metal, with good quality, cleanable casters to promote mobility and ensure ease of disinfection.

Certain devices (e.g., computers) and objects (e.g., carts and cabinets) essential to compounding can be located in the segregated compounding area, but must be located at an appropriate distance from the PEC so that they have no detrimental effects on the air quality inside the PEC. The appropriate distance must be determined by considering the surrounding environment and the activities conducted in it.

Before being brought into a buffer area or segregated compounding area, objects must be cleaned and disinfected. Equipment and other items used in a buffer area or a segregated compounding area should not be removed except for calibration, servicing, or other activities associated with proper maintenance. If removed, these items must be cleaned and disinfected before they are returned to the buffer area or segregated compounding area.

4.5 Certification and Recertification of Facilities

Before a facility is used to compound either Category 1 or Category 2 CSPs, it must be certified by an independent, qualified individual as meeting its design and air quality specifications (see *Table 3*). It is important to place special emphasis on certifying the ISO Class 5 areas. During certification of ISO Class 5 areas, air sampling must be performed inside the PEC and the surrounding ISO-classified areas. Routine staff activity during compounding-related processes must be simulated during certification.

Certification of the PEC must include:

- **Airflow Testing** to determine acceptability of the air velocity and volume, the air exchange rate, and room pressure cascade to ensure that air consistently flows from clean to dirty areas, and that the appropriate quality of air is maintained under typical operating conditions.
- **HEPA Filter Integrity Testing** using the most penetrating particle size. HEPA filters must be leak tested at the factory and then leak tested again after installation and as part of recertification.
- **Total Particle Counts Testing** under typical operating conditions by qualified operators using current, state-of-the-art electronic equipment.
- **Smoke Studies** for each PEC under full operational processing conditions to demonstrate unidirectional airflow and sweeping action over and away from the product(s).

Certification of other ISO-classified areas must include:

- **Airflow Testing** to determine acceptability of the air velocity and volume, the air exchange rate, and room pressure cascade to ensure that air consistently flows from clean to dirty areas and that the appropriate quality of air is maintained under typical operating conditions.

Classified areas must be recertified if there are changes to the area such as redesign, construction, or replacement or relocation of the PEC, or alteration in the configuration of the room that could affect airflow or air quality. Recertification must be done at least every 6 months.

All certification and recertification records must be reviewed by supervising personnel or other designated employees to ensure that the controlled environments comply with the proper standards and records must be maintained in accordance with the requirements in *16. Documentation*.

4.6 Design and Construction of Facilities for Compounding with Hazardous Drugs

For design of facilities in which compounding with hazardous drugs will occur, see (800).

5. ENVIRONMENTAL MONITORING

An effective environmental monitoring program provides meaningful information on the quality of

the compounding environment and any environmental trends in surrounding areas. In addition, an effective environmental monitoring program will identify potential routes of contamination, allowing for implementation of corrections to prevent CSP contamination. Sterile compounding facilities must develop and implement written environmental monitoring procedures (see 9. *SOPs and Master Formulation and Compounding Records*). All environmental sampling and results must be documented, and records must be maintained in accordance with the requirements in 16. *Documentation*.

5.1 General Monitoring Requirements

Sterile compounding facilities must be qualified initially using environmental air and surface sampling as described below to establish a baseline level of environmental quality. After initial qualification, the environment in which sterile compounding activities are performed must be monitored regularly to ensure that the environment remains suitable for sterile compounding.

Environmental monitoring involves the collection and review of environmental samples from various air and surface locations to detect airborne and surface contaminants. Data from sampling are then used to assess airborne nonviable particulate and microbial contamination risks, potential routes of contamination, and the adequacy of disinfection procedures. Data collected from environmental sampling must be reviewed regularly to detect elevated levels of microbial bioburden, elevated levels of nonviable particulates, or other adverse changes within the environment.

Data from air and surface sampling must be reviewed in conjunction with personnel data to assess the state of environmental control and to identify CSP contamination risks. Prompt corrective action in response to any adverse data is essential to maintain the necessary environmental quality for CSP preparation. Data must also be reviewed following corrective actions to confirm that the actions taken have been effective in achieving the required air and surface quality levels (see *Table 3* and *Table 5*).

Routine environmental sampling during compounding operations must be conducted to confirm that the environmental quality in ISO-classified areas is maintained. Sampling also must be performed in any of the following circumstances.

- As part of the certification of new facilities and equipment
- As part of recertification, following any servicing of facilities or equipment (see 4. *Buildings and Facilities*)
- In response to identified problems (e.g., sterility failures; a complaint of patient infection when the CSP is considered to be a potential source of the infection)
- In response to identified trends (e.g., repeated positive fingertip sampling results or failed media fill simulations; repeated observations of air or surface contamination)

The sampling program must include: 1) nonviable airborne particulate sampling; 2) viable airborne particulate sampling; and 3) surface sampling, including but not limited to equipment, work surfaces, and room surfaces.

To obtain an environmental sample that is representative of the full operating conditions at the facility, environmental air sampling (both viable and nonviable) must be conducted during periods of typical activity (i.e., when compounding is occurring). However, the sampling program must be designed and conducted in a manner that minimizes the chance that the sampling itself will contribute to contamination of the CSP, the operator, or the environment.

The sampling program must be developed based on an understanding of risk factors, including but not limited to criticality of the environment sampled, number and types of activities conducted in the room being monitored, maximum number of personnel that may be working in the room at one time, and how the CSPs will be exposed to the immediate environment during compounding. The sampling program must contain a listing of the sample locations, procedures for collecting samples, frequency of sampling, size of sample (e.g., surface area, volume of air), time of day sampled in relation to activities in the compounding area, and levels that will trigger corrective action. Sampling timing and locations should be carefully selected based on their relationship to the operation performed in the area. Sampling locations, frequencies, and timing must be clearly described in a facility's established Standard Operating Procedure (SOP). It is important to sample locations posing the most contamination risk to the CSP (i.e., the PEC), and sampling locations should be selected that are likely to be representative of the conditions throughout the area.

Graphic presentation of the results collected over a period of time can be useful in identifying trends, or for indicating that a significant change has occurred, even when the results fall within the specified limits.

It is important that personnel be trained in the proper operation of the air sampling equipment used to ensure reproducible sampling. All air sampling devices must be serviced and calibrated at appropriate intervals (i.e., as recommended by the manufacturer).

5.2 Monitoring Air Quality for Nonviable Airborne Particles

Because maintaining appropriate air quality is essential to the overall contamination prevention strategy for sterile compounding, it is imperative that all engineering control equipment function as designed and that the levels of airborne particles remain within acceptable limits during compounding operations (see *Table 3*). A monitoring program for nonviable airborne particles must be developed and implemented to measure the performance of the engineering controls that are being used to provide the specified levels of air cleanliness (e.g., in the PEC and ISO Class 7 and 8 areas).

AIR SAMPLING TIMING AND LOCATIONS

Air sampling sites must be selected in all classified areas. Measurements of air cleanliness must be taken in each PEC, at locations where there is greatest risk to the exposed CSPs, containers, and closures. Measurements of air cleanliness in other classified areas, including the buffer area and ante-area, should be taken at representative locations that reflect the quality of air in the area. When conducting sampling of the PEC, care should be taken to avoid disturbing the unidirectional airflow.

Total particle counts of all ISO-classified areas must be conducted during typical operations every 6 months.

DATA EVALUATION AND ACTION LEVELS

If levels measured during the nonviable air sampling program exceed the criteria in *Table 3* for the appropriate ISO classification levels of the area sampled when measured under typical operating conditions, an investigation of the cause must be conducted and corrective action must be taken to prevent future deviations. When nonviable air sampling results for an ISO Class 5 PEC exceed the criteria in *Table 3*, all compounding activities must cease in that PEC and a corrective action plan must be implemented immediately. When nonviable air sampling

results for ISO Class 7 or 8 areas exceed the criteria in *Table 3*, a corrective action plan must be implemented immediately. In such a case, if compounding is continued, the BUDs for any CSPs compounded must not exceed the BUDs for Category 1 CSPs until the area is successfully recertified. Some examples of corrective action include a procedural improvement, such as enhanced disinfection; a process or facility improvement; or HEPA filter replacement or repair. The extent of the investigation should be consistent with the type of excursion, and should include an evaluation of trends.

5.3 Monitoring Air Quality for Viable Airborne Particles

An environmental sampling program for viable airborne particles must be developed and implemented to assess microbiological air quality in all classified areas. The goals of an environmental sampling program are to determine whether contamination is present at unacceptable levels and to assess whether proper personnel practices are being followed and proper environmental conditions maintained.

AIR SAMPLING TIMING AND LOCATIONS

Air sampling sites must be selected in all classified areas. When conducting sampling of the PEC, care should be taken to avoid disturbing unidirectional airflow. See *Box 5-1* for active air sampling procedures. Active air sampling of all ISO-classified areas must be conducted during typical operating conditions at least monthly. Active air sampling is required in each ISO-classified area (e.g., PEC and ISO Class 7 and 8 areas). A general microbiological growth medium that supports the growth of bacteria and fungi, such as trypticase soy agar (TSA) or soybean-casein digest medium, must be used. Samples must be incubated at 20°–25° for 5–7 days and then at 30°–35° for 2–3 additional days. A microbiological incubator that is monitored to maintain the required temperature must be used to incubate the samples. The microbiological incubator must be placed in a location outside of a cleanroom or segregated compounding area. All sampling activities must be performed by properly trained individuals.

Box 5-1 Active Air Sampling Procedures for Viable Airborne Monitoring

- Decontaminate sampling equipment according to the manufacturer's instructions and handle aseptically.
- When media are brought into an ISO-classified area, wipe the wrapping with sterile 70% IPA using a low-lint sterile wipe before removing the media from their packaging.
- Examine media used to collect samples for damage or contamination, and handle in an aseptic manner. Discard contaminated or damaged media and conduct an investigation to determine the cause of the damage or contamination. If a damaged sampling device or packaging is identified (e.g., cracks or foreign bodies on the media surface, or discoloration), examine the entire lot of devices from that vendor to determine whether other devices are damaged or contaminated.
- Using an active air sampling device, test at least 1 cubic meter or 1,000 liters of air from each area sampled.
- At the end of the designated sampling, retrieve the medium and cover it to protect it from external contamination. Protect media from physical damage and keep at appropriate temperatures during transport to the incubator.
- Invert the media plates and incubate the medium at 20°–25° for 5–7 days and then at 30°–35° for 2–3 additional days.
- Examine the media plates for growth daily during normal business hours and record the total number of discrete colonies of microorganisms as CFU per cubic meter of air on an environmental sampling form based on sample type, sample location, and sample date.

DATA EVALUATION AND ACTION LEVELS

Evaluate counts against the action levels in *Table 4*, and examine counts in relation to previous data to identify adverse results or trends. If levels measured during the viable air sampling program reach or exceed the levels in *Table 4*, corrective actions must be taken, including repeat air sampling. If a CFU count is identified below the action levels in *Table 4*, primary screening and characterization must be performed (see *Microbial Characterization, Identification, and Strain Typing* (1113)). Highly pathogenic microorganisms (e.g., gram-negative rods, coagulase positive staphylococcus, molds and yeasts) are potentially fatal to patients receiving CSPs and must be immediately remedied through cleaning and disinfection, regardless of CFU count. If levels measured during viable air sampling exceed the levels in *Table 4*, the genus must be identified, and when possible, identify the species of any microorganism recovered, with the assistance of a credentialed microbiology laboratory.

Table 4. Action Levels for Viable Airborne Particle Air Sampling^a

ISO Class	Air Sampling Action Levels (CFU/m ³) ^b
5	≥1
7	≥10
8	≥100
<p>^a Guidance for Industry: Sterile Drug Products Produced by Aseptic Processing—Current Good Manufacturing Practice—US Dept of Health and Human Services, Food and Drug Administration, (FDA) September 2004.</p> <p>^b All action levels must be based on sampling in the vicinity of exposed materials/articles during compounding operations.</p>	

5.4 Sampling Surfaces for Contamination

Surface sampling is an important component of the maintenance of a suitably controlled environment for compounding CSPs, especially because transfer of microbial contamination from improperly disinfected work surfaces via inadvertent touch contact by compounding personnel is a potential source of contamination of CSPs. Surface sampling is useful for evaluating facility and work surface cleaning and disinfecting procedures, and employee competency in work practices such as cleaning and disinfection of component/vial surfaces.

Surface sampling for microbial contamination must be performed in all ISO-classified areas. All sampling sites and procedures must be described in the facility’s SOP.

SAMPLING TIMING AND LOCATIONS

When conducted, surface sampling must be performed at the conclusion of compounding activities, but before the area has been cleaned and disinfected. Media used for surface sampling must be supplemented with additives to neutralize the effects of any residual disinfecting agents (e.g., TSA with lecithin and polysorbate 80).

Multiple locations must be sampled at least monthly within each ISO-classified area, including the following (see (1116)):

- The interior of the PEC and equipment contained in it
- Staging or work areas near the PEC
- Frequently touched surfaces

- Pass-through chambers

SAMPLING PROCEDURES

Contact sampling devices (e.g., plates, paddles, or slides) containing microbial growth media must be used for sampling flat surfaces. Sterile swabs wetted with sterile water can be used when sampling irregular surfaces and difficult-to-reach locations in classified areas, such as crevices, corners, and spaces between surfaces.

Surface sampling devices must contain general microbial growth media (e.g., soybean casein digest media) supplemented with neutralizing additives (e.g., lecithin and polysorbate 80). Use a surface sampling device (e.g., plates, paddles, or slides) in the size range of 24- to 36-cm². Contact sampling devices must be certified by the manufacturer to meet growth promotion tests in *Microbial Enumeration Tests* (61). Contact plates must have a raised convex surface. Plates must be stored according to the manufacturer's recommendation. See *Box 5-2* for the procedures for conducting surface sampling with contact sampling devices. Follow the manufacturer's instructions for using sampling swabs.

Box 5-2 Using Devices for Flat Surface Sampling

- Examine media used to collect samples for damage or contamination and handle in an aseptic manner. Discard contaminated or damaged media and conduct an investigation to determine the cause of the damage or contamination. If a damaged sampling device or packaging is identified (e.g., cracks or foreign bodies on the media surface, or discoloration), examine the entire lot of devices from that vendor to determine whether other devices are damaged or contaminated.
- If using commercially prepared devices, wipe the wrapping with sterile 70% IPA using a low-lint sterile cloth before removing the devices from their packaging.
- Remove the cover from the contact sampling device and firmly press the media surface onto the surface to be sampled. The contact sampling device will leave a residue of growth medium on the sample site. After sampling, use a low-lint sterile wipe to thoroughly clean the sampled area with sterile water and disinfect with sterile 70% IPA.
- After exposure, cover each contact sampling device to protect it from further contamination.
- Invert the plates and incubate the contact sampling devices at 20°–25° for 5–7 days and then at 30°–35° for 2–3 additional days.
- Examine the sampling devices for growth daily during normal business hours, and record the observed count at each time point. At the final time point, record the total number of discrete colonies of microorganisms (CFU/sample) on the environmental sampling record based on sample type, sample location and sample date.

DATA EVALUATION AND ACTION LEVELS

If levels measured during surface sampling exceed the criteria in *Table 5*, an investigation of the cause must be conducted and corrective action must be taken to prevent future deviations. When surface sampling results for an ISO Class 5 PEC exceed the criteria in *Table 5*, all compounding activities must cease in that PEC. When surface sampling results for ISO Class 7 or 8 areas exceed the criteria in *Table 5*, a corrective action plan must be implemented immediately. In such a case, if compounding is continued, the BUDs for any CSPs compounded must not exceed the BUDs for Category 1 CSPs until the surfaces are retested and the results fall below action levels in *Table 5*. Some examples of corrective action include a procedural, facility, or equipment improvement. The extent of the investigation should be consistent with

the type of excursion and should include an evaluation of trends.

Table 5. Action Levels for Surface Sampling

ISO Class	Work Surfaces Sampled Using Contact Plates (CFU/plate) ^a	Work Surfaces Sampled Using Swabs (CFU/25 cm ² or per sample) ^a	Non-work Surfaces Sampled Using Contact Plates (CFU/plate) ^b	Non-work Surfaces Sampled Using Swabs (CFU/25 cm ² or per sample) ^b
5	>3	>3	N/A ^c	N/A ^c
7	>5	>5	>10	>10
8	>25	>25	>50	>50
<p>^a Work surfaces are those surfaces that are in direct contact with materials used in compounding. These action levels are based on the expectation that materials will be disinfected before introduction to an ISO Class 5 area.</p> <p>^b Non-work surfaces are those surfaces that do not come into direct contact with materials used in compounding.</p> <p>^c All surfaces within the ISO Class 5 area are considered work surfaces.</p>				

6. CLEANING AND DISINFECTING COMPOUNDING AREAS

Surfaces in compounding areas are a major source of microbial contamination of CSPs. Therefore, scrupulous attention must be paid to cleaning and disinfection. Cleaning and disinfecting the surfaces in sterile compounding areas must occur on a regular basis at the intervals noted in *Table 6*. Cleaning and disinfection must be repeated when spills occur; when surfaces, floors, and walls are visibly soiled; and when microbial contamination is known to have been, or is suspected of having been, introduced into the compounding areas.

If compounding is done less frequently than the cleaning frequencies specified below (e.g., once a week or once a month), cleaning must occur before each compounding session begins, instead of according to the frequencies described in *Table 6*.

Table 6. Minimum Frequency for Cleaning and Disinfecting Surfaces in Classified and Segregated Compounding Areas

Site	Minimum Frequency
PEC (except for an isolator)	At the beginning and end of each shift; before each batch; no longer than 30 minutes following the previous surface disinfection when ongoing compounding activities are occurring; after spills; and when surface contamination is known or suspected
Isolator (as defined in 4. Buildings and Facilities)	Clean the isolator each time it is opened; decontaminate the isolator once it is closed after each time it has been opened, or after each cleaning cycle, if cleaning occurs without opening
Work surfaces outside the PEC (e.g., buffer area and/or segregated compounding area)	Daily
Floors	Daily
Walls	Monthly
Ceilings	Monthly
Storage shelving	Monthly

6.1 Disinfectants

Cleaning and disinfection agents must be selected and used with careful consideration of compatibilities, effectiveness, and inappropriate or toxic residues (see *Appendix 2 and Disinfectants and Antiseptics* (1072)). The selection and use of disinfectants must be guided by microbicidal activity, inactivation by organic matter, residue, and shelf life. Sporicidal agents must be used at least weekly to clean all ISO-classified and segregated compounding areas (see *Disinfectants and Antiseptics* (1072), *Classification of Disinfectants, Table 2, General Classification of Antiseptics, Disinfectants, and Sporicidal Agents*).

The frequency, methods, and locations of disinfection agent use must be established in written SOPs, in accordance with the manufacturer's instructions, and followed by environmental services (i.e., custodial) or compounding personnel.

6.2 Cleaning Tools

All cleaning tools (e.g., wipes, sponges, and mop heads) must be sterile and low-lint, preferably composed of synthetic microfibers and dedicated for use in buffer or ante-areas or segregated compounding areas. All cleaning tools must be cleaned and re-sterilized after each use. They must be discarded after an appropriate amount of time, to be determined based on the condition of the materials. Disposal must involve collecting them in suitable plastic bags and removing them from classified and segregated compounding areas, with minimal agitation so as not to disperse contaminants into the air.

6.3 Cleaning and Disinfecting Floors, Ceilings, Walls, and Shelving

Floors in all ISO-classified and segregated compounding areas should be cleaned by mopping with a cleaning and disinfection agent once daily at a time when no aseptic operations are in progress. Mopping should be in the direction of clean to dirty areas. Mopping must be performed by trained personnel using approved agents and procedures, which must be described in written SOPs. In all ISO-classified and segregated compounding areas, the walls, ceilings, and shelving must be cleaned and disinfected monthly.

6.4 Cleaning and Disinfecting Work Surfaces

For both Category 1 and Category 2 CSPs, cleaning and disinfecting work surfaces in the PEC are the most critical steps before preparing CSPs. These surfaces must be cleaned and disinfected more frequently than other surfaces such as walls and ceilings. With the exception of isolators (as defined in 4. *Buildings and Facilities*), all surfaces in the PEC must be cleaned at the beginning and end of each work shift; no longer than 30 minutes following the previous surface disinfection when ongoing compounding activities are occurring; when there are spills; and when surface contamination is known or suspected from procedural breaches. Additionally, surfaces in the PEC in direct contact with materials used in compounding must be cleaned before starting each batch of CSPs. When using an isolator, cleaning must be done when the isolator is opened. Decontaminate the isolator once it is closed after each time it has been opened, or after each cleaning cycle, if cleaning occurs without opening. See *Box 6-1* for a summary of procedures for cleaning and disinfecting visibly soiled areas in the PEC.

Box 6-1 Procedures for Cleaning and Disinfecting Visibly Soiled Areas in the PEC

- Remove all items on the surface and remove loose material and residue from spills using a suitable cleaning agent.
- Use sterile water for injection or irrigation and sterile low-lint wipes to remove water-soluble solid residues.
- Wipe the affected area with a disinfectant (e.g., sterile 70% IPA).
- Allow the surface to dry before beginning compounding.

Work surfaces in the buffer, ante, and segregated compounding areas must be cleaned and disinfected at least daily, and storage sites for compounding ingredients and supplies must remain free from dust and debris. This must be achieved using a method that does not diminish the ISO Class 7 or 8 air quality.

6.5 Cleaning and Disinfecting Compounding Supplies

No shipping or other external cartons are allowed into the buffer or ante-areas or segregated compounding areas. Before compounding supplies are introduced into buffer areas, they must be wiped with a suitable disinfectant (e.g., sterile 70% IPA) that is delivered from a spray bottle or other suitable delivery method. After the disinfectant is sprayed or wiped on the surface to be disinfected, the disinfectant must be allowed to dry, during which time the item cannot be used.

6.6 Disinfecting Critical Sites

Critical sites (e.g., vial stoppers, ampul necks, and intravenous bag septums) must be disinfected by wiping them with sterile 70% IPA swabs that are commercially available in individual foil-sealed packages (or a comparable method). The IPA must be allowed to dry before piercing stoppers with sterile needles or breaking the necks of ampuls. The sterile 70% IPA swabs used for disinfecting critical sites and devices must not contact any other object before contacting the critical site.

7. EQUIPMENT AND COMPONENTS

7.1 Equipment

The equipment used for compounding CSPs must be of appropriate design and adequate size. The equipment also must be of suitable composition such that the surfaces that contact

components are not reactive, additive, or sorptive, and therefore, will not affect or alter the purity of the CSP. Equipment in direct contact with the CSP and container-closure system must be sterilized and depyrogenated using methods appropriate for the equipment and container-closure system (see 8. *Sterilization and Depyrogenation*, and *Sterilization and Sterility Assurance of Compendial Articles* (1211), *Methods of Sterilization*).

Equipment must be suitably located to facilitate sterile compounding operations. It must be consistently capable of operating properly and within acceptable tolerance limits. Compounding personnel must establish, maintain, and follow written procedures for the calibration, maintenance, and use of the equipment, as well as monitoring it for proper function. Personnel must also maintain results from equipment calibration, annual maintenance reports, and other routine maintenance records in accordance with the requirements in 16. *Documentation*.

Automated compounding devices (ACDs) are designed to streamline the labor-intensive processes involved in the compounding of multiple-ingredient preparations (e.g., parenteral nutrition) by automatically delivering the individual ingredients in a predetermined sequence under computerized control. ACDs can improve the accuracy and precision of the compounding process, compared with manual compounding methods.

When using ACDs, compounding personnel must conduct an accuracy assessment of the ACD each day it is used to compound CSPs. The volume and weight accuracy of the ACD must be determined, based on manufacturer recommendations, to ensure that the correct quantities of ingredients are delivered to the final container. The precision of the ACD can be monitored based on an assessment of day-to-day variations in its accuracy measures. Compounding personnel must keep a daily record of the accuracy measures and must review the results at least weekly to identify trends over time.

7.2 Components

Compounding personnel must establish, maintain, and follow written procedures for the selection and inventory control of all CSP components, including all ingredients (i.e., bulk active pharmaceutical ingredients (APIs) and inactive ingredients), containers, and closures. These written procedures must be followed for all components, from receipt to consumption.

COMPONENT SELECTION

Compounders must use qualified vendors. A vendor is qualified when there is evidence to support its ability to supply a material that consistently meets all quality specifications. Qualification must include an evaluation of the vendor's reputation and reliability.

Ingredients that are the subject of a *USP* or *NF* monograph must be used when available. APIs used in compounding must be manufactured by an FDA-registered facility. Each API must be accompanied by a valid COA that includes the specifications and test results and shows that the API meets the monograph, if one exists, and any additional specifications required to appropriately compound the CSP. Other bulk ingredients should be accompanied by a valid COA that shows that the ingredient meets the monograph, if one exists, and any additional specifications for the ingredient.

When ingredients other than APIs cannot be obtained from an FDA-registered facility, compounders must use professional judgment in selecting an acceptable and reliable source. When ingredients are obtained from an unregistered facility, the compounder must establish the identity, strength, purity, and quality of the ingredients obtained from that supplier by

reasonable means. These means may include checking each lot of the component when received, or periodically verifying quality by testing a sample of components obtained from that supplier to determine whether the COAs for ingredients sourced from that supplier accurately reflect the characteristics of the ingredients.

When components of compendial quality are not obtainable, components of high quality such as those that are chemically pure, analytical reagent grade, or American Chemical Society (ACS)-certified may be used. However, these components should be used cautiously because the standards for analytical reagents or ACS-grade materials do not consider whether the presence of any impurity raises human or animal safety concerns.

Careful consideration and evaluation of nonsterile ingredient sources is especially warranted when the CSP will be administered into the vascular system, central nervous system, or eyes.

Each lot of commercially available sterile, depyrogenated containers and container-closure systems must be accompanied by a COA or other documentation showing conformance with established specifications.

COMPONENT RECEIPT

Upon receipt of each lot of a component, a visual inspection must be performed to ensure that the ingredient appears to be what it is represented to be; the lot must also be examined for evidence of deterioration and other aspects of unacceptable quality. Facility personnel must verify the labeling and condition of the component [e.g., whether the outer packaging is damaged and whether temperature-sensing indicators show that the component has been exposed to excessive temperature(s)].

Analytical results in the vendor-supplied COA for each lot of incoming ingredient must be inspected against the compounding facility's current specification sheet to ensure that the acceptance criteria are met. If there is a compendial monograph for any ingredient received, facility personnel must verify that the COA for the ingredient demonstrates that the ingredient has met the acceptance criteria of all specified monograph tests for that lot and includes the test results.

Any ingredients found to be of unacceptable quality must be promptly rejected, clearly labeled as rejected, and segregated to prevent their use before appropriate disposal. Any other lots of that ingredient from that vendor must be examined to determine whether other lots have the same defect.

The date of receipt by the compounding facility must be clearly and indelibly marked on each ingredient package, except for finished dosage forms obtained from FDA-registered manufacturers. For each ingredient, information including receipt date, quantity received, supplier's name, lot number, expiration date, and results of any in-house or third-party testing performed must be recorded. Compounding personnel must keep a written record of each shipment of components received, in accordance with the recordkeeping requirements described in *16. Documentation*.

COMPONENT EVALUATION BEFORE USE

Before use, all components must be re-inspected. Ingredient packages must be inspected to detect container breaks, looseness of the cap or closure, and deviation from the expected appearance, aroma, and texture of the contents that might have occurred during storage.

Sterile container-closures and sterile devices must be visually inspected to ensure that they are free from defects that could compromise sterility, and are otherwise suitable for their intended use.

Compounding personnel must ascertain before use that ingredients for CSPs are of the correct identity and appropriate quality and have been stored under appropriate conditions. The following information should be used to make this determination: prescription or medication order, compounding record, master formulation record (if used), vendor labels and COAs, product labeling, and knowledge of the compounding facility storage conditions and practices.

If the correct identity, purity, strength, and sterility of ingredients and other components intended for preparation of CSPs cannot be confirmed (e.g., containers of ingredients with incomplete labeling, unlabeled syringes, opened ampuls, punctured vial stoppers, flexible intravenous bags), they must be promptly rejected, clearly labeled as rejected, and segregated to prevent their use before appropriate disposal.

COMPONENT HANDLING AND STORAGE

All components must be handled and stored in a manner that prevents contamination, mix-ups, and deterioration. Ingredients must be stored in tightly closed containers under temperature, humidity, and lighting conditions consistent with those indicated in official monographs or specified by the suppliers/manufacture. Moisture-sensitive ingredients must be stored in tight, well-closed containers.

Packages of ingredients that lack a vendor's expiration date must not be used after 1 year from receipt by the compounding facility, unless appropriate inspection and testing indicates that the ingredient has retained its purity and quality for use in CSPs.

For information on handling and storage of hazardous drugs, see (800).

8. STERILIZATION AND DEPYROGENATION

Each CSP must be sterile and pyrogen-free before release. When selecting the sterilization method for each CSP, personnel must take into consideration the nature of the components, its physical and chemical properties, and the intended container-closure system. The sterilization method used must sterilize the CSP while maintaining its physical and chemical stability (i.e., appropriate strength, purity, quality), and the packaging integrity of the CSP. Utensils and materials in direct contact with the components, the CSP, and the container-closure system must be sterilized and depyrogenated using appropriate methods (see *Sterilization of Compendial Articles* (1229)). If sterilization and depyrogenation of container-closure systems is performed on site, the efficacy of each process must be established and documented, and the process must be shown to be reproducible. CSPs that are terminally sterilized are expected to use a process that achieves a sterility assurance level (SAL) of 10^{-6} . An SAL of 10^{-6} is equivalent to a probability that 1 unit in a million is nonsterile. Generally, an SAL value cannot be applied to CSPs that are aseptically filled into a sterile container following sterilization.

The following must be considered when selecting an appropriate sterilization method:

- Terminal sterilization (e.g., dry heat, steam, or irradiation) is the preferred method, unless the specific CSP or container-closure system cannot tolerate terminal sterilization.
- Filtration is not an option if compounding a suspension when the suspended particles

are removed by the filter being used, which could affect the strength of the CSP.

- Dry heat is not an option if a CSP component is labile when exposed to the temperatures used.
- Steam sterilization is not an option if moisture, pressure, or the temperatures used would degrade the CSP.

A description of the sterilization and depyrogenation process, including the temperature, pressure (if applicable), duration, and permissible load conditions for each cycle, must be included in the facility's written SOPs (see 9. *SOPS and Master Formulation and Compounding Records.*)

In addition, the SOPs must include a schedule and method for establishing and periodically verifying the effectiveness of the sterilization and depyrogenation methods selected, as well as the method for maintaining and cleaning the sterilizers and depyrogenation equipment.

The following sections provide general guidance on specific sterilization methods.

8.1 Sterilization by Filtration

See *Sterilizing Filtration of Liquids* (1229.4). Commercially available sterile filters must be certified by the manufacturer as suitable for pharmaceutical use when used to sterilize CSPs. Sterilizing filters must be sterile and pyrogen-free and have a nominal pore size of 0.2 or 0.22 μm . They must be certified by the manufacturer to retain at least 10^7 microorganisms of a strain of *Brevundimonas diminuta* per square centimeter of upstream filter surface area under conditions similar to those in which the CSPs will be filtered (i.e., pressure, flow rate, and volume filtered).

The person responsible for selecting the sterilization method must ascertain from appropriate information sources that the sterilizing-grade membrane filter selected is chemically and physically compatible with the specific formulation of the CSP. For example, CSPs containing water-miscible alcohols may cause undetectable damage to filter integrity and shrinkage of microorganisms to sizes smaller than the filter's nominal pore size.

The responsible person must ensure, directly or from appropriate documentation from the supplier, that the filters 1) are chemically and physically stable at the pressure and temperature conditions that will be used; 2) have enough capacity to filter the required volumes; and 3) will yield a sterile filtrate while maintaining pre-filtration pharmaceutical quality, including strength of ingredients of the specific CSP. The filter dimensions and the preparation to be sterilized by filtration should permit the sterilization process to be completed without the need for replacement of the filter during the process. When CSPs are known to contain excessive particulate matter, to maximize the efficiency of the final sterilizing filtration, a pre-filtration step should be performed using a filter of larger nominal pore size, or a separate filter of larger nominal pore size should be placed upstream of (i.e., prior to) the sterilizing filter to remove gross particulate contaminants before the CSP is passed through the sterilizing grade filter. Excessive particulate matter requiring a prefiltration step also could be a signal of an inappropriate formulation, and therefore the formulation and the process should be assessed to ensure that they are appropriate; if necessary, they should be modified. Filter units used to sterilize CSPs must be subjected to the manufacturers' recommended post-use integrity test, such as a bubble point test.

8.2 Sterilization by Steam Heat

See *Steam Sterilization by Direct Contact* (1229.1). The process of thermal sterilization using saturated steam under pressure (i.e., autoclaving) is the preferred method for terminal sterilization of aqueous preparations in their final, sealed container–closure system. Steam heat sterilization is not an option if moisture, pressure, or the temperatures used would degrade the CSP. Steam heat sterilization is also used to sterilize many components (e.g., elastomeric closures) and some types of equipment. To achieve sterility, all materials must be directly exposed to steam under adequate pressure for the length of time necessary, as determined by use of appropriate biological indicators, to render the items sterile (i.e., kill any microorganisms, including bacterial spores that might be present). This is usually between 20 and 60 minutes at 121° saturated steam under a pressure of 15 psi. The duration of the exposure period must include sufficient time for the CSP or other items to reach the sterilizing temperature. The CSP and other items must remain at the sterilizing temperature for the duration of the sterilization period. The sterilization cycle should be designed to achieve a SAL of 10^{-6} .

CSPs must be placed in suitable trays to allow steam to reach the CSPs without entrapment of air. Flat, stainless steel trays with low sides or ventilated bottoms will permit steam contact. When preparing plastic, glass, and metal devices or other items for steam sterilization, the items must be wrapped in low-lint protective fabric or paper or sealed in envelopes that will permit steam penetration and prevent post sterilization microbial contamination. Immediately before filling ampuls and vials that will be steam sterilized, solutions must be passed through a filter having a nominal pore size of not larger than 1.2 μm for removal of particulate matter.

Sealed containers must be able to generate steam internally. Stoppered and crimped empty vials must contain a small amount of moisture to generate steam. Deep containers, such as beakers and graduated cylinders, should be placed on their sides to prevent air entrapment, or should have a small amount of water placed in them when steam sterilized. Porous materials and those items with occluded pathways (e.g., tubing) should only be sterilized by steam if the autoclave chamber has suitable cycles for dry goods, such as a pre-vacuum process to remove air before steam is sent into the chamber. Elastomeric closures and many other dry goods will need a drying cycle after steam exposure to remove condensed or absorbed moisture.

The effectiveness of steam sterilization must be established and verified with each sterilization run or load by using appropriate biological indicators, such as spores of *Geobacillus stearothermophilus*, ATCC 12980, ATCC 7953 or equivalent (see *Biological Indicators for Sterilization* (1035)), and other confirmation methods such as physicochemical indicators and integrators (see *Sterilization—Chemical and Physicochemical Indicators and Integrators* (1209)).

The steam supplied must be free of contaminants and generated using clean water. The seals on the doors of autoclave chambers should be examined visually every day they are used for cracks or other damage, and the seal surfaces should be kept clean. A data recorder or chart must be used to monitor each cycle and to examine for cycle irregularities (e.g., deviations in temperature or pressure).

Because the temperatures used to achieve sterilization by steam heat are lower than those used to achieve depyrogenation, materials in direct contact with the CSP (e.g., the container–closure system) must first undergo a depyrogenation process (e.g., dry heat or rinsing with pyrogen-free water) before being sterilized using steam heat, unless the materials used are

certified to be pyrogen-free (see *Depyrogenation* <1228>).

8.3 Sterilization by Dry Heat

See *Dry Heat Sterilization* <1229.8>. Dry heat can be used only for those items that cannot be sterilized by steam or other means, when either the moisture would damage the material or the wrapping material is impermeable. Sterilization by dry heat requires higher temperatures and longer exposure times than sterilization by steam. The duration of the exposure period must include sufficient time for the CSP or other items to reach the sterilizing temperature. The CSP and other items must remain at the sterilizing temperature for the duration of the sterilization period.

Dry heat sterilization is usually done in an oven designed for sterilization at a temperature of 160° or higher, although sterilization processes at lower temperatures have been developed and validated. If lower temperatures are used, they must be shown to achieve effective sterilization (see *Dry Heat Sterilization* <1229.8>, *Validation of Dry Heat Sterilization*, *Biological Indicators*).

Heated air must be evenly distributed throughout the chamber, which is typically done by an air blower. The oven must be equipped with temperature controls and a timer. During sterilization, sufficient space must be left between materials to allow for good circulation of the hot air. A data recorder or chart must be used to monitor each cycle and the data must be reviewed to identify cycle irregularities (e.g., deviations in temperature or exposure time).

The effectiveness of the dry heat sterilization method must be established and verified with each sterilization run or load using appropriate biological indicators such as spores of *Bacillus atrophaeus*, ATCC 9372, (see <1035>) and other confirmation methods (e.g., temperature-sensing devices).

Because the temperatures used to achieve sterilization by dry heat are lower than those used to achieve depyrogenation, materials in direct contact with the CSP (e.g., the container-closure system) must first undergo a depyrogenation process (e.g., dry heat or rinsing with pyrogen-free water) before being sterilized using dry heat, unless the materials used are certified to be pyrogen-free (see <1228>).

8.4 Depyrogenation by Dry Heat

See <1228>. Dry heat depyrogenation must be used to render glassware and other thermostable containers pyrogen-free. Depyrogenation processes typically operate at a range of temperatures from approximately 170° up to about 400°, depending on the exposure time. For example, a typical cycle would hold the items at 250° for 30 minutes. The duration of the exposure period must include sufficient time for the items to reach the depyrogenation temperature. The items must remain at the depyrogenation temperature for the duration of the depyrogenation period.

The effectiveness of the dry heat depyrogenation cycle must be established and verified annually using endotoxin challenge vials (ECVs) to demonstrate that the cycle is capable of achieving a ≥ 3 -log reduction in endotoxins (see *Bacterial Endotoxins Test* <85>).

9. SOPS AND MASTER FORMULATION AND COMPOUNDING RECORDS

Every compounding facility must establish and follow written SOPs for sterile compounding. The

SOPs must ensure that the entire compounding operation is well designed, functions as designed, and will yield CSPs that are safe for administration to patients. The compounding process for CSPs must be described in SOPs.

A Master Formulation Record is required when CSPs are prepared in a batch for multiple patients or when CSPs are prepared from nonsterile ingredients. A Master Formulation Record documents the ingredients, specific procedures, equipment to be used, and testing required for each CSP. A Compounding Record is required for every CSP prepared and requires documentation by all individuals involved in the actual preparation of the CSP.

9.1 Creating and Following SOPs

Facilities preparing CSPs must develop SOPs on all aspects of the compounding operation. All personnel who conduct or oversee compounding activities must be trained in the SOPs and are responsible for ensuring that they are followed. All compounding personnel must:

- Be able to immediately recognize potential problems, deviations, or errors associated with preparing a CSP (e.g., related to equipment, facilities, materials, personnel, compounding process, or testing) that could potentially result in contamination or other adverse impact on CSP quality
- Report any problems, deviations, or errors to the compounding supervisor or designee, who must take corrective actions

Compounding supervisors must ensure that SOPs are appropriate and are fully implemented, which includes ensuring that staff demonstrate consistency and competency in performing every procedure that relates to their job function. Compounding supervisors must also ensure that appropriate follow-up occurs if problems, deviations, or errors are identified.

9.2 Creating Master Formulation Records

A Master Formulation Record must be created for CSPs prepared in a batch for multiple patients or for CSPs prepared from nonsterile ingredients. Any changes or alterations to the Master Formulation Record must be performed only by authorized personnel and must be documented. *Box 9-1* lists the information that must be included in a Master Formulation Record.

Box 9-1 Master Formulation Record

A Master Formulation Record must include at least the following information:

- Name, strength, and dosage form of the CSP
- Physical description of the final preparation
- Identities and amounts of all ingredients and appropriate container-closure systems
- Complete instructions for preparing the CSP, including equipment, supplies, and a description of the compounding steps
- BUD and storage requirements
- Quality control procedures (e.g., pH, filter integrity, and visual inspection)
- Sterilization method, if applicable (e.g., filter, steam, or dry heat)
- Any other information needed to describe the operation and ensure its repeatability (e.g., adjusting pH and tonicity and temperature)

9.3 Creating Compounding Records

A Compounding Record must be created by the compounder preparing the CSP to document the compounding process. The Compounding Record or inventory control system must permit traceability of all ingredients. The Master Formulation Record (when used) can be used as the basis for preparing the Compounding Record. For example, a copy of the Master Formulation

Record can be made that contains spaces for recording the information needed to complete the Compounding Record. It is critical that the Compounding Record document in detail any deviations from the process outlined in the Master Formulation Record and any problems or errors experienced during the compounding of the CSP. *Box 9-2* lists the information that must be included in a Compounding Record.

Each Compounding Record must be reviewed and approved before the CSP is released (signature or initials and date).

Box 9-2 Compounding Records

Compounding Records must include at least the following information:

- Name, strength, and dosage form of the CSP
- Master Formulation Record reference for the preparation, when used
- Date and time of preparation of the CSP
- Assigned internal identification number (e.g., prescription or lot number)
- Signature or initials of individuals involved in each step (e.g., technician or pharmacist)
- Name, vendor or manufacturer, lot number, and expiration date of each ingredient and container–closure system
- Weight or measurement of each ingredient
- Documentation of the calculations made to determine and verify quantities and/or concentrations of components, if appropriate
- Documentation of quality control procedures in accordance with the SOP (e.g., filter integrity, pH, and visual inspection)
- Any deviations from the Master Formulation Record, if used, and any problems or errors experienced during the compounding of the CSP
- Total quantity compounded
- Assigned BUD
- Duplicate container label if prepared in a batch

10. RELEASE TESTING

At the completion of compounding, before release and dispensing, the CSP must be inspected as described below to determine whether the physical appearance of the CSP is as it should be and to confirm that the CSP and its labeling match the prescription or medication order.

The physical inspection described in *10.1 Physical Inspection of CSP* must be performed on all CSPs before they are released. In addition, sterility and bacterial endotoxin testing must be performed in some cases (see *12. Establishing Beyond-Use Dates and In-Use Times*), as described in *10.2 Sterility Testing* and *10.3 Bacterial Endotoxins Testing*. All checks and inspections, and any other tests or checks necessary to ensure the quality of the CSP (e.g., assays), must be included in the facility's SOP (see *9. SOPS and Master Formulation and Compounding Records*). Additional quality assurance and quality control activities are discussed in *13. Quality Assurance and Quality Control*.

10.1 Physical Inspection of CSP

After compounding, and as a condition of release, each individual CSP unit must be inspected to identify any apparent physical defect. Each individual injectable CSP unit must be inspected against a lighted white background and a black background for evidence of visible particulates or other foreign matter, or discoloration. Some CSPs also must be visually checked for certain characteristics (e.g., emulsions must be checked for phase separation). Pre-release inspection

also must include a visual inspection of container–closure integrity (e.g., checking for leakage, cracks in the container, or improper seals). CSPs with observed defects must be immediately discarded, or marked and segregated from acceptable units in a manner that prevents them from being released or dispensed.

When a CSP will not be released or dispensed promptly after preparation, a pre-release inspection must be conducted immediately before it is released or dispensed to make sure that the CSP does not exhibit any defects, such as precipitation, cloudiness, or leakage, which may develop during storage. A CSP with such defects must be immediately discarded, or marked and segregated from acceptable units in a manner that prevents it from being released or dispensed.

10.2 Sterility Testing

Category 1 CSP BUDs apply regardless of whether sterility testing is conducted (see *Table 7*). If a Category 2 CSP is assigned a BUD that requires sterility testing (see *Table 8*), the testing must be performed in a manner consistent with $\langle 71 \rangle$, with the exception, in some cases, of the batch sizes specified in *Sterility Tests* $\langle 71 \rangle$, *Table 3. Minimum Number of Articles to be Tested in Relation to the Number of Articles in the Batch*. If the number of units of CSPs to be prepared in a single batch is less than the number of units needed for testing, additional units may be required to be compounded to be able to conduct sterility testing. For batch sizes of 1–39 units, each sterility test must be performed using a number of units equal to 10% of the batch size, rounded up to the next whole number. For batch sizes of 40 or more units, the sample sizes specified in *Sterility Tests* $\langle 71 \rangle$, *Table 3* must be used.

When the CSP formulation permits, the Membrane Filtration method is the method of choice for sterility testing. The preferred alternative is the Direct Inoculation of the Culture Medium method; both methods are described in $\langle 71 \rangle$.

If sterility testing will be conducted, ideally the results should be obtained before dispensing to patient(s). If it is anticipated that there will be situations in which there may be an urgent need to dispense a CSP before the results of the sterility testing are known, a written procedure (SOP) must be developed and followed; this SOP must describe how these situations will be handled. In addition, this SOP must require frequent observation of the incubating test specimen and must require immediate recall of the dispensed CSP (if possible) or immediate notification of the patient’s prescriber, if any evidence of microbial growth is found during the test.

Positive sterility test results must prompt a rapid and systematic investigation into the causes of the sterility failure, including identification of the contaminating organism (at least to the genus level) and any aspects of the facility, process, or personnel that may have contributed to the sterility failure. The source of the contamination, if identified, must be corrected, and the facility should determine whether the conditions causing the sterility failure affect other CSPs. The investigation and resulting corrective actions must be documented.

10.3 Bacterial Endotoxins Testing

All Category 2 CSPs made from one or more nonsterile ingredients, except those for inhalation and topical ophthalmic administration, must be tested to ensure that they do not contain excessive bacterial endotoxins (see $\langle 85 \rangle$ and *Pyrogen Test* $\langle 151 \rangle$). A CSP does not need to be tested for bacterial endotoxins if the COA for the nonsterile ingredient lists the endotoxins

burden, or if the compounding facility has predetermined the endotoxins burden of the nonsterile ingredient and found it acceptable, and the material is stored under cool and dry conditions.

In the absence of a bacterial endotoxins limit in an official monograph or other CSP formula source, the CSP must not exceed the endotoxins limit calculated as described in (85) for the appropriate route of administration.

11. LABELING

CSPs must be labeled with adequate, legible identifying information to prevent errors during storage, dispensing, and use. The term labeling designates all labels and other written, printed, or graphic matter on an article's immediate container or on, or in, any package or wrapper in which it is enclosed, except any outer shipping container. The term label designates that part of the labeling on the immediate container. See *Labeling (7), Labels and Labeling for Products and Other Categories, Compounded Preparations*.

The label must, at a minimum, display prominently and understandably the following information:

- Assigned internal identification number (e.g., prescription or lot number)
- Brand and/or generic name(s), or active ingredient(s) and amounts or concentrations
- Dosage form
- Total amount, if it is not obvious from the container
- Storage conditions
- BUD and when appropriate, an in-use time (see *12. Establishing Beyond-Use Dates and In-Use Times*)
- Whether it is a single-dose or multiple-dose container
- Indication that the preparation is compounded

The labeling must, at a minimum, display prominently and understandably the following information:

- Patient name, or for animal drugs, owner's name and species of patient
- Route of administration, if known
- Any special handling instructions
- Any warning statements that are applicable
- Name, address, and contact information of the compounder if the CSP is to be sent outside of the facility in which it was compounded

Labeling operations must be controlled to prevent labeling errors and CSP mix-ups. A final check must be conducted to verify that the correct and complete label has been affixed to the finished CSP. All labels must also comply with applicable state laws and regulations.

12. ESTABLISHING BEYOND-USE DATES AND IN-USE TIMES

Each CSP label must state the date beyond which the preparation cannot be used and must be discarded. A CSP may also be labeled with an in-use time within which it must be used after it has been opened or punctured. A number of critical parameters must be considered before establishing these dates. It is also important to understand the various terms that are used in discussion of these dates.

12.1 Terminology

A number of terms are used to describe the time period during which a drug is considered to retain its desired characteristics so that it can be safely administered to a patient to achieve the desired therapeutic effect.

The expiration date identifies the time during which a conventionally manufactured drug product may be expected to maintain its labeled identity, strength, quality, and purity, provided it is kept under the labeled storage conditions. The expiration date limits the time during which a conventionally manufactured product may be dispensed or used. Expiration dates are determined based on product-specific studies that evaluate the specific formulation of a drug product in the specific container in which it is to be stored and under the conditions to which it could be exposed. Temperature, humidity, and light are some of the factors that can affect whether and how much a product degrades over time. An expiration date is determined by taking representative samples from batches and placing them in storage under controlled conditions and then testing them at scheduled intervals to determine whether they meet specifications throughout their labeled shelf lives. When an expiration date is stated only in terms of the month and the year, it is a representation that the intended expiration date is the last day of the stated month.

A BUD is included on the label of each CSP to indicate the date or date and hour after which the CSP must not be used, because its required quality characteristics (e.g., sterility, strength, purity) cannot be ensured. The term expiration date is not appropriate for CSPs, because the types of full stability studies conducted by manufacturers to establish expiration dates for conventionally manufactured products are not typically performed for CSPs. BUDs for CSPs are calculated in terms of hours or days.

An in-use time refers to the time before which a conventionally manufactured product or a CSP must be used after it has been opened or needle punctured (e.g., after a container closure of a vial has been penetrated).

12.2 Critical Parameters to Be Considered in Establishing a BUD

Time is a critical factor in establishing a BUD. The more time that passes between the compounding of a CSP and its administration to a patient, the greater the risk of harm to the patient if the stability or sterility of the CSP has been compromised. With respect to sterility, this is especially the case if microbial contamination is present from the outset. BUDs for CSPs should be established conservatively to ensure that the drug maintains its required characteristics until administration to reduce the risk to patients of receiving a contaminated or degraded preparation. Both sterility and stability considerations must be taken into account when establishing a BUD.

STERILITY CONSIDERATIONS

Microbial contamination of a CSP poses a significant risk to patients, and if the CSP is contaminated during preparation, the risk increases the longer the time the CSP is stored before administration.

When establishing a BUD for a CSP, it is critical that compounding personnel carefully consider all of the possible ways that the sterility of the CSP could be compromised over time. The following factors related to sterility must be carefully considered:

- Whether the CSP will be tested for sterility, and the results will be known, before the CSP is released or dispensed

- Whether the CSP will be terminally sterilized in its final container (provided the drug and its container–closure can withstand the terminal sterilization process) (see 8. *Sterilization and Depyrogenation*)
- Whether the CSP contains a preservative, or is inherently susceptible to microbial survival or growth, if contaminated
- Whether the container–closure system and sealing method will ensure the integrity of the CSP until administration to the patient

STABILITY CONSIDERATIONS

Over time, active ingredient(s) in a CSP may degrade, reducing the strength of the preparation and/or producing harmful impurities. Additionally, the container–closure system may degrade, which can lead to several potential deleterious effects, such as: 1) reducing the integrity of the CSP; 2) leaching of harmful chemicals into the preparation from the container–closure system; and/or 3) absorption of the active ingredient onto the container, thereby reducing potency. When establishing a BUD for a CSP, it is critical that compounding personnel carefully consider all of the possible ways that the physical or chemical characteristics of the CSP could change over time. The following issues must be carefully considered:

- The chemical and physical stability properties of the drug and/or its formulation (i.e., if the drug and its formulation are known to degrade over time and/or under certain storage conditions)
- The compatibility of the container–closure system with the finished preparation (e.g., consider leachables, interactions, and storage conditions of the components)

In addition:

- If the CSP includes components from conventionally manufactured product(s), the BUD of the CSP must not exceed the shortest remaining expiration date of any of the starting components.
- If the CSP includes components from other compounded preparations, the BUD of the final CSP must not exceed the shortest remaining BUD of any of the starting CSP components.

12.3 Establishing a BUD for a CSP

BUDs for CSPs must be established in accordance with *Table 7* for Category 1 CSPs and *Table 8* for Category 2 CSPs. The BUDs specified in the tables indicate the hours or days after the CSP is prepared and beyond which the CSP cannot be used. The BUD is determined from the time the CSP is compounded. One day is equivalent to 24 hours.

The BUDs in *Table 7* and *Table 8* for CSPs are based on the risk of microbial contamination, not the physical or chemical stability of the CSP, and involve the following assumptions:

- The CSP and its components can remain chemically and physically stable for the BUD period
- None of the factors identified in *12.2 Critical Parameters to Be Considered in Establishing a BUD*, would require a shorter BUD

If there is any indication, based on the factors described in *12.2. Critical Parameters to be Considered in Establishing a BUD*, that the particular CSP formulation will not remain chemically or physically stable for the specified period, a shorter BUD must be assigned based on the time period during which the CSP is expected to remain chemically and physically stable.

Table 8 establishes the longest permitted BUDs for Category 2 CSPs, based the following variables:

METHOD OF ACHIEVING STERILITY

Because terminal sterilization using a verified method provides reasonable assurance that a CSP will be sterile, *Table 8* allows longer BUDs for CSPs that are terminally sterilized and not sterility tested than for aseptically prepared CSPs that are not sterility tested. Not all CSPs can be terminally sterilized, and if the CSP is aseptically prepared (e.g., using only sterile products or sterilized by filtration), the shorter BUDs in *Table 8* for aseptically prepared CSPs that are not sterility tested must not be exceeded.

STARTING COMPONENTS

An aseptically prepared CSP compounded from one or more nonsterile starting component has a higher risk of microbial contamination than an aseptically prepared CSP compounded only from sterile starting components. *Table 8* allows for longer BUDs for CSPs aseptically prepared from only sterile starting components.

WHETHER THE CSP WILL BE STERILITY TESTED AND THE RESULTS KNOWN BEFORE THE DRUG IS RELEASED OR DISPENSED

Sterility testing (see *10.2 Sterility Testing*) before releasing or dispensing a CSP can provide additional assurance of the absence of contamination. When the results of sterility testing are known before dispensing, a longer BUD is permitted in *Table 8*. If sterility testing is not performed, a shorter BUD is required in *Table 8*.

If a sterility test is performed and there is an urgent need to dispense the CSP before sterility test results become available, a CSP can be dispensed to a patient before the end of the sterility testing period if:

- The prescriber specifically requests dispensing before completion of the sterility test, and the request is documented
- The patient and the prescriber are notified of any microbial growth during the sterility testing. The species of microbial contaminant is reported to the prescriber to ensure appropriate medical therapy following exposure to a contaminated CSP

PRESENCE OF A PRESERVATIVE

Although a preservative must not be considered a substitute for good aseptic practices, preservatives can be added to multiple-dose CSPs because they may inhibit the growth of microorganisms for short periods of time. If a CSP contains a preservative whose effectiveness for the length of the BUD has been verified based on antimicrobial effectiveness testing (see *Antimicrobial Effectiveness Testing* (51)), the BUD in *Table 8* for a CSP containing a preservative can be assigned. Shorter BUDs are required for preservative-free CSPs, as compared to CSPs that contain a verified preservative.

The particular CSP formulation must pass antimicrobial effectiveness testing in accordance with (51) at the completion of the sterility test (if conducted) or at the time of preparation (if sterility testing is not performed). The test must be completed and the results obtained on the specific formulation before any of the CSP is released or dispensed. The test needs to be conducted only once on each formulation in the particular container-closure system in which it will be stored or released/dispensed.

STORAGE CONDITIONS

The specified conditions under which a CSP will be stored are important in determining an appropriate BUD. Storage in a refrigerator or in a freezer (see *Packaging and Storage Requirements* (659)) has been shown to slow the growth of microorganisms. Therefore, *Tables 7 and 8* allow for longer BUDs for CSPs stored in colder conditions than when stored at controlled room temperature.

Storage under frozen conditions places the container–closure under physical stress, and the degree of stress may depend on the formulation and other factors. Therefore, if a Category 2 CSP is to be stored in a freezer, the integrity of the CSP in the particular container–closure system in which it will be stored must have been demonstrated for 45 days at frozen storage. A container–closure integrity test needs to be conducted only once on each formulation and fill volume in the particular container–closure system in which it will be stored or released/dispensed. Once the CSP is thawed, the CSP must not be re-frozen.

It must be recognized that CSPs may be stored under different storage conditions before they are used (e.g., they may first be frozen, and then thawed in the refrigerator, and finally kept at controlled room temperature before administration). The storage time of a CSP must not exceed the original BUD placed on the CSP for its labeled storage conditions, and BUDs are not additive. For example, a CSP cannot be stored for 4 days at controlled room temperature, then 7 days refrigerated, and then 45 days in a freezer, for a total of 56 days. Once a CSP is stored under a condition that would require a shorter BUD (i.e., controlled room temperature), the CSP must be used within the shorter timeframe for that storage condition (in this example, 4 days).

Table 7. BUDs for Category 1 CSPs^a

	Storage Conditions	
	Controlled Room Temperature (20°–25°)	Refrigerator (2°–8°)
BUD	≤12 hours	≤24 hours
^a The BUDs specified in the table indicate the hours after the Category 1 CSP is prepared beyond which the CSP cannot be used. The BUD is determined from the time the CSP is compounded.		

Table 8. BUDs for Category 2 CSPs^a

		Preparation Characteristics		Storage Conditions			
	Method of Achieving Sterility	Sterility Testing Performed	Preservative Added	Controlled Room Temperature (20°–25°)	Refrigerator (2°–8°)	Freezer (–25° to –10°) ^b	
BUD	Aseptically prepared CSPs	No	No	Prepared from one or more nonsterile starting component 4 days	Prepared from one or more nonsterile starting component 7 days	Prepared from one or more nonsterile starting component 45 days	
				Prepared from only sterile starting components 6 days	Prepared from only sterile starting components 9 days	Prepared from only sterile starting components 45 days	
		Yes	No	Yes ^c	28 days	42 days	45 days
				No	28 days	42 days	45 days
			Yes ^d	Yes ^d	42 days	42 days	45 days
				No	14 days	28 days	45 days
	Terminally Sterilized CSPs	No	Yes ^c	28 days	42 days	45 days	
			No	28 days	42 days	45 days	
		Yes	Yes ^d	42 days	42 days	45 days	
			No	14 days	28 days	45 days	

^a The BUDs specified in the table indicate the days after the Category 2 CSP is prepared beyond which the CSP cannot be used. The BUD is determined from the time the CSP is compounded. One day is equivalent to 24 hours.

^b The integrity of the container–closure system with the particular CSP in it must have been demonstrated for 45 days at frozen storage. The container–closure integrity test needs to be conducted only once on each formulation in the particular container–closure system in which it will be stored or released/dispensed.

^c The particular CSP formulation must pass antimicrobial effectiveness testing in accordance with (51) at the time of preparation. The test must be completed and the results obtained on the specific formulation before any of the CSP is dispensed. The test needs to be conducted only once on each formulation in the particular container–closure system in which it will be stored or released/dispensed.

^d The particular CSP formulation must pass antimicrobial effectiveness testing in accordance with (51) at the completion of sterility test (i.e., 14 days after preparation). The test must be completed and the results obtained on the specific formulation before any of the CSP is dispensed. The test needs to be conducted only once on each formulation in the particular container–closure system in which it will be stored or released/dispensed.

12.4 Establishing In-Use Times

The in-use time is the time before which a conventionally manufactured product or a CSP must be used after it has been opened or needle-punctured. The in-use time assigned cannot exceed the expiration date of the conventionally manufactured product or the BUD of a CSP. The in-use time may be dependent on the type of product or CSP and the environment where the manipulations occur (e.g., ISO Class 5, or worse than ISO Class 5). *Table 9* specifies the in-use times for conventionally manufactured products and CSPs that are opened, stored, and used for sterile compounding in ISO Class 5 or better air quality. *Table 10* specifies the in-use times for conventionally manufactured products and CSPs that are opened and/or stored in worse than ISO Class 5 air quality.

Table 9. In-Use Times for Conventionally Manufactured Products and CSPs Opened, Stored, and Used for Sterile Compounding in ISO Class 5 or Better Air Quality

Components	In-Use Time
Conventionally Manufactured Sterile Product	
Ampuls	Use <i>immediately</i> after opening and passing through a sterile particulate filter
Pharmacy Bulk Package	As specified by the manufacturer
Single-dose container (e.g., bag, bottle, syringe, or vial)	6 hours
Multiple-dose container	28 days, unless otherwise specified by the manufacturer
CSP	
Compounded single-dose container	6 hours
Compounded stock solutions	6 hours
Compounded multiple-dose container ^a	28 days, unless otherwise specified by the original compounder
<p>^a The particular CSP formulation must pass antimicrobial effectiveness testing in accordance with (51) at the completion of the sterility test (if conducted) or at the time of preparation (if sterility testing is not performed). The test must be completed and the results obtained on the specific formulation before any of the CSP is released or dispensed. The test needs to be conducted only once on each formulation in the particular container-closure system in which it will be stored or released/dispensed.</p>	

Table 10. In-Use Times for Conventionally Manufactured Products and CSPs Opened and/or Stored in Worse than ISO Class 5 Air^a

Components	In-Use Time
Conventionally Manufactured Sterile Product	
Ampuls	Use <i>immediately</i> after opening and passing through a sterile particulate filter
Pharmacy Bulk Package	Not applicable. Contents of pharmacy bulk packages must be used only in an ISO Class 5 or better environment.
Single-dose container (e.g., bag, bottle, syringe, vial)	Use for a single patient within the time specified by the manufacturer, or by the end of the case or procedure, whichever comes first. Discard remainder.
Multiple-dose container	28 days, unless otherwise specified by the manufacturer
CSP	
Compounded single-dose container	Use for a single patient immediately. Discard remainder.
Compounded multiple-dose container ^b	28 days, unless otherwise specified by the original compounder
<p>^a Compounding or repackaging must not occur in worse than ISO Class 5 air.</p> <p>^b The particular CSP formulation must pass antimicrobial effectiveness testing in accordance with (51) at the completion of the sterility test (if conducted) or at the time of preparation (if sterility testing is not performed). The test must be completed and the results obtained on the specific formulation before any of the CSP is released or dispensed. The test needs to be conducted only once on each formulation in the particular container-closure system in which it will be stored or released/dispensed.</p>	

13. QUALITY ASSURANCE AND QUALITY CONTROL

A quality assurance (QA) and quality control (QC) program is necessary to ensure that consistently high-quality CSPs are prepared. QA is a set of written processes that, at a minimum, verifies, monitors, and reviews the adequacy of the compounding process. QC is the observation of techniques and activities that demonstrate that requirements are met.

Each facility must have a formal, written QA and QC program that establishes a system of adherence to procedures, prevention and detection of errors and other quality problems, and appropriate corrective actions when needed. A facility’s QA program must be formally established and documented in SOPs that ensure that all aspects of the preparation of CSPs are conducted in accordance with this chapter and applicable federal, state, and local laws and regulations.

The QA program must, at a minimum, address the following functions:

- Personnel qualifications and training:
 - Periodically review personnel files for each employee to determine whether personnel continue to meet basic qualifications, are obtaining required training, and are getting qualified and requalified in accordance with the specified frequencies (e.g., gloved fingertip/thumb sampling)
 - Assess staff performance, including aseptic techniques, cleanroom behavior, and

other critical activities (e.g., media-fill testing)

- Component selection and handling:
 - Carefully select, and ensure ongoing qualification of suppliers and service providers (e.g., chemical vendors and external testing laboratories)
 - Select ingredients that are the subject of a *USP* or *NF* monograph and that are manufactured at an FDA-registered facility, when available
 - Inspect incoming components against their COAs to ensure that they meet their specifications
 - Quarantine, properly dispose of, and investigate components that do not meet their specifications
- Design and maintenance of the building, facility, and equipment:
 - Review the adequacy of the design of the building, facility, and equipment; when changes are made, assess their effects to make sure they do not adversely affect the operation (e.g., certification)
 - Ensure that facilities and equipment used in compounding are installed, operated, and maintained properly per appropriate and pre-established specifications
 - Detect adverse trends in environmental monitoring data to take preventive action and corrective action
- Compounding process:
 - Approve Master Formulation Records (when used), or any changes to them, before they are implemented
 - Review Compounding Records for accuracy, completeness, and conformance to established specifications
 - Review final labeling against prescription or medication orders
 - Ensure that all errors, process problems, or deviations from procedures are documented
 - Investigate any error, deviation, out-of-specification result, or complaint, and implement, oversee, and document appropriate corrective action to prevent recurrence
- Final CSP release:
 - Assess the final CSP before release (e.g., physical inspection, sterility testing, and analytical testing)
 - Review internal or external testing programs (if used) for conformance with applicable standards (e.g., sterility testing and endotoxin testing)
- Documentation:
 - Establish SOPs and assess conformance to SOPs
 - Establish and assess conformance with document control and records management procedures
 - Establish, maintain, and follow written procedures for handling all written and oral complaints regarding a CSP

The roles and duties of personnel responsible for each aspect of the QA program must be described in the SOPs. Designated personnel responsible for the QA program must have adequate training, experience, responsibility, and authority to perform these duties.

The overall QA program must be assessed annually.

14. CSP STORAGE, HANDLING, PACKAGING, AND TRANSPORT

Appropriate processes or techniques for storing, handling, packaging, and transporting CSPs must be in place and must also be outlined in SOPs. Personnel who will be storing, handling, packaging, and transporting CSPs within the facility must be properly trained in accordance with the relevant SOPs.

14.1 Storing CSPs within the Compounding Facility

To help ensure that CSP quality is retained while the CSP is stored at the compounding facility, compounding personnel must monitor conditions in the drug storage areas. A controlled temperature area must be checked at least once daily to determine whether the temperature remains within the appropriate range, and the results must be documented on a temperature log. If the compounding facility uses a continuous temperature recording device, compounding personnel must verify at least once daily that the recording device is functioning properly. In addition, the compounding facility must adhere to appropriate procedures for all controlled temperature areas to ensure that such spaces are not subject to prolonged temperature fluctuations (e.g., by leaving a refrigerator door open too long).

When it is known that a CSP has been exposed to temperatures that exceed storage temperature limits, (i.e., temperatures warmer than the warmest labeled limit or temperatures exceeding 40° for more than 4 hours), the CSP should be discarded.

14.2 Handling of CSPs

CSPs must be handled properly while in the compounding facility to maintain CSP quality and packaging integrity. For example, techniques should be in place to prevent the depression of syringe plungers or dislodging of syringe tips. Additionally, disconnection of system components (e.g., where CSPs are dispensed with administration sets attached to them) must be prevented throughout the BUD or until administration of the CSP.

14.3 Packaging of CSPs

Compounding personnel must select and use packaging materials that will maintain the physical integrity, sterility, and stability of the CSPs. Packaging materials must protect CSPs from damage, leakage, contamination, degradation, and adsorption, while simultaneously protecting transport personnel from harm. The facility must have written SOPs that describe appropriate shipping containers and insulating and stuffing materials based on the product specifications, information from vendors, and knowledge of the mode of transport. For example, when CSPs are transported within the facility through pneumatic tube systems, foam padding or inserts may be useful for preventing breakage and spills. Compounding personnel must continuously monitor the effectiveness and reliability of the packaging materials.

Alternative modes of transport and/or special packaging may be needed to protect the quality of CSPs. The use of tamper-evident closures and seals on CSP ports can provide an additional measure of security that can help ensure product integrity, regardless of the transport method used. If the CSP is sensitive to light, light-resistant packaging materials must be used. In some cases, the CSP should be packaged in a special container (e.g., a cooler) to protect it from temperature fluctuations.

14.4 Transporting CSPs

Compounding personnel must select modes of transport that are expected to deliver properly

packed CSPs in an undamaged, sterile, and stable condition. Inappropriate handling and transport can adversely affect the quality of CSPs in general, particularly certain CSPs with unique stability concerns. For example, the physical shaking that might occur during pneumatic tube transport, or undue exposure to heat or light, must be considered and addressed on a preparation-specific basis. Compounding personnel must include specific handling instructions on the exteriors of containers that are used to transport CSPs.

14.5 Handling of Hazardous Drugs

For information on the storage, packaging, handling, and transport of hazardous drugs, see (800).

15. COMPLAINT HANDLING AND ADVERSE EVENT REPORTING

Compounding facilities must provide patients and other CSP recipients with a way to submit questions and report any concerns or complaints they may have regarding a CSP. SOPs must be developed, implemented, and followed for the receipt, acknowledgment, and handling of all complaints about the quality and labeling of, or possible adverse reactions to, a specific CSP.

15.1 Complaint Handling

A qualified individual must review all complaints to determine whether the complaint indicates a potential quality problem with the CSP. If so, a thorough investigation into the cause of the problem must be initiated and completed promptly. The investigation must consider whether the quality problem extends to other batches of the same CSP, or to other CSPs that could have been affected. Corrective action, if necessary, must be implemented immediately for all potentially affected CSPs. When warranted, consider whether to initiate a recall of potentially affected CSPs and whether to cease sterile compounding operations until all underlying problems have been identified and corrected.

A written record of each complaint must be kept, regardless of the source (e.g., e-mail, telephone, mail). The record must contain the name of the complainant, the date the complaint was received, the nature of the complaint, and the response to the complaint. In addition, to the extent that the information is known, the following should be recorded: the name and strength of the CSP, the prescription or medication order number, and the lot number, if one is assigned. The record must also include the findings of any investigation and any follow-up. Complaint records must be easily retrievable for review and evaluation for possible trends and must be retained in accordance with the recordkeeping requirements in *16. Documentation*. A CSP that is returned in connection with a complaint must be quarantined until it is destroyed after completion of the investigation and in accordance with applicable federal, state, and local laws and regulations.

15.2 Adverse Event Reporting

Reports of potential adverse events involving a CSP must be reviewed promptly and thoroughly by compounding personnel. The reports must be handled in accordance with the procedures for handling complaints as described in section *15.1 Complaint Handling*, as well as the record retention requirements described in *16. Documentation*. Relevant healthcare professionals and patients must be informed as appropriate. If required, adverse events must be reported in accordance with applicable state and local laws and regulations. In addition, serious or unexpected adverse events associated with a CSP should be reported to the FDA through the

MedWatch program for human drugs and Form FDA 1932a for animal drugs.

16. DOCUMENTATION

All facilities where CSPs are prepared must have and maintain written documentation to demonstrate compliance with this chapter, including all SOPs, Master Formulation Records (when used), Compounding Records, laboratory and equipment records, prescriptions or medication orders, and all information related to complaints.

All records must be legible and stored in a manner that prevents their deterioration and/or loss. Records can be kept electronically. Records must be maintained either at the facility or at another location that is readily accessible within a reasonable period of time.

All records specific to the compounding of a particular CSP (e.g., Master Formulation Record, Compounding Record, and testing results) must be kept for at least 3 years after the BUD of the CSP, or as required by state laws and regulations, whichever is longer. Facility design and initial qualification records must be kept as long as the facility is in operation. All other records must be kept for at least 3 years, or as required by state laws and regulations, whichever is longer. Examples include records related to personnel training and qualification, equipment maintenance and calibration, receipt of components, environmental monitoring, complaints, and quality assurance.

Recordkeeping must also comply with all applicable federal laws and regulations.

17. RADIOPHARMACEUTICALS AS CSPS

Radiopharmaceuticals are associated with risks of radiation exposure to healthcare practitioners and unintentional radiation exposure to patients. Compounding of radiopharmaceuticals must comply with applicable federal, state, and local laws and regulations such as those from the Nuclear Regulatory Commission (NRC), FDA, and State Boards of Pharmacy.

Unless done in strict conformance with the manufacturer's package insert, any further use or handling and manipulation of conventionally manufactured radiopharmaceutical product is considered compounding and must follow the standards in this chapter and applicable federal, state, and local laws and regulations. Radiation exposures must be kept as low as reasonably achievable (the ALARA principle). Therefore, appropriate shielding must be used to help minimize radiation exposure. Additional equipment needed for radiation control when compounding may include, but is not limited to:

- Radiation detectors
- Static and handheld monitors
- Handheld monitors
- Lead (or other appropriate) shielding
- Shielded waste cans
- Non-shedding absorbent mats
- L-Blocks
- Tongs
- Syringe, vial, and elution shields
- Syringe re-cappers
- Final unit dose containment shielding
- Dose calibrators

- Dippers and dipper lifts

Radioisotope generator systems (e.g., Tc-99m/Mo-99, Rb-82/Sr-82, Ga-68/Ge-68) must be stored and eluted (operated) under conditions recommended by the manufacturer and applicable state and federal regulations. The generators must be eluted in an ISO Class 8 or cleaner air environment that allows special generator shielding, airflow requirements, and the use of lifting devices (e.g., cranes and/or wenchers) due to the weight of the generator and shielding. Radioisotope generators producing radioisotopes with a half-life of 15 minutes or less (e.g., Rb-82/Sr-82) can be eluted in accordance with the manufacturer's instructions at the point of care (e.g., at the bedside or in the patient care area). Visual inspection of radiopharmaceutical CSPs containing high concentrations of radioactivity (e.g., for color and absence of particulate material) must be performed in accordance with ALARA principles to limit acute and chronic radiation exposure of the inspecting personnel.

All compounding personnel must be properly gowned and garbed as described in *3. Personal Hygiene and Personal Protective Equipment*. However, personnel compounding radiopharmaceuticals are permitted to use personal radiation dosimeters. Personal radiation dosimeters can be film, thermoluminescent, or electronic. Whole-body badge radiation dosimeters must be worn underneath the gown, whereas ring/wrist badges that measure the dose at the extremities must be worn under gloves. If personnel are going from a cleanroom to a patient care area, all PPE must be changed before leaving one area and entering the other.

When compounding activities require the manipulation of a patient's blood-derived or other biological material (e.g., radiolabeling of white blood cells), the manipulation must be performed in a separate, dedicated ISO Class 7 area that contains a PEC. All blood manipulations in the radiolabeling process, except for the centrifuge steps, must be performed inside the dedicated PEC. Dedicated equipment must be used for all blood manipulations. Strict SOPs must be developed and implemented to minimize the risk of patient-to-patient cross-contamination.

Some radiopharmaceutical preparations (e.g., volatile or gaseous preparations such as iodine or xenon) may require pressurization configurations that are different from those described in *4. Buildings and Facilities*. In these cases, the facility must comply with applicable federal, state, and local laws and regulations.

Nonradioactive compounds may be compounded in the same compounding area in which radioactive compounds have been prepared, provided the following takes place:

- The ISO Class 5 area is decontaminated and monitored for radioactivity above background levels.
- The dose calibrator is left inside the PEC.
- The PEC is operated in accordance with all the standards in this chapter when nonradioactive CSPs are being prepared.

GLOSSARY

Airlock: A space with interlocked doors, constructed to maintain air pressure control when items move between two adjoining areas (generally with different air cleanliness standards). The intent of an airlock is to prevent ingress of particulate matter and microbial contamination from a lesser-controlled area.

Ante-area: An ISO Class 8 or cleaner area where personnel hand hygiene and garbing procedures and other activities that generate high particulate levels are performed. The ante-

area is the transition area between the unclassified area of the facility and the buffer area. [Note—The ante-area is sometimes referred to as an ante-room when solid doors and walls are present.]

Aseptic processing or preparation: A process by which separate, sterile components (e.g., drugs, containers, or closures) are brought together under conditions that maintain their sterility. The components can either be purchased as sterile or, when starting with nonsterile components, can be separately sterilized prior to combining (e.g., by membrane filtration, autoclave).

Batch: More than one unit of CSP prepared in a single process and intended to have uniform characteristics and quality, within specified limits.

Beyond-use date (BUD): The date or time after which a CSP cannot be used and must be discarded. The date or time is determined from the date or time when the preparation was compounded.

Biological safety cabinet (BSC): A ventilated cabinet with unidirectional HEPA-filtered airflow and HEPA-filtered exhaust to protect the worker from hazardous drugs. A BSC used to prepare a CSP must be capable of providing an ISO Class 5 environment for preparation of the CSP.

Buffer area: An ISO Class 7 (or ISO Class 8 if using an isolator) or cleaner area where the PEC that generates and maintains an ISO Class 5 environment is physically located.

