Potassium Chloride Extended-Release Tablets

Type of Posting: Notice of Intent to Revise
Posting Date: 27–Sep–2019
Targeted Official Date: To Be Determined, Revision Bulletin
Expert Committee: Chemical Medicines Monographs

In accordance with section 7.04 (c) of the 2015–2020 Rules and Procedures of the Council of Experts and the Pending Monograph Guideline, this is to provide notice that the Chemical Medicines Monographs 5 Expert Committee intends to revise the Potassium Chloride Extended-Release Tablets monograph.

Based on the supporting data received from a manufacturer awaiting FDA approval, the Expert Committee proposes to add Test 6 in the Dissolution section of the monograph.

- *Dissolution Test 6* was validated using the Dionex IonPac CS12A brand of L106 column from Thermo Fisher. The typical retention time for potassium is about 7 min.

The proposed revision is contingent on FDA approval of a product that meets the proposed monograph specifications. The proposed revision will be published as a Revision Bulletin and an official date will be assigned to coincide as closely as possible with the FDA approval of the associated product.

See below for additional information about the proposed text.¹

Should you have any questions, please contact Pavani Jagu, Associate Scientific Liaison (+91 40 44488968 or Pavani.jagu@usp.org).

¹ This text is not the official version of a USP–NF monograph and may not reflect the full and accurate contents of the currently official monograph. Please refer to the current edition of the USP–NF for official text.

USP provides this text to indicate changes that we anticipate will be made official once the product subject to this proposed revision under the Pending Monograph Program receives FDA approval. Once FDA approval is granted for the associated revision request, a Revision Bulletin will be posted that will include the changes indicated herein, as well as any changes indicated in the product’s final approval, combined with the text of the monograph as effective on the date of approval. Any revisions made to a monograph under the Pending Monograph Program that are posted without prior publication for comment in the Pharmacopeial Forum must also meet the requirements outlined in the USP Guideline on Use of Accelerated Processes for Revisions to the USP–NF.
Potassium Chloride Extended-Release Tablets

DEFINITION
Potassium Chloride Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of potassium chloride (KCl).

IDENTIFICATION

• A. IDENTIFICATION TESTS—GENERAL (191), Chemical Identification Tests, Potassium

Sample solution: A portion of the filtrate, obtained as directed for the designated Sample stock solution in the Assay

Acceptance criteria: Meet the requirements

• B. IDENTIFICATION TESTS—GENERAL (191), Chemical Identification Tests, Chloride

Sample solution: A portion of the filtrate, obtained as directed for the designated Sample stock solution in the Assay

Acceptance criteria: Meet the requirements

ASSAY

• PROCEDURE

[Note—If necessary, first score nonsugar-coated Tablets. Retain a portion of the filtrate of either Sample stock solution 1 or Sample stock solution 2 for use in Identification A and B.]

Standard stock solution: 19.07 µg/mL of potassium chloride, previously dried at 105° for 2 h, in water. This solution contains 10 µg/mL of potassium.

Standard solutions: To separate 100-mL volumetric flasks transfer 10.0, 15.0, and 20.0 mL, respectively, of Standard stock solution. To each flask add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, and dilute with water to volume. The Standard solutions contain 1.0, 1.5, and 2.0 µg/mL of potassium, respectively.

Sample preparation 1

Sample stock solution 1: Nominally 0.06 mg/mL of potassium chloride prepared as follows. Place NLT 20 Tablets in a suitable container with 400 mL of water, heat to boiling, and boil for 20 min. Allow to cool, transfer the solution to a 1000-mL volumetric flask, and dilute with water to volume. Filter and discard the first 20 mL of the filtrate. Transfer a measured volume of the subsequent filtrate, equivalent to 60 mg of potassium chloride, to a 1000-mL volumetric flask, and dilute with water to volume.

Sample solution 1: Nominally 3 µg/mL of potassium chloride prepared as follows. Transfer 5.0 mL of Sample stock solution 1 to a 100-mL volumetric flask, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, and dilute with water to volume.

