MONOGRAPHS (USP)

BRIEFING

Sodium Chloride, USP 25 page 1578 and page 4822 of PF 23(5) [Sept.-Oct. 1997]. The European Pharmacopoeia is the coordinating pharmacopoeia for the international harmonization of the compendial standards for the Sodium Chloride monograph, as part of the process of international harmonization of monographs and general analytical methods of the European, Japanese, and United States pharmacopoeias. The following monograph, which represents the Adoption Stage 6 document, is based on the corresponding monograph for Sodium Chloride that was prepared by the European Pharmacopoeia. The European Pharmacopoeia draft was based in part on comments from the Japanese Pharmacopoeia and the United States Pharmacopoeia in response to the Provisional Harmonized Text Stage 5A and 5B drafts prepared by the European Pharmacopoeia. Differences between the European Pharmacopoeia Adoption Stage 6 document and the current USP monograph include the following:

1. Definition—No change.
2. Labeling—No change.
3. Appearance of solution—No change.
4. Identification—The test for Chloride is modified to comply with EP standards.
5. Bacterial endotoxins—This test is added to comply with parenteral dosage use.
6. Acidity or alkalinity—No change.
7. Loss on drying—A sample weight of 1.000 g is added.
8. Limit of bromides—No change.
9. Limit of phosphates—No change.
10. Limit of potassium—The test is changed to a method of direct calibration to comply with EP standards.
11. Iodides—No change.
12. Aluminum—This test is added to conform to EP standards concerning usage in dialysis. This requirement is similar to the Limit of aluminum test in the USP Calcium Acetate monograph.
13. Magnesium and alkaline-earth metals—No change.
15. Iron—The limit prescribed by the USP is retained. The general method is modified to create better conditions of evaluation.
16. Barium—Solution concentrations are altered.
17. Ferrocyanides—No change.
18. Sulfate—The test is modified to comply with EP standards.
19. Nitrites—No change.
20. Assay—This test is modified to comply with EP standards.

Add the following:

Sodium Chloride

NaCl 58.44
Sodium Chloride [7647-14-5].

» Sodium Chloride contains not less than 99.0 percent and not more than 100.5 percent of NaCl, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.

Labeling—Where Sodium Chloride is intended for use in the manufacture of injectable dosage forms, peritoneal dialysis solutions, hemodialysis solutions, or hemofiltration solutions, it is so labeled.

Appearance of solution—Dissolve 20.0 g of Sodium Chloride in carbon dioxide-free water, and dilute with the same solvent to 100.0 mL. This solution is clear and colorless.

Identification—Responds to the tests for Sodium (191) and for Chloride.

Chloride—Dissolve about 3 mg of Sodium Chloride in 2 mL of water. Acidify with diluted nitric acid and add 0.4 mL of silver nitrate TS. Shake and allow to stand. A curdled, white precipitate is formed. Centrifuge and wash the precipitate with three 1-mL portions of water, and discard the washings. Carry out this operation rapidly in subdued light, disregarding the fact that the supernatant solution may not become perfectly clear. Suspend the precipitate in 2 mL of water and add 1.5 mL of 10 N ammonium hydroxide. The precipitate dissolves easily with the possible exception of a few large particles, which dissolve more slowly.
Bacterial endotoxins (85)—If intended for use in the manufacture of parenteral dosage forms, it contains not more than 5 I.U. of endotoxin per gram.

Acidity or alkalinity—To 20 mL of the solution prepared for the test for Appearance of solution, add 0.1 mL of bromothymol blue TS: not more than 0.5 mL of 0.01 N hydrochloric acid or 0.01 N sodium hydroxide is required to change the color of this solution.

Loss on drying (731)—Dry the test material at 105° for 2 hours: it loses not more than 0.5% of its weight, determined on a 1.000 g sample.

Limit of bromides—To 0.5 mL of the solution prepared for the test for Appearance of solution, add 4.0 mL of water, 2.0 mL of pH 4.7 phenol red TS, and 1.0 mL of chloramine T solution (0.1 mg per mL), and mix immediately. After 2 minutes, add 0.15 mL of 0.1 N sodium thiosulfate, mix, dilute with water to 10.0 mL, and mix. The absorbance of this solution measured at 590 nm, using water as the comparison liquid, is not greater than that of a Standard solution, concomitantly prepared, using 5.0 mL of a solution containing 3.0 mg of potassium bromide per liter and proceeding as above, starting with the addition of 2.0 mL of pH 4.7 phenol red TS (0.010%).