Category 1 CSP: A CSP assigned a BUD of 12 hours or less at controlled room temperature or 24 hours or less refrigerated.

Category 2 CSP: A CSP assigned a BUD of greater than 12 hours at controlled room temperature or greater than 24 hours refrigerated that is compounded in accordance with all applicable standards for Category 2 CSPs in this chapter.

Certificate of analysis (COA): A report from the supplier of a component, container, or closure that accompanies the supplier's material and contains the specifications and results of all analyses and a description of the material.

Classified space: A space that maintains an air cleanliness classification based on the International Organization for Standardization (see also definition for ISO Class).

Cleanroom: An ISO-classified room in which the concentration of airborne particles is controlled to meet a specified airborne-particulate cleanliness class to prevent particle and microbial contamination of CSPs.

Compounded sterile preparation (CSP): A preparation intended to be sterile that is created by combining, diluting, pooling, or otherwise altering a drug product or bulk drug substance. A product produced by reconstituting a conventionally manufactured product for an individual patient strictly in accordance with the directions contained in the approved labeling provided by the product manufacturer is not considered a CSP for the purposes of this chapter.

Compounding aseptic containment isolator (CACI): A type of RABS that uses HEPA filtration to provide an ISO Class 5 clean air environment designed for the compounding of sterile hazardous drugs.

Compounding aseptic isolator (CAI): A type of RABS that uses HEPA filtration to provide an ISO Class 5 clean air environment designed for compounding of sterile non-hazardous drugs.

Compounded stock solution: A compounded solution to be used in the preparation of multiple units of a finished CSP.

Container–closure system: The sum of packaging components that together contain and protect the dosage form. This includes primary packaging components and secondary packaging components, if the latter are intended to provide additional protection.

Conventionally manufactured product: A pharmaceutical dosage form, usually the subject of an FDA-approved application, and manufactured under current good manufacturing practice conditions. Conventionally manufactured products are not compounded preparations.

Critical site: A location that includes any component or fluid pathway surfaces (e.g., vial septa, injection ports, and beakers) or openings (e.g., opened ampuls and needle hubs) that are exposed and at risk of direct contact with air (e.g., ambient room or HEPA filtered), moisture (e.g., oral and mucosal secretions), or touch contamination.

Direct compounding area: A critical area within the ISO Class 5 PEC where critical sites are exposed to unidirectional HEPA-filtered air, also known as first air.

Disinfectant: A chemical agent used on inanimate surfaces and objects to destroy fungi, viruses, and bacteria, but not necessarily their spores.

Expiration date: Date placed on a conventionally manufactured product to limit the time during which it can be used.

Filter integrity test: A test (e.g., bubble point test) of the integrity of a sterilizing grade filter performed after the filtration process to detect whether the integrity of the filter has been compromised.

First air: The air exiting the HEPA filter in a unidirectional air stream.

Hazardous drug: Any drug identified by at least one of the following six criteria: carcinogenicity, teratogenicity or developmental toxicity, reproductive toxicity in humans, organ toxicity at low dose in humans or animals, genotoxicity, or new drugs that mimic existing hazardous drugs in structure or toxicity.

In-use time: The time before which a conventionally manufactured product or a CSP must be used after it has been opened or needle punctured (e.g., after a container closure of a vial has been penetrated).

ISO Class: An air quality classification from the International Organization for Standardization.

Isolator: An enclosure that provides HEPA-filtered ISO Class 5 unidirectional air operated at a continuously higher pressure than its surrounding environment and is decontaminated using an automated system. It uses only decontaminated interfaces or rapid transfer ports for materials transfer.

Label: A display of written, printed, or graphic matter on the immediate container of any article.

Labeling: All labels and other written, printed, or graphic matter that are 1) on any article or any of its containers or wrappers, or 2) accompanying such an article.

Laminar airflow system (LAFS): A device or zone within a buffer area that provides an ISO Class 5 or better environment for sterile compounding. The system provides a unidirectional

HEPA-filtered airflow.

Laminar airflow workbench (LAFW): A device that is a type of LAFS that provides an ISO Class 5 or better environment for sterile compounding. The device provides a unidirectional HEPA-filtered airflow.

Media fill test: A simulation used to qualify processes and personnel engaged in sterile compounding to ensure that the processes and personnel are able to produce sterile CSPs without microbial contamination.

Microbial contamination: The presence of microorganisms in, or on, an item.

Multiple-dose container: A container of sterile medication for parenteral administration (e.g., injection or infusion) that is designed to contain more than one dose of the medication. A multiple-dose container is usually required to meet the antimicrobial effectiveness testing criteria. See *Container Content for Injections (697)*, *Determination of Volume of Injection in Containers*, *Multi-Dose Containers*.

Pass-through: An enclosure with seals on interlocking doors that are positioned between two spaces for the purpose of minimizing particulate transfer while moving materials from one space to another.

Pharmacy bulk package: A conventionally manufactured sterile product for parenteral use that contains many single doses intended for use in a pharmacy admixture program. A pharmacy bulk package may either be used to prepare admixtures for infusion or, through a sterile transfer device, for the filling of empty sterile syringes.

Positive-pressure room: A room that is maintained at higher pressure than the adjacent spaces, and therefore the net airflow is out of the room.

Primary engineering control (PEC): A device or zone that provides an ISO Class 5 environment for sterile compounding.

Preservative: A substance added to inhibit microbial growth or to prevent decomposition or undesirable chemical changes.

Pyrogen: A substance that induces a febrile reaction in a patient.

Pyrogen-free: A substance lacking sufficient endotoxins or other fever-inducing contamination to induce a febrile or pyrogenic response.

Quality assurance (QA): A system of procedures, activities, and oversight that ensures that operational and quality standards are consistently met.

Quality control (QC): The sampling, testing, and documentation of results that, taken together, ensure that specifications have been met before release of the preparation.

Reconstitution: The process of adding a diluent to a powdered medication to prepare a sterile solution or suspension.

Release testing: Testing performed to ensure that a preparation meets appropriate quality characteristics.

Repackaging: The act of removing a conventionally manufactured sterile product from its original primary container and placing it into another primary container, usually of smaller size.

Responsible person: The individual accountable for an activity.

Restricted access barrier system (RABS): An enclosure that provides HEPA-filtered ISO Class 5 unidirectional air that allows for the ingress and/or egress of materials through defined openings that have been designed and validated to preclude the transfer of contamination, and that generally are not to be opened during operations. Examples of RABS include CAIs and CACIs.

Segregated compounding area: A designated, unclassified space, area, or room that contains a PEC and is suitable for preparation of Category 1 CSPs only.

Single-dose containers: A container of sterile medication for parenteral administration (e.g., injection or infusion) that is designed for use with a single patient as a single injection/infusion. A single-dose container usually does not contain a preservative.

Specification: The tests, analytical methods, and acceptance criteria to which a drug substance, drug product, CSP, component, container-closure system, equipment, or other material used in drug preparation must conform to be considered acceptable for its intended use.

Stability: The extent to which a CSP retains physical and chemical properties and characteristics within specified limits throughout its BUD.

Sterility: The freedom from viable microorganisms.

Sterility testing: A documented and established laboratory procedure for detecting viable microbial contamination in a sample or preparation.

Sterilizing-grade membranes: Filter membranes that are documented to retain 100% of a culture of 10^7 microorganisms of a strain of *Brevundimonas diminuta* per cm^2 of membrane surface under a pressure of not less than 30 psi. Such filter membranes are nominally 0.22- μm or 0.2- μm pore size.

Sterilization by filtration: Passage of a gas or liquid through a sterilizing-grade membrane to consistently yield filtrates that are sterile.

Terminal sterilization: The application of a lethal process (e.g., dry heat, steam, irradiation) to sealed containers for the purpose of achieving a predetermined SAL of greater than 10^{-6} or a probability of less than one in one million of a nonsterile unit.

Unclassified space: A space not required to meet any air cleanliness classification based on the International Organization for Standardization (ISO).

Unidirectional airflow: Air within a PEC moving in a single direction in a uniform manner and at sufficient speed to reproducibly sweep particles away from the direct compounding area or testing area.

Verification: Confirmation that a method, process, or system will perform as expected under the conditions of actual use.

APPENDICES

Appendix 1. Acronyms

ACD	Automated compounding device
ACPH	Air changes per hour
ALARA	As low as reasonably achievable
API	Active pharmaceutical ingredient
BSC	Biological safety cabinet
BUD	Beyond-use date
CACI	Compounding aseptic containment isolator
CAI	Compounding aseptic isolator
CFU	Colony-forming units
COA	Certificate of analysis
CSP	Compounded sterile preparation
ECV	Endotoxin challenge vial
FDA	Food and Drug Administration
HEPA	High-efficiency particulate air
HVAC	Heating, ventilation, and air conditioning
IPA	Isopropyl alcohol
ISO	International Organization for Standardization
LAFS	Laminar airflow system
LAFW	Laminar airflow workbench
NRC	Nuclear Regulatory Commission
PEC	Primary engineering control
PPE	Personal protective equipment
QA	Quality assurance
QC	Quality control
RABS	Restricted access barrier system
SAL	Sterility assurance level
SOP	Standard operating procedure
TSA	Trypticase soy agar

Appendix 2. Common Disinfectants Used in Health Care for Inanimate Surfaces and Noncritical Devices, and Their Microbial Activity and Properties^a

Chemical Category of Disinfectant							
		Isopropyl Alcohol	Accelerated Hydrogen Peroxide	Quaternary Ammonium (e.g., dodecyl dimethyl ammonium chloride)	Phenolics	Chlorine (e.g., sodium hypochlorite)	Iodophors (e.g., povidone-iodine)
Concentration Used		60%–95%	0.5% ^b	0.4%–1.6% aq	0.4%–1.6% aq	100–5000 ppm	30–50 ppm
Microbial Inactivation ^c	Bacteria	+	+	+	+	+	+

BRIEFING

(1039) **Chemometrics.** The purpose of this new general chapter is to summarize and incorporate, into one document, the concepts and practices of chemometrics, which are emerging in the pharmaceutical industry and the relevant fields. The concepts of chemometrics span the areas of chemical analysis and physical analysis of drugs, excipients, dietary supplements, and food ingredients. This chapter is an above-1000 guidance that describes the best practices for incorporation of chemometric models into the lifecycle of the analytical procedure. Key concepts such as method development, validation, and maintenance of these models are described, and an overview of relevant tools and applications is provided.

1. INTRODUCTION

1.1 Scope and Purpose

This chapter provides guidance regarding scientifically sound practices for the chemometric analysis and interpretation of typical multivariate data for compendial and industrial applications. Established chemometric practices, including calibration and validation, and applications within different analytical technologies (e.g., spectroscopic, chromatographic, and others) and for different purposes (e.g., fingerprinting, identification, classification, properties prediction, and others) are discussed in some detail and under a lifecycle approach. Both qualitative and quantitative applications are described.

The chapter discusses how method quality and performance are ensured through the proper lifecycle management of a chemometrics-based model, including the selection of appropriate algorithms, calibration, validation, verification, transfer, and ongoing maintenance steps. This chapter may be viewed as a supplement to other guidance chapters such as *Analytical Data—Interpretation and Treatment* (1010), which are mainly concerned with the analysis and interpretation of univariate data.

Note—It should not be inferred that the multivariate analysis tools mentioned in this chapter form an exhaustive list. Other equally valid models may be used at the discretion of the manufacturer and other users of this chapter.

1.2 Content Summary of Document

The mind map below (*Figure 1*) provides a visual representation of the content of this chapter. This diagram is meant to assist the reader by showing how the various concepts and practices of chemometrics relate to each other.

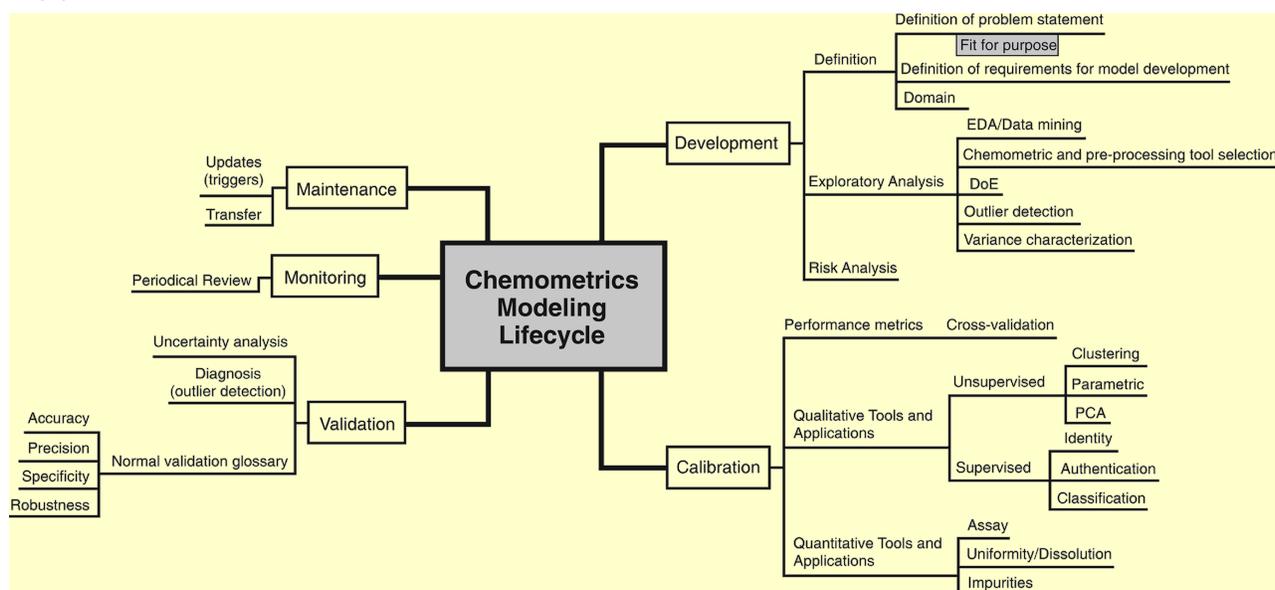

Figure 1. Content summary of document.

1.3 Audience

This chapter provides direction for both the chemometrician applying chemometric techniques to develop a model for a given application and the analyst that runs the model within an analytical procedure. The chemometrician will find support regarding algorithm selection for a given application and guidance for ensuring model performance throughout its lifecycle. The analyst will gain insight regarding the strengths and limitations of the chemometrics techniques as applied to support their applications.

2. WHAT IS CHEMOMETRICS?

Chemometrics was originally defined as the chemical discipline that uses mathematical, statistical, and other methods that employ formal logic to accomplish two objectives: 1) to design or select optimal measurement procedures and experiments, and 2) to provide the maximum amount of relevant chemical information by analyzing chemical data (1,2). More specifically, "chemometrics" has come to mean the application of multivariate methods for the analysis of chemical or related data, although the algorithms in question may be used to extract information out of almost any measured data, regardless of origin—chemical, physical, biological, pharmaceutical, or others. This chapter does not focus on the development of optimal procedures or methods and the applied design of experiments (DoE), but rather on the analysis of chemical sensor-based multidimensional data, such as spectroscopic and chromatographic data. A multivariate data set (i.e., multivariate data obtained for a number of samples or objects) forms an m by n data table or matrix. The matrix is represented by \mathbf{X} , with m as the number of samples or objects and n as the number of variables measured for each sample (Figure 2).

Consequently, the data analysis techniques considered in this chapter will be multivariate in nature. Depending on the purpose of the data treatment, different tools will be applied. Initially, the data handling techniques can be divided into two categories: unsupervised and supervised. The unsupervised tools use only the \mathbf{X} matrix to extract information, but in supervised data analysis, in addition to the \mathbf{X} matrix the samples are also described by a \mathbf{y} vector. This is an m

by 1 table containing property information for each sample (e.g., concentration, enzyme inhibition activity). The supervised data analysis techniques are used to build a model between the \mathbf{X} matrix and the \mathbf{y} vector. In chemometric modeling, the equations provided are data driven to empirically describe the underlying variance in the data for either unsupervised (i.e., qualitative) or supervised (i.e., quantitative) purposes. The different techniques or tools applied for the different purposes are discussed in more detail in 4. *Applications of Chemometrics*. The most commonly used unsupervised technique (principal component analysis, or PCA) and supervised technique (partial least squares regression, or PLS) are by nature projection approaches (see Figure 2), which transform a large number of potentially correlated \mathbf{X} variables, such as intensities at different retention times or wavelengths, into a possibly smaller number of uncorrelated variables (principal components, or PCs; latent variables). As can be seen in Figure 2, the original n -dimensional space was transformed to a two-PC space. When samples from the original data space are projected onto this lower-dimensionality space, the resulting sample coordinates are called scores (\mathbf{T}). Visualization of the scores along two or more PCs forms a score plot that contains information on the relationships among different samples. The loadings (\mathbf{P}) are a linear combination of the original variables and the coefficients or weights used in this linear combination. The loadings for specific latent variables also can be plotted in what is called a loading plot. The loading plot contains information on the relative importance among the original variables. Both scores and loading plots enable visualization and understanding of the underlying data structure (i.e., the presence of groups/clusters and/or outliers) within a reduced dimensional space. The variable matrix (\mathbf{E}) produced by the model is defined as the residual error. The sample information along axes of common variance is captured by the model's PCs. Variance unaccounted for by these PCs (residual error) is left for each sample at each variable, forming the residual matrix (\mathbf{E}).

$$\mathbf{X} = \mathbf{T}\mathbf{P}^T + \mathbf{E}$$

Data decomposition by projection:

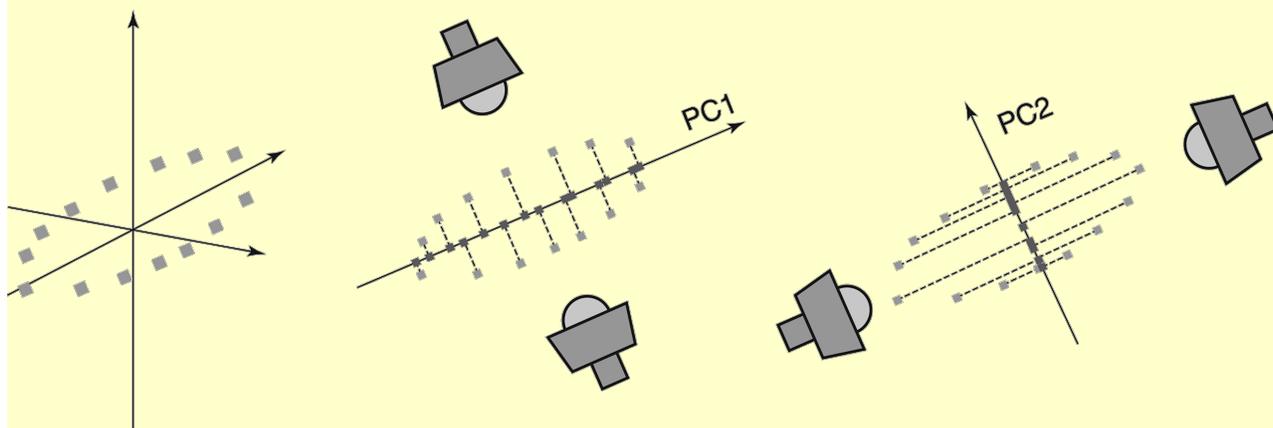

Figure 2. Schematic representation of chemometrics.

3. MODEL LIFECYCLE

The development of a chemometric model, as part of an analytical procedure, aims to fulfill a predefined, intended purpose. The intended purpose is typically a statement describing what to measure, the output format, and the level of performance needed with the result, and should be in accordance with the analytical target profile (ATP). The ATP may specify performance criteria for key characteristics of the analytical procedure output and/or decision risk probabilities expected in routine use of the analytical procedure.

Calibration of the model encompasses an iterative process that involves selection of the sample set to be used to develop the chemometric model, tuning of an appropriate chemometric algorithm with the necessary preprocessing algorithm, and evaluation of model performance according to predefined metrics for the ATP. During the validation stage, the method performance is demonstrated to fulfill the intended purpose and ATP. Both the knowledge gained during calibration and the assessment of specific metrics and corresponding limits are used to evaluate performance and define a method maintenance protocol that will be used for the monitoring stage, before deployment to routine use. Changes that may have an impact on model performance should trigger a defined set of activities to update it. Model update may also be triggered by the necessity of performing model transfer, in the course of its lifecycle, to different equipment or another site. The extent of the revalidation will be defined by the magnitude of the model update. *Figure 3* shows a schematic representation of the described workflow.

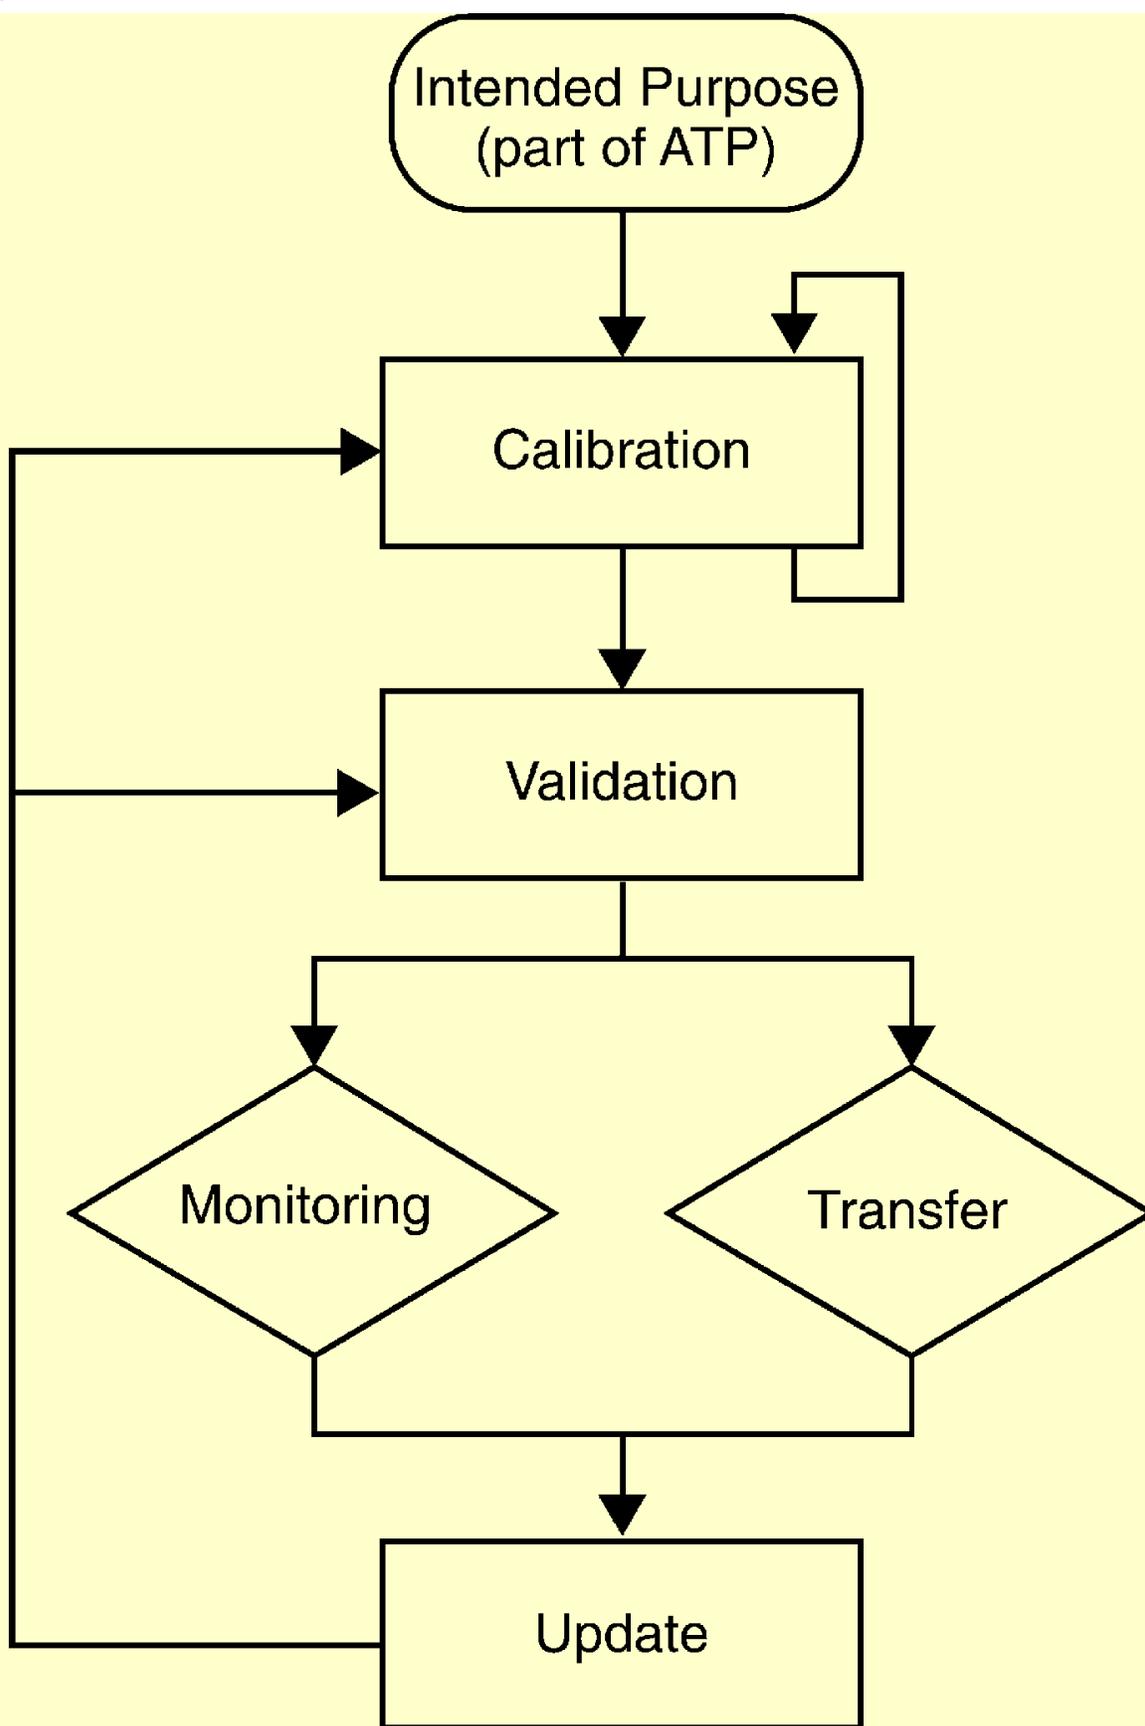

Figure 3. Schematic representation of the lifecycle workflow of a chemometric model.

3.1 Model Development: Calibration

The goal of multivariate calibration is to develop a statistical model that links predictor variables (e.g., absorbance values for the range of spectral wavelengths) with response variables such as concentrations of certain chemical compounds. Response variables are typically more difficult or costly to obtain than predictor variables. Calibration is a critical step because details of the final model are influenced by many factors including the selection of samples, variables, an algorithm, and preprocessing options, as well as the quality of the reference method initially used to measure the response variable(s). Thus, the order of individual components of model calibration presented in this section does not always represent the order of operation, and individual steps might be repeated in an iterative fashion depending upon the outcome of subsequent steps. To perform well, the calibration model should be robust to intended variations.

SAMPLE SELECTION

Selection of samples for the calibration model is a critical step in model development. Scientifically sound rationales must be used to select representative calibration samples with respect to two criteria: the type/range of variability, and the number of samples. The range of response values in selected samples should cover the entire expected range of response variation for the intended application. The range and type of variation in predictors may include relevant variability in factors other than the property being predicted, such as particle size, different lots of ingredients used for sample preparation, analyst-to-analyst and day-to-day variation, and other sources of variation. In the manufacturing setting, batches of samples representing within and outside specification should be included. A risk-based approach is recommended for deciding which factors and variability will be included in the calibration samples. Performing a failure mode and effect analysis (FMEA) or a feasibility study to evaluate the effects of such factors is one of the commonly used approaches.

The required number of samples increases as the complexity of the calibration model (i.e., the type and the range of variability in both response and predictor variables) increases. In general, the larger the number of samples, the higher the probability that correct results can be achieved given a uniform distribution of the samples throughout the range of calibration. However, obtaining new samples can be costly. The DoE and/or historical database approaches are commonly used to build calibration models.

Data obtained from selected samples should undergo further triage. Exploratory data analysis (see *Qualitative Application Examples*) may be valuable for understanding data structure, detecting potential clusters or groups of samples, identifying outliers, and selecting representative samples. Outliers may be detected using metrics that describe how well a given observation fits within model space (e.g., Hotelling's T^2 for latent variable methods) and how far it is from the model hyperplane (e.g., residual for latent variable methods).

PREPROCESSING

The goal of preprocessing is to amplify variation of interest within the data set and attenuate extraneous variation for both variables and observations. Preprocessing is an important initial step for most data analyses, and can be applied iteratively with variable selection. The initial selection of preprocessing options should be guided by an understanding of the sample data and/or the underlying analytical technique. Guidance may also be obtained through exploratory multivariate data analyses (see *Qualitative Application Examples*). Initial selections can be

modified or refined within the context of subsequent model performance optimization. This process is almost always cyclic in practice; comparison across different preprocessing strategies leads to a better understanding of the data, which can further refine the preprocessing to maximize the signal-to-noise ratio.

However, there are two points of caution. Preprocessing should be used judiciously because: 1) overprocessing can attenuate the signal and inflate undesirable variations; and 2) many chemometric methods can accommodate noisy and visually unappealing data. Furthermore, in some instances the preprocessing has been accomplished on the instrument; many algorithms used by instrument vendors are proprietary, and it may be impossible to know exactly what modifications have been made to the data. The chemometrician must be aware of, and cautious about, any preprocessing already applied in the reported raw data.

Preprocessing may consist of transformation, normalization, and/or other mathematical treatment of data. Preprocessing of samples (rows of data matrix) may include mean or median centering, scaling, and other procedures. Variables (columns of data matrix) can also be transformed, aligned (e.g., time warping), or scaled (e.g., autoscaling). Mean centering is probably the most common preprocessing method. For example, the use of mean-centered data in the regression model removes the intercept term, resulting in a parsimonious model. It is also common to remove the linear baseline (e.g., bias/offset correction) or polynomial interferences or to apply digital filtering techniques such as derivatives, wavelets, Fourier filter, or a Savitzky-Golay filter to remove or attenuate linear offsets and noise contribution. Normalization is the scaling of observations, giving objects similar impact on model creation by: 1) accounting for factors other than the analyte of interest that impact measurement (e.g., sample path length variability caused by particle size, sample volume, or tablet thickness); 2) correcting for variation in concentration or mass of an analyte for qualitative models; and 3) attenuating measurement artifacts (e.g., instrument performance drift). When variables are highly correlated, such as in spectroscopic measurements, normalization is typically performed via standard normal variate (SNV) and multiplicative scatter correction (MSC). These normalizations are typically conducted on each sample (row).

In cases where variables have different units, sensitivities, or signal-to-noise ratios, variable scaling is typically applied to correct for that; autoscaling is typically used, but the analyst may consider other alternatives, such as using the pooled standard deviations of measurement replicates as scaling/weight parameters. These normalizations are typically conducted on each variable (column). No guidelines exist for deciding which preprocessing approach is the best for a given data set. It is often a trial-and-error process as the analyst applies different preprocessing techniques to find the best one. Combinations of preprocessing techniques can be applied to a given data set as well.

VARIABLE SELECTION

The intended purpose of variable selection is to identify a subset of variables that can improve the performance of the model. The underlying rationale for variable selection in chemometrics is twofold. First, certain predictor variables could be irrelevant to the intended purpose, and ideally, these variables should be minimized or removed from the model. For example, only specific wavelengths of the whole range generated by the spectrophotometer may bear information relevant to the variation in levels of the response variable. Variable selection for this purpose should be based on first principles and experience. Inclusion of unrelated predictors, such as irrelevant spectral regions, could potentially degrade performance of the model. A smaller number of variables from the preprocessed data can be used to achieve

superior performance.

The second part of the rationale for variable selection is to avoid overfitting. Overfitting is the situation where the model is not only describing the intended variability in the data but also includes the modeling of the noise. The latter has a negative influence on the predictive properties of the model. Typically in chemometrics, the number of predictor variables (hundreds or thousands) is comparable to or larger than the number of observations (dozens to hundreds). There are two general strategies for handling the issue of overfitting. One strategy is to manually or computationally select only a subset of predictor variables and use them for model development. Predictor variables can be selected manually (e.g., choosing certain spectral wavelengths characteristic of a given compound) or by using a variety of statistical selection methods such as stepwise regression and using simple univariate statistical measures such as the *F*-test, *t*-test, correlation coefficient, signal-to-noise ratios, intensity thresholds, variable importance in projection metric, or genetic algorithms. Multivariate approaches may use PC variable loadings, linear discriminants, or regression coefficients to define the key features. In the second strategy for avoiding overfitting, variables are not selected at all. The latent variables methods—PLS and principal components regression (PCR)—avoid overfitting by generating a smaller number of new variables. These new latent variables, or components, are constructed as linear combinations of the observed variables. If combined with variable selection, the performance of latent variable models could potentially be improved, because some measurement channels contain only noise, thus perturbing the model-building process. Selecting a subset of the measurement channels that are informative will reduce the size of the data set, provide computational efficiency, and obtain better models for postprocessing. One caveat for applications such as authentication is that eliminating measurement channels that are devoid of information may prevent the recognition of adulterants or novel objects that have features in these excluded measurement channels.

ALGORITHM SELECTION

Many different algorithms have been tried with varying degrees of success in chemometrics applications. The methods include relatively simple ones such as multivariate linear regression and its modifications (robust or weighted regression); the widely used latent variables approaches such as PCR and PLS; local methods such as *k*-nearest neighbors (kNN); and the more sophisticated methods such as support vector machines (SVM) and artificial neural networks. More details on commonly used algorithmic tools can be found in 4. *Applications of Chemometrics*. In general, it is difficult to predict which algorithm will produce the best results for a particular data set. The multitude of choices for sample selection, variable selection, and data normalization and preprocessing—as well as the combination of tuning parameters for each algorithm—could significantly affect the performance of the calibration model. The choice of algorithm may depend on the task at hand, software availability, and the subject matter expert's familiarity with the method. Another consideration is that some algorithms provide useful tools for diagnostics and interpretation—such as PLS scores, loadings, and coefficients plots, whereas others are sometimes referred to as “black boxes” because their inner workings can be difficult to interpret (e.g., neural networks).

It is important to keep in mind that many algorithms are empirical in nature. Almost always, some kind of model can be developed. Thus, the results should be evaluated critically to ensure that results generated by the model are relevant and correct, and that model performance meets the requirements of the ATP. This can be accomplished by cross-validation, and ultimately, by validation with the independent test data set that was not used to develop the

model.

CROSS-VALIDATION

In practice, cross-validation is used to obtain an estimate of the model performance and to fine-tune an algorithm's parameters (e.g., the number of components for PLS). This is accomplished by repetitive splitting of the data into a calibration set, which is used to develop the model, and a testing set (or internal validation set), which is used to make predictions and to compare actual and predicted values.

There are several options for performing cross-validation. The n -fold cross-validation is used to split the data into n subsets. In each of the n iterations, $n-1$ subsets are used to develop the model, which is used to predict the remaining n^{th} data split. The procedure is repeated until all subsets are predicted. The error between reference values and predicted values during cross-validation is then recorded as root-mean-squared error of cross-validation (RMSECV). Multiple approaches exist for splitting the data into n segments. The most straightforward form is called leave-one-out cross-validation (LOOCV), where samples are removed one at a time. The LOOCV can involve intensive computations; its results can be heavily affected by outliers and are less consistent than the results of other forms of cross-validation. It is also possible to split the data according to prior information, such as one subset per batch given available historical data set across multiple batches. Another option for cross-validation is bootstrapping, where in each iteration a certain proportion of data is randomly sampled to create a calibration set, while the remainder of the data are used as a testing set. The procedure is repeated many times (typically 100 or more cycles) to obtain a stable estimate of prediction error.

The measure of error is the most common figure of merit used to characterize model performance during cross-validation. The intended purpose of the method determines the nature of the errors, such as the misclassification rate for qualitative methods and prediction error for quantitative methods. Irrespective of qualitative or quantitative applications, two metrics are commonly used to characterize error within cross-validation: root-mean-squared error of calibration (RMSEC) and RMSECV. The RMSEC is calculated for the samples when left in the regression, which monotonically decreases with each additional factor (i.e., PC) incorporated into the model. In comparison, the RMSECV that is calculated during cross-validation will decrease until the last meaningful (i.e., relevant signal-containing) factor is incorporated. Then, as each additional factor is incorporated into the model, the RMSECV will increase, indicating that the calibration data are being overfit. The plot of the RMSEC and/or the RMSECV versus the number of factors in the model is referred to as a predicted residual error sum-of-squares plot. In general, the best practice is to avoid inclusion of factors beyond where the minimum of the RMSECV plot line occurs. In addition, correlation between observed and predicted values (e.g., R^2) is also commonly used to assess performance of quantitative methods. Finally, the cross-validating results are only meaningful when the calibration and testing sets are comparable (i.e., drawn from the same population). Otherwise, extrapolation may lead to incorrect predictions.

3.2 Method Validation

The objective of validation is to demonstrate that the performance of a method is suitable for its intended purpose. Validation of a model and validation of a method are two different activities. Model validation routinely involves the use of an internal validation set or cross-validation to assess the appropriate parameters of a model via identification or quantification

error and uncertainty. Parameters often include the range of variables, the type of preprocessing, the model rank, the choice of the algorithm, and others. These activities have been addressed in detail in *3.1 Model Development: Calibration*. In comparison, method validation must be based upon a fully independent external validation set and must follow the validation requirement described in *Validation of Compendial Procedures* (1225), according to the method type category. The acceptance criteria should be justified for the intended purpose. During the lifecycle, method revalidation is necessary after a model transfer or model update. The method validation and revalidation strategy should be risk- and science-based and appropriate to its impact level.

The typical performance characteristics for method validation are specificity, accuracy, precision, linearity, range, and robustness for quantitative models, and specificity and robustness for qualitative models. The metrics and their descriptions are discussed below. In addition to those typical performance metrics, metrics such as limit of detection (LOD), limit of quantitation (LOQ), sensitivity, analytical sensitivity, and effective resolution may not be required for validation purposes but could be useful for understanding the boundary of the method performance for a specific analytical application and the analytical technique that a model is associated with.

PERFORMANCE CHARACTERISTICS FOR CHEMOMETRICS METHOD VALIDATION

The sections that follow provide chemometrics method validation attribute descriptions and metrics.

Accuracy: Statistical comparison between predicted and reference values is recommended. For quantitative applications, root mean-squared error of prediction (RMSEP), squared error of prediction (SEP), and bias are the typical measures of method accuracy. For qualitative applications such as classification, sometimes misclassification rate or positive prediction rate could be used to characterize method accuracy.

Precision: The routine metrics of RMSEP and SEP encompass both accuracy and precision. Assessment of precision could involve a determination of the uncertainty associated with the reportable result and a variance component analysis that determines an "error budget" that quantifies the sources of variation that contribute to the uncertainty. For an estimate of precision alone, the standard deviation across results for replicate analyses of the same sample within method, across days, across analysts, across instruments, and across laboratories could be used.

Specificity: For both qualitative and quantitative methods, whenever possible the underlying chemical or physical meaning of the chemometric model should be demonstrated and validated. For example, the scientific meaning of the variables (such as spectral range) used for model construction, data preprocessing, regression vectors, and loading vectors [(for PLS, PCR, PLS discriminant analysis (PLS-DA), and PCA] should be demonstrated. Specificity could also be validated by the tendency of sample components (matrix or other nonanalyte compounds present in the sample) to adversely affect the ability of the chemometric method to report results accurately and/or precisely. The level of specificity may be assessed by accuracy and precision in the presence of varying amounts of potentially interfering substances. Substances to be tested can be identified by considering the underlying physical/chemical methodology and modeling approach.

For qualitative methods, the method should demonstrate the capability to correctly identify or classify the samples. The receiver operating characteristic (ROC) curve and/or the probability

of identification (POI) are commonly used metrics. The ROC approach is intended to illustrate true-positive rate (TPR) and false-positive rate (FPR) over a range of decision thresholds. A good identification method should generate a ROC curve with the area under the curve (AUC) close to 1. For most well-designed identification methods, the probability of a positive identification is near zero when the analyte is not present, and the probability should approach 1 as the analyte concentration or mass increases.

Linearity: The algorithm used for chemometric method construction can be linear or nonlinear, as long as it is appropriate for modeling the relationship between the analytical signal and the analyte. The measures commonly used to assess either the model fit or its predictive properties are the correlation coefficient, y -intercept, and residual sum of squares of the plot between the predicted versus observed results. Note that the plot between the residual versus observed results across the analytical range is expected to show no pattern.

Range: The range of a method should be appropriate for its intended use (e.g., specification).

Robustness: Typical factors to be considered include the normal variability of materials (e.g., lot-to-lot variability); operating environment variability; and instrument variability, such as minor instrument maintenance. In conjunction with the validation results, the method development strategy—such as the design of the calibration set or library and the choice of model parameters—can be taken into account to demonstrate the method robustness. Other general aspects to be considered for chemometric method validation include the validation samples. The validation samples should be independent of the calibration samples to demonstrate the ability of the model to predict. Being independent means that the validation samples were not used in the calibration set or used for model optimization. Internal validation or cross-validation is typically used during calibration for model parameter optimization, but is not considered sufficient for final method validation. The validation samples should be selected based upon the ATP and the desired performance characteristics of the model. Method robustness is based on the evaluation of authentic samples with typical sources of variance. For pharmaceutical or dietary supplement products, validation samples of nominal production scale, such as those routinely manufactured for in-process, release, and/or stability testing, may be included. For botanical articles, taxonomic identity, geographic origin, season of collection, and other variants may be included. For naturally sourced materials such as many food ingredients and excipients, variables such as the geographic or microbiological source of the material, processing conditions, impurity composition, and other relevant attributes may be included in the validation sample set.

Specificity may be evaluated by including adulterated, substandard, or nonauthentic samples. Authentic samples, both within and out of the target criteria, may not be available for practical or economic reasons. For example, it may not be possible, due to cost, to obtain out-of-target samples for a controlled, large-scale process. Where possible, an exclusion panel of out-of-target samples that may be closely related to the target samples should be considered to increase the confidence in the specificity of the measurement. Simulated off-target samples (such as small-scale samples) may be used to validate the procedure's suitability for the intended purpose and range. In all cases, the suitability of validation samples must be justified with appropriate inclusion and exclusion criteria.

As with any other analytical procedure, the acceptance criteria for a chemometric method should be defined before execution of the validation protocol. If the chemometric model was developed using data from a secondary technique [e.g., near-infrared (NIR) or Raman] with reference values from a primary analytical procedure [e.g., nuclear magnetic resonance (NMR)

or high-performance liquid chromatography (HPLC)], the ATP for validation may not exceed that which is obtainable by the primary method. Some exceptions may occur, for example, it may be possible to achieve superior precision using a secondary procedure, although the accuracy will be limited to that of the reference technique.

In addition to those attributes addressed in *Performance Characteristics for Chemometrics Method Validation*, chemometrics method validation must also take into consideration the setting of diagnostics limits for a multivariate model before deployment for routine use. Samples that are out of model space are considered outliers and not suitable for obtaining a reportable model prediction. The model diagnostic should have a demonstrated capability to flag any of the out-of-model-space samples. To set up the diagnostics limits, two cases must be considered. The first is to determine the statistical distribution of leverage and residual within-the-calibration data set. The second is to prepare intended in- and out-of-model-space validation samples to test the limit. For instance, for an NIR spectroscopy-based content uniformity method, the in- versus out-of-model-space samples could be samples at target label claim versus samples containing active pharmaceutical ingredient (API) concentrations outside of the intended range for the method.

3.3 Model Monitoring

Throughout the model lifecycle, changes that can affect model performance may occur. Procedures should be in place for continuous performance verification of the model and for model update and procedure revalidation if necessary.

A control strategy for checking model performance over its lifecycle should be developed and documented as part of model development and procedure validation. The strategy should identify the necessary elements for ongoing monitoring and evaluation of model performance. In addition, a plan for monitoring, analyzing, and adjusting the model should be in place with a measurement frequency that allows identification of excursions related to critical aspects of the model. The level of maintenance should be considered part of the risk assessment activities and should be adequate for the model criticality. If applicable, analytical instrumentation used to generate the inputs for the model should be qualified and also subjected to a continuous verification plan (for relevant guidance, see general chapters related to the applicable analytical instrumentation).

Ongoing assurance of performance of the model throughout its lifecycle should include:

- Ongoing monitoring and review of the model
- Evaluation of risk assessment
- Evaluation of post-implementation changes and predefined model maintenance
- Model update and procedure revalidation as needed

The ongoing review of a model should occur at predefined intervals and also should be triggered by events that may have an impact on model performance. Examples of such events include changes in raw materials variability or manufacturer; changes in the upstream process that may alter the sample matrix (e.g., process equipment or operation settings); drifts in model prediction; and out-of-specification (OOS) or out-of-trend (OOT) results given by the model (dependent upon the root cause of the OOS or OOT). In addition to triggers that are based on the prediction output of the model, triggers based on model diagnostics metrics and corresponding action rules should be included. Multivariate models may be more strongly affected by aberrant data signatures than are univariate models. Special care is needed to: 1) justify the multivariate model diagnostics statistically, 2) verify with data from the model

development and procedure validation process, and 3) implement multivariate diagnostics for monitoring as part of the control strategy. Comparison of model predictions and reference or orthogonal procedures should take place on a periodic basis or as part of the investigation triggered by the review process.

The use of model diagnostics when applied to a new sample ensures that the model prediction is valid with regard to the calibration and validation sets used during model development and procedure validation, and also ensures that the result does not constitute an outlier. The observation of an outlier means that the result is invalid, but it is not a reliable indication of an OOS result; an OOS result is an observation produced by a model when the prediction falls outside the acceptance criteria and the model diagnostics are within the thresholds. In the case of qualitative models, nonconforming results should be treated as outliers and should trigger an investigation; the output of such an investigation will indicate whether the result is OOS.

The review process for a model should produce a decision regarding the need for an extension of model maintenance; such a decision may be the result of a risk-assessment exercise or the outcome of a predefined decision workflow. Model criticality and usage will define the extension of model maintenance, which can include restraining the model conditions; adjusting the calibration set (samples can be added, replaced, or removed); or even completely rebuilding the model. The decision, and corresponding rationale, must be scientifically sound and documented.

3.4 Model Update and Transfer

Model updating must be considered part of the analytical procedure verification, and both the justification and the activities must be documented as a part of the analytical procedure lifecycle. Before performing a model update, it is critical to understand the underlying causal factor that has prompted the update. The reasons for model updating can be roughly divided into two categories.

The first category is when the calibration set simply needs to be expanded. In this case, nothing has actually changed in terms of the response of the instrument to specific analytes. Instead, the original model is no longer valid because of the expanded range of original calibration, the addition of new analytes, or the occurrence of other, previously unseen variations (e.g., changes in particle size distribution, or the drift of a chemical process to a new steady state). Thus, the calibration space must be expanded with samples exhibiting this variation.

The second category is when the samples are the same but the measurement system response function has changed. This is often due to changes in the measurement components (new light source, clouding of optics, wavelength registration shift) or can be due to method transfer across different instruments. This, in essence, is an instrument standardization problem. Changes in instrument or measurement procedures over time can render a calibration model unusable, in which case a model update becomes necessary or a new model should be developed.

In practice, there are multiple model updating techniques that could be applied to each category of model update. Some updating techniques are relatively straightforward and simple to implement, whereas others are technically complex. Selection of an appropriate model updating approach must be based on a full understanding of the underlying causal factor. As a general rule, simple updating methods (e.g., slope and bias adjustment, as described below) should be considered first.

Before any model maintenance work is initiated, it is good practice to confirm that the

fundamental construct of the original model—such as data preprocessing and variable selection—remains sound. For both qualitative and quantitative applications-based model updates, a straightforward preprocessing approach and a scientifically sound variable selection approach are recommended as the initial attempt to address challenges associated with updating the model. These approaches are equally applicable to differences caused by instruments, measurement conditions, or sample matrices.

SLOPE AND BIAS ADJUSTMENT

One of the simplest model-updating methods is to postprocess the predictions with a bias adjustment, slope adjustment, or both. This approach is often used for quantitative applications. For some qualitative applications, this approach may also be useful, depending on the nature of the method. In a limited set of circumstances, bias/slope adjustments are expected to work. For example, if the matrix of the samples being predicted were systematically different from the calibration/validation sample set, the model predictions would be in error by a constant value. Bias/slope adjustments, however, would not correct for any new variation in the data, such as variation that would result from a different matrix (e.g., new analytes/interferents). Therefore, applying slope/bias adjustments without a full understanding of the underlying causal factor is not recommended. Guidance may be obtained via inspection of residuals corresponding to the new data obtained using the existing model or, alternately, from supplemental exploratory data analyses using techniques such as PCA (see 4. *Applications of Chemometrics*).

CALIBRATION EXPANSION

When expanding the original calibration set, one should consider the number of new samples to be added, the impact (leverage) of the added samples on the overall composition of the new calibration set, and how to partition any new samples between the calibration and validation sets. It may be appropriate to simply augment the original calibration and validation sets with all the new samples, or it may be advisable to use a subset of the new and original samples. Multiple approaches, such as the Kennard-Stone algorithm and nearest-neighbor approach, are available to aid in the selection of new samples to add to an existing calibration set, but in general, all the approaches use methods to identify new samples on the basis of high leverage (i.e., model influence). Hotelling's T^2 or multivariate score plots are also effective approaches for accomplishing this goal.

CALIBRATION TRANSFER

Instrument standardization and calibration transfer methods are used to transform the response function of a measurement system so that it matches that of a reference measurement system. The reference measurement system could consist of a completely different analyzer, or it could be the same analyzer before it experienced a response-function shift. The vast majority of these methods generally requires the use of stable transfer samples that are measured on the original instrument and require the instrument to be standardized at the same time. In addition, the approaches commonly used for instrument standardization could also be applied effectively to address the challenges resulting from changes in sample matrix and measurement conditions.

3.5 Revalidation

Before the redeployment of a multivariate model, appropriate procedure revalidation should be established using criteria equivalent to those used in the original validation protocol. This revalidation is necessary to document the validity of the model as part of the analytical procedure verification. The nature and extent of the revalidation procedure, including aspects such as scientific justification and experimental approaches, must be based on the cause of the update and the nature of the corrective action required for establishing suitable performance. Revalidation should be documented as part of the analytical procedure lifecycle.

4. APPLICATIONS OF CHEMOMETRICS

As discussed in 2. *What is Chemometrics?*, chemometric analyses may be performed in either a supervised or unsupervised manner depending on the availability of data and the specifics of a given application. This section provides an explanation of these different analysis scenarios, as well as the chemometric tools (i.e., algorithms) that are commonly used. Additionally, several specific applications will be described in detail.

4.1 Qualitative

GENERAL ASPECTS

Qualitative chemometric analyses may be performed by using supervised and/or unsupervised approaches. However, to be incorporated into analytical procedures that are alternatives to compendial methods, the performance of any chemometric model must be verified as described in 3. *Model Lifecycle*. This may not be possible if very little is known about the samples being analyzed. Nevertheless, unsupervised analyses play an important supporting role during the development of chemometric alternatives to compendial procedures within the lifecycle framework, and are recommended for use before the development of subsequent supervised approaches (examples are provided in *Qualitative Application Examples*).

Qualitative compendial procedures are those that seek to supply the value of some categorical descriptor for an unknown sample. Examples of categorical properties include (among others):

- Chemical identity: microcrystalline cellulose versus API
- Morphology: polymorph A versus B; monoclinic versus triclinic
- Sample authenticity: authentic versus nonauthentic and/or adulterated
- Sample origin: facility A versus B; lot ABC-001 versus lot XYZ-002

Categorical properties can be modeled effectively using supervised chemometric algorithms that leverage either proximity or distance in multivariate space, resulting in a qualitative assignment of samples to one or more classes depending on the application and the technique used.

According to (1225), procedures based on models of this type are suitable for incorporation into Category IV methods for identification and should be validated to demonstrate adequate specificity for the intended use. "Identification" is a term that is generally used to describe a range of analysis scenarios; several common ones are described in *Qualitative Tools*.

Supervised techniques used for classification purposes, besides the analytical sensor information, make use of discrete information related to the samples in the data set (e.g., class labels). It is intended to define the borders of the clusters (or classes), providing statistical criteria, in addition to the visualization techniques (e.g., scores plot of PCs from a PCA). The borders then can be used as acceptance criteria for inclusion or exclusion of new samples into

a given class. Several useful tools are available to the analyst for building the model, such as linear discriminant analysis (LDA) and quadratic discriminant analysis (QDA), soft independent modeling of class analogy (SIMCA), kNN, and PLS-DA. Additional, more complex techniques also may be used with justification. Each type of model has its own strengths and weaknesses. If a particular algorithm does not give the desired level of performance, a different algorithm may be selected. These aspects are discussed further in *Qualitative Tools*.

For model development, optimization, and validation, the classification and discrimination techniques follow the same process described in 3. *Model Lifecycle*. These techniques develop a threshold or limits to make class assignments. The simplest form of classification is a two-class system (e.g., good/bad or A/B). When a new sample is classified as good or bad (A or B) by the model, this results from what is called a discrimination technique. Classification is the technique of assigning a new sample as A, B, either A or B, or neither A nor B. The error rate of the model is the total number of incorrect classifications divided by the total number of samples. The specific details of the application will determine whether the assignment of a sample to more than one class would be an acceptable result. Where this must be avoided, classification thresholds should be set appropriately during model development to guarantee single-class results.

QUALITATIVE TOOLS

PCA: PCA is a commonly used exploratory analysis tool that was briefly introduced in 2. *What is Chemometrics?*. PCA is a variable reduction technique and acts on the data by defining new variables, so-called latent variables, or PCs. PCs are orthogonal and are defined in the direction of the largest (remaining) variance in the data. The results of PCA are discussed in terms of PC scores and loadings, which may be plotted graphically in two (and sometimes three) dimensions for visualizing clusters of samples or outlying samples (score plots, see *Figure 4*), whereas the loadings plots provide information on the original variables. The scores are the projections of the samples on the PCs, whereas the loadings provide the weights (coefficients) by which the values of the original variables are multiplied to generate the component score for a particular sample. Loadings are rich in information regarding which variables in the matrix are prominent and can be used to "understand" the information captured by the latent variables that provide the basis for the observed sample distribution in the scores plot (*Figure 4*). The PCs may also be used as the basis for quantitative models via PCR (see 4.2 *Quantitative*).

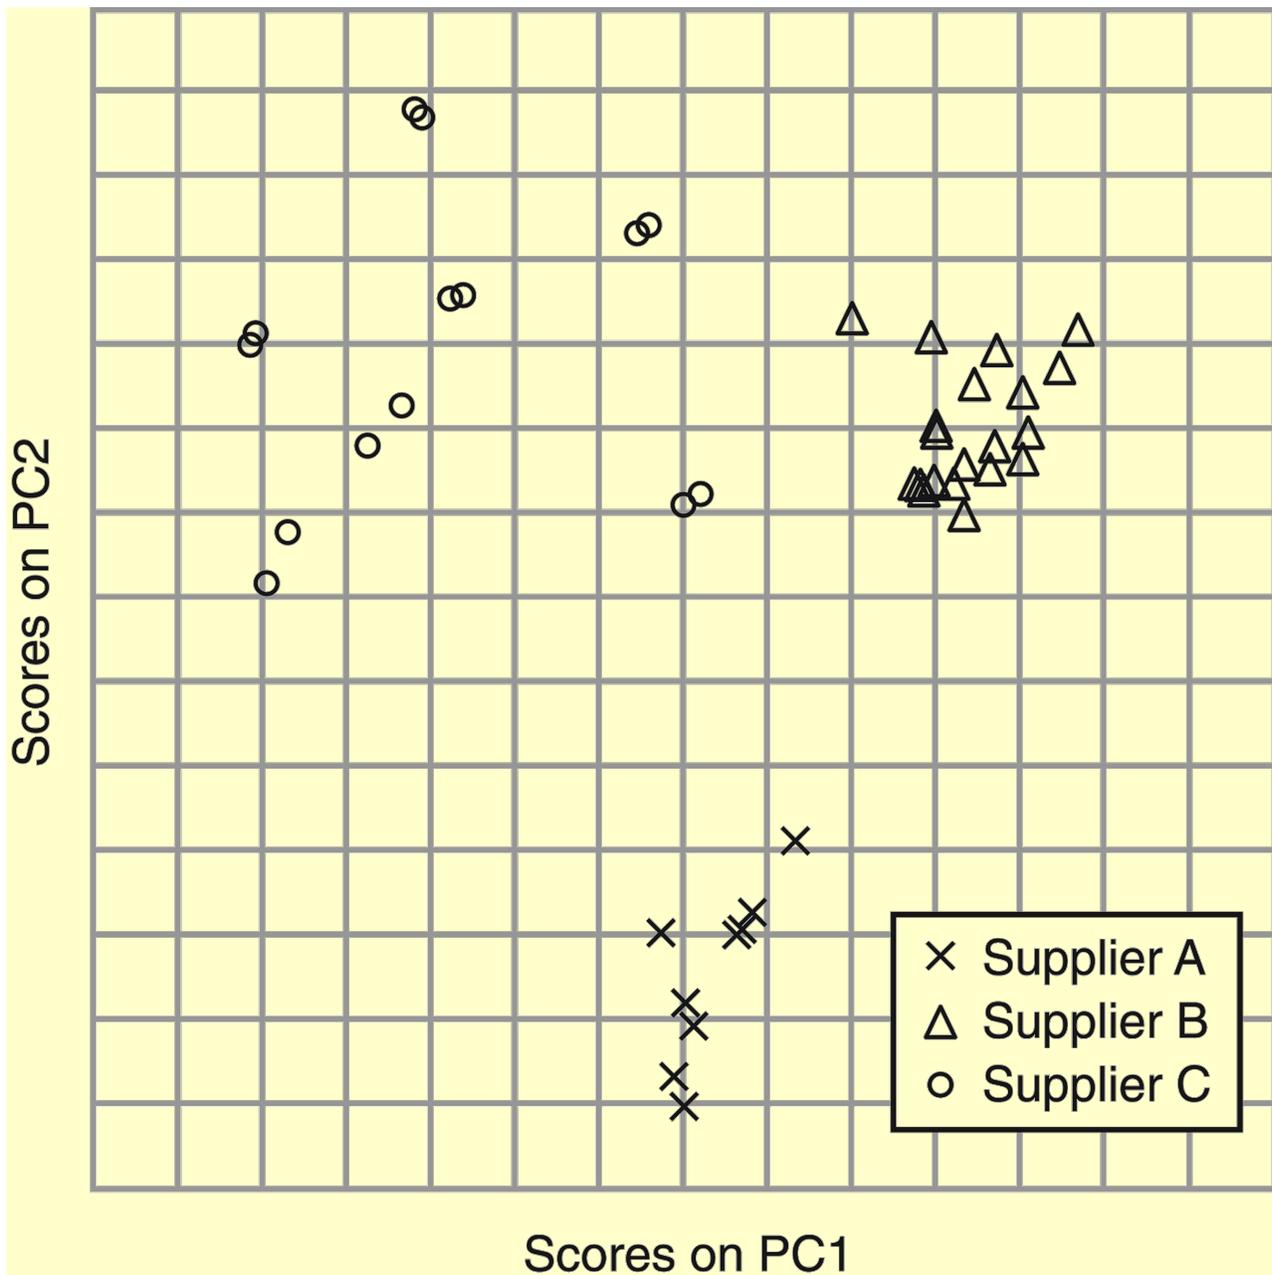

Figure 4. PCA scores plot: projection of PC1 versus PC2.

Clustering algorithms: The aim of clustering analyses is to partition data into different groups. Some methods, such as hierarchical cluster analysis (HCA), result in tree-like structures called dendrograms (*Figure 5*) that provide information on groups of samples or outlying objects occurring in the data set. Dendrograms can be built in many different ways and thus may show different aspects of the data set. A first possibility, called divisive or top-down methods, starts from the entire data set, which is split in consecutive steps until each object is in an individual cluster or all elements of a cluster fulfill a given similarity criterion. In the second scenario, called agglomerative or bottom-up methods, the opposite is done. Starting from individual objects/clusters, those most similar are merged until everything is in one cluster. Of the two options, bottom-up approaches tend to be computationally less intensive, are part of most computer packages, and are more frequently used.

The parameters used to express (dis)similarity between objects or clusters (see y-axis on

Figure 5) can be either correlation-based (e.g., correlation coefficient, r , for similarity or $1-|r|$ for dissimilarity) or distance-based (e.g., Euclidian distance) measures. Two clusters are linked in the dendrogram at the height related to this (dis)similarity measure. The parameter applied is expressed in such a way that clusters/objects linked low (i.e., close to the x-axis) are similar, whereas those linked high are dissimilar. Many different methods or criteria exist for use in deciding which objects/clusters are consecutively merged, e.g., single linkage, complete linkage, (weighted) average linkage, and centroid linkage. Depending on the applied criterion, the dendrograms may look very different. Drawing arbitrary horizontal lines (see Figure 5) splits the data set into different groups, which occasionally may be linked to sample properties. Outlying samples are linked very high in the dendrograms, most often as one-object clusters. The stability of clustering results can be affected by many factors, such as noise in the data, sample size, choice of algorithm, distance measure, and others. Divisive methods tend to produce more stable results than agglomerative methods, even though they are hardly ever used.

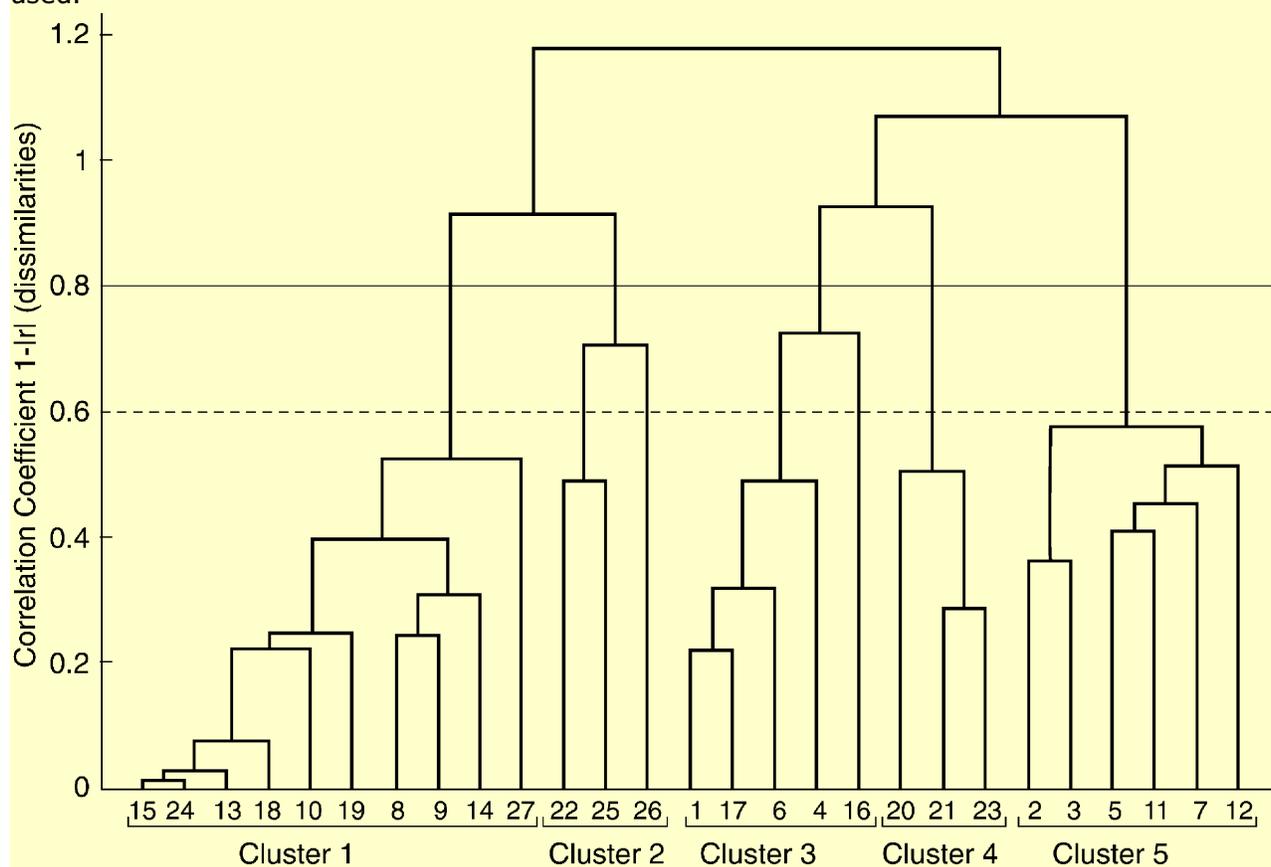

Figure 5. Hierarchical clustering based dendrogram for 27 objects. Abscissa: object numbers.

Parametric modeling: Authentication of a material or formulated product for quality assurance purposes may be achieved via multivariate parametric modeling of the chemical profile (e.g., spectrum or chromatogram). These methods are sometimes referred to as "one-class classifiers". Basically, a parametric model is developed statistically or empirically with a confidence boundary around the data from known authentic samples. Parametric models describe the behavior or structure of the majority of the data from a single class, assuming that a distribution (typically, a multivariate normal one) exists in those data. Predictions against a parametric model identify deviating points outside the significant boundaries of that distribution. Whereas classification or discrimination approaches provide identification (as

previously described) of the unknown sample, parametric models will designate the unknown sample as either belonging to the authentic class or as an outlier, or exhibiting features other than those defined by the distribution. Some discrimination techniques will also optimize class separation, and may have greater selectivity, but will tend to fail when presented with an object from none of the classes. In contrast, parametric modeling methods will reject any sample that does not fall within the confidence boundary established for the model. Perhaps the most commonly used parametric modeling algorithm is SIMCA, where PCA is used to model the data and Hotelling's T^2 and Q residuals (DmodX) are used to define the limits. In some instances, parametric modeling approaches will result in "soft classifications" wherein a sample may be assigned to more than one class. To satisfy compendial usage requirements, appropriate action must be predefined for cases of ambiguous class assignment, and/or the α and β error rates must be established and justified according to risk.

QUALITATIVE APPLICATION EXAMPLES

Exploratory analysis: Unsupervised algorithms are routinely used for initial exploratory data analyses, which precede formal calibration and validation exercises. Unsupervised data exploration can rapidly indicate, in the absence of any prior knowledge, whether distinct classes or outliers exist within the pool of available data. For instance, in *Figure 4* a graphical example is shown in which PCA applied to spectroscopic data was used to differentiate between samples from different suppliers. Exploratory models yield latent variables that may be inspected to identify the original variables with the greatest amounts of relevant analyte signal to carry forward into subsequent models or to guide and/or verify the results of variable selection approaches. Additionally, exploratory analyses may be used to test and empirically optimize various signal preprocessing options to maximize the relative contribution of desired analyte signal versus signals from sources of interference (e.g., scattering effects, optical path length differences, sample physical properties, and instrumental drift).

Analysis of DoE data: Unsupervised techniques provide a means of rapidly assessing the distribution, range, and precision of responses in latent variable space before submission of samples for reference data collection. This approach can be used as a feedback mechanism to optimize the experimental design before investing time in reference data collection (e.g., NMR, HPLC, bioassays). This concept can also be leveraged in chemometric model development to optimize various aspects of the overall analytical procedure (e.g., sampling procedure, sample physical properties, and other aspects) based on the responses from unsupervised algorithms during the design of the calibration strategy.

Material identity testing: Identification testing is routinely performed for all pharmaceutical active ingredients, excipients, drug products, and packaging materials to authenticate them and verify that the correct materials are used in manufacturing, release testing, and packaging operations. *Spectrophotometric Identification Tests* (197) illustrates one of the most widely used analytical techniques for identification, Fourier transform IR spectroscopy. Typically, identification testing involves comparing the sample spectrum to the spectrum of a reference sample and assessing the level of agreement between the two. Different chemometric algorithms can be applied for identification, and the general model development and maintenance should follow the guidance in *3. Model Lifecycle*. All methods for identity testing are supervised classification methods because either a single reference spectrum or a set of reference spectra from material(s) with known identity is utilized by these algorithms. Algorithms can be applied in either original variable space or transformed variable space (such

as latent variable space) after data preprocessing.

According to (1225), models of this type are suitable for incorporation into Category IV methods for identification and should, at a minimum, be validated to demonstrate adequate specificity for the intended use. An example approach for performance verification is the documentation of TPR and FPR. TPR is the percentage of samples which are correctly identified, whereas FPR is the percentage of samples which are incorrectly identified. TPR is also referred to as sensitivity, and FPR is referred to as specificity. Regardless of which approach is taken, there is always a trade-off between FPR and TPR, and this trade-off behavior and overall procedure performance are best visualized in a ROC curve plot (see *Figure 6*).

A classical ROC curve is generated by plotting the TPR on the ordinate and the FPR on the abscissa. Each point on a ROC curve represents a specific TPR and FPR pair obtained at a specific threshold. The threshold is typically a number generated by the algorithm, and when it is exceeded, this corresponds to a positive identification. This threshold value is determined during the procedure development process. The threshold could be the *P* value from hypothesis testing, hit quality index (HQI) threshold, Mahalanobis distance threshold, PLS discriminant score threshold, or some other threshold.

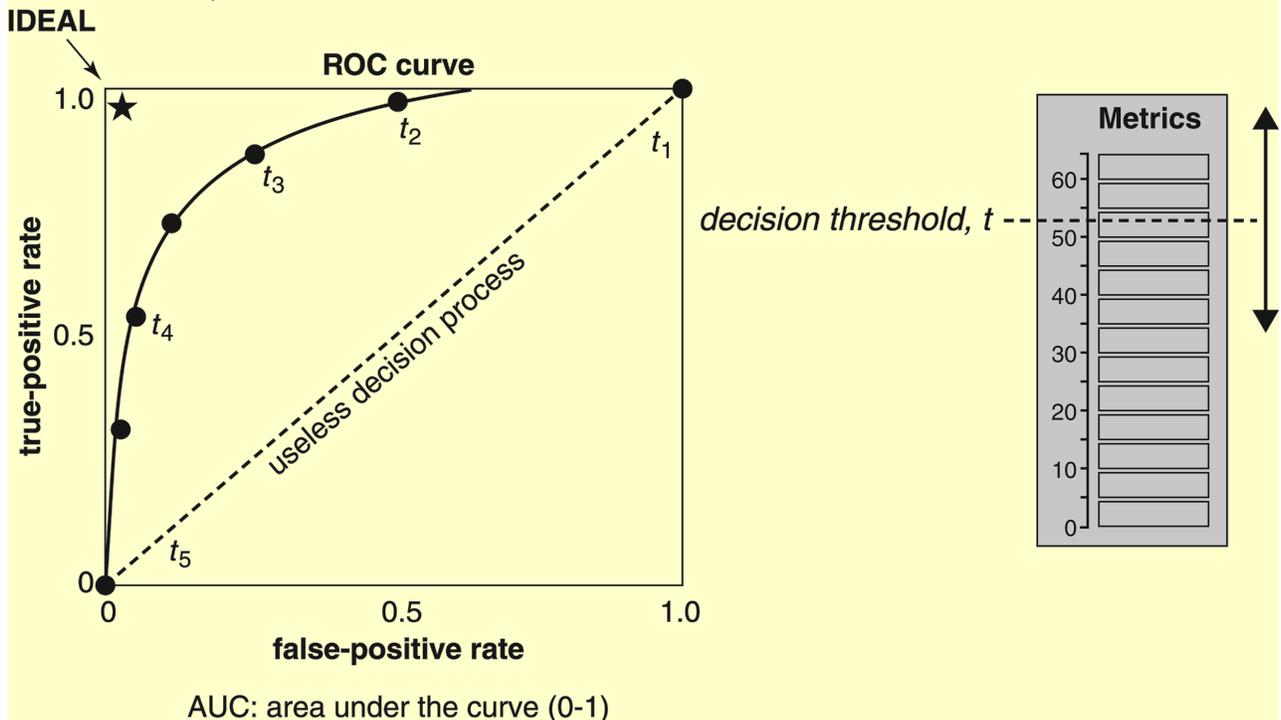

Figure 6. ROC curve plot showing the AUC (3).

During procedure development, a number of known positive and negative samples are examined, and the algorithm output for each sample is recorded. The performance of the method when operating at a particular threshold *t* is characterized by a single TPR/FPR pair, and the full operating characteristic curve can be produced by plotting TPR/FPR pairs over a range of decision thresholds. A false-positive identification corresponds to a decision threshold that is too low. False positives can be minimized by raising the decision threshold. However, excessively high decision thresholds can produce a false-negative identification.

A good identification method should generate a ROC curve that produces one or more TPR/FPR pairs in the top-left corner of the plot, as shown in *Figure 6*. This characteristic is best captured by the AUC. A random decision method is represented by the diagonal line with an

AUC of 0.5, whereas a good identification method should have an AUC closer to 1. The shape of ROC curve depends upon a combination of spectral properties of the sample and the chemometric algorithm used for identification. Characterization of the ROC curve is a fundamental task associated with method development and validation.

For a two-class model, false positives and false negatives are the incorrectly assigned samples. Together with the true positives and true negatives, they make up the success rate of the model. The analyst may wish to care about one type of error (α or β) more than another, and therefore could change the model to be more conservative when choosing a threshold. Thresholds can be used as action criteria or evaluation criteria.

Complex material authentication testing: Nutraceuticals and samples of herbal origin may be complex mixtures of numerous components. Authentication relies upon assessment of the presence of multiple analytes and their relative concentrations as well as potentially demonstrating the absence of adulterants and/or related materials. Thus, authentication in this scenario is a multivariate decision process that is appropriate for chemometric approaches. Typically, a characteristic "fingerprint" pattern incorporating information from the various analytes (and adulterants, potentially) that are present in the sample is obtained by applying a combination of separation and characterization techniques or spectroscopic measurements. The chemical composition information in the sample fingerprint provides a basis for multivariate pattern recognition. In particular, techniques with exceptional analytical selectivity, such as mass spectrometry and NMR spectroscopy, have emerged as powerful fingerprinting tools, especially when operated as detectors for chromatographic separations of multicomponent samples. Chromatographic fingerprinting is recognized as a viable identification procedure for herbal medicines by both the World Health Organization and the U.S. Food and Drug Administration (4,5).

Depending on the origin and purity of the sample, it may be appropriate to develop a multivariate classification model using either the entire fingerprint or a selected subset of peaks. Variable selection approaches may be useful in determining the optimal approach, depending on the nature of the samples and/or the ATP. It is crucial that the samples have an associated class label or quantitative property (activity) obtained by an objective reference technique (separate from that used to generate the fingerprint) to enable supervised modeling and subsequent model performance verification. Care should be taken to ensure that appropriate sources and levels of variability are included in model development and performance verification exercises based on the intended use of the test.

Several useful tools are available to the analyst for building the model, such as LDA and QDA, SIMCA, kNN, and PLS-DA. Additional, more complex techniques may also be used with justification (e.g., SVM).

Chemometric methods for multicomponent sample authentication are consistent with *Validation of Compendial Procedures* (1225), *Validation, Data Elements Required for Validation, Category IV*. Various numerical methods may be used to verify predictive performance. As discussed in *Qualitative Tools* for pure material identification, predictive performance may be verified by comparison of the TPR and FPR once a classification threshold appropriate to the application has been established. It is crucial to finalize this threshold before formal validation of the overall analytical method.

Classification: This is a supervised learning technique. The goal of calibration is to construct a classification rule based on a calibration set where both **X** and **Y** (class labels) are known. Once

obtained, the classification rule can then be used for the prediction of new objects whose **X** data are available.