Sample preparation 2 (for formulations containing crystals coated with hydrophobic polymers)

Sample stock solution 2: Nominally 0.06 mg/mL of potassium chloride prepared as follows. Place NLT 20 Tablets in a 2000-mL volumetric flask. Add 1200 mL of a mixture of acetonitrile and water (1:1), and shake by mechanical means, or stir using a magnetic bar for 90 min. Dilute with the mixture of acetonitrile and water (1:1) to volume. Allow to stand for 90 min. Pass through a filter of 0.2-µm pore size. Transfer a measured volume of the filtrate, and quantitatively dilute with water to obtain a solution with a concentration of 0.06 mg/mL. [Note—Alternatively, Sample stock solution 2 can be prepared by the following procedure. Nominally 0.15 mg/mL of potassium chloride from NLT 20 finely powdered Tablets, prepared as follows. Transfer an appropriate amount of the powder, equivalent to about 5–6 Tablets, to a suitable volumetric flask, add 10% of the final flask volume of acetone, and sonicate for 45 min with intermittent shaking. Add 80% of the final flask volume of water and sonicate for 45 min with intermittent shaking. Cool to room temperature and dilute with water to volume. Centrifuge a portion of the solution at 5000 rpm for 10 min. Transfer an appropriate amount of the supernatant to a 100-mL volumetric flask and dilute with water to volume to obtain a solution with a concentration of 0.15 mg/mL.]

Sample solution 2: Nominally 3 µg/mL of potassium chloride prepared as follows. Transfer an appropriate amount of Sample stock solution 2 to a 100-mL volumetric flask, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, and dilute with water to volume.

Instrumental conditions

(See Atomic Absorption Spectroscopy (852).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Potassium emission line at 766.5 nm

Lamp: Potassium hollow-cathode

Flame: Air–acetylene

Blank: Water

Analysis

Samples: Standard solutions, Sample solution 1 or Sample solution 2, and Blank

Plot the absorbances of the Standard solutions versus the concentration of potassium, in µg/mL, and draw the straight line best fitting the three plotted points. From the graph, determine the concentration of potassium in the Sample solution (µg/mL).

Calculate the percentage of the labeled amount of potassium chloride (KCl) in each Tablet taken:

\[
\text{Result} = \left( \frac{C}{C_0} \right) \times \left( \frac{M_r}{A_r} \right) \times 100
\]

where

- \(C\) = concentration of potassium in the Sample solution as determined in this test (µg/mL)
- \(C_0\) = nominal concentration of potassium chloride in the Sample solution (µg/mL)
- \(M_r\) = molecular weight of potassium chloride, 74.55
- \(A_r\) = atomic weight of potassium, 39.10

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

Change to read:

• DISSOLUTION (711)

Test 1

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 2 h

Standard stock solution: 19.07 µg/mL of potassium chloride, previously dried at 105° for 2 h, in water. This solution contains 10 µg/mL of potassium.

Standard solutions: To separate 100-mL volumetric flasks transfer 10.0, 15.0, and 20.0 mL, respectively, of Standard stock solution. To each flask add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, and dilute with water to volume. The Standard solutions contain, respectively, 1.0, 1.5, and 2.0 µg/mL of potassium.

C220295-M67390-CHM52015, rev 00 20190927
2 Potassium

Sample stock solution: Filter the solution under test, and dilute with Medium to obtain a solution containing nominally 60 µg/mL of potassium chloride.

Sample solution: Transfer 5.0 mL of the Sample stock solution to a 100-mL volumetric flask. Add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, and dilute with water to volume.

Instrumental conditions
(See Atomic Absorption Spectroscopy (852).)

Mode: Atomic absorption spectrophotometry
Analytical wavelength: Potassium emission line at 766.5 nm
Lamp: Potassium hollow-cathode
Flame: Air-acetylene
Blank: Water

Analysis
Samples: Standard solutions, Sample solution, and Blank
Plot the absorbances of the Standard solutions versus the concentration of potassium, in µg/mL, and draw the straight line best fitting the three plotted points. From the graph, determine the concentration of potassium in the Sample solution (µg/mL).