Limit of phosphates—Dilute 2 mL of the solution prepared in the test for Appearance of solution to 100 mL with water. Add 4 mL of sulfomolybdic acid TS, and add 0.1 mL of a mixture of 1 mL of stronger acid stannous chloride TS and 10 mL of 2 N hydrochloric acid. Concomitantly prepare a Standard solution in the same manner, using a mixture of 2 mL of a freshly prepared 1 to 100 dilution of a stock solution containing 0.716 mg of monobasic potassium phosphate per mL and 98 mL of water. After 10 minutes compare the colors of 20 mL of each solution. Any color in the test solution is not more intense than that in the Standard solution (0.0025%, or 25 ppm).

Limit of potassium (where it is labeled as intended for use in the manufacture of injectable dosage forms, peritoneal dialysis solutions, hemodialysis solutions, or hemofiltration solutions)—

Test solution—Transfer 1.00 g of Sodium Chloride to a 100-mL volumetric flask, add water and swirl to dissolve, dilute with water to volume, and mix.

Standard solution—[NOTE—The Standard solution and Test solutions may be modified, if necessary, to obtain solutions of suitable concentrations adaptable to the linear or working range of the instrument.] Dissolve 1.144 g of potassium chloride, previously dried at 105° for 3 hours, in water, dilute with water to 1000 mL, and mix. This solution contains the equivalent of 600 µg of potassium per mL. Dilute as required to obtain no fewer than three solutions at concentrations that span the expected value in the Test solution.

Procedure—Using atomic absorption spectrophotometry (see Spectrophotometry and Light-Scattering (851)), measure, at least three times, the emission intensity of the Test solution and Standard solutions using an air–acetylene flame and a wavelength of 766.5 nm. Prepare a calibration curve from the mean of the readings obtained with the Standard solutions and determine the concentration of potassium in the Test solution. The limit is 0.05%.

Iodides—Moisten 5 g of Sodium Chloride by the dropwise addition of a freshly prepared mixture of 0.15 mL of sodium nitrite solution (1 in 10), 2 mL of 1 N sulfuric acid, 25 mL of iodide-free starch TS, and 25 mL of water. After 5 minutes, examine the substance in natural light. No blue color is observed.

Aluminum (where it is labeled as intended for use in the manufacture of peritoneal dialysis solutions, hemodialysis solutions, or hemofiltration solutions)—
Standard aluminum solution—To 352 mg of aluminum potassium sulfate in a 100-mL volumetric flask, add a few mL of water, swirl to dissolve, add 20 mL of diluted sulfuric acid, dilute with water to volume, and mix. Immediately before use, transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with water to 250 mL, and mix.

pH 6.0 acetate buffer—Dissolve 50 g of ammonium acetate in 150 mL of water, adjust with glacial acetic acid to a pH of 6.0, dilute with water to 250 mL, and mix.

Test solution—Dissolve 20.0 g of Sodium Chloride in 100 mL of water, and add 10 mL of pH 6.0 acetate buffer. Extract this solution with successive portions of 20, 20, and 10 mL of a 0.5% solution of 8-hydroxyquinoline in chloroform, combining the chloroform extracts in a 50-mL volumetric flask. Dilute the combined extracts with chloroform to volume, and mix.

Standard solution—Prepare a mixture of 2.0 mL of Standard aluminum solution, 10 mL of pH 6.0 acetate buffer, and 98 mL of water. Extract this mixture as described for the Test solution, dilute the combined extracts with chloroform to volume, and mix.

Blank solution—Prepare a mixture of 10 mL of pH 6.0 acetate buffer and 100 mL of water. Extract this mixture as described for the Test solution, dilute the combined extracts with chloroform to volume, and mix.

Procedure—Determine the fluorescence intensities of the Test solution and the Standard solution in a fluorometer set at an excitation wavelength of 392 nm and an emission wavelength of 518 nm, using the Blank solution to set the instrument to zero. The fluorescence of the Test solution does not exceed that of the Standard solution (0.2 µg per g).

Magnesium and alkaline-earth metals—To 200 mL of water, adding 20 mL of ammonium hydroxide and diluting to 100 mL), 1 mL of 0.1 M zinc sulfate, and about 0.2 g of eriochrome black T trituration. Heat to about 40°. Titrate this solution with 0.01 M edetate disodium VS until the violet color changes to deep blue. To this solution add 10.0 g of Sodium Chloride dissolved in 100 mL of water. If the color changes to violet, titrate the solution with 0.01 M edetate disodium VS to a deep blue endpoint. The volume of 0.01 M edetate disodium consumed in the second titration does not exceed 2.5 mL (0.01%, calculated as Ca).