Classification models may be divided into two main groups: hard and soft. Hard classification directly targets the classification decision boundary without producing a probability estimation. Examples of hard classification techniques are kNN and expert systems. Soft classification estimates the class conditional probabilities explicitly and then makes the class assignment based on the largest estimated probability. SIMCA is a commonly used soft classification technique. In either scenario, the thresholds to determine the class boundaries are important and should be established during method development based on the resulting TPR and FPR, the requirements for which are determined by the ATP. These rates should also be verified as part of the full procedure validation.

In many applications, it is unacceptable to have a sample classified into two classes. Further, if a sample is not classified into any class, the sample is deemed an outlier to the calibration set. For example, a classification model built from NIR spectra of four materials (A, B, C, D) has four classes. Any material that has a source of variance (e.g., different water content) not previously seen and included in the model calibration may not be classified, and therefore the material is an outlier. Similarly, when a spectrum of another material (E) is applied to the model, the model should not be able to classify it into a given class. If similar samples are expected in the future, then the model should be revised to include the outlier samples in the calibration set, either to supplement the calibration data for existing classes or to create an entirely new class, depending on the nature of the outlier(s) and the specific requirements of the application.

4.2 Quantitative

GENERAL ASPECTS

When the intended use of an analytical procedure is the determination of one or more sample components or properties that have values that can vary continuously rather than categorically, then a quantitative model is required. Similar to the process for qualitative modeling, quantitative chemometric models are produced in a supervised manner using both the independent **X**-block and dependent **y** variables to ensure optimal predictive performance. The difference arises in the nature of the **y** values, which are continuous/numerical (rather than categorical) for quantitative applications. Per (1225), quantitative chemometric models are suitable for incorporation into Category I, II, or III methods for determination of the content of drug substance or finished drug product, impurity levels, or performance characteristics, respectively. In-process tests applied in an offline manner or an in/on/at-line manner that produce the value for a continuous variable would also represent appropriate uses of quantitative chemometric models. The specific requirements of the analysis per the ATP (see 3. *Model Lifecycle*) should be used to guide the validation metrics used to demonstrate performance.

QUANTITATIVE TOOLS

The algorithmic tools needed for quantitative applications are wide ranging; for more complete descriptions see 6. *Appendix: Additional Sources of Information*. Tools that are commonly used are briefly described here. As is the case with any chemometric model, the tool must be matched to the ATP, and vice versa. Certain advantages and disadvantages are characteristic of each tool, and the chemometrician must be mindful of these when justifying their use.

Multi-linear regression (MLR): This tool establishes a correlation between a dependent variable (or \mathbf{y} , response variable) and multiple independent variables (or \mathbf{X} , explanatory variables) by fitting a linear equation to observed data. MLR has two broad applications, as follows.

The first broad application of MLR is to establish a model that explains the importance or magnitude of effect on the response variable, and this is typically used in the DoE screening or response analysis. Typically the input variables are mutually independent and by design represent large magnitudes. Often, the higher order of terms such as square terms and interaction terms are included, and a step-wise procedure is used to exclude those that make a smaller contribution to the model. Caution is advised to avoid having too many variables in the model, because including too many terms will overfit the model. The adjusted R^2 statistic is typically used to estimate whether there are too many factors in the model. Adjusted R^2 is a modification of the standard coefficient of determination that takes into account the number of model terms and the number of samples, resulting in a plot of R^2 (adjusted) that has a maximum value beyond which additional terms result in overfitting.

The second broad application of MLR is to establish a prediction model for analytical purpose. MLR can be used to fit a predictive model to an observed data set of \mathbf{y} and \mathbf{x} values. The established model can be used to predict the value \mathbf{y} from the \mathbf{x} of new samples. The model for prediction purpose created from correlated \mathbf{x} inputs is suitable to explore the relationship between \mathbf{y} and individual \mathbf{x} s.

The prediction MLR model can be used in a procedure or method for a pharmaceutical compendial test. For example, a filter NIR, which is designed for a specific use such as water testing in the product, produces a "spectrum" of only a few data points.

The development and validation can follow the same procedures as are used with latent variable models such as a PLS. During the development and validation of an MLR model: 1) appropriate data preprocessing needs to be used; 2) cross-validation is used to estimate the model performance; and 3) an independent data set is used to assess the model.

A limitation of MLR is the inability to model collinear variables. Thus, performance verification using independent samples is crucial to avoid erroneous models. Another disadvantage is that MLR models do not have diagnostic metrics (such as Hotelling's T^2 and \mathbf{X} residual test) that PLS models offer. Therefore, when the model is used for prediction on new data, it is important to include some prescreening steps to ensure that only valid data are processed; such prescreening tools could include individual variable range check, spectral similarity comparison, and others.

PCR: This is a two-step modeling approach in which a PCA is first performed on the \mathbf{X} -block data to obtain a basis set of PCs. The PCs are then used in combination with the \mathbf{y} data to develop a regression model to predict the \mathbf{y} values.

PLS: This is one of the most commonly used chemometric algorithms for both quantitative and qualitative (PLS-DA, see *Qualitative Tools*) modeling scenarios. The computational advantage that PLS offers over MLR and PCR is that the PCs are derived in the PLS algorithm using the \mathbf{X} and \mathbf{y} data simultaneously. This often results in predictive models that require fewer latent variables compared to PCR, thereby improving robustness. PLS is capable of handling mildly nonlinear relationships, whereas PCR and MLR are linear modeling techniques. Further, more than one \mathbf{y} variable can be modeled using the same \mathbf{X} -block data via different algorithmic approaches. PLS-1 results in a separate model for each \mathbf{y} variable. PLS-2 will produce a single model capable of simultaneously predicting the values of two or more \mathbf{y} variables. The relative

advantages of each approach may vary from one application to another. For instance, if different mathematical preprocessing is necessary to resolve each component to be predicted, separate PLS-1 models may provide improved performance over a single PLS-2 model.

QUANTITATIVE APPLICATION EXAMPLES

Pharmaceutical dosage form assay and/or uniformity of content: Assay of the API content in the final dosage form is commonly performed via measurement of a sample drawn from a homogenous composite of a number of individual dosage units (e.g., tablets or capsules). The quantitative result is then reported as an "average content" (expressed as % of target API amount) for the batch tested. Uniformity of content may be tested using a method similar to the assay, but measurements are performed on individual samples. The reported result is primarily based on the variability in assay results across the individual dosage units analyzed. Assay and uniformity of content methods are intended to characterize the "major" component in the sample(s) in question and are considered Category I tests per the definitions established in (1225). In the majority of cases, the target analyte will be the active ingredient in the sample, although quantitative assays for other components exist throughout the compendia as well.

For pharmaceutical solid dosage forms, the majority of assay procedures are based upon HPLC. HPLC analysis is time consuming and often involves the use of large volumes of solvent for the mobile phase. However, HPLC is highly linear and is typically calibrated using univariate mathematics, i.e., one measured variable is directly and uniquely proportional to sample concentration.

In contrast, alternative methods for assay that are based on spectrophotometry (e.g., NIR and transmission Raman spectroscopies) offer the advantage of increased analysis speed and are nondestructive. However, in many cases the analyte signal may not display the same degree of linearity or signal-to-noise as with the corresponding HPLC method. Moreover, no single variable is directly and uniquely related to the concentration of interest. For this reason, multivariate models, often based on PLS regression, are commonly used in spectrophotometric procedures for assay and uniformity of content.

For Category I tests, it is crucial to demonstrate the accuracy, precision, specificity, linearity, and range of results during the validation of the overall analytical procedure. Each of these performance aspects involves considerations during multivariate model development or validation that are distinct from those related to univariate techniques.

Most spectrophotometric methods are not quantitative in an absolute sense. For example, models developed using NIR or Raman data must be calibrated relative to a primary reference technique such as HPLC or NMR spectroscopy. Given the nondestructive nature of NIR and Raman, it is straightforward to analyze a given set of samples using one of these techniques and then subsequently analyze the same set of samples via HPLC or NMR spectroscopy to obtain the reference content values. The chemometric models are developed via a multivariate calibration using the NIR or Raman spectral data and the content values from the reference technique. Accuracy is determined by using the absolute difference between the model predictions and the reference values. Precision is determined by using the standard deviation of procedure results alone, such as from replicate analyses of the same sample. The model itself will be absolutely precise. That is, given the same spectral input, the same numeric output will always be generated. Thus, precision is a measure of performance for the analytical procedure as a whole. That said, precision may be influenced by the specifics of the chemometric modeling approach (e.g., preprocessing, modeling algorithm, number of latent variables) and therefore precision should be evaluated during model development as well as during validation.

It is important to note that the accuracy of chemometric models will not be able to exceed the accuracy of the reference analytical technique used to calibrate the model. However, it may in certain cases be possible to exceed the precision of the reference technique.

The range of the method will be determined by the calibration samples that are used to develop the multivariate model. According to (1225), it is recommended that assay calibration samples should have analyte contents ranging from 80%–120% of the target amount. For evaluating uniformity of content, the recommended range is 70%–130% of the target amount. In some cases, both the assay results and uniformity results may be obtained from the same set of sample measurements. Averaging of a requisite number of individual dosage-unit assay results will provide a value equivalent to the “average content” parameter. Calculation of the “acceptance value” (see *Uniformity of Dosage Units* (905)) using this mean result combined with the standard deviation for the same set of individual dosage unit results will provide a uniformity of content result. In this scenario, a single calibration set that spans the wider of the two recommended ranges (70%–130%) should be used.

If it is not practical to obtain a sufficiently wide range of content values in calibration samples produced at commercial manufacturing scale, calibration samples may also be produced in a smaller scale or in the laboratory. In this scenario, all attempts should be made to replicate the physical properties representative of the commercial scale. Additionally, care should be taken to verify that minimal bias exists between samples from different scales. Commercial-scale samples may need to be incorporated into the model (and/or procedure) validation process to verify the accuracy and precision of the model (and/or procedure) results against any differences and/or variability in physical properties. Mathematical processing algorithms (e.g., normalization, second derivatives) should be optimized as much as possible during initial exploratory data analysis (see *Qualitative Application Examples*) to mitigate prediction bias resulting from these factors. For instance, it is known that thickness, particle size, and density differences can lead to spectral slope changes and baseline offsets in NIR spectra. Depending on which specific effect is present, improperly selected preprocessing may not fully correct for spectral differences, leading to errors in prediction.

Fit and predictive performance of chemometric models should be demonstrated via the linearity of a plot of the model outputs versus the reference or nominal values of the target analyte(s), ideally using results from a set of independent test samples. The raw analytical signal may demonstrate a nonlinear relationship with the reference analyte concentrations. Likewise, multiple latent variables may be utilized for the chemometric model building. However, the key aspect of the model that must be demonstrated to vary linearly with analyte concentration is the model outputs, not the inputs. A plot of the prediction residuals versus concentration may assist in revealing any systematic lack of fit. Any observations of patterns in this residuals plot may indicate a need for revision of either 1) the number of latent variables included in the model, 2) the preprocessing mathematics, or 3) the algorithm type used for modeling.

Demonstration of the specificity of the procedure for assay may be based on likely sources of interference or material substitution based on an understanding of the material properties of the sample components and the manufacturing process and/or supply chain. One approach might be to verify that low assay results that are OOS are consistently obtained for a placebo version of the dosage unit. Another approach might be to verify that dosage units of a different product (especially one manufactured in the same facility and/or tested in the same laboratory) result in assay values that are consistently OOS.

Impurity limit tests: Routine testing is required for determination of impurities and/or degradants in intermediates, bulk drug substances, and finished pharmaceutical products.

Testing for this purpose typically takes the form of a limit test. This type of test is considered a Category II procedure per the definitions established in (1225).

Traditionally, these impurities tests are based upon HPLC or other methods (e.g., Karl Fischer titration for water). These analytical procedures are highly linear and are typically calibrated using univariate mathematics. However, these methods are often time consuming and involve manual sampling, which is disadvantageous, especially for products having high potency or for those with toxic intermediates produced during API synthesis.

In contrast, alternative methods for assay based on spectrophotometry (e.g., NIR and Raman spectroscopy) offer the advantage of increased analysis speed, and more importantly, total elimination of human sampling due to the noninvasive nature of the measurement. However, these advantages are typically offset by decreased sensitivity (LOD) and potentially nonlinear sensor response across the required analyte concentration range as the corresponding reference method. For this reason, multivariate approaches combining spectral preprocessing and latent variable models are often employed in spectrophotometric methods for these limit tests.(6)

For a limit test in Category II procedures, a calibration set containing varied concentrations of the analyte of interest is often used to characterize the performance of such an analytical procedure. Although it is not required, these performance metrics could include accuracy, range, linearity, and others. The use of the performance metrics depends on the nature of the limit test.

In contrast, it is critical to illustrate specificity and LOD during validation of a limit test according to (1225). For specificity, a comparison between loading/regression vector and a spectrum representative of the pure component of interest is often used. Additionally, measuring matrix effects on the determination of the analyte within the specified range is another useful approach to demonstrate that the analytical procedure is specific to the analyte of interest without impacts from other variables introduced in the calibration set. Moreover, evidence of method specificity can be demonstrated by calculation of a selectivity ratio from the calibration data set, defined as the variance of model-reconstructed spectra divided by that of residual spectra. The selectivity ratio at the analyte absorption band is expected to be higher relative to other spectral regions.

For LOD, the traditional approach to determine LOD involves calculating a spectral signal-to-noise ratio. The instrument response on a blank sample may be used to represent the noise. Alternatively, the noise may be approximated using the standard error of a multivariate model. For example, the LOD of a PLS model could be estimated using three times the RMSEP (or RMSECV). With either approach, the estimated LOD should be verified experimentally using samples with analyte levels at or near that concentration. Because the LOD obtainable via a spectrophotometric method will likely be higher than that obtainable via a traditional chromatographic approach, it becomes crucial to demonstrate that the LOD based on the chemometric model meets the requirements of the ATP.

Dissolution testing: A performance test based on dissolution is required for drugs with solid oral dosage forms to provide critical in vitro drug-release information. Dissolution results are used to predict in vivo drug-release profiles during drug development and to assess batch-to-batch consistency for quality control purposes. Chemometric models can be used to predict the drug product dissolution from relevant measured product properties, and the method that uses such a model may be established as an alternative procedure.

Dissolution data may be collected as a profile (i.e., a series of values obtained at various time points), even though the acceptance criteria may rely on a single time point. When building a

chemometric model, it is essential for the model to be able to predict the entire profile. The number, and spacing in time, of points in the dissolution profile will vary depending upon the product type (e.g., immediate versus modified/extended release). A common approach is to transform the profile into a single value, which then serves as a dependent variable (or y , response variable). This variable, combined with another measured variable, can be used to restore the dissolution profile. The transformation can be accomplished by fitting the dissolution profile data into a mechanistic model (such as a first-order rate equation or its variants) or an empirical model (such as a Weibull function). After transformation, a few variables (typically, two or three variables) can be used to represent the dissolution profile. Generally, the two variables are a dissolution rate factor and a plateau factor; a third variable such as lag time may be necessary. The dissolution rate factor, which represents the rate of dissolution, will be the dependent variable for the modeling. The plateau factor represents the final amount of the drug in the solution, which should be equal to the drug content for most products. These two factors are used to restore the profile. Therefore, the model for dissolution prediction is used to predict the dissolution rate.

The key to designing a successful model is defining the input variables. The plateau factor may be obtained from drug content data, whereas the dissolution rate factor may be modeled from a data set of chemical and physical attributes of the product or intermediate product. The necessary knowledge of physicochemical properties and engineering concepts should be used to identify and justify the relevant inputs that have potential impact on the dissolution of the product. This typically involves risk assessment and an additional data collection step such as a small-scale DoE study. The inputs typically include the measured material attributes at various processing stages (such as particle size data for granules or blend; NIR measurements for blend or tablets; and physical tablet properties).

There are two approaches for defining samples in the model calibration: batch samples and individual unit dose samples. For the batch-sample approach, one product batch is treated as a sample, and the input variables are the attribute means of the batch. The individual unit dose approach is to measure the attributes of individual unit doses (such as NIR measurement on the individual tablets). The input variables from both approaches may be supplemented with other raw material properties as justified by the critical quality attributes.

The validation of the model-based dissolution prediction method could be different from the traditional HPLC dissolution method validation, depending on the specific approach used. The HPLC dissolution method puts more emphasis on precision, as the dissolution is treated as a Category III method in (1225).

In the batch-sample approach, the model-based method treats dissolution as a batch property instead of a property of individual tablets, and accuracy is the focus of method validation or verification. For example, each batch forms a sample, and then it is not realistic to have a large validation sample set. This approach generates a single profile for a batch, and the result at a certain time point can be used to assess the product batch quality. Evaluation of variability must be aligned with the criteria in *Dissolution* (711). The variability of the final dissolution result can be evaluated by analyzing the variations of inputs. Possible ways to evaluate the variation of the sample (batch) include the analysis of variation of inputs; simulations; and dividing a batch into multiple sub-batches.

In the individual unit dose approach, the model-based method evaluates individual dosage units. If many tablets are tested, this becomes a large n situation in which the acceptance criteria in (711) should be used with caution. The chemometrician may propose acceptance criteria as long as these criteria are demonstrated (by simulation or other means) to have

equivalent or tighter passing criteria than those in (711). In the method validation or verification, it is desirable to have at least one sample that shows low dissolution (near or below the specification), and the chemometric model-based method should demonstrate the capability to distinguish this low-dissolution sample from normal samples.

GLOSSARY

Many common chemometric terms have been defined within the text of this chapter. Some additional terms are defined here and serve as a reference to their usage in the text. For a more complete description, consult the texts listed in *Appendix: Additional Sources of Information*.

Calibration model: A mathematical expression used to relate the response from an analytical instrument to the properties of samples, or to capture the underlying structure of a calibration data set.

Calibration set: Collection of data used to develop a chemometric classification or model.

Derivatives: The change in intensity with respect to the measurement variable (i.e., abscissa). Derivatives are useful for removing baseline offsets (constant or linear) due to sample properties, or for highlighting small changes in a signal, helping to enhance selectivity and sensitivity (e.g., one spectroscopy and chromatographic peak with a shoulder peak adjacent).

Internal validation: The application of resampling statistics such as cross-validation. Subsets of the calibration data set are subjected to a variety of statistical processes to identify which calibration model best fits the available data. Each model is characterized by a statistical parameter. For cross-validation, the entire data set of samples is split into individual samples or groups of samples, which are removed individually from the rest of the samples and tested as unknowns against a calibration model constructed using the rest of the samples. The characteristic statistic is the standard error of cross validation (SECV).

Matrix: A two-dimensional data structure comprised of columns and rows used to organize inputs or outputs during chemometric analyses. Common practice is for each row to correspond to an individual sample and each column to correspond to an individual variable.

Validation set: The data set that challenges the performance attributes of the model. The validation data set is independent of the training data set, although testing on the training data set gives an optimistic view of performance and thus allows for iteration of preprocessing and model tweaking until this optimistic view meets the expectations. Validation or cross-validation is then necessary to adequately gauge the performance of the model. The model performance with the validation data set will always be equal to or worse than its performance with the training data set. If the performance attributes are not met, then the chemometrician must assess whether the model underfits or overfits the data and whether iterations of the model are needed to meet the acceptable error rate. If these efforts fail, it is recommended to back up one step, alter the preprocessing conditions, and perform the same task again.

1. SCOPE

1.1 Introduction

This chapter provides guidance on the inspection of injections for visible particles. The terms particle, particulates, and particulate matter are equivalent and do not have different meaning when used in this chapter. Particulate matter is defined in *Particulate Matter in Injections* (788) as “mobile undissolved particles, other than gas bubbles, unintentionally present in the solutions.” Visual inspection is a probabilistic process and the specific detection probability observed for a given product for visible particles will vary with differences in product formulation, particle characteristics, and package design. The methods discussed in this chapter are also applicable to the detection of other visible defects not the subject of *Visible Particulates in Injections* (790), but critical to a qualified, comprehensive inspection process. These include, but are not limited to, container integrity defects such as cracks, misplaced stoppers, or incomplete seals, any of which may compromise the sterility of the product. Additional container defects (1), as well as other product characteristics such as fill level, discoloration, or clarity may also be detected during visual inspection, and non-conforming units should be rejected using the methods described in this chapter. Inspection for these other quality attributes often occurs at the same time as the inspection for particles. The primary focus of this chapter is a manual reference inspection method; however, semi-automated and automated methods are also discussed and permitted by the pharmacopeia.

1.2 Related Chapters

Injections and Implanted Drug Products (1) provides an overview of injectable dosage forms and the quality tests associated with them. Another chapter, (790), has been added to the *USP–NF* to provide a clear definition of routine inspection procedures for injectable products; the goal is to comply with the expectation that products be essentially free of visible particulate matter. Additionally, information on the detection of subvisible particulates is provided in *Subvisible Particulate Matter in Therapeutic Protein Injections* (787), (788), and *Particulate Matter in Ophthalmic Solutions* (789). *Measurement of Subvisible Particulate Matter in Therapeutic Protein Injections* (1787) and *Methods for the Determination of Particulate Matter in Injections and Ophthalmic Solutions* (1788) provide additional supporting information on measurement methods for subvisible particles.

1.3 Defect Prevention

Although this chapter focuses on detection and removal of product units that show evidence of visible particles, the need for preventing such contamination should not be overlooked. No inspection process, manual or automated, can guarantee complete removal of all visible particulate matter or other visible defects; thus, prevention of such defects is an important consideration. Good process and product design, along with environmental control, are necessary to ensure the reliable production of products with a low particle burden. To ensure

the control of defects throughout the process, manufacturers should consider an inspection life-cycle approach (2). This approach begins with developing quality attributes based on incoming component specifications, followed by component-level acceptance testing. It extends to component preparation and product-filling procedures, followed by 100% in-process inspection of filled product, and concluding with final acceptance sampling and testing of the finished product. The approach must extend to purchased, ready-to-use components such as containers or closures, where there is no opportunity for subsequent particle removal after receipt and before filling. Stability and retention sample inspection, customer complaint evaluation, and in-house investigative procedures support this integrated approach. The inspection life-cycle is composed of, and supported by, sub-cycles involving qualification, maintenance, personnel training, defect characterization by forensic analytical methods, and the use of standards within each of the critical areas. The final element of the life-cycle is a feedback loop of trending and data review from each of these process areas, resulting in a mechanism that supports continuous process improvement.

2. INTRODUCTION

2.1 Inspection Process Capability

Visual inspection of injections is necessary to minimize the introduction of unintended particles to patients during the delivery of injectable medications. Such inspection also offers the opportunity to reject containers whose integrity has been compromised, such as those with cracks or incomplete seals, which pose a risk to the sterility of the product. The desire to detect these defects, despite their very low frequency and the randomness of their occurrence, has resulted in the long standing expectation that each finished unit will be inspected (100% inspection). Although zero defects is the goal and this should drive continuous process improvement, zero defects is not a feasible specification for visible particles given current packaging components, processing capability and the probabilistic nature of the inspection process.

The detection process is probabilistic: the likelihood of detection is a cumulative function of visible attributes such as particle size, shape, color, density, and reflectivity. Understanding human performance is therefore critical to establishing visual inspection criteria. Individual receptors in the eye have a theoretical resolution of 11 μm , but typical resolving power is reported as 85–100 μm (3). Analysis of inspection results pooled from several studies (4–6) conducted with standards prepared with single spherical particles show that the probability of detection for a seeded sample with a single 50- μm particle in a clear solution contained in a clear 10-mL vial utilizing diffuse illumination between 2,000 and 3,000 lux is only slightly greater than 0%. The detection probability increases to approximately 40% for a seeded standard with a 100- μm particle and the threshold for routine, reliable detection ($\geq 70\%$ probability of detection) of individual visible particles is often near 150 μm in diameter (4) and typically exceeds 95% for particles that are 200 μm and larger. Thus, in a qualified visual inspection system, the vast majority of particles that might go undetected and be introduced into the pharmaceutical supply chain will be smaller than 200 μm . Changes to the container (e.g., increasing size and opacity), formulation (e.g., color and clarity), fill level, and particle characteristics beyond size (e.g., color, shape, and density) will all affect the probability of detection which can be achieved for a specific product and package (6).

2.2 Patient Risk

A complete review of the medical literature is beyond the scope of this chapter, but the effect of extraneous particles on the patient must be considered. A number of reviews on this subject are available (7–13). The clinical implications of extraneous particulate matter in injections are determined by many factors, including the size and number of particles, the composition of the material, the potential for microbiological contamination, the route of administration, the intended patient population, and the clinical condition of the patient. For example, an otherwise healthy individual receiving a subcutaneous or intramuscular injection containing sterile, inert particulates would likely experience no adverse effect or at worst would develop a small granuloma. On the other hand, a critically ill premature infant receiving a particle-laden infusion directly through an umbilical catheter might suffer considerable pathophysiologic sequelae (14,15).

Garvin and Gunner were among the first to report a concern about the effects of particles in human patients (16,17). For obvious ethical reasons, there is a lack of controlled clinical studies on the effects of particles in human patients. Some anecdotal information about human patient safety may be obtained by examining case reports of intravenous drug abusers (18–20). In these cases, solid oral dosages are often ground up and injected as a slurry; pulmonary foreign body emboli and granulomas were observed in these patients (21). Unfortunately, the clinical risks to human patients posed by small numbers of particles are difficult to infer from these observations due to the extreme number of insoluble particles and the uncontrolled conditions in which they were administered.

Numerous animal studies have been conducted to determine the fate of intravenous particles with different sizes and composition (22–25). Most studies have focused on subvisible particles with a diameter of <50 µm. In these studies, a massive infusion of particles has been accompanied by histologic evidence of injury to pulmonary capillary endothelial cells (26), microscopic thrombi in the pulmonary capillaries (27), pulmonary microscopic granulomata (28), and hepatic inflammatory effects (29). Although useful for understanding the pathophysiologic response to particulate matter, the large number of particles used in these studies (e.g., 109 particles/kg/injection) provides little insight into the risk to humans posed by small numbers of macroscopic particles. Arterial embolization using materials such as polyvinyl alcohol (PVA), collagen-coated acrylic microspheres, and gelatin spheres also provides some insight into the potential human pathophysiologic implications of non-target embolization of extraneous-particle intravenous infusions. In these cases, massive particle loads moving from the arterial injection site into the venous circulation were also reported (30–34).

In a review of the hazards of particle injection, it has been found that the primary contributor of particulate matter in vial presentations is the rubber closure, a risk that is present with almost every injection. In addition, case reports have documented injury associated with infusion of significant quantities of precipitated admixtures or therapeutic use of particles for embolization (14,15,35). Despite the administration of an estimated 15 billion doses of injectable medicines each year (36), no reports of adverse events associated with the injection of individual visible particles have been found.

Ultimately, the safety considerations related to particulate matter in injections must be assessed for each drug product, intended patient population, and method of administration. No single set of inspection criteria can adequately anticipate all of the potential risks to the patient. The methods outlined in (790), should serve as essential requirements when assessing the adequacy of the visual inspection procedure, but alternative acceptance criteria (for example, the use of tightened sampling plans) should be implemented when the patient population and intended use of the product warrant these additional measures.

2.3 History of Compendial Inspection Standards

The requirement for injections to be “true solutions” appeared in *USP IX* in 1915, and the first appearance of “solution clarity” for parenterals occurred in 1936 in *NF IV*. Since then, there have been numerous modifications to the compendia in this regard. A comprehensive history of compendial inspection standards is available in the *Pharmaceutical Forum* (37).

3. TYPICAL INSPECTION PROCESS FLOW

3.1 100% Inspection

Chapter (790) establishes the expectation that each unit of injectable product will be inspected as part of the routine manufacturing process. This inspection should take place at a point when defects are most easily detected; for example, prior to labeling or insertion into a device or combination product. Each unit may be examined manually with the unaided eye, or by using a conveyor to transport and present the containers to a human inspector (semi-automated inspection), or by means of light obscuration or electronic image analysis (automated inspection). Manual and semi-automated inspection should only be performed by trained, qualified inspectors. Inspection may also be enhanced by means of a device that holds more than a single unit at one time for examination. This inspection may be performed in-line with filling or packaging or in a separate, off-line inspection department. The intent of this inspection is the detection and removal of any observed defect. When in doubt, units should be removed (see *Figure 1*).

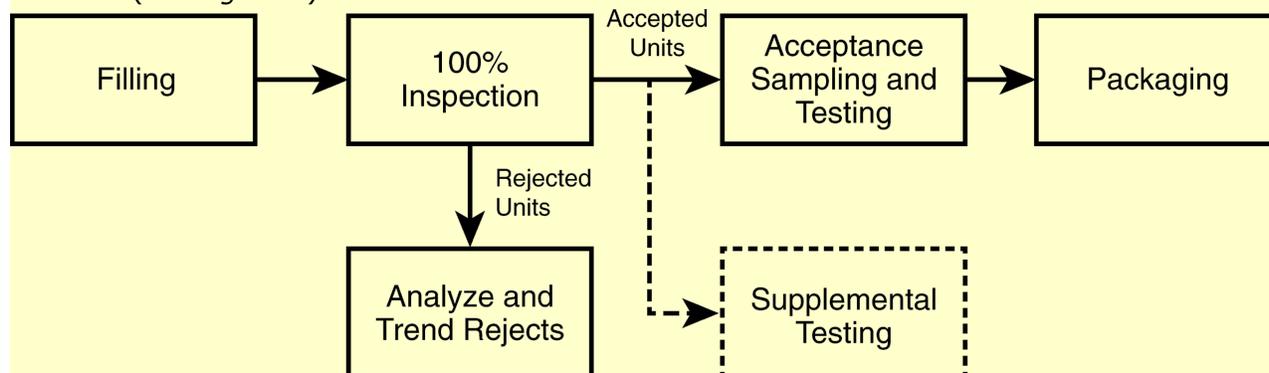

Figure 1. Typical process flow chart.

[Note—100% inspection refers to the complete inspection of the container–closure system and its contents. Inspection may be accomplished in a single operation or in multiple steps using a combination of technologies. See additional discussion in 3.3 *Remediation and Alternative Practices* and 6. *Inspection Methods and Technologies*.][Note—Supplemental testing is required when the nature of the product or container limits visual inspection of the contents (e.g., with a lyophilized cake or powder or with an amber glass or opaque container). See additional discussion in 5.2 *Unique Product and Container Considerations*. Samples for supplemental testing may be taken from any point in the process after 100% inspection.]

During 100% inspection, limits on typical rejection rates should be established to identify atypical lots (38). These limits may be established for categories of defects (e.g., critical, major, and minor) or for specific types of defects (e.g., particles). A review of historical performance is useful in establishing these limits, and the review may include grouping products similar in appearance and manufacture. Periodic reassessment of these limits is recommended to

account for expected process improvements and/or normal fluctuations in process baseline (39). If a limit is exceeded, it should trigger an investigation. The investigation may include additional inspection or it may determine whether additional inspection is necessary.

3.2 Acceptance Sampling and Testing

After 100% inspection, a statistically valid sample is taken from the units accepted by the inspection process. This may be a random sample or a representative sample (e.g., at fixed time intervals or a fixed number per tray). Defects may not be distributed equally over the lot, and therefore a sampling process that represents the whole lot is required. Typical sampling plans used for this purpose can be found in the ANSI/ASQ Z1.4 standard (40). Equivalent plans may also be found in the ISO 2859 (41) or JIS Z9015 (42) standards. For batch release, the sampling plans listed as Normal II are typically used. Tightened sampling plans may be appropriate when an atypical result is observed or reinspection is performed. These plans specify a sample size for a range of batch sizes and require selection of an acceptable quality limit (AQL). The AQL is the defect rate at which 95% of the lots examined will be accepted and is a measure of falsely rejecting good batches. Critical defects (those that pose the greatest risk to the patient) should be assigned an AQL with a very low value. Often, the accept number (the number of defective units allowed in the sample) for a critical defect is zero. Major and minor defects, which pose less risk to the patient, will have increasing (less stringent) AQL values and accept numbers greater than zero. *Table 1* shows the range of AQL values typically used for visual inspection processes (43).

Table 1. Typical AQL Values for Visual Inspection Processes

Defect Category	AQL Range (%)
Critical	0.010–0.10
Major	0.10–0.65
Minor	1.0–4.0
[Note—When selecting a sampling plan for AQL testing after 100% inspection using ANSI/ASQ Z1.4, ISO 2859 or JIS Z9015, choose the sample size to satisfy the AQL value for the most critical category (e.g., critical) of defects being evaluated. Then use the accept numbers for this sample size for the AQL values chosen for the other defect categories (e.g., major and minor). This assures that the sample size will produce a statistically valid result for all defect categories examined. The defect categories shown here represent a common basic approach to grouping defects by risk; however additional categories may be added to these for more detailed analysis.]	

The unacceptable quality limit (UQL) for the sampling plan used should also be known. The UQL is the defect rate at which 90% of the lots examined will be rejected and is a better measure of the customer or patient risk. The protection afforded by any sampling plan is represented by its operational characteristic (OC) curve. This is a plot of the probability of lot acceptance versus the defect rate in the lot. The AQL and UQL are two points on this curve. Sampled units should be manually inspected under controlled conditions by trained inspectors. Inspection conditions should be aligned with the 100% inspection process.

Acceptance sampling should be performed after any type of 100% inspection process, including manual, semi-automated, and automated inspection processes. It provides a measure of the performance of the overall inspection process and the quality of a specific lot, compared with predefined acceptance criteria. Although automated systems are validated before use and are

routinely challenged to ensure acceptable performance, the use of acceptance sampling detects unexpected defects that were not included in the development and training of the automated system by the manual inspection process.

Acceptance criteria are comprised of the product specifications and acceptance/rejection criteria, such as the AQL and UQL values, with an associated sampling plan that are necessary for making a decision to accept or reject a lot or batch (or any other convenient subgroups of manufactured units) as described in 21 CFR 210.3 (44). If the acceptance criteria of the sampling plan are not met, an investigation should be conducted. Depending on the nature of the failure, this investigation should include examinations of the manufacturing process, the raw materials, and the packaging materials, as well as the inspection process. If, after investigation, the inspection process is deemed capable of detecting the defect(s) in question, the batch may be reinspected. An alternative inspection process, better suited to detection of a specific defect may also be chosen for reinspection. After reinspection, a new sample of the accepted units is taken and compared against established acceptance criteria. It is a good practice to use a tightened sampling plan and acceptance criteria under these circumstances because of the atypical nature of this process step.

3.3 Remediation and Alternative Practices

REINSPECTION

As discussed in the preceding section, reinspection may be appropriate if the initial 100% inspection is not successful. This includes instances when the established 100% inspection failure rate(s) and/or the accept/reject number(s) associated with the chosen AQL values have been exceeded. Reinspection should only be conducted using a prior-approved procedure that addresses key parameters such as the inspection conditions (e.g., same as primary inspection or modified to enhance detection of a specific defect type), the number of times reinspection may be performed (this should be limited, and justified), and the acceptance criteria (e.g., same as primary inspection or tightened). If reinspection is required often, consideration should be given to improving the sensitivity of the primary inspection process. Frequent and routine reinspection is not recommended. Reinspection is not considered rework and is more closely associated with reprocessing as defined in 21 CFR 211.115 (45), where a qualified or validated processing step is repeated.

TWO-STAGE INSPECTION

In cases where an assignable cause, such as formation of air bubbles or specific container or closure variation, results in a high false-rejection rate (rejection of acceptable units), the use of a second inspection step may be considered. This is more common with automated inspection systems, where there is less ability to tolerate normal variation in product or container. Under these circumstances, the inspection system is adjusted to ensure acceptance of good units. Those not accepted are considered of uncertain disposition until inspected by another means (e.g., manual inspection following automated inspection). Inspection conditions may be adjusted to provide greater sensitivity in this second inspection step (e.g., additional inspection time) to ensure a high probability that true defective units will be rejected. The limitations of the first inspection and the reason for conducting a second stage of inspection should be clearly defined and documented. The second inspection of these units by the same method (e.g., automated inspection after automated inspection) is generally not recommended, because the same limitation in inspection method is present for both inspections. However, it

may be suitable when the root cause is air bubbles in the solution and a study has been performed to establish an appropriate holding time to allow the bubbles to dissipate before performing the second inspection. It is recommended that each inspection stream (those accepted by the first stage and those accepted by the second stage) be sampled separately and evaluated against the sampling plan acceptance criteria before they are confirmed as accepted and recombined into a single batch.

4. INSPECTION LIFE-CYCLE

4.1 Extrinsic, Intrinsic or Inherent Particles

Particles may originate from many sources. These are discussed here, as well as in other chapters in the *USP* (e.g., (1787)). Those that are foreign to the manufacturing process are considered to be exogenous or "extrinsic" in origin; these include hair, non-process-related fibers, starch, minerals, insect parts, and similar inorganic and organic materials. Extrinsic material is generally a one-time occurrence and should result in the rejection of the affected container in which it is seen; however, elevated levels in the lot may implicate a broader contribution from the same source. These particles may carry an increased risk of microbiological or extractable contamination, because less is known about their path prior to deposition in the product container or their interaction with the product.

Other particles are considered "intrinsic", from within the process, or "inherent", which are known to be or intended to be associated with specific product formulations. The determination of whether the particulate is inherent or intrinsic to the process is based upon appropriate characterization of the particle's physicochemical properties. Intrinsic particles may come from processing equipment or primary packaging materials that were either added during processing or not removed during container preparation. These primary product-contact materials may include stainless steel, seals, gaskets, packaging glass and elastomers, fluid transport tubing, and silicone lubricant. Such particles still pose the risk of a foreign body, but generally come from sterile or sanitized materials and more is known about their interactions when in contact with the product. Any process-related intrinsic particles should have controls established based on the use of a life-cycle approach as outlined in *1.3 Defect Prevention*. Another group of particles considered intrinsic is interrelated with the stability of the product. These product stability-related particles come from container-closure interaction, changes to the drug formulation (insoluble degradation products), or temperature sensitivity over time. Stability-related intrinsic particles should be identified and addressed as early in the product development process as possible.

The physical form or nature of inherent particles varies from product to product and includes solutions, suspensions, emulsions, and other drug delivery systems that are designed as particle assemblies (agglomerates, aggregates). Product formulation-related particulate formation should be studied in the development phase and in samples placed on stability to determine the normal characteristics and time-based changes that can occur. Use of automated particle counting or image analysis in the subvisible (for particle sizes $\geq 2 \mu\text{m}$) and visible ranges may be required to fully characterize inherent formulation-related particles. In biologics, protein particles are considered inherent when their presence may be measured, characterized, and determined to be part of the clinical profile. Inherent particles may be accepted if the drug product has a control strategy showing that this particulate category is part of the product clinical profile. The manufacturer may allow inherent particles if the product appearance

specification also allows their presence or if the product is an emulsion or suspension.

An evaluation of the potential impact of particles identified from any of these sources may be enhanced by incorporating a clinical risk assessment. This assessment may include factors such as the intended patient population, route of administration, source of the particles, and implications for product sterility. For intrinsic or inherent particulate matter sources, a risk assessment may be useful in developing product-specific control strategies. Given the probabilistic nature of particle detection, it is important to assess the possible implications of particles identified through the product life-cycle to better ensure the product's safe use.

4.2 Prevention of Particulates

The manufacturing process is designed to keep the final container and its contents clean within the control parameters established for process-related particulates. Once the container is filled, the stability of the product needs to be maintained throughout its shelf life. Changes that occur as the product ages during its normal shelf life must be characterized. Avoidance of intrinsic particle sources that may affect final product stability depends on careful consideration of the entire product system. If these intrinsically sourced changes occur, and they affect stability, particles ranging from sub-visible to visible may develop. Typically, these particles result from change mechanisms that slowly affect the on-shelf product.

ROBUST DESIGN DURING DEVELOPMENT

To anticipate potential sources of instability that yield intrinsic particles, the product design is evaluated from many perspectives, beginning with a literature review of similar formulae/packages. Points to consider include the reported sensitivities of the active, the formulation type, and the final container-closure system needed for delivery. Knowledge of how glass containers are fabricated, controlled, sterilized, and tested is important as this may affect the tendency to form glass lamellae (46,47). Obtaining further information on residual extracts, possible leachates, metals, or solubility-edge conditions is important as these factors may promote formation of solid material in the aging solution. Several additional key factors for successful product design are the product concentration, solution pH, critical micelle concentration, oligomerization content/potential, package effects (large surface area, product volume, head space, light/oxygen transmission), and compatibility of the formulation with the package. Some key formulation design factors include the formula components chosen and their purity; the solubilities of the active ingredient(s) and excipients, and consideration of potential salt forms. Finally, to maximize product stability, consider the final product preparation for delivery, product dilutions, and shelf stability of the commercial product or its therapeutic preparations.

To examine the appropriateness of the product design for maintaining product stability, there are two levels of evaluation. Both levels examine retained containers for visible changes using methods described in this chapter, but neither level dwells on low percentage defects. For the first level of stability study, bench trials consisting of visual inspection of trial containers in the formulation lab will show general compatibility of the chosen components over time with regard to clarity, color, and particle formation. Careful product assembly in clean containers, with consideration of the container type, headspace, and sealing, will yield a beneficial first-pass trial of stability over several months' time. Detection of extrinsic particles at this stage of development is generally not significant, as the particles do not reflect on the formulation under development.

The second, more refined level of stability study involves conducting visual inspections of the injection in defined, International Conference on Harmonisation (ICH)-relevant trials. This may include periodic inspection of the same containers over time if the product does not require reconstitution or is not affected by frequent temperature changes. Detection of minor or subtle differences in these containers is not the goal at this stage of development. Catastrophic change and the occurrence of intrinsic product-related visible particles should be the focus. Typically, a set of containers is carefully prepared to exclude extrinsic particles and is then inspected to cull out any units with visible defects. Next, a numbered set of containers appropriate for the batch size is placed on trial and visually inspected periodically; a typical sample size is 80–100 units. Additional sets of containers stored at selected extremes of ICH temperatures can be followed to aid discovery of solubility-edge phenomena. When unwanted changes are detected, such as particle formation, solution color change, solution haze, and package changes, the process of isolation, characterization, and identification can commence. Identification of the material making up the changes aids in determination of the cause, as well as development of improvements for future use.

COMMON SOURCES OF INTRINSIC PARTICULATES

Process-related intrinsic particles originating from product contact materials tend to be stable and unchanging (e.g., glass, rubber, or metal). In contrast, there may also be particles resulting from product stability-related change mechanisms within the final product. It is very important to understand that these changes only have to be slight in certain cases, far below the detection limit of most release or stability assays, to result in visible changes to the product. The threshold levels for the formation of visible change for certain substances may be only 10–100 ppm (0.001%–0.01%). However, if all of this insoluble material were contained in a single visible particle, it would likely cause rejection of the container.

FORMULATION COMPONENTS

The active ingredient may also contribute to the presence of stability indicating intrinsic particles. For example, significant haze and particles have manifested in aqueous formulations due to extraction of plasticizers from filtration media during bulk drug production (5). Metal content in the active ingredient has contributed to organometallic salt formation and has also been observed as precipitated inorganic salts, blooming long after product release. The active ingredient and related degradation products may also be relatively insoluble and may grow to form visible particles. The particulate material must be analyzed to determine its chemical nature and possible identification.

Monomers or single molecules may join together through chemical processes to form dimers, trimers, and oligomers (a limited assemblage of monomers, short of polymerization). Such changes are not unexpected (48). In high-concentration and/or saturated formulations, and especially for micellar drug associations, the solubility of related forms is significant when the aging formulations contain progressively higher concentrations of these substances. Larger molecules may have a greater effect on solution integrity due to their inherent insolubility, especially if the active drug is in a micellar formulation.

Polymorphs are unique crystalline forms of identical chemical entities. Although uncommon in solutions that have been mixed homogeneously and filtered, small seed crystals of a relatively stable polymorph may form over time, especially at nucleation sites such as container-surface defects. More common than formation of polymorphs is formation of a modified crystal lattice containing an integral liquid, typically water or solvent. The lattice may form slowly, promoted

by evaporation, nucleation, and temperature extremes (49,50).

PACKAGING COMPONENTS

Extractables and leachables are terms commonly used to describe the potential for primary packaging materials to contribute unwanted agents to the product. Extractables represent all of the materials that could be contributed, and leachables represent the practical contribution upon contact between packaging components and drug formulation (51). These substances can also contribute to the formation of subvisible and visible particles.

Formulation attack of the container is a dramatic change and most often occurs in glass container systems. Glass containers undergo corrosion that is 25 times greater at pH 8 than at pH 4 (52). A formulation pH above 7, especially with high-ionic strength solutions, promotes attack of the inner glass surface, resulting in particle generation.

Silicone oil is added to pre-filled glass syringe systems to enhance lubricity for closure insertion and/or syringe movement. Silicone may also come from tubing used for fluid transfer and a variety of polymeric fittings and seals that are used in the processing equipment. All of these components must be compatible with the formulation to minimize leachates. Although silicones are processed to be sterile and are widely used, their use must still be controlled. Silicone can cause container sidewall droplets and a variety of visible semi-solid forms. No more than the minimum quantity should be used during processing. Silicone and other hydrophobic substances have the capacity to coalesce and agglomerate with other particles, reaching a visible size.

4.3 Particulate Removal by Component Washing

GLASS CONTAINERS

Each step of the glass-container washing and rinsing process should be evaluated for particle-reduction capability. The washer validation studies should demonstrate a reduction in naturally occurring particles or should use seeded containers to demonstrate such reduction capability. The use of statistical sampling plans with light obscuration and/or membrane microscopic particle-counting methods can provide a means to demonstrate reduction of both subvisible and visible particles during washing cycle development and validation. During process development, validation, and routine use, container-washing procedures should include periodic visual operational checks. This routine verification ensures that effective draining of all containers is occurring during all washing and rinsing steps. Review the wash-water recirculating filter maintenance procedures to ensure that particle overloading or breakthrough is being prevented.

Glass breakage that occurs during the component washing process could affect surrounding containers and the washing cycle should be evaluated for possible glass particle generation and distribution. Effective, written container-clearance procedures following these occurrences should specify the number of containers to be removed from the affected portion of the line. Removing units that could potentially contain glass particles aids in minimizing particle transfer to the downstream process.

ELASTOMERIC CLOSURES

Each step of the elastomeric-component washing and rinsing process should be evaluated for particle-reduction opportunities. Utilize statistical sampling plans to collect meaningful test units. Light obscuration or other automated particle counting and membrane microscopic particle-counting methods may be used to demonstrate reduction of both subvisible and visible

particles during washing validation. During process development and validation and in routine use, container-washing procedures should include visual checks to ensure that stoppers are not routinely sticking together. Such sticking surfaces reduce cleaning efficacy and entrap particles. Periodic assessment of component cleanliness and supplier washing capabilities should be included as part of the supplier qualification program when using purchased, ready-to-sterilize, or ready-to-use components.

Evaluate any current siliconization process used, whether in-house or by the supplier, to minimize excess silicone levels while maintaining machinability of the stoppers. Light obscuration or other automated particle-counting method may be used to compare overall particle level reduction (background silicone oil droplets) during process development or validation. The level of residual silicone oil will affect the particulate quality of the final filled product, observed as dispersed droplets and particle-forming matrices.

GLASS HANDLING

Processes that use racks or trays for transporting and holding samples, as are typically used in batch ovens, should be monitored for metal particle generation. The racks or trays should have a formal maintenance program associated with their routine use. Trays should be inspected for wear and scoring, which can be sources of particulates. Periodic cleaning, polishing, and/or resurfacing may be warranted to effectively control particles. Tunnels used for depyrogenation should also have a routine maintenance program for periodic cleaning, inspection, and replacement of parts that may wear and generate particles. Routine process observation for glass breakage allows for clearance of any potentially affected surrounding containers and minimizes the occurrence of glass particles being carried downstream to filling. Glass-to-glass and glass-to-metal contact should be minimized where possible to reduce weakening of the glass surface and increasing the risk of subsequent fracture. The use of polymeric facing on guides can help in reducing such damage.

EQUIPMENT PREPARATION

It is important to minimize redeposition of particles on product contact surfaces after cleaning. Cleaned and sterilized equipment should be protected by HEPA-filtered, unidirectional airflow until transferred to, and installed on, the filling line. For cleaned equipment that needs to be wrapped or bagged prior to sterilization, utilize low-shedding, non-cellulose (synthetic) wrapping materials. Cellulose fibers are one of the most common particles found in the injections-manufacturing environment and injectable products and their origin will be a prime concern (43).

FILLING LINE

The transfer of open containers should be evaluated and reviewed to mitigate particle contamination. For example, for aseptically filled products the transfer should be conducted in Grade A (ISO 5, Class 100), unidirectional air flow to minimize particle contamination. The air in critical zones should be monitored continuously during operation to confirm compliance. Routine checks to detect particles and potential particle-generation locations should be explained in the procedures. Effective, written container-clearance procedures to be used after glass breakage should specify the number of containers to remove from the affected portion of the line. Note that improper set-up and adjustment of the filler can lead to "needle strikes" where the filling needles make contact with the container being filled. This can generate either

stainless steel or glass particles.

Filling pump design and the pump's compatibility with the filling solution are important considerations. Metal-on-metal piston pumps have a greater potential for generating metal particles, compared with other types of piston pumps. Pump maintenance is essential and includes a requirement to resurface the cylinders and pistons periodically. Peristaltic-action pumps must be monitored for generation of silicone tubing particles, especially with aggressive, near-saturated solutions or suspensions. Friction in the peristaltic roller area can break down the tubing, resulting in the generation of particles.

Stopper bowl surfaces should have a formal maintenance program, and stopper handling or replenishment by operators should be specifically designed to minimize particle transfer to the stoppers. Proper operator positioning and avoidance of open containers is important in good, aseptic filling practices, to avoid microbial contamination. These same principles help reduce particle transfer to the open containers and exposed elastomeric closures.

Careful selection of cleaning and gowning materials will help reduce contamination from extrinsic particles and fibers. These clean-room materials should be selected for their superior non-shedding and low-particle properties.

4.4 Trending

Data obtained from the inspection process are used for batch release. These data should also be analyzed for adverse trends on a periodic basis, typically at least once per year. High-volume products may generate sufficient data to allow quarterly analysis, whereas a longer period of time may be necessary to accumulate data for products that are produced infrequently. Data from component inspection, production 100% inspection, and the AQL inspections should be evaluated based upon sound statistical principles to determine whether the current action levels are accurately reflecting the current process capability. Alert levels may be introduced and/or adjusted accordingly if the statistical analyses indicate that lower defect levels are being observed consistently.

When establishing new action or alert levels, a preliminary value may be used until sufficient production experience is obtained. Consideration should be given to planned improvements in the manufacturing and inspection processes. If significant improvements are planned, the reduction of the action/alert level should not be instituted until the impact of the improvement is measured over sufficient time to establish the validity of the new value.

5. INTERPRETATION OF INSPECTION RESULTS

5.1 Defect Classification

Defects are commonly grouped into classifications based on patient and compliance risk (1). The most common system uses three groups: critical, major, and minor. Critical defects are those that may cause serious adverse reaction or death of the patient if the product is used. This classification includes any nonconformity that compromises the integrity of the container and thereby risks microbiological contamination of the sterile product. Major defects carry the risk of a temporary impairment or medically reversible reaction, or involve a remote probability of a serious adverse reaction. This classification is also assigned to any defect which causes impairment to the use of the product. These may result in a malfunction that makes the product unusable. Minor defects do not impact product performance or compliance; they are

often cosmetic in nature, affecting only product appearance or pharmaceutical elegance. For visible particles, particle motion aids in detection. Stationary particles are difficult to detect. Upon 100% inspection, visible extrinsic and intrinsic particles should be reliably removed. The test method allows inherent particles to be accepted if the product appearance specification allows inherent particle types. The size of particles reliably detected ($\geq 70\%$ probability of detection) is generally 150 μm or larger (4). This Probability of Detection (POD) is dependent on the container characteristics (e.g., size, shape, transparency), inspection conditions (lighting and duration), formulation characteristics (color and clarity), and particle characteristics (size, shape, color, and density). The POD at 70% or greater is known as the Reject Zone described in Knapp's methodology (53,54) which is used worldwide as an industry common practice for rejecting particle defects. Test sets characterized by repeated inspections, as described in 7.4 *Rejection Probability Determination*, are used to "calibrate" the inspection method's POD, inspector performance or automated inspection systems, and to demonstrate the sensitivity to threshold particle size at the Reject Zone of $>70\%$ POD. It should be understood that the limitation of the Reject Zone at 70% detection is that at this size threshold particles of the same size may routinely be missed or go undetected up to 30% of the time. These undetected units may contain some amount of threshold sized particles or sub-visible particles at a lower POD. It is therefore important to characterize any particles recovered from AQL testing, retention sample inspection and product returned from distribution to understand how it could have gone undetected originally during the initial 100% in-process inspection.

5.2 Unique Product and Container Considerations

LYOPHILIZED PRODUCT

Lyophilized products receive 100% inspection after the freeze-drying step has been completed and each unit has been sealed. However, the solid, lyophilized cake can mask the presence of visible particles because they cannot be seen within the solid matrix. The cake surface is visible during inspection but accounts for only a small fraction of the cake volume. Because of these challenges in evaluating acceptability, a small sample of units is reconstituted and inspected for visible particles in addition to the 100% inspection of the cakes for visible particles. Care must be taken during reconstitution of these samples to avoid contamination that can lead to false-positive results. Sample preparation should be done in a clean environment with appropriate particle-control measures. Reconstituted samples should be inspected using the same conditions as those for visible particles. The destructive nature of this test limits the size of the sample; however, the resultant fluid allows visible particles to be more readily detected. Typical sampling plans for this type of test can be found in the special sampling plans S-3 and S-4 in ANSI/ASQ Z1.4 (40). The S-plans offer a practical compromise between sample size and statistical power and for most batch sizes between 3,201 and 150,000 suggest a sample size of 20 with an accept number of 0 (based on an AQL of 0.65%). Alternative plans are acceptable, but care should be taken to examine the UQL of such plans to assess their sensitivity. Once inspection of these reconstituted samples has been performed, they may be used for other required testing, such as that for subvisible particles, potency, impurities, or other specified tests. If particles are detected in this relatively small sample, additional units may be reconstituted as part of an investigation and to assess the compliance of the entire batch.

POWDER PRODUCT

Sterile powders are difficult to inspect for particles due to powder flow and the occlusion of white or light-colored particles by the drug product itself. Sterile powders should be reconstituted and inspected for visible foreign particles using an approach similar to that for lyophilized products, as discussed above.

EMULSION AND SUSPENSION PRODUCT

The manufacturer may allow inherent particles if the product is an emulsion or suspension. For suspension products, a test dissolving the suspension or disruption of the emulsion that provides for extrinsic and intrinsic particle detection is also recommended as part of destructive supplemental testing of a small sample as described above for lyophilized products.

AMBER CONTAINERS

Inspecting amber containers is challenging because selected elements have been added to mask UV light penetration into the Type I glass container. Light transmission is blocked below 500 nm, and thus increased light intensity (e.g., 8,000–10,000 lux) may be required to observe visible particles during inspection. Directional lighting from behind the container may also be beneficial. At the extreme, filled solution in practically opaque containers may be audited via sampling and transfer to clear, clean containers.

TRANSLUCENT PLASTIC CONTAINERS

Plastic or translucent containers are chosen for break resistance or other properties that glass cannot offer, such as injection molding into shapes that minimize hold-up volume or for use in a combination product. Plastic containers may have optical properties that require significantly more light (e.g., 8,000–10,000 lux) to illuminate any visible particles against black and white backgrounds. Directional lighting from behind the container may also be beneficial.

LARGE-VOLUME CONTAINERS

Large-volume containers (>100 mL) may require additional time to complete a thorough inspection. For flexible bags, the semi-transparent nature of the PVC film used to manufacture these containers may require the use of additional light intensity to enhance the visibility of particles. Directional lighting from behind the container may also be beneficial.

COMBINATION PRODUCTS

When inspecting the unlabeled primary drug container for a combination product, the inspection considerations should be the same as those specified for a conventional drug product in a vial or syringe. This inspection should be performed before assembly into the device. Where there are critical attributes that are only visible after assembly (such as alignment with a fill-level window), a second inspection after assembly may also be required.

6. INSPECTION METHODS AND TECHNOLOGIES

6.1 Manual Visual Inspection

Manual visual inspection (MVI) is the reference inspection method described in all of the major pharmacopeias (55,56). It consists of viewing filled and sealed containers under controlled

conditions. This process may be aided by the use of a tool to allow consistent examination of more than one container at a time. The quality decision, to either accept or reject the container, is made by a trained person. Inspection is a probabilistic process, and detection rates <100% are to be expected, especially for smaller or low-contrast defects.

CRITICAL PROCESS PARAMETERS IN MVI

Light intensity: The results of the manual inspection process are influenced by the intensity of the light in the inspection zone. In general, increasing the intensity of the light that illuminates the container being inspected will improve inspection performance; (790) recommends light levels NLT 2,000–3,750 lux at the point of inspection for routine inspection of clear glass containers. Special attention should be given to assure that inspection is not performed below the lower limit of 2,000 lux. Increased light levels are recommended for plastic containers or those made from amber glass. Under these circumstances, light levels as high as 10,000 lux may prove beneficial. The final inspection condition will depend on measured performance. Light should be diffuse and even across the inspection zone, and it is a good practice to clearly identify this zone within the inspection station where the intensity meets the required levels. Fluorescent lamps have often been used as the light source for inspection. When fluorescent lamps are used, high-frequency ballasts are recommended to reduce visible flicker (and associated inspector fatigue). Incandescent lamps have also been used successfully for this purpose, but they generate significant heat during use. Light-emitting diodes (LED) offer an energy efficient, stable source of light without the added heat of incandescent lamps. Light intensity in each inspection station should be measured periodically to ensure continued compliance within the specified range. The frequency of monitoring should be based on historical experience with the type of light source in use. A lower light-intensity action limit should be established to trigger corrective action before inspection is performed below the lower limit of the range.

Background and contrast: Contrast between the defect of interest and the surrounding background is required for detection, and increased contrast improves detection. The use of both black and white backgrounds is described in (790), as well as other global pharmacopeias. The use of both backgrounds provides good contrast for a wide range of particulate and container defects, which can be light or dark in appearance.

Inspection rate: Sufficient time must be provided to allow for thorough inspection of each container; chapter (790) specifies a reference time of 10 s/container (5 s each against both black and white backgrounds). Larger or more complex containers may require additional time for inspecting all attributes. Increased time may facilitate detection of defects near the threshold of detection, but studies by Wolfe, et al. (57,58) suggest that there are diminishing gains with increasing inspection time. Time spent per container may be controlled through the use of a pacing device such as a light or tone, or these may be used during training only, much as a musician uses a metronome during practice to learn the tempo of a musical piece for later performance. Recording the time spent inspecting each batch and then calculating a nominal inspection rate is a good way to confirm that the rate of inspection was within established limits. Correction can be made for non-inspection activities performed during this time by the inspectors to better document the nominal inspection rate.

Container handling and movement: When observing objects, the human eye is very sensitive to movement. Good techniques for manual inspection include a careful swirl or inversion of the liquid product within the container. This rinses any particles from the upper inner surfaces of the container and the closure and puts them into motion. A technique that

minimizes the introduction of air bubbles is important, as air bubbles can appear as particles and interfere with detection of offending particles. A tool that holds multiple containers for consistent presentation can be useful when performing inspection. Holding many containers by hand at once should be avoided, as it is difficult to obtain a complete view of all container surfaces and contents. Container motion is also helpful for identifying small container defects such as cracks or chips.

Magnification: Some inspection processes use a large magnifier to increase image size and thus increase the probability of detecting and rejecting containers with defects near the threshold of detection. Although magnification can be useful for critical examination of a portion of the container, it does not often lead to increased overall detection rates for defects of interest. This may be due, in part, to the added eye strain that often results from use of magnification. As such, it is not recommended as part of the reference inspection method described in (790) or in other global pharmacopeias (55,56). Although not recommended for use during routine inspections, magnification can be helpful for critical examination of a small number of units, as may be needed during an investigation.

INSPECTOR FATIGUE AND ERGONOMIC CONSIDERATIONS

Inspecting for extended periods of time can cause inspector fatigue and a decrease in inspection performance. Based on industry experience (43), it is recommended that inspectors be given a break from performing inspection at least every hour. This break should allow time to rest the eyes and mind, and may be achieved with a short rest (e.g., 5 min) or a longer meal break. This need for regular breaks may also be met through rotation to a non-inspection function, such as material handling or documentation.

Inspection stations should be designed and operated in a manner that minimizes the inspector's risk of repetitive-motion injury. Adjustable chairs and careful positioning of light sources as well as incoming and inspected product can reduce the risk of such injury. These adjustments can also reduce inspector fatigue and discomfort, both of which can be distracting and thus can decrease performance.

The inspection room environment should also be considered. Temperature and humidity should be controlled for inspector comfort. Reduced ambient lighting is recommended to focus the inspection process and to reduce distraction from extraneous reflections. Special care should be given to inspection rooms with exterior windows that allow daylight into the room and thus changing ambient lighting throughout the day and with changing seasons.

6.2 Semi-Automated Visual Inspection

Semi-automated visual inspection combines automated material handling of the containers to be inspected with human vision and judgment to make the decision to accept or reject. These systems often use a conveyor equipped with rollers to transport the containers in front of the inspector inside an inspection booth or station. For inspection of liquids, the booth can be equipped with a high-speed spin station to set particles in motion. The rollers are also used to slowly rotate the containers in front of the inspector as they traverse the inspection zone. These systems offer a means to control the presentation of the vials and can offer additional lighting options, such as Tyndall lighting, which may enhance the appearance of some defects such as cracks or small particles. Mirrors may also be used to provide a clear view of the top and bottom of each container. Rejected units may be removed from the rollers by hand, and some systems are equipped with a remote rejection system that can be triggered by the

inspector. Care should be taken in the qualification and operation of these systems to ensure full rotation of vials in the inspection zone; this allows examination of all surfaces. In addition, studies should be conducted to ensure the detection of heavy particles, which may not be lifted from the bottom of the container, and to ensure that the rate of inspection produces an acceptable detection rate for defects of interest.

With semi-automated visual inspection, performance is similar to that with MVI. Some increase in throughput may be achieved because the inspector spends all of the available time viewing the containers, rather than splitting the time between inspection and material handling.

CRITICAL PROCESS PARAMETERS FROM SEMI-AUTOMATED INSPECTION

Light intensity must be controlled, as with MVI. The rate of inspection is controlled by the speed of the roller/conveyor. Spin speed for liquid products and rotation rate for all containers should be established during validation/qualification and maintained within the validated range for routine inspection. The background color is controlled by the color of the rollers selected and the color of the background seen through the spaces between the rollers. Qualification of inspectors and validation of the inspection equipment should be based on comparison with the compendial manual inspection process with an expectation that alternative methods such as semi-automated inspection demonstrate equivalent or better performance.

6.3 Automated Visual Inspection

Automated visual inspection (AVI) combines automated material handling of the containers with electronic sensing of product appearance. Containers that do not meet pre-programmed acceptance criteria are automatically rejected by the machine. Early machines performed inspection for particles and fill level, but manual or semi-automated inspection was required for the container and closure system. Newer models have the capability to inspect all attributes of the containers, along with the contents. As with MVI, machines often spin the containers to set particles in motion and make them easier to detect. Multiple cameras are used to image various regions on the container in great detail. Each camera is coupled with unique lighting to highlight specific defects in the region of interest. Light-field and dark-field lighting techniques offer the same benefits as white and black backgrounds as discussed above, offering contrast for a full range of light- and dark-colored defects. A defect found by any camera is tracked through the machine to allow accurate ejection by the reject system. These machines also offers detailed reporting of defects observed in a specific production lot.

AVI offers advantages in the areas of throughput and consistency, compared with MVI (4). AVI may also offer enhanced sensitivity for some defects, compared with MVI, but may suffer from higher false rejection rates due to the inability to tolerate normal variation in containers or product. This is especially true for molded glass containers and flexible bags.

Validation of the automated inspection equipment should be based on comparison with the compendial manual inspection process with an expectation that alternative inspection methods demonstrate equivalent or better performance.

LIGHT-OBSCURATION METHODS

Some systems use an optical sensor to detect the shadow of particles in solution products. This method requires particles to be in motion, typically using a high-speed spin and rapid braking of the container to achieve this motion. Spin conditions must be optimized to provide sensitivity for heavier particles while minimizing false rejections due to bubbles. Some biological

products experience shear-induced agglomeration, so care should be taken with regard to agitation of these products.

Light obscuration methods are optimized for sensitivity to moving particles, and can thus be made less sensitive to minor container imperfections. This technique can be used with both tubing and molded containers. Results are generally robust in detecting particles that are 100 μm in diameter and larger.

These systems can also detect fill height by detecting the shadow of the solution meniscus. Generally, this process is not sensitive enough to ensure compliance with dose or fill-weight specifications, but it can provide a secondary check of gross fill. Sensitivity is a function of the container shape, with greater sensitivity achieved in small-diameter containers.

IMAGING METHODS

Continuing advances in camera technology now allow the rapid capture of high-resolution images for inspection. When coupled with high-speed processors that have ever-increasing computational capability, a powerful inspection tool can result. Images are divided into inspection windows, and an array of tools such as image subtraction, pixel counting, intensity analysis, and others are used to assess the images against programmed quality attributes. Significant amounts of time are required to train inspectors to test the performance of such systems against a range of known defects, as well as acceptable containers.

Imaging systems can detect particles and fill level, as well as other container and closure attributes. Inspection in this manner can provide 100% inspection of all visual attributes. These systems can offer high sensitivity, but may also have high false-rejection rates if container and product attributes are not tightly controlled.

OTHER TECHNOLOGIES

Container-closure integrity can also be assessed using non-visual methods such as electrical conductivity and capacitance, vacuum decay, or mass extraction, for example (59). Laser-based gas headspace analysis can also be used if there is a modified headspace such as vacuum or inert gas. Generally, such nondestructive container-integrity inspection methods offer greater sensitivity than visual detection with the potential to reduce false rejection of acceptable product. See *Sterile Product Packaging—Integrity Evaluation* (1207) for further information regarding package integrity testing by these and other test methods.

X-ray imaging has also been explored as a means to detect particles within freeze-dried cakes, powders, or suspensions (60).

These technologies may be used alone or in combination with other inspection methods to provide a comprehensive assessment of product quality before labeling and packaging.

7. QUALIFICATION AND VALIDATION OF INSPECTION PROCESSES

7.1 Standards

The use of standards for visual inspection has been described by Melchore and Berdovich (61). Development of inspection standards begins with identification or characterization of the defect types that will be represented in the test set(s). This information typically comes from the manufacturing area, where naturally occurring defective units can be identified from rejected product. The defects are categorized as critical, major, or minor. These defects must be

further characterized to allow for 1) selection from naturally occurring particulate and physical or cosmetic production rejects removed from product lots, and/or 2) re-creation of equivalent defect types in a controlled laboratory environment. Characterization information on defects should include, where appropriate, the range of sizes typically observed and the specific location on the container. If feasible, a photograph of the defect should be included. All information that could support consistent re-creation of the defect standards should be included in the characterization description.

7.2 Preparing Defect Standards

Visual inspection standards may be identified from known production rejects, or may be created manually with characterized particulate material. A single particle/seeded container should be used when determining detection thresholds.

7.3 Particle Types

The primary packaging materials that directly contact the product and the potential environmental contaminants can be divided into specific particle groups such as glass, stainless steel, elastomeric closure, plastic, and fibers (synthetic or natural). Naturally occurring particles from rejects should be no smaller than the visible particle (measured in situ) in the container. Measurement can be accomplished with a wide field microscope or loupe with a calibrated reticle. Physically prepared particles can be sieved initially to target a specific size, and then the individual particles are measured using optical microscopy. These materials, or production defects, are preferred for inspector training and qualification, as well as machine validation as they better represent actual inspection performance. Spherical standard particles may be utilized as surrogates for naturally occurring particulates; however, these are best used for routine machine calibration rather than validation or inspector qualification, as they do not move or look like actual production defects.

7.4 Rejection Probability Determination

Once a well-defined defect standard is available, it is assigned a detection frequency or probability of detection (POD) by conducting a documented, manual human inspection qualification that is accomplished by repeated manual inspection. This repeated inspection is the basis for qualifying the defect standard. This approach has been described by Knapp and Kushner (53,54). The Knapp methodology recognizes that the detection of particles is probabilistic, and repeated inspections with strict controls on lighting and inspection pacing/sequencing generate the statistical confidence to assign a reject probability to each standard unit. A manual, visual inspection POD of ≥ 0.7 or 70%, is required to assign the container to the Reject Zone for subsequent calculation of the reject zone efficiency (RZE). Secure probabilistic data for particulate standards can be achieved with 30–50 inspections of each container. This is best achieved with multiple inspectors. Inspection reject probability is calculated for the defect as follows:

$$\text{POD} = (\text{Number of times rejected}) / (\text{Number of times inspected})$$

7.5 Test Sets

These qualified defect standard units are then assembled into test sets, which may be used to

specifically challenge the particle detection technique of human inspectors, used as part of a defect test set (including container–closure defects) for human qualification, or for comparison during automated equipment qualification and validation. When possible, the test set should be prepared with duplicate product units per particle type and size to ensure that backup units are available in the event that a standard container is broken or the particle is trapped or lost within the container. When using test sets, it is a good practice to verify the presence of particles before and after use, as particles may become lodged between the container and the closure. When a freely moving particle cannot be verified, the unit should not be used and the data should be excluded from subsequent calculations. When this happens, it may be possible to free the particle with the use of an ultrasonic bath. If this is not possible, the unit should be replaced. The number of defective units in each test set should be limited to approximately 10% to prevent rejection bias (57). The accept containers will be identified as having a pre-determined manual, visual inspection POD of <0.3 or 30%. Any particle standards found to fall within the acceptable “grey zone”, indicating a manual inspection rejection probability $\geq 30\%$ and $<70\%$, may be included as an “acceptable unit” in a test set, if desired.

It is important to prepare a written procedure for the creation and maintenance of standards. This procedure should define the qualification criteria, appropriate storage conditions, periodic examination and requalification, expiration, and sample custody during use. Test sets should be approved by the quality unit. The container in which the specific particle set is stored must be clearly labeled with the test set identification information.

7.6 Types of Test Sets

The particle detection threshold can be determined for a specific inspection method and product/package combination. It is a standard curve of detection probabilities at various particle types and sizes in an approximate range of 100–500 μm (with recommended increments of 100 μm). Fibers are typically observed in sizes $>500 \mu\text{m}$. The typical size range of particles used in threshold studies incorporates a variety of particle types and densities that are typically found in the manufacturing environment.

Threshold studies are conducted to determine the sensitivity of manual inspection methods, using a range of particle sizes, in a blinded study that yields the particle-size detection capabilities of a defined group or of an individual inspector. The threshold studies indicate that the method of inspection is valid and appropriate. For example, for clear solutions in 10-mL tubing glass vials, past thresholds studies indicate that particles within the range of 150–250 μm (500–2000 μm for fibers) can be detected with a POD of 70% or greater. Results can differ due to differences in product formulation as well as container type and size. Threshold studies are also useful as an assessment tool when evaluating or qualifying visual inspection staff on a specific method with fixed testing parameters. Detection threshold studies are typically the first step in evaluating the performance of any new inspection method.

Depending on product and/or presentation, rejects in the test set should represent all defects anticipated for a given container type or product family. For particles, use a bracketed range of types (densities) and sizes from near the lower limit of the visible range (100 μm) to the largest routinely observed in the pool of rejects. For an individual manual test set, it is important that all containers and closures are of the same type, and the samples are blinded. UV ink (invisible to the inspectors) may be used to mark all containers. Alternatively, bar codes or other coded labels may be used. Manual test sets can be used initially to qualify, or periodically to re-qualify, human inspectors. These test sets may also be used for direct comparison to semi-automated or automated inspection methods. If significantly different formulations (e.g., clear

solution, suspension, lyophilized) or packages (e.g., clear vials, amber vials, ampoules, syringes) are produced at the same facility, separate test sets should be prepared to represent each unique combination. A bracketing approach may be used with regard to different container sizes.

7.7 Training and Qualification of Human Inspectors

Before training, potential inspectors should be tested for visual acuity (62) and color perception. Near-vision performance should be the equivalent of 20/20 with no impairment of color vision. Both the Snellen and Jaeger charts are useful for verifying visual acuity; they test far and near vision, respectively. Training should include a phased approach with a specified number of training hours expected for each segment. Initially, train the potential inspectors with defect photographs or a video library and clear written descriptions. Utilize subject matter experts to mentor and provide hands-on training with defect standards for the specified method. Reinforce mental or silent counting and follow the paced sequence to achieve consistent inspection timing. Stress the importance of strict adherence to the inspection process (procedure, sequence, and timing). Inspector fatigue may be addressed in the qualification process by testing under worst case conditions (e.g., at the end of a typical inspection shift). Train all inspectors (QC, QA, and production) with common procedures used for 100% inspections and AQL inspections. All inspection practices should be standardized and consistently executed across all inspection groups.

Qualification should be performed for each product type and package that the inspector will encounter. A bracketed or matrix approach can be used to simplify qualification of products with similar physical or visual characteristics such as container type and size, formulation type, product viscosity, color, and others. It is common to initially train and qualify personnel on clear solutions in clear containers (if produced at the facility) and then expand their expertise to inspection of more difficult formulations or presentations.

7.8 Inspector Qualification Requirements

The qualification of all inspection personnel utilizes a manual test set to be inspected under normal operating conditions and inspection critical parameters, including inspection timing and sequence, physical environment, and inspection duration. Three successful inspections of the test set are recommended to demonstrate consistent performance for initial qualification of new inspectors. Acceptance criteria for each defect class should be based on the POD (or RZE) observed during test set qualification. A limit is also needed for false rejection, with a recommended target of <5% falsely rejected good units.

7.9 Requalification

Inspectors should be requalified at least annually. Requalification includes a test of visual acuity and testing with at least one product/test set configuration. A single successful inspection of the test set is sufficient for requalification. Requalification may also be necessary in the event that poor performance is observed during routine inspection or if the inspector has been away from the inspection operation for an extended period of time (e.g., 3 months).

If an inspector fails the requalification test, a retraining process should be initiated to identify the root cause and allow the inspector to receive additional instruction. After this process has been completed, the inspector may attempt to meet the acceptance criteria one additional

time. If the inspector fails, he or she may attempt to qualify again after a specified time period.

8. PRODUCTS IN DISTRIBUTION

Chapter (790) states, "If it becomes necessary to evaluate product that has been shipped to customers (e.g., because of a complaint or regulatory concern), sample and inspect 20 units. If no particles are observed in the sample, the batch is considered essentially free of visible particulates. If available, additional units may be inspected to gain further information on the risk of particulates in the batch."

For products in distribution, questions regarding batch quality will occasionally arise from customer complaints, observations in the field, customer use questions and from the use of non-standard (sensitive) conditions of inspection. As discussed in this chapter, the detection process is probabilistic and the likelihood of detection is a cumulative function of the particle's visible attributes, drug product and container characteristics, and the inspection method used. In an appropriately qualified manufacturing process, the batch is presumed to have been prepared according to robust processes and all containers with package defects and visible particles (non-conforming units) removed prior to labeling. In that regard, the evaluation outlined in general chapter *Visible Particulates in Injections (790), Introduction, Sampling at Batch Release (After 100% Manufacturing Inspection), Product in Distribution* is only permissible if both *Sampling at Batch Release* and a *100% Manufacturing Inspection* have been successfully completed.