Calculate the percentage of the labeled amount of potassium chloride (KCl) dissolved:

\[ \text{Result} = \left[ \left( \frac{A}{C} \times D \times (V/L) \right) \times (M/A) \right] \times 100 \]

C = concentration of potassium in the Sample solution as determined in this test (µg/mL)
D = dilution factor of the Sample solution
V = volume of Medium, 900 mL
L = labeled amount of potassium chloride (µg/Tablet)
M = molecular weight of potassium chloride, 74.55
A = atomic weight of potassium, 39.10

Tolerances: NMT 35% (Q) of the labeled amount of potassium chloride (KCl) is dissolved in 2 h. The requirements are met if the quantities dissolved from the Tablets tested conform to Table 1 instead of the table shown in Dissolution (711).

Test 2: If the product complies with this procedure, the labeling indicates that it meets USP Dissolution Test 2.

Standard stock solution and Standard solutions:
Prepare as directed in Test 1.

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Times: 1, 2, 4, and 8 h

Sample stock solution: Transfer 4.0 mL of the solution under test into either a 50-mL volumetric flask (for 750-mg Tablet) or a 100-mL volumetric flask (for 1500-mg Tablet), dilute with water to volume, and filter.

Sample solution: Transfer 4.0 mL of the Sample stock solution to a 100-mL volumetric flask. Add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, and dilute with water to volume.

Blank solution: To a 100-mL volumetric flask, add 2.0 mL of sodium chloride solution (1 in 5) and 1.0 mL of hydrochloric acid, and dilute with water to volume.

Instrumental conditions: Proceed as directed in Test 1, except do not use the Blank.

System suitability
Samples: Standard solutions
Suitability requirements
Linearity: Correlation coefficient NLT 0.99
Relative standard deviation: NMT 5.0% from 5 replicate analyses of the 1.5-µg/mL Standard solution

Analysis
Samples: 1.5-µg/mL Standard solution, Sample solution, and Blank solution
Calculate the percentage of the labeled amount of potassium chloride (KCl) dissolved:

\[ \text{Result} = \left( \frac{A}{C} \times D \times (V/L) \right) \times (M/A) \times 100 \]

A = absorbance of potassium in the Sample solution
C = absorbance of potassium in the Standard solution
D = concentration of potassium in the Standard solution (µg/mL)
V = volume of Medium, 900 mL
L = labeled amount of potassium chloride (µg/Tablet)
M = molecular weight of potassium chloride, 74.55
A = atomic weight of potassium, 39.10

Tolerances: See Table 2.

The percentages of the labeled amount of potassium chloride (KCl), dissolved at the times specified, conform to Dissolution (711), Acceptance Table 2.

Test 3: If the product complies with this procedure, the labeling indicates that it meets USP Dissolution Test 3.

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Times: 0.5, 2, 4, and 10 h

Mobile phase: 20 mM methanesulfonic acid in water

Standard solution: (L/900) mg/mL of USP Potassium Chloride RS in water, where L is the label claim of potassium chloride in mg/Tablet, prepared as follows. Transfer an appropriate quantity of USP Potassium Chloride RS to a suitable volumetric flask. Add 50% of the flask volume of water and sonicate to dissolve. Dilute with water to volume.

Sample solution: Pass a portion of the solution under test through a filter with a suitable pore size and use the filtrate.
Chromatographic system
(See Chromatography (621), System Suitability.)
Mode: LC
Detector: Conductivity with suppression
Column: 4.0-mm × 25-cm; 8.5-μm packing L106
Column temperature: 30°C
Flow rate: 1.0 mL/min
Injection volume: 5 μL
Run time: NLT 2 times the retention time of potassium

System suitability
Sample: Standard solution
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%

Analysis
Samples: Standard solution and Sample solution
Calculate the percentage of the labeled amount of potassium chloride (KCl) dissolved at each time point (i):

\[
\text{Result}_i = \left( \frac{r_i}{r_s} \right) \times C_s \times V \times \left( \frac{1}{L} \right) \times 100
\]

\[ r_i = \text{peak response of potassium from the} \ \text{Sample solution} \]
\[ r_s = \text{peak response of potassium from the} \ \text{Standard solution} \]
\[ C_s = \text{concentration of USP Potassium Chloride RS in the} \ \text{Standard solution (mg/mL)} \]
\[ V = \text{volume of Medium, 900 mL} \]
\[ L = \text{label claim of potassium chloride (mg/Tablet)} \]

Tolerances: See Table 3.

The percentages of the labeled amount of potassium chloride (KCl), dissolved at the times specified, conform to Dissolution (711), Acceptance Table 2.