Arsenic, Method I (211): 1 µg per g.

Iron—

Test preparation—Use a 10-mL portion of the solution prepared for the test for Appearance of Solution.

Standard preparation—Immediately before use, dilute Standard iron solution (see Iron (241)) 1 to 10 with water. This solution contains the equivalent of 1 mg of iron per mL. Combine 4 mL of this solution and 6 mL of water.

Procedure—To each of the preparations, add 2 mL of a 200g/L solution of citric acid and 0.1 mL of thioglycolic acid. Mix, make alkaline with stronger ammonia water and dilute to 20 mL with water. After 5 minutes, any pink color in the Test solution is not more intense than that from the Standard preparation. The limit is 2 mg per g.

Barium—To 5 mL of the solution prepared for the test for Appearance of solution, add 2 mL of 2 N sulfuric acid and 5 mL of water. To another 5 mL of the solution prepared for the test for Appearance of solution, add 7 mL of water. The solutions are equally clear after standing for 2 hours.

Ferrocyanides—Dissolve 2.0 g in 6 mL of water. Add 0.5 mL of a mixture of 5 mL of ferric ammonium sulfate solution (1 g in 100 mL of 0.1 N sulfuric acid) and 95 mL of ferrous sulfate solution (1 in 100): no blue color develops in 10 minutes.
Sulfate—

*Standard sulfate solution A*—To 181 mg of potassium sulfate in a 100-mL volumetric flask, add a few mL of 30 percent alcohol, swirl to dissolve, dilute with 30 percent alcohol to volume, and mix. Immediately before use, transfer 10.0 mL of this solution to a 1000-mL volumetric flask, dilute with 30 percent alcohol to volume, and mix. This solution contains 10 μg of sulfate per mL.

*Standard sulfate solution B*—To 181 mg of potassium sulfate in a 100-mL volumetric flask, add a few mL of 30 percent alcohol, swirl to dissolve, dilute with 30 percent alcohol to volume, and mix. Immediately before use, transfer 10.0 mL of this solution to a 1000-mL volumetric flask, dilute with 30 percent alcohol to volume, and mix. This solution contains 10 μg of sulfate per mL.

*Sodium chloride solution*—Dissolve 2.5 g of Sodium Chloride in 50 mL of water.

**Procedure**—To 1.5 mL of *Standard sulfate solution A* add 1 mL of a barium chloride solution (1 in 4), shake, and allow to stand for 1 minute. To 2.5 mL of the resulting suspension, add 15 mL of the Sodium Chloride solution and 0.5 mL of 5 N acetic acid, and mix (Test solution). Prepare the *Standard solution* in the same manner, except use 15 mL of *Standard sulfate solution B* instead of the Sodium Chloride solution: any turbidity produced in the Test solution after 5 minutes standing is not greater than that produced in the Standard solution (0.020%).

**Nitrites**—To 10 mL of the solution prepared in the test for Appearance of solution, add 10 mL of water, and measure the absorbance of the solution in a 1-cm cell at 354 nm. The absorbance is not greater than 0.01.

**Heavy metals, Method I** (231): 5 ppm.

**Assay**—Dissolve 50 mg of Sodium Chloride, accurately weighed, in water and make 50 mL. Titrate with 0.1 N silver nitrate VS, determining the end-point potentiometrically (see *Titrimetry* (541)). Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of NaCl.

## MONOGRAPHS (NF)

### Briefing

**Carboxymethylcellulose Calcium, NF 20** page 2522. The United States Pharmacopeia is the coordinating pharmacopeia for the international harmonization of compendial standards for this article. The revisions presented in this proposal, which represents the Adoption Stage 6 draft, reflect the Committee of Revision's results in this harmonization effort and have been accepted by the members of the Pharmacopeial Discussion Group. Proposed changes from the current NF monograph include the following:

1. **Definition**—No change.
2. **Packaging and storage**—No change.
3. **Identification**—No change.
4. **Alkalinity**—No change.
5. **Loss on drying**—No change.
6. **Residue on ignition**—No change.
7. **Heavy metals**—No change.
8. **Limit of chloride**—No change.
9. **Limit of sulfate**—The limit has been modified to 1.0% from 0.96%.
10. **Silicate**—Deleted, based on comments that this test is unnecessary since silicate is not added to the article of commerce.
11. **Starch**—Deleted, based on comments that this test is unnecessary since starch is not added to the article of commerce.
12. **Organic volatile impurities**—Deleted, based on information that no organic solvents are used in the manufacture of the article of commerce.