The particle detection threshold should be determined for a specific inspection method and product/package combination incorporating a variety of particle types and densities that are typically found in the manufacturing environment. For example, the detection threshold for routine, reliable detection ($\geq 70\%$ probability) of a single spherical particle in a clear solution contained in a 10-mL vial utilizing diffuse illumination between 2,000 and 3,000 lux is often near 150 μm in diameter (4). Units returned from distribution may be false positive, may contain particles larger than the acceptance threshold that were missed, may contain particle(s) in the "grey zone", e.g., less than the detection threshold, or may have suffered a physicochemical change that resulted in a visible change. Ideally there were no visible particles in the containers released to market; however, there is always a low probability that this may occur. Upon receipt, suspect containers should be subjected to the same inspection conditions and methodology used in the release inspection. Particle(s) verified in the returned or re-evaluated supply must be carefully characterized by an analytical forensic process to determine their source and likely cause. Single particles of typical product-contact materials are unlikely to present a concern. Multiple particles, large particle sizes, and any particles indicative of physical or chemical change are significant events and should be subject to further investigation. Rare instances of particulate material falling into the "grey zone" should be expected given the probabilistic nature of the inspection process and should not routinely trigger further evaluation of retention samples. While (790) provides that zero particles found in the sampling and inspection of 20 units signifies that the batch is essentially free of visible particulates, if multiple suspect containers from the same batch are detected, additional units should be inspected and an appropriate rationale provided to support the batch's conformance to the registered specifications.

Overall batch quality using internal systems to control particulate matter and the means to investigate these occurrences is key to the life cycle approach for modern pharmaceutical production. Evaluation of retention and stability samples provides insight to batch quality, as do

the field-use effects for any medication. While the presence of particles or product or container defects discovered in retained or returned product do not necessarily incriminate the quality of the batch, careful investigation should be conducted to exclude systemic risks.

9. CONCLUSIONS AND RECOMMENDATIONS

Visual inspection for particles and other visible defects continues to be an important part of the manufacturing process for injections. Chapter <790> provides a useful reference method and acceptance criteria for visible particulates in injections. Successful execution of visual inspection requires an understanding of the inspection process and careful control of inspection conditions. Inspectors must be trained to ensure consistent, high-quality performance. Alternative inspection methods, either semi-automated or fully automated, may be used in place of manual inspection methods. Where machine methods are used, the equipment must be validated to demonstrate equivalent or better performance when compared to manual inspection. The use of test sets that contain standard defects is an important element in inspector training and qualification as well as machine validation. Good product development will lead to a stable product with a lower risk of particle formation. Identification of the type or types of particles found during product development and routine manufacturing is an important aid in source identification and reduction. Inspection results should be trended to further aid in continuous process improvement with the ultimate goal of defect prevention.

BRIEFING

Reagents: Reagents, Indicators, and Solutions, page 7691 of the *Second Supplement* to *USP 38*. It is proposed to delete the entries under *4.7 Water* from the text. Each type of water is being added individually to the *Reagent Specifications* section.

Additionally, minor editorial changes have been made to update the text to current *USP* style.

(HDQ: M. Marques.)

Correspondence Number—C164385

1. SCOPE

Reagents required in the tests and assay for *U.S. Pharmacopeia* and *National Formulary* articles and those required only in determining the quality of other reagents are listed in this section, with specifications appropriate to their intended uses.

As stated in *General Notices, 6.70 Reagents*, listing of reagents, indicators, and solutions in the *U.S. Pharmacopeia* in no way implies that they have therapeutic utility; thus, any reference to *USP* or *NF* in their labeling shall include also the term “reagent” or “reagent grade”.

Where a particular brand or source of a material, instrument, or piece of equipment, or the name and address of a manufacturer or distributor, is mentioned (ordinarily in a note or footnote), this identification is furnished solely for informational purposes as a matter of convenience, without implication of approval, endorsement, or certification.

1.1 ACS (American Chemical Society) Reagent Grade

Where it is directed to "Use ACS reagent grade", it is intended that a grade meeting the corresponding specifications of the current edition of *Reagent Chemicals*, published by the American Chemical Society (ACS), shall be used.

1.2 Suitable Grade

In the cases where no ACS reagent monograph exists or if the reagent is available in different quality grades, each one specific for a particular application, it is directed to "Use a suitable grade". The intent is that a suitable reagent grade available commercially shall be used. Occasionally, additional test(s) augment the designation "suitable grade", as indicated in the text. Listed also are some, but not all, reagents that are required only in determining the quality of other reagents. For those reagents that are not listed, satisfactory specifications are available in standard reference publications.

1.3 USP or NF or FCC Grade

In the instances in which a reagent required in a *U.S. Pharmacopeia* or *National Formulary* test or assay meets the requirements in the monograph for that article appearing in this *U.S. Pharmacopeia* or the *National Formulary* or the current edition of the *Food Chemicals Codex (FCC)*, it suffices to refer to the corresponding monograph in one of the these three compendia. In such cases it is to be understood that the specifications are minimum requirements and that any substance meeting more rigid specifications for chemical purity is suitable.

2. PACKAGING AND STORAGE

Reagents and solutions should be preserved in tight containers made of resistant glass or other suitable material. Directions for storage in light-resistant containers should be carefully observed.

Stoppers and stopcocks brought into contact with substances capable of attacking or penetrating their surfaces may be given a protective coating of a thin film of a suitable lubricant unless specifically interdicted.

3. METAL-ION STANDARD SOLUTIONS

Atomic absorption and flame photometry require the use of a number of metal-ion standard solutions. While the individual monographs usually provide directions for preparation of these solutions, use of commercially prepared standardized solutions of the appropriate ions is permissible, provided that the analyst confirms the suitability of the solutions and has data to support their use.

Change to read:

4. DEFINITIONS

4.1 Reagents: Reagents are substances used either as such or as constituents of solutions.

4.2 Indicators: Indicators are reagents used to determine the specified endpoint in a chemical reaction, to measure hydrogen-ion concentration (pH), or to indicate that a desired change in pH has been effected. They are listed together with indicator test papers.

4.3 Buffer Solutions: Buffer solutions resist changes in the activity of an ion on the addition of substances that are expected to change the activity of that ion.

4.4 Colorimetric Solutions (CS): Colorimetric solutions are solutions used in the preparation of colorimetric standards for comparison purposes.

4.5 Test Solutions (TS): Test solutions are solutions of reagents in such solvents and of such definite concentrations as to be suitable for the specified purposes.

4.6 Volumetric Solutions (VS): Volumetric solutions are solutions of reagents of known concentration intended primarily for use in quantitative determinations.

~~**4.7 Water:**—As elsewhere in the *U.S. Pharmacopeia*, where “water”, without qualification, is mentioned in the tests for reagents or in directions for preparing any solutions, *Purified Water* (USP monograph) is always to be used.~~

~~—4.7.1 CARBON DIOXIDE-FREE WATER:—It is *Purified Water* that has been boiled vigorously for 5 min or more and allowed to cool while protected from absorption of carbon dioxide from the atmosphere, or *Purified Water* that has a resistivity of NLT 18 Mohm-cm.~~

~~—4.7.2 DEAERATED WATER:—For purposes other than dissolution and drug release testing, it is *Purified Water* that has been treated to reduce the content of dissolved air by suitable means, such as by boiling vigorously for 5 min and cooling or by application of ultrasonic vibration.~~

~~—4.7.3 PARTICLE-FREE WATER:—It is water that has been passed through a suitable filter of 0.22- μ m pore size.~~

~~—4.7.4 ORGANIC-FREE WATER:—It is *Purified Water* that produces no significantly interfering peaks when chromatographed as indicated in *Residual Solvents* (467), *Identification, Control, and Quantification of Residual Solvents*.~~

▲▲USP40

5. CHROMATOGRAPHIC SOLVENTS AND CARRIER GASES

The chromatographic procedures set forth in the *U.S. Pharmacopeia* may require use of solvents and gases that have been especially purified for such use. The purpose may be (a) to exclude certain impurities that interfere with the proper conduct of the test procedure, or (b) to extend the life of a column by reducing the buildup of impurities on the column. Where solvents and gases are called for in chromatographic procedures, it is the responsibility of the analyst to ensure the suitability of the solvent or gas for the specific use. Solvents and gases suitable for specific high-pressure or other chromatographic uses are available as specialty products from various reagent supply houses, although there is no assurance that similar products from different suppliers are of equivalent suitability in any given procedure.

BRIEFING

Copper Sulfate Pentahydrate. It is proposed to add this new reagent.

(HDQ: M. Marques.)

Correspondence Number—C164326

Comment deadline: January 31, 2016

Add the following:

▲ Copper Sulfate Pentahydrate (*Cupric Sulfate Pentahydrate*), $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ —**249.68** [7758-99-8]—Use ACS Cupric Sulfate Pentahydrate reagent grade. ▲USP40

BRIEFING

1,1-Cyclobutanedicarboxylic Acid. It is proposed to add this new reagent used in the *Limit of 1,1-Cyclobutanedicarboxylic Acid* test in the monographs for *Carboplatin* and *Carboplatin for Injection*.

(HDQ: M. Marques.)

Correspondence Number—C165298

Comment deadline: January 31, 2016

Add the following:

▲ 1,1-Cyclobutanedicarboxylic Acid (*Cyclobutane-1,1-dicarboxylic acid; 1,1-Dicarboxycyclobutane*), $C_6H_8O_4$ —**144.13** [5445-51-2]—Use a suitable grade with a content of NLT 99%.

[Note—A suitable grade is available as catalog number C95803 from www.sigmaaldrich.com.]

▲USP40

BRIEFING

Hydroxypropyl Cellulose. It is proposed to add this new reagent.

(HDQ: M. Marques.)

Correspondence Number—C163758

Comment deadline: January 31, 2016

Add the following:

▲ Hydroxypropyl Cellulose, Average molecular weight approximately **100,000** [9004-64-2]

VISCOSITY—Dissolve 5.0 g of Hydroxypropyl Cellulose with 95.0 mL of water by stirring. If necessary, centrifuge the solution to expel any entrapped air bubbles. Determine the viscosity of the solution as directed in *Viscosity—Rotational Methods* (912) at $25 \pm 0.1^\circ$. The viscosity is between 75 and 150 centipoises. ▲USP40

BRIEFING

Isonicotinic Acid, *USP* 38 page 1846. It is proposed to correct the CAS number of this reagent.

(HDQ: M. Marques.)

Correspondence Number—C165257

Comment deadline: January 31, 2016

Change to read:

Isonicotinic Acid, $C_6H_5NO_2$ —**123.11** [~~52-22-1~~

▲ 55-22-1 ▲USP40

]—Use a suitable grade.

BRIEFING

Lithium. It is proposed to add this new reagent.

(HDQ: M. Marques.)

Correspondence Number—C165112

Comment deadline: January 31, 2016

Add the following:

▲ Lithium, Li—**6.94** [7439-93-2]—Use a suitable grade (ribbon, granular, or wire) with a content of NLT 99.9%. ▲*USP40*

BRIEFING

Malonic Acid. It is proposed to add this new reagent used in the test for *Limit of Acetic Acid/Acetate* in the monograph for *Polyvinyl Acetate Dispersion*, published in *PF* 41(5) [Sept.–Oct. 2015].

(HDQ: M. Marques.)

Correspondence Number—C164754

Comment deadline: January 31, 2016

Add the following:

▲ Malonic Acid (*Propanedioic Acid*), $C_3H_4O_4$ —**104.06** [141-82-2]—Use a suitable grade with a content of NLT 98%. ▲*USP40*

BRIEFING

d-Mannitol. It is proposed to add this new reagent.

(HDQ: M. Marques.)

Correspondence Number—C164320

Comment deadline: January 31, 2016

Add the following:

▲ d-Mannitol—Use Mannitol USP. ▲*USP40*

BRIEFING

Marfey's Reagent. It is proposed to add this new reagent used in the *Enantiomeric Purity* test in the new monograph for *Pregabalin*, also appearing in this issue of *PF*.

(HDQ: M. Marques.)

Correspondence Number—C136074

Comment deadline: January 31, 2016

Add the following:

▲ Marfey's Reagent [N_α -(2,4-dinitro-5-fluorophenyl)-l-alaninamide, FDAA], $C_9H_9FN_4O_5$ —**272.19** [95713-52-3]—Use a suitable grade with a content of NLT 99.0%. ▲*USP40*

BRIEFING

Methyl cis-11-eicosenoate. It is proposed to add this new reagent used in *Identification, A. Identity by Fatty Acid Composition* in the monograph for *Castor Oil* and in *Identification, C. Identity by Fatty Acid Composition* in the monograph for *Polyoxyl 35 Castor Oil*, both published in *PF* 41(5) [Sept.–Oct. 2015].

(HDQ: M. Marques.)

Correspondence Number—C164757

Comment deadline: January 31, 2016

Add the following:

▲ **Methyl cis-11-eicosenoate** (*cis-11-eicosenoic acid methyl ester*), $C_{21}H_{40}O_2$ —**324.54** [2390-09-2]—Use a suitable grade with a content of NLT 98%. ▲*USP40*

BRIEFING

Methyl 12-Ketostearate. It is proposed to add this new reagent used in *Identification, A. Identity by Fatty Acid Composition* in the monograph for *Hydrogenated Castor Oil* and in *Identification, A. Identity by Fatty Acid Composition* in the monograph for *Polyoxyl 40 Hydrogenated Castor Oil*, both published in *PF* 41(5) [Sept.–Oct. 2015].

(HDQ: M. Marques.)

Correspondence Number—C164755

Comment deadline: January 31, 2016

Add the following:

▲ **Methyl 12-Ketostearate** (*Methyl 12-oxooctadecanoate*), $C_{19}H_{36}O_3$ —**312.49** [2380-27-0]—Use a suitable grade with a content of NLT 97%. [Note—A suitable grade is available as catalog number sc-235651 from www.scbt.com or as catalog number M5306 from www.usbio.net.] ▲*USP40*

BRIEFING

Nickel Nitrate Hexahydrate. It is proposed to add this new reagent.

(HDQ: M. Marques.)

Correspondence Number—C164322

Comment deadline: January 31, 2016

Add the following:

▲ **Nickel Nitrate Hexahydrate** [*Nickel(III) Nitrate Hexahydrate, Nickelous Nitrate Hexahydrate*], $Ni(NO_3)_2 \cdot 6H_2O$ —**290.81** [13478-00-7]—Use ACS reagent grade. ▲*USP40*

BRIEFING

Propionic Acid. It is proposed to add this new reagent.

(HDQ: M. Marques.)

Correspondence Number—C164327

Comment deadline: January 31, 2016

Add the following:

▲ **Propionic Acid** (*Propanoic Acid*), $C_3H_6O_2$ —**74.08** [79-09-4]—Use ACS reagent grade. ▲*USP40*

BRIEFING

Sodium 1-Dodecanesulfonate. It is proposed to add this new reagent.

(HDQ: M. Marques.)

Correspondence Number—C163759

Comment deadline: January 31, 2016

Add the following:

▲ Sodium 1-Dodecanesulfonate (*1-Dodecanesulfonic Acid Sodium Salt*), $C_{12}H_{25}NaSO_3$ —**272.38**
[2386-53-0]—Use a suitable grade with a content of NLT 99%. ▲*USP40*

BRIEFING

Tetrahydrofuran, *USP 38* page 1874. It is proposed to add the specification for chromatographic applications.

Additionally, minor editorial changes have been made to update the reagent to current *USP* style.

(HDQ: M. Marques.)

Correspondence Number—C163685

Comment deadline: January 31, 2016

Change to read:

Tetrahydrofuran, C_4H_8O —**72.11** [109-99-9]—Use ACS reagent grade.

▲ **For chromatographic application:** Use a suitable grade, inhibitor-free, with a content of NLT 99.9%.

▲*USP40*

BRIEFING

Water. It is proposed to add the specification of water for analytical purposes to the *Reagent Specifications* section.

(HDQ: M. Marques.)

Correspondence Number—C164477

Comment deadline: January 31, 2016

Add the following:

▲ Water—Use *USP Purified Water*. ▲*USP40*

BRIEFING

Water, Carbon Dioxide-Free, *USP 38* page 1880. It is proposed to add the specification of this type of water for analytical purposes to the *Reagent Specifications* section.

Additionally, minor editorial changes have been made to update this reagent to current *USP* style.

(HDQ: M. Marques.)

Correspondence Number—C164564

Comment deadline: January 31, 2016

Change to read:

Water, Carbon Dioxide-Free—~~See *Water*, in the introductory section.~~

▲ It is *Purified Water* that has been boiled vigorously for 5 min or more and allowed to cool while protected from absorption of carbon dioxide (CO₂) from the atmosphere, or *Purified Water* that has a resistivity of NLT 18 Mohm-cm. ▲*USP40*

BRIEFING

Water, Deaerated, *USP 38* page 1880. It is proposed to add the specification of this type of water for analytical purposes to the *Reagent Specifications* section.

Additionally, minor editorial changes have been made to update this reagent to current *USP* style.

(HDQ: M. Marques.)

Correspondence Number—C164563

Comment deadline: January 31, 2016

Change to read:

Water, Deaerated—~~See *Water*, in the introductory section.~~

▲ For purposes other than dissolution and drug release testing, it is *Purified Water* that has been treated to reduce the content of dissolved air by suitable means, such as by boiling vigorously for 5 min and cooling or by application of ultrasonic vibration. ▲*USP40*

BRIEFING

Water, Organic-Free. It is proposed to add the specification of this type of water for analytical purposes to the *Reagent Specifications* section.

(HDQ: M. Marques.)

Correspondence Number—C164481

Comment deadline: January 31, 2016

Add the following:

▲ Water, Organic-Free—It is *Purified Water* that produces no significantly interfering peaks when chromatographed as indicated in *Residual Solvents* (467), *Identification, Control, and Quantification of Residual Solvents*. ▲*USP40*

BRIEFING

Water, Particle-Free. It is proposed to add the specification of this type of water for analytical purposes to the *Reagent Specifications* section.

(HDQ: M. Marques.)

Correspondence Number—C164480

Comment deadline: January 31, 2016

Add the following:

▲ **Water, Particle-Free**—It is *Purified Water* that has been passed through a suitable filter of 0.22- μm pore size. ▲*USP40*

BRIEFING

2 N Sodium Hydroxide TS. It is proposed to add this new test solution used in the monograph for *Acamprosate Delayed-Release Tablets*, also appearing in this issue of *PF*.

(HDQ: M. Marques.)

Correspondence Number—C141734

Add the following:

▲ **2 N Sodium Hydroxide TS**—Dissolve 80 g of *sodium hydroxide* in about 800 mL of water. Cool and dilute with water to 1000 mL. ▲*USP40*

BRIEFING

Cupric Tartrate, Alkaline, Solution (Fehling's Solution), *USP 38* page 1895. It is proposed to revise this volumetric solution to current *USP* style and include a note about standardization.

(HDQ: M. Marques.)

Correspondence Number—C164716

Comment deadline: January 31, 2016

Change to read:

Cupric Tartrate, Alkaline, Solution (Fehling's Solution)

Copper solution (Solution A)—Transfer 34.639 g of *cupric sulfate* to a 500-mL volumetric flask, and dissolve in and dilute with *water* to volume. Filter, if necessary.

Alkaline tartrate solution (Solution B)—Transfer 173 g of *potassium sodium tartrate* and 50 g of *sodium hydroxide* to a 500-mL volumetric flask, and dissolve in and dilute with *water* to volume. Filter, if necessary.

Just before use, prepare *Cupric tartrate, alkaline, solution* by mixing equal volumes of *Solution A* and *Solution B*. ~~Standardize this solution as follows.~~

▲ **Standardization**▲*USP40*

Standard stock solution—Transfer 9.5 g of *sucrose* to a 1-L volumetric flask, dissolve in 100 mL of *water*, add 5 mL of *hydrochloric acid*, and store 3 days at 20°–25°. Dilute with *water* to volume. This solution is stable for several months.

Invert sugar solution—Immediately before use in standardizing the *Cupric tartrate, alkaline, solution*, transfer 25 mL of *Standard stock solution* to a 100-mL volumetric flask, and dilute with *water* to volume.

Procedure

Apparatus—Mount a ring support on a ring stand 1–2 inches above a gas burner, and mount a second ring 6–7 inches above the first. Place 6-inch open-wire gauze on the lower ring to support a 400-mL conical flask, and place a 4-inch watch glass with a center hole on the upper ring to deflect heat. Attach a 50-mL buret to the ring stand so that the tip just passes through the watch glass centered above the flask. Place an indirectly lighted white surface behind the assembly for observing the endpoint.

Standardization—Transfer 20.0 mL of the *Cupric tartrate, alkaline, solution* to a 400-mL flask containing a few boiling chips, and add 15 mL of *water* and 39.0 mL of *Invert sugar solution*. Mix by swirling at ambient temperature, and immediately place the flask on the wire gauze of the *Apparatus*. Adjust the burner so that the boiling point of the solution is reached in about 2 min. Boil gently but steadily for 2 min. As boiling continues, add 3–4 drops of *methylene blue* solution (1 in 100). Complete the titration within 1 min by adding the *Invert sugar solution* dropwise until the blue color disappears. Allow a 5-s reaction time between drops at the end of titration. Adjust the *Cupric tartrate, alkaline, solution* for the correct amount of copper (equivalent to 100 mg of invert sugar), and restandardize if the total volume of *Invert sugar solution* is more or less than 40.0 mL.

▲ [Note—If this volumetric solution is used in a qualitative application such as pH adjustment, dissolution medium, or diluent, its standardization is not required.]▲*USP40*

BRIEFING

Perchloric Acid, Tenth-Normal (0.1 N) in Glacial Acetic Acid, *USP 38* page 1898. It is proposed to revise this volumetric solution to current *USP* style and include a note about standardization.

(HDQ: M. Marques.)

Correspondence Number—C164482

Comment deadline: January 31, 2016

Change to read:**Perchloric Acid, Tenth-Normal (0.1 N) in Glacial Acetic Acid****▲ 0.1 N Perchloric Acid in Glacial Acetic Acid VS ▲*USP40***

HClO₄, **100.46**

10.05 g in 1000 mL

[Note—Where called for in the tests and assays, this volumetric solution is specified as “0.1 N perchloric acid.” Thus, where 0.1 N or other strength of this volumetric solution is specified, the solution in glacial acetic acid is to be used, unless the words “in dioxane” are stated. (See also *Perchloric Acid, Tenth-Normal (0.1 N) in Dioxane*

▲ 0.1 N Perchloric Acid in Dioxane VS. ▲*USP40*

)]

Mix 8.5 mL of *perchloric acid* with 500 mL of *glacial acetic acid* and 21 mL of *acetic anhydride*, cool, and add *glacial acetic acid* to make 1000 mL. Alternatively, the solution may be prepared as follows. Mix 11 mL of 60% *perchloric acid* with 500 mL of *glacial acetic acid* and 30 mL of *acetic anhydride*, cool, and add *glacial acetic acid* to make 1000 mL.

Allow the prepared solution to stand for 1 day for the excess acetic anhydride to be combined, and determine the water content by *Method I* (see *Water Determination* (921)), except to use a test specimen of about 5 g of the 0.1 N perchloric acid that is expected to contain approximately 1 mg of water and the *Reagent* (see *Reagent in Water Determination* (921), *Method 1a*) diluted such that 1 mL is equivalent to about 1–2 mg of water. If the water content exceeds 0.5%, add more acetic anhydride. If the solution contains no titratable water, add sufficient water to obtain a content of between 0.02% and 0.5% of water. Allow the solution to stand for 1 day, and again titrate the water content. The solution so obtained contains between 0.02% and 0.5% of water, indicating freedom from acetic anhydride.

~~Standardize the solution as follows.~~

▲ Standardization: ▲*USP40*

Accurately weigh about 700 mg of *potassium biphthalate*, previously crushed lightly and dried at 120° for 2 h, and dissolve it in 50 mL of *glacial acetic acid* in a 250-mL flask. Add 2 drops of *crystal violet TS*, and titrate with the perchloric acid solution until the violet color changes to blue-green. Deduct the volume of the perchloric acid consumed by 50 mL of the *glacial acetic acid*. Each 20.422 mg of potassium biphthalate is equivalent to 1 mL of 0.1 N perchloric acid.

$$N = \frac{\text{g KHC}_8\text{H}_4\text{O}_4}{0.20422 \times \text{mL HClO}_4 \text{ (corrected for the blank)}}$$

Comment deadline: January 31, 2016

Change to read:

Standard Dichlorophenol–Indophenol Solution

To 50 mg of *2,6-dichlorophenol–indophenol sodium* that has been stored in a desiccator over *soda lime* add 50 mL of *water* containing 42 mg of *sodium bicarbonate*, shake vigorously, and when the dye is dissolved, add *water* to make 200 mL. Filter into an amber, glass-stoppered bottle. Use within 3 days and standardize immediately before use. ~~Standardize the solution as follows:~~

▲ **Standardization:** ▲*USP40*

Accurately weigh 50 mg of *USP Ascorbic Acid RS*, and transfer to a glass-stoppered, 50-mL volumetric flask with the aid of a sufficient volume of *metaphosphoric–acetic acids TS* to make 50 mL. Immediately transfer 2 mL of the ascorbic acid solution to a 50-mL conical flask containing 5 mL of the *metaphosphoric–acetic acids TS*, and titrate rapidly with the dichlorophenol–indophenol solution until a distinct rose-pink color persists for at least 5 s. Perform a blank titration by titrating 7 mL of the *metaphosphoric–acetic acids TS* plus a volume of *water* equal to the volume of the dichlorophenol solution used in titrating the ascorbic acid solution. Express the concentration of the standard solution in terms of its equivalent in mg of ascorbic acid.

▲ [Note—If this volumetric solution is used in a qualitative application such as pH adjustment, dissolution medium, or diluent, its standardization is not required.]▲*USP40*

BRIEFING

0.1 M Zinc Sulfate VS. It is proposed to add this new volumetric solution.

(HDQ: M. Marques.)

Correspondence Number—C164323

Comment deadline: January 31, 2016

Add the following:

▲ **0.1 M Zinc Sulfate VS**

ZnSO₄·7H₂O, **287.54**

28.8 g in 1000 mL

Dissolve 28.8 g of *zinc sulfate heptahydrate* in water to make 1 L.

Standardization: Accurately measure about 10 mL of 0.1 M *edetate disodium VS* into a 125-mL conical flask, and add, in the order given, 10 mL of *acetic acid–ammonium acetate buffer TS*, 50 mL of *alcohol*, and 2 mL of *dithizone TS*. Titrate with the zinc sulfate solution to a clear, rose-pink color.

$$M = \frac{\text{mL edetate disodium} \times M \text{ edetate disodium}}{\text{mL ZnSO}_4}$$

[Note—If this volumetric solution is used in a qualitative application such as pH adjustment, dissolution medium, or diluent, its standardization is not required.]▲*USP40*

The following table is provided as a reminder for the pharmacist engaged in the typical dispensing situation who already is acquainted with the *Packaging and Storage* requirements set forth in the individual monographs. It lists the capsules and tablets that are official in the *United States Pharmacopeia* and indicates the relevant tight (T), well-closed (W), and light-resistant (LR) specifications applicable to containers in which the drug that is repackaged should be dispensed.

This table is not intended to replace, nor should it be interpreted as replacing, the definitive

requirements stated in the individual monographs.

Add the following:

▲ **Carglumic Acid:** White, crystalline powder. Soluble in boiling water; slightly soluble in cold water; practically insoluble in organic solvents.▲*USP40*

Add the following:

▲ **Pemetrexed Disodium:** White or almost white powder. Freely soluble in water; very slightly soluble in dehydrated alcohol; practically insoluble in methylene chloride.▲*USP40*

Add the following:

▲ **Pregabalin:** White to off-white, crystalline solid. Freely soluble in water and in both basic and acidic aqueous solutions.▲*USP40*

BRIEFING

Acamprosate Delayed-Release Tablets. Because there is no existing *USP* monograph for this drug product, a new monograph, based on validated methods of analysis, is being proposed.

1. The isocratic liquid chromatographic procedures in the *Assay* and *Dissolution* tests are based on analyses performed with the Luna Phenyl-Hexyl brand of L11 column. The retention times for acamprosate are about 9.5 and 5.7 min, respectively.
2. The isocratic liquid chromatographic procedure in the test for *Limit of Acamprosate Related Compound A* is based on analyses performed with the Discovery HS C18 brand of L1 column with a 3- μm particle size manufactured by Supelco. The Intersil ODS-3V brand of L1 column with a 5- μm particle size may also be suitable. The retention time for acamprosate related compound A is about 13.2 min.
3. The gradient liquid chromatographic procedure in the test for *Organic Impurities* is based on analyses performed with the Luna Phenyl-Hexyl brand of L11 column. The retention time for acamprosate is about 10.5 min.

All interested parties are encouraged to submit their U.S. FDA-approved specifications to USP if they are wider than those proposed.

(CHM4: H. Joyce.)

Comment deadline: January 31, 2016

Add the following:

▲ Acamprosate Delayed-Release Tablets

DEFINITION

Acamprosate Delayed-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of acamprosate calcium ($\text{C}_{10}\text{H}_{20}\text{CaN}_2\text{O}_8\text{S}_2$).

IDENTIFICATION

- **A. Infrared Absorption** (197K)

Standard: USP Acamprosate Calcium RS

Sample: Remove the coating from 5 Tablets. Powder the remaining material, mix it well, and use a suitable portion of the mixture.

Analysis

Samples: *Standard* and *Sample*

Acceptance criteria: The *Sample* exhibits maxima only at the same wavelengths as the *Standard* over the range of 1750–600 cm^{-1} .

- **B.** The retention time of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **Procedure**

Buffer: Add 1.0 mL of *triethylamine* per 1 L of water and adjust with *phosphoric acid* to a pH of 2.5.

Mobile phase: *Methanol* and *Buffer* (2:98)

Standard solution: 0.3 mg/mL of USP Acamprosate Calcium RS in *Mobile phase*. Sonication may be used to promote dissolution.

Sample stock solution: Nominally 3 mg/mL of acamprosate calcium from Tablets prepared as follows. Transfer a suitable portion of powdered Tablets (NLT 20) to an appropriate volumetric flask. Add 40% of the final flask volume of *Mobile phase* and sonicate for 30 min with intermittent shaking to avoid lump formation. Dilute with *Mobile phase* to volume.

Sample solution: Nominally 0.3 mg/mL of acamprosate calcium from the *Sample stock solution* in *Mobile phase* passed through a suitable filter. Use the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 25-cm; 5-μm packing *L11*

Column temperature: 30°

Flow rate: 0.7 mL/min

Injection volume: 10 μL

Run time: NLT 1.2 times the retention time of acamprosate

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of acamprosate calcium (C₁₀H₂₀CaN₂O₈S₂) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Acamprosate Calcium RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of acamprosate calcium in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **Dissolution** (711)

Acid stage

Acid stage medium: 0.1 N hydrochloric acid; 1000 mL

Apparatus 1: 180 rpm

Time: 2 h

Buffer stage

Buffer stage medium: pH 6.8 citrate buffer. [After 2 h with *Acid stage medium*, replace the contents of the dissolution vessels with *pH 6.8 citrate buffer* (21 g/L of *citric acid* and 12 g/L of *sodium hydroxide* in water adjusted with 2 N *sodium hydroxide TS* or 420.3 g/L of *citric acid* in water to a pH of 6.8).]; 1000 mL

Apparatus 1: 180 rpm

Time: 3 h. The time in the *Buffer stage medium* does not include the time in the *Acid stage medium*.

Mobile phase: Add 0.4 mL of *trifluoroacetic acid* per 1 L of water.

Standard stock solution: 1.6 mg/mL of USP *Acamprosate Calcium RS* in *Mobile phase*

Acid stage standard solution: ($L/1000$) mg/mL of USP *Acamprosate Calcium RS* from the *Standard stock solution* in *Acid stage medium*, where L is the label claim of *acamprosate calcium* in mg/Tablet

Buffer stage standard solution: ($L/1000$) mg/mL of USP *Acamprosate Calcium RS* from the *Standard stock solution* in *Buffer stage medium*, where L is the label claim of *acamprosate calcium* in mg/Tablet

Acid stage sample solution: Pass a portion of solution under test through a suitable filter and use the filtrate.

Buffer stage sample solution: Pass a portion of solution under test through a suitable filter and use the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 25.0-cm; 5- μ m packing *L11*

Column temperature: 30°

Flow rate: 0.8 mL/min

Injection volume: 10 μ L

Run time: NLT 2 times the retention time of *acamprosate*

System suitability

Samples: *Acid stage standard solution* and *Buffer stage standard solution*

Suitability requirements

Tailing factor: NMT 2.0, *Acid stage standard solution* and *Buffer stage standard solution*

Relative standard deviation: NMT 2.0%, *Acid stage standard solution* and *Buffer stage standard solution*

Analysis

Samples: *Acid stage standard solution*, *Buffer stage standard solution*, *Acid stage sample solution*, and *Buffer stage sample solution*

Calculate the percentage of the labeled amount of acamprosate calcium ($C_{10}H_{20}CaN_2O_8S_2$) dissolved in the *Acid stage medium*:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response of acamprosate from the *Acid stage sample solution*

r_S = peak response of acamprosate from the *Acid stage standard solution*

C_S = concentration of USP Acamprosate Calcium RS in the *Acid stage standard solution* (mg/mL)

V = volume of *Acid stage medium*, 1000 mL

L = label claim of acamprosate calcium (mg/Tablet)

Calculate the percentage of the labeled amount of acamprosate calcium ($C_{10}H_{20}CaN_2O_8S_2$) dissolved in the *Buffer stage medium*:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response of acamprosate from the *Buffer stage sample solution*

r_S = peak response of acamprosate from the *Buffer stage standard solution*

C_S = concentration of USP Acamprosate Calcium RS in the *Buffer stage standard solution* (mg/mL)

V = volume of *Buffer stage medium*, 1000 mL

L = label claim of acamprosate calcium (mg/Tablet)

Tolerances: The requirements must be met for both the *Acid stage* and the *Buffer stage*.

Acid stage: NMT 2% of the labeled amount of acamprosate calcium ($C_{10}H_{20}CaN_2O_8S_2$) is dissolved.

Buffer stage: NLT 80% (Q) of the labeled amount of acamprosate calcium ($C_{10}H_{20}CaN_2O_8S_2$) is dissolved.

- **Uniformity of Dosage Units** (905): Meet the requirements

IMPURITIES

- **Limit of Acamprosate Related Compound A**

Solution A: 5 g/L of *fluorescamine* in acetonitrile. Use within 4 h.

Buffer: 13.6 g/L of *monobasic potassium phosphate* (0.1 M phosphate buffer) prepared as follows. Transfer a suitable amount of *monobasic potassium phosphate* to a volumetric flask. Dissolve in 95% of the final flask volume of water. Adjust with 1.8 N *potassium hydroxide TS* or 1 N *phosphoric acid TS* to a pH of 6.5. Dilute with water to volume.

Mobile phase: *Acetonitrile, methanol, and Buffer* (10:10:80)

Diluent: 6.2 g/L of *boric acid*, 7.5 g/L of *potassium chloride*, and 3.6 g/L of *sodium hydroxide* prepared as follows. Transfer suitable amounts of *boric acid, potassium chloride, and sodium hydroxide* to a suitable volumetric flask. Dissolve in 95% of the final flask volume of water. Adjust with 2.5 N *sodium hydroxide TS* to a pH of 10.4. Dilute with water to volume.

Standard stock solution A: 250 µg/mL of USP Acamprosate Related Compound A RS in water

Standard stock solution B: 1 µg/mL of USP Acamprosate Related Compound A RS from *Standard stock solution A* in *Diluent*

Standard solution: Transfer 3.0 mL of *Standard stock solution B* to an appropriate container. Add 0.15 mL of *Solution A* and shake vigorously for 30 s. Heat in a water bath at 50° for 30 min. Cool under a stream of cold water, centrifuge, and pass the supernatant through a suitable membrane filter.

Sample stock solution A: Nominally 20 mg/mL of acamprosate calcium from Tablets prepared as follows. Transfer a suitable amount of powdered Tablets (NLT 5) to an appropriate volumetric flask. Dissolve in 60% of the final flask volume of water and sonicate for NLT 30 min. Dilute with water to volume.

Sample stock solution B: Nominally 2 mg/mL of acamprosate calcium from *Sample stock solution A* in *Diluent*. Pass through a suitable filter and use the filtrate.

Sample solution: Transfer 3.0 mL of *Sample stock solution B* to an appropriate container. Add 0.15 mL of *Solution A* and shake for 30 s. Heat in a water bath at 50° for 30 min. Cool under a stream of cold water, centrifuge, and pass the supernatant through a suitable membrane filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 261 nm

Column: 4.6-mm × 15-cm; 3- or 5-µm packing *L1*

Flow rate: 1 mL/min

Injection volume: 20 µL

Run time: NLT 2 times the retention time of acamprosate related compound A

System suitability

Sample: *Standard solution*

[Note—The relative retention times for fluorescamine and acamprosate related compound A are 0.3 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between fluorescamine and acamprosate related compound A

Relative standard deviation: NMT 5.0% for acamprosate related compound A

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of acamprosate related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Acamprosate Related Compound A RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of acamprosate calcium in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.10%

• **Organic Impurities**

Buffer: Add 1.0 mL of *triethylamine* per 1 L of water and adjust with *phosphoric acid* to a pH of 2.5.

Solution A: *Buffer*

Solution B: *Acetonitrile*

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
20	100	0
50	80	20
60	100	0
75	100	0

System suitability solution: 5 mg/mL of USP Acamprosate Calcium RS, 0.005 mg/mL of USP Acamprosate Related Compound B RS, and 0.005 mg/mL of *glacial acetic acid* in *Buffer*. Sonication may be used to aid in dissolution.

Standard solution: 0.005 mg/mL of USP Acamprosate Calcium RS in *Buffer*. Sonication may be used to aid in dissolution.

Sample solution: Nominally 5 mg/mL of acamprosate calcium from Tablets prepared as follows. Transfer a suitable portion of powdered Tablets (NLT 10) to an appropriate volumetric flask. Add 70% of the final flask volume of *Buffer* and sonicate for 30 min with intermittent shaking to avoid lump formation. Dilute with *Buffer* to volume and pass through a suitable filter. Use the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 25-cm; 5- μ m packing *L11*

Column temperature: 40°

Flow rate: 0.7 mL/min

Injection volume: 10 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.5 between acetic acid and acamprosate related compound B; NLT 1.5 between acamprosate related compound B and acamprosate, *System suitability solution*

Relative standard deviation: NMT 5% for acamprosate, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each degradation product from the *Sample solution*

r_S = peak response of acamprosate from the *Standard solution*

C_S = concentration of USP Acamprosate Calcium RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of acamprosate calcium in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 2*. Disregard peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Calcium ^a	0.6	—
Acetic acid ^b	0.7	—
Acamprosate related compound B ^b	0.8	—
Acamprosate	1.0	—
<i>N</i> -Methyl acamprosate ^c	2.7	—
Any individual, unspecified degradation products	—	0.1
Total degradation products ^d	—	1.0

^a Included for identification only. This peak is due to the calcium counterion and hence is not an impurity.

^b This is a process impurity that is included in the table for identification purposes. It is controlled in the drug substance and is not to be reported or included in the total degradation products for the drug product.

^c 3-(*N*-Methylacetamido)propane-1-sulfonate.

^d The sum of acamprosate related compound A from the *Limit of Acamprosate Related Compound A* and all degradation products from the test for *Organic Impurities*.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight, light-resistant containers. Store at controlled room temperature.
- **USP Reference Standards** <11>
 - USP Acamprosate Calcium RS
 - USP Acamprosate Related Compound A RS
 - 3-Aminopropane-1-sulfonic acid.
 - C₃H₉NO₃S 139.17
 - USP Acamprosate Related Compound B RS
 - Calcium 3-formamidopropane-1-sulfonate.

$C_8H_{16}CaN_2O_8S_2$ 372.42

▲USP40

BRIEFING

Acetaminophen and Codeine Phosphate Oral Solution, *USP 38* page 2031. As part of the USP monograph modernization initiative and based on correspondence from the FDA regarding modernization, the addition of an HPLC procedure for monitoring 4-aminophenol, based on general chapter *4-Aminophenol in Acetaminophen-Containing Drug Products* (227), is being proposed. This liquid chromatographic procedure is based on analyses performed with the Dionex Acclaim Mixed Mode WCX-1 brand of L85 column. The typical retention time for 4-aminophenol is about 4.2–5.3 min. The proposed limit of this nephrotoxin is 0.15% and is based on input provided by the FDA and the pharmaceutical industry to the USP Acetaminophen Expert Panel, which reports to the Chemical Medicines Monographs 2 Expert Committee.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(CHM2: C. Anthony.)

Comment deadline: January 31, 2016

Acetaminophen and Codeine Phosphate Oral Solution**DEFINITION**

Acetaminophen and Codeine Phosphate Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amounts of acetaminophen ($C_8H_9NO_2$) and codeine phosphate hemihydrate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$).

IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solutions* correspond to those of the *Standard solutions*, as obtained in the *Assays for Acetaminophen and Codeine Phosphate*.

- **B. Thin-Layer Chromatography**

Standard solution: 12 mg/mL each of USP Acetaminophen RS and USP Codeine Phosphate RS in methanol

Sample solution: Transfer a volume of Oral Solution, equivalent to 12 mg of codeine phosphate, to a separator. Add 1 mL of ammonium hydroxide and 5 mL of methylene chloride. Shake for 1 min, and allow the layers to separate. Use the clear lower layer.

Developing solvent system: Methanol and ammonium hydroxide (49:1)

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 μ L

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Locate the spots on the plate by examination under short-wavelength UV light.

Acceptance criteria: The R_F values of the two principal spots of the *Sample solution* correspond to those of the *Standard solution*.

BRIEFING

Acetaminophen and Codeine Phosphate Oral Suspension, *USP 38* page 2032. As part of the USP monograph modernization initiative and based on correspondence from the FDA regarding modernization, the addition of an HPLC procedure for monitoring 4-aminophenol, based on general chapter *4-Aminophenol in Acetaminophen-Containing Drug Products* (227), is proposed. This liquid chromatographic procedure is based on analyses performed with the Dionex Acclaim Mixed Mode WCX-1 brand of L85 column. The typical retention time for 4-aminophenol is about 4.2–5.3 min. The proposed limit of this nephrotoxin is 0.15% and is based on input provided by the FDA and the pharmaceutical industry to the USP Acetaminophen Expert Panel, which reports to the Chemical Medicines Monographs 2 Expert Committee.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Acetaminophen and Codeine Phosphate Oral Suspension

DEFINITION

Acetaminophen and Codeine Phosphate Oral Suspension is a suspension of Acetaminophen and Codeine Phosphate in a suitable aqueous vehicle. It contains NLT 90.0% and NMT 110.0% of the labeled amounts of acetaminophen ($C_8H_9NO_2$) and codeine phosphate hemihydrate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$).

IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

- **B. Thin-Layer Chromatography**

Standard solution: 12 mg/mL each of USP Acetaminophen RS and USP Codeine Phosphate RS in methanol

Sample solution: Transfer a volume of Oral Suspension, equivalent to 12 mg of codeine phosphate, to a separator. Add 1 mL of ammonium hydroxide and 5 mL of methylene chloride, shake for 1 min, and allow the layers to separate. Use the clear lower layer.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Developing solvent system: Methanol and ammonium hydroxide (49:1)

Application volume: 10 μ L

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Locate the spots on the plate by examination under short-wavelength UV light.

Acceptance criteria: The R_f values of the two principal spots of the *Sample solution* correspond to those of the *Standard solution*.

ASSAY

Change to read:

- **Procedure**

Diluent: Methanol and 0.01 N sodium hydroxide (30:70)

Mobile phase: Dissolve 4.9 g of monobasic potassium phosphate in 900 mL of water, adjust with phosphoric acid to a pH of 3.9, and add 216 mg of sodium 1-octanesulfonate. Add 100 mL of acetonitrile, and filter.

Codeine phosphate standard stock solution: 0.5 mg/mL of USP Codeine Phosphate RS in *Diluent*

Standard stock solution: Transfer a quantity of 5J mg of USP Acetaminophen RS (J being

the ratio of the labeled amount, in mg, of acetaminophen to the labeled amount, in mg, of codeine phosphate hemihydrate) and 10.0 mL of *Codeine phosphate standard stock solution* to a 100-mL volumetric flask. Dissolve in and dilute with *Diluent* to volume.

System suitability stock solution: 0.02 mg/mL of sodium benzoate and 0.03 mg/mL of methylparaben in *Diluent*

System suitability solution: Transfer 10.0 mL of the *System suitability stock solution* to a 50-mL volumetric flask, add 10.0 mL of *Standard stock solution*, and dilute with *Mobile phase* to volume.

Standard solution: 0.01 mg/mL of USP Codeine Phosphate RS and 0.01J mg/mL of USP Acetaminophen RS in *Mobile phase*. Prepare by diluting 10.0 mL of the *Standard stock solution* with *Mobile phase* to 50 mL in a volumetric flask.

Sample stock solution: Nominally 0.5 mg/mL of acetaminophen ▲ and 0.5J mg/mL of codeine phosphate hemihydrate ▲^{USP40} in *Diluent* prepared as follows. Transfer a measured volume of well-mixed Oral Suspension, equivalent to 50 mg of acetaminophen, to a 100-mL volumetric flask. Add 50 mL of *Diluent*, and mix by mechanical means for 30 min. Dilute with *Diluent* to volume. Foaming may be minimized by adding a few drops of acetonitrile before diluting with *Diluent* to volume. Centrifuge a portion of this mixture.

Sample solution: Dilute 10.0 mL of the clear supernatant from the *Sample stock solution* with *Mobile phase* to 50 mL in a volumetric flask.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 15-cm; 5-μm packing L11

Flow rate: 2 mL/min

Injection volume: 20 μL

USP Codeine Phosphate RS

BRIEFING

Albumin Human, *USP 38* page 2067. On the basis of comments received, the following changes are proposed:

1. Revise the *Definition* to remove aspects of processing.
2. Revise the *Definition* to add appropriate reference to the Code of Federal Regulations.
3. Add *Identification* methods and zone electrophoresis.
4. Add the *Assay* based on protein determination.
5. Add the *Impurities* test *Prekallikrein Activator* (165).
6. Add the *Other Components* test for *Content of Sodium Caprylate* based on ion chromatography using the Microsorb C18 brand of 5- μ m guard column and the Nucleosil C18 brand of 5- μ m analytical column.
7. Add the *Other Components* test for *Content of N-Acetyl-dl-tryptophan* based on HPLC using the TSK G3000SW brand of guard column and the TSK G3000SW brand of analytical column.
8. Add *Specific Tests* for *Bacterial Endotoxins Test* (85), *Biological Reactivity Tests* (88), *In Vivo*, *Sterility Tests* (71), and *pH* (791).
9. Add to *Specific Tests* an HPLC method for *Molecular Weight Distribution*, using the TSK G3000SW brand of guard column and the TSK G3000SW brand of analytical column.
10. Add to *Specific Tests* a method for *Heat Stability*.
11. Add to *Specific Tests* atomic adsorption methods for the *Content of Sodium* and *Limit of Potassium*.
12. Revise the *Labeling* section to align with the Code of Federal Regulations.
13. Add USP Albumin Human RS and USP Endotoxin RS to the *USP Reference Standards* section.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Albumin Human

DEFINITION

Change to read:

~~Albumin Human conforms to the regulations of the federal Food and Drug Administration concerning biologics (640.80 to 640.86) (see *Biologics* (1041)). It is a sterile, nonpyrogenic preparation of serum albumin obtained by fractionating material (source blood, plasma, serum, or placentas) from healthy human donors, the source material being tested for the absence of~~

hepatitis B surface antigen. It is made by a process that yields a product that is safe for intravenous use.

▲ Albumin Human is a sterile, nonpyrogenic preparation of serum albumin. The source material of Albumin Human shall be plasma recovered from Whole Blood prepared as prescribed in the Code of Federal Regulations (CFR) Title 21 sections 640.1 through 640.5, or Source Plasma prepared as prescribed in sections 640.60 through 640.76. Albumin Human is manufactured by a process that yields a product that is safe for intravenous use. Heating of the final containers of Albumin Human begins within 24 h after completion of filling. Heat treatment is conducted so that the solution is heated continuously for NLT 10 and NMT 11 h, at an attained temperature of $60 \pm 0.5^\circ$. All final containers of Albumin Human are incubated at 20° – 35° for at least 14 days following the heat treatment. ▲*USP40*

NLT 96% of its total protein is albumin. ~~It is a solution containing, in each 100 mL, either 25 g of serum albumin osmotically equivalent to 500 mL of normal human plasma, or 20 g equivalent to 400 mL, or 5 g equivalent to 100 mL, or 4 g equivalent to 80 mL, and contains NLT 93.75% and NMT 106.25% of the labeled amount in the case of the solution containing 4 g in each 100 mL, and NLT 94.0% and NMT 106.0% of the labeled amount in the other cases.~~

▲ The final product shall conform to one of the following concentrations: 40 ± 2.5 ; 50 ± 3.0 ; 200 ± 12 ; and 250 ± 15 g/L solution of protein. ▲*USP40*

It contains no added antimicrobial agent, but may contain sodium acetyltryptophanate with or without sodium caprylate as a stabilizing agent. ~~It has a heme content such that the absorbance of a solution, diluted to contain 1% of protein, in a 1-cm holding cell, measured at a wavelength of 403-nm, is NMT 0.25. It meets the requirements of the test for heat stability and for pH.~~

▲ Albumin Human conforms to the regulations of the federal Food and Drug Administration concerning biologics (sections 640.80–640.84). ▲*USP40*

IDENTIFICATION

Add the following:

▲ ● A. Immunodiffusion

Buffer A: Dissolve 1.98 g of barbituric acid, 1.03 g of sodium barbital, and 8.7 g of sodium chloride in 900 mL of water. Adjust with a sodium hydroxide solution to a pH of 8.0, dilute with water to 1 L, and mix.

Agar-gel immunodiffusion plates: Prepare agar-gel immunodiffusion plates each containing a central well and 5 or 6 outer wells concentric with the central well using 1.9 g of agar in 150 mL of *Buffer A*.

Standard solution: 5 μ L of USP Albumin Human RS

Sample solution: 5 μ L of Albumin Human

System suitability

Sample: *Standard solution*

Suitability requirements: The plate containing the *Standard solution* shows an arc between the central well and the well containing antiserum.

Analysis

Samples: *Standard solution* and *Sample solution*

Place *Sample solution* in the central well of one plate and *Standard solution* in the central well of another plate. Add 5 μL of an antiserum specific to human plasma proteins from a suitable commercial source in one of the appropriately marked outer wells of each plate. Place 5 μL each of antisera specific to plasma proteins of animals commonly used in the preparation of materials of biological origin in other appropriately marked outer wells of each plate. [Note—At the minimum, antisera against plasma proteins of bovine, porcine, and ovine should be used.] Incubate the plates at 2°–8° for NLT 24 h.

Acceptance criteria: The plates containing *Sample solution* observed in a bright white light shows a sharp white arc between the central well and the well containing antiserum specific to human plasma proteins, and no arc between the central well and the wells containing antisera specific to plasma proteins of other animals. ▲*USP40*

Add the following:

▲ ● B. Protein Composition by Zone Electrophoresis

Solution A: 0.9% (w/v) Sodium chloride in water

Solution B: 5% (v/v) Acetic acid in water

Running buffer: 1.38 g of barbital, 8.76 g of barbital sodium, and 0.38 g of calcium lactate. Dilute with water to 1000.0 mL.

Fixative dye solution: A 5-g/L solution of amido black 10B in a mixture of methanol and glacial acetic acid (90:10)

Destaining solution: Methanol and glacial acetic acid (90:10)

Clearing solution: Methanol and glacial acetic acid (81:19)

Support media: Use strips of suitable cellulose acetate gel or agarose gel. [Note—Method may be adapted to an automated system.]

Standard solution: USP Albumin Human RS diluted to 50 g/L of protein in *Running buffer*

Sample solution: Albumin Human diluted to 50 g/L of protein in *Running buffer*

Electrophoretic system

Run buffer: *Running buffer*

Voltage: Apply suitable voltage such that the most rapid band migrates at least 30 mm.

Loading volume: Apply 2.5 μL of the *Sample solution* as a 10 mm band or apply 0.25 $\mu\text{L}/\text{mL}$ if a narrower strip is used.

Staining: Immerse the strips in *Fixative dye solution* for 5 min.

Destaining: Immerse in 10 volumes of *Destaining solution* until just free of color. Develop with *Clearing solution*.

System suitability

Sample: *Standard solution*

Suitability requirements: In the electropherogram obtained with the *Standard solution*, the proportion of protein in the principal band is within the limits stated in the certificate for USP Albumin Human RS.

Analysis

Sample: *Sample solution*

Scan membranes measuring the absorbance at 600 nm. Integrate the dye density and report the relative percent areas of any peaks.

Calculate the percentage of albumin human in the portion of Albumin Human taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of albumin from the *Sample solution*

r_T = sum of all the peak responses present from the *Sample solution*

Acceptance criteria: NLT 96% for Albumin Human ▲*USP40*

ASSAY

Add the following:

▲ ● Procedure

Biuret reagent: Dissolve 3.46 g of cupric sulfate ($\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$) in 10 mL of hot water. Dissolve 34.6 g of sodium citrate ($\text{Na}_3\text{C}_6\text{H}_5\text{O}_7 \cdot 2\text{H}_2\text{O}$) and 20.0 g of sodium carbonate (Na_2CO_3) in 80 mL of hot water. When the solutions cool, mix together, and dilute to a final volume with water to 200 mL.

Solution A: 6% Sodium hydroxide

Solution B: 0.9% Sodium chloride

Standard solutions: 0.5, 4.75, and 10 g/L of USP Albumin Human RS in *Solution B*

Sample solution: Albumin Human diluted to a protein concentration in the range of the *Standard solutions* with *Solution B*

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: Vis

Wavelength: 545 nm

Blank: *Solution B*

System suitability

Samples: *Standard solutions* and *Sample solution*

Suitability requirements: The r^2 value of the standard curve must be at NLT 0.99. The absorbance of the *Sample solution* must fall within the range of the absorbance of the *Standard solutions*.

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*

To 1 volume of the *Blank*, *Standard solutions*, and *Sample solution*, add 1 volume of *Solution A*, and mix. Immediately add 0.4 volumes of *Biuret reagent*, and mix. Between 30 and 60 min, zero the suitable spectrophotometer with the *Blank* and record the absorbance of the *Standard solutions* and *Sample solution*. Generate a standard curve using linear regression by the least squares method for the peak areas of the *Standard solutions* versus the *Standard solutions* concentration. From the standard curve, calculate the protein concentration of the *Sample solution* and correct for the dilution.

Acceptance criteria: The final product shall conform to one of the following

concentrations: 40 ± 2.5 ; 50 ± 3.0 ; 200 ± 12 ; and 250 ± 15 g/L solution of protein. ▲USP40

OTHER COMPONENTS

Add the following:

▲ ● Content of Sodium Caprylate

Solution A: 90% Acetonitrile

Solution B: 0.1 N hydrochloric acid

Solution C: 0.1 N hydrochloric acid in *Solution A*

Solution D: 0.005 N hydrochloric acid

Solution E: 0.0025 N potassium hydroxide

Mobile phase: Acetonitrile, methanol, hydrochloric acid, and water (36: 27: 0.0004: 37)

Standard solutions: 10, 55, and 120 mM sodium caprylate in *Solution C*

Sample solution: Pipet 1 mL of Albumin Human into a 10-mL beaker. Rinse the pipet.

Collect this rinse in the same 10 mL beaker and record for calculating dilution. Using

Solution B, adjust the pH of the sample to between 3.8 and 4.0. Transfer 1 mL of the pH-adjusted Albumin Human to a 50-mL volumetric flask. Fill with *Solution A* to volume and mix. Transfer a portion to a centrifuge tube and centrifuge at 16,000 g for 10 min. Use the supernatant as *Sample solution*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Conductivity

Suppressor: AMMS-ICE

Columns

Guard: 4.6-mm × 1.5-cm; 5- μ m packing L1

Analytical: 4.0-mm × 25.0-cm; 5- μ m packing L1

Flow rate: 0.7 mL/min

Injection volume: 20 μ L

Regenerant: *Solution E*

System suitability

Samples: *Standard solutions* and *Sample solution*

Suitability requirements: The r^2 value of the standard curve must be at least 0.98. The *Sample solution* peak area must fall within the range of the highest and lowest standards.

Analysis

Samples: *Standard solutions* and *Sample solution*

Generate the standard curve by the linear regression by the least squares method of the peak areas of the *Standard solutions* versus the caprylate concentration. Determine the *Sample solution* concentration by comparison to the standard curve and correct for dilution.

Acceptance criteria: 0.08 ± 0.016 mM sodium caprylate ▲*USP40*

Add the following:

▲ ● **Content of *N*-Acetyl-dl-tryptophan**

[Note—Perform if *N*-acetyl-dl-tryptophan is used in the product.]

Mobile phase: 0.10 M dibasic sodium phosphate anhydrous, 0.10 M monobasic sodium phosphate monohydrate, 0.15 M sodium chloride, and 0.05% sodium azide. Adjust with 10 N sodium hydroxide to a pH of 6.8.

Standard solution: 0.004 M *N*-acetyl-dl-tryptophan

Sample solution: 50 g/L of Albumin Human, diluted in *Mobile phase* if necessary

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Columns

Guard: 7.5-mm × 7.5-cm; packing L59

Analytical: 7.5-mm × 60-cm; packing L59

Flow rate: 1.0 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 2500 theoretical plates

Tailing factor: 0.9–1.2

Analysis

Samples: *Standard solution* and *Sample solution*

Perform duplicate injections using the average peak area.

Calculate the concentration of *N*-acetyl-dl-tryptophan in the portion of Albumin Human taken:

$$\text{Result} = (r_U/r_S) \times C_S \times D$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of *N*-acetyl-dl-tryptophan in the *Standard solution*

D = dilution factor

Acceptance criteria: 0.08 ± 0.016 mM sodium acetyltryptophanate ▲*USP40*

IMPURITIES

Add the following:

▲ ● **Prekallikrein Activator** (165): NMT 35 IU/mL ▲*USP40*

SPECIFIC TESTS

Add the following:

▲ ● **Bacterial Endotoxins Test** (85): It contains NMT 0.5 USP Endotoxin Units/mL. ▲*USP40*

Add the following:

▲ ● **Biological Reactivity tests** (88), *In Vivo, Safety Tests—Biologicals*: Meets the requirements ▲*USP40*

Add the following:

▲ ● **Sterility Tests** (71): Meets the requirements ▲*USP40*

Add the following:

▲ ● **pH** (791)

Sample solution: Albumin Human diluted to 10 g/L in 0.15 M sodium chloride

Acceptance criteria: 6.4–7.4 ▲*USP40*

Add the following:

▲ ● **Molecular Weight Distribution**

Mobile phase: Prepare a solution containing 7.337 g/L of dibasic sodium phosphate heptahydrate, 1.741 g/L of monobasic sodium phosphate monohydrate, and 11.688 g/L of sodium chloride in water, degas, and filter.

Standard solution: Dilute a solution of USP Human Albumin RS in *Mobile phase* to obtain a solution with a concentration of about 10 mg/mL of protein.

Sample solution: Dilute a solution of Albumin Human in *Mobile phase* to obtain a solution with about the same concentration of protein as the *Standard solution*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV-Vis

Wavelength: 280 nm

Columns

Guard: 7.5-mm × 7.5-cm; L59

Analytical: 7.5-mm × 60-cm; L59

Flow rate: 0.5 mL/min

Injection volume: 25 μL

System suitability

Sample: *Standard solution*

Suitability requirements: The test is not valid unless the value obtained for USP Human Albumin RS is within the value stated in the USP Human Albumin RS certificate.

Analysis

Sample: *Sample solution*

Measure the areas of the major peak of all other peaks, excluding the solvent peaks. Calculate the percentage of the major peak in the portion of Albumin Human taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response from the *Sample solution*

r_T = sum of all the peak responses from the *Sample solution*

Acceptance criteria: The area of the major peak is NLT 85% of the total area in the chromatogram. ▲*USP40*

Add the following:

- ▲ ● **Heat Stability:** A final container sample of Albumin Human shall remain unchanged, as determined by visual inspection, after heating at 57° for 50 h, when compared to its control consisting of a sample, from the same lot, which has not undergone the heat treatment. ▲*USP40*

Add the following:**▲ ● Content of Sodium**

Standard solutions: 1.0 mEq/L of sodium with 25 mEq/L of potassium and 0.6 mEq/L of sodium with 25 mEq/L of potassium

Sample solution: Dilute Albumin Human with water such that the sodium concentration is within the range of the standards.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: Atomic absorption spectrophotometry

Lamp: Sodium

Analytical wavelength: 589 nm

System suitability

Sample: *Sample solution*

Suitability requirements: Duplicate absorbance readings must be within 3.0 mEq/L.

Analysis

Samples: *Standard solutions* and *Sample solution*

Establish a stable baseline with water. Read the absorption of the *Standard solutions* and *Sample solution*.

Calculate the sodium concentration of the *Sample solution* from the response line of the *Standard solutions* and correct for the *Sample solution* dilution.

Acceptance criteria: 130–160 mEq/L ▲*USP40*

Add the following:**▲ ● Limit of Potassium**

Standard solution: 0.06 mEq/L of potassium and 40 mEq/L of sodium

Sample solution: Dilute Albumin Human such that the potassium concentration is within the range of the standard.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: Atomic absorption spectrometry

Lamp: Potassium

Analytical wavelength: 766 nm

System suitability

Samples: *Standard solution* and *Sample solution*

Suitability requirements: Duplicate absorbances readings must be within ± 0.005 AU

Analysis

Samples: *Standard solution* and *Sample solution*

Establish a stable baseline with water. Read the absorption of the *Standard solution* and *Sample solution*.

Calculate the sodium concentration of the *Sample solution* from the response line of the *Standard solution*, and correct for dilution.

Acceptance criteria: NMT 2 mEq/L ▲*USP40*

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers, and store at the temperature recommended by the manufacturer or indicated on the label.
- **Expiration Date:** The expiration date is not later than 5 years after issue from manufacturer's cold storage (5°, 3 years) if labeling recommends storage between 2° and 10°; not later than 3 years after issue from manufacturer's cold storage (5°, 3 years) if labeling recommends storage at temperatures not higher than 37°; and not later than 10 years after date of manufacture if in a hermetically sealed metal container and labeling recommends storage between 2° and 10°.

Change to read:

- **Labeling:** ~~Label it to state that it is not to be used if it is turbid and that it is to be used within 4 h after the container is entered. Label it also to state the osmotic equivalent in terms of plasma, the sodium content, and the type of source material (venous plasma, placental plasma, or both) from which it was prepared. Label it also to indicate that additional fluids are needed when the 20-g/100-mL or 25-g/100-mL product is administered to a markedly dehydrated patient.~~

▲ Label it to state: the osmotic equivalent in terms of plasma and the sodium concentration in terms of a value or a range in mEq/L; the cautionary statement placed in a prominent position on the label, "Do Not Use if Turbid. Do Not Begin Administration More Than 4 Hours After the Container Has Been Entered." The need for additional fluids when 20% or 25% albumin is administered to a patient with marked. The protein concentration, expressed as a 4%, 5%, 20%, or 25% solution. Label it to indicate the volume of the preparation, storage conditions, the expiration date, and the name and concentration of

any added substance (for example, stabilizer). ▲*USP40*

BRIEFING

Alprazolam Tablets, *USP 38* page 2099. As part of *USP* modernization efforts, it is proposed to revise the monograph as follows:

1. A new validated test for *Organic Impurities* is proposed. This new liquid chromatographic procedure is also proposed to replace the existing *Assay* and is based on analyses conducted with the Luna C8(2) brand of L7 column. The typical retention time for alprazolam is about 5 min. The limits listed in the proposed test for *Organic Impurities* are based on the currently official monograph for *Alprazolam*. Stakeholders are encouraged to submit their approved specifications to *USP* if they are different from those proposed in this revision.
2. The *Identification* section is revised to replace *Identification* test *A* with a test based on the retention time agreement based on the proposed *Assay* and to add *Identification* test *B* based on UV spectral agreement based on the proposed *Assay*. This approach eliminates the use of chloroform, which is a safety hazard.
3. The cross-references to the existing *Assay* in the test for *Uniformity of Dosage Units* are expanded to include the procedure details.
4. *USP* Alprazolam Related Compound A RS and *USP* Clordiazepoxide Related Compound A RS are added to the *USP Reference Standards* section to support the proposed revisions to the *Assay* and test for *Organic Impurities*.

Interested parties are encouraged to submit validated dissolution procedures, which test individual units, and validated uniformity of dosage form procedures, which avoid the use of internal standards and chloroform, along with supporting data for each to further improve this monograph.

Interested parties are also encouraged to submit validated identification tests to add to the *Alprazolam Orally Disintegrating Tablets* monograph.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Alprazolam Tablets

DEFINITION

Alprazolam Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of alprazolam

(C₁₇H₁₃ClN₄).

IDENTIFICATION

Delete the following:

▲ ● A. Infrared Absorption

Sample: An amount of finely powdered Tablets, equivalent to 15 mg of alprazolam, prepared as follows. Dissolve the *Sample* in 10 mL of 10 mg/mL of sodium carbonate solution. Add 15 mL of chloroform, and shake vigorously for 30 min. Centrifuge, withdraw the aqueous layer, and transfer the chloroform to a clean container. Add 200 mg of potassium bromide. Evaporate the chloroform from this mixture to dryness, and dry the dispersion in vacuum at 60° for 24 h. Grind this dispersion into a fine powder. Prepare a suitable pellet for testing by placing 100 mg of dried potassium bromide into a die. Sprinkle 20 mg of the finely ground alprazolam-potassium bromide dispersion onto the dried potassium bromide layer, and cover with another specimen of 100 mg of dried potassium bromide.

Acceptance criteria: The IR absorption spectrum of the potassium bromide dispersion so obtained exhibits maxima characteristic of alprazolam, as compared to that of a similar preparation of USP Alprazolam RS, at the following wavenumbers: at 1609, 1578, 1566, 1539, 1487, and 1379 wavenumbers in the region of 1650–1300 cm⁻¹; at 932, 891, 826, 779, 746, 696, and 658 wavenumbers in the region of 975–600 cm⁻¹. ▲USP40

Add the following:

▲ ● **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲USP40

Add the following:

▲ ● **B.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲USP40

ASSAY

Change to read:

● **Procedure**

Mobile phase: Acetonitrile, chloroform, butyl alcohol, glacial acetic acid, and water (850: 80: 50: 0.5: 20)

Internal standard solution: 0.25 mg/mL of triazolam in acetonitrile

Standard stock solution: 0.25 mg/mL of USP Alprazolam RS in *Internal standard solution*

Standard solution: 25 µg/mL of USP Alprazolam RS from *Standard stock solution* in acetonitrile

Sample solution: Nominally 25 µg/mL of alprazolam from finely powdered Tablets (NLT 20) prepared as follows. Transfer a suitable amount of the powdered tablets to a suitable volumetric flask. Add 1% of the flask volume of water. Transfer 10% of the flask volume of *Internal standard solution*, shake vigorously for 10 min, and dilute with acetonitrile to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6 mm x 30 cm, packing L3

Flow rate: 2 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between triazolam and alprazolam

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of alprazolam ($C_{17}H_{13}ClN_4$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area response ratio of the alprazolam peak relative to the internal standard peak from the *Sample solution*

R_S = peak area response ratio of the alprazolam peak relative to the internal standard peak from the *Standard solution*

C_S = concentration of USP Alprazolam RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of alprazolam in the *Sample solution* (µg/mL)

▲ Solution A: 0.77 g/L of ammonium acetate prepared as follows. Dissolve 0.77 g of ammonium acetate in each L of water and adjust with acetic acid to a pH of 4.7.

Solution B: *Chromatographic acetonitrile*

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	60	40
2.5	60	40
9.0	5	95
9.1	60	40
11.0	60	40

Diluent: *Chromatographic acetonitrile* and *water* (40:60)

System suitability solution: 50 µg/mL of USP Alprazolam RS, 1 µg/mL of USP Alprazolam Related Compound A RS, and 1 µg/mL of USP Chlordiazepoxide Related Compound A RS in

Diluent

Standard solution: 50 µg/mL of USP Alprazolam RS in *Diluent*

Sample solution: Nominally 50 µg/mL of alprazolam from Tablets prepared as follows.

Transfer a suitable portion of powder from NLT 10 Tablets to an appropriate volumetric flask. Add 80% of the total flask volume of *Diluent*. Sonicate for NLT 10 min. Dilute with *Diluent* to volume. Centrifuge a portion and use the clear supernatant. [Note—The use of a centrifuge speed of 3500 rpm for 10 min may be suitable.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 260 nm. For *Identification* test B, use a diode array detector in the range of 200–400 nm.

Column: 4.6-mm × 15-cm; 3-µm packing L7

Flow rate: 1 mL/min

Injection volume: 25 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—See *Table 2* for the relative retention times.]

Comment deadline: January 31, 2016

Ascorbic Acid Injection

DEFINITION

Ascorbic Acid Injection is a sterile solution, in Water for Injection, of Ascorbic Acid prepared with the aid of Sodium Hydroxide, Sodium Carbonate, or Sodium Bicarbonate. It contains NLT 90.0% and NMT 110.0% of the labeled amount of ascorbic acid (C₆H₈O₆).

IDENTIFICATION

- **A.**

Analysis: To a volume of Injection, equivalent to 40 mg of ascorbic acid, add 4 mL of 0.1 N hydrochloric acid, then add 4 drops of methylene blue TS, and warm to 40°.

Acceptance criteria: The deep blue color becomes appreciably lighter or is completely discharged within 3 min.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, obtained as directed in the *Assay*.

Delete the following:

▲ ● ~~**C. Identification Tests—General, Sodium**~~ <191>: Meets the requirements ▲*USP40*

Add the following:

▲ ● **C.** Ascorbic Acid Injection imparts an intense yellow color to a nonluminous flame. ▲*USP40*

ASSAY

- **Procedure**

Mobile phase: Dissolve 15.6 g of *dibasic sodium phosphate* and 12.2 g of *monobasic potassium phosphate* in 2000 mL of water, and adjust with *phosphoric acid* to a pH of 2.5 ± 0.05.

Standard solution: 0.5 mg/mL of USP Ascorbic Acid RS in *Mobile phase*. [Note—Refrigerate and store protected from light until use. The solution is stable for at least 24 h. Inject within 3 h after removal from the refrigerator.]

Sample solution: Dilute the Injection, if necessary, with *Mobile phase* to obtain a solution with a concentration of about 0.5 mg/mL. [Note—Refrigerate and store protected from light until use. The solution is stable for at least 24 h. Inject within 3 h after removal from the refrigerator.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 245 nm

Column: 150-cm × 6-mm; packing L39

Flow rate: 0.6 mL/min

Injection volume: 4 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 3500 theoretical plates

Tailing factor: NMT 1.6

Relative standard deviation: NMT 1.5%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ascorbic acid (C₆H₈O₆) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Ascorbic Acid RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of ascorbic acid in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES

• Limit of Oxalate

Analysis: Dilute a volume of Injection, equivalent to 50 mg of ascorbic acid, with water to 5 mL. Add 0.2 mL of acetic acid and 0.5 mL of *calcium chloride TS*.

Acceptance criteria: No turbidity is produced in 1 min.

SPECIFIC TESTS

- **pH** (791): 5.5–7.0
- **Other Requirements:** It meets the requirements in *Injections* (1).
- **Bacterial Endotoxins Test** (85): It contains NMT 1.2 USP Endotoxin Units/mg of ascorbic acid.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in light-resistant, single-dose containers, preferably of Type I or Type II glass.
- **Labeling:** In addition to meeting the requirements in *Injections* (1), *Labels and Labeling*, *Labeling*, fused-seal containers of the Injection in concentrations of 250 mg/mL and greater are labeled to indicate that since pressure may develop on long storage, precautions should be taken to wrap the container in a protective covering while it is being opened.
- **USP Reference Standards** (11)
USP Ascorbic Acid RS
USP Endotoxin RS

BRIEFING

Aspirin, *USP 38* page 2289. On the basis of comments received, it is proposed to make the following changes.

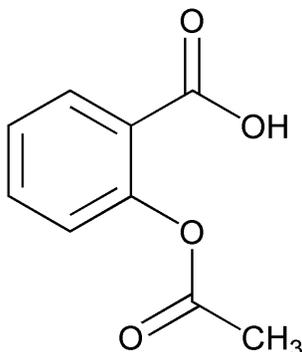

1. Replace the nonspecific *Identification* test *A* based on an outdated color test with a retention time agreement using the procedure in the proposed *Assay*.
2. Revise *Identification* test *B* to allow for both potassium bromide dispersion and attenuated total reflectance methods.
3. Replace the current titrimetric *Assay* procedure with an HPLC method. The HPLC procedure was validated using the Merck KGaA Lichrosorb RP-18 brand of L1 column in which aspirin elutes at about 2.5 min.
4. Change the *Acceptance criteria* in the *Assay* from 99.5%–100.5% to 98.0%–102.0% because this is consistent with the precision of typical HPLC assay procedures compared to typical titrations.
5. Replace the limit test for salicylic acid in the *Organic Impurities* section with a chromatographic procedure based on the *European Pharmacopoeia V.8.5* monograph for *Acetylsalicylic Acid*. The procedure was verified using the Phenomenex Kinetix XB-C18 brand of L1 column in which aspirin and salicylic acid elutes at about 3.8 and 5.1 min, respectively.
6. Remove the *Readily Carbonizable Substances Test* (271) and the *Substances Insoluble in Sodium Carbonate TS* test as they are no longer required with the introduction of the proposed chromatographic procedure in the test for *Organic Impurities*.
7. Add USP Salicylic Acid RS to the *USP Reference Standards* section to support the proposed *Assay* and *Organic Impurities* tests.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Sample: 1.5 g of Aspirin

Titrimetric system:

See *Titrimetry* (541)

Mode: Residual titration

Titrant: 0.5N sodium hydroxide VS

Back-Titrant: 0.5N sulfuric acid VS

Endpoint detection: Visual

Analysis: Transfer the Sample to a suitable flask. Add 50.0 mL of *Titrant* and boil the mixture gently for 10 min. Add phenolphthalein TS, and titrate the excess sodium hydroxide with *Back-Titrant*. Perform a blank determination. Each mL of *Back-Titrant* is equivalent to 45.04 mg of aspirin ($C_9H_8O_4$).

Acceptance criteria: 99.5%–100.5% on the dried basis

▲ **Mobile phase:** Acetonitrile, phosphoric acid, and water (400:2:600, v/v/v)

Standard solution: 0.5 mg/mL of USP Aspirin RS in acetonitrile

Sample solution: 0.5 mg/mL of Aspirin in acetonitrile

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 275 nm

Column: 4.6-mm × 25-cm; 5- μ m packing L1

Flow rate: 2 mL/min

Injection volume: 10 μ L

Run time: 2 times the retention time of the aspirin peak

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: 0.8–1.5

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of aspirin ($C_9H_8O_4$) in the portion of Aspirin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of aspirin from the *Sample solution*

r_S = peak response of aspirin from the *Standard solution*

C_S = concentration of USP Aspirin RS in the *Standard solution* (mg/mL)

C_U = concentration of Aspirin in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis ▲*USP40*

IMPURITIES

- **Residue on Ignition** (281): NMT 0.05%
- **Chloride and Sulfate** (221), *Chloride*

Standard solution: Transfer 0.10 mL of 0.020 N hydrochloric acid to a suitable container. Dilute with water to 25 mL.

Sample solution: Transfer 1.5 g of Aspirin to a suitable container. Dilute with water to 75 mL. Boil for 5 min, cool, add sufficient water to restore the original volume, and filter.

Analysis: To the *Standard solution* and the *Sample solution*, separately add 1 mL of *silver nitrate TS*.

Acceptance criteria: A 25-mL portion of filtrate of the *Sample solution* shows no more chloride than that of the *Standard solution* (0.014%).