Test 4: If the product complies with this procedure, the labeling indicates that it meets USP Dissolution Test 4.

Standard stock solution and Instrumental conditions:
Proceed as directed in Test 1, except Blank.

Medium: Water; 900 mL
Apparatus 2: 50 rpm
Times: 2, 4, and 8 h

Dilute glacial acetic acid solution: Dilute 25 mL of glacial acetic acid with 75 mL of water.

Saturated potassium sulfate solution: Dissolve sufficient quantities of potassium sulfate in a suitable volume of water until undissolved particles appear in the solution.

0.01 N silver nitrate solution: Transfer 10 mL of 0.1 N silver nitrate VS to a 100-mL volumetric flask and dilute with water to volume.

Standard solution: (L/900) mg/mL of potassium chloride, previously dried at 105°C for 2 h, in water, where L is the label claim in mg/Tablet. Pass the solution through a suitable filter.

Sample solution: Withdraw 10 mL of the solution under test at the specified time points and pass a suitable portion of the solution through a suitable filter. Replace each of the volume withdrawn with an equal volume of the Medium.

Blank: Medium

Titrmetric system
(See Titrmetric (541),)
Mode: Direct titration
Titrant: 0.01 N silver nitrate solution
Endpoint detection: Potentiometric

System suitability
Sample: Standard solution
Transfer 5 mL of Standard solution into a titration vessel and add 25 mL of water, 5 mL of Dilute glacial acetic solutions contain 1.0, 1.5, and 2.0 μg/mL of potassium, respectively.

Sample stock solution: Pass a portion of the solution under test through a filter with a suitable pore size and use the filtrate.

Sample solution: Transfer 1.0 mL of the Sample stock solution to a suitable volumetric flask and dilute with water if necessary. To the final dilution, add 2.0% flask volume of Sodium chloride solution and 4.0% flask volume of Hydrochloric acid solution, and dilute with water to volume.

Blank: To a suitable volumetric flask, add 2.0% flask volume of Sodium chloride solution and 4.0% flask volume of Hydrochloric acid solution, and dilute with water to volume.

System suitability
Samples: Standard solutions
Suitability requirements
Linearity: Correlation coefficient NLT 0.999
Relative standard deviation: NMT 1.5% from the absorbance responses of 5 replicate analyses of each Standard solution

Analysis: Proceed as directed in Test 1.

Tolerances: See Table 4.

Analysis
Samples: Sample solution and Blank
Transfer 5 mL of each solution into separate titration vessels and add 25 mL of water, 5 mL of Dilute glacial acetic acid solution, and 0.1 mL of Saturated potassium sulfate solution to each vessel. Titrate with Titrant and determine the endpoint potentiometrically.
Calculate the concentration (C) of potassium chloride (KCl) in the sample withdrawn from the vessel at each time point (i):

\[ \text{Result}_i = (V_u - V_d) \times N \times F \times (1/V_v) \]

\[ V_u = \text{volume of Titrant used to titrate the Sample solution} \]
\[ V_d = \text{volume of Titrant used to titrate the Blank} \]
\[ N = \text{actual normality of Titrant (mEq/mL)} \]
\[ F = \text{equivalency factor, } 74.55 \text{ mg/mEq} \]
\[ V_v = \text{volume of Sample solution used in the test, } 5 \text{ mL} \]

Calculate the percentage of the labeled amount of potassium chloride (KCl) dissolved at each time point (i):

\[ \text{Result}_1 = C_i \times V \times (1/L) \times 100 \]
\[ \text{Result}_2 = [(C_2 \times V) + (C_1 \times V_0)] \times (1/L) \times 100 \]
\[ \text{Result}_3 = [(C_1 \times V) + (C_2 + C_3) \times V_w] \times (1/L) \times 100 \]

\[ C_i = \text{concentration of potassium chloride in the portion of sample withdrawn at the specific time point} \]
\[ V = \text{volume of Medium, } 900 \text{ mL} \]
\[ L = \text{labeled amount of potassium chloride (mg/Tablet)} \]
\[ V_w = \text{volume of Sample solution withdrawn from vessel, } 10 \text{ mL} \]

Tolerances: See Table 5.