- **Sulfate**

Sample: Transfer 6.0 g of Aspirin to a suitable container. Dissolve in 37 mL of *acetone* and add 3 mL of water.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.02 M lead perchlorate, prepared by dissolving 9.20 g of *lead perchlorate* in water to make 1000 mL of solution

Endpoint detection: Potentiometric

Analysis: Titrate with *Titrant* using a pH meter capable of a minimum reproducibility of ± 0.1 mV (see *pH* (791)) and equipped with an electrode system consisting of a lead-specific electrode and a silver–silver chloride reference glass-sleeved electrode containing a solution of *tetraethylammonium perchlorate* in *glacial acetic acid* (1 in 44).

[Note—After use, rinse the lead-specific electrode with water, drain the reference electrode, flush with water, rinse with methanol, and allow to dry.]

Acceptance criteria: NMT 1.25 mL of 0.02 M lead perchlorate is consumed (0.04%).

Delete the following:

- **Heavy Metals**

Sample: 2-g

Analysis: Dissolve *Sample* in 25 mL of *acetone*, and add 1 mL of water. Add 1.2 mL of *thioacetamide glycerin base TS* and 2 mL of *pH 3.5 Acetate Buffer* (see *Heavy Metals* (231)), and allow to stand for 5 min.

Acceptance criteria: Any color produced is not darker than that of a control made with 25 mL of *acetone* and 2 mL of *Standard Lead Solution* (see *Heavy Metals* (231)), treated in the same manner (NMT 10 ppm). • (Official 1-Jan-2018)

BRIEFING

Azathioprine Sodium for Injection, *USP 38* page 2337. As part of the USP monograph modernization effort, it is proposed to make the following changes:

1. The polarographic *Assay* is replaced with a validated stability-indicating HPLC procedure. The liquid chromatographic procedure in the *Assay* is based on analyses performed with the μ Bondapak C18 brand of L1 column. The typical retention time for azathioprine is 4.3 min.
2. *Identification* test *B*, by retention time agreement based on the *Assay*, is added.
3. The redundant test for *Completeness of Solution* is deleted, as the monograph already contains *Injections* <1>.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(CHM3: F. Mao.)

Correspondence Number—C139064

Comment deadline: January 31, 2016

Azathioprine Sodium for Injection**DEFINITION**

Azathioprine Sodium for Injection is a sterile solid prepared by the freeze-drying of an aqueous solution of Azathioprine and Sodium Hydroxide. It contains NLT 93.0% and NMT 107.0% of the labeled amount of azathioprine ($C_9H_7N_7O_2S$).

IDENTIFICATION

- **A.** The principal spot from the *Sample solution* shows the same R_F value as that obtained from *Standard solution A* in the test for *Limit of Mercaptopurine*.

Add the following:

- ▲ ● **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲*USP40*

ASSAY**Change to read:**

- **Procedure**

~~**Standard solution:** 0.1 mg/mL of USP Azathioprine RS prepared as follows. Transfer USP Azathioprine RS into a suitable volumetric flask, dissolve in 0.1 N sodium hydroxide equivalent to 5% of the final volume, and dilute with water to volume. Transfer 10.0 mL~~

of this solution into a 50-mL volumetric flask, and dilute with 0.1 N sulfuric acid to volume.

Sample solution: Transfer the contents of 1 vial of Azathioprine Sodium for Injection with the aid of water into a 100-mL volumetric flask, and dilute with water to volume. Transfer 10 mL of this solution into another 100-mL volumetric flask, and dilute with 0.1 N sulfuric acid to volume.

Analysis: Transfer 20 mL each of the *Standard solution* and the *Sample solution*, separately, to polarographic cells, and deaerate for 10 min with nitrogen that previously has been saturated with 0.1 N sulfuric acid. Blanket the solution with saturated nitrogen, insert the dropping mercury electrode of a suitable polarograph, and record the polarogram from -0.60 to -1.00 V, using a saturated calomel electrode as the reference electrode. Determine the height of the diffusion current as the difference between the residual current and diffusion current plateau.

Calculate the percentage of the labeled amount of azathioprine ($C_9H_7N_7O_2S$) in the portion of Azathioprine Sodium for Injection taken:

$$\text{Result} = [(i_d)_U / (i_d)_S] \times (C_S / C_U) \times 100$$

$(i_d)_U$ = diffusion currents of the *Sample solution*

$(i_d)_S$ = diffusion currents of the *Standard solution*

C_S = concentration of USP Azathioprine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of azathioprine in the *Sample solution* (mg/mL)

▲ Solution A: 1.6 g/L of sodium 1-heptanesulfonate in water

Mobile phase: Methanol and Solution A (30:70). Adjust with 1 N hydrochloric acid to a pH of 3.5 ± 0.1 .

Standard stock solution: 0.5 mg/mL of USP Azathioprine RS prepared as follows. Transfer USP Azathioprine RS to a suitable volumetric flask. Add 25% of the flask volume of methanol and 1% of ammonium hydroxide to the flask, swirl, and sonicate for 2 min or until dissolved. Dilute with methanol to volume.

Standard solution: 0.1 mg/mL of USP Azathioprine RS in water from the *Standard stock solution*

Sample solution: Nominally equivalent to 0.1 mg/mL of azathioprine in water from Azathioprine Sodium for Injection

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 30-cm; 10- μ m packing L1

Flow rate: 1.8 mL/min

Injection volume: 10 μ L

- **Water Determination** (921), *Method I*: NMT 7.0%, when the *Sample solution* is prepared as directed for a hygroscopic specimen
- **Other Requirements:** It meets the requirements in *Injections* (1).

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve as directed in *Containers for Sterile Solids* as described in *Injections* (1), at controlled room temperature.
- **USP Reference Standards** (11)
 - USP Azathioprine RS
 - USP Endotoxin RS
 - USP Mercaptopurine RS

BRIEFING

Buprenorphine Hydrochloride, *USP 38* page 2486. On the basis of comments received, it is proposed to make the following revisions:

1. Replace the wet chemistry procedure for *Identification* test *B* with an HPLC retention time agreement based on the proposed chromatographic procedure for the *Assay*.
2. Revise *Identification* test *C* based on the corresponding procedure in the current edition of the *European Pharmacopoeia* to improve sample solubility and accuracy of the test.
3. Replace the titration procedure for the *Assay* with an HPLC procedure. The proposed liquid chromatographic procedure is based on analyses performed with the Sunfire C18 brand of L1 column. The typical retention time for buprenorphine is about 10.8 min.
4. Revise the *Definition* and the *Acceptance criteria* in the *Assay* from "98.5%–101.0%" to "98.0%–102.0%," which is typical for a chromatographic assay.
5. Replace the test for *Organic Impurities* with an HPLC procedure, based on the corresponding procedure in the current edition of the *European Pharmacopoeia*, to improve the resolution and accuracy of the test. The limits for organic impurities are proposed based on the specifications approved by FDA. The proposed liquid chromatographic procedure is based on analyses performed with the Sunfire C18 brand of L1 column. The typical retention time for buprenorphine is about 8.5 min.
6. Replace the test for *pH* with the test for *Acidity or Alkalinity* to improve sample solubility and accuracy of the test, based on the corresponding procedure in the current edition of the *European Pharmacopoeia*.

7. Add the chemical information of buprenorphine related compound A and USP Buprenorphine System Suitability Mixture RS to the *USP Reference Standards* section.

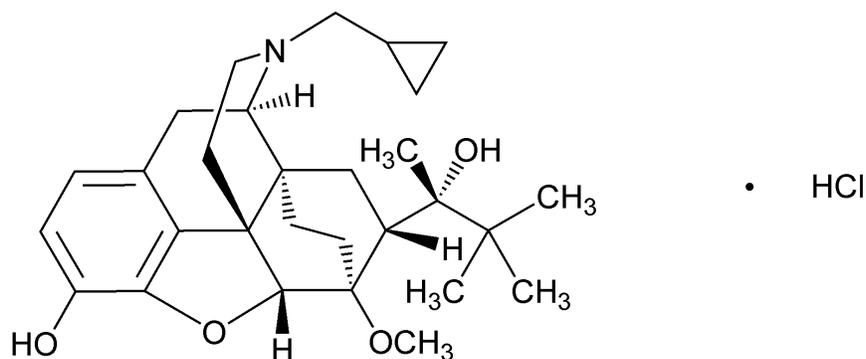

Additionally, minor editorial changes have been made to update the monograph to the current *USP* style.

BRIEFING

Carboplatin, USP 38 page 2602. On the basis of comments received, it is proposed to make the following changes:

1. The *Definition* is revised to calculate the *Assay* based on the dried basis to be consistent with the monograph in the *European Pharmacopoeia*. The test for *Water Determination* is replaced with the test for *Loss on Drying*.
2. *Identification* test A is revised to include *Infrared Absorption* (197A).
3. *Identification* test B, based on the retention time agreement in the *Assay*, is added.
4. The system suitability requirements for *Capacity factor* and *Column efficiency* are deleted from the *Assay* because the remaining criteria are adequate to evaluate the system suitability.
5. The system suitability requirement for *Column efficiency* is deleted from the test for *Limit of 1,1-Cyclobutanedicarboxylic Acid* because the remaining criteria are adequate to evaluate the system suitability.
6. The column size in the *Assay* is changed to be consistent with the procedure for *Related substances* in the *European Pharmacopoeia* monograph. The typical retention time for carboplatin is about 7 min.
7. The *Organic Impurities* test is revised to include the specified impurity of cisplatin and the run time.
8. The test for *Platinum Content* is revised to avoid the use of the toxic reagent, hydrazine hydrate.
9. The storage temperature is added to the *Packaging and Storage* section.

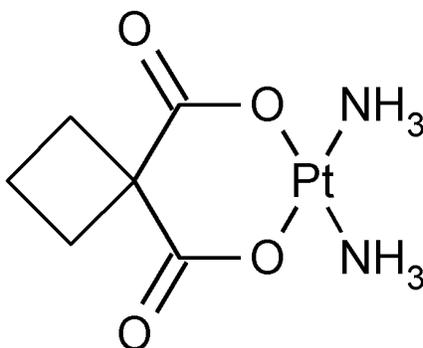

Additionally, minor editorial changes have been made to update the monograph to current USP style.

Tailing factor: NMT 2.5

Relative standard deviation: NMT 1.2%

Analysis

Samples: *Standard solution and Sample solution*

Calculate the percentage of carboplatin ($C_6H_{12}N_2O_4Pt$) in the portion of Carboplatin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Carboplatin RS in the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the *anhydrous*

▲ dried▲USP40

basis

OTHER COMPONENTS

Change to read:

● **Platinum Content**

~~Thoroughly cleanse all glassware with nitric acid, and rinse with water to prevent “mirroring” of platinum precipitate.~~

Sample solution: ~~Transfer 0.25 g of Carboplatin to a 600-mL beaker. Add 400 mL of water, and slowly dissolve by heating almost to the boiling point, stirring frequently with a glass rod.~~

Analysis: ~~When the *Sample solution* is complete, remove the insulating pad, and boil for about 10 min. Remove the beaker from the hot plate, allow to cool for 1 min without stirring, and pass through quantitative, fine porosity, smooth, dense, ashless filter paper, collecting the filtrate in a 600-mL beaker, and completing the transfer to the filter with~~

hot water. Wash the filter with hot water. Place the beaker containing the combined filtrate and washings on a hot plate, and evaporate to a volume of about 300 mL. Place a glass stirring rod in the beaker, and heat the solution to boiling. Slowly add to the center of the beaker, by dropwise additions, 10.0 mL of hydrazine hydrate, 85%. [**Caution**—Hydrazine is toxic.] Add 2 drops of 10 N sodium hydroxide, boil for 10 min to coagulate the precipitate for ease of filtration, cool, and pass through quantitative, medium-porosity, smooth, ashless filter paper. Rinse the beaker with hot water, and pour the rinsings onto the filter. Wipe the beaker and the stirring rod with small pieces of the same kind of paper used for this filtration, and place these and the filter containing the precipitate in a No. 1 porcelain crucible, previously ignited to constant weight. Dry on a hot plate covered with an insulating pad, slowly increase the heat to char, and ignite for 1 h at 800°. Cool in a desiccator, and weigh again.

Acceptance criteria: The weight of the platinum so obtained is between 52.0% and 53.0% of the carboplatin taken on the anhydrous basis.

▲ **Sample:** 0.2 g of Carboplatin, from *Loss on Drying*

Analysis: Ignite the *Sample* to constant weight at $800 \pm 50^\circ$, and weigh the residue. The residue is platinum.

Calculate the platinum content in the portion of Carboplatin taken:

$$\text{Result} = (W_U/W_S) \times 100$$

W_U = weight of platinum

W_S = weight of *Sample*

Acceptance criteria: 52.0%–53.0% on the dried basis ▲*USP40*

IMPURITIES

Change to read:

- **Limit of 1,1-Cyclobutanedicarboxylic Acid**

Solution A: Dissolve 8.5 g of *tetrabutylammonium hydrogen sulfate* in 80 mL of *water*. Add 3.4 mL of *phosphoric acid*, and adjust with 10 N *sodium hydroxide* to a pH of 7.55.

Mobile phase: *Acetonitrile*, *Solution A*, and *water* (100:20:880)

Standard solution: 5 µg/mL of 1,1-cyclobutanedicarboxylic acid in *Mobile phase*

System suitability solution: 2.5 µg/mL of 1,1-cyclobutanedicarboxylic acid and 0.5 mg/mL of Carboplatin in *Mobile phase* prepared as follows. Mix 1.0 mL of *Standard solution* with 1.0 mL of *Standard solution* in the *Assay*.

Sample solution: 1 mg/mL of Carboplatin in *Mobile phase*

Chromatographic system

Carboplatin for Injection

DEFINITION

Carboplatin for Injection is a sterile, lyophilized mixture of Carboplatin and Mannitol. It contains NLT 90.0% and NMT 110.0% of the labeled amount of carboplatin ($C_6H_{12}N_2O_4Pt$).

[**Caution**—Great care should be taken in handling Carboplatin because it is a suspected carcinogen.]

IDENTIFICATION

• A. Thin-Layer Chromatography

Standard solution: 10 mg/mL of USP Carboplatin RS in *water*

Sample solution: Nominally equivalent to 10 mg/mL of carboplatin in *water* from the contents of 1 container

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 10 μ L

Developing solvent system: Acetone and water (80:20)

Spray reagent: Add 5.6 g of *stannous chloride* to 10 mL of *hydrochloric acid*, and stir for 5 min. [Note—It is not necessary that all of the solids dissolve.] Add 90 mL of *water* and 1 g of *potassium iodide*, and stir. Prepare this solution fresh daily.

Analysis

Samples: *Standard solution* and *Sample solution*

Place the plate in a chromatographic chamber lined with filter paper and equilibrated for 2 h in *Developing solvent system*. Develop the chromatogram until the solvent front has moved 10 cm from the origin. Remove the plate from the chamber, and air-dry at room temperature for 2 h. Spray with the *Spray reagent*, and heat at 110° for 10 min.

Acceptance criteria: The principal spot of the *Sample solution* corresponds in appearance and R_F value to that of the *Standard solution*.

Add the following:

- ▲ • B. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲USP40

ASSAY

Acceptance criteria: NMT 1.0%

SPECIFIC TESTS

- **Bacterial Endotoxins Test** <85>: NMT 0.54 USP Endotoxin Units/mg of carboplatin

- **Sterility Tests** (71), *Test for Sterility of the Product to Be Examined, Membrane Filtration*: Meets the requirements
- **Constituted Solution**: At the time of use, it meets the requirements in *Injections* (1), *Constituted Solutions*.
- **pH** (791)
Sample solution: Use Sterile Water for Injection, and constitute as directed in the labeling.
Acceptance criteria: 5.0–7.0
- **Water Determination** (921), *Method I*
Analysis: Use *anhydrous formamide* as the extraction solvent. Introduce 50 mL of *anhydrous formamide* into the titration vessel, and titrate with the *Reagent* to the electrometric endpoint. Use the formamide thus dried to rinse a suitable glass syringe equipped with an 8-cm long, 22-gauge needle. Add the rinse back to the titration vessel, and titrate the vessel contents again, if necessary. Via the syringe, withdraw 5 mL of the formamide thus titrated and, through the closure of the container, expel the contents into the container. Shake the container to obtain a solution. With the same syringe, withdraw all of the contents of the container, and transfer to the titration vessel. Titrate to the endpoint, adjusting the feeding speed control to the lowest setting to avoid overtitration.
Acceptance criteria: NMT 3.0%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage**: Preserve as described in *Injections* (1), *Packaging, Containers for Sterile Solids*, and protect from light.
- **USP Reference Standards** (11)
 USP Carboplatin RS
 USP Endotoxin RS

BRIEFING

Carglumic Acid. Because there is no existing *USP* monograph for this drug substance, a new monograph based on validated methods of analysis is being proposed. The stability-indicating liquid chromatographic procedure in the *Assay* and the test for *Organic Impurities* is based on analysis performed using the Nucleodur C18 Pyramid brand of L1 column. The typical retention time for carglumic acid is about 3.5 min based on conditions specified. The liquid chromatographic procedure in the test for *Limit of d-Carglumic Acid* is based on analysis performed using the 5- μ m Astec Chirobiotic TAG brand of L63 column. The typical retention times for carglumic acid and d-carglumic acid are about 3.4 and 7.5 min, respectively.

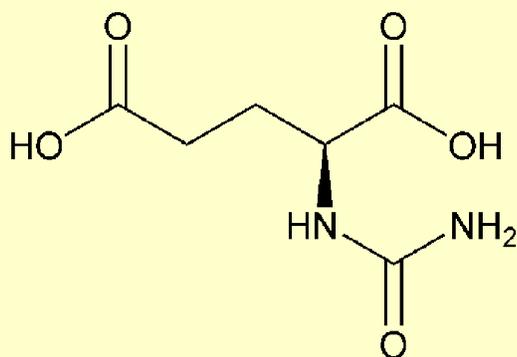

(CHM2: S. Ramakrishna.)

Correspondence Number—C120395

Comment deadline: January 31, 2016

Add the following:

BRIEFING

Cisplatin, USP 38 page 2832. On the basis of comments received, it is proposed to make the following changes:

1. *Identification* test B is revised to include *Infrared Absorption* <197A>.
2. *Identification* test C is deleted because the remaining requirements adequately identify this drug substance.
3. The requirement for *Relative standard deviation* in the *Assay* is changed from NMT 2.0% to NMT 0.73% to be consistent with what is stated in *Chromatography* <621>, *System Suitability*.
4. The time allowed for the use of the *Sample solution* is added in the *Assay* for clarification.
5. The pH adjustment for the *Mobile phase* is added in the test for *Limit of Trichloroamineplatin* for clarification.
6. The use of low-actinic glassware for preparation is replaced with protection from light to give flexibility in the test for *Limit of Trichloroamineplatin*.
7. The relative retention times are revised in the test for *Limit of Trichloroamineplatin* to be consistent with the current USP style.
8. The system suitability requirements for *Column efficiency* is deleted from the test for *Limit of Transplatin* because the remaining criteria are adequate to evaluate the system suitability.
9. The word "derivatized" is added in the test for *Limit of Transplatin* for clarification.
10. The peaks to determine the resolution are added for clarification in the test for *Limit of Transplatin*.
11. The derivatized transplatin peak is added to determine the relative standard deviation for clarification in the test for *Limit of Transplatin*.

12. The test for *Platinum Content* is revised to avoid the use of the toxic reagent hydrazine hydrate.
13. The storage temperature is added to the *Packaging and Storage* section.

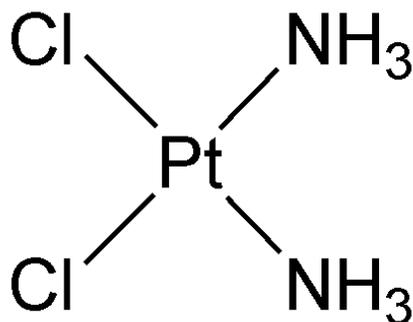

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

● **UV Purity Ratio**

Cleanse all glassware with a mixture of *hydrochloric acid* and *nitric acid* (3:1), rinse thoroughly with *water*, and dry before use. Do not use dichromate for cleaning. Do not use *acetone* or pressurized air for drying. Protect the *Sample solution* from light, and use within 1 h of preparation.

Sample: 98.5 ± 0.5 mg of ground Cisplatin

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: Maxima near 301 nm and minima near 246 nm

Cell: 2 cm

Blank: 0.1 N *hydrochloric acid*

Analysis

Transfer the *Sample* to a 100-mL volumetric flask, and add 0.1 N *hydrochloric acid* to volume. Using a clean magnetic stir bar, alternately stir at a high speed for 5 min and sonicate for 10 s until complete solution is effected, inverting the flask frequently to remove particles that may cling to the neck. Obtain the absorption spectrum. Calculate the absorbance ratio as follows:

$$\text{Result} = A_{301}/A_{246}$$

A_{301} = absorbance at near 301 nm

A_{246} = absorbance at near 246 nm

Acceptance criteria: NLT 4.5

SPECIFIC TESTS

Change to read:

● **Platinum Content**

~~[Note—Thoroughly cleanse all glassware with nitric acid, and rinse with Purified Water, to prevent “mirroring” of the platinum precipitate.]~~

~~**Analysis:** Transfer 0.5 g of Cisplatin to a 600-mL beaker. Add 300 mL of 0.1 N hydrochloric acid, and slowly dissolve by heating nearly to boiling on a hot plate covered with an insulating pad, and stirring frequently with a glass stirring rod. When solution is complete, remove the insulating pad, and boil for about 10 min. Remove the beaker from~~

the hot plate, allow to cool for 1 min without stirring, and pass through quantitative, fine porosity, smooth, dense, ashless filter paper, collecting the filtrate in a 600-mL beaker, completing the transfer to the filter with hot water. Wash the filter with hot water. Place the beaker containing the combined filtrate and washings on a hot plate, and evaporate to a volume of 300 mL. Place a glass stirring rod in the beaker, and heat the solution to boiling. Slowly add to the center of the beaker, by dropwise additions, 10.0 mL of hydrazine hydrate, 85%. [**Caution**—Hydrazine is toxic.] Add 2 drops of 10-N sodium hydroxide, boil for 10 min to coagulate the precipitate for ease of filtration, cool, and pass through quantitative, medium porosity, smooth, ashless filter paper. Rinse the beaker with hot water, and pour the rinsings onto the filter. Wipe the beaker and the stirring rod with small pieces of the same kind of paper used for this filtration, and place these and the filter containing the precipitate in a No. 1 porcelain crucible, previously ignited to constant weight. Dry on a hot plate covered with an insulating pad, slowly increase the heat to char, and ignite for 1 h at 800°. Cool in a desiccator, and again weigh.

Acceptance criteria: The weight of the platinum so obtained is between 64.42% and 65.22% of the weight of Cisplatin taken, on the anhydrous basis.

▲ **Sample:** 0.5 g of Cisplatin

Analysis: Ignite the *Sample* to constant weight at $800 \pm 50^\circ$, and weigh the residue. The residue is platinum.

Calculate the platinum content in the portion of Cisplatin taken:

$$\text{Result} = (W_U/W_S) \times 100$$

W_U = weight of platinum

W_S = weight of the *Sample*

Acceptance criteria: 64.42%–65.22% on the anhydrous basis ▲*USP40*

Cisplatin for Injection

DEFINITION

Cisplatin for Injection is a sterile, lyophilized mixture of Cisplatin, Mannitol, and Sodium Chloride. It contains NLT 90.0% and NMT 110.0% of the labeled amount of cisplatin ($\text{Cl}_2\text{H}_6\text{N}_2\text{Pt}$).

[**Caution**—Cisplatin is potentially cytotoxic. Great care should be taken in handling the powder and preparing solutions.]

IDENTIFICATION

• **A. Thin-Layer Chromatography**

Solution A: 5.6 g of *stannous chloride* in 10 mL of *hydrochloric acid*. Stir for 5 min. [Note —It is not necessary that all of the solids dissolve.]

Solution B: 0.2 g of *potassium iodide* in 90 mL of *water*

Standard solution: 1.0 mg/mL of USP Cisplatin RS, 9 mg/mL of *sodium chloride*, and 10 mg/mL of d-mannitol in *water*

Sample solution: Nominally equivalent to 1.0 mg/mL of cisplatin by dissolving the contents of 1 container of Cisplatin for Injection in *water*, based on the label claim

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 5 μ L

Developing solvent system: *Acetone* and 1 N *nitric acid* (9:1)

Spray reagent A: Mix *Solution A* and *Solution B* together. Disregard any precipitate that is formed. Store in the dark. [Note—The solution is usable for at least 1 week.]

Spray reagent B: 20 mg/mL of *potassium iodide* in water

Analysis

Samples: *Standard solution* and *Sample solution*

Develop with *Developing solvent system*, in a suitable chromatographic chamber containing a filter paper lining and equilibrated for 30 min with the *Developing solvent system*, for a distance of about 8 cm from the origin, followed by air drying. Complete the drying by heating in a forced-air oven at about 100° for 1 min. Spray with *Spray reagent A*, heat in an oven at about 100° for 5 min, cool, and spray with *Spray reagent B* to bring out the full color of the spots.

Acceptance criteria: The principal spot from the *Sample solution* corresponds in appearance and R_F value to that produced by the *Standard solution*.

Add the following:

- ▲ ● **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲USP40

• Limit of Transplatin

Mobile phase: 0.18 M *monobasic potassium phosphate* in water. Adjust with *phosphoric acid* to a pH of 3.2.

Standard stock solution A: 0.05 mg/mL of USP Transplatin RS in *saline TS*. Dissolve by stirring by mechanical means for 30 min.

Standard stock solution B: Transfer 5 mL of *Standard stock solution A* to a 25-mL volumetric flask containing 12 mg of USP Cisplatin RS. Dilute with *saline TS* to volume, and stir by mechanical means for 30 min to dissolve.

System suitability stock solution: 0.05 mg/mL of USP Cisplatin RS in *saline TS*. Dissolve by stirring by mechanical means for 30 min.

System suitability solution: Transfer 10 mL each of *System suitability stock solution* and *Standard stock solution A* to a 50-mL volumetric flask. Add 5.0 mL of a solution (5 mg/mL) of *thiourea* (prepared fresh daily) and 5.0 mL of 1 N *hydrochloric acid*, and dilute with *saline TS* to volume. Place 10 mL of this solution in a suitable serum vial, seal with a polytef-lined closure, and heat in a heating block at $60 \pm 0.5^\circ$ for 60 min. Remove, and

cool to room temperature.

Standard solution: Transfer 10 mL of *Standard stock solution B* to a 50-mL volumetric flask. Add 5.0 mL of a solution (5 mg/mL) of *thiourea* (prepared fresh daily) and 5.0 mL of *1 N hydrochloric acid*, and dilute with *saline TS* to volume. Place 10 mL of this solution in a suitable serum vial, seal with a polytef-lined closure, and heat in a heating block at $60 \pm 0.5^\circ$ for 60 min. Remove, and cool to room temperature.

Sample stock solution: Nominally equivalent to 0.5 mg/mL of cisplatin by dissolving the contents of 1 container of Cisplatin for Injection with *water*.

Sample solution: Transfer 10 mL of *Sample stock solution* to a 50-mL volumetric flask. Add 5.0 mL of a solution (5 mg/mL) of *thiourea* (prepared fresh daily) and 5.0 mL of *1 N hydrochloric acid*, and dilute with *saline TS* to volume. Place 10 mL of this solution in a suitable serum vial, seal with a polytef-lined closure, and heat in a heating block at $60 \pm 0.5^\circ$ for 60 min. Remove, and cool to room temperature.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; packing *L9*

Column temperature: 45°

Flow rate: 2.0 mL/min

Injection volume: 20 μ L

[Note—Condition the *Column* by pumping the *Mobile phase* at a flow rate of 2.0 mL/min for 30 min, then at 0.5 mL/min for 30 min, and then again at 2.0 mL/min for 30 min.]

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The retention time for derivatized transplatin is between 5.0 and 9.0 min; or, if it is not, modify the *Mobile phase* as necessary, and recondition the *Column*. The relative retention times for

▲ derivatized ▲*USP40*

cisplatin and

▲ derivatized ▲*USP40*

transplatin are about 1.0 and 1.3, respectively.]

Suitability requirements

~~**Column efficiency:** NLT 2500 theoretical plates, *Standard solution*~~

▲ ▲*USP40*

Resolution: NLT 1.7

▲ between the derivatized cisplatin and derivatized transplatin peaks, ▲*USP40*
System suitability solution

Relative standard deviation: NMT 4.0%

▲ for the derivatized transplatin peak, ▲*USP40*
Standard solution

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of transplatin in the portion of Cisplatin for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of
 ▲ derivatized ▲ USP40
 transplatin from the *Sample solution*

r_S = peak area of
 ▲ derivatized ▲ USP40
 transplatin from the *Standard solution*

C_S = concentration of USP Transplatin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of cisplatin in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 2.0%

SPECIFIC TESTS

- **pH** <791>:

Sample: Constituted as directed in the labeling, using Sterile Water for Injection

Acceptance criteria: 3.5–6.2

- **Bacterial Endotoxins Test** <85>: It contains NMT 2.0 USP Endotoxin Units/mg of cisplatin.
- **Sterility Tests** <71>, *Test for Sterility of the Product to be Examined, Membrane Filtration*: Meets the requirements
- **Water Determination** <921>, *Method I*

Sample: One container of Cisplatin for Injection

Analysis: Use *anhydrous formamide* as the extraction solvent, and use the following procedure. Introduce 50 mL of *anhydrous formamide* into the titration vessel, and titrate with the *Reagent* to the electrometric endpoint. Use the formamide thus dried to rinse a suitable glass syringe equipped with a 22-gauge needle, about 8 cm long. Add the rinse back to the titration vessel, and again titrate the vessel contents, if necessary. Via the syringe, withdraw 5 mL of the formamide thus titrated, and, through the closure of the container, expel the contents into the container. Shake the container to obtain a solution. With the same syringe, withdraw all of the contents of the container, and transfer to the titration vessel. Titrate to the endpoint, adjusting the feeding speed control to the lowest setting, to avoid over-titration.

Acceptance criteria: NMT 2.0%

- **Constituted Solutions:** At the time of use, it meets the requirements for *Injections* <1>, *Constituted Solutions*.
- **Other Requirements:** It meets the requirements for *Injections* <1>, *Labels and Labeling*.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in *Containers for Sterile Solids* as described in *Injections* <1>. Protect from light.

- **USP Reference Standards** <11>

BRIEFING

Desogestrel. Because there is no existing *USP* monograph for this drug substance, a new monograph based on the *European Pharmacopoeia* is being proposed. The liquid chromatographic procedures in the *Assay* and in the *Organic Impurities* tests are based on analyses performed with the Zorbax SB-C18 brand of *L1* column. The typical retention times for desogestrel in the *Assay* and the *Organic Impurities* tests are about 26 min. The Phenomenex Luna C18(2) brand of *L1* column may also be suitable.

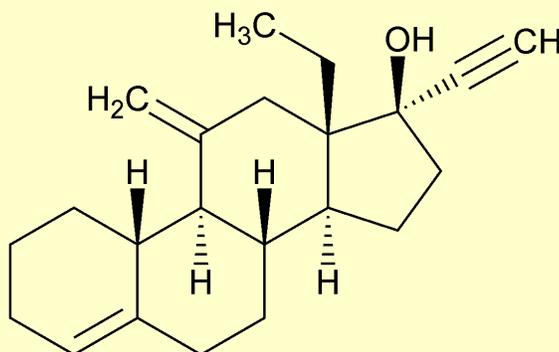

(CHM5: R.-H. Yeh, D. Vicchio.)

BRIEFING

Fenbendazole, USP 38 page 3453. The following revisions are proposed:

1. *Identification* test A is revised to provide multiple analysis options to allow flexibility to the user.
2. Comments were received indicating that the *Organic Impurities* calculation uses an incorrect factor that could potentially lead to under-reporting of impurities. The proposed calculation format eliminates the use of the factor. In addition, *Table 2* is added to list the relative retention times and acceptance criteria.

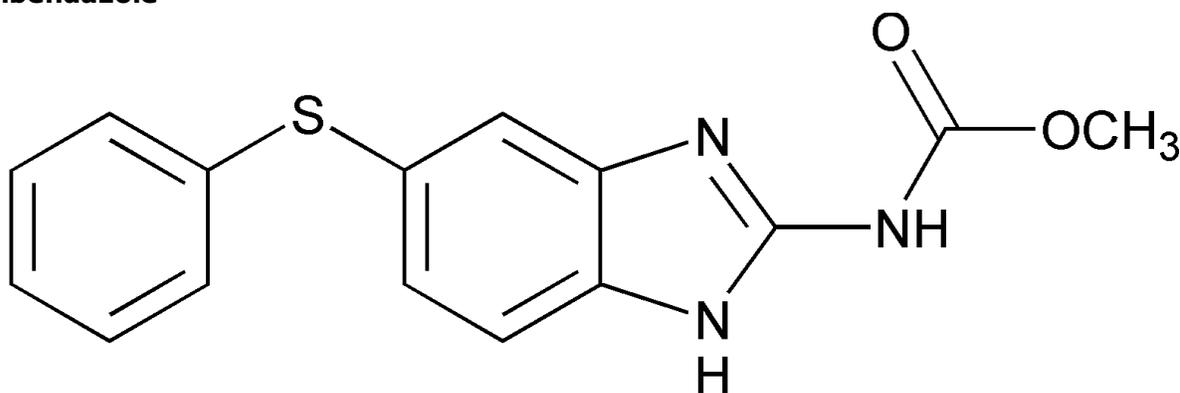

Additionally, minor editorial changes have been made to update the monograph to current USP style.

Fluticasone Propionate Nasal Spray, USP 38 page 3590. As part of the USP monograph modernization initiative, it is proposed to make the following changes.

1. Replace the titration procedure for the *Content of Benzalkonium Chloride* test, which uses chloroform, with an HPLC method using the Kinetex C18 brand of L1 column manufactured by Phenomenex, in which the C₁₂, C₁₄, and C₁₆ homologs of benzalkonium elute at about 1.5, 2.0, and 2.4 min, respectively.
2. Remove the stringent constraints for pH adjustment for buffer preparation in both the *Assay* and *Organic Impurities* procedures.
3. Replace the USP Fluticasone Propionate Nasal Spray Resolution Mixture RS used in the *Assay* and *Delivered Dose Uniformity* tests with the individual components, USP Fluticasone Propionate RS and USP Fluticasone Propionate Related Compound D RS.

4. Replace the USP Fluticasone Propionate Related Compounds Mixture RS used in the *Organic Impurities* test with two of the three individual components, USP Fluticasone Propionate RS and USP Fluticasone Propionate Related Compound D RS.
5. Remove the *Foreign Particulates* test from the monograph as it is non-value added for a public standard and can remain a part of the private standard.
6. Remove the *Droplet Size Distribution* test from the monograph as it does not have a requirement. This is dependent on the spray valve, making it a manufacturer specific parameter. Thus, it is not appropriate to include in the public standard.
7. Remove the *Spray Pattern* test from the monograph as it does not have a requirement. This is dependent on the spray valve, making it a manufacturer specific parameter. Thus, it is not appropriate to include in the public standard.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Fluticasone Propionate Nasal Spray

DEFINITION

Fluticasone Propionate Nasal Spray is a white, opaque suspension of Fluticasone Propionate in water. It is supplied in a form suitable for nasal administration. It contains NLT 95.0% and NMT 115.0% of the labeled amount of fluticasone propionate ($C_{25}H_{31}F_3O_5S$).

IDENTIFICATION

- **A. Infrared Absorption** (197M)

Sample: Transfer 30 g of Nasal Spray equally into two 50-mL centrifuge tubes. Add 10 mL of water to each tube, insert the stopper, and shake vigorously for 2 min. Centrifuge at 3500 rpm for 10 min, and discard the supernatant. Add 10 mL of water to each tube, insert the stopper, and shake vigorously for 2 min. Centrifuge at 3500 rpm for 10 min, and discard the supernatant. Add 10 mL of water to each tube, insert the stopper, and shake vigorously for 2 min. Centrifuge at 3500 rpm for 10 min, and discard the supernatant. To one tube add 10 mL of methanol. Shake to disperse the residue, and transfer to the other tube. Shake the other tube for 1 min. Centrifuge at 3500 rpm for 10 min. Decant the supernatant into an agate mortar. Evaporate the methanol either by carefully blowing dry with compressed air or nitrogen, or by allowing the methanol to evaporate naturally. If using an air or nitrogen line, use a suitable in-line filter to avoid contamination. Allow the residue to dry overnight in a desiccator over silica gel.

Acceptance criteria: Meets the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

Change to read:● **Procedure**

Diluent: *Acetonitrile* and 0.001 M hydrochloric acid (60:40)

Samples: *System suitability solution* and *Standard solution*

Record the chromatogram at 210 nm for 5 min and then change the wavelength to 239 nm.

[Note—The relative retention times for phenylethyl alcohol, fluticasone propionate, and fluticasone propionate related compound D are about 0.42, 1.0, and 1.10, respectively.]

Suitability requirements

Resolution: NLT 1.5 between fluticasone propionate and fluticasone propionate related compound D, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of fluticasone propionate (C₂₅H₃₁F₃O₅S) in the portion of Nasal Spray taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Fluticasone Propionate RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of fluticasone propionate in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 95.0%–115.0%

OTHER COMPONENTS

• Content of Phenylethyl Alcohol

Diluent, Mobile phase, System suitability solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Standard solution: 0.05 mg/mL of USP Phenylethyl Alcohol RS in *Diluent*

Sample solution: Transfer 1.0 g of the Nasal Spray to a 50-mL volumetric flask. Add about 40 mL of *Diluent*, and sonicate for 10 min until supernatant is clear. Use the clear supernatant for analysis.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the quantity, in mg/g, of phenylethyl alcohol in the portion of Nasal Spray taken:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/W)$$

r_U = peak response of phenylethyl alcohol from the *Sample solution*

r_S = peak response of phenylethyl alcohol from the *Standard solution*

C_S = concentration of USP Phenylethyl Alcohol RS in the *Standard solution* (mg/mL)

V = volume of the *Sample solution*, 50 mL

W = weight of the Nasal Spray in the *Sample solution* (g)

Acceptance criteria

For 50 sprays: 1.75–2.63 mg/g

For 120 sprays: 1.88–2.63 mg/g

Change to read:

• Content of Benzalkonium Chloride

~~**Buffer:** 250 mg/mL of *citric acid*. Adjust the solution with 2-N *sodium hydroxide TS* to a pH of 3.5 ± 0.05 .~~

~~**Standard solution:** 200 $\mu\text{g/mL}$ [0.02% (w/w)] of USP Benzalkonium Chloride RS in water~~

~~**Docosate sodium titrant:** Dissolve 0.22 g of USP Docosate Sodium RS in 100 mL of warm water. Dilute with water to make 1000 mL.~~

~~**Eosin Y indicator:** Dissolve 25 mg of eosin Y in 50 mL of acetone. Add 450 mL of chloroform and 5.0 ± 0.5 g of citric acid. Shake thoroughly until no discoloration occurs. Filter the mixture to remove any undissolved citric acid. Store in an amber bottle.~~

Titer value of docusate sodium: Pipet 10 mL of the *Standard solution* into a 250 mL glass stoppered flask containing 40 mL of water, 5 mL of *Eosin Y indicator*, and 2 mL of *Buffer*. Insert the stopper into the flask, and shake, releasing any build-up of pressure. Titrate with *Docusate sodium titrant* with vigorous shaking to a point when pink coloration is discharged from the chloroform layer. Perform a blank determination, substituting 10 mL of water for the *Standard solution*, and make any necessary correction (see *Titrimetry* (541)).

Calculate the titer value (T) of the *Docusate sodium titrant*, in $\mu\text{g/mL}$, of benzalkonium chloride:

$$\text{Result} = C_S \times (V_S/V_D)$$

C_S = concentration of USP Benzalkonium Chloride RS in the *Standard solution* ($\mu\text{g/mL}$)

V_S = volume of the *Standard solution*, 10 mL

V_D = volume of the *Docusate sodium titrant* used in the titration of the *Standard solution* (mL)

Analysis-

Sample: 10 g of Nasal Spray

Transfer the *Sample* into a 250 mL glass stoppered flask containing 40 mL of water, 5 mL of *Eosin Y indicator*, and 2 mL of *Buffer*. Repeat the procedure as given above for the *Standard solution*. To clarify the endpoint, place the flask in an ultrasonic bath for 1–2 min to separate the chloroform layer from the aqueous phase. Perform a blank determination.

Calculate the concentration of benzalkonium chloride, in $\mu\text{g/g}$, in the portion of Nasal Spray taken:

$$\text{Result} = TV/W$$

T = titer value of the *Docusate sodium titrant*

V = volume of the *Docusate sodium titrant* used in the titration of the Nasal Spray (mL)

W = weight of the portion of Nasal Spray taken (g)

▲ Buffer: Dissolve 10.8 g of *monobasic sodium phosphate dihydrate* in 90 mL of water, and adjust with *phosphoric acid* to a pH of 2.5. Dilute with water to 100 mL.

Solution A: Mix 50 mL of *Buffer*, 750 mL of water, and 200 mL of *methanol*. Add 5 mL of *triethylamine*. Mix and adjust with *phosphoric acid* to a pH of 2.5.

Solution B: Mix 1 L of *methanol* with 50 mL of *phosphoric acid*.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	55	45
3.0	5	95
3.2	55	45
5.0	55	45

Diluent: 1% Hydrochloric acid (v/v) in methanol

System suitability solution: 0.04 mg/mL of USP Benzalkonium Chloride RS prepared as follows. Transfer the required quantity of USP Benzalkonium Chloride RS to a suitable volumetric flask, and add 30% of the flask volume of water. Dilute with *Diluent* to volume.

Standard stock solution: 200 µg/mL of USP Benzalkonium Bromide RS in water. [Note—A few drops of methanol may be used to resolve the formation of foam prior to dilution.]

Standard solution: 20 µg/mL of USP Benzalkonium Bromide RS. Transfer an aliquot of *Standard stock solution* to a suitable volumetric flask, and add water equal to 30% of the flask volume. Dilute with *Diluent* to volume.

Sample solution: Transfer 1.0 g of the Nasal Spray to a 10-mL volumetric flask. Dilute with *Diluent* to volume. Centrifuge if necessary and use the supernatant.

[Note—Centrifuging at 4000 rpm for 15 min may be suitable. Supernatant may be passed through a suitable filter with a pore size of NMT 0.2 µm.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 3.0-cm; 2.6-µm packing *L1*

Column temperature: 50°

Flow rate: 2 mL/min

Injection volume: 100 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—See *Table 2* for relative retention times. C₁₀ homolog may not be present.]

Suitability requirements

Resolution: NLT 2.5 between the pairs of C₁₂ and C₁₄ homologs and the C₁₄ and C₁₆ homologs of benzalkonium, *System suitability solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 2%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the sum of the corrected benzalkonium peak responses (r_{CU}) in the portion of the *Sample solution* taken:

$$\text{Result} = \sum [r_U \times (1/F)]$$

r_U = peak response of each C_{10} , C_{12} , C_{14} , and C_{16} benzalkonium homolog from the *Sample solution*

F = relative response factor of the corresponding benzalkonium homolog relative to benzalkonium bromide (see *Table 2*)

Table 2

Benzalkonium Chloride Analog	Relative Retention Time	Relative Response Factor
C_{10}	0.65	1.2
C_{12}	1.0	1.1
C_{14}	1.35	1.0
C_{16}	1.59	0.98

Calculate the percentage of benzalkonium chloride in the portion of Nasal Spray taken:

$$\text{Result} = (r_{CU}/r_S) \times C_S \times (V/W) \times 100$$

r_{CU} = sum of the corrected peak responses of the benzalkonium homologs from the *Sample solution*

r_S = peak response of benzalkonium from the *Standard solution*

C_S = concentration of USP Benzalkonium Bromide RS in the *Standard solution* ($\mu\text{g/mL}$)

V = volume of the *Sample solution* (mL)

W = weight of Nasal Spray in the *Sample solution* (g)

▲USP40

Acceptance criteria: 140–220 $\mu\text{g/g}$

PERFORMANCE TESTS

Change to read:

- **Delivered Dose Uniformity** (within container)

Diluent: *Acetonitrile* and 0.001 M hydrochloric acid (60:40)

Buffer: 1.2 g/L of *monobasic ammonium phosphate*. Adjust with *phosphoric acid* to a pH of 3.5 ± 0.05 .

Mobile phase: *Methanol*, *acetonitrile*, and *Buffer* (50:15:35)

System suitability solution: 5 $\mu\text{g/mL}$ of USP Fluticasone Propionate Nasal Spray Resolution Mixture RS

▲USP Fluticasone Propionate RS and 0.5 $\mu\text{g/mL}$ of USP Fluticasone Propionate Related Compound D RS ▲USP40 in *Diluent*

Standard solution: 4 $\mu\text{g/mL}$ of USP Fluticasone Propionate RS in *Diluent*

Sample solution: Wipe the pump clean. Shake the bottle for 30 s, and mechanically prime the bottle. Hold a 25-mL volumetric flask in an inverted position, and discharge the first two actuations (1 dose) into the flask. Turn the flask to the upright position immediately after each actuation. Insert the stopper into the flask after collecting two actuations. Discharge actuations 3–48 (50-spray pack) or 3–118 (120-spray pack) to waste. Wipe the

bottle clean, and collect the last two actuations (49 and 50 or 119 and 120) in a second 25-mL volumetric flask. Turn the flask to the upright position immediately after each actuation, and insert the stopper into the flask. Add 20 mL of *Diluent* to each flask, and shake well for 10 min to disperse the suspension. Dilute with *Diluent* to volume, and mix thoroughly. Allow the flask to stand until the excipients have settled. Inject the clear supernatant. Repeat this procedure with 4 additional bottles.

SPECIFIC TESTS

- **Microbial Enumeration Tests** (61) and **Tests for Specified Microorganisms** (62): Meets the requirements of the tests for absence of *Staphylococcus aureus*, *Escherichia coli*, *Salmonella* species, and *Pseudomonas aeruginosa*. The total aerobic microbial count does not exceed 25 cfu/mL, and the total combined molds and yeasts count does not exceed 25 cfu/mL.
- **pH** (791): 5.0–7.0
- **Particle Size**

Analysis: Remove the pump system after shaking the test bottle to ensure product uniformity. Transfer 1 drop of the Nasal Spray onto a clean microscope slide. Examine 10 random fields of view on the slide using 400 \times magnification. Drug substance particles are irregular in shape, whereas the excipient particles are elongated and angular. Record the number of individual drug substance particles that are less than 5 μ m in diameter, greater than 5 μ m but less than 15 μ m in diameter, and greater than 15 μ m in diameter. Calculate

the percentage of each category by number.

Acceptance criteria: See Table 4.

Table 4

Particle Size (μm)	Acceptance Criteria (%)
<5	NLT 98
>5 to <15	NMT 1.8
>15	NMT 0.2

Delete the following:

▲ ● Foreign Particulates

Analysis: Shake the required number of bottles to ensure uniformity. Remove the pump system carefully to minimize contamination of the sample. Collect about 100 g of Nasal Spray, and pass it through a wetted 250 μm screen. Rinse each bottle with a portion of water equal to twice the volume of each bottle. Pass the rinse through the 250 μm screen. Visually observe the screen and filtrate for any foreign particulates. Also examine the screen under a microscope using transmitted light.

Acceptance criteria: No foreign particulates greater than 250 μm are visible. ▲USP40

Delete the following:

▲ ● Droplet Size Distribution: Determine using a validated laser diffraction technique and method that measures the volume diameters of droplets. In preparation shake the bottle to ensure product uniformity. Prime the pump by discharging a predetermined (refer to the product label) number of actuations to waste, at which time a fine mist should appear. Measure and record the average of three sprays per bottle, and report the mean diameter defining the population of particles, by volume, below 10% (D_{10}), 50% (D_{50}), and 90% (D_{90}) of five bottles. ▲USP40

Delete the following:

▲ ● Spray Pattern: Determine the spray pattern using a validated method that measures the size of the pattern. Gently shake the bottle to ensure product uniformity. Prime the pump by discharging a predetermined number (refer to the product label) of actuations to waste, at which time a fine mist should appear. Measure and record the average of two sprays per bottle and report the longest axis (x axis), and the ratio of longest to shortest axes (x/y ratio) of two bottles. ▲USP40

▲▲USP40

USP Phenylethyl Alcohol RS **BRIEFING**

Hard Gelatin Capsule Shell, PF 41(1) [Jan.-Feb. 2015]. On the basis of comments received, it is proposed to cancel the proposal published in PF 41(1) and replace it with the following proposal. Comments and suggestions should be sent to Margareth Marques, Ph.D., at mrm@usp.org not later than Jan. 31, 2016.

(GCDF: M. Marques.)

Correspondence Number—C161795

Comment deadline: January 31, 2016**Add the following:**▲ **Hard Gelatin Capsule Shell****DEFINITION**

Hard Gelatin Capsule Shell consists of two overlapping pieces (cap and body). One end of each piece is rounded and closed while the other is open. The cap overlaps the body and maintains a tight closure. Hard Gelatin Capsule Shell is composed of NF *Gelatin* and water, and may also contain additives such as plasticizers, surfactants, dispersing agents, flavoring agents, antimicrobial agents, and sweeteners. It may contain opacifiers, colorants, and/or processing aids. It may be externally coated and imprinted.

IDENTIFICATION

- **A.**

Sample solution: Dissolve an amount of Hard Gelatin Capsule Shell equivalent to 1 g in 100 mL of *carbon dioxide-free water* at about 55°. Let the solution stand for a period of time to allow any suspended solids to settle to the bottom of the vessel.

Analysis: To 2 mL of the supernatant of the *Sample solution*, add 0.05 mL of a 125-g/L solution of copper sulfate pentahydrate. Mix, and add 0.5 mL of an 85-g/L solution of *sodium hydroxide*.

Acceptance criteria: A violet color is produced.

- **B.**

Sample: A quantity of Capsule Shells equivalent to 0.5 g

Analysis: Place the *Sample* in a test tube of about 15 mm internal diameter and add 10 mL of *water*. Allow to stand for 10 min and then heat to 60° for 15 min. Keep the tube upright and store at 0° for 6 h. Invert the tube.

Acceptance criteria: The content of the tube does not flow out immediately.

SPECIFIC TESTS

- **Loss on Drying** (731)

Sample: 1.5 ± 0.5 g

Analysis: Dry the *Sample* in an oven at 105 ± 2° to constant weight.

Acceptance criteria: 11.0%–16.0%

- **Disintegration** (701)

Medium: *Water*

Analysis: Fill each Hard Gelatin Capsule Shell body to capacity with lactose or other suitable material. Place the cap onto the body and press the cap and body together to lock. Place the Hard Gelatin Capsule Shell in the basket and add disks.

For capsules larger than 18 mm: Use the apparatus described in *Disintegration and Dissolution* (2040).

Acceptance criteria: 15 min

- **Microbial Enumeration Tests** (61) and **Tests for Specified Microorganisms** (62): The total bacteria count does not exceed 10³ cfu/g, and the total yeast and molds count does not exceed 10² cfu/g.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Store in tightly closed containers at 15°–25° and at a relative humidity of 35%–65%, unless moisture impermeable containers are used. Protect from the light. ▲USP40

BRIEFING

Heparin Sodium, USP 38 page 3748. In preparation for the omission of the flame tests from *Identification Tests—General* (191), proposed in PF 41(2), it is proposed to delete the reference to (191) under *Identification* test E and include a description of the flame test and requirement in the monograph. Manufacturers are encouraged to submit a replacement wet-chemistry test

or an instrumental procedure for Expert Committee consideration.

Corrections have also been made to the column description under *Molecular Weight Determinations* to make it consistent with the information in the corresponding footnote, and the benzonase concentration was corrected in another footnote to reflect the information in the method validation document.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(BIO3: A. Szajek.)

Heparin Sodium

DEFINITION

Heparin Sodium is the sodium salt of sulfated glycosaminoglycans present as a mixture of heterogeneous molecules varying in molecular weights that retains a combination of activities against different factors of the blood clotting cascade. It is present in mammalian tissues and is usually obtained from the intestinal mucosa or other suitable tissues of domestic mammals used for food by humans. The sourcing of heparin material must be specified in compliance with applicable regulatory requirements. The manufacturing process should be validated to demonstrate clearance and inactivation of relevant infectious and adventitious agents (e.g., viruses, TSE agents). See *Viral Safety Evaluation of Biotechnology Products Derived from Cell Lines of Human or Animal Origin* (1050) for general guidance on viral safety evaluation. The heparin manufacturing process should also be validated to demonstrate clearance of lipids. It is composed of polymers of alternating derivatives of α -D-glucosamido (*N*-sulfated, *O*-sulfated, or *N*-acetylated) and *O*-sulfated uronic acid (α -L-iduronic acid or β -D-glucuronic acid). The component activities of the mixture are in ratios corresponding to those shown by USP Heparin Sodium for Assays RS. Some of these components have the property of prolonging the clotting time of blood. This occurs mainly through the formation of a complex of each component with the plasma proteins antithrombin and heparin cofactor II to potentiate the inactivation of thrombin (factor IIa). Other coagulation proteases in the clotting sequence, such as activated factor X (factor Xa), are also inhibited. The ratio of anti-factor Xa activity to anti-factor IIa potency is between 0.9 and 1.1. The potency of Heparin Sodium, calculated on the dried basis, is NLT 180 USP Heparin Units in each mg.

IDENTIFICATION

● A. ^1H NMR spectrum

(See *Nuclear Magnetic Resonance* (761).)

Standard solution: NLT 20 mg/mL of USP Heparin Sodium Identification RS in deuterium oxide with 0.002% (w/v) deuterated trimethylsilylpropionic (TSP) acid sodium salt

System suitability solution: Prepare 0.3% (w/w) USP Oversulfated Chondroitin Sulfate RS in the *Standard solution*.

Sample solution: NLT 20 mg/mL of Heparin Sodium in deuterium oxide with 0.002% (w/v)

deuterated TSP. [Note—EDTA may be added to the *Sample solution* to NMT 12 µg/mL. In the event that EDTA is added to the *Sample solution*, spectra should be recorded and compared both with and without addition of EDTA.]

Instrumental conditions

(See *Nuclear Magnetic Resonance* (761).)

Mode: NMR, pulsed (Fourier transform)

Frequency: NLT 500 MHz (for ^1H)

Temperature: 20°–30°

System suitability

Samples: *Standard solution* and *System suitability solution*

Using a pulsed (Fourier transform) NMR spectrometer operating at NLT 500 MHz for ^1H , acquire a free induction decay (FID) using NLT 16 scans using a 90° pulse, an acquisition time of NLT 2 s, and at least a 10-s delay. Record the ^1H NMR spectra of the *Standard solution* and the *System suitability solution* at a stable temperature between 20°–30°.

Collect the ^1H NMR spectrum with a spectral window of at least 10 to –2 ppm and without spinning. The number of transients should be adjusted until the signal-to-noise ratio of the *N*-acetyl heparin signal in the *Standard solution* is at least 1000/1 in the region near 2 ppm. The *Standard solution* shall be run at least daily when *Sample solutions* are being run. For all samples, the TSP methyl signal should be set to 0.00 ppm. The chemical shift for the *N*-acetyl resonance of heparin and oversulfated chondroitin sulfate in the *System suitability solution* should be observed at 2.05 ± 0.02 and 2.16 ± 0.03 ppm, respectively. Record the ^1H NMR spectrum of the *Sample solution* at a stable temperature between 20°–30°. Draw a baseline from 8.00 ppm to 0.10 ppm. The ppm values for H1 of GlcNAc/GlcNS, 6S (signal 1), H1 of IdoA2S (signal 2), the H2 of GlcNS (signal 3), and the methyl of GlcNAc (signal 4) of heparin are present at 5.42, 5.21, 3.28 (doublet centered at 3.28 ppm), and 2.05 ppm, respectively.¹ The chemical shifts of these signals do not differ by more than ± 0.03 ppm. Measure the signal heights above the baseline of signal 1 and signal 2, and calculate the mean of these signal heights. Other signals of variable heights and ppm values, attributable to heparin and HOD, may be seen between signal 2 and 4.55 ppm. Residual solvent signals may be observed in the 0.10–3.75 range. Heparin Sodium must meet the requirements stated in *Residual Solvents* (467).

Suitability requirements

Number of transients: Adjust until the signal-to-noise ratio of the *N*-acetyl heparin signal in the *Standard solution* is at least 1000/1 in the region near 2 ppm.

Chemical shift: The TSP methyl signal should be set to 0.00 ppm for all samples.

Chemical shifts (for the *N*-acetyl resonance of heparin and oversulfated chondroitin sulfate in the *System suitability solution*): Should be observed at 2.05 ± 0.02 and 2.16 ± 0.03 ppm, respectively

Analysis

Sample: *Sample solution*

Acceptance criteria: No unidentified signals greater than 4% of the mean of the height of signals 1 and 2 are present in the following ranges: 0.10–2.00, 2.10–3.20, and 5.70–8.00

ppm. No signals greater than 200% of the mean of the height of signals 1 and 2 are present in the 3.75–4.55 ppm for porcine heparin.

• **B. Chromatographic Identity**

Solution A: Dissolve 0.8 g of monobasic sodium phosphate dihydrate in 2 L of water, and adjust with phosphoric acid to a pH of 3.0. Pass the solution through a membrane filter with a 0.45- μm pore size, and degas before use.

Solution B: Dissolve 0.8 g of monobasic sodium phosphate dihydrate and 280 g of sodium perchlorate monohydrate in 2 L of water, and adjust with phosphoric acid to a pH of 3.0. Pass the solution through a membrane filter with a 0.45- μm pore size, and degas before use.

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	80	20
30	10	90
31	80	20
45	80	20

Standard solution: NLT 20 mg/mL of USP Heparin Sodium Identification RS in water

System suitability solution: Prepare 0.1% (w/w) USP Oversulfated Chondroitin Sulfate RS and 0.5% (w/w) USP Dermatan Sulfate RS in the *Standard solution*.

Sample solution: NLT 20 mg/mL of Heparin Sodium in water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 202 nm

Column: 2-mm \times 25-cm; packing L81²

Guard column: 2-mm \times 5-cm; packing L61

Column temperature: Maintain columns at 40°

Flow rate: 0.22 mL/min

Injection volume: 20 μL

System suitability

Sample: *System suitability solution*

[Note—The retention times for dermatan sulfate, heparin, and oversulfated chondroitin sulfate are about 17, 22, and 30 min, respectively.]

Suitability requirements

Resolution: NLT 1.0 between the dermatan sulfate and heparin peaks, and NLT 1.5 between the heparin and oversulfated chondroitin sulfate peaks

Relative standard deviation: NMT 2% for the heparin peak area determined from three replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Record the chromatograms, and measure the retention times for the major peaks.

Acceptance criteria: The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*.

• **C. Anti-Factor Xa to Anti-Factor IIa Ratio**

Anti-Factor Xa and Anti-Factor IIa Assays for Unfractionated and Low Molecular Weight Heparins (208), *Anti-Factor Xa and Anti-Factor IIa Assays for Unfractionated Heparin*

Acceptance criteria: 0.9–1.1

Change to read:

• **D. Molecular Weight Determinations**

1 M ammonium acetate solution: Accurately weigh 77.1 g of ammonium acetate, and dissolve in 1 L of water.

1% Sodium azide solution: Dissolve 1 g of sodium azide in 100 mL of water.

Mobile phase: Transfer 100 mL of *1 M ammonium acetate solution* to a 1-L volumetric flask, add 20 mL of *1% sodium azide solution*, and dilute with water to volume. Filter using a nylon membrane with a 0.2- μ m pore size prior to use.

Calibration solution: Prepare by dissolving 10 mg of the USP Heparin Sodium Molecular Weight Calibrant RS in 2 mL of *Mobile phase*, and filter using a nylon membrane with a 0.2- μ m pore size.

System suitability solution: 5 mg/mL of USP Heparin Sodium Identification RS in *Mobile phase*. Filter using a nylon membrane with a 0.2- μ m pore size.

Sample solution: Dissolve about 10 mg of Heparin Sodium sample in 2 mL of *Mobile phase*, and filter using a nylon membrane with a 0.2- μ m pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

[Note—The temperature of the refractive index detector must be set at the same temperature as the *Column temperature*.]

Mode: LC

Detector: Refractive index

Columns: One 7.8-mm \times 30-cm, 5

▲ 8▲*USP40*

- μ m packing L59 in series with a 7.8-mm \times 30-cm, 8

▲ 5▲*USP40*

- μ m packing L59³

Guard column: 6-mm \times 4-cm; 7- μ m packing L59

Column temperature: 30°

Flow rate: 0.6 mL/min \pm 0.1%

Column equilibration: 0.6 mL/min for 2 h

Injection volume: 20 μ L

System suitability

Samples: *Calibration solution* and *System suitability solution* (duplicate injections)

Suitability requirements

Weight-average molecular weight (M_w): Take the mean of the calculated M_w from the duplicate injections of the *System suitability solution*, and round to the nearest 100 Da. The chromatographic system is suitable if the M_w of the *System suitability* sample is within 500 Da of the labeled value as stated in the USP Certificate for USP Heparin Sodium Identification RS.

Peak molecular weights (M_p): The peak molecular weights (M_p) of the duplicate injections of the *System suitability solution* do not differ by more than 5% of the upper value.

Resolution: There is baseline resolution between the heparin and salt peaks.

Calibration curve: The linear regression coefficient of the calibration curve fitted to the Broad Standard Table values must be NLT 0.990, using a third-order polynomial equation.

Analysis

Samples: Inject 20 μ L of the *System suitability solution* (duplicate injections), *Sample solution* (duplicate injection), and *Calibration solution* (single injection), and record the chromatograms for a length of time to ensure complete elution, including salt and solvent peaks (about 50 min). [Note—The calibrant, standard, or sample of heparin will give a broad heparin peak between about 20 and 40 min, followed by a later eluting narrow salt peak, as illustrated in the USP Certificate for USP Heparin Sodium Molecular Weight Calibrant RS.]

Calculations: Calculate the total area under the heparin peak in the *Calibration solution* chromatogram, and the cumulative area at each point under the peak as a percent of the total. Do not include the salt peak. Using the Broad Standard Table provided in the USP Certificate for USP Heparin Sodium Molecular Weight Calibrant RS, identify those points in the chromatogram for which the percent cumulative area is closest to the percent fractions listed in the Table, and assign the molecular weight (MW) in the Table to the corresponding retention time (RT) in the chromatogram. For the set of retention times and molecular weights identified, fit $\log(MW)$ vs. RT to a third-order polynomial function using suitable gel permeation chromatography (GPC) software [or: find values of a , b , c , and d such that $\log(MW) = a + b(RT) + c(RT)^2 + d(RT)^3$]. Using the same GPC software, for each of the duplicate chromatograms of the *System suitability solution* and the *Sample solution*, with the calibration function derived as described above, calculate M_w according to the following formula:

$$M_w = \Sigma(RI_i M_i) / \Sigma RI_i$$

where the detector response at each point is defined as RI_i and the MW at each point as M_i . Round the mean value of M_w to the nearest 100 Da.

Using the same GPC software, determine for each of the duplicate *Sample solution* chromatograms: the percentage of heparin with molecular weight in the range 8,000–16,000, $M_{8000-16000}$, the percentage of heparin with molecular weight in the range 16,000–24,000, $M_{16000-24000}$, and the percentage of heparin with molecular weight greater than 24,000, M_{24000} . Round the mean percentage values to the nearest 1%.

Acceptance criteria: M_{24000} is NMT 20%, M_w is between 15,000 Da and 19,000 Da, and

the ratio of $M_{8000-16000}$ to $M_{16000-24000}$ is NLT 1.0.

ASSAY

● **Anti-Factor IIa Potency**

Anti-Factor Xa and Anti-Factor IIa Assays for Unfractionated and Low Molecular Weight Heparins (208), Anti-Factor IIa Activity for Unfractionated Heparin

Acceptance criteria: The potency of Heparin Sodium, calculated on the dried basis, is NLT 180 USP Heparin Units in each mg.

OTHER COMPONENTS

- **Nitrogen Determination (461), Method I:** 1.3%–2.5%, calculated on the dried basis, using the procedure for *Nitrates and Nitrites Absent*

IMPURITIES

- **Residue on Ignition (281):** 28.0%–41.0%

Delete the following:

- ~~* ● Heavy Metals (231), Method II: NMT 30 ppm (Official 1-Jan-2018)~~

- **Limit of Galactosamine in Total Hexosamine** (a measure of dermatan sulfate and other galactosamine containing impurities)

Mobile phase: 14 mM potassium hydroxide

Glucosamine standard solution: 1.6 mg/mL of USP Glucosamine Hydrochloride RS in 5 N hydrochloric acid

Galactosamine standard solution: 16 µg/mL of USP Galactosamine Hydrochloride RS in 5 N hydrochloric acid

Standard solution: Mix equal volumes of the *Glucosamine standard solution* and the *Galactosamine standard solution*.

Hydrolyzed standard solution: Transfer 5 mL of the *Standard solution* to a 7-mL screw-cap test tube, cap, and heat for 6 h at 100°. Cool to room temperature, and dilute with water (1 in 100).

Sample solution: Transfer 12 mg of Heparin Sodium to a 7-mL screw-cap test tube, dissolve in 5 mL of 5 N hydrochloric acid, and cap.

Hydrolyzed sample solution: Heat the *Sample solution* for 6 h at 100°. Cool to room temperature, and dilute with water (1 in 100).

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: HPIC

Detector: Pulsed amperometric detector, set to the following waveform. See *Table 2*.

Table 2

Step	Time (s)	Potential (V)	Integration
1	0.00	+0.1	—
2	0.20	+0.1	Begins
3	0.40	+0.1	Ends
4	0.41	-2.0	—
5	0.42	-2.0	—
6	0.43	+0.6	—
7	0.44	-0.1	—
8	0.50	-0.1	—

Column: 3-mm × 3-cm amino acid trap column in series with a 3-mm × 3-cm guard column and a 3-mm × 15-cm column that contains packing L69

Column temperature: 30°

Flow rate: 0.5 mL/min

Pre-equilibration: At least 60 min with *Mobile phase*

Injection volume: 10 µL

Elution: 10 min with *Mobile phase*

Column cleaning: At least 10 min with 100 mM potassium hydroxide

Equilibration: At least 10 min with *Mobile phase* before each injection

System suitability

Sample: *Hydrolyzed standard solution*

Suitability requirements

Resolution: NLT 2 between the galactosamine and glucosamine peaks

Column efficiency: NLT 2000 theoretical plates for glucosamine

Tailing factor: Between 0.8 and 2.0 for the galactosamine and glucosamine peaks

Analysis

Samples: *Hydrolyzed standard solution* and *Hydrolyzed sample solution*

Record the chromatograms, and measure the responses for the peaks at the retention time of galactosamine and glucosamine. Calculate the response ratio of galactosamine to glucosamine ($GalN_R$) in the *Hydrolyzed standard solution*:

$$\text{Result} = (GalN_B / GalN_W) \times (GlcN_W / GlcN_B)$$

$GalN_B$ = peak area of galactosamine from the *Hydrolyzed standard solution*

$GalN_W$ = weight of galactosamine for the *Standard solution*

$GlcN_W$ = weight of glucosamine for the *Standard solution*

$GlcN_B$ = peak area of glucosamine from the *Hydrolyzed standard solution*

Calculate the percentage of galactosamine in the portion of total hexosamine taken:

$$\text{Result} = \{[(GalN_U/GalN_R)]/[(GalN_U/GalN_R) + GlcN_U]\} \times 100$$

$GalN_U$ = peak area of galactosamine from the *Hydrolyzed sample solution*

$GalN_R$ = response ratio of galactosamine

$GlcN_U$ = peak area of glucosamine from the *Hydrolyzed sample solution*

Acceptance criteria: The percent galactosamine peak area of the total hexosamine of the *Hydrolyzed sample solution* must be NMT 1%.

Change to read:

• **Nucleotidic Impurities**

Solution A: Dissolve 3.08 g of ammonium acetate in 2 L of water, and adjust with glacial acetic acid to a pH of 4.4 ± 0.2 . Degas for 2 min under vacuum with sonication before use.

Solution B: 100% acetonitrile. Degas for 1 min under vacuum with sonication before use.

Mobile phase: See *Table 3*.

Table 3

Time (min)	Solution A (%)	Solution B (%)
0	98	2
5.00	98	2
15.00	80	20
20.00	80	20
20.10	98	2
25.00	98	2

Nucleoside identification solution: Accurately weigh and transfer about 25 mg each of uridine, guanosine, cytidine, thymidine, 2'-deoxyadenosine, 2'-deoxyguanosine, 2'-deoxycytidine, and 5-methyl-2'-deoxycytidine into a 200-mL volumetric flask, add approximately 185 mL of water, and dissolve with sonication and vortexing, if necessary. Dilute with water to volume, and mix. Transfer 2.0 mL of this solution into a 100-mL volumetric flask, dilute with water to volume, and mix.

Adenosine stock solution: Accurately weigh and transfer 25 mg of USP Adenosine RS into a 100-mL volumetric flask, add approximately 85 mL of water, and dissolve with sonication and vortexing, if necessary. Dilute with water to volume, and mix.

Standard solution: Transfer 2.0 mL of the *Adenosine stock solution* into a 200-mL volumetric flask, dilute with water, and mix.

System suitability solution: Transfer 2.0 mL of the *Standard solution* into a 100-mL volumetric flask, dilute with water to volume, and mix.

Reaction buffer: Accurately weigh and transfer 0.41 g of magnesium chloride hexahydrate,

0.24 g of tris (hydroxymethyl)amino methane, and 0.58 g of sodium chloride into a 100-mL volumetric flask, dissolve in 75 mL of water, and mix. Adjust with 1 N hydrochloric acid to a pH of 7.9 ± 0.1 . Dilute with water to volume, and mix.

PDE I diluent: Transfer 5.0 mL of glycerol and 5.0 mL of the *Reaction buffer* into a 20-mL flask, and vortex to mix.

PDE I solution: 0.1 Unit/ μL of phosphodiesterase I (PDE I) in *PDE I diluent*. Store at -20° .

Enzyme digest solution: Add 10 μL of Benzonase⁴, 222 Units of alkaline phosphatase (AP), and 125 μL of *PDE I solution* to 5.0 mL of *Reaction buffer*. Store at -20° .

Blank: Transfer 100 μL of water and 100 μL of *Enzyme digest solution* into a 250- μL HPLC vial, and mix with a micropipette. Incubate NLT 60 min in the autosampler at 37° before injection.

Sample solution: Accurately weigh and transfer 400 mg of Heparin Sodium into a 20-mL volumetric flask, dilute with water to volume, and mix. Transfer 100 μL of this solution and 100 μL of *Enzyme digest solution* into a 250- μL HPLC vial, and mix. Incubate NLT 60 min in the autosampler at 37° before injection.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Column: 4.6-mm \times 15-cm; 4- μm packing L1

Detector: UV 260 nm

Autosampler temperature: $37 \pm 1^\circ$

Column temperature: $20 \pm 3^\circ$

Flow rate: 1 mL/min

Injection volume: 10 μL

Run time: 25 min

System suitability

Samples: *Nucleoside identification solution*, *Standard solution*, and *System suitability solution*

Suitability requirements

Resolution: The resolution between the 2'-deoxycytidine peak and the uridine peak is NLT 1.3 for the injection of the *Nucleoside identification solution*.

Relative standard deviation: Inject six replicates of the *Standard solution*, and record the chromatograms. The percent relative standard deviation (%RSD) of the areas of the adenosine peak is NMT 10%.

Signal-to-noise ratio: The *S/N* of the adenosine peak in the *System suitability solution* is NLT 10.

Analysis

Samples: *Water*, *Blank*, *Nucleoside identification solution*, *Standard solution*, *System suitability solution*, and *Sample solution*

Record the chromatograms. Calculate the area reject value, *Q*:

$$Q = (10 \times A_{SSS})/(S/N)$$

A_{SSS} = peak area of adenosine in the *System suitability solution*

S/N = signal-to-noise ratio of the adenosine peak in the *System suitability solution*

For the *Standard solution*, calculate the concentration of adenosine, in mg/mL:

$$C_s = W_s/DF$$

C_s = concentration of adenosine in the *Standard solution* (mg/mL)

W_s = weight of USP Adenosine RS (mg)

DF = 10,000 (dilution factor)

Calculate the percentage of nucleotidic impurities:

$$\text{Result} = \Sigma[(C_s/A_s) \times A_i \times (MW_{ratio}/RRF_i)] \times (DF/W_{sample}) \times 100$$

C_s = concentration of adenosine in the *Standard solution* (mg/mL)

A_s = average peak area ($n = 6$) of adenosine in the *Standard solution*

A_i = peak area of each impurity above Q in the *Sample solution*

MW_{ratio} = see *Table 4*

RRF_i = relative response factor for the corresponding peak (see *Table 4*)

DF = dilution factor, 40

W_{sample} = sample weight of Heparin Sodium (mg)

Table 4

Name	Relative Retention Time	Relative Response Factor	MW_{ratio}
Cytidine	0.28	0.53	1.2548
2'-Deoxycytidine	0.38	0.56	1.2727
Uridine	0.40	0.75	1.2537
5-Methyl-2'-deoxycytidine	0.66	0.25	1.2569
Guanosine	0.81	0.74	1.2188
2'-Deoxyguanosine	0.89	0.83	1.2319
Thymidine	0.92	0.68	1.2558
Adenosine	1.00	1.00	1.2319
2'-Deoxyadenosine	1.04	1.09	1.2466
Others	—	1.00	1.0000

Acceptance criteria: NMT 0.1% (w/w) is found.

- **Absence of Oversulfated Chondroitin Sulfate**

A. Proceed as directed in *Identification* test *A*. No features associated with oversulfated chondroitin sulfate are found between 2.12 and 3.00 ppm.

B. Proceed as directed in *Identification* test *B*. No peaks corresponding to oversulfated chondroitin sulfate should be detected eluting after the heparin peak.

- **Protein Impurities**

[Note—Treatment for interfering substances is only required for samples previously tested with

a protein content greater than 0.1%. *Spiked sample* should be prepared and assayed only if the treatment for interfering substances is performed.]

Standard stock solution: 2.0 mg/mL of bovine serum albumin in water

Standard solutions: Dilute portions of the *Standard stock solution* with water to obtain NLT 5 standard solutions having concentrations between 0.010 and 0.050 mg/mL of bovine serum albumin, the concentrations being evenly spaced.

System suitability standard: Dilute a portion of the *Standard stock solution* with water to obtain a solution containing 0.030 mg/mL of bovine serum albumin.

Sample solution: 30 mg/mL of Heparin Sodium in water. Prepare in triplicate.

Spiked sample: Using an appropriate dilution scheme and the *Standard stock solution*, prepare a *Spiked sample* containing 30 mg/mL Heparin Sodium and 0.030 mg/mL bovine serum albumin in water.

Blank: Water

Lowry reagent A: Prepare a solution of 10 g/L of sodium hydroxide in water and a solution of 50 g/L of sodium carbonate in water. Mix equal volumes (2V:2V) of each solution, and dilute with water to 5V.

Lowry reagent B: Prepare a solution of 29.8 g/L of disodium tartrate dihydrate in water. Prepare a solution of 12.5 g/L of cupric sulfate in water. Mix equal volumes of both solutions (2V:2V), and dilute with water to 5V.

Lowry reagent C: Mix 50 volumes of *Lowry reagent A* with 1 volume of *Lowry reagent B*. Prepare fresh daily.

Diluted Folin–Ciocalteu’s phenol reagent: Dilute Folin–Ciocalteu’s phenol reagent 1–2 times with water. The dilution should be chosen such that the pH of the samples (i.e., *Standard solution* and *Sample solution* after addition of *Lowry reagent C* and the *Diluted Folin–Ciocalteu’s phenol reagent*) is 10.3 ± 0.3 .

Sodium deoxycholate reagent: Prepare a solution of sodium deoxycholate in water having a concentration of 150 mg in 100 mL.

Trichloroacetic acid reagent: Prepare a solution of trichloroacetic acid in water having a concentration of 72 g in 100 mL.

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*

To 1 mL each of *Standard solution*, *Sample solution*, and *Blank*, add 5 mL of *Lowry reagent C*. Mix. Allow to stand at room temperature for 10 min. Add 0.5 mL of *Diluted Folin–Ciocalteu’s phenol reagent* to each solution, mix immediately, and allow to stand at room temperature for NLT 30 min. Determine the absorbance at the wavelength of maximum absorbance at 750 nm with a suitable spectrophotometer, using the solution from the *Blank* to set the instrument to zero and ensuring that all samples and standards absorbances are measured after the same final incubation time. To remove interfering substances, add 0.1 mL of *Sodium deoxycholate reagent* to 1 mL of a solution of the protein under test. Mix on a vortex mixer, and allow to stand at room temperature for 10 min. Add 0.1 mL of *Trichloroacetic acid reagent*, and mix on a vortex mixer. Centrifuge at a speed that ensures removal of visible particulate matter. [Note—NLT 14,100 RCF should be used. Appropriate centrifuge speed should be determined by each laboratory.] The supernatant should be essentially free of visible particulates. A pellet may not be

visible. If the interfering substances method is used, dissolve the protein residue in 1 mL of *Lowry reagent C*.

Calculations

Using the linear regression method, plot the absorbances of the solutions from the *Standard solutions* versus the protein concentrations, and determine the standard curve best fitting the plotted points. From the standard curve so obtained and the absorbance of the *Sample solution*, determine the concentration of protein in the *Sample solution*.

System suitability: The correlation coefficient (r) for a linear fit of all standards is NLT 0.99. The percent RSD between triplicate sample results is NMT 10%. If the sample absorbances are lower than the standard curve, the percent RSD specification is not required. The percent recovery of the *System suitability standard* is 90%–110%. If the interfering substances treatment is performed, the percent recovery of the *Spiked sample* is 85%–115%.

Acceptance criteria: NMT 0.1% (w/w) is found.

SPECIFIC TESTS

- **Bacterial Endotoxins Test** (85): It contains NMT 0.03 USP Endotoxin Unit/USP Heparin Unit.
- **Loss on Drying** (731)
 - Analysis:** Dry a sample in a vacuum at 60° for 3 h.
 - Acceptance criteria:** It loses NMT 5.0% of its weight.
- **pH** (791): 5.0–7.5 in a solution (1 in 100)
- **Sterility Tests** (71): Where it is labeled as sterile, it meets the requirements.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers, and store below 40°, preferably at room temperature.
- **Labeling:** Label it to indicate the tissue and the animal species from which it is derived.
- **USP Reference Standards** (11)
 - USP Adenosine RS
 - USP Oversulfated Chondroitin Sulfate RS
 - USP Dermatan Sulfate RS

units/μL.

BRIEFING

Histidine, *USP 38* page 3760. As part of USP monograph modernization efforts, the following changes are proposed:

1. Replace the titrimetric *Assay* and the TLC *Related Compounds* tests with an HPLC procedure to address the specificity issue and to improve the characterization of the impurities. The liquid chromatographic procedures in the *Assay* and in the test for *Related Compounds* are based on analyses performed with the GL Sciences Inertsil ODS-3V brand of L1 column. The typical retention times for alanine, biotin, histidine, lysine, arginine, and thiamine are 4.4, 9.8, 13.7, 15.8, 16.7, and 21.1 min, respectively.
2. Add *Identification test B* based on the retention time comparison of the main peaks obtained from the *Assay*.
3. Revise the *USP Reference Standards* section to include the new Reference Standards used in the revised tests.

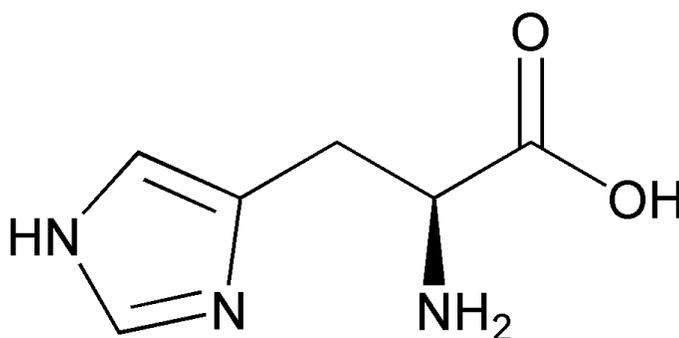

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(NBDS: H. Dinh.)

Comment deadline: January 31, 2016

Hydrocortisone Sodium Succinate

$C_{25}H_{33}NaO_8$ 484.51

Pregn-4-ene-3,20-dione, 21-(3-carboxy-1-oxopropoxy)-11,17-dihydroxy-, monosodium salt, (11 β)-;

Cortisol 21-(sodium succinate) [125-04-2].

DEFINITION

Hydrocortisone Sodium Succinate contains NLT 97.0% and NMT 102.0% of total steroids, calculated as hydrocortisone sodium succinate ($C_{25}H_{33}NaO_8$), on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption**

Sample: Transfer 100 mg of Hydrocortisone Sodium Succinate to a suitable container, and dissolve in 10 mL of water. In rapid succession, add 1 mL of 3 N *hydrochloric acid*, shake briefly, immediately decant the aqueous layer, and wash the precipitate with two additional 10-mL portions of water, each time removing the water by decanting. Remove as much of the water as possible, spread the precipitate in a suitable container, and dry under vacuum at 60° for 3 h.

Acceptance criteria: The IR spectrum of a mineral oil dispersion of the precipitate so obtained exhibits maxima only at the same wavelengths as those of a similar preparation of USP Hydrocortisone Hemisuccinate RS.

- **B. Ultraviolet Absorption** (197U)

Sample solution: 20 µg/mL in *methanol*

Analytical wavelength: 242 nm

Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.

Delete the following:

~~▲ ● **C. Identification Tests—General, Sodium** (191): It meets the requirements of the flame test. ▲USP40~~

Add the following:

▲ ● **C. Sodium compounds impart an intense yellow color to a nonluminous flame.** ▲USP40

ASSAY

- **Assay for Steroids** (351)

Blue tetrazolium solution: 5 mg/mL of blue tetrazolium in *alcohol*

Tetramethylammonium hydroxide solution: *Tetramethylammonium hydroxide TS* in *alcohol* (1 in 10)

Standard solution: 12.5 µg/mL of USP Hydrocortisone Hemisuccinate RS in *alcohol*

Sample solution: 12.5 µg/mL of Hydrocortisone Sodium Succinate in *alcohol*

Blank solution: *Alcohol*

Analysis

Samples: *Standard solution, Sample solution, and Blank solution*

Transfer 20.0-mL aliquots of the *Samples* to separate glass-stoppered, 50-mL conical flasks. To each flask add 2.0 mL of *Blue tetrazolium solution*, mix, and add 4.0 mL of *Tetramethylammonium hydroxide solution*. Allow to stand in the dark for 90 min, and add 1.0 mL of *glacial acetic acid*. Concomitantly determine the absorbances of the solutions from the *Sample solution* and the *Standard solution* at about 525 nm, with a suitable spectrophotometer, against the blank.

Calculate the percentage of total steroids, as hydrocortisone sodium succinate (C₂₅H₃₃NaO₈), in the portion of Hydrocortisone Sodium Succinate taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Hydrocortisone Hemisuccinate RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = concentration of Hydrocortisone Sodium Succinate in the *Sample solution* ($\mu\text{g/mL}$)

M_{r1} = molecular weight of hydrocortisone sodium succinate, 484.51

M_{r2} = molecular weight of hydrocortisone hemisuccinate, 462.53

Acceptance criteria: 97.0%–102.0% on the dried basis

SPECIFIC TESTS

• Sodium Content

Sample: 1 g

Analysis: Dissolve the *Sample*, with gentle heating, in 75 mL of *glacial acetic acid*. Add 20 mL of *dioxane*, then add crystal violet TS, and titrate with 0.1 N *perchloric acid* VS. Each mL of 0.1 N *perchloric acid* is equivalent to 2.299 mg of sodium (Na).

Acceptance criteria: 4.60%–4.84% on the dried basis

• Optical Rotation (781S), Procedures, Specific Rotation

Sample solution: 10 mg/mL in *alcohol*

Acceptance criteria: +140° to +150°

• Loss on Drying (731)

Sample: Dry at 105° for 3 h.

Acceptance criteria: NMT 2.0%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight, light-resistant containers.

- **USP Reference Standards (11)**

BRIEFING

Iodine Topical Solution, USP 38 page 3890. In preparation for the omission of the flame tests from *Identification Tests—General* (191), proposed in PF 41(2) [Mar.–Apr. 2015], it is proposed to delete the reference to *Sodium* under *Identification* test B, and include a complete description of the flame test in the monograph.

Additionally, minor editorial changes have been made to update the monograph to current USP style.

(CMP: J. Sun.)

Correspondence Number—C164384

Comment deadline: January 31, 2016

Iodine Topical Solution

DEFINITION

Iodine Topical Solution contains NLT 1.8 g and NMT 2.2 g of iodine (I) and NLT 2.1 g and NMT 2.6 g of sodium iodide (NaI) in each 100 mL.

Iodine	20 g
Sodium Iodide	24 g
Purified Water, a sufficient quantity to make	1000 mL

Dissolve *Iodine* and *Sodium Iodide* in 50 mL of *Purified Water*, then add sufficient *Purified Water* to bring to final volume.

IDENTIFICATION• **A.**

Analysis: Add 1 drop to a mixture of 1 mL of starch TS and 9 mL of water.

Acceptance criteria: A deep blue color is produced.

Change to read:• **B. Identification Tests—General** (191), *Iodide* and ~~*Sodium*~~

▲▲USP40

Sample: Evaporate a few mL on a steam bath to dryness.

Acceptance criteria: The residue meets the requirements of the test for *Iodide*. and the flame test for ~~*Sodium*~~.

▲▲USP40

Add the following:▲ • **C. Sodium**

Acceptance criteria: The *Sample* obtained in *Identification B* imparts an intense yellow color to a nonluminous flame. ▲USP40

ASSAY• **Iodine**

Sample: 10.0 mL

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* into a glass-stoppered 500-mL flask, and dilute with 10 mL of water. Titrate with *Titrant*, adding 3 mL of starch TS as the endpoint is approached. Each mL of *Titrant* is equivalent to 12.69 mg of iodine (I).

Acceptance criteria: 1.8–2.2 g in 100 mL of Topical Solution

• **Sodium Iodide**

Sample: 10.0 mL

Titrimetric system

Mode: Direct titration

Titrant: 0.05 M potassium iodate VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* into a glass-stoppered 500-mL flask, add 30 mL of water and 50 mL of hydrochloric acid, cool to room temperature, and titrate with *Titrant* until the dark brown solution that is produced becomes pale brown. Add 1 mL of amaranth TS, and continue the titration slowly until the red color just changes to yellow. The difference in volume, in mL, between the *Titrant* used and half the volume of 0.1 N sodium thiosulfate VS used in the *Assay for Iodine*, multiplied by 14.99, represents the number of mg of sodium iodide (NaI) in the portion of Topical Solution taken.

Acceptance criteria: 2.1–2.6 g in 100 mL of Topical Solution

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Package in tight, light-resistant containers. Store at a temperature not exceeding 35°.

BRIEFING

Iodine Tincture, *USP 38* page 3891. In preparation for the omission of the flame tests from *Identification Tests—General* (191), proposed in *PF 41(2)* [Mar.–Apr. 2015], it is proposed to delete the reference to *Sodium* under *Identification* test *B*, and include a complete description of the flame test in the monograph.

Strong Iodine Tincture

DEFINITION

Strong Iodine Tincture contains NLT 6.8 g and NMT 7.5 g of iodine (I) and NLT 4.7 g and NMT 5.5 g of potassium iodide (KI) in each 100 mL.

Prepare Strong Iodine Tincture as follows.

Potassium Iodide	50 g
Iodine	70 g
Purified Water	50 mL
Alcohol, a sufficient quantity to make	1000 mL

Dissolve *Potassium Iodide* in *Purified Water*. Add *Iodine* and agitate until the solution is effected. Add *Alcohol* to bring to final volume.

IDENTIFICATION

- **A.**

Analysis: Add 1 drop to a mixture of 1 mL of starch TS and 9 mL of water.

Acceptance criteria: A deep blue color is produced.

Change to read:

- **B. Identification Tests—General** (191), *Potassium* and

▲▲*USP40*

Iodide

Analysis: Evaporate a few mL on a steam bath to dryness.

Acceptance criteria: The residue meets the requirements of ~~the flame test for *Potassium*~~

and of

▲▲USP40

the test for *Iodide*.

Add the following:

▲ ● **C. Potassium**

Acceptance criteria: The *Sample* obtained in *Identification B* imparts a violet color to a nonluminous flame. The presence of small quantities of sodium masks the color unless the yellow color produced by sodium is screened out by viewing through a blue filter that blocks the emission at 589 nm (sodium). It is transparent to the emission at 404 nm (potassium).

[Note—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.]

Benzoic acid, 3-(acetamino)-2,4,6-triiodo-5-[(methylamino)carbonyl]-, monosodium salt.
Monosodium 5-acetamido-2,4,6-triiodo-N-methylisophthalamate [[1225-20-3]]:

» Iothalamate Sodium Injection is a sterile solution of Iothalamic Acid in Water for Injection prepared with the aid of Sodium Hydroxide. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of iothalamate sodium ($C_{11}H_8I_3N_2NaO_4$). It may contain small amounts of suitable buffers and of Edetate Calcium Disodium or Edetate Disodium as a stabilizer. Iothalamate Sodium Injection intended for intravascular use contains no antimicrobial agents.

Packaging and storage—Preserve in single-dose containers, preferably of Type I glass, protected from light.

Labeling—Label containers of the Injection intended for intravascular injection to direct the

user to discard any unused portion remaining in the container. Label containers of the Injection intended for other than intravascular injection to show that the contents are not intended for intravascular injection.

~~USP Reference standards (11)~~

~~C₉H₇I₃N₂O₃ 571.88~~

~~USP Endotoxin RS~~

~~USP Iothalamic Acid RS~~

Identification

A: Dilute 3 mL of Injection with water to 100 mL, add an excess of 3-N hydrochloric acid, and filter. Wash the precipitated iothalamic acid with four 10-mL portions of water, and dry at 105° for 4 hours: the dried iothalamic acid responds to *Identification* tests A and B under *Iothalamate Meglumine Injection*.

B: It responds to the flame test for *Sodium* (191).

~~Bacterial endotoxins (85)~~—It contains not more than 3.35 USP Endotoxin Units per mL.

~~pH (791):~~ between 6.5 and 7.7.

Free aromatic amine—Dilute a suitable volume of Injection with water to yield a solution containing 100 mg of iothalamate sodium per mL. Proceed as directed in the test for *Free aromatic amine* under *Iothalamic Acid*, beginning with "Pipet 5 mL of this solution into a 50-mL volumetric flask."

Iodine and iodide—Dilute a volume of Injection, equivalent to about 2 g of iothalamate sodium, with 20 mL of water in a 50-mL beaker, add 5 mL of 2-N sulfuric acid, stir, and filter into a glass-stoppered, 50-mL cylinder. Proceed as directed for *Procedure* in the test for *Iodine and iodide* under *Iothalamic Acid*, beginning with "To the filtrate add 5 mL of toluene."

Heavy metals (231)—In a 50-mL color-comparison tube, mix a volume of Injection, equivalent to 1.0 g of iothalamate sodium, with 5 mL of 1-N sodium hydroxide, dilute with water to 40 mL, and mix. Using this as the *Test preparation*, proceed as directed in the test for *Heavy metals* under *Diatrizoate Meglumine*: the limit is 0.002%.

Other requirements—It meets the requirements under *Injections* (1).

Assay—Proceed with Injection as directed in the *Assay* under *Iothalamate Meglumine Injection*. Each mL of 30.05-N silver nitrate is equivalent to 10.60 mg of C₁₁H₈I₃N₂NaO₄. ▲USP40

BRIEFING

Iron Sucrose Injection, USP 38 page 3944. On the basis of comments received, it is proposed to revise the final concentration of the Injection after dilution in the *Labeling* statement from 0.5–2.0 mg/mL of elemental iron to 1.0–2.0 mg/mL of elemental iron to be consistent with the FDA-approved label content.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(CHM2: S. Ramakrishna.)

Comment deadline: January 31, 2016

Iron Sucrose Injection

DEFINITION

Iron Sucrose Injection is a sterile, colloidal solution of ferric hydroxide in complex with Sucrose in Water for Injection. It contains NLT 95.0% and NMT 105.0% of the labeled amount of iron. Sodium Hydroxide may be added to adjust the pH. It contains no antimicrobial agent, chelating agent, dextran, gluconate, or other added substances.

IDENTIFICATION

- **A. Iron**

To 2.5 mL of Injection add 17.5 mL of water and 5 mL of hydrochloric acid. Mix and heat the solution for 5 min in a boiling water bath. Cool, add dropwise 13.5 N ammonium hydroxide until no further precipitation of ferric hydroxide occurs, and filter. Wash the precipitate with water to remove excess ammonium hydroxide, dissolve the precipitate in a minimum volume of 2 N hydrochloric acid, and add sufficient water to make a volume of 20 mL. To 3 mL of the solution add 1 mL of 2 N hydrochloric acid and 1 mL of potassium thiocyanate TS: the resulting solution (Solution 1) is red. To 1 mL of Solution 1 add 5 mL of amyl alcohol or ethyl ether, shake, and allow to stand: the organic layer is pink. To a separate 1-mL aliquot of Solution 1 add 2 mL of mercuric chloride TS: a red color is discharged [iron (III) salts].

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay for Sucrose*.

- **C. Molecular Weight Determination**

Mobile phase: Dissolve 7.12 g of dibasic sodium phosphate dihydrate, 5.52 g of monobasic sodium phosphate, and 0.40 g of sodium azide in 2 L of water.

System suitability solution: Dissolve 200 mg of high molecular weight dextran and 100 mg of glucose in 20 mL of *Mobile phase*.

Standard solutions: Transfer about 20 mg of each polysaccharide molecular weight standard (5,000–400,000 Da) to separate 5-mL volumetric flasks. Add 4 mL of *Mobile phase* to each flask, and allow each aliquot to stand at or below 25° for a minimum of 12 h. After the agglomerate particles of each *Standard solution* have swelled to their fullest extent, gently swirl each *Standard solution* until dissolved.

[Note—The chromatograms of freshly prepared *Standard solutions* regularly show a small, unidentified secondary peak following the main peak. Discard the *Standard solutions* if the secondary peak reaches half the height of the main peak.]

Sample solution: Transfer 5.0 mL of Injection to a 10-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: Refractive index, maintained at a constant temperature of 45°

Columns: Two 7.8-mm × 30-cm; packing L39 with pore sizes of 1000 and 120 Å, respectively

Column temperature: $45 \pm 2^\circ$

Flow rate: 0.5 mL/min

Injection volume: 25 μ L

System suitability

Samples: *System suitability solution* and *Standard solutions*

Suitability requirements

Resolution: NLT 4.0 between dextran and glucose, *System suitability solution*

Correlation coefficient: NLT 0.98 for the calibration curve generated using a suitable program, plotting the retention times of the *Standard solutions* and their molecular weights to generate a third order (cubic) calibration curve

Analysis

Samples: *System suitability solution*, *Standard solutions*, and *Sample solution*

The molecular weight of the complex is calculated from the calibration curve. The molecular weight distribution curve of the sample is sliced into fractions. Calculate the weight-average molecular weight (M_W) as follows:

$$\text{Result} = \Sigma(A_T M_T) / \Sigma A_T$$

Calculate the number-average molecular weight (M_N) as follows:

$$\text{Result} = \Sigma(A_T) / \Sigma(A_T / M_T)$$

A_T = area of each fraction of the sample distribution

M_T = corresponding mean molecular weight of each fraction as determined from its retention time on the calibration curve

Acceptance criteria: The molecular weight distribution curve of the Injection conforms to the following parameters.

M_W : 34,000–60,000 Da

M_N : NLT 24,000 Da

M_W/M_N : NMT 1.7

ASSAY

• Sucrose

Mobile phase: Acetonitrile and water (79:21)

Standard solutions: Individual solutions of 13, 16, 18, 21, and 23 mg/mL of sucrose from USP Sucrose RS, in water

Sample solution: Transfer about 1.875 g of Injection to a 25-mL flask. Add 1.25 mL of water and mix. Add 1.25 mL of a monobasic sodium phosphate solution, prepared by dissolving 30 g in 50 mL, and mix. Allow the resulting solution to stand for 10 min to precipitate the colloidal ferric hydroxide. Dilute with water to volume. Centrifuge this solution at 3000 rpm for 15 min. Pass the resulting solution through a filter, discarding the first 2 mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 4-mm × 25-cm; packing L8

Temperatures

Detector: 20–25° (±2°)

Column: 20–25° (±2°)

Flow rate: 2 mL/min

Injection volume: 20 µL

System suitability

Samples: *Standard solutions*

[Note—The retention time for sucrose is about 8 min.]

Suitability requirements

Correlation coefficient: NLT 0.998 from the linear regression of the *Standard solutions*

Analysis

Samples: *Standard solutions* and *Sample solution*

Plot the peak area for each *Standard solution* versus concentration of sucrose in mg/mL, and draw the straight line best fitting the five plotted points. From the graph, determine the concentration of sucrose, in mg/mL, in the *Sample solution*.

Calculate the quantity of sucrose, in mg, in each mL of Injection taken:

$$\text{Result} = (C_U \times D \times G)/W$$

C_U = concentration of sucrose in the *Sample solution* (mg/mL)

D = dilution volume of the *Sample solution* (mL)

G = density of Injection taken (g/mL)

W = weight of Injection taken (g)

Acceptance criteria: 260–340 mg/mL

Change to read:

- **Iron**

Solution A: Transfer 2.64 g of calcium chloride to a 1000-mL volumetric flask, add 500 mL of water, and swirl to dissolve. Add 5.0 mL of hydrochloric acid, and dilute with water to volume.

Standard stock solution: 50 µg/mL of iron prepared as follows. Transfer about 350 mg of ferrous ammonium sulfate to a 1000-mL volumetric flask. Add water to dissolve, dilute with water to volume, and mix.

Standard solutions: Individual solutions containing 2.0, 4.0, 6.0, 8.0, and 10.0 µg/mL of iron in *Solution A* from the *Standard stock solution*

Sample stock solution: Using a “to contain” pipet, transfer 2.0 mL of Injection to a 100-

mL volumetric flask. Rinse the pipet several times with *Solution A*. Add 5 mL of hydrochloric acid, and swirl until the solution turns yellow. After the solution has cooled to room temperature, dilute with *Solution A* to volume, and mix.

Sample solution: Nominally 8.0 µg/mL of iron prepared as follows. Pipet 2.0 mL of the *Sample stock solution* to a 100-mL volumetric flask, and dilute with *Solution A* to volume.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 248.3 nm iron emission line

Lamp: Iron hollow-cathode

Flame: Air-acetylene

Blank: *Solution A*

Analysis

Samples: *Standard solutions* and *Sample solution*

Plot the absorbance of each *Standard solution* versus concentration, in µg/mL, of iron, and draw the straight line best fitting the five plotted points. From the graph, determine the concentration, in µg/mL, of iron in the *Sample solution*.

Calculate the quantity, in mg, of iron in each mL of the Injection taken:

$$\text{Result} = 5C/V$$

C = concentration of iron in the *Sample solution* (µg/mL)

V = volume of Injection taken

▲ Calculate the percentage of the labeled amount of iron in each mL of Injection taken:

$$\text{Result} = (C_A/C_U) \times 100$$

C_A = actual concentration of iron in the *Sample solution* determined from the calibration curve (µg/mL)

C_U = nominal concentration of iron in the *Sample solution* (µg/mL) ▲USP40

Acceptance criteria: 95.0%–105.0%

OTHER COMPONENTS

• Content of Chloride

Sample: About 12 g of Injection

Analysis: Transfer the *Sample* to a 50-mL beaker. Add 40 mL of water and 0.3 mL of 65% nitric acid, and, while stirring, titrate with 0.01 N silver nitrate VS, determining the endpoint potentiometrically with silver-glass electrodes.

Calculate the chloride content, in mg, of Injection taken. Each mL of 0.01 N silver nitrate consumed is equal to 0.3545 mg of chloride (Cl).

Acceptance criteria: 0.012%–0.025%

IMPURITIES

- **Limit of Iron [Fe(II)]**

Supplementary electrolyte solution: Dissolve 15.0 g of sodium acetate in 100 mL of water and adjust with 0.1 N acetic acid to a pH of 7.0.

Sample solution: Volume of Injection equivalent to 20–120 µg/mL of elemental iron

Analysis: Transfer a suitable amount of *Supplementary electrolyte solution* to a polarographic cell equipped with a mercury drop electrode. With the electrode submerged in the liquid, bubble nitrogen through the liquid for 5 min. Avoiding any undue exposure to air, immediately transfer the *Sample solution* to the polarographic cell. The sample must be analyzed immediately upon opening the container.

Record the polarogram from 0 mV and –1700 mV. The iron [Fe(III)/Fe(II)] peak is detected at -750 ± 50 mV and the iron [Fe(II)/Fe(0)] peak is detected at -1400 ± 50 mV. Measure the iron [Fe(II)/Fe(III)] peak responses obtained from the polarogram, and perform a blank determination.

Calculate the Fe(II) content, in % w/v, in the volume of Injection taken:

$$\text{Result} = [1 - (2/R)] \times C_T$$

R = peak response ratio of iron [Fe(II)]/iron [Fe(III)]

C_T = total iron concentration of the Injection (% w/v)

Acceptance criteria: NMT 0.4%

SPECIFIC TESTS

- **pH (791):** 10.5–11.1 at 20°

- **Turbidity**

Sample solution: Transfer 0.5 g of Injection to a 150-mL beaker. Add 100 mL of water and, with constant stirring, adjust with 0.1 N hydrochloric acid VS to a pH of 6.0.

Analysis: Remove the pH electrode from the solution. Adjust a light source such that the beam hits the beaker at a parallel angle 2 cm below the surface of the liquid. The light must shine through to the surface, and the solution must not have any turbidity. Measurement must be carried out in a room as dark as possible. Slowly add 0.1 N hydrochloric acid VS, dropwise, until a slight but lasting turbidity develops. Record the pH of the solution as the turbidity point of the Injection.

Acceptance criteria: 4.4–5.3

- **Absence of Low-Molecular Weight Iron [Fe(II) and Fe(III)] Complexes:** In the polarograms obtained in the test for *Limit of Iron [Fe(II)]*, no additional peaks are found.

- **Alkalinity**

Sample solution: 5 mL of Injection

Analysis: Titrate the *Sample solution* with 0.1 N hydrochloric acid VS with constant stirring to a pH of 7.4. Record the volume of 0.1 N hydrochloric acid VS consumed, and calculate the alkalinity of the Injection as the volume of acid, in mL, consumed per mL of Injection.

Acceptance criteria: 0.5–0.8 mL of 0.1 N hydrochloric acid VS is consumed per mL of Injection.

- **Osmolality and Osmolarity** (785), *Osmolarity*
Sample solution: Dilute Injection in water (1 in 10).
Acceptance criteria: 1150–1350 mOsmol/L
- **Specific Gravity** (841): 1.135–1.165 at 20°
- **Particulate Matter in Injections** (788), *Method 1 Light Obscuration Particle Count Test*
Sample solution: Prepare a solution of Injection (1 in 40) using water that has been passed through a filter having a 1.2- μm or finer pore size.
Acceptance criteria: Meets the requirements for small-volume injections
- **Bacterial Endotoxins Test** (85): NMT 3.7 USP Endotoxin Units/mg of iron contained in the Iron Sucrose Injection
- **Other Requirements:** Meets the requirements in *Injections* (1)

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in single-dose containers of Type I glass. Store at controlled room temperature. Do not freeze.

Change to read:

- **Labeling:** Label it to indicate that it is for intravenous use only, and that when administered by intravenous infusion, the Injection must be diluted with 0.9% Sodium Chloride Injection to a concentration of 0.5
▲ 1.0 ▲ USP40
–2.0 mg/mL of elemental iron. Label it also to state the total osmolality of the solution expressed in mOsmol/L.

BRIEFING

Ixabepilone. Because there is no existing *USP* monograph for this drug substance, a new monograph based on validated methods of analysis is proposed. The liquid chromatographic procedure for the *Assay* and test for *Organic Impurities* is based on analyses performed with the Phenomenex Gemini C18 brand of L1 column. The typical retention time for ixabepilone is about 8.5 min.

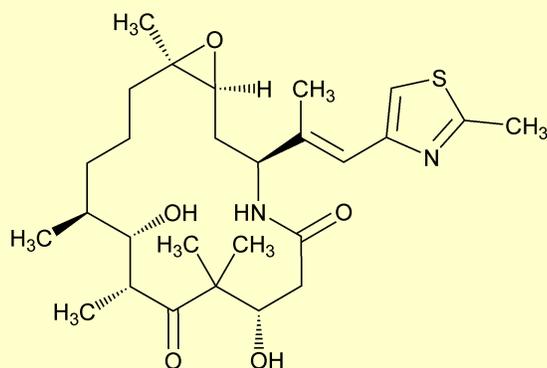

(CHM3: F. Mao.)

Correspondence Number—C139175

Comment deadline: January 31, 2016

Add the following:

▲ **Ixabepilone**

$C_{27}H_{42}N_2O_5S$ 506.70

17-Oxa-4-azabicyclo[14.1.0]heptadecane-5,9-dione, 7,11-dihydroxy-8,8,10,12,16-pentamethyl-3-[(1*E*)-1-methyl-2-(2-methyl-4-thiazolyl)ethenyl]-, (1*S*,3*S*,7*S*,10*R*,11*S*,12*S*,16*R*)-; (1*S*,3*S*,7*S*,10*R*,11*S*,12*S*,16*R*)-7,11-Dihydroxy-8,8,10,12,16-pentamethyl-3-[(*E*)-1-(2-methylthiazol-4-yl)prop-1-en-2-yl]-17-oxa-4-azabicyclo[14.1.0]heptadecane-5,9-dione. BRIEFING

Methylprednisolone Acetate, USP 38 page 4353. As part of USP monograph modernization efforts, it is proposed to revise the monograph as follows:

1. Replace the liquid chromatographic procedure that requires the use of tetrahydrofuran in the test for *Organic Impurities* with a chromatographic procedure that specifies and identifies impurities. The liquid chromatographic procedure was validated using the Phenomenex Kinetex phenyl-hexyl brand of L11 column. The typical retention time for methylprednisolone acetate is about 15 min.
2. Replace the current HPLC procedure in the *Assay* that requires the use of an internal standard in chloroform with the same chromatographic parameters as those in the proposed test for *Organic Impurities*.
3. Revise *Identification* test A for flexible IR sample preparations.
4. Replace *Identification* test B based on UV absorption with the retention time agreement in the proposed *Assay*.
5. Revise the storage condition in the *Packaging and Storage* section to be consistent with the description in *Packaging and Storage Requirements* <659>.
6. Add USP Dexamethasone Acetate RS to the *USP Reference Standards* section to support the proposed test for *Organic Impurities*.

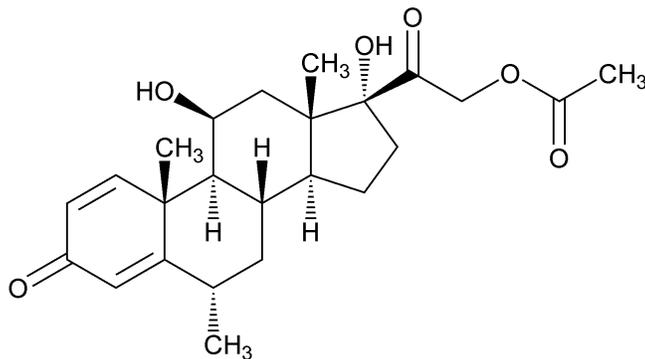

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

USP Methylprednisolone Acetate RS

BRIEFING

Methylprednisolone Acetate Injectable Suspension, USP 38 page 4354. As part of the USP monograph modernization efforts, it is proposed to revise the monograph as follows:

1. Add a new liquid chromatographic procedure in the test for *Organic Impurities*. The HPLC procedure was validated using the Phenomenex Kinetex phenyl-hexyls brand of L11 column. The typical retention time for methylprednisolone acetate is about 15 min.
2. Replace the current HPLC procedure in the *Assay* that requires the use of an internal standard in chloroform with a chromatographic procedure using the same parameters as those in the proposed test for *Organic Impurities*.
3. Revise *Identification* test A for flexible IR sample preparations.
4. Add *Identification* test B based on the retention time agreement in the proposed *Assay*.
5. Add additional requirements in the *Packaging and Storage* section based on the

information from the drug product packaging insert.

6. Add USP Dexamethasone Acetate RS to the *USP Reference Standards* section to support the proposed test for *Organic Impurities*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Methylprednisolone Acetate Injectable Suspension

DEFINITION

Methylprednisolone Acetate Injectable Suspension is a sterile suspension of Methylprednisolone Acetate in a suitable aqueous medium. It contains NLT 90.0% and NMT 110.0% of the labeled amount of methylprednisolone acetate ($C_{24}H_{32}O_6$).

IDENTIFICATION

Delete the following:

▲ ● A. Infrared Absorption ~~(197K)~~

Sample: Nominally 100 mg of methylprednisolone acetate from Injectable Suspension

Analysis: Filter the *Sample* through paper. Wash the residue with several 5-mL portions of water, and dry at 105° for 3 h.

Acceptance criteria: Meets the requirements ▲*USP40*

Add the following:

▲ ● A. Infrared Absorption (197)

[Note—Methods described in (197K) or (197A) may be used.]

Sample: Nominally 100 mg of methylprednisolone acetate from Injectable Suspension

Analysis: Filter the *Sample* through paper. Wash the residue with several 5-mL portions of water, and dry at 105° for 3 h.

Acceptance criteria: Meets the requirements ▲*USP40*

Add the following:

- ▲ ● **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲*USP40*

ASSAY

Change to read:

- **Procedure**

Mobile phase: ~~*n*-Butyl chloride, water-saturated *n*-butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (95:95:14:7:6)~~

Internal standard solution: ~~6 mg/mL of prednisone prepared as follows. Transfer an appropriate amount of prednisone to a suitable volumetric flask. Add 3% of the flask volume of *glacial acetic acid*, and sonicate. Dilute with *chloroform* to volume, slowly adding the *chloroform*. Sonicate, and shake to dissolve.~~

Standard solution: ~~0.2 mg/mL of USP Methylprednisolone Acetate RS prepared as follows. Transfer an appropriate amount of USP Methylprednisolone Acetate RS to a suitable volumetric flask, and add 5% of the flask volume of the *Internal standard solution*. Dilute with *chloroform* to volume, and shake to dissolve.~~

Sample solution: ~~Swirl Injectable Suspension to ensure uniformity before analysis. Transfer a suitable quantity of Injectable Suspension equivalent to 40 mg of methylprednisolone acetate to a 25 mL volumetric flask, add 10.0 mL of the *Internal standard solution*, dilute with *chloroform* to volume, and shake for 15 min or until the aqueous layer is clear. Transfer 4.0 mL of the *chloroform* layer to a suitable vial, add 30 mL of *chloroform* and a small quantity (about 400 mg) of *anhydrous sodium sulfate*, shake for 5 min. Use the clear solution.~~

USP Methylprednisolone Acetate RS

BRIEFING

Morphine Sulfate Extended-Release Capsules, *USP 38* page 4450. On the basis of comments received, the following revisions are proposed.

1. Replace the IR procedure for *Identification* test A, which lacks specified sample preparation, with the UV spectra agreement from the *Assay*. The *Detector* for the *Assay* is updated accordingly.
2. Revise the calculation for the *Assay* to include the molecular weight conversion to be consistent with the label information of USP Morphine Sulfate RS.
3. Revise the preparation of the *Sample stock solution* in the *Assay* to make it more flexible and less formulation specific.
4. Update the sensitivity requirement in the test for *Organic Impurities* to add a limit for *Signal-to-noise ratio* based on supporting data.
5. Revise the test for *Organic Impurities* by using the external standard approach for specified impurities to address the comments on the relative response factors. Quantitation of individual unspecified impurity is revised to indicate that peak responses are from the *Sample solution* to be consistent with the FDA-approved specifications.
6. Update the disregard limits in the *Organic Impurities* based on the supporting data.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Pemetrexed Disodium. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods of analysis, is proposed.

1. The liquid chromatographic procedure used in the *Assay* is based on analyses performed with the Zorbax SB-C8 brand of L7 column. The typical retention time for pemetrexed is about 3 min.
2. The liquid chromatographic procedure used in the test for *Organic Impurities* is also based on analyses performed with the Zorbax SB-C8 brand of L7 column. The typical retention time for pemetrexed is about 29 min.
3. The liquid chromatographic procedure used in the *Enantiomeric Purity* test is based on analyses performed with the Phenomenex IB-SIL C18 brand of L1 column. The typical retention time for pemetrexed is about 33 min.

(CHM3: F. Mao.)

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: 0.8–1.5

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of pemetrexed disodium ($C_{20}H_{19}N_5Na_2O_6$) in the portion of Pemetrexed Disodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Pemetrexed Disodium RS in the *Standard solution* (mg/mL)

C_U = concentration of Pemetrexed Disodium in the *Sample solution* (mg/mL)

Acceptance criteria: 97.5%–102.0% on the anhydrous and solvent-free basis

IMPURITIES

• Organic Impurities

Buffer: 1.45 g/L of *ammonium formate* in water. Adjust with *formic acid* to a pH of 3.5 ± 0.1 .

Solution A: *Acetonitrile* and *Buffer* (5:95)

Solution B: *Acetonitrile* and *Buffer* (30:70)

Mobile phase: See *Table 1*. [Note—After each injection, re-equilibrate the chromatographic system at the initial condition for a minimum of 13 min.]

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
45	0	100
47	100	0

System suitability stock solution: Prepare 3 mg/mL of USP Pemetrexed Disodium RS in 0.1 N *sodium hydroxide*. Heat this solution at 70° for 40 min.

[Note—The preparation degrades pemetrexed and generates the pemetrexed *R*-dimer and pemetrexed *S*-dimer as follows:

Pemetrexed *R*-dimer: (2*S*,2'*S*)-2,2'-{[(*R*)-2,2'-Diamino-4,4',6-trioxo-1,4,4',6,7,7'-hexahydro-1'*H*,5*H*-5,6'-bipyrrolo[2,3-*d*]pyrimidine-5,5'-diyl]bis(ethylenebenzene-4,1-diylcarbonylimino)}diglutamic acid.

Pemetrexed *S*-dimer: (2*S*,2'*S*)-2,2'-{[(*S*)-2,2'-Diamino-4,4',6-trioxo-1,4,4',6,7,7'-hexahydro-1'*H*,5*H*-5,6'-bipyrrolo[2,3-*d*]pyrimidine-5,5'-diyl]bis(ethylenebenzene-4,1-diylcarbonylimino)}diglutamic acid.]

System suitability solution: Transfer 1 mL of the *System suitability stock solution* to a 10-mL volumetric flask and dilute with water to volume.

Sensitivity solution: 0.1 µg/mL of USP Pemetrexed Disodium RS in water

Sample solution: 0.2 mg/mL of Pemetrexed Disodium in water. Do not sonicate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 250 nm

Column: 4.6-mm × 15-cm; 3.5-µm packing *L7*

Autosampler temperature: 2°–8°

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Sensitivity solution*

[Note—The relative retention times for the pemetrexed *R*-dimer and pemetrexed *S*-dimer peaks are 0.87 and 0.88, respectively.]

Suitability requirements

Peak-to-valley ratio: The ratio of the height of the pemetrexed *R*-dimer peak to the height of the valley between the pemetrexed *R*-dimer and pemetrexed *S*-dimer is NLT 1.5, *System suitability solution*.

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Pemetrexed Disodium taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area of each impurity from the *Sample solution*

r_T = total peak areas from the *Sample solution*

Acceptance criteria: See *Table 2*. Disregard any peak less than 0.05%.

BRIEFING

Penicillin G Procaine, USP 38 page 4789. The following revisions are proposed:

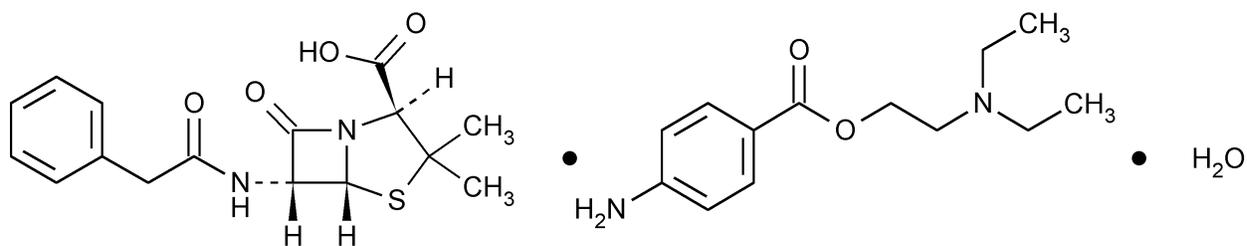

1. In preparation for the revisions to *Packaging and Storage Requirements* (659) proposed in PF 41(3) [May–June 2015], it is proposed to revise the *Packaging and Storage* section to indicate that the requirement applies only to those products that are intended for use in preparing injectable dosage forms.
2. Added a reference to *Antibiotics—Microbial Assays* (81) to clarify the preparation of *Buffer B.1* in the *Assay*.
3. References to USP Penicillin V Potassium RS are added to the test for *Content of Penicillin G and Procaine* and the *USP Reference Standards* sections; this Reference Standard is used to evaluate system suitability.
4. The column dimensions in the test for *Content of Penicillin G and Procaine* are revised to the correct inner diameter for the Waters μ Bondapak C18 column that was used in the original validation of the procedure. Relative retention times for the procaine, penicillin G, and penicillin V are revised based on supporting data. The reagents used in the test are revised for clarity.
5. The *Sample solution* in the test for *pH* is revised for clarity.
6. The chemical names are updated to align with each other.
7. The requirement in *Sterility Tests* is revised to make it more flexible.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(CHM1: M. Puderbaugh.)

carboxylic acid compound with 2-(diethylamino)ethyl *p*-aminobenzoate (1:1) monohydrate [6130-64-9].
Anhydrous [54-35-3].

DEFINITION

Penicillin G Procaine has a potency of NLT 900 Penicillin G Units/mg and NMT 1050 Penicillin G Units/mg.

IDENTIFICATION

• A. Thin-Layer Chromatography

Solution A: Acetone, 0.1 M citric acid, and 0.1 M sodium citrate (2:1:1)

Standard solution 1: Prepare a solution containing the equivalent of 12,000 Penicillin G Units/mL, from USP Penicillin G Potassium RS in *Solution A*.

Standard solution 2: 5 mg/mL of USP Procaine Hydrochloride RS in *Solution A*

Sample solution: Nominally 12,000 Penicillin G Units/mL from Penicillin G Procaine in *Solution A*

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 20 μ L

Developing solvent system: Toluene, dioxane, and glacial acetic acid (90:25:4)

Spray reagent 1: Starch TS

Spray reagent 2: Iodine TS diluted 1 in 10 with water

Spray reagent 3: 50 mg/mL of *p*-dimethylaminobenzaldehyde in methanol

Analysis

Samples: *Standard solution 1*, *Standard solution 2*, and *Sample solution*

Proceed as directed in the chapter. Develop the chromatogram until the solvent has moved three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow to air-dry. Examine the plate under short- and long-wavelength UV light, noting the positions of the spots. Spray the plate with *Spray reagent 1* followed by *Spray reagent 2*. Penicillin G appears as a white spot on a purple background. Spray the location of the spots visualized with UV light with *Spray reagent 3*. Procaine appears as a bright yellow spot.

Acceptance criteria: The R_F value of the penicillin G spot from the *Sample solution* corresponds to that from *Standard solution 1*. The R_F value of the procaine spot from the *Sample solution* corresponds to that from *Standard solution 2*.

ASSAY

Resolution: NLT 2.0 between penicillin G and penicillin V, *System suitability solution*

Relative standard deviation: NMT 3.0% for penicillin G potassium, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of penicillin G ($C_{16}H_{18}N_2O_4S$) in the portion of Penicillin G Procaine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times G_S$$

r_U = peak response of penicillin G from the *Sample solution*

r_S = peak response of penicillin G from the *Standard solution*

C_S = concentration of USP Penicillin G Potassium RS in the *Standard solution* (mg/mL)

C_U = concentration of Penicillin G Procaine in the *Sample solution* (mg)

G_S = content of penicillin G in USP Penicillin G Potassium RS (%)

Calculate the percentage of procaine ($C_{13}H_{20}N_2O_2$) in the portion of Penicillin G Procaine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of procaine from the *Sample solution*

r_S = peak response of procaine from the *Standard solution*

C_S = concentration of USP Procaine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Penicillin G Procaine in the *Sample solution* (mg)

M_{r1} = molecular weight of procaine, 236.32

M_{r2} = molecular weight of procaine hydrochloride, 272.78

Acceptance criteria: See Table 1.

Table 1

Penicillin G	51.0%–59.6%
Procaine	37.5%–43.0%

- **Bacterial Endotoxins Test** (85): Where the label states that Penicillin G Procaine is sterile or that it must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.01 USP Endotoxin Unit/100 Penicillin G Units.

Change to read:

USP Procaine Hydrochloride RS

BRIEFING

Pentazocine and Acetaminophen Tablets, *USP 38* page 4803. As part of the USP monograph modernization initiative and based on correspondence from the FDA regarding modernization, the addition of an HPLC procedure for monitoring 4-aminophenol, based on *4-Aminophenol in Acetaminophen-Containing Drug Products (227)*, is proposed. This liquid chromatographic procedure is based on analyses performed with the Dionex Acclaim Mixed Mode WCX-1 brand of L85 column. The typical retention time for 4-aminophenol is about 4.2–5.3 min. The proposed limit of this nephrotoxin is 0.15% and is based on input provided by the FDA and the pharmaceutical industry to the USP Acetaminophen Expert Panel, which reports to the Small Molecules-2 Expert Committee.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(CHM6: C. Anthony.)

Correspondence Number—C161687

Comment deadline: January 31, 2016

Pentazocine and Acetaminophen Tablets**DEFINITION**

Pentazocine and Acetaminophen Tablets contain an amount of Pentazocine Hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of pentazocine ($C_{19}H_{27}NO$) and NLT 90.0% and NMT 110.0% of the labeled amount of acetaminophen ($C_8H_9NO_2$).

IDENTIFICATION**• A. Thin-Layer Chromatographic Identification Test (201)**

Diluent: Chloroform and methanol (1:1)

Standard solution A: 1 mg/mL of USP Pentazocine RS in *Diluent*

Standard solution B: 26 mg/mL of USP Acetaminophen RS in *Diluent*

Sample solution: Transfer a quantity of finely powdered Tablets, nominally equivalent to about 5 mg of pentazocine and 130 mg of acetaminophen, to a suitable flask. Add 5 mL of *Diluent*, shake, and allow the solids to settle. Use the supernatant.

Chromatographic system

Developing solvent system: Ethyl acetate, methanol, and formic acid (90:5:5)

Spray reagent: Dissolve 300 mg of platinum chloride in 100 mL of water and add 100 mL of potassium iodide solution (6 in 100).

Analysis: Evaporate the solvents in cool, circulating air. After developing and examining the spots, spray the plate with *Spray reagent*.

Acceptance criteria: The R_F values, size, and intensity of color of the two principal spots of the *Sample solution* correspond to those of *Standard solution A* and *Standard solution B*.

B.

BRIEFING

Phenoxybenzamine Hydrochloride Capsules, USP 38 page 4842. On the basis of comments received, the following changes are proposed:

1. *Identification* test *A* is replaced with the matching of the UV absorption spectra of the phenoxybenzamine peak from the *Sample solution* and the *Standard solution*, as obtained in *Assay*.
2. An orthogonal *Identification* test *B* is included based on the retention time agreement of the phenoxybenzamine peak from the *Sample solution* and the *Standard solution*, as obtained in *Assay*.
3. The *Detector* in the *Assay* is revised to include the diode array range for performing *Identification* test *A*.
4. The *Procedure for content uniformity* under the test for *Uniformity of Dosage Units* is deleted to provide flexibility for using either of the procedures described in *Uniformity of*

Dosage Units (905).

5. The *Column temperature* in the *Assay* and *Dissolution* test is deleted as it is listed in *Chromatography* (621).
6. The relative retention times of known degradation products is included under *System suitability* in the *Assay*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Phenoxybenzamine Hydrochloride Capsules

DEFINITION

Phenoxybenzamine Hydrochloride Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of phenoxybenzamine hydrochloride ($C_{18}H_{22}ClNO \cdot HCl$).

IDENTIFICATION

Delete the following:

▲ ● **A. Ultraviolet Absorption**

Analytical wavelengths: 268 and 272 nm

Sample solution: 0.15 mg/mL of phenoxybenzamine hydrochloride in acidic alcohol (1 in 1000 solution of hydrochloric acid in alcohol)

Acceptance criteria: The ratio A_{268}/A_{272} of the maximum at 268 ± 2 nm and the minimum at 272 ± 2 nm is between 1.75 and 1.95. ▲*USP40*

Add the following:

- ▲ ● **A.** The UV absorption spectra of the phenoxybenzamine peak of the *Sample solution* exhibit maxima and minima at the same wavelengths as those of the corresponding peak from the *Standard solution*, as obtained in the *Assay*. ▲*USP40*

Add the following:

- ▲ ● **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. ▲*USP40*

ASSAY

Change to read:

● **Procedure**

Solution A: 2.2 mg/mL of *anhydrous monobasic sodium phosphate* in water. Adjust with concentrated

▲ ▲*USP40*

phosphoric acid to a pH of 3.0.

Mobile phase: Filtered and degassed mixture of *Solution A* and *acetonitrile* (45:55)

Standard solution: 0.2 mg/mL of USP Phenoxybenzamine Hydrochloride RS in *acetonitrile*.
[Note—Sonicate if necessary.]

System suitability solution: 10 mL of the *Standard solution* and 0.5 mL of 0.1 N *sodium hydroxide* taken in a vial. [Note—Basic solutions of phenoxybenzamine hydrochloride will produce the known degradant, tertiary amine phenoxybenzamine—the second major peak that elutes before the phenoxybenzamine peak and has a relative retention time of about 0.3 and an unknown related substance. Severe degradation of the drug substance will be observed if the solution is allowed to stand for more than 1 h.]

Sample solution: 0.2 mg/mL of phenoxybenzamine hydrochloride in *acetonitrile* prepared as follows. Remove, as completely as possible, the contents of NLT 20 Capsules. Transfer a portion of the mixed powder, equivalent to about 10 mg of phenoxybenzamine hydrochloride, to a 50-mL volumetric flask. Add about 40 mL of *acetonitrile*, and sonicate for 15 min with occasional swirling. Cool, and dilute with *acetonitrile* to volume to obtain the concentration, based on the label claim. Allow the sample to stand undisturbed for 30 min such that the undissolved material settles to the bottom. Transfer the top clear solution into HPLC vials, and use as the *Sample solution*.

Procedure for content uniformity

Solution A, Mobile phase, Standard solution, and Chromatographic system:

~~Proceed as directed in the Assay.~~

Sample solution: ~~0.2 mg/mL of phenoxybenzamine hydrochloride in water prepared as follows: Carefully open 10 Capsules, and transfer each immediately into separate volumetric flasks, including the Capsule shells. Add acetonitrile, to about 60% of the volume of the flask, and sonicate for 15 min with occasional stirring. Cool the flask, and dilute with acetonitrile to volume to achieve a concentration of 0.2 mg/mL. [Note—The Capsule shell does not dissolve. Cool, dilute with acetonitrile to volume, mix, and pass through a nylon membrane filter of 0.45- μ m pore size, discarding the first few mL of the filtrate.]~~

Analysis

~~**Samples:** *Standard solution* and *Sample solution*~~

Calculate the quantity of phenoxybenzamine hydrochloride in the Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Phenoxybenzamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of phenoxybenzamine hydrochloride in the *Sample solution*, based on the labeled quantity per Capsule and the extent of dilution (mg/mL)

F = labeled quantity of phenoxybenzamine hydrochloride in the Capsules taken (mg)

Acceptance criteria: Meet the requirements

IMPURITIES

- **Organic Impurities**

Solution A, Mobile phase, Standard solution, System suitability solution, Sample

solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each individual impurity in the portion of Capsules taken:

$$\text{Result} = (r_U/r_T) \times (1/F) \times 100$$

r_U = peak response of the individual impurity from the *Sample solution*

r_T = sum of all the peak responses from the *Sample solution*

F = relative response factor, 1.1 for phenoxybenzamine tertiary amine, and 1.0 for all other individual impurities

Acceptance criteria

Individual impurities: NMT 0.5% of phenoxybenzamine tertiary amine; NMT 0.1% of any other specified or unspecified individual impurity (degradant)

Total impurities: NMT 0.5%, includes both specified and unspecified

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers.

- **USP Reference Standards** <11>

USP Phenoxybenzamine Hydrochloride RS

BRIEFING

Prompt Phenytoin Sodium Capsules, *USP 38* page 4869. It is proposed omit this dosage form monograph from *USP* for the following reasons:

1. This dosage form is not used for human use in the United States.
2. This dosage form is not used currently in veterinary medicine in the United States.

(CHM4: R. Ravichandran.)

Potassium Gluconate

$C_6H_{11}KO_7$ 234.25
 $C_6H_{11}KO_7 \cdot H_2O$ 252.26

d-Gluconic acid, monopotassium salt;
 Monopotassium d-gluconate.
 Anhydrous [299-27-4].
 Monohydrate [35398-15-3].

DEFINITION

Potassium Gluconate is anhydrous or contains one molecule of water of hydration. It contains NLT 97.0% and NMT 103.0% of anhydrous potassium gluconate ($C_6H_{11}KO_7$), calculated on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption** (197M)

Delete the following:

- ▲ • ~~**B. Identification Tests—General, Potassium** (191): Meets the requirements of the flame test~~ ▲*USP40*

Add the following:

- ▲ • **B.** Potassium Gluconate imparts a violet color to a nonluminous flame. Because the presence of small quantities of sodium masks the color, screen out the yellow color produced by sodium by viewing through a blue filter that blocks emission at 589 nm (sodium) but is transparent to emission at 404 nm (potassium). [Note—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.] ▲*USP40*

- **C. Thin-Layer Chromatography**

Standard solution: 10 mg/mL of USP Potassium Gluconate RS

Sample solution: 10 mg/mL of Potassium Gluconate

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 5 μ L

Developing solvent system: *Alcohol, ethyl acetate, ammonium hydroxide, and water* (50:10:10:30)

Spray reagent: Dissolve 2.5 g of *ammonium molybdate* in 50 mL of 2 N sulfuric acid in a 100-mL volumetric flask, add 1.0 g of *ceric sulfate*, swirl to dissolve, and dilute with 2 N sulfuric acid to volume.

Analysis

Samples: *Standard solution and Sample solution*

Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and dry at 110° for 20 min. Allow to cool, and spray with the *Spray reagent*. Heat the plate at 110° for about 10 min.

Acceptance criteria: The principal spot of the *Sample solution* corresponds in color, size, and R_F to that of the *Standard solution*.

ASSAY

• Procedure

Standard stock solution: Transfer 190.7 mg of *potassium chloride*, previously dried at 105° for 2 h, to a 1000-mL volumetric flask, add sufficient *water* to dissolve, and dilute with *water* to volume. Transfer 100.0 mL of this solution to a 1000-mL volumetric flask, and dilute with *water* to volume. This solution contains 10 µg/mL of potassium (equivalent to 19.07 µg/mL of potassium chloride).

Standard solutions: Transfer 10.0, 15.0, and 20.0 mL of *Standard stock solution* to separate 100-mL volumetric flasks. Add 2.0 mL of a 200-mg/mL *sodium chloride* solution and 1.0 mL of *hydrochloric acid* to each flask. Dilute with *water* to volume and mix. The *Standard solutions* contain 1.0, 1.5, and 2.0 µg/mL of potassium, respectively.

Sample stock solution: 0.18 mg/mL of Potassium Gluconate in *water*. Filter the solution.

Sample solution: Transfer 5.0 mL of the filtrate from the *Sample stock solution* to a 100-mL volumetric flask. Add 2.0 mL of a 200-mg/mL *sodium chloride* solution and 1.0 mL of *hydrochloric acid*, and dilute with *water* to volume.

Blank: *Water*

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 766.5 nm

Lamp: Potassium hollow-cathode

Flame: Air-acetylene

Analysis

Samples: *Standard solutions and Sample solution*

Determine the absorbances of the *Standard solutions* and the *Sample solution*. Plot the absorbance of the *Standard solutions* versus their concentrations, in µg/mL, of potassium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C_K , in µg/mL, of potassium in the *Sample solution*.

Calculate the percentage of potassium gluconate ($C_6H_{11}KO_7$) in the portion of Potassium Gluconate taken:

$$\text{Result} = (C_K/C_U) \times (M_r/A_r) \times 100$$

C_K = determined concentration of potassium in the *Sample solution* ($\mu\text{g/mL}$)

C_U = concentration of Potassium Gluconate in the *Sample solution* ($\mu\text{g/mL}$)

M_r = molecular weight of potassium gluconate, 234.25

A_r = atomic weight of potassium, 39.10

Acceptance criteria: 97.0%–103.0% on the dried basis

IMPURITIES

Delete the following:

- **Heavy Metals, Method I (231)**

Test preparation: 1.0 g in 10 mL of water. Add 6 mL of 3 N hydrochloric acid, and dilute with water to 25 mL.

Acceptance criteria: NMT 20 ppm (Official 1-Jan-2018)

- **Reducing Substances**

Sample: 1.0 g of Potassium Gluconate

Blank: 10 mL of water

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: *Iodine*

Back titrant: *Sodium thiosulfate*

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a 250-mL conical flask, dissolve in 10 mL of *water*, and add 25 mL of *alkaline cupric citrate TS*. Cover the flask, boil gently for 5 min, accurately timed, and cool rapidly to room temperature. Add 25 mL of 0.6 N *acetic acid*, 10.0 mL of *Titrant*, and 10 mL of 3 N *hydrochloric acid*, and titrate with *Back titrant*, adding 3 mL of *starch TS* as the endpoint is approached. Perform the *Blank* determination.

Calculate the percentage of reducing substances (as dextrose) in the portion of the *Sample* taken:

$$\text{Result} = \{[(V_B - V_S) \times N \times F]/W\} \times 100$$

V_B = *Back titrant* volume consumed by the *Blank* (mL)

V_S = *Back titrant* volume consumed by the *Sample* (mL)

N = actual *Back titrant* normality (mEq/mL)

F = equivalency factor, 27 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: NMT 1.0%

SPECIFIC TESTS

- **Loss on Drying** (731)

Analysis: Dry under vacuum at 105° for 4 h.

Acceptance criteria

Anhydrous: NMT 3.0%

Monohydrate: 6.0%–7.5%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight containers.
- **Labeling:** Label it to indicate whether it is the anhydrous or the monohydrate form.
- **USP Reference Standards** (11)

USP Potassium Gluconate RS

BRIEFING

Potassium Gluconate Oral Solution, *USP 38* page 4943. In preparation for the omission of the flame tests from *Identification Tests—General* (191), proposed in *PF 41(2)* [Mar.–Apr. 2015], the reference to (191) in *Identification* test *A* is deleted and a complete description of the flame test is included.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(NBDS: N. Davydova.)

Correspondence Number—C164837

Comment deadline: January 31, 2016

Potassium Gluconate Oral Solution**DEFINITION**

Potassium Gluconate Oral Solution contains NLT 95.0% and NMT 105.0% of the labeled amount of potassium gluconate (C₆H₁₁KO₇).

IDENTIFICATION**Delete the following:**

- ▲ ● ~~**A. Identification Tests—General**, *Potassium* (191): Meets the requirements of the flame test ▲*USP40*~~

Add the following:

- ▲ ● **A.** Potassium Gluconate Oral Solution imparts a violet color to a nonluminous flame. The presence of small quantities of sodium can mask the color unless the yellow color produced by sodium is screened out by viewing through a blue filter that blocks emission at 589 nm (sodium) but is transparent to emission at 404 nm (potassium). [Note—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.] ▲*USP40*

- **B.**

Analysis: Evaporate 5 mL on a steam bath to dryness.

Acceptance criteria: A mineral oil dispersion of the residue exhibits an IR absorption maximum in the spectral region of 6.2–6.25 μm (carboxylic acid salt).

ASSAY

• Procedure

Standard stock solution: Transfer 190.7 mg of *potassium chloride*, previously dried at 105° for 2 h, to a 1000-mL volumetric flask, add sufficient water to dissolve, and dilute with water to volume. Transfer 100.0 mL of this solution to a 1000-mL volumetric flask, and dilute with water to volume. This solution contains 10 $\mu\text{g/mL}$ of potassium (equivalent to 19.07 $\mu\text{g/mL}$ of potassium chloride).

Standard solutions: Transfer 10.0, 15.0, and 20.0 mL of *Standard stock solution* to separate 100-mL volumetric flasks. To each flask add 2.0 mL of a 200-mg/mL sodium chloride solution and 1.0 mL of hydrochloric acid. Dilute with water to volume, and mix. The *Standard solutions* contain 1.0, 1.5, and 2.0 $\mu\text{g/mL}$ of potassium, respectively.

Sample solution: Transfer an accurately measured volume of Oral Solution, equivalent to 1.8 g of potassium gluconate, to a 1000-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of the solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of the resulting solution to a 100-mL volumetric flask, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, dilute with water to volume, and mix.

Blank: Water

Instrumental conditions

(See *Spectrophotometry and Light-Scattering* (851).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 766.5 nm

Lamp: Potassium hollow-cathode

Flame: Air-acetylene

Analysis

Samples: *Standard solutions* and *Sample solution*

Determine the absorbances of the *Standard solutions* and the *Sample solution*. Plot the absorbance of the *Standard solutions* versus their concentrations, in $\mu\text{g/mL}$, of potassium, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C_K , in $\mu\text{g/mL}$, of potassium in the *Sample solution*. Calculate the percentage of the labeled amount of potassium gluconate ($\text{C}_6\text{H}_{11}\text{KO}_7$) in the portion of Oral Solution taken:

$$\text{Result} = (C_K/C_U) \times (M_r/A_r) \times 100$$

C_K = concentration of potassium in the *Sample solution*, determined from the linear regression line ($\mu\text{g/mL}$)

C_U = nominal concentration of potassium gluconate in the *Sample solution* ($\mu\text{g/mL}$)

M_r = molecular weight of potassium gluconate, 234.25

A_r = atomic weight of potassium, 39.10

Acceptance criteria: 95.0%–105.0%

SPECIFIC TESTS

- **Alcohol Determination** (611), *Method II*: 4.5%–5.5% of alcohol (C₂H₅OH)

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight, light-resistant containers.

BRIEFING

Potassium Gluconate Tablets, *USP 38* page 4943. In preparation for the omission of the flame tests from *Identification Tests—General* (191), proposed in *PF 41(2)* [Mar.–Apr. 2015], it is proposed to delete the reference to (191) under *Identification* test *B*, and replace it with a complete description of the flame test.

USP Potassium Gluconate RS

BRIEFING

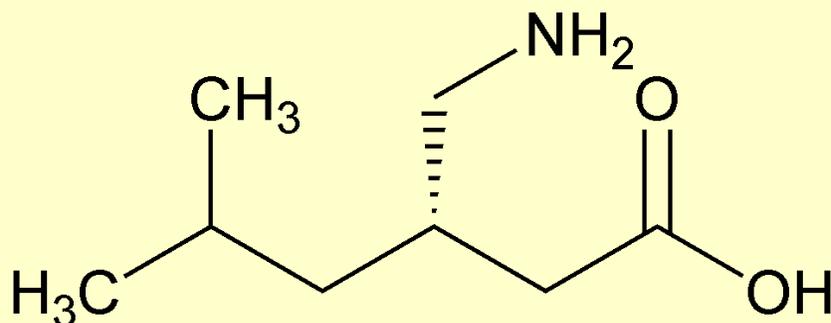

Pregabalin. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods of analysis, is proposed.

1. The liquid chromatographic procedure in the *Assay* and the test for *Organic Impurities* is based on analyses performed with the Inertsil ODS-3V brand of L1 column. The typical retention times for pregabalin in the *Assay* and the test for *Organic Impurities* are about 12 and 11 min, respectively.
2. The liquid chromatographic procedure in the test for *Enantiomeric Purity* is based on analyses performed with the Hypersil BDS C18 brand of L1 column. The typical retention time for pregabalin is about 9.5–11.5 min.

(CHM2: H. Cai.)

Correspondence Number—C136074; C137864

BRIEFING

Pseudoephedrine Sulfate, *USP 38* page 5080. As part of the USP monograph modernization initiative, and on the basis of comments received, it is proposed to make the following changes:

1. Add the chemical structure of pseudoephedrine sulfate to the monograph.

2. Revise the upper limit of the *Definition* from 100.5% to 102.0% to be consistent with the customary range afforded to HPLC assays of bulk active ingredients.
3. Replace the nonselective titration *Assay* with a stability-indicating HPLC-based method. The proposed liquid chromatographic procedure is based on analyses performed with the Pinnacle DB Biphenyl brand of L11 column. The typical retention time for pseudoephedrine is about 4 min.
4. Replace *Identification* test *B* that is based on spectroscopic absorption with an orthogonal test based on HPLC retention time in the *Assay*.
5. Replace the test for *Ordinary Impurities* with a stability-indicating HPLC procedure. The proposed liquid chromatographic procedure is based on analyses performed with the Pinnacle DB Biphenyl brand of L11 column. The typical retention times for ephedrine and pseudoephedrine are about 3.2 and 3.9 min, respectively.
6. Delete the test for *Melting Range or Temperature* because the proposed test for *Organic Impurities* and other tests adequately establish the identity, purity, and quality of the drug substance.
7. USP Ephedrine Sulfate RS is added to the *USP Reference Standards* section to support the proposed procedures.

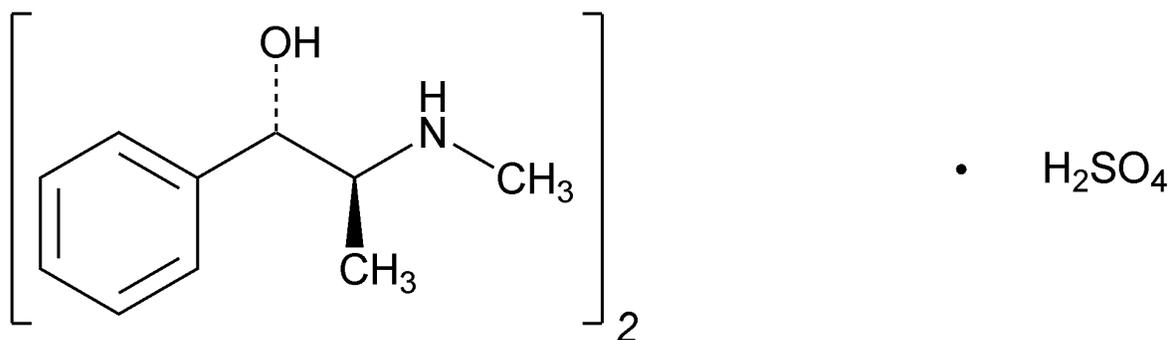

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Riboflavin Tablets

DEFINITION

Riboflavin Tablets contain NLT 95.0% and NMT 115.0% of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$).

ASSAY

Change to read:

- **Riboflavin Assay** (481),
▲ *Chemical Methods, Procedure 1* ▲*USP40*

Assay preparation:

▲ **Sample solution:** ▲*USP40*

Transfer a portion of the powder from NLT 20 finely powdered Tablets, equivalent to 20 mg of riboflavin, to a 250-mL flask, and add 150 mL of 0.1 N *hydrochloric acid*. Shake vigorously, and wash down the sides of the flask with sufficient 0.1 N *hydrochloric acid* to ensure that the pH remains below 1.5 during the subsequent period of heating. Heat the mixture on a steam bath, with frequent agitation, until the riboflavin has dissolved, or in an autoclave at 121° for 30 min. Cool, and with vigorous agitation, adjust the mixture with 1 N *sodium hydroxide* to a pH of 5–6. Transfer to a 1000-mL volumetric flask, and dilute with water to volume. If the solution is not clear, filter through paper known not to adsorb riboflavin. Dilute an aliquot of the clear solution with water to a final volume that contains 0.1 µg/mL of riboflavin.

Analysis: Proceed as directed in the chapter.

Calculate the percentage of the labeled amount of riboflavin ($C_{17}H_{20}N_4O_6$) in the portion of Tablets taken:

$$\text{Result} = (I_U/I_S) \times (C_S/C_U) \times 100$$

Comment deadline: January 31, 2016

Ringer's Injection

DEFINITION

Ringer's Injection is a sterile solution of Sodium Chloride, Potassium Chloride, and Calcium Chloride in Water for Injection. It contains, in each 100 mL, NLT 323.0 mg and NMT 354.0 mg of sodium (Na) [equivalent to NLT 820.0 mg and NMT 900.0 mg of sodium chloride (NaCl)]; NLT 14.9 mg and NMT 16.5 mg of potassium (K) [equivalent to NLT 28.5 mg and NMT 31.5 mg of potassium chloride (KCl)]; NLT 8.20 mg and NMT 9.80 mg of calcium (Ca) [equivalent to NLT 30.0 mg and NMT 36.0 mg of calcium chloride (CaCl₂·2H₂O)]; and NLT 523.0 mg and NMT 580.0 mg of chloride (Cl) [as sodium chloride (NaCl), potassium chloride (KCl), and calcium chloride (CaCl₂·2H₂O)]. It contains no antimicrobial agents.

[Note—The calcium, chloride, potassium, and sodium ion contents of Ringer's Injection are approximately 4.5, 156, 4, and 147.5 mEq/L, respectively.]

Sodium Chloride	8.6 g
Potassium Chloride	0.3 g
Calcium Chloride	0.33 g
Water for Injection, a sufficient quantity to make	1000 mL

Dissolve the three salts in the *Water for Injection*, filter until clear, place in suitable containers, and sterilize.

IDENTIFICATION

Change to read:

- **A. Identification Tests—General** (191), ~~*Sodium* (flame test), *Potassium* (flame test),~~

▲▲*USP40*

Calcium and *Chloride*: Meets the requirements of the ammonium oxalate test for *Calcium*, and the test for *Chloride*

Add the following:

- ▲● **B. Sodium:** A sample imparts an intense yellow color to a nonluminous flame. ▲*USP40*

Add the following:

- ▲● **C. Potassium:** A sample imparts a violet color to a nonluminous flame. The presence of

small quantities of sodium masks the color unless the yellow color produced by sodium is screened out by viewing through a blue filter that blocks the emission at 589 nm (sodium). It is transparent to emission at 404 nm (potassium). [Note—Traditionally, cobalt glass has been used, but other suitable filters are commercially available.]▲USP40

ASSAY

• Calcium

[Note—Concentrations of the *Standard solutions* and the *Sample solution* may be modified to fit the linear or working range of the atomic absorption spectrophotometer.]

Lanthanum chloride solution: Transfer 17.69 g of lanthanum chloride to a 200-mL volumetric flask, add 100 mL of water, and carefully add 50 mL of hydrochloric acid. Mix, and allow to cool. Dilute with water to volume.

Calcium stock solution: 1 mg/mL of calcium (Ca) prepared as follows. Transfer 499.5 mg of primary standard calcium carbonate to a 200-mL volumetric flask, and add 10 mL of water. Carefully add 5 mL of diluted hydrochloric acid, and swirl to dissolve the calcium carbonate. Dilute with water to volume.

Standard solutions: 0.010, 0.015, and 0.020 mg/mL of calcium (Ca) prepared as follows. To three separate 100-mL volumetric flasks, each containing 5.0 mL of *Lanthanum chloride solution*, add 1.0, 1.5, and 2.0 mL, respectively, of *Calcium stock solution*. Dilute the contents of each flask with water to volume.

Sample solution: Transfer 20.0 mL of Injection, equivalent to 1.8 mg of calcium (Ca), to a 100-mL volumetric flask containing 5.0 mL of *Lanthanum chloride solution*. Dilute with water to volume.

Blank: Transfer 5.0 mL of *Lanthanum chloride solution* to a 100-mL volumetric flask, and dilute with water to volume.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometer

Emission wavelength: Calcium emission line at 422.7 nm

Lamp: Calcium hollow-cathode

Flame: Air-acetylene

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*

Plot the absorbances of the *Standard solutions* versus the concentration, in mg/mL, of calcium, and draw the straight line best fitting the three plotted points. From the graph, determine the concentration (*C*), in mg/mL, of calcium in the *Sample solution*.

Calculate the quantity (mg) of calcium (Ca) in each 100 mL of Injection taken:

$$\text{Result} = C \times D \times F$$

C = concentration of calcium in the *Sample solution*, as determined from the graph (mg/mL)

D = dilution factor of the *Sample solution*, 5

F = conversion factor for each 100 mL of Injection, 100 mL

Acceptance criteria: 8.20–9.80 mg of calcium (Ca) in each 100 mL

- **Potassium**

Solution A: Suitable wetting agent (1 in 500)

Solution B: 10.93 mg/mL of sodium chloride in water

Standard stock solution: 100 µg/mL of potassium prepared as follows. Dissolve 190.7 mg of potassium chloride, previously dried at 105° for 2 h, in 50 mL of water, transfer to a 1-L volumetric flask, and dilute with water to volume.

Standard solutions: 0.005, 0.01, 0.015, and 0.020 mg/mL of potassium prepared as follows. Transfer 10 mL of *Solution B* to each of four 100-mL volumetric flasks containing 10.0 mL of *Solution A*. To each flask add, 5.0, 10.0, 15.0, and 20.0 mL of *Standard stock solution*, respectively, and dilute with water to volume.

Sample solution: Transfer 10 mL of Injection to a 100-mL volumetric flask. Add 10.0 mL of *Solution A*. Dilute with water to volume.

Blank: Transfer 10 mL of *Solution B* to a 100-mL volumetric flask containing 10.0 mL of *Solution A*. Dilute with water to volume.

Instrumental conditions

Mode: Atomic emission spectrophotometry

Emission wavelength: 766 nm

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank*

Set the flame photometer for maximum transmittance at a wavelength of 766 nm. Adjust the instrument to zero transmittance with the *Blank*. Adjust the instrument to 100% transmittance with the most concentrated of the *Standard solutions*. Read the percentage transmittance of the other *Standard solutions*, and plot transmittances versus concentration of potassium. Read the percentage transmittance of the *Sample solution*. Calculate the quantity (mg) of potassium (K) in each 100 mL of Injection.

Acceptance criteria: 14.9–16.5 mg of potassium (K) in each 100 mL

- **Sodium**

Solution A: Suitable nonionic wetting agent (1 in 500)

Standard stock solution: 100 µg/mL of sodium in water prepared as follows. Dissolve 254.2 mg of sodium chloride, previously dried at 105° for 2 h, in 50 mL of water. Transfer the resulting solution to a 1-L volumetric flask, and dilute with water to volume.

Standard solutions: 0.005, 0.010, 0.015, and 0.020 mg/mL of sodium prepared as follows. Transfer 10 mL of *Solution A* to each of four 100-mL volumetric flasks. To each flask add 5.0, 10.0, 15.0, and 20.0 mL of *Standard stock solution*, respectively, and dilute with water to volume.

Sample solution: Transfer 5 mL of Injection into a 1-L volumetric flask containing 100 mL of *Solution A*. Dilute with water to volume.

Blank: Transfer 10 mL of *Solution A* to a 100-mL volumetric flask. Dilute with water to volume.

Instrumental conditions

Mode: Atomic emission spectrophotometry

Emission wavelength: 589 nm

Analysis

Samples: *Standard solutions, Sample solution, and Blank*

Set the flame photometer for maximum transmittance at a wavelength of 589 nm. Adjust the instrument to zero transmittance with the *Blank*. Adjust the instrument to 100% transmittance with the most concentrated of the *Standard solutions*. Read the percentage transmittance of the other *Standard solutions*, and plot transmittances versus concentration of sodium. Read the percentage transmittance of the *Sample solution*. Calculate the quantity (mg) of sodium (Na) in each 100 mL of Injection.

Acceptance criteria: 323.0–354.0 mg of sodium (Na) in each 100 mL

• Chloride

Sample solution: Transfer 10 mL of Injection into a conical flask. Add 10 mL of glacial acetic acid, 75 mL of methanol, and 3 drops of eosin Y TS.

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N silver nitrate VS

Endpoint detection: Visual

Analysis

Sample: *Sample solution*

Titrate, with shaking, with *Titrant* to a pink endpoint. Each mL of *Titrant* is equivalent to 3.545 mg of chloride (Cl). Calculate the quantity (mg) of chloride (Cl) in each 100 mL of Injection.

Acceptance criteria: 523.0–580.0 mg of chloride (Cl) in each 100 mL

IMPURITIES

Delete the following:

- ~~• **Heavy Metals** (231): Evaporate 67 mL to a volume of 20 mL, add 2 mL of 1-N acetic acid, and dilute with water to 25 mL: NMT 0.3 ppm. (Official 1-Jan-2018)~~

SPECIFIC TESTS

- **Bacterial Endotoxins Test** (85): It contains NMT 0.5 USP Endotoxin Unit/mL
- **pH** (791): 5.0–7.5
- **Other Requirements:** It meets the requirements under *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Package in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.
- **Labeling:** The label states the total osmolar concentration in mOsmol/L. Where the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in

mOsmol/mL.

Delete the following:

▲ Secobarbital Sodium Injection

» Secobarbital Sodium Injection is a sterile solution of Secobarbital Sodium in a suitable solvent. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{12}H_{17}N_2NaO_3$.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light, in a refrigerator.

Labeling—The label indicates that the Injection is not to be used if it contains a precipitate.

~~USP Reference standards (11)—~~

~~USP Secobarbital RS~~

~~USP Endotoxin RS~~

Identification—

A: Transfer a volume of Injection, equivalent to about 100 mg of secobarbital sodium, to a separator containing 15 mL of water. Render the mixture distinctly acid to litmus with hydrochloric acid, extract the liberated secobarbital with 25 mL of ether, collect the ether extract in a separator, and wash with 10 mL of water. Discard the water solution. Filter the ether extract into a beaker, and evaporate on a steam bath with the aid of a current of air just to dryness. Dissolve the residue in 3 mL of alcohol, and evaporate to dryness. Repeat the dissolution and evaporation with 3 mL of alcohol, and dry the residue at 100° for 2 hours: the IR absorption spectrum of a solution prepared by dissolving the residue of secobarbital so obtained in chloroform to a concentration of about 50 mg per mL, 0.1-mm sodium chloride cells being used and chloroform being used as the blank, exhibits maxima only at the same wavelengths as that of a similar preparation of *USP Secobarbital RS*.

B: It responds to the flame test for *Sodium* (191).

~~Bacterial endotoxins (85)—~~It contains not more than 0.9 USP Endotoxin Unit per mg of secobarbital sodium.

~~pH (791): between 9.0 and 10.5.~~

~~**Other requirements**—It meets the requirements under *Injections* (1).~~

~~**Assay**~~

~~*Buffer solution*— Dissolve 6.19 g of boric acid and 14.91 g of potassium chloride in water, dilute with water to 200 mL, and mix. After 24 hours, filter if necessary to obtain a clear solution.~~

~~*Standard preparation 1*— Dissolve a suitable quantity of *USP Secobarbital RS*, accurately weighed, in 0.5 N sodium hydroxide to obtain a solution having a known concentration of about 23 µg per mL.~~

~~*Standard preparation 2*— Mix 5.0 mL of *Standard preparation 1* with 5.0 mL of *Buffer solution*.~~

~~*Assay preparation 1*— Transfer an accurately measured volume of *Injection*, equivalent to about 50 mg of secobarbital sodium, to a 100 mL volumetric flask, dilute with 0.5 N sodium hydroxide to volume, and mix. Pipet 5 mL of this solution into a 100 mL volumetric flask, add 0.5 N sodium hydroxide to volume, and mix.~~

~~*Assay preparation 2*— Mix 5.0 mL of *Assay preparation 1* with 5.0 mL of *Buffer solution*.~~

~~*Procedure*— Concomitantly determine the absorbances of *Assay preparation 1* and *Standard preparation 1* in 1-cm cells at 260 nm, with a suitable spectrophotometer, using 0.5 N sodium hydroxide as the blank. Similarly determine the absorbances of *Assay preparation 2* and *Standard preparation 2*, using as the blank a mixture of equal volumes of 0.5 N sodium hydroxide and *Buffer solution*. Calculate the quantity, in mg, of $C_{12}H_{17}N_2NaO_3$ in the volume of *Injection* taken by the formula:~~

$$1.092(2C)(A_U - 2a_U) / (A_S - 2a_S)$$

~~in which 1.092 is the ratio of the molecular weight of sodium secobarbital to that of secobarbital, C is the concentration, in µg per mL, of *USP Secobarbital RS* in *Standard preparation 1*, A_U and A_S are the absorbances of *Assay preparation 1* and *Standard preparation 1*, respectively, and a_U and a_S are the absorbances of *Assay preparation 2* and *Standard preparation 2*, respectively. ▲*USP40*~~

Identification—

A: ~~Suspend the contents of 1 Capsule in 10 mL of water, and filter: the filtrate responds to the~~

flame test for *Sodium* (191):

B: The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those of the *Standard preparation* obtained in the *Assay*.

Dissolution (711):

Medium: water; 500 mL.

Apparatus 1: 100 rpm.

Time: 60 minutes.

Procedure— Determine the total amount of $C_{12}H_{17}N_2NaO_3$ and $C_{11}H_{17}N_2NaO_3$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 239 nm of filtered portions of the solution under test, suitably diluted with 0.1 N sodium hydroxide, in comparison with a Standard solution having known concentrations of about 7.5 µg each per mL, of *USP Secobarbital RS* and *USP Amobarbital RS* in the same medium. An amount of alcohol not to exceed 1% of the total volume of the Standard solution may be used to dissolve the Reference Standards prior to dilution with water and 0.1 N sodium hydroxide.

Tolerances— Not less than 60% (Q) of the labeled total amount of $C_{12}H_{17}N_2NaO_3$ and $C_{11}H_{17}N_2NaO_3$ is dissolved in 60 minutes.

Uniformity of dosage units (905): meet the requirements for *Content Uniformity* with respect to secobarbital sodium and to amobarbital sodium.

Assay—

Internal standard solution— Dissolve aprobarbital in chloroform to obtain a solution having a concentration of about 0.75 mg per mL.

Standard preparation— Transfer about 92 mg of *USP Secobarbital RS*, and about 91 mg of *USP Amobarbital RS*, both accurately weighed, to a 100 mL volumetric flask, and dissolve in 50 mL of chloroform. Dilute with chloroform to volume, and mix.

Assay preparation— Remove, as completely as possible, the contents of not less than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of secobarbital sodium, to a separator, add 20 mL of water, 1 mL of hydrochloric acid, and 100.0 mL of chloroform, and shake for 3 minutes. Remove the chloroform layer, and use as directed in the *Procedure*.

Chromatographic system (see *Chromatography* (621))— The gas chromatograph is equipped with a flame ionization detector and contains a 0.6-m × 3.5-mm glass column packed with 3 percent liquid phase G10 on 100 to 120 mesh support S1AB. The column is maintained at about 175°, the injection port at about 235°, the detector block at about 245°, and dry helium is used as the carrier gas at a flow rate of about 55 mL per minute. Chromatograph five replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2%; the resolution factor between amobarbital and the internal standard is not less than 1.5; the resolution factor between amobarbital and secobarbital is not less than 2.5; and the tailing factor does not exceed 1.5 for any of the three peaks.

Procedure— Mix 5.0 mL of the *Standard preparation* with 5.0 mL of the *Internal standard solution*. Mix 5.0 mL of the *Assay preparation* with 5.0 mL of the *Internal standard solution*. Separately inject equal volumes (about 3 μ L) of the resulting solutions into the chromatograph, and record the chromatograms. Measure the responses for the major peaks. The relative retention times with respect to the internal standard are about 1.3 for amobarbital and 1.8 for secobarbital. Calculate the quantity, in mg, of secobarbital sodium ($C_{12}H_{17}N_2NaO_3$) in the portion of Capsules taken by the formula:

$$(260.27 / 238.28)W(R'_U / R'_S)$$

in which 260.27 and 238.28 are the molecular weights of secobarbital sodium and secobarbital, respectively, W is the weight, in mg, of *USP Secobarbital RS* taken for the *Standard preparation*, and R'_U and R'_S are the ratios of the peak response of secobarbital to that of the internal standard in the *Assay preparation* and the *Standard preparation*, respectively. Similarly calculate the quantity, in mg, of amobarbital sodium ($C_{11}H_{17}N_2NaO_3$) in the portion of Capsules taken by the formula:

$$(248.26 / 226.28)W''(R''_U / R''_S)$$

in which 248.26 and 226.28 are the molecular weights of amobarbital sodium and amobarbital, respectively, W'' is the weight, in mg, of *USP Amobarbital RS* taken for the *Standard preparation*, and R''_U and R''_S are the ratios of the peak response of amobarbital to that of the internal standard obtained from *Assay preparation* and the *Standard preparation*, respectively.

▲USP40

BRIEFING

Selamectin. Because there is no existing *USP* monograph for this drug substance, a new monograph, based on validated methods of analysis, is proposed. The HPLC procedures in the *Assay* and in the test for *Organic Impurities* are based on analyses performed with the Waters Nova-Pac C18 brand of L1 column. The typical retention times for selamectin are about 9 min in the *Assay* and about 22 min in the test for *Organic Impurities*.

BRIEFING

Sodium Citrate and Citric Acid Oral Solution, *USP 38* page 5317. It is proposed to make the following revisions to the monograph:

1. In preparation for the omission of the flame tests from *Identification Tests—General* (191), proposed in PF 41(2) [Mar.–Apr. 2015], it is proposed to delete the reference to (191) under *Identification* test A, and replace it with a complete description of the flame test. Manufacturers are encouraged to submit replacement wet chemistry or instrumental procedures for consideration by the Expert Committee.
2. Add the ratio of the pyridine and acetic anhydride mixture under *Identification* test D.
3. Revise the equations in the *Assay* for *Sodium*, for *Sodium Citrate*, and for *Citric Acid* to be consistent with the *Definition* section.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Sodium Citrate and Citric Acid Oral Solution

DEFINITION

Sodium Citrate and Citric Acid Oral Solution is a solution of Sodium Citrate and Citric Acid in a suitable aqueous medium. It contains, in each 100 mL, NLT 2.23 g and NMT 2.46 g of sodium (Na), and NLT 6.11 g and NMT 6.75 g of citrate ($C_6H_5O_7$), equivalent to NLT 9.5 g and NMT 10.5 g of sodium citrate dihydrate ($C_6H_5Na_3O_7 \cdot 2H_2O$), and NLT 6.34 g and NMT 7.02 g of citric acid monohydrate ($C_6H_8O_7 \cdot H_2O$).

IDENTIFICATION

Delete the following:

- ▲ ● ~~A. Identification Tests—General (191), Sodium: Meets the requirement of the flame test~~
▲USP40

Add the following:

- ▲ ● A. Sodium Citrate and Citric Acid Oral Solution imparts an intense yellow color to a nonluminous flame. ▲USP40
- B.
Sample solution: 2 mL of Oral Solution
Analysis: Add 2 mL of 15% *potassium carbonate TS* to the *Sample solution*, boil, and cool. Add 4 mL of *potassium pyroantimonate TS*.
Acceptance criteria: A dense precipitate is formed (indicates the presence of sodium).
- C.
Sample solution: A dilution of Oral Solution (1 in 20)
Analysis: Add 5 mL of *sodium cobaltinitrite TS* to 2 mL of *Sample solution*.
Acceptance criteria: A yellow precipitate is not formed immediately (indicates the absence of potassium).

Change to read:

Sodium stock solution: 58.44 mg/mL of *sodium chloride* prepared as follows. Transfer 14.61 g of *sodium chloride*, previously dried at 105° for 2 h, to a 250-mL volumetric flask. Dilute with *water* to volume.

Potassium stock solution: 74.56 mg/mL of *potassium chloride* prepared as follows. Transfer 18.64 g of *potassium chloride*, previously dried at 105° for 2 h, to a 250-mL volumetric flask. Dilute with *water* to volume.

Diluent: 1.04 mg/mL of *lithium nitrate* in *water* (equivalent to 15 mEq per 1000 mL of lithium) with a suitable nonionic surfactant

Standard stock solution: Pipet 50 mL of the *Sodium stock solution* and 50 mL of the *Potassium stock solution* into a 500-mL volumetric flask and dilute with *water* to volume.

Standard solution: Dilute 50 µL of the *Standard stock solution* with *Diluent* to 10 mL.

Sample stock solution: Transfer a volume of Oral Solution, equivalent to 1 g of sodium citrate dihydrate, to a 100-mL volumetric flask and dilute with *water* to volume.

Sample solution: Dilute 50 µL of the *Sample stock solution* with *Diluent* to 10 mL.

Blank: *Diluent*

Instrumental conditions

Mode: Flame photometry

Analytical wavelength: Sodium emission line at 589 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Adjust the flame photometer to read zero with the *Diluent*. Concomitantly determine the sodium flame emission readings for the *Standard solution* and the *Sample solution*.

Calculate the quantity, in g, of Na in each mL of Oral Solution:

$$\text{Result} = (14.61/25V) \times (22.99/58.44) \times (R_{U,Na}/R_{S,Na})$$

V = volume of the Oral Solution taken to prepare the *Sample stock solution* (mL)

$R_{U,Na}$ = sodium emission reading of the *Sample solution*

$R_{S,Na}$ = sodium emission reading of the *Standard solution*

▲ Calculate the quantity (g) of sodium (Na) in 100 mL of Oral Solution taken:

$$\text{Result} = (R_{U, Na} / R_{S, Na}) \times (W/V) \times F \times (A_r / M_r) \times F_1$$

$R_{U, Na}$ = sodium emission reading of the *Sample solution*

$R_{S, Na}$ = sodium emission reading of the *Standard solution*

W = weight of sodium chloride in the *Sodium stock solution* (g)

V = volume of Oral Solution taken (mL)

F = ratio of the dilution factor of the *Sample solution* to the *Standard solution*, 0.04

A_r = atomic weight of sodium, 22.99

M_r = molecular weight of sodium chloride, 58.44

F_1 = conversion factor for each 100 mL of Oral Solution, 100 mL \blacktriangle USP40

Acceptance criteria: 2.23–2.46 g of sodium (Na) in each 100 mL of Oral Solution

Change to read:

• Sodium Citrate

Cation-exchange column: Mix 10 g of *styrene-divinylbenzene cation-exchange resin* with 50 mL of *water* in a suitable beaker. Allow the resin to settle and decant the supernatant until a slurry of resin remains. Pour the slurry into a 15-mm × 30-cm glass chromatographic tube (having a sealed-in, coarse-porosity fritted disk and fitted with a stopcock), and allow to settle as a homogeneous bed. Wash the resin bed with about 100 mL of *water*, closing the stopcock when the *water* level is about 2 mm above the resin bed.

Sample solution: Transfer a volume of Oral Solution, equivalent to 1 g of sodium citrate dihydrate, to a 100-mL volumetric flask and dilute with *water* to volume.

Titrimetric system

Mode: Direct titration

Titrant: 0.02 N sodium hydroxide VS

Endpoint detection: Visual

Analysis

Sample: *Sample solution*

Pipet 5 mL of the *Sample solution* carefully onto the top of the resin bed in the *Cation-exchange column*. Place a 250-mL conical flask below the column, open the stopcock, and allow to flow until the solution has entered the resin bed. Elute the column with 60 mL of *water* at a flow rate of about 5 mL/min, collecting about 65 mL of the eluate. Add 5 drops of *phenolphthalein TS* to the eluate, swirl the flask, and titrate with *Titrant*. Record the buret reading and calculate the volume of *Titrant* consumed.

Calculate the quantity (mg) of sodium citrate dihydrate ($C_6H_5Na_3O_7 \cdot 2H_2O$) in each mL of the Oral Solution:

$$\text{Result} = [1.961 \times B \times (20/V)] \div [(294.10/210.14) \times C]$$

B = volume of Titrant

V = volume of the Oral Solution taken (mL)

~~C = concentration of citric acid monohydrate from the Oral Suspension in the Sample solution, as obtained in the Assay for Citric Acid (mg/mL)~~

- ▲ Calculate the quantity (g) of sodium citrate dihydrate ($C_6H_5Na_3O_7 \cdot 2H_2O$) in 100 mL of the Oral Solution taken:

$$\text{Result} = \{[V \times N \times F \times (D/V_S)] - [(M_{r1}/M_{r2}) \times C]\} \times F_1 \times F_2$$

V = volume of Titrant consumed by the Sample solution (mL)

N = actual normality of the Titrant (mEq/mL)

F = equivalency factor, 98.05 mg/mEq for sodium citrate dihydrate

D = dilution factor of the Sample solution, 20

V_S = volume of Oral Solution taken (mL)

M_{r1} = molecular weight of sodium citrate dihydrate, 294.10

M_{r2} = molecular weight of citric acid monohydrate, 210.14

C = concentration of citric acid monohydrate in the Sample solution, as obtained in the Assay for Citric Acid (mg/mL)

F_1 = conversion factor from mg to g, 0.001

F_2 = conversion factor for each 100 mL of Oral Solution, 100 mL ▲USP40

Acceptance criteria: 9.5–10.5 g of sodium citrate dihydrate ($C_6H_5Na_3O_7 \cdot 2H_2O$) in each 100 mL of Oral Solution

Change to read:

● Citric Acid

Sample solution: Transfer a volume of Oral Solution, equivalent to 0.67 g of citric acid monohydrate, to a 100-mL volumetric flask and dilute with water to volume.

Titrimetric system

Mode: Direct titration

Titrant: 0.02 N sodium hydroxide VS

Endpoint detection: Visual

Analysis

Sample: Sample solution

Transfer 5 mL of the Sample solution to a suitable flask. Add 25 mL of water and 5 drops of phenolphthalein TS. Titrate with Titrant to a pink endpoint. Record the buret reading and calculate the volume of Titrant consumed.

~~Calculate the quantity (mg) of citric acid ($C_6H_8O_7 \cdot H_2O$) in each mL of the Oral Solution:~~

~~$$\text{Result} = 1.401 \times A \times (20/V)$$~~

~~A = volume of Titrant consumed (mL)~~

~~V = volume of Oral Solution taken (mL)~~

- ▲ Calculate the quantity (g) of citric acid monohydrate ($C_6H_8O_7 \cdot H_2O$) in 100 mL of the Oral Solution taken:

$$\text{Result} = V \times N \times F \times (D/V_S) \times F_1 \times F_2$$

V = volume of *Titrant* consumed by the *Sample solution* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 70.05 mg/mEq for citric acid monohydrate

D = dilution factor of the *Sample solution*, 20

V_S = volume of Oral Solution taken (mL)

F_1 = conversion factor from mg to g, 0.001

F_2 = conversion factor for each 100 mL of Oral Solution, 100 mL \blacktriangle *USP40*

Acceptance criteria: 6.34–7.02 g of citric acid monohydrate ($C_6H_8O_7 \cdot H_2O$) in each 100 mL of Oral Solution

Sulfadoxine and Pyrimethamine Tablets

DEFINITION

Sulfadoxine and Pyrimethamine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of sulfadoxine ($C_{12}H_{14}N_4O_4S$) and NLT 90.0% and NMT 110.0% of the labeled amount of pyrimethamine ($C_{12}H_{13}ClN_4$).

IDENTIFICATION

Change to read:

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solutions* for pyrimethamine and sulfadoxine, ~~relative to the internal standard,~~
▲▲USP40
as obtained in the *Assay*.

- **B.**

Diluent: Ammonium hydroxide and methanol (1 in 50)

Standard solution A: 10 mg/mL of USP Sulfadoxine RS in *Diluent*

Standard solution B: 0.5 mg/mL of USP Pyrimethamine RS in *Diluent*

Sample solution: Vigorously shake 700 mg of finely ground Tablet powder with 50 mL of *Diluent* for 3 min, and filter.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 μ L

Developing solvent system: Heptane, chloroform, solution of methanol in alcohol (1 in 20), and glacial acetic acid (4:4:4:1)

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Allow the solvent front to move about two-thirds of the length of the plate, remove the plate, dry, and examine under short-wavelength UV light.

Acceptance criteria: The R_F values of the principal spots from the *Sample solution* correspond to the R_F values of the principal spots from the corresponding *Standard solutions*.

ASSAY**Change to read:**

- **Procedure**

Solution A: 1 mL of phosphoric acid in 1000 mL of water

Mobile phase: Acetonitrile and *Solution A* (17:83)

Standard solution: 0.4 mg/mL of USP Sulfadoxine RS and 0.02 mg/mL of USP Pyrimethamine RS prepared as follows. Transfer suitable amounts of USP Sulfadoxine RS and USP Pyrimethamine RS to a suitable volumetric flask. Dissolve in acetonitrile using about 17% of the final flask volume, then dilute with *Solution A* to volume.

Sample stock solution: Transfer an equivalent of about 200 mg sulfadoxine and 10 mg pyrimethamine from NLT 10 finely powdered Tablets to a 100-mL volumetric flask. Add about 28 mL of acetonitrile and sonicate for about 30 min. Allow to cool and dilute with *Solution A* to volume.

Sample solution: Nominally 0.4 mg/mL of sulfadoxine and 0.02 mg/mL of pyrimethamine in

Mobile phase from *Sample stock solution*. Pass through a PVDF filter of 0.45- μ m pore size. Discard the first 5 mL and use the remaining filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

▲ Testosterone Topical Gel

DEFINITION

Testosterone Topical Gel contains NLT 90.0% and NMT 110.0% of the labeled amount of testosterone ($C_{19}H_{28}O_2$).

IDENTIFICATION

- **A.** The UV spectrum of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **Procedure**

Mobile phase: *Acetonitrile* and water (50:50)

System suitability stock solution: 400 µg/mL of USP Testosterone Related Compound A RS in *acetonitrile*

Standard stock solution: 0.4 mg/mL of USP Testosterone RS in *acetonitrile*

System suitability solution: 16 µg/mL each of USP Testosterone RS and USP Testosterone Related Compound A RS from the *Standard stock solution* and the *System suitability stock solution*, respectively, in *Mobile phase*

Standard solution: 0.04 mg/mL of USP Testosterone RS from the *Standard stock solution* in *Mobile phase*

Sample solution: Transfer 200 mg of the Gel to a 100-mL volumetric flask and dilute with *Mobile phase* to volume. Sonicate to dissolve.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 245 nm. For *Identification* test A, use a diode-array detector in the range of 200–400 nm.

Column: 4.6-mm × 15-cm column; 3-µm packing L1

Flow rate: 1 mL/min

Injection volume: 10 µL

Run time: NLT 2 times the retention time of testosterone

System suitability

Samples: *System suitability solution* and *Standard solution*

[Note—The relative retention times for testosterone and testosterone related compound A are 1.0 and 1.2, respectively.]

Suitability requirements

Resolution: NLT 1.5 between testosterone and testosterone related compound A, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of testosterone (C₁₉H₂₈O₂) in the portion of Gel taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of testosterone from the *Sample solution*

r_S = peak response of testosterone from the *Standard solution*

C_S = concentration of USP Testosterone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of Testosterone in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **Uniformity of Dosage Units** (905): Meets the requirements for gels packaged in single-dose containers

IMPURITIES

- **Organic Impurities**

Mobile phase: *Acetonitrile, methanol, and water (40:10:50)*

System suitability solution: 0.4 µg/mL each of USP Testosterone Related Compound A RS and USP Testosterone Related Compound C RS in *Mobile phase*

Standard stock solution: 0.2 mg/mL of USP Testosterone RS in *acetonitrile*

Standard solution: 0.4 µg/mL of USP Testosterone RS from the *Standard stock solution* in *Mobile phase*

Sample solution: Transfer 1 g of the Gel to a 50-mL volumetric flask and dilute with *Mobile phase* to volume. Sonicate to dissolve.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 250 nm

Column: 4.6-mm × 15-cm column; 3-µm packing *L1*
[Note—A suitable guard column may be used.]

Flow rate: 0.8 mL/min

Injection volume: 20 µL

Run time: NLT 1.5 times the retention time of testosterone

System suitability

Samples: *System suitability solution* and *Standard solution*
[Note—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 1.5 between testosterone related compound A and testosterone related compound C, *System suitability solution*

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of testosterone related compound A in the portion of Gel taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 1/T \times 100$$

r_U = peak response of testosterone related compound A from the *Sample solution*

r_S = peak response of testosterone from the *Standard solution*

C_S = concentration of USP Testosterone RS in *Standard solution* (mg/mL)

C_U = nominal concentration of testosterone in the *Sample solution* (mg/mL)

T = amount of testosterone determined in the *Assay* (g/100g of gel)

Calculate the percentage of any individual unspecified degradation product in the portion of Gel taken:

$$\text{Result} = (r_U/r_S) \times 100$$

r_U = peak response of the individual unspecified degradation product from the *Sample solution*

r_S = peak response of testosterone from the *Sample solution*

Acceptance criteria: See *Table 1*. Disregard peaks less than 0.05%.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Testosterone related compound I ^{a,b}	0.82	—
Testosterone	1.0	—
Testosterone related compound A	1.3	0.5
Testosterone related compound C ^a	1.4	—
Any individual unspecified degradation product	—	0.2
Total degradation products	—	1.5

^a This is a process impurity and is included in the table for identification only. It is not to be reported or included in the total degradation products.

^b Testosterone-6-ene; 17 β -Hydroxyandrosta-4,6-dien-3-one.

SPECIFIC TESTS

- **Viscosity—Rotational Methods** (912)

Sample: Transfer 100 mL of the Gel to a 100-mL beaker and adjust the temperature of the Gel to $20 \pm 2^\circ$.

Analysis: Use a suitable rotational viscometer with a spindle having a disk that is 1.46 cm in diameter and 0.16 cm in height, with an immersion depth of 4.92 cm. Allow the spindle to rotate in the Gel at 10 rpm for 30 s, and then observe the scale reading. Convert the scale reading to centipoises by multiplying by the constant for the spindle and speed used.

Acceptance criteria: 9000–33,000 centipoises

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers. Store at controlled room temperature.

- **USP Reference Standards** (11)

BRIEFING

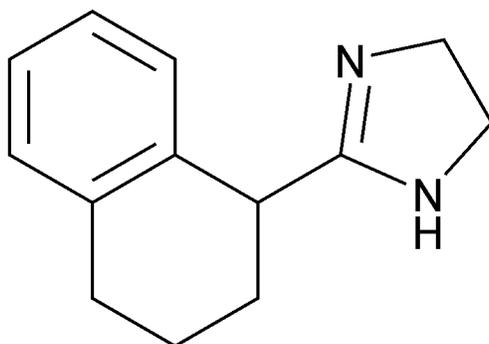

Tetrahydrozoline Hydrochloride, *USP 38* page 5520. As part of the USP monograph modernization effort, it is proposed to make the following changes:

1. *Identification* test *A* is revised to include *Infrared Absorption* (197A).
2. The titration procedure in the *Assay* is replaced with a validated HPLC procedure based on analyses performed with the Waters XBridge C18 brand of L1 column. The typical retention time for tetrahydrozoline is about 4.5 min.
3. The acceptance criteria in the *Definition* is revised from 98.0%–100.5% to 98.0%–102.0%, which is typical for HPLC procedures.
4. The UV procedure in *Identification* test *B* is replaced with a retention time agreement based on the *Assay*.
5. The nonspecific test for *Ordinary Impurities* is replaced with a GC procedure in the test for *Organic Impurities* based on the current monograph for *Tetrahydrozoline Hydrochloride* in the *European Pharmacopoeia*. The GC procedure in the test for *Organic Impurities* is based on analyses performed with the Agilent HP-1 brand of G1 column. The typical retention time for tetrahydrozoline is about 12 min.
6. The storage temperature is added in the *Packaging and Storage* section.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(CHM6: F. Mao.)

Thiamine Hydrochloride Tablets

DEFINITION

Thiamine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$).

IDENTIFICATION• **A.**

Sample solution: Triturate a quantity of powdered Tablets, equivalent to 10 mg of thiamine hydrochloride, with 10 mL of 0.5 N *sodium hydroxide*, and filter.

Analysis: To 5 mL of the *Sample solution* add 0.5 mL of *potassium ferricyanide TS* and 5 mL of *isobutyl alcohol*, shake the mixture vigorously for 2 min, and allow the liquid layers to separate. Illuminate from above by a vertical beam of UV light, and observe the air-liquid meniscus at a right angle to this beam.

Acceptance criteria: The air-liquid meniscus shows a vivid blue fluorescence, which disappears when the mixture is slightly acidified, but reappears when it is again made alkaline.

• **B.**

Sample solution: Triturate a quantity of powdered Tablets, equivalent to 10 mg of thiamine hydrochloride, with 10 mL of water, and filter.

Analysis 1: To 2 mL of the *Sample solution* add *iodine TS*.

Acceptance criteria 1: A red-brown precipitate is formed.

Analysis 2: To 2 mL of the *Sample solution* add *mercuric chloride TS*.

Acceptance criteria 2: A white precipitate is formed.

Analysis 3: *Identification Tests—General* (191), *Chloride*.

Acceptance criteria 3: Meet the requirements

• **C.**

Sample solution: Use the remainder of the *Sample solution* from *Identification* test *B*.

Analysis: Add 1 mL of lead acetate TS and 1 mL of 2.5 N sodium hydroxide.

Acceptance criteria: A yellow color is produced. Heat the mixture for several min on a steam bath: the color changes to brown, and, on standing, a precipitate of lead sulfide separates.

ASSAY**Change to read:**• **Thiamine Assay** (531),

▲ *Chemical Methods, Procedure 1* ▲ *USP40*

Assay preparation:

▲ **Sample solution:** ▲ *USP40*

Place NLT 20 Tablets in a flask of suitable size, half fill the flask with 0.2 N *hydrochloric acid*, and heat on a steam bath, with frequent agitation, until the Tablets have dissolved or have disintegrated so that a uniform dispersion is obtained. Cool, transfer the contents of the flask to a volumetric flask, and dilute with 0.2 N *hydrochloric acid* to volume. If the

mixture is not clear, either centrifuge it or filter it through paper known not to adsorb thiamine. Dilute a portion of the clear solution with 0.2 N *hydrochloric acid* to obtain a 0.2- $\mu\text{g}/\text{mL}$ solution of thiamine hydrochloride.

Analysis: Proceed as directed in the chapter.

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **Dissolution** (711), *Procedure, Apparatus 1 and 2, Procedure for a Pooled Sample*

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Standard solution: A known concentration of USP Thiamine Hydrochloride RS in *Medium*

Sample solution: Filtered portion of the solution under test, suitably diluted with the *Medium* if necessary

Mobile phase: A mixture of methanol, *glacial acetic acid*, and water (27:1:73) containing 1.40 mg/mL of *sodium 1-hexanesulfonate*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of thiamine hydrochloride ($\text{C}_{12}\text{H}_{17}\text{ClN}_4\text{OS}\cdot\text{HCl}$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S \times D \times V/L) \times 100$$

r_U = peak area of thiamine from the *Sample solution*

r_S = peak area of thiamine from the *Standard solution*

C_S = concentration of USP Thiamine Hydrochloride RS in the *Standard solution* (mg/mL)

D = dilution factor for the *Sample solution*

V = volume of *Medium*, 900 mL

L = labeled claim of thiamine hydrochloride (mg/Tablet)

Tolerances: NLT 75% (Q) of the labeled amount of thiamine hydrochloride ($C_{12}H_{17}ClN_4OS \cdot HCl$) is dissolved.

- **Uniformity of Dosage Units** (905): Meet the requirements

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in tight, light-resistant containers.
- **USP Reference Standards** (11)
USP Thiamine Hydrochloride RS

BRIEFING

Citrulline. Because there is no existing *USP* monograph for this dietary ingredient, a new monograph is being proposed. The liquid chromatographic procedures in the *Assay* and the test for *Related Compounds* are based on analyses performed with the GL Sciences Inertsil ODS-3V brand of L1 column. The typical retention times for citrulline and *N*-acetyl-leucine are 3.8 and 9.3 min, respectively.

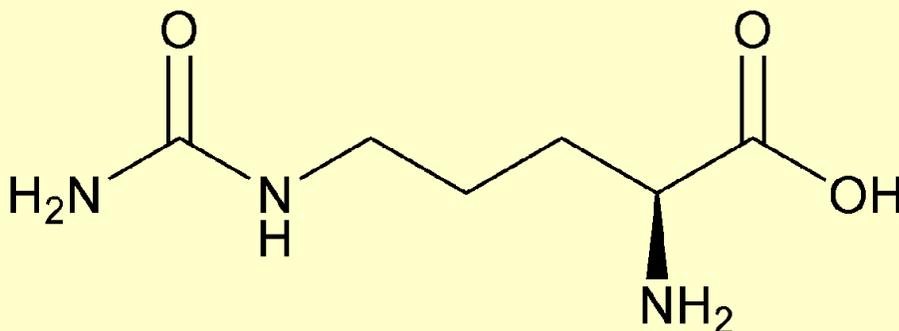

(NBDS: H. Dinh.)

Correspondence Number—C158693

Comment deadline: January 31, 2016

Add the following:

▲ Citrulline

$C_6H_{13}N_3O_3$ 175.19

(*S*)-2-Amino-5-ureidopentanoic acid;
L-Citrulline [372-75-8].

DEFINITION

Citrulline contains NLT 98.0% and NMT 102.0% of L-citrulline ($C_6H_{13}N_3O_3$), calculated on the dried basis.

IDENTIFICATION

- **A. Infrared Absorption** (197K)

- **B.** It meets the requirements in *Specific Tests for Optical Rotation* (781S), *Procedures, Specific Rotation*.
- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **Procedure**

Solution A: 10 mM octanesulfonic acid sodium salt in water. Adjust with dilute phosphoric acid (1 in 10) to a pH of 2.5.

Solution B: Acetonitrile

Mobile phase: Gradient elution. See *Table 1*.

BRIEFING

Rutin, USP 38 page 6204. On the basis of comments received, it is proposed to modify the gradient elution in *Table 1* in order to improve the robustness of the *Quercetin and Other Related Compounds* test. Typical retention times for rutin, kaempferol 3-rutinoside, isoquercitroside, and quercetin are 7.5, 8.4, 9.1, and 18.5 min, respectively.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(NBDS: H. Dinh.)

Correspondence Number—C163643

Comment deadline: January 31, 2016

Rutin

$C_{27}H_{30}O_{16} \cdot 3H_2O$ 664.56

3-Rhamnoglucoside of 5,7,3',4'-tetrahydroxyflavonol;
2-(3,4-Dihydroxyphenyl)-5,7-dihydroxy-4*H*-chromen-4-one-3-yl 6-*O*- α -L-rhamnopyranosyl- β -D-glucoside [250249-75-3].

DEFINITION

Rutin contains NLT 95.0% and NMT 101.0% of rutin ($C_{27}H_{30}O_{16}$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. Infrared Absorption** (197K)

- **B. Ultraviolet Absorption** (197U)

Analytical wavelength: 210–450 nm

Sample solution: 20 μ g/mL of Rutin in *methanol*. Filter if necessary.

Acceptance criteria: The spectrum exhibits two absorption maxima at 257 nm and 358 nm. The absorptivity at the maximum at 358 nm is 30.5–33.0, calculated on the anhydrous basis.

- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the

Standard solution, as obtained in the test for *Quercetin and Other Related Compounds*.

ASSAY

• Procedure

Sample: 200 mg of Rutin

Blank: 20 mL of *dimethylformamide*

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: *Tetrabutylammonium hydroxide*

Endpoint detection: Potentiometric

Analysis: Dissolve the *Sample* in 20 mL of *dimethylformamide*, and titrate with *Titrant*. Perform the *Blank* determination and make corrections if necessary.

Calculate the percentage of rutin (C₂₇H₃₀O₁₆) in the portion of the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times M \times F]/W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

M = actual *Titrant* molarity (mmol/mL)

F = equivalency factor, 305.3 mg/mmol

W = *Sample* weight (mg)

Acceptance criteria: 95.0%–101.0% on the anhydrous basis

IMPURITIES

• **Residue on Ignition** (281): NMT 0.1%

• Light Absorbing Substances

Analytical wavelength: 450–800 nm

Sample solution: Dissolve 0.200 g of Rutin in 40 mL of *2-propanol*. Stir for 15 min, dilute with *2-propanol* to 50.0 mL, and filter.

Acceptance criteria: The absorbance of any substance is NMT 0.10.

• Methanol Insoluble Substances

Sample: 2.5 g

Analysis: Shake the *Sample* for 15 min in 50 mL of *methanol* at 20°–25°. Filter under reduced pressure through a sintered-glass filter previously dried for 15 min at 100°–105°, cooled in a desiccator, and tared. Wash the filter three times with 20 mL of *methanol*. Dry the filter for 30 min at 105°. Allow to cool, and weigh.

Acceptance criteria: The residue weighs NMT 75 mg (3%).

Delete the following:

• **Heavy Metals**, *Method II* (231): NMT 20 µg/g (Official 1-Jan-2018)

Change to read:

- **Quercetin and Other Related Compounds**

Solution A: Mix 50 mL of *tetrahydrofuran* with 950 mL of a 15.6 mg/mL solution of *monobasic sodium phosphate*. Adjust with *phosphoric acid* to a pH of 3.0.

Solution B: Mix 400 mL of *tetrahydrofuran* with 600 mL of a 15.6 mg/mL solution of *monobasic sodium phosphate*. Adjust with *phosphoric acid* to a pH of 3.0.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	50	50

15 ▲ 20 ▲ USP40	0	100
16 ▲ 21 ▲ USP40	50	50
20 ▲ 25 ▲ USP40	50	50

Standard solution A: Transfer 10 mg of USP Rutin RS into a 10-mL volumetric flask, add 2 mL of *methanol*, and mix to dissolve. Dilute with *Solution B* to volume.

Standard solution B: 20 µg/mL of USP Rutin RS in *Solution B*, prepared from the dilution of *Standard solution A* with *Solution B*

Standard solution C: 20 µg/mL of USP Quercetin RS in *Solution B*

Sample solution: Transfer 100 mg of Rutin into a 100-mL volumetric flask, add 20 mL of *methanol*, and mix to dissolve. Dilute with *Solution B* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4-mm × 25-cm; 5-µm packing *L7*

Column temperature: 30°

Flow rate: 1.0 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution A*

[Note—The relative retention times for rutin, kaempferol 3-rutinoside, isoquercitroside, and quercetin are 1.0, 1.1, 1.2, and 2.5, respectively.]

Suitability requirements

Chromatographic similarity: The chromatogram from *Standard solution A* is similar to the reference chromatogram provided with the USP Rutin RS being used.

Resolution: NLT 1.5, between the rutin and kaempferol 3-rutinoside peaks

Analysis

Samples: *Standard solution B, Standard solution C, and Sample solution*

Calculate the percentage of quercetin¹ in the portion of Rutin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of quercetin from the *Sample solution*

r_S = peak response of quercetin from *Standard solution C*

C_S = concentration of USP Quercetin RS in *Standard solution C* (mg/mL)

C_U = concentration of Rutin in the *Sample solution* (mg/mL)

Calculate the percentage of each impurity in the portion of Rutin taken: [Note—Disregard any impurity less than 0.1%.]

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of rutin from *Standard solution B*

C_S = concentration of USP Rutin RS in *Standard solution B* (mg/mL)

C_U = concentration of Rutin in the *Sample solution* (mg/mL)

F = correction factor for each individual impurity (see *Table 2*)

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Correction Factor (F)	Acceptance Criteria, NMT (%)
Kaempferol 3-Rutinoside ^a	1.1	1	2.0
Isoquercitroside ^b	1.2	0.8	2.0

USP Quercetin RS USP Rutin RS

¹ 2-(3,4-Dihydroxyphenyl)-3,5,7-trihydroxy-4H-1-benzopyran-4-one.

BRIEFING

Sodium Ferrous Citrate. Because there is no existing *USP* monograph for this dietary ingredient, a new monograph is being proposed.

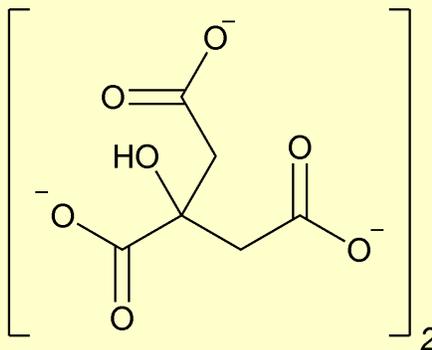

(NBDS: H. Dinh.)

Correspondence Number—C162405

Comment deadline: January 31, 2016

Add the following:

▲ Sodium Ferrous Citrate

 $\text{C}_{12}\text{H}_{10}\text{FeNa}_4\text{O}_{14} \quad 526.00$

Tetrasodium biscitrato iron (II) [43160-25-4].

DEFINITION

Sodium Ferrous Citrate contains NLT 10.0% and NMT 11.0% of iron (Fe), calculated on the as-is basis.

IDENTIFICATION

- **A. Sodium**

Sample: Ignite 3 g of Sodium Ferrous Citrate at 500°–600° for 3 h.

Acceptance criteria: The residue obtained from the ignition imparts an intense yellow color to a nonluminous flame.

- **B. Identification Tests—General** (191), *Iron, Ferrous salts:* A solution of 10 mg/mL of Sodium Ferrous Citrate in 5% *hydrochloric acid* meets the requirements.

- **C. Citrate**

Sample: 0.5 g of Sodium Ferrous Citrate

Analysis: Transfer the *Sample* to an appropriate container. Add 5 mL of water and 10 mL of 4% *potassium hydroxide* solution. Heat the solution in a water bath for 10 min while stirring well. Allow the solution to cool to room temperature and filter. Neutralize a portion of the filtrate with 50% *acetic acid*, add an excessive amount of 7.5% *calcium chloride* solution and boil. A white crystalline precipitate is formed. Collect the precipitate.

Acceptance criteria: The precipitate formed does not dissolve upon addition of 4% *sodium hydroxide* solution; the precipitate does dissolve in 25% *hydrochloric acid* solution.

- **D. Complex Salt of Ferrous Iron and Citric Acids**

Sample solution: 10 mg/mL of Sodium Ferrous Citrate

Analysis: Add 2 mL of *stronger ammonia water* to 5 mL of the *Sample solution*.

Acceptance criteria: A red-brown color develops with no precipitation.

ASSAY

- **Content of Iron**

Sample: 1 g of Sodium Ferrous Citrate

Blank: Proceed as directed in the *Analysis* without the *Sample*.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N *sodium thiosulfate VS*

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a flask with a ground-glass stopper. Carefully add 25 mL of 5% *sulfuric acid* and 2 mL of *nitric acid* to the flask, and boil the mixture for 10 min. Allow the mixture to cool to room temperature. Add 20 mL of water and 4 g of *potassium iodide*, and immediately stopper the flask tightly. Allow the mixture to stand in the dark for 15 min, then add 100 mL of water. Titrate the liberated iodine with *Titrant* (indicator: *starch TS*). Perform a blank determination.

Calculate the percentage of iron (Fe) in the portion of the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual *Titrant* normality (mEq/mL)

F = equivalency factor, 55.85 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: 10.0%–11.0% on the as-is basis

IMPURITIES

- **Chloride and Sulfate** (221), *Chloride*

Standard solution: 0.10 mL of 0.020 N *hydrochloric acid*

Sample: 73 mg of Sodium Ferrous Citrate

Acceptance criteria: NMT 0.1%

- **Chloride and Sulfate** (221), *Sulfate*

Standard solution: 1.0 mL of 0.20 N *sulfuric acid*

Sample: 200 mg of Sodium Ferrous Citrate

Acceptance criteria: NMT 0.5%

- **Ferric Iron**

Sample: 2.0 g of Sodium Ferrous Citrate

Analysis: Transfer the *Sample* to an appropriate flask with a ground-glass stopper, dissolve in 5 mL of *hydrochloric acid*, and dilute with water to 30 mL. Add 4 g of *potassium iodide* and close the flask with the stopper. Allow the mixture to stand in the dark for 15 min. Add 2 mL of *starch TS*, and mix well.

Acceptance criteria: A color develops and disappears upon addition of 1.0 mL of 0.1 N *sodium thiosulfate VS* to the solution.

- **Elemental Impurities—Procedures** (233)

Acceptance criteria

Arsenic: NMT 4.0 µg/g

Lead: NMT 10 µg/g

Mercury: NMT 3.0 µg/g

SPECIFIC TESTS

- **Tartrate**

Sample: 1.0 g of Sodium Ferrous Citrate

Analysis: Transfer the *Sample* into an appropriate container. Carefully add 5 mL of water and 10 mL of 6.7% (w/v) *potassium hydroxide* solution. Heat the mixture in a water bath for 10 min while stirring well. Allow the mixture to cool to room temperature and filter. To 5 mL of the filtrate, add 25% *acetic acid* solution to make the mixture weakly acidic, and 2 mL of *acetic acid*. Allow the solution to stand for 24 h.

Acceptance criteria: No white, crystalline precipitate is formed.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers.
- **Labeling:** Label it to indicate that it is not to be used if it is coated with brownish yellow basic ferric sulfate. ▲*USP40*

BRIEFING

Tienchi Ginseng Root and Rhizome Dry Extract Capsules. A new monograph is proposed. The liquid chromatographic procedures in the test for *Content of Ginsenosides* use the Phenomenex Kinetex brand of L1 column. The typical retention times for notoginsenoside R1, ginsenoside Rg1, ginsenoside Re, ginsenoside Rb1, and ginsenoside Rd are about 2.1, 2.7, 2.9, 4.7, and 5.2 min, respectively.

(BDSHM: N. Davydova.)

Correspondence Number—C143401

Comment deadline: January 31, 2016

Add the following:

▲ Tienchi Ginseng Root and Rhizome Dry Extract Capsules

DEFINITION

Tienchi Ginseng Root and Rhizome Dry Extract Capsules contain Tienchi Ginseng Root and Rhizome Dry Extract. They contain NLT 90.0% and NMT 110.0% of the labeled amount of ginsenosides calculated as the sum of notoginsenoside R1 ($C_{47}H_{80}O_{18}$), ginsenoside Rg1 ($C_{42}H_{72}O_{14}$), ginsenoside Re ($C_{48}H_{82}O_{18}$), ginsenoside Rb1 ($C_{54}H_{92}O_{23}$), and ginsenoside Rd ($C_{48}H_{82}O_{18}$).

IDENTIFICATION

• **A. HPTLC for Articles of Botanical Origin** (203)

Standard solution A: 0.5 mg/mL of USP Ginsenoside Rg1 RS in methanol

Standard solution B: 5 mg/mL of USP *Panax notoginseng* Root and Rhizome Dry Extract RS in methanol. Sonicate for about 10 min, centrifuge, and use the supernatant.

Sample solution: Transfer a portion of the contents of the Capsules, equivalent to 50 mg of Tienchi Ginseng Root and Rhizome Dry Extract, to a conical flask, add 10 mL of methanol, mix and sonicate for 20 min, centrifuge, and use the supernatant.

Chromatographic system

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 μ m (HPTLC plates)

Application volume: 4 μ L, as 8-mm bands

Relative humidity: Condition the plate to a relative humidity of about 33% using a suitable device.

Developing solvent system: A mixture of dichloromethane, dehydrated alcohol, and water (60: 45: 6.5)

Developing distance: 6 cm

Derivatization reagent: 10% Sulfuric acid in alcohol. Prepare fresh. Keep alcohol cold over ice. Carefully and gradually add sulfuric acid.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the *Samples* as bands to a suitable HPTLC plate, and dry in air. Develop the chromatograms in a saturated chamber, remove the plate from the chamber, and dry. Treat with *Derivatization reagent*, heat at 105° for 5–10 min, and examine immediately under visible light and UV light at 366 nm.

System suitability

Under visible light: The chromatogram of *Standard solution B* exhibits five main reddish-violet bands. A band in the upper-half section corresponding in R_f to the band of ginsenoside Rg1 in *Standard solution A*; a band in the lower-third section of the

chromatogram due to ginsenoside Rb1; three less intense bands clearly separated between the bands of ginsenoside Rg1 and ginsenoside Rb1—the lower band due to ginsenoside Rd, the middle due to ginsenoside Re, and the upper due to notoginsenoside R1. The two most intense bands in the chromatogram are those of ginsenoside Rb1 and ginsenoside Rg1.

Under UV light at 366 nm: The chromatogram of *Standard solution B* exhibits a pinkish-violet band at an R_f corresponding to the ginsenoside Rg1 band in the chromatogram of *Standard solution A*; a blue fluorescent band in the lower-third section of the chromatogram due to ginsenoside Rb1; three less intense bands clearly separated between the bands of ginsenoside Rg1 and ginsenoside Rb1—the lower due to ginsenoside Rd, the middle due to ginsenoside Re, and the upper due to notoginsenoside R1 (the band due to ginsenoside Rd is blue fluorescent, while the other two bands are pinkish-violet). The two most intense bands in the chromatogram are those of ginsenoside Rb1 and ginsenoside Rg1.

Acceptance criteria

Under visible light: The chromatogram of the *Sample solution* exhibits five main reddish-violet bands corresponding in R_f to similar bands in the chromatogram of *Standard solution B*: a band in the upper-half section corresponding in R_f to the band of ginsenoside Rg1 in *Standard solution A*; a band in the lower-third section of the chromatogram due to ginsenoside Rb1; three less intense bands clearly separated between the bands of ginsenoside Rg1 and ginsenoside Rb1—the lower band due to ginsenoside Rd, the middle one due to ginsenoside Re, and the upper due to notoginsenoside R1. The two most intense bands in the chromatogram are those of ginsenoside Rb1 and ginsenoside Rg1.

Under UV light at 366 nm: The chromatogram of the *Sample solution* exhibits the bands corresponding in R_f to similar bands in the chromatogram of *Standard solution B*: a pinkish-violet band at an R_f corresponding to the ginsenoside Rg1 band in the chromatogram of *Standard solution A*; a blue fluorescent band in the lower-third section of the chromatogram due to ginsenoside Rb1; three less intense bands clearly separated between the bands of ginsenoside Rg1 and ginsenoside Rb1—the lower due to ginsenoside Rd, the middle due to ginsenoside Re, and the upper due to notoginsenoside R1 (the band due to ginsenoside Rd is blue fluorescent, while the other two bands are pinkish-violet). The two most intense bands in the chromatogram are those of ginsenoside Rb1 and ginsenoside Rg1.

• B. LC

Analysis: Proceed as directed in the test for *Content of Ginsenosides*.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits peaks at the retention times corresponding to the peaks due to notoginsenoside R1, ginsenoside Rg1, ginsenoside Re, ginsenoside Rb1, and ginsenoside Rd in the chromatogram of *Standard solution B*. The two most intense peaks in the chromatogram are those of ginsenoside Rg1 and ginsenoside Rb1.

STRENGTH

• Content of Ginsenosides

Extraction solvent: Methanol and water (7:3)

Solution A: 0.03% Phosphoric acid in water (v/v)

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	83	17
2.4	80	20
3.5	70	30
4.2	69	31
5.0	58	42
5.1	0	100
6.0	0	100
6.1	83	17
7.5	83	17

Standard solution A: 0.04 mg/mL of USP Ginsenoside Rg1 RS in methanol. Sonicate to dissolve, if necessary.

Standard solution B: 3.0 mg/mL of USP *Panax notoginseng* Root and Rhizome Dry Extract RS in *Extraction solvent*. Sonicate for about 10 min, centrifuge, and use the supernatant. Before injection, pass through a polytetrafluoroethylene (PTFE) membrane filter of 0.2- μ m pore size and discard the first portion of the filtrate.

Sample solution: Determine the total weight of 20 Capsules. Open the Capsules and combine their contents in an appropriate container. Weigh the empty Capsule shells and calculate the average fill weight per Capsule. Transfer a portion of the Capsule contents, equivalent to 35 mg of ginsenosides (sum of notoginsenoside R1, ginsenoside Rg1, ginsenoside Re, ginsenoside Rb1, and ginsenoside Rd) into a 25-mL volumetric flask. Add 20 mL of *Extraction solvent* and sonicate for 30 min with occasional shaking. Cool to room temperature, dilute with *Extraction solvent* to volume, mix well, and centrifuge. Before injection, pass through a PTFE membrane filter of 0.2- μ m pore size and discard the first portion of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 203 nm

Column: 2.1-mm \times 5-cm; 1.7- μ m packing L1

Column temperature: 30°

Flow rate: 0.8 mL/min

Injection volume: 5 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram of *Standard solution B* is similar to the

reference chromatogram provided with the lot of USP *Panax notoginseng* Root and Rhizome Dry Extract RS being used.

Resolution: NLT 1.5 between the ginsenoside Rg1 and ginsenoside Re peaks, *Standard solution B*

Relative standard deviation: NMT 2.0%, determined from the ginsenoside Rg1 peak in repeated injections, *Standard solution A*

Analysis

Samples: *Standard solution A, Standard solution B, and Sample solution*

Using the chromatograms of *Standard solution A, Standard solution B,* and the reference chromatogram provided with the lot of USP *Panax notoginseng* Root and Rhizome Dry Extract RS being used, identify the peaks corresponding to notoginsenoside R1, ginsenoside Rg1, ginsenoside Re, ginsenoside Rb1, and ginsenoside Rd in the *Sample solution* chromatogram. Measure the areas of the analyte peaks.

Calculate the quantity, in mg, each of notoginsenoside R1, ginsenoside Rg1, ginsenoside Re, ginsenoside Rb1, and ginsenoside Rd in each Capsule:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times F \times (W_{av}/W)$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of ginsenoside Rg1 from *Standard solution A*

C_S = concentration of USP Ginsenoside Rg1 RS in *Standard solution A* (mg/mL)

V = volume of the solvent taken for preparation of the *Sample solution* (mL)

F = response factor for analytes (see *Table 2*)

W_{av} = average fill weight per Capsule (mg)

W = weight of the sample taken for preparation of the *Sample solution* (mg)

Table 2

Analyte	Response Factor
Notoginsenoside R1	1.09
Ginsenoside Rg1	1.00
Ginsenoside Re	1.02
Ginsenoside Rb1	1.26
Ginsenoside Rd	1.03

Calculate the percentage of the labeled amount of ginsenosides as the sum of notoginsenoside R1, ginsenoside Rg1, ginsenoside Re, ginsenoside Rb1, and ginsenoside Rd in each Capsule:

$$\text{Result} = (\Sigma Q_i/L) \times 100$$

ΣQ_i = sum of the quantities of ginsenosides as determined above (mg)

L = labeled amount of ginsenosides (mg)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **Disintegration and Dissolution** (2040), *Disintegration*: Meet the requirements
- **Weight Variation** (2091): Meet the requirements

CONTAMINANTS

- **Microbial Enumeration Tests** (2021): The total aerobic bacterial count does not exceed 10^4 cfu/g, and the total combined molds and yeasts count does not exceed 10^3 cfu/g.
- **Absence of Specified Microorganisms** (2022), *Test Procedures, Test for Absence of Salmonella Species* and *Test for Absence of Escherichia coli*: Meet the requirements

ADDITIONAL REQUIREMENTS

- **Packaging and Storage**: Preserve in well-closed containers, protected from light and moisture, and store at room temperature.
- **Labeling**: The label states the Latin binomial and the official name. The label states the amount of ginsenosides as the sum of notoginsenoside R1, ginsenoside Rg1, ginsenoside Re, ginsenoside Rb1, and ginsenoside Rd; and the amount of Tienchi Ginseng Root and Rhizome Dry Extract in mg/Capsule.

Tienchi Ginseng Root and Rhizome Dry Extract Tablets contain Tienchi Ginseng Root and Rhizome Dry Extract. They contain NLT 90.0% and NMT 110.0% of the labeled amount of ginsenosides calculated as the sum of notoginsenoside R1 ($C_{47}H_{80}O_{18}$), ginsenoside Rg1 ($C_{42}H_{72}O_{14}$), ginsenoside Re ($C_{48}H_{82}O_{18}$), ginsenoside Rb1 ($C_{54}H_{92}O_{23}$), and ginsenoside Rd ($C_{48}H_{82}O_{18}$).

IDENTIFICATION

- **A. HPTLC for Articles of Botanical Origin** (203)

Standard solution A: 0.5 mg/mL of USP Ginsenoside Rg1 RS in methanol

Standard solution B: 5 mg/mL of USP *Panax notoginseng* Root and Rhizome Dry Extract RS in methanol. Sonicate for about 10 min, centrifuge, and use the supernatant.

Sample solution: Transfer a portion of the powdered Tablets, equivalent to 50 mg of Tienchi Ginseng Root and Rhizome Dry Extract, to a conical flask, add 10 mL of methanol, mix and sonicate for 20 min, centrifuge, and filter.

Chromatographic system

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 μm (HPTLC plates)

Application volume: 4 μL , as 8-mm bands

Relative humidity: Condition the plate to a relative humidity of about 33% using a suitable device.

Developing solvent system: A mixture of dichloromethane, dehydrated alcohol, and water (60: 45: 6.5)

Developing distance: 6 cm

Derivatization reagent: 10% Sulfuric acid in alcohol. Prepare fresh. Keep alcohol cold over ice. Carefully and gradually add sulfuric acid.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the *Samples* as bands to a suitable HPTLC plate, and dry in air. Develop the chromatograms in a saturated chamber, remove the plate from the chamber, and dry. Treat with *Derivatization reagent*, heat at 105° for 5–10 min, and examine immediately under visible light and UV light at 366 nm.

System suitability

Under visible light: The chromatogram of *Standard solution B* exhibits five main reddish-violet bands. A band in the upper-half section corresponding in R_f to the band of ginsenoside Rg1 in *Standard solution A*; a band in the lower-third section of the chromatogram due to ginsenoside Rb1; three less intense bands clearly separated between the bands of ginsenoside Rg1 and ginsenoside Rb1—the lower band due to ginsenoside Rd, the middle due to ginsenoside Re, and the upper due to notoginsenoside R1. The two most intense bands in the chromatogram are those of ginsenoside Rb1 and ginsenoside Rg1.

Under UV light at 366 nm: The chromatogram of *Standard solution B* exhibits a pinkish-violet band at an R_f corresponding to the ginsenoside Rg1 band in the chromatogram of *Standard solution A*; a blue fluorescent band in the lower-third section of the chromatogram due to ginsenoside Rb1; three less intense bands clearly separated between the bands of ginsenoside Rg1 and ginsenoside Rb1—the lower due to ginsenoside Rd, the middle due to ginsenoside Re, and the upper due to notoginsenoside R1 (the band due to ginsenoside Rd is blue fluorescent, while the other two bands are pinkish-violet). The two most intense bands in the chromatogram are those of

ginsenoside Rb1 and ginsenoside Rg1.

Acceptance criteria

Under visible light: The chromatogram of the *Sample solution* exhibits five main reddish-violet bands corresponding in R_f to similar bands in the chromatogram of *Standard solution B*: a band in the upper-half section corresponding in R_f to the band of ginsenoside Rg1 in *Standard solution A*; a band in the lower-third section of the chromatogram due to ginsenoside Rb1; three less intense bands clearly separated between the bands of ginsenoside Rg1 and ginsenoside Rb1—the lower band due to ginsenoside Rd, the middle one due to ginsenoside Re, and the upper due to notoginsenoside R1. The two most intense bands in the chromatogram are those of ginsenoside Rb1 and ginsenoside Rg1.

Under UV light at 366 nm: The chromatogram of the *Sample solution* exhibits the bands corresponding in R_f to similar bands in the chromatogram of *Standard solution B*: a pinkish-violet band at an R_f corresponding to the ginsenoside Rg1 band in the chromatogram of *Standard solution A*; a blue fluorescent band in the lower-third section of the chromatogram due to ginsenoside Rb1; three less intense bands clearly separated between the bands of ginsenoside Rg1 and ginsenoside Rb1—the lower due to ginsenoside Rd, the middle due to ginsenoside Re, and the upper due to notoginsenoside R1 (the band due to ginsenoside Rd is blue fluorescent, while the other two bands are pinkish-violet). The two most intense bands in the chromatogram are those of ginsenoside Rb1 and ginsenoside Rg1.

• B. LC

Analysis: Proceed as directed in the test for *Content of Ginsenosides*.

Acceptance criteria: The chromatogram of the *Sample solution* exhibits peaks at the retention times corresponding to the peaks due to notoginsenoside R1, ginsenoside Rg1, ginsenoside Re, ginsenoside Rb1, and ginsenoside Rd in the chromatogram of *Standard solution B*. The two most intense peaks in the chromatogram are those of ginsenoside Rg1 and ginsenoside Rb1.

STRENGTH

• Content of Ginsenosides

Extraction solvent: Methanol and water (7:3)

Solution A: 0.03% Phosphoric acid in water (v/v)

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	83	17
2.4	80	20
3.5	70	30
4.2	69	31
5.0	58	42
5.1	0	100
6.0	0	100
6.1	83	17
7.5	83	17

Standard solution A: 0.04 mg/mL of USP Ginsenoside Rg1 RS in methanol. Sonicate to dissolve, if necessary.

Standard solution B: 3.0 mg/mL of USP *Panax notoginseng* Root and Rhizome Dry Extract RS in *Extraction solvent*. Sonicate for about 10 min, centrifuge, and use the supernatant. Before injection, pass through a polytetrafluoroethylene (PTFE) membrane filter of 0.2- μ m pore size and discard the first portion of the filtrate.

Sample solution: Weigh NLT 20 Tablets, determine the average Tablet weight, and finely powder. Transfer a portion of finely powdered Tablets, nominally equivalent to 35 mg of ginsenosides (sum of notoginsenoside R1, ginsenoside Rg1, ginsenoside Re, ginsenoside Rb1, and ginsenoside Rd) into a 25-mL volumetric flask. Add 20 mL of *Extraction solvent* and sonicate for 30 min with occasional shaking. Cool to room temperature, dilute with *Extraction solvent* to volume, mix well, centrifuge, pass the supernatant through a PTFE membrane filter of 0.2- μ m pore size, and discard the first portion of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 203 nm

Column: 2.1-mm \times 5-cm; 1.7- μ m packing L1

Column temperature: 30°

Flow rate: 0.8 mL/min

Injection volume: 5 μ L

System suitability

Samples: *Standard solution A* and *Standard solution B*

Suitability requirements

Chromatogram similarity: The chromatogram of *Standard solution B* is similar to the reference chromatogram provided with the lot of USP *Panax notoginseng* Root and Rhizome Dry Extract RS being used.

Resolution: NLT 1.5 between the ginsenoside Rg1 and ginsenoside Re peaks, *Standard solution B*

Relative standard deviation: NMT 2.0%, determined from the ginsenoside Rg1 peak in repeated injections, *Standard solution A*

Analysis

Samples: *Standard solution A, Standard solution B, and Sample solution*

Using the chromatograms of *Standard solution A, Standard solution B,* and the reference chromatogram provided with the lot of USP *Panax notoginseng* Root and Rhizome Dry Extract RS being used, identify the peaks corresponding to notoginsenoside R1, ginsenoside Rg1, ginsenoside Re, ginsenoside Rb1, and ginsenoside Rd in the *Sample solution* chromatogram. Measure the areas of the analyte peaks.

Calculate the quantity, in mg, each of notoginsenoside R1, ginsenoside Rg1, ginsenoside Re, ginsenoside Rb1, and ginsenoside Rd in each Tablet:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times F \times (W_{av}/W)$$

r_U = peak area of the relevant analyte from the *Sample solution*

r_S = peak area of ginsenoside Rg1 from *Standard solution A*

C_S = concentration of USP Ginsenoside Rg1 RS in *Standard solution A* (mg/mL)

V = volume of the solvent taken for preparation of the *Sample solution* (mL)

F = response factor for analytes (see *Table 2*)

W_{av} = average Tablet weight (mg)

W = weight of the sample taken for preparation of the *Sample solution* (mg)

Table 2

Analyte	Response Factor
Notoginsenoside R1	1.09
Ginsenoside Rg1	1.00
Ginsenoside Re	1.02
Ginsenoside Rb1	1.26
Ginsenoside Rd	1.03

Calculate the percentage of the labeled amount of ginsenosides, as the sum of notoginsenoside R1, ginsenoside Rg1, ginsenoside Re, ginsenoside Rb1, and ginsenoside Rd, in each Tablet:

$$\text{Result} = (\Sigma Q_i/L) \times 100$$

ΣQ_i = sum of the quantities of ginsenosides as determined above (mg)

L = labeled amount of ginsenosides (mg)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **Disintegration and Dissolution** (2040), *Disintegration:* Meet the requirements
- **Weight Variation** (2091): Meet the requirements

CONTAMINANTS

- **Microbial Enumeration Tests** <2021>: The total aerobic bacterial count does not exceed 10^4 cfu/g, and the total combined molds and yeasts count does not exceed 10^3 cfu/g.
- **Absence of Specified Microorganisms** <2022>, *Test Procedures, Test for Absence of Salmonella Species* and *Test for Absence of Escherichia coli*: Meet the requirements

ADDITIONAL REQUIREMENTS

- **Packaging and Storage**: Preserve in well-closed containers, protected from light and moisture, and store at room temperature.
- **Labeling**: The label states the Latin binomial and the official name. The label states the amount of ginsenosides, as the sum of notoginsenoside R1, ginsenoside Rg1, ginsenoside Re, ginsenoside Rb1, and ginsenoside Rd; and the amount of Tienchi Ginseng Root and Rhizome Dry Extract in mg/Tablet.

Add the following:

▲ Tienchi Ginseng Root and Rhizome Powder Capsules

DEFINITION

Tienchi Ginseng Root and Rhizome Powder Capsules contain Tienchi Ginseng Root and Rhizome Powder. They contain NLT 5.0% of ginsenosides calculated as the sum of notoginsenoside R1 ($C_{47}H_{80}O_{18}$), ginsenoside Rg1 ($C_{42}H_{72}O_{14}$), ginsenoside Re ($C_{48}H_{82}O_{18}$), ginsenoside Rb1 ($C_{54}H_{92}O_{23}$), and ginsenoside Rd ($C_{48}H_{82}O_{18}$) from the labeled amount of Tienchi Ginseng Root and Rhizome Powder.

IDENTIFICATION

- **A. HPTLC for Articles of Botanical Origin** <203>
Standard solution A: 0.5 mg/mL of USP Ginsenoside Rg1 RS in methanol
Standard solution B: 5 mg/mL of USP *Panax notoginseng* Root and Rhizome Dry Extract RS in methanol. Sonicate for about 10 min, centrifuge, and use the supernatant.

Sample solution: Transfer a finely powdered portion of the contents of the Capsules, equivalent to 0.4 g of Tienchi Ginseng Root and Rhizome Powder, to a suitable container, add 10.0 mL of methanol, and sonicate for 20 min. Centrifuge, and use the supernatant.

Chromatographic system

Adsorbent: Chromatographic silica gel mixture with an average particle size of 5 μm (HPTLC plates)

Application volume: 4 μL , as 8-mm bands

Relative humidity: Condition the plate to a relative humidity of about 33% using a suitable device.

Developing solvent system: A mixture of dichloromethane, dehydrated alcohol, and water (60: 45: 6.5)

Developing distance: 6 cm

Derivatization reagent: 10% Sulfuric acid in alcohol. Prepare fresh. Keep alcohol cold over ice. Carefully and gradually add sulfuric acid.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the *Samples* as bands to a suitable HPTLC plate, and dry in air. Develop in a saturated chamber, remove the plate from the chamber, and dry in air. Treat the plate with *Derivatization reagent*, heat at 105° for 5 min, and examine immediately under visible light and UV light at 366 nm.

System suitability

Under visible light: The chromatogram of *Standard solution B* exhibits five main reddish-violet bands. A band in the upper-half section corresponding in R_f to the band of ginsenoside Rg1 in *Standard solution A*; a band in the lower-third section of the chromatogram due to ginsenoside Rb1; three less intense bands clearly separated between the bands of ginsenoside Rg1 and ginsenoside Rb1—the lower band due to ginsenoside Rd, the middle due to ginsenoside Re, and the upper due to notoginsenoside R1. The two most intense bands in the chromatogram are those of ginsenoside Rb1 and ginsenoside Rg1.

Under UV light at 366 nm: The chromatogram of *Standard solution B* exhibits a pinkish-violet band at an R_f corresponding to the ginsenoside Rg1 band in the chromatogram of *Standard solution A*; a blue fluorescent band in the lower-third section of the chromatogram due to ginsenoside Rb1; three less intense bands clearly separated between the bands of ginsenoside Rg1 and ginsenoside Rb1—the lower due to ginsenoside Rd, the middle due to ginsenoside Re, and the upper due to notoginsenoside R1 (the band due to ginsenoside Rd is blue fluorescent, while the other two bands are pinkish-violet). The two most intense bands in the chromatogram are those of ginsenoside Rb1 and ginsenoside Rg1.

Acceptance criteria

Under visible light: The chromatogram of the *Sample solution* exhibits five main reddish-violet bands corresponding in R_f to similar bands in the chromatogram of *Standard solution B*: a band in the upper-half section corresponding in R_f to the band of

ginsenoside Rg1 in *Standard solution A*; a band in the lower-third section of the chromatogram due to ginsenoside Rb1; three less intense bands clearly separated between the bands of ginsenoside Rg1 and ginsenoside Rb1—the lower band due to ginsenoside Rd, the middle due to ginsenoside Re, and the upper due to notoginsenoside R1. Ginsenoside Rg1	1.00
Ginsenoside Re	1.02
Ginsenoside Rb1	1.26
Ginsenoside Rd	1.03

Calculate the percentage of ginsenosides, as the sum of notoginsenoside R1, ginsenoside Rg1, ginsenoside Re, ginsenoside Rb1, and ginsenoside Rd, of the labeled amount of Tienchi Ginseng Root and Rhizome Powder in each Tablet:

$$\text{Result} = (\Sigma Q_i/L) \times 100$$

ΣQ_i = sum of the quantities of ginsenosides as determined above (mg)

L = labeled amount of Tienchi Ginseng Root and Rhizome Powder (mg)

Acceptance criteria: NLT 5.0%

PERFORMANCE TESTS

- **Disintegration and Dissolution** (2040), *Disintegration*: Meet the requirements
- **Weight Variation** (2091): Meet the requirements

CONTAMINANTS

- **Microbial Enumeration Tests** (2021): The total aerobic bacterial count does not exceed 10^4 cfu/g, and the total combined molds and yeasts count does not exceed 10^3 cfu/g.
- **Absence of Specified Microorganisms** (2022), *Test Procedures, Test for Absence of Salmonella Species* and *Test for Absence of Escherichia coli*: Meets the requirements

ADDITIONAL REQUIREMENTS

- **Packaging and Storage**: Preserve in well-closed containers, protected from light and moisture, and store at room temperature.
- **Labeling**: The label states the Latin binomial and the official name. The label states the amount of Tienchi Ginseng Root and Rhizome Powder in mg/Tablet.
- **USP Reference Standards** (11)
 - USP Ginsenoside Rg1 RS
 - USP *Panax notoginseng* Root and Rhizome Dry Extract RS

BRIEFING

Tribasic Calcium Phosphate, NF 33 page 6559. On the basis of comments received, the following changes are proposed:

1. Modify the *Analysis* section in *Identification* test A by changing the volume of *ammonium molybdate TS* added from 0.5 mL to 2 mL to improve the test performance.
2. In preparation for the omission of the flame tests from *Identification Tests—General*

(191), proposed in *PF* 41(2) [Mar.–Apr. 2015], it is proposed to replace the flame test for calcium with a calcium precipitation test.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(NBDS: H. Dinh.)

Correspondence Number—C164267

Comment deadline: January 31, 2016

Tribasic Calcium Phosphate

$\text{Ca}_5(\text{OH})(\text{PO}_4)_3$ 502.31

Calcium hydroxide phosphate [12167-74-7].

DEFINITION

Tribasic Calcium Phosphate consists of a variable mixture of calcium phosphates with the approximate composition ($10\text{CaO}\cdot 3\text{P}_2\text{O}_5\cdot \text{H}_2\text{O}$). It contains NLT 34.0% and NMT 40.0% of calcium (Ca).

IDENTIFICATION

Change to read:

- **A.**

Sample solution: Dissolve 100 mg in 5 mL of *diluted nitric acid*.

Analysis: Warm the *Sample solution*, and add ~~0.5 mL~~

▲ 2 mL ▲*NF35*

of *ammonium molybdate TS*.

Acceptance criteria: A yellow precipitate is formed.

Delete the following:

▲ ● **~~B. Identification Tests—General, Calcium (191):~~** Meets the requirements of the flame test ▲*NF35*

Add the following:

- ▲ ● **B.**

Sample: 100 mg of Tribasic Calcium Phosphate

Analysis: Dissolve the *Sample* by warming in 10 mL of 2 N *hydrochloric acid*. Add 2.5 mL of *ammonia TS* dropwise, with shaking, and then add 5 mL of *ammonium oxalate TS*.

Acceptance criteria: A white precipitate is formed. ▲*NF35*

ASSAY

Change to read:

- **Procedure**

Sample: 150 mg of Tribasic Calcium Phosphate

• (ERR 1-Dec-2014)

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.05 M edetate disodium VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample*, with the aid of gentle heat if necessary, in a mixture of *hydrochloric acid* and *water* (5:3) contained in a 250-mL beaker equipped with a magnetic stirrer, and cautiously add 125 mL of *water*. With constant stirring, add in the following order: 0.5 mL of *triethanolamine*, 300 mg of *hydroxy naphthol blue*, and from the titration buret, about 23 mL of *Titrant*. Add *sodium hydroxide* solution (45 in 100) until the initial red color changes to clear blue. Continue to add it dropwise until the color changes to violet, and add an additional 0.5 mL. The pH is 12.3–12.5. Continue the titration dropwise with *Titrant* to the appearance of a clear blue endpoint that persists for NLT 60 s. Calculate the percentage of calcium (Ca) in the portion of the *Sample* taken:

$$\text{Result} = [(V_S \times M \times F)/W] \times 100 \quad \bullet \text{(ERR 1-Dec-2014)}$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

• (ERR 1-Dec-2014)

M = actual molarity of the *Titrant* (mmol/mL)

F = equivalency factor, 40.08 mg/mmol

W = *Sample* weight (mg)

Acceptance criteria: 34.0%–40.0%

IMPURITIES

- **Chloride and Sulfate** (221), *Chloride*

Standard: 1.0 mL of 0.020 N *hydrochloric acid*

Sample: 0.500 g of Tribasic Calcium Phosphate

Analysis: Dissolve the *Sample* in 25 mL of 2 N *nitric acid*, and add 1 mL of *silver nitrate TS*.

Acceptance criteria: NMT 0.14%

- **Chloride and Sulfate** (221), *Sulfate*

Standard: 1.0 mL of 0.020 N *sulfuric acid*

Sample: 0.500 g of Tribasic Calcium Phosphate

Analysis: Dissolve the *Sample* in the smallest possible amount of 3 N *hydrochloric acid*. Dilute with *water* to 100 mL, and filter, if necessary. To 25 mL of the filtrate add 1 mL of *barium chloride TS*.

Acceptance criteria: NMT 0.8%

- **Arsenic** (211), *Method I*

Test preparation: Dissolve 1.0 g in just sufficient 3 N *hydrochloric acid*.

Acceptance criteria: NMT 3 ppm

- **Barium**

Sample: 500 mg of Tribasic Calcium Phosphate

Analysis: Mix the *Sample* with 10 mL of *water*, heat, add *hydrochloric acid*, dropwise, until solution is effected, and then add 2 drops of the acid in excess. Filter, and add to the filtrate 1 mL of *potassium sulfate TS*.

Acceptance criteria: No turbidity appears within 15 min.

Delete the following:

- ~~**Heavy Metals**, *Method I* (231)~~

~~**Test preparation:** Mix 1.3 g with 9 mL of 3 N *hydrochloric acid*, dilute with *water* to 50 mL, and heat to boiling. Cool to room temperature, and filter. [Note—Filter the mixture after the pH adjustment.]~~

~~**Acceptance criteria:** NMT 30 ppm (Official 1-Jan-2018)~~

- **Carbonate**

Sample: 2 g of Tribasic Calcium Phosphate

Analysis: Mix the *Sample* with 20 mL of *water*, and add 3 N *hydrochloric acid*, dropwise, to effect solution.

Acceptance criteria: No effervescence is produced.

- **Acid-Insoluble Substances**

Analysis: If an insoluble residue remains in the test for *Carbonate*, boil the solution, filter, wash the residue well with hot *water* until the last washing is free from chloride, and ignite the residue to constant weight.

Acceptance criteria: NMT 0.2%; the weight of the residue is NMT 4 mg.

Change to read:

- **Dibasic Salt and Calcium Oxide**

Sample: 1.5 g of Tribasic Calcium Phosphate

● (ERR 1-Dec-2014)

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 1 N *hydrochloric acid VS*

Back-titrant: 0.1 N *sodium hydroxide VS*

Endpoint detection: Potentiometric

Analysis: Dissolve the *Sample* by warming with 25.0 mL of *Titrant*. Cool, and slowly titrate the excess of *Titrant*, while agitating constantly, with the *Back-titrant* to a pH of 4.0.

Acceptance criteria: 13.0–14.3 mL of 1 N *hydrochloric acid* is consumed for each g of salt, calculated on the ignited basis.

- **Limit of Fluoride**

[Note—Prepare and store all solutions in plastic containers.]

Buffer solution: 294 mg/mL of *sodium citrate dihydrate* in *water*

Standard stock solution: 1.1052 mg/mL of USP Sodium Fluoride RS in *water*

Standard solution: Transfer 20.0 mL of *Standard stock solution* to a 100-mL volumetric flask containing 50.0 mL of *Buffer solution*, dilute with *water* to volume, and mix. Each mL of this solution contains 100 µg of fluoride ion.

Sample solution: Transfer 2.0 g of Tribasic Calcium Phosphate to a beaker containing a plastic-coated stirring bar. Add 20 mL of *water* and 3.0 mL of *hydrochloric acid*, and stir until dissolved. Add 50.0 mL of *Buffer solution* and sufficient *water* to make 100 mL.

Electrode system: Use a fluoride-specific ion-indicating electrode and a silver-silver chloride reference electrode connected to a pH meter capable of measuring potentials with a minimum reproducibility of ±0.2 mV (see *pH* (791)).

Analysis

Samples: *Standard solution* and *Sample solution*

Standard response line: Transfer 50.0 mL of *Buffer solution* and 3.0 mL of *hydrochloric acid* to a beaker, and add *water* to make 100 mL. Add a plastic-coated stirring bar, insert the electrodes into the solution, stir for 15 min, and read the potential, in mV. Continue stirring, and at 5-min intervals add 100, 100, 300, 500, and 500 µL of *Standard solution*, reading the potential 5 min after each addition. Plot the logarithms of the cumulative fluoride ion concentrations (0.1, 0.2, 0.5, 1.0, and 1.5 µg/mL) versus potential, in mV.

Rinse and dry the electrodes, insert them into the *Sample solution*, stir for 5 min, and read the potential, in mV. From the measured potential and the *Standard response line* determine the concentration, *C* (in µg/mL), of fluoride ion in the *Sample solution*.

Calculate the content of fluoride in the portion of Tribasic Calcium Phosphate taken:

$$\text{Result} = (V \times C)/W$$

V = volume of the *Sample solution* (mL)

C = concentration of fluoride ion in the *Sample solution* determined from the *Standard response line* (µg/mL)

W = weight of Tribasic Calcium Phosphate taken to prepare the *Sample solution* (g)

Acceptance criteria: NMT 75 ppm

- **Limit of Nitrate**

Sample: 200 mg of Tribasic Calcium Phosphate

Analysis: Mix the *Sample* with 5 mL of *water*, and add just sufficient *hydrochloric acid* to effect solution. Dilute with *water* to 10 mL, add 0.20 mL of *indigo carmine TS*, then add, with stirring, 10 mL of *sulfuric acid*.

Acceptance criteria: The blue color persists for NLT 5 min.

- **Water-Soluble Substances**

Sample: 2 g of Tribasic Calcium Phosphate

Analysis: Digest the *Sample* with 100 mL of *water* on a steam bath for 30 min. Cool, add sufficient *water* to restore the original volume, stir well, and filter. Evaporate 50 mL of the

filtrate in a tared porcelain dish on a steam bath to dryness, and dry the residue at 120° to constant weight.

Acceptance criteria: NMT 0.5%; the weight of the residue is NMT 5 mg.

SPECIFIC TESTS

- **Loss on Ignition** (733)

Analysis: Ignite at 800° for 30 min.

Acceptance criteria: NMT 8.0%

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers.

- **USP Reference Standards** (11)

USP Sodium Fluoride RS

BRIEFING

Croscarmellose Sodium, *NF 33* page 6630. In preparation for the omission of the flame tests from *Identification Tests—General* (191), proposed in *PF 41(2)* [Mar.–Apr. 2015], the reference to (191) in *Identification test C* is deleted and a complete description of the flame test is included in the monograph. Manufacturers are encouraged to submit a replacement wet chemistry test or an instrumental procedure for Expert Committee consideration.

A statement is added in the beginning of the monograph: "Portions of this monograph that are national *USP* text, and are not part of the harmonized text, are marked with symbols (◆) to specify this fact."

The symbols (◆) are added to the non-harmonized attributes or local requirements—*Identification test C, Sodium Chloride and Sodium Glycolate, Content of Water-Soluble Material, and Microbial Enumeration Tests and Tests for Specified Microorganisms*.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

(EXC2: J. Liu.)

Correspondence Number—C164908

Comment deadline: January 31, 2016

Croscarmellose Sodium

Add the following:

▲ Portions of this monograph that are national *USP* text, and are not part of the harmonized text, are marked with symbols (◆) to specify this fact. ▲*NF35*

DEFINITION

Croscarmellose Sodium is the sodium salt of a cross-linked, partly *O*-(carboxymethylated) cellulose.

IDENTIFICATION

- **A.** Mix 1 g with 100 mL of methylene blue solution (1 in 250,000), stir the mixture, and allow it to settle. The Croscarmellose Sodium absorbs the methylene blue and settles as a blue, fibrous mass.
- **B.** Mix 1 g with 50 mL of water. Transfer 1 mL of the mixture to a small test tube, and add 1 mL of water and 5 drops of *1-naphthol TS*. Incline the test tube, and carefully add 2 mL of *sulfuric acid* down the side so that it forms a lower layer: a reddish-violet color develops at the interface.

Change to read:

•

▲◆▲NF35

C. A portion of the mixture of Croscarmellose Sodium with water, prepared as directed in *Identification test B*, ~~meets the requirements of the flame test for Identification Tests—General (191), Sodium.~~

▲ imparts an intense yellow color to a nonluminous flame. ◆▲NF35

IMPURITIES

- **Residue on Ignition (281):** 14.0%–28.0%, calculated on the dried basis. Use 1.0 g for the test, and use sufficient *sulfuric acid* to moisten the entire residue after the initial charring step, and additional *sulfuric acid* if an excessive amount of carbonaceous material remains after the initial complete volatilization of white fumes.

Delete the following:

* • **Heavy Metals (231), Method II:** 10 ppm • (Official 1-Jan-2018)

Change to read:

•

▲◆▲NF35

Sodium Chloride and Sodium Glycolate**Sodium chloride**

Sample: 5 g of Croscarmellose Sodium

Analysis: Transfer the *Sample* to a 250-mL beaker. Add 50 mL of water and 5 mL of 30% *hydrogen peroxide*, and heat on a steam bath for 20 min, stirring occasionally to ensure hydration. Cool, and add 100 mL of water and 10 mL of *nitric acid*. Titrate with 0.05 N silver nitrate VS, determining the endpoint potentiometrically, using a silver-based indicator electrode and a double-junction reference electrode containing 10% potassium nitrate filling solution in the outer jacket and a standard filling solution in the inner jacket, and stirring constantly (see *Titrimetry (541)*).

Calculate the percentage of sodium chloride in the specimen taken:

$$\text{Result} = (F \times V \times N) / [(100 - b) \times W]$$

F = equivalence factor for sodium chloride, 584.4

V = volume of the silver nitrate (mL)

N = normality of the silver nitrate

b = percentage of *Loss on Drying*, determined separately

W = weight of the specimen (g)

Sodium glycolate

Standard stock solution: Transfer 100 mg of *glycolic acid*, previously dried in a desiccator at room temperature overnight, to a 100-mL volumetric flask. Dissolve in and dilute with water to volume, and mix.

[Note—Use this solution within 30 days.]

Standard solution A: Transfer 1.0 mL of the *Standard stock solution* to a 100-mL volumetric flask. Add water to make 5 mL, then add 5 mL of glacial acetic acid. Dilute with acetone to volume, and mix.

Standard solution B: Transfer 2.0 mL of the *Standard stock solution* to a 100-mL volumetric flask. Add water to make 5 mL, then add 5 mL of glacial acetic acid. Dilute with acetone to volume, and mix.

Standard solution C: Transfer 3.0 mL of the *Standard stock solution* to a 100-mL volumetric flask. Add water to make 5 mL, then add 5 mL of glacial acetic acid. Dilute with acetone to volume, and mix.

Standard solution D: Transfer 4.0 mL of the *Standard stock solution* to a 100-mL volumetric flask. Add water to make 5 mL, then add 5 mL of glacial acetic acid. Dilute with acetone to volume, and mix.

Sample solution: Transfer 500 mg to a 100-mL beaker. Moisten thoroughly with 5 mL of *glacial acetic acid*, followed by 5 mL of water, and stir with a glass rod to ensure proper hydration (usually about 15 min). Slowly add 50 mL of acetone while stirring, then add 1 g of *sodium chloride*, and stir for several min to ensure complete precipitation of the carboxymethylcellulose. Filter through a soft, open-textured paper, previously wetted with a small amount of acetone, and collect the filtrate in a 100-mL volumetric flask. Use an additional 30 mL of acetone to facilitate the transfer of the solids and to wash the filter cake, then dilute with acetone to volume, and mix.

Analysis

Samples: *Standard solution A, Standard solution B, Standard solution C, Standard solution D, and Sample solution*

Transfer 2.0 mL of the *Sample solution* and 2.0 mL of each *Standard solution* to separate 25-mL volumetric flasks, and prepare a blank flask containing 2.0 mL of a solution containing 5% each of glacial acetic acid and water in acetone. Place the uncovered flasks in a boiling water bath for 20 min to remove the acetone. Remove from the bath, and cool. Add to each flask 5.0 mL of *2,7-dihydroxynaphthalene TS*, mix, add an additional 15 mL, and again mix. Cover the mouth of each flask with a small piece of aluminum foil. Place the flasks upright in a boiling water bath for 20 min, then remove from the bath, cool, dilute with sulfuric acid to volume, and mix.

Determine the absorbance of each solution at 540 nm, with a suitable spectrophotometer, against the blank, and prepare a standard curve using the absorbances obtained from the *Standard solutions*.

Calculate the percentage of sodium glycolate in the specimen taken:

$$\text{Result} = (F \times W_1) / [(100 - b) \times W_2]$$

F = factor converting glycolic acid to sodium glycolate, 12.9

W_1 = weight of glycolic acid in the specimen, determined from the standard curve and the absorbance of the *Sample solution* (mg)

b = percentage of *Loss on Drying*, determined separately

W_2 = weight of the specimen taken (g)

Acceptance criteria: The sum of the percentages of sodium chloride and sodium glycolate is NMT 0.5%.

▲◆▲NF35

SPECIFIC TESTS

Change to read:

•

▲◆▲NF35

Content of Water-Soluble Material

Analysis: Disperse 10 g in 800 mL of water, and stir for 1 min every 10 min during the first 30 min. Allow to stand for an additional h, or centrifuge, if necessary. Decant 200 mL of the aqueous slurry onto a rapid-filtering filter paper in a vacuum filtration funnel, apply vacuum, and collect about 150 mL of the filtrate. Pour the filtrate into a tared 250-mL beaker, weigh, and calculate the weight, in g, of the filtrate, W_3 , by difference.

Concentrate on a hot plate to a small volume, but not to dryness; dry at 105° for 4 h; and again weigh.

Calculate, in g, the weight of the residue by difference, W_1 .

Calculate the percentage of water-soluble material in the specimen, on the dried basis, taken:

$$\text{Result} = [100 \times W_1 \times (800 + W_2)] / \{W_2 \times W_3 \times [1 - (0.01 \times b)]\}$$

W_1 = weight of residue by difference (g)

W_2 = weight of the specimen taken (g)

W_3 = weight of the filtrate by difference (g)

b = percentage *Loss on Drying* of the specimen taken

Acceptance criteria: NMT 10.0%

▲◆▲NF35

• Degree of Substitution

Sample: 1 g

Analysis: Transfer the *Sample* to a glass-stoppered, 500-mL conical flask. Add 300 mL of sodium chloride solution (1 in 10), then add 25.0 mL of 0.1 N sodium hydroxide VS. Insert the stopper, and allow to stand for 5 min with intermittent shaking. Add 5 drops of *m-cresol purple TS*, and from a buret add 15 mL of 0.1 N hydrochloric acid VS. Insert the stopper in the flask, and shake. If the solution is violet, add 0.1 N hydrochloric acid VS in 1-mL portions until the solution becomes yellow, shaking after each addition. Titrate with 0.1 N sodium hydroxide VS to a violet endpoint.

Calculate the net number of milliequivalents, M , of base required for the neutralization of 1

g of Croscarmellose Sodium, on the dried basis.

Calculate the degree of acid carboxymethyl substitution, A:

$$\text{Result} = 1150 \times M / [7102 - (412 \times M) - (80 \times C)]$$

M = milliequivalents of base

C = percentage of *Residue on Ignition* of the Croscarmellose Sodium as determined in the test for *Residue on Ignition*

Calculate the degree of sodium carboxymethyl substitution, S:

$$\text{Result} = [162 + (58 \times A)] \times C / [7102 - (80 \times C)]$$

A = degree of acid carboxymethyl substitution, as determined above

C = percentage of *Residue on Ignition* of the Croscarmellose Sodium as determined in the test for *Residue on Ignition*

The degree of substitution is the sum of *A* + *S*.

Acceptance criteria: The degree of substitution is 0.60–0.85 on the dried basis

- **Loss on Drying** (731)

Analysis: Dry at 105° for 6 h.

Acceptance criteria: NMT 10.0%

Change to read:

-

Microbial Enumeration Tests (61) and **Tests for Specified Microorganisms** (62): The total aerobic microbial count does not exceed 1000 cfu/g, and the total combined molds and yeasts count does not exceed 100 cfu/g. It meets the requirements of the tests for absence of *Escherichia coli*.

- **pH** (791)

Analysis: Mix 1 g with 100 mL of water for 5 min.

Acceptance criteria: 5.0–7.0

- **Settling Volume**

Analysis: To 75 mL of water in a 100-mL graduated cylinder, add 1.5 g of it in 0.5-g portions, shaking vigorously after each addition. Add water to make 100 mL, shake again until all of the powder is homogeneously distributed, and allow to stand for 4 h. Note the volume of the settled mass.

Acceptance criteria: The volume of the settled mass is 10.0–30.0 mL.

ADDITIONAL REQUIREMENTS

- **Packaging and Storage:** Preserve in well-closed containers. No storage requirements specified.

Monosodium Glutamate, *NF 33* page 6766. As part of the USP monograph modernization effort and on the basis of comments received, it is proposed to make the following revisions:

1. Add chemical names, chemical structure, chemical formula, and molecular weight.
2. Replace the current *Identification* tests *A* and *B* based on the wet chemistry procedures with a single identification test, *Infrared Absorption* (197A), based on an attenuated total internal reflection IR spectrometric procedure. This test requires the use of USP Monosodium Glutamate RS. Rename the *Identification* tests accordingly.
3. Add a *USP Reference Standards* section and add USP Monosodium Glutamate RS to the section.

Additional work is in progress to develop and validate an HPLC method that will replace the titrimetric *Assay* and will be employed in a test for organic impurities. The HPLC method will be proposed in a future *PF* publication.

Additionally, minor editorial changes have been made to update the monograph to current *USP* style.

Potassium Hydroxide contains NLT 85.0% of total alkali, calculated as potassium hydroxide (KOH), including NMT 3.5% of potassium carbonate (K_2CO_3).

▲ It also contains NLT 85.0% of potassium. ▲NF35

[**Caution**—Exercise great care in handling Potassium Hydroxide because it rapidly destroys tissues.]

IDENTIFICATION

- **A. Identification Tests—General** (191), *Potassium*: A solution (1 in 25) meets the requirements.

Add the following:

- ▲ ● **B. pH** (791)

Sample solution: 0.1 mg/mL of Potassium Hydroxide

Acceptance criteria: NLT 10.5 ▲NF35

ASSAY

Change to read:

- **Procedure**

▲ **Total Alkali** ▲NF35

Sample: 1.5 g of Potassium Hydroxide

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 1 N sulfuric acid VS

Endpoint detection: Colorimetric

Analysis: Dissolve the *Sample* in 40 mL of carbon dioxide-free water. Cool the solution to 15° and add *phenolphthalein TS*. Titrate with 1 N sulfuric acid VS. At the discharge of the

pink color of the indicator, record the volume of acid solution required, then add *methyl orange TS* and continue the titration to a persistent pink color. Each mL of 1 N sulfuric acid is equivalent to 56.11 mg of total alkali, calculated as potassium hydroxide (KOH), and each mL of acid consumed in the titration with methyl orange is equivalent to 138.2 mg of potassium carbonate (K_2CO_3).

Acceptance criteria: NLT 85.0% of total alkali, calculated as potassium hydroxide (KOH), including NMT 3.5% of potassium carbonate (K_2CO_3)

Add the following:

▲ ● Content of Potassium

Diluent: 1% *Hydrochloric acid* solution

Sodium chloride solution: 0.2 g/mL of *sodium chloride*

Blank solution: Transfer 2.0 mL of the *Sodium chloride solution* to a 100-mL volumetric flask and dilute with *Diluent* to volume.

Standard stock solution: 57.21 $\mu\text{g/mL}$ of *potassium chloride*, previously dried at 105° for 2 h, in water. This solution contains 30 $\mu\text{g/mL}$ of potassium.

Standard solutions: Transfer 2.0-, 4.0-, and 6.0-mL portions of the *Standard stock solution* to separate 100-mL volumetric flasks. To each flask, add 2.0 mL of the *Sodium chloride solution*. Dilute the content of each flask with *Diluent* to volume and mix to obtain solutions with known concentrations of 0.6, 1.2, and 1.8 $\mu\text{g/mL}$ of potassium.

Sample stock solution: 0.5 mg/mL of Potassium Hydroxide

Sample solution: Transfer 1.0 mL of the *Sample stock solution* to a 250-mL volumetric flask. Add 5.0 mL of the *Sodium chloride solution* and dilute with *Diluent* to volume.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 766.5 nm (potassium emission line)

Lamp: Potassium hollow-cathode

Flame: Air-acetylene

Stage 4 Harmonization

This section contains monographs or chapters undergoing harmonization by the Pharmacopoeial Discussion Group (PDG). The PDG consists of the United States Pharmacopeia (USP), the European Pharmacopoeia (EP), and the Japanese Pharmacopoeia (JP). The process of harmonization consists of several steps (**Stages 1** through **7**, as defined below). Stage 4 drafts are available for comments. Below are descriptions of the developmental Stages as defined by the United States Pharmacopeia, the European Pharmacopoeia, and the Japanese Pharmacopoeia.

Stage 1: Identification The PDG identifies items to be harmonized and designates a coordinating pharmacopeia for each item. The PDG distributes the work by consensus among the three participating pharmacopeias. Harmonization may be carried out retrospectively for existing monographs or chapters, or prospectively for new monographs or chapters.

Stage 2: Investigation The investigation process conducted by the coordinating pharmacopeia results in the preparation of a Stage 3 draft monograph or chapter accompanied by a report giving the rationale for the proposal and including validation data where appropriate. This report is based on input that comes from users, authorities, producers, associations, literature, experts, and staff.

Stage 3: Proposal The Stage 3 draft is reviewed and commented on by the other two pharmacopeias. The coordinating pharmacopeia reviews those comments, prepares a harmonized Stage 4 draft, and sends it to the other two participating pharmacopeias.

Stage 4: Official Inquiry The Stage 4 draft is published in the Forum of each pharmacopeia. In *PF*, this stage appears as OFFICIAL INQUIRY STAGE 4 in the *Harmonization* section. Each pharmacopeia analyzes the comments it receives and submits the consolidated comments to the coordinating pharmacopeia, which then reviews those comments, prepares a harmonized Stage 5A draft, and sends it to the other two participating pharmacopeias.

Stage 5: Consensus

A. Provisional

The Stage 5A draft is reviewed and commented on by the other two pharmacopeias. When consensus is reached, a CONSENSUS STAGE 5B document is prepared by the coordinating pharmacopeia.

B. Final

The Stage 5B draft (consensus document) is sent by the coordinating pharmacopeia to the other two participating pharmacopeias for final approval.

Stage 6: Adoption Each pharmacopeia incorporates the harmonized Stage 5B draft according to its own procedure. Adopted items are published by the three pharmacopeias in their Supplements or, where applicable, in a new edition of their Pharmacopeias.

Stage 7: Date of Implementation The pharmacopeias inform each other of the date of implementation in the particular region.

STIMULI TO THE REVISION PROCESS

Stimuli articles do not necessarily reflect the policies of the USPC or the USP Council of Experts

STIMULI TO THE REVISION PROCESS

This section may contain the following:

- reports or statements of Expert Committees
- original research reports
- evaluations of new and existing pharmacopeial methods
- commentaries
- articles relevant to compendial issues.

These items are published to stimulate discussion and continual review of Pharmacopeial standards. Generally, if an Expert Committee publishes an article on which they are specifically seeking comment, this will be clearly stated in the article. Readers may submit comments on issues raised in this section, but comment is not as critical as that for the *In-Process Revision* section. Readers interested in submitting comments should see *Instructions to Authors*.

Instructions to Authors

Contributions in the form of original research reports, evaluations of new and existing compendial methods, and other commentaries and articles relevant to drug standards or to *USP–NF* revision will be considered for publication in *Pharmacopeial Forum* under the section *Stimuli to the Revision Process*. Manuscripts are received with the explicit understanding that they have not been published previously in any language or medium and that they are not simultaneously under consideration by any other publication. All manuscripts are subject to review by USP headquarters staff, Committee members, or qualified outside referees, and if accepted for publication they will be subject to editing by USP staff. Accepted manuscripts become the property of the USP Convention (USPC) and may not be subsequently published elsewhere without written permission from the USPC. Authors are also responsible for obtaining permission for reprinting any illustrations that have been published elsewhere.

Abstract—Include an abstract of not more than 250 words stating the purpose and the results or conclusions of the article.

Style and Usage—*Stimuli* articles generally follow the current *Chicago Manual of Style* except in scientific usage (numbers, abbreviations, etc.). For the latter, authors should use the current *AMA Manual of Style* or the current *ACS Style Guide*. Authors may usefully consult a current edition of *Pharmacopeial Forum*.

References—Consult the current *AMA Manual of Style*, which is generally consistent with the National Library of Medicine's *Recommended Formats for Bibliographic Citation*. A current edition of *Pharmacopeial Forum* will offer examples of reference formats.

Copyright—Copyright transfer documents will be sent to authors after manuscripts have been accepted for publication.

Disclosure of Potential Conflicts of Interest—Maintaining independence and impartiality are critical to the integrity and credibility of USP's public health mission. Accordingly, authors are expected to conform to the Conflict of Interest provisions of the USP Code of Ethics (see link below), including as part of their manuscript submission disclosure of all financial and personal relationships that may potentially influence, or be perceived to influence, their article. USP staff are available to provide additional guidance to authors on the range of disclosure that would be appropriate. Although USP *Stimuli* articles are not the type of source likely to be relied on as a basis for governmental actions (e.g., not a vehicle for reports of human clinical research), USP nevertheless supports the overall policies of the International Committee of Medical Journal Editors (ICMJE) regarding Uniform Requirements for Manuscripts Submitted to Biomedical Journals and Ethical Considerations in the Conduct and Reporting of Research (links below).

USP Code of Ethics:

<http://www.usp.org/aboutUSP/governance/policies/codeOfEthics.html>

ICMJE Uniform Requirements:

http://www.icmje.org/urm_main.html

ICMJE Conflicts of Interest:

<http://www.icmje.org/conflicts-of-interest/>

Contact Person—USP will designate a Scientific Liaison in the Documentary Standards Division as the corresponding author. This ensures that USP receives all comments generated by the *Stimuli* article. Authors should contact the Scientific Liaison if they would like to receive copies of comments generated by their *Stimuli* articles.

Submission Instructions—Manuscripts must be submitted both as an electronic file and as a printed copy of the electronic file. Submit the text in Microsoft® Word or another current word-processing application. The preferred format for graphics submitted electronically is tagged image file format (TIFF). Photocopies are not acceptable. Manuscripts submitted for publication should be addressed to:

GUIDELINE FOR ASSIGNING TITLES TO USP DIETARY SUPPLEMENT MONOGRAPHS

USP Dietary Supplement and Herbal Medicines Nomenclature Joint Subcommittee, USP Staff^{a,b}

ABSTRACT The first publication of the *Pharmacopoeia of the United States* in 1820 included quality monographs of articles that would today be considered dietary supplements, for example, vitamins, minerals, and certain botanicals. Titles for such monographs were crafted to be brief and distinct, and in many instances a single word sufficed if that word was expressive and unambiguous. The 1820 volume discussed a guide for developing botanical monograph titles and indicated that USP would adapt a nomenclature that was simple, with the intent that the monograph title would be brief and explicit, expressing the medical meaning and nothing else. This *Stimuli* article presents a new guideline for formulating titles of dietary supplement monographs. The intent of this article is to initiate a discussion on this new proposed guideline, to solicit public comments, and to invite the participation of interested parties in USP's efforts to develop a nomenclature guideline for dietary supplement monographs. The goal of this effort is to eventually bring existing monograph titles into alignment with a uniform naming convention.

INTRODUCTION

The first publication of the *United States Pharmacopoeia (USP)* in 1820 included quality monographs of articles that today are referred to as dietary supplements (DSs), including vitamins, minerals, and certain botanicals. Monographs for some of these articles have been included in the compendium since the 1820 edition. In 1993, in response to the Nutrition Labeling and Education Act (NLEA) of 1990, a separate compendium section titled *Nutritional Supplements* was created to contain monographs for vitamins and mineral combinations. DS monographs were started in 1995 in response to the Dietary Supplement Health and Education Act of 1994 (DSHEA) and included some monographs for botanicals that were originally placed in the *National Formulary (NF)*. The *Nutritional Supplements* section was active through the publication of *USP 26-NF 21* in 2003. In 2004, a new section, *Dietary Supplements*, was introduced into *USP 27-NF 22* to replace the *Nutritional Supplements* section and included monographs for ingredients and dosage forms of DSs as defined by DSHEA. Monographs for botanical DSs originally in the *NF* were also moved to this new DS section. This new DS section is currently published in the *USP-NF*, which combines all of the dietary supplement monographs from the two compendia.

It should be noted, however, that other botanical articles in the *USP-NF* are not necessarily DSs because they are classified as drugs, excipients, or medical devices. For example, *Aloe*, *Elm*, *Ipecac*, *Psyllium*, and *Senna* remain in the *USP* section of the *USP-NF*. There is a *USP* monograph for *Gutta Percha*, which is used as a medical device material, e.g., for endodontic (root canal) treatment. *Belladonna*, *Digitalis*, *Opium*, *Podophyllum*, and *Rauwolfia serpentina* are monograph examples currently included in the *USP* as prescription drugs or sources of prescription drugs. Other articles, such as flavors, fragrances, and other excipients, were placed in the *NF*.

Crafting monograph titles for vitamins and minerals has always been more straightforward than

it is for botanicals, as the former are mostly comprised of single ingredients with titles largely formulated in a manner similar to those for drugs. A guide for developing botanical monograph titles was discussed in the first *USP* (published as the *Pharmacopeia of the United States*) in 1820 to adopt a nomenclature to "...be conformable to the present language of science, divested of as much of its prolixity as can be done consistently with clearness and distinctness." The intent was for the monograph title to "...expresses the medicine, and nothing else; ...needed to be short and explicit, and does not require to be mutilated in practical use, as long names will inevitably be" (1). Thus, a monograph title was to be brief and distinct; a single word sufficed if that word was expressive and unambiguous. Plant parts were not included in monograph titles except where multiple monographs were developed for different plant parts of the same species, in which case the plant part was included to distinguish the monographs from each other by title. The USP staff followed this format when formulating monograph titles until the enactment of DSHEA in 1994.

DSHEA defines a DS as: "(1) a product (other than tobacco) intended to supplement the diet that bears or contains one or more of the following dietary ingredients: (A) a vitamin; (B) a mineral; (C) a herb or other botanical; (D) an amino acid; (E) a dietary substance for use by man to supplement the diet by increasing the total dietary intake; or (F) a concentrate, metabolite, constituent, extract, or combination of any ingredient described in clause (A), (B), (C), (D), or (E)."¹ DSHEA also mandates that the label of a DS must bear a statement of identity that, as stated in the Code of Federal Regulations Title 21 (21 CFR) section 101.4 (h), includes the common or usual names of botanical dietary ingredients (including fungi and algae) and these names must be consistent with the names standardized in *Herbs of Commerce* (2).

In accordance with DSHEA, USP adopted common names of botanicals utilized in North American commerce as monograph titles (3). In some cases, two or more species of plants may have the same standardized common name (SCN) in *Herbs of Commerce* but they can be distinguished from each other in the monograph title—if necessary to meet the requirements of the monograph—by including another common name (OCN) provided in *Herbs of Commerce* (2). For example, "Labrador tea" is the SCN for both *Ledum groenlandicum* [currently accepted name: *Ledum palustre* subsp. *groenlandicum* (Oeder) Hultén] and *Ledum palustre* subsp. *decumbens*, but to have a separate DS monograph for each species, the OCNs "Bog Labrador Tea" and "Marsh Labrador Tea," respectively, could be included in the monograph titles. The Latin binomial or a recognized common name used in commerce is required in the DS monograph title for plants that are not listed in the *Herbs of Commerce* and thus not assigned an SCN in *Herbs of Commerce*, e.g., *Pelargonium sidoides*, or Banaba for *Lagerstroemia speciosa*; or if the SCN applies to more than one species, no OCNs are provided to distinguish those species, and a distinction is necessary for the purposes of the monograph. There are some cases where the SCN provided in *Herbs of Commerce* is not necessarily the most common name in commerce (2), e.g., *Euterpe oleracea* has the SCN "Cabbage Palm" but is now better known as "Açaí Palm". *Siraitia grosvenorii* has the SCN "Luo Han Guo", which is the best known common name for it when used in Traditional Chinese Medicine, but when used in foods and DSs as a natural low-calorie sweetener it may be better known as "Monk Fruit". In these cases, using the Latin binomial in the DS monograph title helps avoid confusion.

Any name in Latin form shall be in accordance with internationally accepted rules on nomenclature, such as those found in the *International Code of Nomenclature for Algae, Fungi, and Plants (Melbourne Code)* (the 2011 edition replaced the document previously known as the *International Code of Botanical Nomenclature*) (4). Normally, Latin binomials and subspecies or variety names are italicized (4).

For brevity, it is not necessary to include the author citation of a Latin binomial in the DS

monograph title; it will be provided in the *Definition* section of the monograph. The citation of the author or authors who validly published the Latin binomial is a key part of the scientific name of an organism. The authors' names follow directly after the Latin binomial, e.g., *Andrographis paniculata* (Burm.f.) Nees. The reason the Latin binomial needs to be followed by the author citation is that the author citation helps in locating the original published plant description, which helps determine the "type species" (from which the original description was created), and the date (priority) of publication of the name; these are key criteria used to determine which name for a particular species is correct. The author citation also identifies the source of the name to prevent confusion over duplicate names and helps trace changes in names. For example, the author citation for the plant name *Andrographis paniculata* (Burm.f.) Nees indicates that Christian Gottfried Daniel Nees von Esenbeck (internationally standardized abbreviation, "Nees") transferred this species to the genus *Andrographis* after re-examining and reclassifying the same type specimen from which was derived the original name *Justicia paniculata* Burm.f. published by Nicolaas Laurens Burman ("f." stands for *filii* because he was the son of another botanist, Johannes Burman, whose abbreviation is "Burm").

A detailed explanation of how authors are cited and the meaning of terms such as "ex" or "in" found within the author citation is provided in Chapter VI of the *International Code of Nomenclature for Algae, Fungi, and Plants* (4). In the context of the details to be provided in the DS monograph *Definition* section, the author citation becomes critical when a positive identification of the article cannot be made in its absence (e.g., see discussion of *Illicium anisatum* below). This would also be an issue on a product label, on a raw material order form, or in a master formula. Thus, the level of detail in the DS monograph *Description* section will be consistent with the labeling regulations that require inclusion of the designation of the author or authors who published the Latin name.

In the DS monograph title, the name of the plant part follows the name (common or Latin binomial) of the article. For example, *Echinacea purpurea Aerial Parts* is a separate monograph from "*Echinacea purpurea* Root". This is consistent with 21 CFR101.4(h)(1), which requires the DS label to list the part of the plant (e.g., root, leaf) from which the dietary ingredient is derived [e.g., "Garlic bulb" or "Garlic (bulb)"]. The name of the part of the plant shall be expressed in English (e.g., "flower" rather than the Latin term "flos" used in some pharmacopeias).

All titles of dietary ingredient monographs and DS monographs are approved by the appropriate Expert Committee (EC), based on USP staff research and the best scientific judgment of the EC. There have been many considerations in naming dietary ingredients and DSs including, but not limited to: USP's historical and scientific practices, industry convention, international similarities and differences, regulatory status, and environmental and agricultural practices. The guideline below was developed with input from the Nomenclature, Safety, and Labeling (NSL) EC and the Monographs—Dietary Supplements and Herbal Medicines (DSHM) EC as a complement to *Nomenclature* (1121). The guideline is intended to provide a systematic approach to developing monograph titles for dietary ingredients and DS dosage forms admitted to the compendium. To minimize the potential for confusion and controversy, the naming of monographs in this guideline is guided by available scientific conventions, the practices of the DS industry, and the labeling requirements of applicable federal regulations.

Some DS monographs define and characterize plant, fungal, algal, animal, and certain bacterial materials. Botanical materials are often processed to some extent, such as by drying and milling (cutting, sifting, particle sizing, and density adjustment). Other DS monographs describe extracts, processed extracts, partially purified natural complexes, or purified substances of botanical materials. There are also monographs for single chemical entities and for finished oral

dosage forms. This guideline indicates how DS monograph titles shall be developed for the different types of articles included below, with examples. It is preferable that existing monograph titles that do not conform to the new approach be revised on an as-needed, case-by-case basis.

DIETARY INGREDIENT MONOGRAPH TITLES

A "dietary ingredient", as defined by DSHEA, is a substance intended for use in the manufacture of DS finished dosage forms. Some of these articles may in fact be raw materials (as described in *Identification of Articles of Botanical Origin* (563)) that are subject to further processing for the manufacture of dietary ingredients, or they may be dietary ingredients when used directly in the manufacture of DSs. Dietary ingredients can be broadly categorized into the following groups: complex articles of botanical origin, complex articles of animal origin, other complex dietary substance articles, and single chemical entities (including vitamins, minerals, amino acids, and other examples that will be provided below).

Titles for Monographs of Complex Articles of Botanical Origin

These articles include plant (or fungal, algal, or certain bacterial) materials such as the whole plant or a specific plant part (e.g., leaf, root, stem, fruiting body of a fungus, thallus of an alga, and others) and plant products, which are substances produced naturally by a plant or plant part that do not require processing beyond pressing or cutting and scraping to be obtained, such as a seed oil, gum, latex, or resin.

Each monograph shall have a title that is consistent with its *Definition* and *Identification* sections. The monograph title shall include the SCN (or OCN in the cases explained above) from *Herbs of Commerce* or the Latin binomial where necessary (in the cases explained above), followed by the name of the botanical part(s) or botanical product, except in the case of single-celled or colonial organisms such as yeasts (e.g., *Saccharomyces cerevisiae*, *Monascus purpureus*), certain algae (e.g., *Chlorella*), and cyanobacteria (also known as blue-green algae, e.g., *Spirulina*, *Nostoc*), which have no parts. The part name is followed, where applicable, by the processed form. The botanical part name, botanical product name, and processed form name shall be written in English and in singular form.

In cases where more than one species of a genus are represented in a monograph, the genus name shall be used followed by the word Species² unless there is one SCN for all the included species and there is no need to distinguish among them for the purposes of the monograph. For example, *Herbs of Commerce* has a separate SCN for each of 11 different species of willow, but in commerce the barks of various species of *Salix* are used alone or mixed to make "willow bark" or "willow bark extract" supplements (2). Due to substantial anatomical and chemical similarities and hybridization between species, distinguishing them by microscopic, chemical, or genetic tests is neither readily feasible nor necessary. Because the use of any one willow SCN in the DS monograph title will not accurately reflect the composition of the article of commerce, a more appropriate title would be "*Salix* Species Bark".

Additional information about the DS article that is the subject of the monograph, e.g., the Latin binomial(s), with their corresponding author(s) and the family, common name(s), identity and strength of solvent(s), range of ratios of crude plant material to extract, and range of concentration of marker compound(s), shall be included under its *Definition*.

Inclusion of the variety or subspecies in the title of a DS monograph depends on whether or not it is relevant to the accurate definition of the article of commerce. Phytochemical differences, safety differences, and traditional use differences at the variety or subspecies level should be

evaluated to determine whether the variety or subspecies should be included in the monograph title. For example, if the fruit with the SCN "Jujube" did not have an SCN, then to accurately reflect the identity of the article used in Traditional Chinese Medicine it would be necessary for the DS monograph title to include the variety name: "*Ziziphus jujuba* var. *spinosa* Seed". When a variety or subspecies is not relevant to the article's definition and characterization, it should not be used in the title of the monograph.

Occasionally, in the absence of an SCN or OCN from *Herbs of Commerce*, the Latin binomial most widely known in commerce will be used in the monograph title even if it does not represent current accepted taxonomic nomenclature. For example, if a DS monograph were to be developed for the fungus *Antrodia camphorata* (which is an article in the *Herbal Medicines Compendium*), the DS monograph title would be *Antrodia camphorata* Fruiting Body, even though the Index Fungorum—Species Fungorum database indicates that the current name should be *Taiwanofungus camphoratus*. The monograph *Description* would give the authors of the Latin binomial, i.e., *Antrodia camphorata* (M. Zang & C.H. Su) Sheng H. Wu, Ryvardeen & T.T. Chang, to clarify that the currently accepted name is *Taiwanofungus camphoratus* (M. Zang & C.H. Su) Sheng H. Wu, Z.H. Yu, Y.C. Dai & C.H. Su, and indicate that another synonym is *Ganoderma camphoratum* M. Zang & C.H. Su. By providing these details in the *Definition* of the monograph, the connection is maintained between the article of commerce and its various Latin binomials which are subject to revision by taxonomists.

Since a synonym may be used in a DS monograph title, it is important to be pragmatic in selecting which other taxonomic synonyms to be included in the monograph text for clarification of the article's identity, since there may be more than one commonly used synonym for an article of commerce. Taxonomic web sites such as The Plant List (developed through a collaboration between the Royal Botanic Gardens, Kew; the Missouri Botanical Garden; and other authoritative institutions) (5) and the U.S. Department of Agriculture, Agricultural Research Service Germplasm Resources Information Network (GRIN) online database (6) can be checked for a reasonably comprehensive list of synonyms, so it will not be necessary to duplicate all of that information in a DS monograph.

The following criteria may be helpful in deciding how to select synonyms for inclusion in the DS monograph *Definition*:

1. If the Latin binomial selected for use in the DS monograph title or associated with the DS monograph title's SCN is a synonym according to the current nomenclature set out in The Plant List (5) or the USDA GRIN database (6), then clarification of the synonymy should be included in the DS monograph *Definition*. For example, *Polygonum multiflorum* Thunb. is the Latin binomial associated with the SCN "Fo-Ti" but it is a synonym for *Reynoutria multiflora* (Thunb.) Moldenke, so both this synonym and the current correct Latin binomial should be included in the monograph for Fo-Ti. As another example, *Garcinia cambogia* (SCN: *Garcinia*) is a synonym used currently as a DS monograph title; both *Garcinia cambogia* (Gaertn.) Desr. and the accepted Latin binomial name *Garcinia gummi-gutta* (L.) Roxb. (except with the author N. Robson, which has since been revised to Roxb.) are included in the *Definition*. To determine which synonyms are well-established in commerce, references to consult include key compendia or pharmacopeias from authoritative sources (e.g., labeling standards or monographs published by the *European Medicines Agency*, or compendia such as the *Food Chemicals Codex*, *European Pharmacopoeia*, *Pharmacopoeia of the People's Republic of China*, or the *Herbal Medicines Compendium*).
2. Where key compendia or pharmacopeias from authoritative sources provide multiple

synonyms, the presence of a synonym in two or more compendia/pharmacopoeias may be evidence that it is well-known enough to cite in the DS monograph *Definition* [e.g., *Momordica grosvenorii* Swingle and *Thladiantha grosvenorii* (Swingle) C. Jeffrey are commonly cited synonyms for *Siraitia grosvenorii* (Swingle) C. Jeffrey ex A.M. Lu & Zhi Y. Zhang]. Setting a criterion that synonyms must be found in two or more references may help avoid unnecessary listings, if the sources give multiple synonyms that are not necessarily used in commerce. This criterion can be revisited if too long a list is obtained in too many cases.

3. If a synonym is not listed in one of these official compendia but other peer-reviewed literature suggests there is a risk of confusion, such as happened in the case of the potentially hazardous confusion between the edible Chinese star anise, *Illicium verum* Hook. f., synonym *Illicium anisatum* Lour., and the toxic Japanese star anise, *Illicium anisatum* L. (only the authors of these last two Latin binomials differ), then this synonymy should be included in the monograph text as it is relevant to safety.

Below are examples indicating how monograph titles shall be developed for the different types of complex dietary ingredients of botanical origin including botanical materials, botanical products, and botanical processed forms.

titles for botanical material monographs

DS plant articles (or fungal, algal, or bacterial material articles) include the whole plant or a specific part of the plant, with the exception noted above for single-celled or colonial organisms. The term "botanical material" is used here to indicate material derived directly from a plant and does not include articles that may be obtained from these materials when processed, such as extracts, juices, oils, and others. The examples provided in *Table 1* illustrate how titles for botanical material monographs will be derived when following the new guideline, compared to how current monograph titles were derived.

Table 1. Current and Proposed Nomenclature Formats for Botanical Material Monograph Titles

Current Examples	Proposed Examples ^a
[{SCN} OR {LATIN BINOMIAL W/O AUTHORITY}] ^b {BOTANICAL PART(S)}	[{SCN} OR {LATIN BINOMIAL W/O AUTHORITY}] [BOTANICAL PART(S)]
<i>Andrographis</i>	Andrographis Stem and Leaf
<i>Asian Ginseng</i>	Asian Ginseng Root
<i>Capsicum</i>	<i>Capsicum</i> Species Fruit
<i>Centella asiatica</i>	Gotu Kola Aerial Parts
<i>Chamomile</i>	Chamomile Flower Head
NA ^c	Chlorella
<i>Ganoderma lucidum</i> Fruiting Body	Reishi Fruiting Body
NA	Kelp Thallus ^d
<i>Rhodiola rosea</i>	<i>Rhodiola rosea</i> Root and Rhizome
<i>Senna</i> Leaf	<i>Senna</i> Leaf
<i>Senna</i> Pods	<i>Senna</i> Pod
<i>Spirulina</i>	<i>Spirulina</i> Species
<i>Valerian</i>	<i>Valerian</i> Rhizome, Root and Stolon

^a Some examples provided are hypothetical, solely to show what the new titles would look like.

^b Items within brackets [] are required, whereas those within braces { } are to be used as appropriate, e.g., one should use {SCN} where an unambiguous SCN is provided in *Herbs of Commerce* but use {Latin binomial} in other cases as explained above.

^c NA, title not available because currently no USP monograph exists for this article.

^d As an example of an unusual case, *Kelp* is the SCN for various species of brown algae: *Alaria marginata*, *Ascophyllum nodosum*, *Laminaria digitata*, *L. hyperborea* (synonym *L. cloustonii*), *L. setchellii*, *L. sinclairii*, and *Macrocystis pyrifera*. Not all of these species have assigned OCNs. Another species, *L. saccharina*, has "Sugar Kelp" as the SCN. *Kelp* is defined in 21CFR172.365 as the dehydrated, ground product prepared from *Macrocystis pyrifera*, *Laminaria digitata*, *Laminaria saccharina*, and *Laminaria cloustoni* [sic] for special dietary and nutritional additives as a source of the essential mineral iodine. Therefore, using *Kelp* as the SCN in a DS monograph title might be interpreted to capture only three of the four species set out in 21CFR172.365, and could include other genera and species not permitted as *Kelp* under the conditions set out in this regulation. To resolve this rare exception to the general approach, a DS monograph entitled "Kelp Thallus" could specify the four species from 21CFR172.365 in the *Definition*, while a monograph for *Ascophyllum nodosum* could have the title "Kelp (*Ascophyllum nodosum*) Thallus" to include the SCN and be distinguishable from the other monograph.

titles for botanical product monographs

Articles referred to as plant (or fungal, algal, or bacterial) products include substances produced naturally by a plant or plant part that do not require processing beyond pressing or cutting and scraping to be obtained, such as seed oil, gum, latex, resin, and others. The examples provided below illustrate how titles for plant product monographs will be derived following the guideline, compared to how current monograph titles were derived.

Table 2. Current and Proposed Nomenclature Formats for Botanical Product Monograph Titles

Current Examples	Proposed Examples
[{SCN} OR {LATIN BINOMIAL W/O AUTHORITY}] {BOTANICAL PART(S)} {BOTANICAL PRODUCT}	[{SCN} OR {LATIN BINOMIAL W/O AUTHORITY}] [{BOTANICAL PART(S)} AND/OR {BOTANICAL PRODUCT}]
<i>Almond Oil</i>	Almond Seed Oil
<i>Castor Oil</i>	Castor Seed Oil
<i>Aromatic Castor Oil</i>	Castor Seed Aromatic Oil ^a
<i>Crypthecodinium cohnii Oil</i>	<i>Crypthecodinium cohnii</i> Oil
<i>Boswellia serrata</i>	<i>Boswellia serrata</i> Oleo-gum-resin
<i>Evening Primrose Oil</i>	Evening Primrose Seed Oil
<i>Flax Seed Oil</i>	Flax Seed Oil
<i>Guggul</i>	Guggul Oleo-gum-resin
<i>Myrrh</i>	Myrrh Oleo-gum-resin
Palm Oil	Palm Fruit Oil
Palm Oil	Palm Kernel Oil
<i>Schizochytrium Oil</i>	Schizochytrium Species Oil
^a An aromatic botanical product article is created by the addition of essential oils as flavoring agents, so the DS monograph title follows the proposed format with the addition of the adjective "Aromatic".	

titles for botanical processed form monographs

Articles referred to as plant (or fungal, algal, or bacterial) processed forms include plant powders, dry extracts, dry juices, liquid articles, and fractions, but do not include isolated pure compounds. The examples provided below illustrate how titles for plant processed form monographs will be derived when following the new guideline, compared to how current monograph titles were derived.

Titles for botanical powder monographs: The term "powder" often indicates that the botanical material has been milled (comminuted) into a powder, but some materials such as spores and pollen occur naturally as powders. Botanical powders (see *Table 3* for examples) include powdered botanical materials but are not meant to include other botanically derived ingredients that may be powdered or present in powder form, such as dry extracts and dry juices.

Table 3. Current and Proposed Nomenclature Formats for Botanical Powders

Current Examples	Proposed Examples
{PROCESS } [{SCN} OR {LATIN BINOMIAL W/O AUTHORITY}] {BOTANICAL PART(S)}	[{SCN} OR {LATIN BINOMIAL W/O AUTHORITY}] [BOTANICAL PART(S)] [{POWDER} OR {SPORE} OR {POLLEN}]
<i>Powdered Andrographis</i>	Andrographis Stem and Leaf Powder
<i>Powdered Ashwagandha Root</i>	Ashwagandha Root Powder
Powdered Asian Ginseng	Asian Ginseng Root Powder
<i>Powdered Black Cohosh</i>	Black Cohosh Rhizome and Root Powder
NA	Clubmoss Spore
<i>Powdered Centella asiatica</i>	Gotu Kola Aerial Parts Powder
<i>Powdered Garlic</i>	Garlic Bulb Powder
Powdered Hawthorn Leaf with Flower	Hawthorn Leaf with Flower Powder
<i>Powdered Horse Chestnut</i>	Horse Chestnut Seed Powder
NA	Pine Pollen

Titles for botanical extract monographs: Extracts obtained from botanical materials are classified and named based on their physical state or consistency, such as liquid (liquid extracts), semisolid (soft extracts), or dry (extracts in solid form, e.g., powders, granules, or flakes) (see *Botanical Extracts* (565)). The examples provided in *Tables 4* and *5* illustrate how titles for botanical extract monographs will be derived when following the new guideline compared to how current monograph titles were derived. For the sake of clarity, in the following tables the format terms: **[{SCN} OR {LATIN BINOMIAL W/O AUTHORITY}]** **[{BOTANICAL PART(S)} AND/OR {BOTANICAL PRODUCT}]** used above to describe botanical materials, products, and powders will be simplified to **[SOURCE MATERIAL NAME]**, which incorporates all of the above terms.

Table 4. Current and Proposed Nomenclature Formats for Botanical Dry Extracts

Current Examples	Proposed Examples
[{PROCESS} {TYPE}] [SOURCE MATERIAL ^a NAME] [{EXTRACT}]	[SOURCE MATERIAL NAME {FRESH} ^b] [{TYPE} ^c DRY EXTRACT]
<i>Powdered Andrographis Extract</i>	Andrographis Stem and Leaf Dry Extract
<i>Powdered Asian Ginseng Extract</i>	Asian Ginseng Root Dry Extract
<i>Powdered Centella asiatica Extract</i>	<i>Centella asiatica</i> Aerial Parts Dry Extract
<i>Powdered Goldenseal Extract</i>	Goldenseal Root and Rhizome Dry Extract
NA	Oat Fresh Seed Dry Extract
NA	Rosemary Leaf Aqueous Dry Extract
<i>Powdered Valerian Extract</i>	Valerian Rhizome, Root and Stolon Dry Extract
Yeast Extract	Yeast Dry Extract

^a Source material refers to the unprocessed botanical material or product used to prepare an extract or other processed botanical materials. Crude herb, or raw material would be synonymous terms the naming of which is exemplified in *Tables 1* and *2*.

^b If fresh plant material is used to prepare the extract, the word "Fresh" is included after the SCN or Latin binomial and before the plant part. Otherwise, dry material is assumed.

^c "TYPE" is an additional term that further identifies the article. The solvent is specified when two articles need to be differentiated based on their chemical profile due to the solvent used. For example, the terms aqueous or hydroalcoholic specify the type of extraction solvent used, which will create a unique article.

Table 5. Current and Proposed Nomenclature Formats for Botanical Soft Extracts

Current Examples	Proposed Examples
[SOURCE MATERIAL NAME] [{EXTRACT}]	[SOURCE MATERIAL NAME {FRESH}] [{TYPE} {OLEORESIN} OR {TYPE} {SOFT EXTRACT}]
<i>Capsicum Oleoresin</i>	<i>Capsicum</i> Species Fruit Oleoresin
NA	Turmeric Rhizome Ethanol Oleoresin
NA	Ginger Rhizome CO ₂ Soft Extract
NA	Lemon Balm Leaf Soft Extract
NA	Valerian Fresh Rhizome, Root and Stolon Soft Extract

The term "botanical liquid articles" is intended to capture a variety of types of extracts, including not only fluid extracts and tinctures, which are described in (565), but also articles such as essential oils, essential oil spirits, and essential oil waters. Examples are provided in *Table 6*.

Table 6. Current and Proposed Nomenclature Formats for Botanical Liquid Articles

Current Examples	Proposed Examples
[SOURCE MATERIAL NAME] [EXTRACT]	[SOURCE MATERIAL NAME {FRESH}] [LIQUID ARTICLE]
<i>Belladonna Tincture</i>	Belladonna Leaf Tincture
<i>Black Cohosh Fluidextract</i>	Black Cohosh Root and Rhizome Fluidextract
<i>Aromatic Cascara Fluidextract</i>	Cascara Sagrada Bark Aromatic Fluidextract ^a
<i>Garlic Fluidextract</i>	Garlic Bulb Fluidextract
<i>Ginger Tincture</i>	Ginger Rhizome Tincture
<i>Licorice Fluidextract</i>	Licorice Root, Rhizome and Stolon Fluidextract
NA	Oat Fresh Seed Tincture
<i>Peppermint Oil</i>	Peppermint Leaf Essential Oil
<i>Peppermint Spirit</i>	Peppermint Leaf Essential Oil Spirit
<i>Peppermint Water</i>	Peppermint Leaf Essential Oil Water
<i>Rhodiola rosea</i> Tincture	<i>Rhodiola rosea</i> Root and Rhizome Tincture
<i>Valerian Tincture</i>	Valerian Rhizome, Root and Stolon Tincture
^a An aromatic botanical product article is created by the addition of essential oils as flavoring agents, so the DS monograph title follows the proposed format with the addition of the adjective "Aromatic".	

Juices are distinguished from other botanical liquid articles because while they are liquid to start, they may be subsequently concentrated or dried to make the article of commerce. In most cases the ability to extract the juice depends upon the plant material being fresh, so {FRESH} can be assumed unless otherwise specified. Examples are provided in *Table 7*.

Table 7. Current and Proposed Nomenclature Formats for Plant Juices

Current Examples	Proposed Examples
[SOURCE MATERIAL NAME] [EXTRACT]	[SOURCE MATERIAL NAME] [JUICE] OR [DRY JUICE]
<i>Cranberry Liquid Preparation</i>	Cranberry Fruit Juice
NA	<i>Echinacea purpurea</i> Aerial Parts Dry Juice
NA	European Elder Fruit Dry Juice

Chapter (565) states that certain botanical extracts may be referred to as "native extracts", which are extracts with no added inert substances and not processed beyond initial extraction. The only DS monographs with the word "native" in the title are *Native Guggul Extract* and *Native Gymnema Extract*, both of which have a contrasting monograph, *Purified Guggul Extract* and *Purified Gymnema Extract*. Other monographs indicate in the *Definition* rather than the title if suitable added substances such as carriers may be added (e.g., *Powdered Holy Basil Leaf Extract* or *Powdered Red Clover Extract*) or if the extract has no added substances (e.g., *Cranberry Liquid Preparation* or *Saw Palmetto Extract*). Another possibility is that the *Definition* may say nothing about the presence or absence of added substances (e.g., *Maritime Pine Extract*, or *Powdered St. John's Wort Extract*).

Some extracts are subject to additional processes that increase the content of characterized constituents, decrease the content of unwanted constituents, or both. The percentage of

characterized or unwanted constituents in a processed extract may vary and will be specified in the *Definition* of the article. For example, the *Powdered Garcinia Hydroxycitrate Extract* monograph specifies NLT 40% (–)-hydroxycitric acid. *Powdered Decaffeinated Green Tea Extract* serves as an example of a monograph for an article with a reduction of the level of a constituent, by its caffeine specification of NMT 0.1%. Another potential example would be “Deglycyrrhizinated Licorice Root Extract” which is processed to remove glycyrrhizin (glycyrrhizic acid or glycyrrhizinic acid).

In other cases, the specification may be for a class of compounds rather than a single characterized constituent, e.g., NLT 90.0% *Centella asiatica* triterpene derivatives in the monograph *Centella asiatica Triterpenes*; NLT 75.0% oligomeric proanthocyanidins in *Grape Seeds Oligomeric Proanthocyanidins*; NLT 90.0% and NMT 110.0% of the labeled amount of the sum of guggulsterones *E* and *Z* calculated as guggulsterone *Z* in *Purified Guggul Extract*; and NLT 90.0% and NMT 110.0% of the labeled amount of the sum of a specific list of isoflavones in *Powdered Soy Isoflavones Extract*.

As a very complex example, the *Saw Palmetto Extract* monograph allows for three types of extraction solvent: hydroalcoholic mixtures to produce a hydrophilic extract; hexane to produce a lipophilic extract; and supercritical carbon dioxide to produce extracts that are also lipophilic, although their composition can be altered by variations in temperature, pressure, time, and other factors. The hydroalcoholic extract contains NLT 0.01% and NMT 0.15% of long-chain alcohols, whereas the lipophilic extract contains NLT 0.15% and NMT 0.35% of long-chain alcohols; all extracts are required to contain NLT 80.0% of fatty acids, NLT 0.2% of sterols, and NLT 0.1% of β -sitosterol, all on the anhydrous basis.

Titles of monographs for extracts that have been processed for specified content ranges of particular constituents are made more precise by identifying the class of compounds whose content in the extract has been increased or decreased, as demonstrated in the examples provided in *Table 8* with comparisons to current monograph titles.

Table 8. Current and Proposed Nomenclature Formats for Additionally Processed Botanical Extracts

Current Examples	Proposed Examples
<p style="text-align: center;">[{PROCESS}] [{TYPE}] [{SOURCE MATERIAL NAME}] [{CONSTITUENT OR CLASS OF COMPOUNDS}] [{EXTRACT}]</p>	<p style="text-align: center;">[{SOURCE MATERIAL NAME}] [{CONSTITUENT OR CLASS OF COMPOUNDS}] [{TYPE}] [{DRY EXTRACT}] OR [{SOFT EXTRACT}] OR [{LIQUID ARTICLE}] OR [{BOTANICAL PRODUCT}]</p>
<i>Powdered Garcinia Hydroxycitrate Extract</i>	Garcinia Pericarp Hydroxycitrate Dry Extract
<i>Centella asiatica Triterpenes</i>	Gotu Kola Aerial Parts Triterpenes Dry Extract
<i>Grape Seed Oligomeric Proanthocyanidins</i>	Grape Seed Oligomeric Proanthocyanidins Dry Extract
<i>Powdered Decaffeinated Green Tea Extract</i>	Green Tea Leaf Decaffeinated Dry Extract
<i>Purified Guggul Extract</i>	Guggul Guggulsterones Dry Extract
<i>Purified Gymnema Extract</i>	Gymnema Leaf Gymnemic Acids Dry Extract
NA	Licorice Root Deglycyrrhizinated Soft Extract
<i>Psyllium Hemicellulose</i>	Psyllium Seed Husk Hemicellulose Dry Extract
<i>Saw Palmetto Extract</i>	Saw Palmetto Fruit Hydroalcoholic ^a Dry Extract
NA	Saw Palmetto Fruit Lipophilic ^a Soft Extract
NA	Saw Palmetto Fruit CO ₂ ^a Soft Extract
<i>Powdered Soy Isoflavones Extract</i>	Soy Seed Isoflavones Dry Extract
<i>Tomato Extract Containing Lycopene</i>	Tomato Fruit Lycopene Dry Extract
	<i>Echinacea angustifolia</i> Root Alkylamides Fluidextract
	Evening Primrose Seed Gamma-Linolenic Acid Oil
<p>^a For some articles the targets of additional processing include several constituents or classes of compounds, e.g., Saw Palmetto Fruit fatty acids, sterols, and long-chain alcohols, with different specifications for different types of extracts, e.g., with respect to the long-chain alcohols content. In such cases, the type of extract may be used in the DS monograph title for brevity and the details of the associated targeted constituents or classes of compounds provided in the <i>Definition</i>.</p>	

Further processing of plant extracts can lead to the production of “partially purified natural complexes”, as opposed to the processed/semi-purified extracts just described. It would be arbitrary to set any numerical concentration threshold to distinguish between a plant extract processed with regard to particular constituents and a partially purified natural complex—they are all complex articles. However, the *Definition* section of currently monographed articles explicitly makes the distinction that partially purified natural complexes are comprised mainly of particular characterized constituents and their closely related congeners, whereas the processed extracts are characterized as fractions of an extract enriched or depleted in a particular substance or group of related substances. In practice, the degree of purification of natural complexes may overlap with that of processed extracts, but the intent of a monograph for a partially purified natural complex is to provide quality specifications for a complex article that is more akin to a single chemical entity than an unprocessed botanical extract.

The format for monograph titles for partially purified natural complexes is simply **[CLASS OF COMPOUNDS]**. For example, *Sennosides* is defined as a partially purified natural complex of

anthraquinone glucosides isolated from senna leaf and/or senna pod, with NLT 90.0% and NMT 110.0% of the labeled amount of sennosides, and the labeled amount should be NLT 60.0% (w/w) of the article. *Curcuminoids* is defined as a partially purified natural complex of diaryl heptanoid derivatives isolated from turmeric, with NLT 95.0% of curcuminoids, calculated on the dried basis as a sum of curcumin (70.0%–80.0%), desmethoxycurcumin (15.0%–25.0%), and bisdesmethoxycurcumin (2.5%–6.5%).

Titles for Monographs of Complex Articles of Animal Origin

Monograph titles for dietary ingredients of animal origin should follow the directives in 21CFR101.4 *Food; designation of ingredients*, which is consistent with DSHEA with respect to the requirement to use common or usual English names where available. Taxonomic details may be provided in the article's *Definition*, e.g., the families of fish that may be used to produce fish oil are provided in the *Definition* because it is not feasible to identify each individual species in the monograph title or *Definition*. The general nomenclature convention for DS monograph titles is **[ANIMAL NAME] {ANIMAL ORGAN(S)} [ANIMAL PRODUCT] {MAJOR CONSTITUENT}**. Examples include *Cod Liver Oil*, *Krill Oil*, "Oyster Shell", and "Shark Cartilage".

As with partially purified natural complexes from plants, some complex articles of animal origin may be comprised mainly of particular characterized constituents and their closely related congeners, so the format of the monograph titles can be similar to those for processed botanical articles (see *Table 9*). An added benefit of including the source material is that greater precision is provided, e.g., fish is not the only commercial source of omega-3 fatty acid triglycerides from which ethyl esters can be made. α -Linolenic acid can be sourced from the oils of flaxseeds, walnuts, or soybeans, and there are DS monographs for docosahexaenoic acid (DHA) from algal oil sources (*Crypthecodinium cohnii* and *Schizochytrium* spp.).

Table 9. Current and Proposed Nomenclature Formats for Processed Animal Products

Current Examples	Proposed Examples
{PROCESS} {TYPE} {SOURCE MATERIAL NAME} [CLASS OF COMPOUNDS]	[SOURCE MATERIAL NAME] [CLASS OF COMPOUNDS]
<i>Fish Oil Containing Omega-3 Acids</i>	Fish Oil Omega-3 Acids
<i>Omega-3 Acids Triglycerides</i>	Fish Oil Omega-3-Acid Triglycerides

The format for monograph titles for partially purified natural complexes from animal source materials, as with that type of botanical monograph title, is simply **[CLASS OF COMPOUNDS]**, e.g., *Pancreatin*, where the source material name (hog or ox) is provided in the *Definition* and can be specified in labeling, e.g., to allow consumers to make informed choices with respect to kosher or halal products.

Titles for Monographs of Other Complex Dietary Substances

In contrast to the examples cited above of cyanobacteria, which resemble algae in their growth form and thus fit within the DSHEA dietary ingredient definition part (C) "a herb or other botanical", monographs for other bacterial articles such as probiotic species better fit the DSHEA definition part (E), "a dietary substance ...". Titles for these monographs should follow the format **[LATIN BINOMIAL W/O AUTHORITY] [STRAIN IDENTIFIER]** e.g., *Bacillus coagulans* GBI-30, 6086; *Lactobacillus rhamnosus* GG; or *Lactobacillus johnsonii* NCC 533.

Titles for Single Chemical Entity Monographs

The nomenclature for single chemical entities (e.g., vitamins, mineral nutrients, amino acids, enzymes, and isolated or synthetic substances) is the same as for drug substances, as outlined in §1121. Some examples include *Alanine*, *Ascorbic Acid*, *N-Acetylglucosamine*, *Chromium Picolinate*, *Cyanocobalamin*, *Ergocalciferol*, *Glutathione*, *Lactase*, *Lycopene*, *Magnesium Sulfate*, *Melatonin*, *Quercetin*, *Rutin*, *S-Adenosyl-L-methionine Disulfate Tosylate*, and *Vinpocetine*.

In some cases, "single" chemical entities may in fact be comprised of isomers or derivatives. For example, the *Phytonadione* monograph contains a purity specification of NLT 97.0% and NMT 103.0%, but it is a mixture of the *E*- and *Z*-isomers, of which it contains NMT 21.0% of the *Z*-isomer. To be compliant with the "Vitamin A" monograph, the article must possess NLT 95.0% of the vitamin A activity declared on the label but it may consist of retinol or esters of retinol formed from edible fatty acids, principally acetic and palmitic acids. The "Vitamin E" article consists of alpha-tocopherol and its alpha-tocopheryl acetate or alpha-tocopheryl acid succinate derivatives, and it may be the *RRR*- (previously referred to as *d*-) isomer or the all-racemic (*d,l*-) form. Other tocopherols and tocotrienols are not included in the "Vitamin E" *Definition*—a potential separate monograph could cover mixed tocopherols and tocotrienols.

The Term "Preparation" in Monograph Titles

The term "Preparation" is used in a number of current DS monograph titles. The original intent was to indicate articles that may be intermediates used in formulating finished dosage forms. In comparison, the *European Pharmacopoeia* distinguishes an "Herbal Drug Preparation" as an article obtained by subjecting the herbal drug to processes such as extraction (e.g., liquid extract/tincture/dry extract/soft extract); the class of extract may be further indicated as standardized or quantified.

With regard to current DS monographs, *Cranberry Liquid Preparation* has cranberry juice and no added substances. *Vitamin E Preparation* combines a single form of vitamin E with one or more inert substances. *Dexpanthenol Preparation* contains dexpanthenol and pantolactone, both of which have Reference Standards (RS). *Lutein Preparation* combines lutein (95.0%–130.0% of the labeled amount of lutein, with NLT 85.0% lutein, NMT 9.0% zeaxanthin) with one or more inert substances. *Lycopene Preparation* combines lycopene with one or more inert substances and suitable antioxidants. *Vitamin A Oral Liquid Preparation* consists of either retinyl acetate or retinyl palmitate in an emulsion, suspension, or solution.

The term "Preparation" will not be used in future DS monograph titles. As discussed above, many complex botanical articles may be used either as raw materials to be processed further in formulating DS finished products, or they may be used directly as dietary ingredients. Many current monographs that do not contain the word "Preparation" in the title include provisions in the *Definition* section that allow for the addition of "suitable added substances" (excipients, e.g., *Powdered Andrographis Extract*). Some allow for the addition of "suitable antioxidants" (e.g., *Schizochytrium Oil*), and many allow for multiple ingredients that each have an RS (e.g., *Vitamin E*).

TITLES FOR DIETARY SUPPLEMENT MONOGRAPHS

Dietary supplements are finished oral dosage forms manufactured to include dietary ingredients. Most commonly, DSs are available as tablets, capsules, liquid extracts (e.g., fluidextracts and tinctures), syrups, teas for infusion, and powders to be reconstituted for ingestion or sprinkled on food. DS dosage form nomenclature typically follows the same rules as those for drug

products (see general chapter *Pharmaceutical Dosage Forms* (1151)).

Some examples are provided below (note that some examples are hypothetical and are provided only to illustrate how titles should be derived). For the sake of clarity, the format terms:

[{SCN} OR {LATIN BINOMIAL W/O AUTHORITY}] [{FRESH}{BOTANICAL PART(S)} AND/OR {BOTANICAL PRODUCT}] [{TYPE} {DRY EXTRACT} OR {OLEORESIN} OR {SOFT EXTRACT} OR {LIQUID ARTICLE} OR {JUICE} OR {DRY JUICE} AND/OR {CONSTITUENT OR CLASS OF COMPOUNDS}] used above to describe botanical materials and products will be simplified to **[DIETARY INGREDIENT NAME]** which incorporates all of the above terms. The general form is as follows: **[DIETARY INGREDIENT NAME] {RELEASE CHARACTERISTIC} [DOSAGE FORM]**

Tablets: Black Cohosh Rhizome and Root Fluidextract Tablets, Cat's Claw Stem Bark Dry Extract Tablets, *Chondroitin Sulfate Sodium Tablets*, *Glucosamine Tablets*, Gymnema Leaf Dry Extract Tablets, *Methylsulfonylmethane Tablets*.

Capsules: Asian Ginseng Root Powder Capsules, *Fish Oil Omega-3 Acids Capsules*, *Cod Liver Oil Capsules*, Milk Thistle Fruit Dry Extract Capsules.

Lozenges: *Zinc and Vitamin C Lozenges*.

Oral solutions: *Ascorbic Acid Oral Solution*, *Cholecalciferol Solution*, *Oil-Soluble Vitamins with Minerals Oral Solution*, *Water-Soluble Vitamins with Minerals Oral Solution*, *Zinc Acetate Oral Solution*.

Oral suspensions: *Calcium Carbonate Oral Suspension*.

Powders for oral suspension: *Psyllium Hydrophilic Mucilloid for Oral Suspension*.

DRUG VERSUS DIETARY SUPPLEMENT NAMES FOR ARTICLES

In the United States, drugs and DSs conform to different standards and require different testing procedures for identity, purity, strength, and composition. Occasionally, the same substance is used in a drug and in a DS. When used in a drug, the substance is given a US Adopted Name (USAN) or an International Nonproprietary Name (INN), but when the same substance is used in a DS, it may be referred to by another scientific, traditional, or *Herbs of Commerce* name (2). Because the articles (drug vs. DS) may have to meet different standards, the use of different names may be important. *Table 10* provides some examples of such multiple names.

Table 10. USAN Names vs. DS Names

USAN Name	DS Name
Ademetionine	S-Adenosylmethionine or SAME
Ubidecarenone	Coenzyme Q ₁₀ , Co-Q ₁₀
Sinecatechins	Green Tea Catechin Extract

GLOSSARY

This glossary does not include terms for plant (or fungal, algal, bacterial, or animal) materials that are defined in standard textbooks. It focuses on terms specific to DS products and ingredients whose definitions are not so readily available elsewhere or that have been defined differently in various sources. Readers are also encouraged to consult (563) and (565) for additional information on terminology that applies to DSs.

Aqueous extract: Articles prepared by extracting materials with water.

Concentrate: Historically, "concentrate" had two meanings. One was simply reflecting a liquid or solid preparation of higher concentration sometimes referred to as "high potency". The other meaning was that the product must be diluted before administration. Not all "high potency" products had to be diluted, so the word "concentrate" lost its definitive meaning and created confusion. The nomenclature committee has recommended that the term "concentrate" be phased out of nomenclature. Instead, the appropriate dosage form terms, e.g., fluidextract or tincture, with the extraction or concentration ratio in the *Definition* and on the label, can be used to indicate potency. If applicable, the statement "must be diluted" should be displayed prominently on the label.

Dry extract: Solid preparations obtained by evaporation of the solvent used in their production.

Dry juice: Dry material obtained by, for example, freeze drying or spray drying juice, often onto a carrier.

Essential oil: Natural aromatic complex mixtures of compounds (there may be 200 or more in one essential oil) belonging mainly to two chemical classes: terpenoids (e.g., monoterpenoid ketones, alcohols, hydrocarbons, and esters such as carvone, menthol, α -pinene, and thymol acetate; sesquiterpenoids such as α -bisabolol and caryophyllene; and less commonly, diterpenoids such as phyllocladene and (+)-kaurene) and phenylpropanoids (e.g., anethole, cinnamaldehyde, coniferyl alcohol). However, there may also be some phenols such as methyl salicylate (oil of wintergreen) or vanillin, sulfur-containing compounds such as allyl isothiocyanate in mustard oil, or aldehydes such as benzaldehyde in bitter almond essential oil. They are liquid at room temperature and generally immiscible in water but are soluble in alcohol or other organic solvents, so they act like oils. They are called "essential" because they represent the "essence" of the plant in terms of fragrance. Since they evaporate when exposed to the air at room temperature, they are also called volatile oils or ethereal oils. They may be present in the leaf, seed, bark, stem, root, flower, and other plant parts, and may be obtained by steam distillation, extraction using various solvents, or other techniques.

Extract: Preparations with liquid, solid, or semisolid consistency obtained from plant material using solvents (such as ethanol, methanol, and others) to separate constituents of interest from the plant material. Types of extracts are namely: *Dry extract*, *Soft extract*, and *Liquid extract*; each is defined in this *Glossary*. Excipients may be included except for native extracts, which contain no constituents that were not native to the plant from which the extract was made.

Fluid extract: A type of *Liquid extract* preparation of plant matter, containing ethanol as a solvent or as a preservative, or both, so made that each 1 mL contains the extracted constituents of 1 g of the crude dry material that it represents, unless otherwise specified (e.g., 1:2) in the individual monograph.

Fraction: Processed extracts that consist of a specific class of compounds. For example sennosides from Senna, oligomeric proanthocyanidins from Grape Seed, and triterpenes from *Centella asiatica*.

Gum: A water-soluble carbohydrate derivative in the form of a hydrocolloid comprised of an anionic or nonionic polysaccharide or salts of polysaccharides, e.g., tragacanth, arabic (also known as acacia), ghatti, guar, karaya, locust bean, or xanthan.

Latin binomial: A system of nomenclature of animals, plants, and other life forms (developed by Linnaeus) that assigns a two-part Latinized name, the generic and specific epithets, to each species, such as *Harpagophytum procumbens* or *Harpagophytum zeyheri* for the two species of Devil's Claw included in the "Harpagophytum Species Root" monograph.

Latin binomial authority: The author of the Latin binomial, i.e. the individual(s) who first

named, or later revised the name of the plant and validly published that binomial. The author information immediately follows the specific epithet, e.g., *Harpagophytum procumbens* (Burch.) DC. ex Meisn. or *Harpagophytum zeyheri* Decne.

Liquid extract: Liquid preparations of plant matter containing ethanol, water, vinegar, vegetable oil, or glycerin (or a mixture, e.g., aqueous ethanol) as a solvent. The term liquid indicates a material that is pourable and conforms to its container at room temperature.

Oleo-gum-resin: A mixture of an oleoresin and a gum, e.g., myrrh.

Plant processed forms: Plant material that has been subjected to processing, e.g., grinding to powder. Examples of processed plant forms include juices, powders, extracts, and fractions, but not isolated pure compounds.

Plant product: Substance produced naturally by a plant or plant part that does not require processing beyond pressing or cutting and scraping to be obtained. Examples include seed oil, gum, latex, resin, and others.

Resin: An amorphous complex mixture of resin acids, resin alcohols, resinotannols, esters and resins, usually hard and transparent or translucent at room temperature, and insoluble in water, e.g., rosin, guaiac, and mastic.

Soft extract: Soft extracts are preparations having consistencies between those of liquid extracts and those of dry extracts, and are obtained by partial evaporation of the solvent (e.g., water, alcohol, or hydroalcoholic mixture) used for extraction.

Tincture: Tinctures are liquid preparations usually prepared by extracting plant materials with alcohol or hydroalcoholic mixtures. Traditionally, tinctures of potent articles of botanical origin represent the activity of 1 g of the drug in each 10 mL of tincture, the strength being adjusted following the test for content of active principles or marker compounds.
